To find the limits of integration for evaluating the integral, we begin by sketching $D$ and its projection $R$ on the $xy$-plane (Figure 15.46).

*The $\rho$-limits of integration.* We draw a ray $M$ from the origin through $D$ making an angle $\phi$ with the positive $z$-axis. We also draw $L$, the projection of $M$ on the $xy$-plane, along with the angle $\theta$ that $L$ makes with the positive $x$-axis. Ray $M$ enters $D$ at $\rho = 0$ and leaves at $\rho = 1$.

*The $\phi$-limits of integration.* The cone $\phi = \pi/3$ makes an angle of $\pi/3$ with the positive $z$-axis. For any given $\theta$, the angle $\phi$ can run from $\phi = 0$ to $\phi = \pi/3$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

*The $\theta$-limits of integration.* The ray $L$ sweeps over $R$ as $\theta$ runs from 0 to $2\pi$. The volume is

$$V = \iiint_D \rho^2 \sin\phi \, d\rho \, d\phi \, d\theta = \int_0^{2\pi}\int_0^{\pi/3}\int_0^1 \rho^2 \sin\phi \, d\rho \, d\phi \, d\theta$$

$$= \int_0^{2\pi}\int_0^{\pi/3} \left[\frac{\rho^3}{3}\right]_0^1 \sin\phi \, d\phi \, d\theta = \int_0^{2\pi}\int_0^{\pi/3} \frac{1}{3}\sin\phi \, d\phi \, d\theta$$

$$= \int_0^{2\pi} \left[-\frac{1}{3}\cos\phi\right]_0^{\pi/3} d\theta = \int_0^{2\pi} \left(-\frac{1}{6} + \frac{1}{3}\right) d\theta = \frac{1}{6}(2\pi) = \frac{\pi}{3}. \quad \blacksquare$$

## EXAMPLE 6 Finding a Moment of Inertia

A solid of constant density $\delta = 1$ occupies the region $D$ in Example 5. Find the solid's moment of inertia about the $z$-axis.

**Solution** In rectangular coordinates, the moment is

$$I_z = \iiint (x^2 + y^2)\, dV.$$

In spherical coordinates, $x^2 + y^2 = (\rho\sin\phi\cos\theta)^2 + (\rho\sin\phi\sin\theta)^2 = \rho^2\sin^2\phi$. Hence,

$$I_z = \iiint (\rho^2\sin^2\phi)\,\rho^2\sin\phi \, d\rho \, d\phi \, d\theta = \iiint \rho^4 \sin^3\phi \, d\rho \, d\phi \, d\theta.$$

For the region in Example 5, this becomes

$$I_z = \int_0^{2\pi}\int_0^{\pi/3}\int_0^1 \rho^4\sin^3\phi \, d\rho \, d\phi \, d\theta = \int_0^{2\pi}\int_0^{\pi/3} \left[\frac{\rho^5}{5}\right]_0^1 \sin^3\phi \, d\phi \, d\theta$$

$$= \frac{1}{5}\int_0^{2\pi}\int_0^{\pi/3} (1 - \cos^2\phi)\sin\phi \, d\phi \, d\theta = \frac{1}{5}\int_0^{2\pi} \left[-\cos\phi + \frac{\cos^3\phi}{3}\right]_0^{\pi/3} d\theta$$

$$= \frac{1}{5}\int_0^{2\pi} \left(-\frac{1}{2} + 1 + \frac{1}{24} - \frac{1}{3}\right) d\theta = \frac{1}{5}\int_0^{2\pi} \frac{5}{24}\, d\theta = \frac{1}{24}(2\pi) = \frac{\pi}{12}. \quad \blacksquare$$

### Coordinate Conversion Formulas

| Cylindrical to Rectangular | Spherical to Rectangular | Spherical to Cylindrical |
|---|---|---|
| $x = r\cos\theta$ | $x = \rho\sin\phi\cos\theta$ | $r = \rho\sin\phi$ |
| $y = r\sin\theta$ | $y = \rho\sin\phi\sin\theta$ | $z = \rho\cos\phi$ |
| $z = z$ | $z = \rho\cos\phi$ | $\theta = \theta$ |

Corresponding formulas for $dV$ in triple integrals:

$$dV = dx\, dy\, dz$$
$$= dz\, r\, dr\, d\theta$$
$$= \rho^2\sin\phi \, d\rho \, d\phi \, d\theta$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

In the next section we offer a more general procedure for determining $dV$ in cylindrical and spherical coordinates. The results, of course, will be the same.

# EXERCISES 15.6

## Evaluating Integrals in Cylindrical Coordinates

Evaluate the cylindrical coordinate integrals in Exercises 1–6.

**1.** $\displaystyle\int_0^{2\pi}\int_0^{1}\int_r^{\sqrt{2-r^2}} dz\, r\, dr\, d\theta$

**2.** $\displaystyle\int_0^{2\pi}\int_0^{3}\int_{r^2/3}^{\sqrt{18-r^2}} dz\, r\, dr\, d\theta$

**3.** $\displaystyle\int_0^{2\pi}\int_0^{\theta/2\pi}\int_0^{3+24r^2} dz\, r\, dr\, d\theta$

**4.** $\displaystyle\int_0^{\pi}\int_0^{\theta/\pi}\int_{-\sqrt{4-r^2}}^{3\sqrt{4-r^2}} z\, dz\, r\, dr\, d\theta$

**5.** $\displaystyle\int_0^{2\pi}\int_0^{1}\int_r^{1/\sqrt{2-r^2}} 3\, dz\, r\, dr\, d\theta$

**6.** $\displaystyle\int_0^{2\pi}\int_0^{1}\int_{-1/2}^{1/2} (r^2\sin^2\theta + z^2)\, dz\, r\, dr\, d\theta$

## Changing Order of Integration in Cylindrical Coordinates

The integrals we have seen so far suggest that there are preferred orders of integration for cylindrical coordinates, but other orders usually work well and are occasionally easier to evaluate. Evaluate the integrals in Exercises 7–10.

**7.** $\displaystyle\int_0^{2\pi}\int_0^{3}\int_0^{z/3} r^3\, dr\, dz\, d\theta$

**8.** $\displaystyle\int_{-1}^{1}\int_0^{2\pi}\int_0^{1+\cos\theta} 4r\, dr\, d\theta\, dz$

**9.** $\displaystyle\int_0^{1}\int_0^{\sqrt{z}}\int_0^{2\pi} (r^2\cos^2\theta + z^2)\, r\, d\theta\, dr\, dz$

**10.** $\displaystyle\int_0^{2}\int_{r-2}^{\sqrt{4-r^2}}\int_0^{2\pi} (r\sin\theta + 1)\, r\, d\theta\, dz\, dr$

**11.** Let $D$ be the region bounded below by the plane $z = 0$, above by the sphere $x^2 + y^2 + z^2 = 4$, and on the sides by the cylinder $x^2 + y^2 = 1$. Set up the triple integrals in cylindrical coordinates that give the volume of $D$ using the following orders of integration.

**a.** $dz\, dr\, d\theta$

**b.** $dr\, dz\, d\theta$

**c.** $d\theta\, dz\, dr$

**12.** Let $D$ be the region bounded below by the cone $z = \sqrt{x^2 + y^2}$ and above by the paraboloid $z = 2 - x^2 - y^2$. Set up the triple integrals in cylindrical coordinates that give the volume of $D$ using the following orders of integration.

**a.** $dz\, dr\, d\theta$

**b.** $dr\, dz\, d\theta$

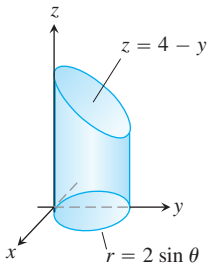
**c.** $d\theta\, dz\, dr$

**13.** Give the limits of integration for evaluating the integral

$$\iiint f(r, \theta, z)\, dz\, r\, dr\, d\theta$$

as an iterated integral over the region that is bounded below by the plane $z = 0$, on the side by the cylinder $r = \cos\theta$, and on top by the paraboloid $z = 3r^2$.

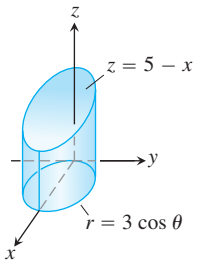
**14.** Convert the integral



$$\int_{-1}^{1}\int_0^{\sqrt{1-y^2}}\int_0^{x} (x^2 + y^2)\, dz\, dx\, dy$$

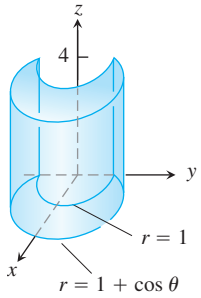
to an equivalent integral in cylindrical coordinates and evaluate the result.

## Finding Iterated Integrals in Cylindrical Coordinates

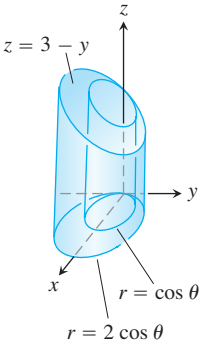


In Exercises 15–20, set up the iterated integral for evaluating $\iiint_D f(r, \theta, z)\, dz\, r\, dr\, d\theta$ over the given region $D$.

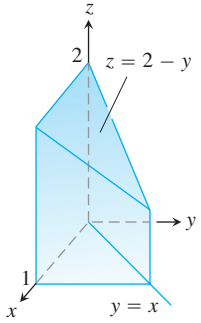
**15.** $D$ is the right circular cylinder whose base is the circle $r = 2\sin\theta$ in the $xy$-plane and whose top lies in the plane $z = 4 - y$.



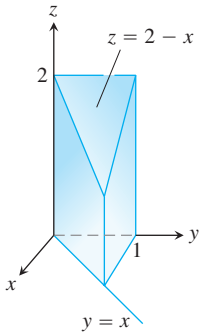
**16.** $D$ is the right circular cylinder whose base is the circle $r = 3\cos\theta$ and whose top lies in the plane $z = 5 - x$.



Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



**17.** $D$ is the solid right cylinder whose base is the region in the $xy$-plane that lies inside the cardioid $r = 1 + \cos\theta$ and outside the circle $r = 1$ and whose top lies in the plane $z = 4$.



**18.** $D$ is the solid right cylinder whose base is the region between the circles $r = \cos\theta$ and $r = 2\cos\theta$ and whose top lies in the plane $z = 3 - y$.

**19.** $D$ is the prism whose base is the triangle in the $xy$-plane bounded by the $x$-axis and the lines $y = x$ and $x = 1$ and whose top lies in the plane $z = 2 - y$.

**20.** $D$ is the prism whose base is the triangle in the $xy$-plane bounded by the $y$-axis and the lines $y = x$ and $y = 1$ and whose top lies in the plane $z = 2 - x$.

## Evaluating Integrals in Spherical Coordinates

Evaluate the spherical coordinate integrals in Exercises 21–26.

**21.** $\displaystyle\int_0^{\pi}\int_0^{\pi}\int_0^{2\sin\phi} \rho^2 \sin\phi \, d\rho \, d\phi \, d\theta$

**22.** $\displaystyle\int_0^{2\pi}\int_0^{\pi/4}\int_0^{2} (\rho\cos\phi)\,\rho^2 \sin\phi \, d\rho \, d\phi \, d\theta$

**23.** $\displaystyle\int_0^{2\pi}\int_0^{\pi}\int_0^{(1-\cos\phi)/2} \rho^2 \sin\phi \, d\rho \, d\phi \, d\theta$

**24.** $\displaystyle\int_0^{3\pi/2}\int_0^{\pi}\int_0^{1} 5\rho^3 \sin^3\phi \, d\rho \, d\phi \, d\theta$

**25.** $\displaystyle\int_0^{2\pi}\int_0^{\pi/3}\int_{\sec\phi}^{2} 3\rho^2 \sin\phi \, d\rho \, d\phi \, d\theta$

**26.** $\displaystyle\int_0^{2\pi}\int_0^{\pi/4}\int_0^{\sec\phi} (\rho\cos\phi)\,\rho^2 \sin\phi \, d\rho \, d\phi \, d\theta$

## Changing Order of Integration in Spherical Coordinates

The previous integrals suggest there are preferred orders of integration for spherical coordinates, but other orders are possible and occasionally easier to evaluate. Evaluate the integrals in Exercises 27–30.

**27.** $\displaystyle\int_0^{2}\int_{-\pi}^{0}\int_{\pi/4}^{\pi/2} \rho^3 \sin 2\phi \, d\phi \, d\theta \, d\rho$

**28.** $\displaystyle\int_{\pi/6}^{\pi/3}\int_{\csc\phi}^{2\csc\phi}\int_0^{2\pi} \rho^2 \sin\phi \, d\theta \, d\rho \, d\phi$

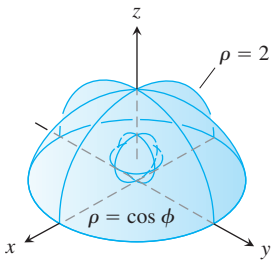
**29.** $\displaystyle\int_0^{1}\int_0^{\pi}\int_0^{\pi/4} 12\rho \sin^3\phi \, d\phi \, d\theta \, d\rho$

**30.** $\displaystyle\int_{\pi/6}^{\pi/2}\int_{-\pi/2}^{\pi/2}\int_{\csc\phi}^{2} 5\rho^4 \sin^3\phi \, d\rho \, d\theta \, d\phi$

**31.** Let $D$ be the region in Exercise 11. Set up the triple integrals in spherical coordinates that give the volume of $D$ using the following orders of integration.

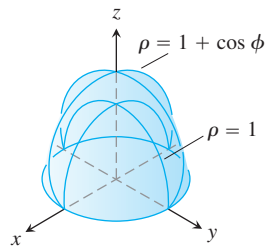
**a.** $d\rho \, d\phi \, d\theta$ **b.** $d\phi \, d\rho \, d\theta$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



**32.** Let $D$ be the region bounded below by the cone $z = \sqrt{x^2 + y^2}$ and above by the plane $z = 1$. Set up the triple integrals in spherical coordinates that give the volume of $D$ using the following orders of integration.

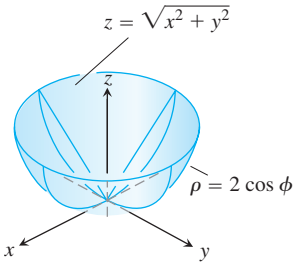
**a.** $d\rho\, d\phi\, d\theta$ **b.** $d\phi\, d\rho\, d\theta$



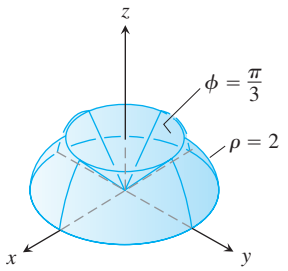
## Finding Iterated Integrals in Spherical Coordinates

In Exercises 33–38, **(a)** find the spherical coordinate limits for the integral that calculates the volume of the given solid and **(b)** then evaluate the integral.

**33.** The solid between the sphere $\rho = \cos\phi$ and the hemisphere $\rho = 2, z \geq 0$



**34.** The solid bounded below by the hemisphere $\rho = 1, z \geq 0$, and above by the cardioid of revolution $\rho = 1 + \cos\phi$



**35.** The solid enclosed by the cardioid of revolution $\rho = 1 - \cos\phi$

**36.** The upper portion cut from the solid in Exercise 35 by the $xy$-plane

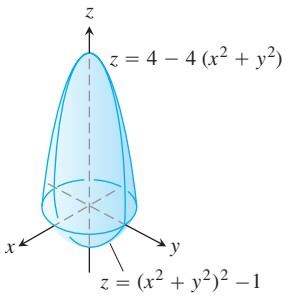
**37.** The solid bounded below by the sphere $\rho = 2\cos\phi$ and above by the cone $z = \sqrt{x^2 + y^2}$

**38.** The solid bounded below by the $xy$-plane, on the sides by the sphere $\rho = 2$, and above by the cone $\phi = \pi/3$

## Rectangular, Cylindrical, and Spherical Coordinates

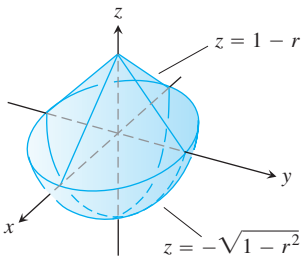
**39.** Set up triple integrals for the volume of the sphere $\rho = 2$ in **(a)** spherical, **(b)** cylindrical, and **(c)** rectangular coordinates.

**40.** Let $D$ be the region in the first octant that is bounded below by the cone $\phi = \pi/4$ and above by the sphere $\rho = 3$. Express the volume of $D$ as an iterated triple integral in **(a)** cylindrical and **(b)** spherical coordinates. Then **(c)** find $V$.



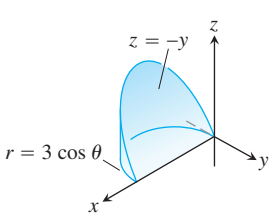
**41.** Let $D$ be the smaller cap cut from a solid ball of radius 2 units by a plane 1 unit from the center of the sphere. Express the volume of $D$ as an iterated triple integral in **(a)** spherical, **(b)** cylindrical, and **(c)** rectangular coordinates. Then **(d)** find the volume by evaluating one of the three triple integrals.

**42.** Express the moment of inertia $I_z$ of the solid hemisphere $x^2 + y^2 + z^2 \leq 1, z \geq 0$, as an iterated integral in **(a)** cylindrical and **(b)** spherical coordinates. Then **(c)** find $I_z$.

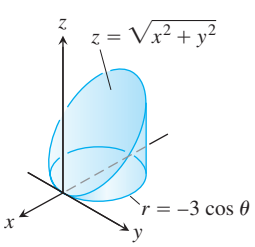


## Volumes

Find the volumes of the solids in Exercises 43–48.

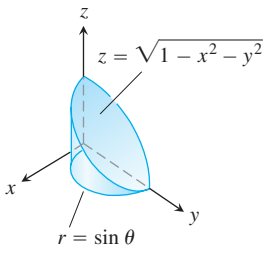


**43.**

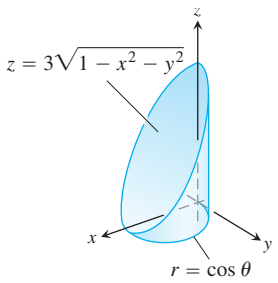


**44.**

**45.**



**46.**



Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**47.**

**48.**

**49. Sphere and cones** Find the volume of the portion of the solid sphere $\rho \le a$ that lies between the cones $\phi = \pi/3$ and $\phi = 2\pi/3$.

**50. Sphere and half-planes** Find the volume of the region cut from the solid sphere $\rho \le a$ by the half-planes $\theta = 0$ and $\theta = \pi/6$ in the first octant.

**51. Sphere and plane** Find the volume of the smaller region cut from the solid sphere $\rho \le 2$ by the plane $z = 1$.

**52. Cone and planes** Find the volume of the solid enclosed by the cone $z = \sqrt{x^2 + y^2}$ between the planes $z = 1$ and $z = 2$.

**53. Cylinder and paraboloid** Find the volume of the region bounded below by the plane $z = 0$, laterally by the cylinder $x^2 + y^2 = 1$, and above by the paraboloid $z = x^2 + y^2$.

**54. Cylinder and paraboloids** Find the volume of the region bounded below by the paraboloid $z = x^2 + y^2$, laterally by the cylinder $x^2 + y^2 = 1$, and above by the paraboloid $z = x^2 + y^2 + 1$.

**55. Cylinder and cones** Find the volume of the solid cut from the thick-walled cylinder $1 \le x^2 + y^2 \le 2$ by the cones $z = \pm\sqrt{x^2 + y^2}$.

**56. Sphere and cylinder** Find the volume of the region that lies inside the sphere $x^2 + y^2 + z^2 = 2$ and outside the cylinder $x^2 + y^2 = 1$.

**57. Cylinder and planes** Find the volume of the region enclosed by the cylinder $x^2 + y^2 = 4$ and the planes $z = 0$ and $y + z = 4$.

**58. Cylinder and planes** Find the volume of the region enclosed by the cylinder $x^2 + y^2 = 4$ and the planes $z = 0$ and $x + y + z = 4$.

**59. Region trapped by paraboloids** Find the volume of the region bounded above by the paraboloid $z = 5 - x^2 - y^2$ and below by the paraboloid $z = 4x^2 + 4y^2$.

**60. Paraboloid and cylinder** Find the volume of the region bounded above by the paraboloid $z = 9 - x^2 - y^2$, below by the $xy$-plane, and lying *outside* the cylinder $x^2 + y^2 = 1$.

**61. Cylinder and sphere** Find the volume of the region cut from the solid cylinder $x^2 + y^2 \le 1$ by the sphere $x^2 + y^2 + z^2 = 4$.

**62. Sphere and paraboloid** Find the volume of the region bounded above by the sphere $x^2 + y^2 + z^2 = 2$ and below by the paraboloid $z = x^2 + y^2$.

## Average Values

**63.** Find the average value of the function $f(r, \theta, z) = r$ over the region bounded by the cylinder $r = 1$ between the planes $z = -1$ and $z = 1$.

**64.** Find the average value of the function $f(r, \theta, z) = r$ over the solid ball bounded by the sphere $r^2 + z^2 = 1$. (This is the sphere $x^2 + y^2 + z^2 = 1$.)

**65.** Find the average value of the function $f(\rho, \phi, \theta) = \rho$ over the solid ball $\rho \le 1$.

**66.** Find the average value of the function $f(\rho, \phi, \theta) = \rho\cos\phi$ over the solid upper ball $\rho \le 1, 0 \le \phi \le \pi/2$.

## Masses, Moments, and Centroids

**67. Center of mass** A solid of constant density is bounded below by the plane $z = 0$, above by the cone $z = r, r \ge 0$, and on the sides by the cylinder $r = 1$. Find the center of mass.

**68. Centroid** Find the centroid of the region in the first octant that is bounded above by the cone $z = \sqrt{x^2 + y^2}$, below by the plane $z = 0$, and on the sides by the cylinder $x^2 + y^2 = 4$ and the planes $x = 0$ and $y = 0$.

**69. Centroid** Find the centroid of the solid in Exercise 38.

**70. Centroid** Find the centroid of the solid bounded above by the sphere $\rho = a$ and below by the cone $\phi = \pi/4$.

**71. Centroid** Find the centroid of the region that is bounded above by the surface $z = \sqrt{r}$, on the sides by the cylinder $r = 4$, and below by the $xy$-plane.

**72. Centroid** Find the centroid of the region cut from the solid ball $r^2 + z^2 \le 1$ by the half-planes $\theta = -\pi/3, r \ge 0$, and $\theta = \pi/3, r \ge 0$.

**73. Inertia and radius of gyration** Find the moment of inertia and radius of gyration about the $z$-axis of a thick-walled right circular cylinder bounded on the inside by the cylinder $r = 1$, on the outside by the cylinder $r = 2$, and on the top and bottom by the planes $z = 4$ and $z = 0$. (Take $\delta = 1$.)

**74. Moments of inertia of solid circular cylinder** Find the moment of inertia of a solid circular cylinder of radius 1 and height 2 **(a)** about the axis of the cylinder and **(b)** about a line through the centroid perpendicular to the axis of the cylinder. (Take $\delta = 1$.)

**75. Moment of inertia of solid cone** Find the moment of inertia of a right circular cone of base radius 1 and height 1 about an axis through the vertex parallel to the base. (Take $\delta = 1$.)

**76. Moment of inertia of solid sphere** Find the moment of inertia of a solid sphere of radius $a$ about a diameter. (Take $\delta = 1$.)

**77. Moment of inertia of solid cone** Find the moment of inertia of a right circular cone of base radius $a$ and height $h$ about its axis. (*Hint:* Place the cone with its vertex at the origin and its axis along the $z$-axis.)

**78. Variable density** A solid is bounded on the top by the paraboloid $z = r^2$, on the bottom by the plane $z = 0$, and on the sides by

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

the cylinder $r = 1$. Find the center of mass and the moment of inertia and radius of gyration about the $z$-axis if the density is

**a.** $\delta(r, \theta, z) = z$

**b.** $\delta(r, \theta, z) = r$.

**79. Variable density** A solid is bounded below by the cone $z = \sqrt{x^2 + y^2}$ and above by the plane $z = 1$. Find the center of mass and the moment of inertia and radius of gyration about the $z$-axis if the density is

**a.** $\delta(r, \theta, z) = z$

**b.** $\delta(r, \theta, z) = z^2$.

**80. Variable density** A solid ball is bounded by the sphere $\rho = a$. Find the moment of inertia and radius of gyration about the $z$-axis if the density is

**a.** $\delta(\rho, \phi, \theta) = \rho^2$

**b.** $\delta(\rho, \phi, \theta) = r = \rho \sin \phi$.

**81. Centroid of solid semiellipsoid** Show that the centroid of the solid semiellipsoid of revolution $(r^2/a^2) + (z^2/h^2) \leq 1, z \geq 0$, lies on the $z$-axis three-eighths of the way from the base to the top. The special case $h = a$ gives a solid hemisphere. Thus, the centroid of a solid hemisphere lies on the axis of symmetry three-eighths of the way from the base to the top.

**82. Centroid of solid cone** Show that the centroid of a solid right circular cone is one-fourth of the way from the base to the vertex. (In general, the centroid of a solid cone or pyramid is one-fourth of the way from the centroid of the base to the vertex.)

**83. Variable density** A solid right circular cylinder is bounded by the cylinder $r = a$ and the planes $z = 0$ and $z = h, h > 0$. Find the center of mass and the moment of inertia and radius of gyration about the $z$-axis if the density is $\delta(r, \theta, z) = z + 1$.

**84. Mass of planet's atmosphere** A spherical planet of radius $R$ has an atmosphere whose density is $\mu = \mu_0 e^{-ch}$, where $h$ is the altitude above the surface of the planet, $\mu_0$ is the density at sea level, and $c$ is a positive constant. Find the mass of the planet's atmosphere.

**85. Density of center of a planet** A planet is in the shape of a sphere of radius $R$ and total mass $M$ with spherically symmetric density distribution that increases linearly as one approaches its center. What is the density at the center of this planet if the density at its edge (surface) is taken to be zero?

## Theory and Examples

**86. Vertical circular cylinders in spherical coordinates** Find an equation of the form $\rho = f(\phi)$ for the cylinder $x^2 + y^2 = a^2$.

**87. Vertical planes in cylindrical coordinates**

**a.** Show that planes perpendicular to the $x$-axis have equations of the form $r = a \sec \theta$ in cylindrical coordinates.

**b.** Show that planes perpendicular to the $y$-axis have equations of the form $r = b \csc \theta$.

**88.** (*Continuation of Exercise 87.*) Find an equation of the form $r = f(\theta)$ in cylindrical coordinates for the plane $ax + by = c$, $c \neq 0$.

**89. Symmetry** What symmetry will you find in a surface that has an equation of the form $r = f(z)$ in cylindrical coordinates? Give reasons for your answer.

**90. Symmetry** What symmetry will you find in a surface that has an equation of the form $\rho = f(\phi)$ in spherical coordinates? Give reasons for your answer.

# 15.7 Substitutions in Multiple Integrals

This section shows how to evaluate multiple integrals by substitution. As in single integration, the goal of substitution is to replace complicated integrals by ones that are easier to evaluate. Substitutions accomplish this by simplifying the integrand, the limits of integration, or both.

## Substitutions in Double Integrals

The polar coordinate substitution of Section 15.3 is a special case of a more general substitution method for double integrals, a method that pictures changes in variables as transformations of regions.

Suppose that a region $G$ in the $uv$-plane is transformed one-to-one into the region $R$ in the $xy$-plane by equations of the form

$$x = g(u, v), \qquad y = h(u, v),$$

as suggested in Figure 15.47. We call $R$ the **image** of $G$ under the transformation, and $G$ the **preimage** of $R$. Any function $f(x, y)$ defined on $R$ can be thought of as a function

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$f(g(u, v), h(u, v))$ defined on $G$ as well. How is the integral of $f(x, y)$ over $R$ related to the integral of $f(g(u, v), h(u, v))$ over $G$?

The answer is: If $g$, $h$, and $f$ have continuous partial derivatives and $J(u, v)$ (to be discussed in a moment) is zero only at isolated points, if at all, then

$$\iint_R f(x, y)\, dx\, dy = \iint_G f(g(u, v), h(u, v))\,|J(u, v)|\, du\, dv. \tag{1}$$

HISTORICAL BIOGRAPHY

Carl Gustav Jacob Jacobi
(1804–1851)

The factor $J(u, v)$, whose absolute value appears in Equation (1), is the *Jacobian* of the coordinate transformation, named after German mathematician Carl Jacobi. It measures how much the transformation is expanding or contracting the area around a point in $G$ as $G$ is transformed into $R$.

**Definition** **Jacobian**

The **Jacobian determinant** or **Jacobian** of the coordinate transformation $x = g(u, v), y = h(u, v)$ is

$$J(u, v) = \begin{vmatrix} \dfrac{\partial x}{\partial u} & \dfrac{\partial x}{\partial v} \\ \dfrac{\partial y}{\partial u} & \dfrac{\partial y}{\partial v} \end{vmatrix} = \frac{\partial x}{\partial u}\frac{\partial y}{\partial v} - \frac{\partial y}{\partial u}\frac{\partial x}{\partial v}. \tag{2}$$

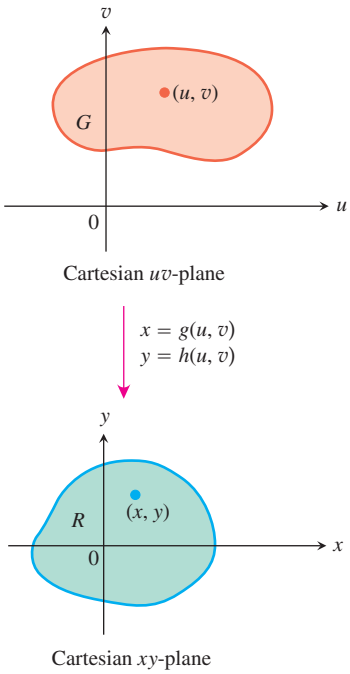

**FIGURE 15.47** The equations $x = g(u, v)$ and $y = h(u, v)$ allow us to change an integral over a region $R$ in the $xy$-plane into an integral over a region $G$ in the $uv$-plane.

The Jacobian is also denoted by

$$J(u, v) = \frac{\partial(x, y)}{\partial(u, v)}$$

to help remember how the determinant in Equation (2) is constructed from the partial derivatives of $x$ and $y$. The derivation of Equation (1) is intricate and properly belongs to a course in advanced calculus. We do not give the derivation here.

For polar coordinates, we have $r$ and $\theta$ in place of $u$ and $v$. With $x = r\cos\theta$ and $y = r\sin\theta$, the Jacobian is

$$J(r, \theta) = \begin{vmatrix} \dfrac{\partial x}{\partial r} & \dfrac{\partial x}{\partial \theta} \\ \dfrac{\partial y}{\partial r} & \dfrac{\partial y}{\partial \theta} \end{vmatrix} = \begin{vmatrix} \cos\theta & -r\sin\theta \\ \sin\theta & r\cos\theta \end{vmatrix} = r(\cos^2\theta + \sin^2\theta) = r.$$

Hence, Equation (1) becomes

$$\iint_R f(x, y)\, dx\, dy = \iint_G f(r\cos\theta, r\sin\theta)\,|r|\, dr\, d\theta$$

$$= \iint_G f(r\cos\theta, r\sin\theta)\, r\, dr\, d\theta, \qquad \text{If } r \geq 0 \tag{3}$$

which is the equation found in Section 15.3.

Figure 15.48 shows how the equations $x = r\cos\theta, y = r\sin\theta$ transform the rectangle $G$: $0 \leq r \leq 1, 0 \leq \theta \leq \pi/2$ into the quarter circle $R$ bounded by $x^2 + y^2 = 1$ in the first quadrant of the $xy$-plane.

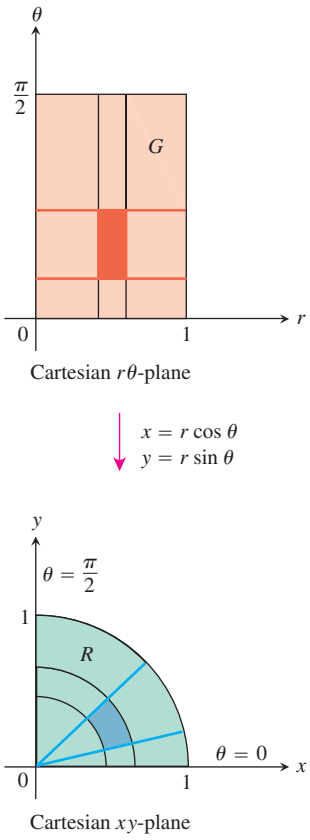

**FIGURE 15.48** The equations $x = r\cos\theta$, $y = r\sin\theta$ transform $G$ into $R$.

Notice that the integral on the right-hand side of Equation (3) is not the integral of $f(r\cos\theta, r\sin\theta)$ over a region in the polar coordinate plane. It is the integral of the product of $f(r\cos\theta, r\sin\theta)$ and $r$ over a region $G$ in the *Cartesian* $r\theta$-plane.

Here is an example of another substitution.

## EXAMPLE 1 Applying a Transformation to Integrate

Evaluate

$$\int_0^4 \int_{x=y/2}^{x=(y/2)+1} \frac{2x - y}{2}\, dx\, dy$$

by applying the transformation

$$u = \frac{2x - y}{2}, \qquad v = \frac{y}{2} \tag{4}$$

and integrating over an appropriate region in the $uv$-plane.

**Solution** We sketch the region $R$ of integration in the $xy$-plane and identify its boundaries (Figure 15.49).

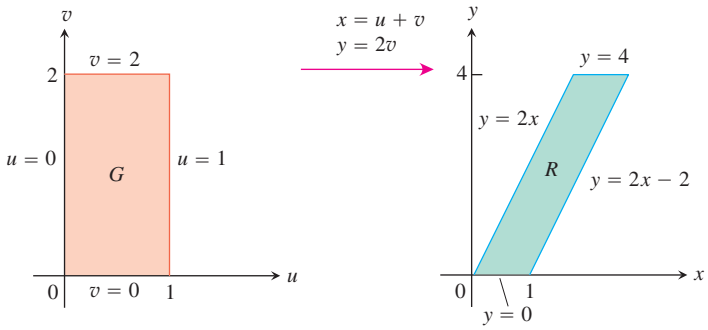

**FIGURE 15.49** The equations $x = u + v$ and $y = 2v$ transform $G$ into $R$. Reversing the transformation by the equations $u = (2x - y)/2$ and $v = y/2$ transforms $R$ into $G$ (Example 1).

To apply Equation (1), we need to find the corresponding $uv$-region $G$ and the Jacobian of the transformation. To find them, we first solve Equations (4) for $x$ and $y$ in terms of $u$ and $v$. Routine algebra gives

$$x = u + v \qquad y = 2v. \tag{5}$$

We then find the boundaries of $G$ by substituting these expressions into the equations for the boundaries of $R$ (Figure 15.49).

| ***xy*-equations for the boundary of *R*** | **Corresponding *uv*-equations for the boundary of *G*** | **Simplified *uv*-equations** |
|---|---|---|
| $x = y/2$ | $u + v = 2v/2 = v$ | $u = 0$ |
| $x = (y/2) + 1$ | $u + v = (2v/2) + 1 = v + 1$ | $u = 1$ |
| $y = 0$ | $2v = 0$ | $v = 0$ |
| $y = 4$ | $2v = 4$ | $v = 2$ |

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The Jacobian of the transformation (again from Equations (5)) is

$$J(u, v) = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \begin{vmatrix} \frac{\partial}{\partial u}(u + v) & \frac{\partial}{\partial v}(u + v) \\ \frac{\partial}{\partial u}(2v) & \frac{\partial}{\partial v}(2v) \end{vmatrix} = \begin{vmatrix} 1 & 1 \\ 0 & 2 \end{vmatrix} = 2.$$

We now have everything we need to apply Equation (1):

$$\int_0^4 \int_{x=y/2}^{x=(y/2)+1} \frac{2x - y}{2}\, dx\, dy = \int_{v=0}^{v=2} \int_{u=0}^{u=1} u|J(u, v)|\, du\, dv$$

$$= \int_0^2 \int_0^1 (u)(2)\, du\, dv = \int_0^2 \left[u^2\right]_0^1 dv = \int_0^2 dv = 2.$$

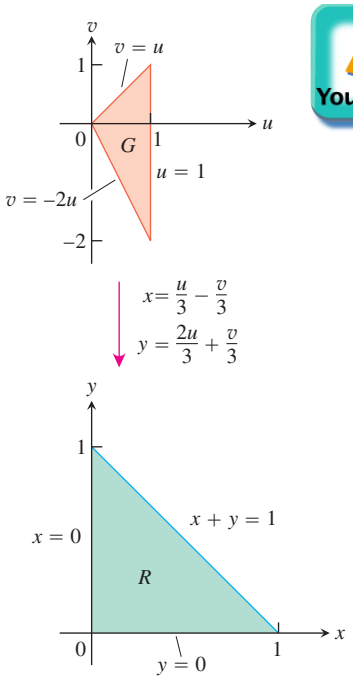

**FIGURE 15.50** The equations $x = (u/3) - (v/3)$ and $y = (2u/3) + (v/3)$ transform $G$ into $R$. Reversing the transformation by the equations $u = x + y$ and $v = y - 2x$ transforms $R$ into $G$ (Example 2).

**EXAMPLE 2** Applying a Transformation to Integrate

Evaluate

$$\int_0^1 \int_0^{1-x} \sqrt{x + y}\,(y - 2x)^2\, dy\, dx.$$

**Solution** We sketch the region $R$ of integration in the $xy$-plane and identify its boundaries (Figure 15.50). The integrand suggests the transformation $u = x + y$ and $v = y - 2x$. Routine algebra produces $x$ and $y$ as functions of $u$ and $v$:

$$x = \frac{u}{3} - \frac{v}{3}, \qquad y = \frac{2u}{3} + \frac{v}{3}. \tag{6}$$

From Equations (6), we can find the boundaries of the $uv$-region $G$ (Figure 15.50).

| ***xy*-equations for the boundary of *R*** | **Corresponding *uv*-equations for the boundary of *G*** | **Simplified *uv*-equations** |
|---|---|---|
| $x + y = 1$ | $\left(\frac{u}{3} - \frac{v}{3}\right) + \left(\frac{2u}{3} + \frac{v}{3}\right) = 1$ | $u = 1$ |
| $x = 0$ | $\frac{u}{3} - \frac{v}{3} = 0$ | $v = u$ |
| $y = 0$ | $\frac{2u}{3} + \frac{v}{3} = 0$ | $v = -2u$ |

The Jacobian of the transformation in Equations (6) is

$$J(u, v) = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} \end{vmatrix} = \begin{vmatrix} \frac{1}{3} & -\frac{1}{3} \\ \frac{2}{3} & \frac{1}{3} \end{vmatrix} = \frac{1}{3}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Applying Equation (1), we evaluate the integral:

$$\int_0^1 \int_0^{1-x} \sqrt{x+y}\,(y-2x)^2\,dy\,dx = \int_{u=0}^{u=1} \int_{v=-2u}^{v=u} u^{1/2}\,v^2\,|J(u,v)|\,dv\,du$$

$$= \int_0^1 \int_{-2u}^{u} u^{1/2}\,v^2 \left(\frac{1}{3}\right) dv\,du = \frac{1}{3}\int_0^1 u^{1/2}\left[\frac{1}{3}v^3\right]_{v=-2u}^{v=u} du$$

$$= \frac{1}{9}\int_0^1 u^{1/2}(u^3 + 8u^3)\,du = \int_0^1 u^{7/2}\,du = \frac{2}{9}u^{9/2}\Big]_0^1 = \frac{2}{9}.$$

## Substitutions in Triple Integrals

The cylindrical and spherical coordinate substitutions in Section 15.6 are special cases of a substitution method that pictures changes of variables in triple integrals as transformations of three-dimensional regions. The method is like the method for double integrals except that now we work in three dimensions instead of two.

Suppose that a region $G$ in $uvw$-space is transformed one-to-one into the region $D$ in $xyz$-space by differentiable equations of the form

$$x = g(u, v, w), \qquad y = h(u, v, w), \qquad z = k(u, v, w),$$

as suggested in Figure 15.51. Then any function $F(x, y, z)$ defined on $D$ can be thought of as a function

$$F(g(u, v, w), h(u, v, w), k(u, v, w)) = H(u, v, w)$$

defined on $G$. If $g$, $h$, and $k$ have continuous first partial derivatives, then the integral of $F(x, y, z)$ over $D$ is related to the integral of $H(u, v, w)$ over $G$ by the equation

$$\iiint_D F(x, y, z)\,dx\,dy\,dz = \iiint_G H(u, v, w)\,|J(u, v, w)|\,du\,dv\,dw. \tag{7}$$

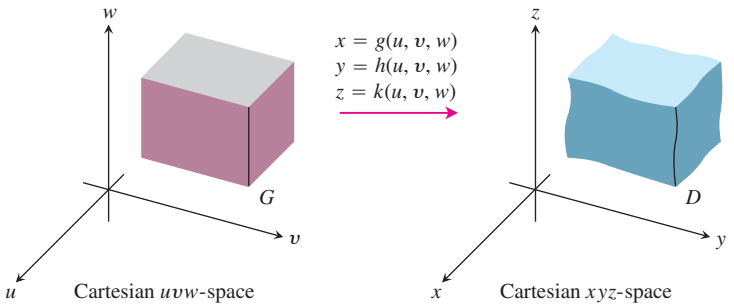

**FIGURE 15.51** The equations $x = g(u, v, w)$, $y = h(u, v, w)$, and $z = k(u, v, w)$ allow us to change an integral over a region $D$ in Cartesian $xyz$-space into an integral over a region $G$ in Cartesian $uvw$-space.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

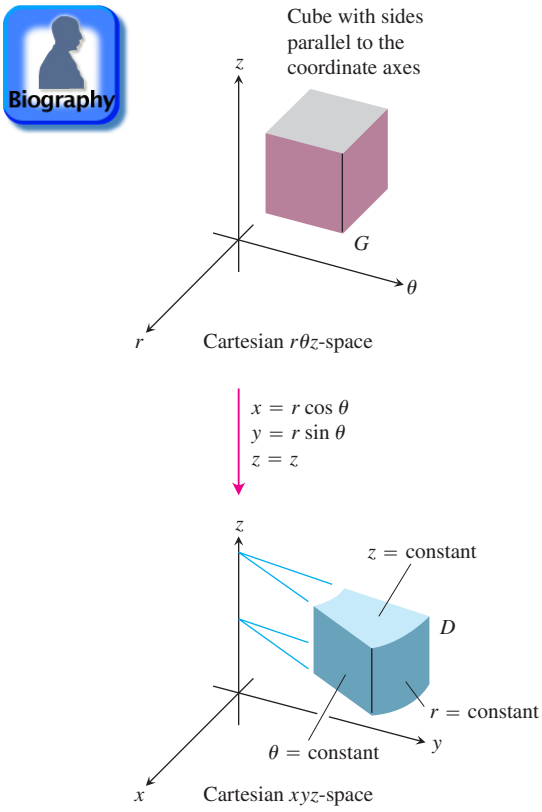

**FIGURE 15.52** The equations $x = r\cos\theta$, $y = r\sin\theta$, and $z = z$ transform the cube $G$ into a cylindrical wedge $D$.

The factor $J(u, v, w)$, whose absolute value appears in this equation, is the **Jacobian determinant**

$$J(u, v, w) = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} & \frac{\partial x}{\partial w} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} & \frac{\partial y}{\partial w} \\ \frac{\partial z}{\partial u} & \frac{\partial z}{\partial v} & \frac{\partial z}{\partial w} \end{vmatrix} = \frac{\partial(x, y, z)}{\partial(u, v, w)}.$$

This determinant measures how much the volume near a point in $G$ is being expanded or contracted by the transformation from $(u, v, w)$ to $(x, y, z)$ coordinates. As in the two-dimensional case, the derivation of the change-of-variable formula in Equation (7) is complicated and we do not go into it here.

For cylindrical coordinates, $r$, $\theta$, and $z$ take the place of $u$, $v$, and $w$. The transformation from *Cartesian* $r\theta z$-space to Cartesian $xyz$-space is given by the equations

$$x = r\cos\theta, \qquad y = r\sin\theta, \qquad z = z$$

(Figure 15.52). The Jacobian of the transformation is

$$J(r, \theta, z) = \begin{vmatrix} \frac{\partial x}{\partial r} & \frac{\partial x}{\partial \theta} & \frac{\partial x}{\partial z} \\ \frac{\partial y}{\partial r} & \frac{\partial y}{\partial \theta} & \frac{\partial y}{\partial z} \\ \frac{\partial z}{\partial r} & \frac{\partial z}{\partial \theta} & \frac{\partial z}{\partial z} \end{vmatrix} = \begin{vmatrix} \cos\theta & -r\sin\theta & 0 \\ \sin\theta & r\cos\theta & 0 \\ 0 & 0 & 1 \end{vmatrix}$$

$$= r\cos^2\theta + r\sin^2\theta = r.$$

The corresponding version of Equation (7) is

$$\iiint_D F(x, y, z)\, dx\, dy\, dz = \iiint_G H(r, \theta, z)|r|\, dr\, d\theta\, dz.$$

We can drop the absolute value signs whenever $r \geq 0$.

For spherical coordinates, $\rho$, $\phi$, and $\theta$ take the place of $u$, $v$, and $w$. The transformation from Cartesian $\rho\phi\theta$-space to Cartesian $xyz$-space is given by

$$x = \rho\sin\phi\cos\theta, \qquad y = \rho\sin\phi\sin\theta, \qquad z = \rho\cos\phi$$

(Figure 15.53). The Jacobian of the transformation is

$$J(\rho, \phi, \theta) = \begin{vmatrix} \frac{\partial x}{\partial \rho} & \frac{\partial x}{\partial \phi} & \frac{\partial x}{\partial \theta} \\ \frac{\partial y}{\partial \rho} & \frac{\partial y}{\partial \phi} & \frac{\partial y}{\partial \theta} \\ \frac{\partial z}{\partial \rho} & \frac{\partial z}{\partial \phi} & \frac{\partial z}{\partial \theta} \end{vmatrix} = \rho^2\sin\phi$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(Exercise 17). The corresponding version of Equation (7) is

$$\iiint_D F(x, y, z)\, dx\, dy\, dz = \iiint_G H(\rho, \phi, \theta)\,|p^2 \sin\phi|\, d\rho\, d\phi\, d\theta.$$

We can drop the absolute value signs because $\sin\phi$ is never negative for $0 \le \phi \le \pi$. Note that this is the same result we obtained in Section 15.6.

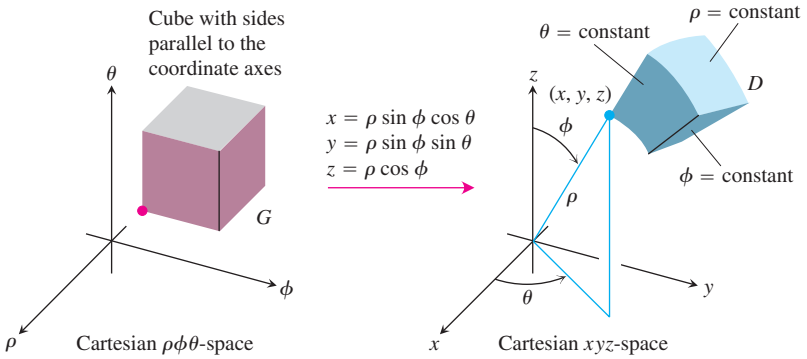

**FIGURE 15.53** The equations $x = \rho \sin\phi \cos\theta$, $y = \rho \sin\phi \sin\theta$, and $z = \rho \cos\phi$ transform the cube $G$ into the spherical wedge $D$.

Here is an example of another substitution. Although we could evaluate the integral in this example directly, we have chosen it to illustrate the substitution method in a simple (and fairly intuitive) setting.

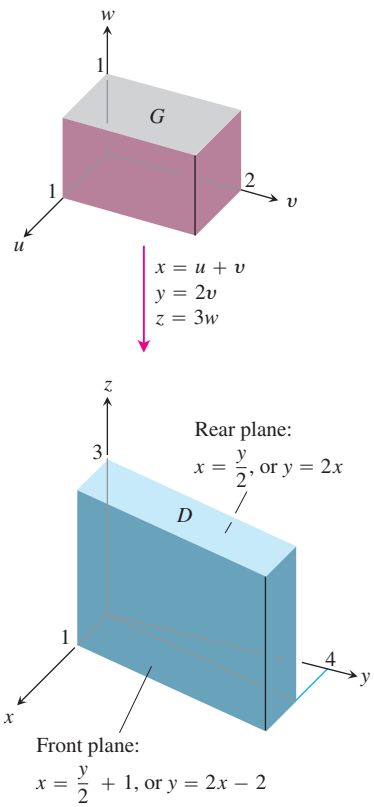

**FIGURE 15.54** The equations $x = u + v$, $y = 2v$, and $z = 3w$ transform $G$ into $D$. Reversing the transformation by the equations $u = (2x - y)/2$, $v = y/2$, and $w = z/3$ transforms $D$ into $G$ (Example 3).

## EXAMPLE 3 Applying a Transformation to Integrate

Evaluate

$$\int_0^3 \int_0^4 \int_{x=y/2}^{x=(y/2)+1} \left(\frac{2x - y}{2} + \frac{z}{3}\right) dx\, dy\, dz$$

by applying the transformation

$$u = (2x - y)/2, \qquad v = y/2, \qquad w = z/3 \tag{8}$$

and integrating over an appropriate region in $uvw$-space.

**Solution** We sketch the region $D$ of integration in $xyz$-space and identify its boundaries (Figure 15.54). In this case, the bounding surfaces are planes.

To apply Equation (7), we need to find the corresponding $uvw$-region $G$ and the Jacobian of the transformation. To find them, we first solve Equations (8) for $x$, $y$, and $z$ in terms of $u$, $v$, and $w$. Routine algebra gives

$$x = u + v, \qquad y = 2v, \qquad z = 3w. \tag{9}$$

We then find the boundaries of $G$ by substituting these expressions into the equations for the boundaries of $D$:

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

| ***xyz*-equations for the boundary of *D*** | **Corresponding *uvw*-equations for the boundary of *G*** | **Simplified *uvw*-equations** |
|---|---|---|
| $x = y/2$ | $u + v = 2v/2 = v$ | $u = 0$ |
| $x = (y/2) + 1$ | $u + v = (2v/2) + 1 = v + 1$ | $u = 1$ |
| $y = 0$ | $2v = 0$ | $v = 0$ |
| $y = 4$ | $2v = 4$ | $v = 2$ |
| $z = 0$ | $3w = 0$ | $w = 0$ |
| $z = 3$ | $3w = 3$ | $w = 1$ |

The Jacobian of the transformation, again from Equations (9), is

$$J(u, v, w) = \begin{vmatrix} \frac{\partial x}{\partial u} & \frac{\partial x}{\partial v} & \frac{\partial x}{\partial w} \\ \frac{\partial y}{\partial u} & \frac{\partial y}{\partial v} & \frac{\partial y}{\partial w} \\ \frac{\partial z}{\partial u} & \frac{\partial z}{\partial v} & \frac{\partial z}{\partial w} \end{vmatrix} = \begin{vmatrix} 1 & 1 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 3 \end{vmatrix} = 6.$$

We now have everything we need to apply Equation (7):

$$\int_0^3 \int_0^4 \int_{x=y/2}^{x=(y/2)+1} \left(\frac{2x - y}{2} + \frac{z}{3}\right) dx\, dy\, dz$$

$$= \int_0^1 \int_0^2 \int_0^1 (u + w)\,|J(u, v, w)|\, du\, dv\, dw$$

$$= \int_0^1 \int_0^2 \int_0^1 (u + w)(6)\, du\, dv\, dw = 6\int_0^1 \int_0^2 \left[\frac{u^2}{2} + uw\right]_0^1 dv\, dw$$

$$= 6\int_0^1 \int_0^2 \left(\frac{1}{2} + w\right) dv\, dw = 6\int_0^1 \left[\frac{v}{2} + vw\right]_0^2 dw = 6\int_0^1 (1 + 2w)\, dw$$

$$= 6\Big[w + w^2\Big]_0^1 = 6(2) = 12.$$

The goal of this section was to introduce you to the ideas involved in coordinate transformations. A thorough discussion of transformations, the Jacobian, and multivariable substitution is best given in an advanced calculus course after a study of linear algebra.

# EXERCISES 15.7

## Finding Jacobians and Transformed Regions for Two Variables

**1. a.** Solve the system

$$u = x - y, \qquad v = 2x + y$$

for $x$ and $y$ in terms of $u$ and $v$. Then find the value of the Jacobian $\partial(x, y)/\partial(u, v)$.

**b.** Find the image under the transformation $u = x - y$, $v = 2x + y$ of the triangular region with vertices $(0, 0)$, $(1, 1)$, and $(1, -2)$ in the $xy$-plane. Sketch the transformed region in the $uv$-plane.

**2. a.** Solve the system

$$u = x + 2y, \qquad v = x - y$$

for $x$ and $y$ in terms of $u$ and $v$. Then find the value of the Jacobian $\partial(x, y)/\partial(u, v)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**b.** Find the image under the transformation $u = x + 2y$, $v = x - y$ of the triangular region in the $xy$-plane bounded by the lines $y = 0, y = x$, and $x + 2y = 2$. Sketch the transformed region in the $uv$-plane.

**3. a.** Solve the system

$$u = 3x + 2y, \qquad v = x + 4y$$

for $x$ and $y$ in terms of $u$ and $v$. Then find the value of the Jacobian $\partial(x, y)/\partial(u, v)$.

**b.** Find the image under the transformation $u = 3x + 2y$, $v = x + 4y$ of the triangular region in the $xy$-plane bounded by the $x$-axis, the $y$-axis, and the line $x + y = 1$. Sketch the transformed region in the $uv$-plane.

**4. a.** Solve the system

$$u = 2x - 3y, \qquad v = -x + y$$

for $x$ and $y$ in terms of $u$ and $v$. Then find the value of the Jacobian $\partial(x, y)/\partial(u, v)$.

**b.** Find the image under the transformation $u = 2x - 3y$, $v = -x + y$ of the parallelogram $R$ in the $xy$-plane with boundaries $x = -3, x = 0, y = x$, and $y = x + 1$. Sketch the transformed region in the $uv$-plane.

## Applying Transformations to Evaluate Double Integrals

**5.** Evaluate the integral

$$\int_0^4 \int_{x=y/2}^{x=(y/2)+1} \frac{2x - y}{2}\, dx\, dy$$

from Example 1 directly by integration with respect to $x$ and $y$ to confirm that its value is 2.

**6.** Use the transformation in Exercise 1 to evaluate the integral

$$\iint_R (2x^2 - xy - y^2)\, dx\, dy$$

for the region $R$ in the first quadrant bounded by the lines $y = -2x + 4, y = -2x + 7, y = x - 2$, and $y = x + 1$.

**7.** Use the transformation in Exercise 3 to evaluate the integral

$$\iint_R (3x^2 + 14xy + 8y^2)\, dx\, dy$$

for the region $R$ in the first quadrant bounded by the lines $y = -(3/2)x + 1, y = -(3/2)x + 3, y = -(1/4)x$, and $y = -(1/4)x + 1$.

**8.** Use the transformation and parallelogram $R$ in Exercise 4 to evaluate the integral

$$\iint_R 2(x - y)\, dx\, dy.$$

**9.** Let $R$ be the region in the first quadrant of the $xy$-plane bounded by the hyperbolas $xy = 1, xy = 9$ and the lines $y = x, y = 4x$. Use the transformation $x = u/v, y = uv$ with $u > 0$ and $v > 0$ to rewrite

$$\iint_R \left(\sqrt{\frac{y}{x}} + \sqrt{xy}\right) dx\, dy$$

as an integral over an appropriate region $G$ in the $uv$-plane. Then evaluate the $uv$-integral over $G$.

**10. a.** Find the Jacobian of the transformation $x = u, y = uv$, and sketch the region $G$: $1 \le u \le 2, 1 \le uv \le 2$ in the $uv$-plane.

**b.** Then use Equation (1) to transform the integral

$$\int_1^2 \int_1^2 \frac{y}{x}\, dy\, dx$$

into an integral over $G$, and evaluate both integrals.

**11. Polar moment of inertia of an elliptical plate** A thin plate of constant density covers the region bounded by the ellipse $x^2/a^2 + y^2/b^2 = 1, a > 0, b > 0$, in the $xy$-plane. Find the first moment of the plate about the origin. (*Hint:* Use the transformation $x = ar\cos\theta, y = br\sin\theta$.)

**12. The area of an ellipse** The area $\pi ab$ of the ellipse $x^2/a^2 + y^2/b^2 = 1$ can be found by integrating the function $f(x, y) = 1$ over the region bounded by the ellipse in the $xy$-plane. Evaluating the integral directly requires a trigonometric substitution. An easier way to evaluate the integral is to use the transformation $x = au, y = bv$ and evaluate the transformed integral over the disk $G$: $u^2 + v^2 \le 1$ in the $uv$-plane. Find the area this way.

**13.** Use the transformation in Exercise 2 to evaluate the integral

$$\int_0^{2/3} \int_y^{2-2y} (x + 2y)e^{(y-x)}\, dx\, dy$$

by first writing it as an integral over a region $G$ in the $uv$-plane.

**14.** Use the transformation $x = u + (1/2)v, y = v$ to evaluate the integral

$$\int_0^2 \int_{y/2}^{(y+4)/2} y^3(2x - y)e^{(2x-y)^2}\, dx\, dy$$

by first writing it as an integral over a region $G$ in the $uv$-plane.

## Finding Jacobian Determinants

**15.** Find the Jacobian $\partial(x, y)/\partial(u, v)$ for the transformation

**a.** $x = u\cos v, \quad y = u\sin v$

**b.** $x = u\sin v, \quad y = u\cos v$.

**16.** Find the Jacobian $\partial(x, y, z)/\partial(u, v, w)$ of the transformation

**a.** $x = u\cos v, \quad y = u\sin v, \quad z = w$

**b.** $x = 2u - 1, \quad y = 3v - 4, \quad z = (1/2)(w - 4)$.

**17.** Evaluate the appropriate determinant to show that the Jacobian of the transformation from Cartesian $\rho\phi\theta$-space to Cartesian $xyz$-space is $\rho^2\sin\phi$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

**18. Substitutions in single integrals** How can substitutions in single definite integrals be viewed as transformations of regions? What is the Jacobian in such a case? Illustrate with an example.

## Applying Transformations to Evaluate Triple Integrals

Exercises

**19.** Evaluate the integral in Example 3 by integrating with respect to $x$, $y$, and $z$.

**20. Volume of an ellipsoid** Find the volume of the ellipsoid

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1.$$

(*Hint:* Let $x = au$, $y = bv$, and $z = cw$. Then find the volume of an appropriate region in $uvw$-space.)

**21.** Evaluate

$$\iiint |xyz|\, dx\, dy\, dz$$

over the solid ellipsoid

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} \le 1.$$

(*Hint:* Let $x = au$, $y = bv$, and $z = cw$. Then integrate over an appropriate region in $uvw$-space.)

**22.** Let $D$ be the region in $xyz$-space defined by the inequalities

$$1 \le x \le 2, \quad 0 \le xy \le 2, \quad 0 \le z \le 1.$$

Evaluate

$$\iiint_D (x^2y + 3xyz)\, dx\, dy\, dz$$

by applying the transformation

$$u = x, \quad v = xy, \quad w = 3z$$

and integrating over an appropriate region $G$ in $uvw$-space.

**23. Centroid of a solid semiellipsoid** Assuming the result that the centroid of a solid hemisphere lies on the axis of symmetry three-eighths of the way from the base toward the top, show, by transforming the appropriate integrals, that the center of mass of a solid semiellipsoid $(x^2/a^2) + (y^2/b^2) + (z^2/c^2) \le 1$, $z \ge 0$, lies on the $z$-axis three-eighths of the way from the base toward the top. (You can do this without evaluating any of the integrals.)

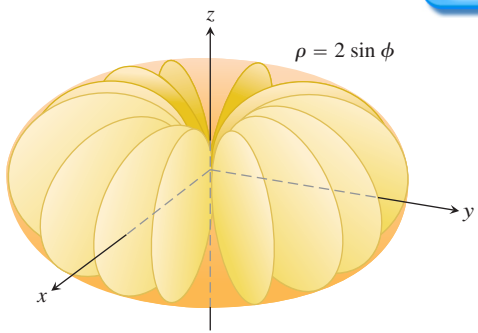
**24. Cylindrical shells** In Section 6.2, we learned how to find the volume of a solid of revolution using the shell method; namely, if the region between the curve $y = f(x)$ and the $x$-axis from $a$ to $b$ $(0 < a < b)$ is revolved about the $y$-axis, the volume of the resulting solid is $\int_a^b 2\pi x f(x)\, dx$. Prove that finding volumes by using triple integrals gives the same result. (*Hint:* Use cylindrical coordinates with the roles of $y$ and $z$ changed.)

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# Chapter 15 Additional and Advanced Exercises

## Volumes

1. **Sand pile: double and triple integrals** The base of a sand pile covers the region in the $xy$-plane that is bounded by the parabola $x^2 + y = 6$ and the line $y = x$. The height of the sand above the point $(x, y)$ is $x^2$. Express the volume of sand as **(a)** a double integral, **(b)** a triple integral. Then **(c)** find the volume.



2. **Water in a hemispherical bowl** A hemispherical bowl of radius 5 cm is filled with water to within 3 cm of the top. Find the volume of water in the bowl.

3. **Solid cylindrical region between two planes** Find the volume of the portion of the solid cylinder $x^2 + y^2 \le 1$ that lies between the planes $z = 0$ and $x + y + z = 2$.

4. **Sphere and paraboloid** Find the volume of the region bounded above by the sphere $x^2 + y^2 + z^2 = 2$ and below by the paraboloid $z = x^2 + y^2$.

5. **Two paraboloids** Find the volume of the region bounded above by the paraboloid $z = 3 - x^2 - y^2$ and below by the paraboloid $z = 2x^2 + 2y^2$.

6. **Spherical coordinates** Find the volume of the region enclosed by the spherical coordinate surface $\rho = 2 \sin \phi$ (see accompanying figure).

7. **Hole in sphere** A circular cylindrical hole is bored through a solid sphere, the axis of the hole being a diameter of the sphere. The volume of the remaining solid is

$$V = 2\int_0^{2\pi}\int_0^{\sqrt{3}}\int_1^{\sqrt{4-z^2}} r\, dr\, dz\, d\theta\,.$$

   **a.** Find the radius of the hole and the radius of the sphere.

   **b.** Evaluate the integral.

8. **Sphere and cylinder** Find the volume of material cut from the solid sphere $r^2 + z^2 \le 9$ by the cylinder $r = 3 \sin \theta$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**9. Two paraboloids** Find the volume of the region enclosed by the surfaces $z = x^2 + y^2$ and $z = (x^2 + y^2 + 1)/2$.

**10. Cylinder and surface $z = xy$** Find the volume of the region in the first octant that lies between the cylinders $r = 1$ and $r = 2$ and that is bounded below by the $xy$-plane and above by the surface $z = xy$.

## Changing the Order of Integration

**11.** Evaluate the integral

$$\int_0^\infty \frac{e^{-ax} - e^{-bx}}{x}\,dx.$$

(*Hint:* Use the relation

$$\frac{e^{-ax} - e^{-bx}}{x} = \int_a^b e^{-xy}\,dy$$

to form a double integral and evaluate the integral by changing the order of integration.)

**12. a. Polar coordinates** Show, by changing to polar coordinates, that

$$\int_0^{a\sin\beta}\int_{y\cot\beta}^{\sqrt{a^2-y^2}} \ln(x^2 + y^2)\,dx\,dy = a^2\beta\left(\ln a - \frac{1}{2}\right),$$

where $a > 0$ and $0 < \beta < \pi/2$.

**b.** Rewrite the Cartesian integral with the order of integration reversed.

**13. Reducing a double to a single integral** By changing the order of integration, show that the following double integral can be reduced to a single integral:

$$\int_0^x\int_0^u e^{m(x-t)} f(t)\,dt\,du = \int_0^x (x - t)e^{m(x-t)} f(t)\,dt.$$

Similarly, it can be shown that

$$\int_0^x\int_0^v\int_0^u e^{m(x-t)} f(t)\,dt\,du\,dv = \int_0^x \frac{(x - t)^2}{2} e^{m(x-t)} f(t)\,dt.$$

**14. Transforming a double integral to obtain constant limits** Sometimes a multiple integral with variable limits can be changed into one with constant limits. By changing the order of integration, show that

$$\int_0^1 f(x)\left(\int_0^x g(x - y)f(y)\,dy\right)dx$$

$$= \int_0^1 f(y)\left(\int_y^1 g(x - y)f(x)\,dx\right)dy$$

$$= \frac{1}{2}\int_0^1\int_0^1 g(|x - y|)f(x)f(y)\,dx\,dy.$$

## Masses and Moments

**15. Minimizing polar inertia** A thin plate of constant density is to occupy the triangular region in the first quadrant of the $xy$-plane having vertices $(0, 0)$, $(a, 0)$, and $(a, 1/a)$. What value of $a$ will minimize the plate's polar moment of inertia about the origin?

**16. Polar inertia of triangular plate** Find the polar moment of inertia about the origin of a thin triangular plate of constant density $\delta = 3$ bounded by the $y$-axis and the lines $y = 2x$ and $y = 4$ in the $xy$-plane.

**17. Mass and polar inertia of a counterweight** The counterweight of a flywheel of constant density 1 has the form of the smaller segment cut from a circle of radius $a$ by a chord at a distance $b$ from the center $(b < a)$. Find the mass of the counterweight and its polar moment of inertia about the center of the wheel.

**18. Centroid of boomerang** Find the centroid of the boomerang-shaped region between the parabolas $y^2 = -4(x - 1)$ and $y^2 = -2(x - 2)$ in the $xy$-plane.

## Theory and Applications

**19.** Evaluate

$$\int_0^a\int_0^b e^{\max(b^2x^2,\, a^2y^2)}\,dy\,dx,$$

where $a$ and $b$ are positive numbers and

$$\max(b^2x^2, a^2y^2) = \begin{cases} b^2x^2 & \text{if } b^2x^2 \ge a^2y^2 \\ a^2y^2 & \text{if } b^2x^2 < a^2y^2. \end{cases}$$

**20.** Show that

$$\iint \frac{\partial^2 F(x, y)}{\partial x\,\partial y}\,dx\,dy$$

over the rectangle $x_0 \le x \le x_1, y_0 \le y \le y_1$, is

$$F(x_1, y_1) - F(x_0, y_1) - F(x_1, y_0) + F(x_0, y_0).$$

**21.** Suppose that $f(x, y)$ can be written as a product $f(x, y) = F(x)G(y)$ of a function of $x$ and a function of $y$. Then the integral of $f$ over the rectangle $R$: $a \le x \le b, c \le y \le d$ can be evaluated as a product as well, by the formula

$$\iint_R f(x, y)\,dA = \left(\int_a^b F(x)\,dx\right)\left(\int_c^d G(y)\,dy\right). \qquad (1)$$

The argument is that

$$\iint_R f(x, y)\,dA = \int_c^d \left(\int_a^b F(x)G(y)\,dx\right)dy \qquad \text{(i)}$$

$$= \int_c^d \left(G(y)\int_a^b F(x)\,dx\right)dy \qquad \text{(ii)}$$

$$= \int_c^d \left(\int_a^b F(x)\,dx\right)G(y)\,dy \qquad \text{(iii)}$$

$$= \left(\int_a^b F(x)\,dx\right)\int_c^d G(y)\,dy. \qquad \text{(iv)}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**a.** Give reasons for steps (i) through (v).

When it applies, Equation (1) can be a time saver. Use it to evaluate the following integrals.

**b.** $\displaystyle\int_0^{\ln 2}\int_0^{\pi/2} e^x \cos y\, dy\, dx$ **c.** $\displaystyle\int_1^2\int_{-1}^1 \frac{x}{y^2}\, dx\, dy$

**22.** Let $D_{\mathbf{u}} f$ denote the derivative of $f(x, y) = (x^2 + y^2)/2$ in the direction of the unit vector $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j}$.

**a. Finding average value** Find the average value of $D_{\mathbf{u}} f$ over the triangular region cut from the first quadrant by the line $x + y = 1$.

**b. Average value and centroid** Show in general that the average value of $D_{\mathbf{u}} f$ over a region in the $xy$-plane is the value of $D_{\mathbf{u}} f$ at the centroid of the region.

**23. The value of $\Gamma(1/2)$** The gamma function,

$$\Gamma(x) = \int_0^\infty t^{x-1} e^{-t}\, dt,$$

extends the factorial function from the nonnegative integers to other real values. Of particular interest in the theory of differential equations is the number

$$\Gamma\left(\frac{1}{2}\right) = \int_0^\infty t^{(1/2)-1} e^{-t}\, dt = \int_0^\infty \frac{e^{-t}}{\sqrt{t}}\, dt. \qquad (2)$$

**a.** If you have not yet done Exercise 37 in Section 15.3, do it now to show that

$$I = \int_0^\infty e^{-y^2}\, dy = \frac{\sqrt{\pi}}{2}.$$

**b.** Substitute $y = \sqrt{t}$ in Equation (2) to show that $\Gamma(1/2) = 2I = \sqrt{\pi}$.

**24. Total electrical charge over circular plate** The electrical charge distribution on a circular plate of radius $R$ meters is $\sigma(r, \theta) = kr(1 - \sin\theta)$ coulomb/m$^2$ ($k$ a constant). Integrate $\sigma$ over the plate to find the total charge $Q$.

**25. A parabolic rain gauge** A bowl is in the shape of the graph of $z = x^2 + y^2$ from $z = 0$ to $z = 10$ in. You plan to calibrate the bowl to make it into a rain gauge. What height in the bowl would correspond to 1 in. of rain? 3 in. of rain?

**26. Water in a satellite dish** A parabolic satellite dish is 2 m wide and $1/2$ m deep. Its axis of symmetry is tilted 30 degrees from the vertical.

**a.** Set up, but do not evaluate, a triple integral in rectangular coordinates that gives the amount of water the satellite dish will hold. (*Hint:* Put your coordinate system so that the satellite dish is in "standard position" and the plane of the water level is slanted.) (*Caution:* The limits of integration are not "nice.")

**b.** What would be the smallest tilt of the satellite dish so that it holds no water?

**27. An infinite half-cylinder** Let $D$ be the interior of the infinite right circular half-cylinder of radius 1 with its single-end face suspended 1 unit above the origin and its axis the ray from (0, 0, 1) to $\infty$. Use cylindrical coordinates to evaluate

$$\iiint_D z(r^2 + z^2)^{-5/2}\, dV.$$

**28. Hypervolume** We have learned that $\int_a^b 1\, dx$ is the length of the interval $[a, b]$ on the number line (one-dimensional space), $\iint_R 1\, dA$ is the area of region $R$ in the $xy$-plane (two-dimensional space), and $\iiint_D 1\, dV$ is the volume of the region $D$ in three-dimensional space ($xyz$-space). We could continue: If $Q$ is a region in 4-space ($xyzw$-space), then $\iiiint_Q 1\, dV$ is the "hypervolume" of $Q$. Use your generalizing abilities and a Cartesian coordinate system of 4-space to find the hypervolume inside the unit 4-sphere $x^2 + y^2 + z^2 + w^2 = 1$.

# Chapter 15 Practice Exercises

## Planar Regions of Integration

In Exercises 1–4, sketch the region of integration and evaluate the double integral.

**1.** $\int_1^{10}\int_0^{1/y} ye^{xy}\,dx\,dy$

**2.** $\int_0^1\int_0^{x^3} e^{y/x}\,dy\,dx$

**3.** $\int_0^{3/2}\int_{-\sqrt{9-4t^2}}^{\sqrt{9-4t^2}} t\,ds\,dt$

**4.** $\int_0^1\int_{\sqrt{y}}^{2-\sqrt{y}} xy\,dx\,dy$

## Reversing the Order of Integration

In Exercises 5–8, sketch the region of integration and write an equivalent integral with the order of integration reversed. Then evaluate both integrals.

**5.** $\int_0^4\int_{-\sqrt{4-y}}^{(y-4)/2} dx\,dy$

**6.** $\int_0^1\int_{x^2}^{x} \sqrt{x}\,dy\,dx$

**7.** $\int_0^{3/2}\int_{-\sqrt{9-4y^2}}^{\sqrt{9-4y^2}} y\,dx\,dy$

**8.** $\int_0^2\int_0^{4-x^2} 2x\,dy\,dx$

## Evaluating Double Integrals

Evaluate the integrals in Exercises 9–12.

**9.** $\int_0^1\int_{2y}^{2} 4\cos(x^2)\,dx\,dy$

**10.** $\int_0^2\int_{y/2}^{1} e^{x^2}\,dx\,dy$

**11.** $\int_0^8\int_{\sqrt[3]{x}}^{2} \frac{dy\,dx}{y^4+1}$

**12.** $\int_0^1\int_{\sqrt[3]{y}}^{1} \frac{2\pi\sin\pi x^2}{x^2}\,dx\,dy$

## Areas and Volumes

**13. Area between line and parabola** Find the area of the region enclosed by the line $y = 2x + 4$ and the parabola $y = 4 - x^2$ in the $xy$-plane.

**14. Area bounded by lines and parabola** Find the area of the "triangular" region in the $xy$-plane that is bounded on the right by the parabola $y = x^2$, on the left by the line $x + y = 2$, and above by the line $y = 4$.

**15. Volume of the region under a paraboloid** Find the volume under the paraboloid $z = x^2 + y^2$ above the triangle enclosed by the lines $y = x, x = 0$, and $x + y = 2$ in the $xy$-plane.

**16. Volume of the region under parabolic cylinder** Find the volume under the parabolic cylinder $z = x^2$ above the region enclosed by the parabola $y = 6 - x^2$ and the line $y = x$ in the $xy$-plane.

## Average Values

Find the average value of $f(x, y) = xy$ over the regions in Exercises 17 and 18.

**17.** The square bounded by the lines $x = 1, y = 1$ in the first quadrant

**18.** The quarter circle $x^2 + y^2 \le 1$ in the first quadrant

## Masses and Moments

**19. Centroid** Find the centroid of the "triangular" region bounded by the lines $x = 2, y = 2$ and the hyperbola $xy = 2$ in the $xy$-plane.

**20. Centroid** Find the centroid of the region between the parabola $x + y^2 - 2y = 0$ and the line $x + 2y = 0$ in the $xy$-plane.

**21. Polar moment** Find the polar moment of inertia about the origin of a thin triangular plate of constant density $\delta = 3$ bounded by the $y$-axis and the lines $y = 2x$ and $y = 4$ in the $xy$-plane.

**22. Polar moment** Find the polar moment of inertia about the center of a thin rectangular sheet of constant density $\delta = 1$ bounded by the lines

**a.** $x = \pm 2, \quad y = \pm 1$ in the $xy$-plane

**b.** $x = \pm a, \quad y = \pm b$ in the $xy$-plane.

(*Hint:* Find $I_x$. Then use the formula for $I_x$ to find $I_y$ and add the two to find $I_0$).

**23. Inertial moment and radius of gyration** Find the moment of inertia and radius of gyration about the $x$-axis of a thin plate of constant density $\delta$ covering the triangle with vertices (0, 0), (3, 0), and (3, 2) in the $xy$-plane.

**24. Plate with variable density** Find the center of mass and the moments of inertia and radii of gyration about the coordinate axes of a thin plate bounded by the line $y = x$ and the parabola $y = x^2$ in the $xy$-plane if the density is $\delta(x, y) = x + 1$.

**25. Plate with variable density** Find the mass and first moments about the coordinate axes of a thin square plate bounded by the lines $x = \pm 1, y = \pm 1$ in the $xy$-plane if the density is $\delta(x, y) = x^2 + y^2 + 1/3$.

**26. Triangles with same inertial moment and radius of gyration** Find the moment of inertia and radius of gyration about the $x$-axis of a thin triangular plate of constant density $\delta$ whose base lies along the interval $[0, b]$ on the $x$-axis and whose vertex lies on the line $y = h$ above the $x$-axis. As you will see, it does not matter where on the line this vertex lies. All such triangles have the same moment of inertia and radius of gyration about the $x$-axis.

## Polar Coordinates

Evaluate the integrals in Exercises 27 and 28 by changing to polar coordinates.

**27.** $\int_{-1}^{1}\int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} \frac{2\,dy\,dx}{(1+x^2+y^2)^2}$

**28.** $\int_{-1}^{1}\int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} \ln(x^2+y^2+1)\,dx\,dy$

**29. Centroid** Find the centroid of the region in the polar coordinate plane defined by the inequalities $0 \le r \le 3, -\pi/3 \le \theta \le \pi/3$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**30. Centroid** Find the centroid of the region in the first quadrant bounded by the rays $\theta = 0$ and $\theta = \pi/2$ and the circles $r = 1$ and $r = 3$.

**31. a. Centroid** Find the centroid of the region in the polar coordinate plane that lies inside the cardioid $r = 1 + \cos\theta$ and outside the circle $r = 1$.

**b.** Sketch the region and show the centroid in your sketch.

**32. a. Centroid** Find the centroid of the plane region defined by the polar coordinate inequalities $0 \le r \le a$, $-\alpha \le \theta \le \alpha$ $(0 < \alpha \le \pi)$. How does the centroid move as $\alpha \to \pi^-$?

**b.** Sketch the region for $\alpha = 5\pi/6$ and show the centroid in your sketch.

**33. Integrating over lemniscate** Integrate the function $f(x, y) = 1/(1 + x^2 + y^2)^2$ over the region enclosed by one loop of the lemniscate $(x^2 + y^2)^2 - (x^2 - y^2) = 0$.

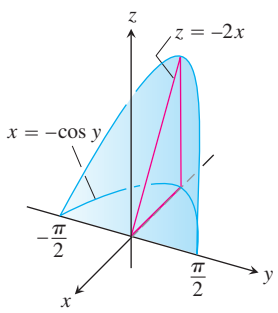
**34.** Integrate $f(x, y) = 1/(1 + x^2 + y^2)^2$ over

**a. Triangular region** The triangle with vertices (0, 0), (1, 0), $\left(1, \sqrt{3}\right)$.

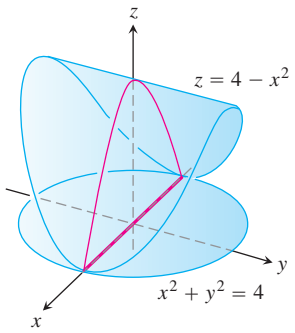
**b. First quadrant** The first quadrant of the $xy$-plane.

## Triple Integrals in Cartesian Coordinates

Evaluate the integrals in Exercises 35–38.



**35.** $\displaystyle\int_0^{\pi}\int_0^{\pi}\int_0^{\pi} \cos(x + y + z)\, dx\, dy\, dz$



**36.** $\displaystyle\int_{\ln 6}^{\ln 7}\int_0^{\ln 2}\int_{\ln 4}^{\ln 5} e^{(x+y+z)}\, dz\, dy\, dx$

**37.** $\displaystyle\int_0^1\int_0^{x^2}\int_0^{x+y} (2x - y - z)\, dz\, dy\, dx$

**38.** $\displaystyle\int_1^e\int_1^x\int_0^z \frac{2y}{z^3}\, dy\, dz\, dx$

**39. Volume** Find the volume of the wedge-shaped region enclosed on the side by the cylinder $x = -\cos y$, $-\pi/2 \le y \le \pi/2$, on the top by the plane $z = -2x$, and below by the $xy$-plane.

**40. Volume** Find the volume of the solid that is bounded above by the cylinder $z = 4 - x^2$, on the sides by the cylinder $x^2 + y^2 = 4$, and below by the $xy$-plane.

**41. Average value** Find the average value of $f(x, y, z) = 30xz\sqrt{x^2 + y}$ over the rectangular solid in the first octant bounded by the coordinate planes and the planes $x = 1$, $y = 3$, $z = 1$.

**42. Average value** Find the average value of $\rho$ over the solid sphere $\rho \le a$ (spherical coordinates).

## Cylindrical and Spherical Coordinates

**43. Cylindrical to rectangular coordinates** Convert

$$\int_0^{2\pi}\int_0^{\sqrt{2}}\int_r^{\sqrt{4-r^2}} 3\, dz\, r\, dr\, d\theta, \qquad r \ge 0$$

to **(a)** rectangular coordinates with the order of integration $dz\, dx\, dy$ and **(b)** spherical coordinates. Then **(c)** evaluate one of the integrals.

**44. Rectangular to cylindrical coordinates** **(a)** Convert to cylindrical coordinates. Then **(b)** evaluate the new integral.

$$\int_0^1\int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}}\int_{-(x^2+y^2)}^{(x^2+y^2)} 21xy^2\, dz\, dy\, dx$$

**45. Rectangular to spherical coordinates** **(a)** Convert to spherical coordinates. Then **(b)** evaluate the new integral.

$$\int_{-1}^1\int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}}\int_{\sqrt{x^2+y^2}}^1 dz\, dy\, dx$$

**46. Rectangular, cylindrical, and spherical coordinates** Write an iterated triple integral for the integral of $f(x, y, z) = 6 + 4y$ over the region in the first octant bounded by the cone $z = \sqrt{x^2 + y^2}$, the cylinder $x^2 + y^2 = 1$, and the coordinate planes in **(a)** rectangular coordinates, **(b)** cylindrical coordinates, and **(c)** spherical coordinates. Then **(d)** find the integral of $f$ by evaluating one of the triple integrals.

**47. Cylindrical to rectangular coordinates** Set up an integral in rectangular coordinates equivalent to the integral

$$\int_0^{\pi/2}\int_1^{\sqrt{3}}\int_1^{\sqrt{4-r^2}} r^3(\sin\theta\cos\theta)z^2\, dz\, dr\, d\theta.$$

Arrange the order of integration to be $z$ first, then $y$, then $x$.

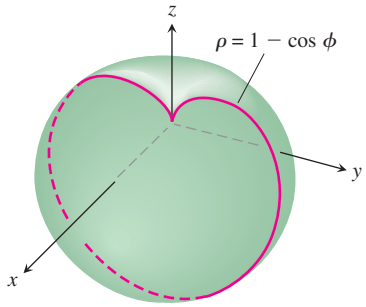
**48. Rectangular to cylindrical coordinates** The volume of a solid is

$$\int_0^2\int_0^{\sqrt{2x-x^2}}\int_{-\sqrt{4-x^2-y^2}}^{\sqrt{4-x^2-y^2}} dz\, dy\, dx.$$

**a.** Describe the solid by giving equations for the surfaces that form its boundary.

**b.** Convert the integral to cylindrical coordinates but do not evaluate the integral.

**49. Spherical versus cylindrical coordinates** Triple integrals involving spherical shapes do not always require spherical coordinates for convenient evaluation. Some calculations may be accomplished more easily with cylindrical coordinates. As a case in point, find the volume of the region bounded above by the



Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

sphere $x^2 + y^2 + z^2 = 8$ and below by the plane $z = 2$ by using **(a)** cylindrical coordinates and **(b)** spherical coordinates.

**50. Finding $I_z$ in spherical coordinates** Find the moment of inertia about the $z$-axis of a solid of constant density $\delta = 1$ that is bounded above by the sphere $\rho = 2$ and below by the cone $\phi = \pi/3$ (spherical coordinates).

**51. Moment of inertia of a "thick" sphere** Find the moment of inertia of a solid of constant density $\delta$ bounded by two concentric spheres of radii $a$ and $b$ $(a < b)$ about a diameter.

**52. Moment of inertia of an apple** Find the moment of inertia about the $z$-axis of a solid of density $\delta = 1$ enclosed by the spherical coordinate surface $\rho = 1 - \cos\phi$. The solid is the red curve rotated about the $z$-axis in the accompanying figure.

## Substitutions

**53.** Show that if $u = x - y$ and $v = y$, then

$$\int_0^\infty \int_0^x e^{-sx} f(x - y, y)\, dy\, dx = \int_0^\infty \int_0^\infty e^{-s(u+v)} f(u, v)\, du\, dv.$$

**54.** What relationship must hold between the constants $a$, $b$, and $c$ to make

$$\int_{-\infty}^{\infty} \int_{-\infty}^{\infty} e^{-(ax^2+2bxy+cy^2)}\, dx\, dy = 1?$$

(*Hint:* Let $s = \alpha x + \beta y$ and $t = \gamma x + \delta y$, where $(\alpha\delta - \beta\gamma)^2 = ac - b^2$. Then $ax^2 + 2bxy + cy^2 = s^2 + t^2$.)

Chapter

# 16 INTEGRATION IN VECTOR FIELDS

**OVERVIEW** This chapter treats integration in vector fields. It is the mathematics that engineers and physicists use to describe fluid flow, design underwater transmission cables, explain the flow of heat in stars, and put satellites in orbit. In particular, we define line integrals, which are used to find the work done by a force field in moving an object along a path through the field. We also define surface integrals so we can find the rate that a fluid flows across a surface. Along the way we develop key concepts and results, such as *conservative* force fields and Green's Theorem, to simplify our calculations of these new integrals by connecting them to the single, double, and triple integrals we have already studied.

## 16.1 Line Integrals

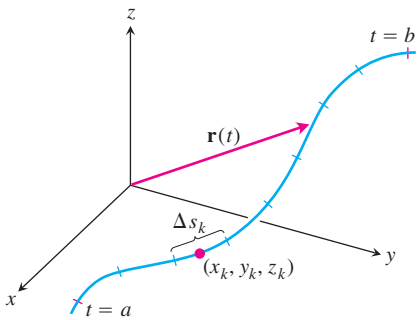

**FIGURE 16.1** The curve $\mathbf{r}(t)$ partitioned into small arcs from $t = a$ to $t = b$. The length of a typical subarc is $\Delta s_k$.

In Chapter 5 we defined the definite integral of a function over a finite closed interval $[a, b]$ on the $x$-axis. We used definite integrals to find the mass of a thin straight rod, or the work done by a variable force directed along the $x$-axis. Now we would like to calculate the masses of thin rods or wires lying along a *curve* in the plane or space, or to find the work done by a variable force acting along such a curve. For these calculations we need a more general notion of a "line" integral than integrating over a line segment on the $x$-axis. Instead we need to integrate over a curve $C$ in the plane or in space. These more general integrals are called *line integrals*, although "curve" integrals might be more descriptive. We make our definitions for space curves, remembering that curves in the $xy$-plane are just a special case with $z$-coordinate identically zero.

Suppose that $f(x, y, z)$ is a real-valued function we wish to integrate over the curve $\mathbf{r}(t) = g(t)\mathbf{i} + h(t)\mathbf{j} + k(t)\mathbf{k}$, $a \le t \le b$, lying within the domain of $f$. The values of $f$ along the curve are given by the composite function $f(g(t), h(t), k(t))$. We are going to integrate this composite with respect to arc length from $t = a$ to $t = b$. To begin, we first partition the curve into a finite number $n$ of subarcs (Figure 16.1). The typical subarc has length $\Delta s_k$. In each subarc we choose a point $(x_k, y_k, z_k)$ and form the sum

$$S_n = \sum_{k=1}^{n} f(x_k, y_k, z_k)\, \Delta s_k.$$

If $f$ is continuous and the functions $g$, $h$, and $k$ have continuous first derivatives, then these sums approach a limit as $n$ increases and the lengths $\Delta s_k$ approach zero. We call this limit the **line integral of $f$ over the curve from $a$ to $b$**. If the curve is denoted by a single letter, $C$ for example, the notation for the integral is

$$\int_C f(x, y, z)\, ds \qquad \text{"The integral of } f \text{ over } C\text{"} \tag{1}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

If $\mathbf{r}(t)$ is smooth for $a \le t \le b$ ($\mathbf{v} = d\mathbf{r}/dt$ is continuous and never $\mathbf{0}$), we can use the equation

$$s(t) = \int_a^b |\mathbf{v}(\tau)|\, d\tau \qquad \text{Equation (3) of Section 13.3 with } t_0 = a$$

to express $ds$ in Equation (1) as $ds = |\mathbf{v}(t)|\, dt$. A theorem from advanced calculus says that we can then evaluate the integral of $f$ over $C$ as

$$\int_C f(x, y, z)\, ds = \int_a^b f(g(t), h(t), k(t))|\mathbf{v}(t)|\, dt.$$

Notice that the integral on the right side of this last equation is just an ordinary (single) definite integral, as defined in Chapter 5, where we are integrating with respect to the parameter $t$. The formula evaluates the line integral on the left side correctly no matter what parametrization is used, as long as the parametrization is smooth.

### How to Evaluate a Line Integral

To integrate a continuous function $f(x, y, z)$ over a curve $C$:

1. Find a smooth parametrization of $C$,
$$\mathbf{r}(t) = g(t)\mathbf{i} + h(t)\mathbf{j} + k(t)\mathbf{k}, \qquad a \le t \le b$$
2. Evaluate the integral as
$$\int_C f(x, y, z)\, ds = \int_a^b f(g(t), h(t), k(t))|\mathbf{v}(t)|\, dt. \tag{2}$$

If $f$ has the constant value 1, then the integral of $f$ over $C$ gives the length of $C$.

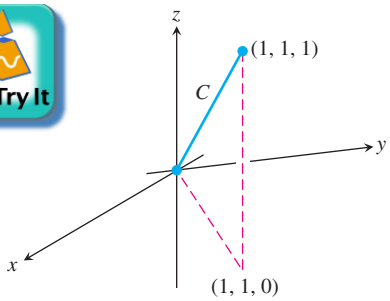

**FIGURE 16.2** The integration path in Example 1.

### EXAMPLE 1 Evaluating a Line Integral

Integrate $f(x, y, z) = x - 3y^2 + z$ over the line segment $C$ joining the origin to the point $(1, 1, 1)$ (Figure 16.2).

**Solution** We choose the simplest parametrization we can think of:

$$\mathbf{r}(t) = t\mathbf{i} + t\mathbf{j} + t\mathbf{k}, \qquad 0 \le t \le 1.$$

The components have continuous first derivatives and $|\mathbf{v}(t)| = |\mathbf{i} + \mathbf{j} + \mathbf{k}| = \sqrt{1^2 + 1^2 + 1^2} = \sqrt{3}$ is never 0, so the parametrization is smooth. The integral of $f$ over $C$ is

$$\int_C f(x, y, z)\, ds = \int_0^1 f(t, t, t)\left(\sqrt{3}\right) dt \qquad \text{Equation (2)}$$

$$= \int_0^1 (t - 3t^2 + t)\sqrt{3}\, dt$$

$$= \sqrt{3}\int_0^1 (2t - 3t^2)\, dt = \sqrt{3}\left[t^2 - t^3\right]_0^1 = 0. \qquad \blacksquare$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Additivity

Line integrals have the useful property that if a curve $C$ is made by joining a finite number of curves $C_1, C_2, \ldots, C_n$ end to end, then the integral of a function over $C$ is the sum of the integrals over the curves that make it up:

$$\int_C f\,ds = \int_{C_1} f\,ds + \int_{C_2} f\,ds + \cdots + \int_{C_n} f\,ds. \tag{3}$$

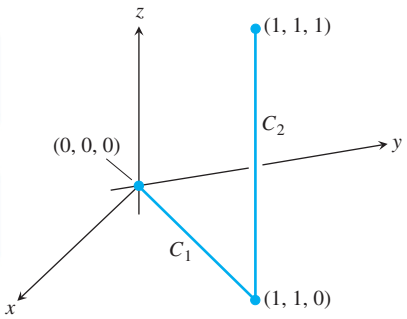

**FIGURE 16.3** The path of integration in Example 2.

### EXAMPLE 2 Line Integral for Two Joined Paths

Figure 16.3 shows another path from the origin to (1, 1, 1), the union of line segments $C_1$ and $C_2$. Integrate $f(x, y, z) = x - 3y^2 + z$ over $C_1 \cup C_2$.

**Solution** We choose the simplest parametrizations for $C_1$ and $C_2$ we can think of, checking the lengths of the velocity vectors as we go along:

$$C_1: \quad \mathbf{r}(t) = t\mathbf{i} + t\mathbf{j}, \quad 0 \le t \le 1; \quad |\mathbf{v}| = \sqrt{1^2 + 1^2} = \sqrt{2}$$

$$C_2: \quad \mathbf{r}(t) = \mathbf{i} + \mathbf{j} + t\mathbf{k}, \quad 0 \le t \le 1; \quad |\mathbf{v}| = \sqrt{0^2 + 0^2 + 1^2} = 1.$$

With these parametrizations we find that

$$\int_{C_1 \cup C_2} f(x, y, z)\,ds = \int_{C_1} f(x, y, z)\,ds + \int_{C_2} f(x, y, z)\,ds \qquad \text{Equation (3)}$$

$$= \int_0^1 f(t, t, 0)\sqrt{2}\,dt + \int_0^1 f(1, 1, t)(1)\,dt \qquad \text{Equation (2)}$$

$$= \int_0^1 (t - 3t^2 + 0)\sqrt{2}\,dt + \int_0^1 (1 - 3 + t)(1)\,dt$$

$$= \sqrt{2}\left[\frac{t^2}{2} - t^3\right]_0^1 + \left[\frac{t^2}{2} - 2t\right]_0^1 = -\frac{\sqrt{2}}{2} - \frac{3}{2}.$$

■

Notice three things about the integrations in Examples 1 and 2. First, as soon as the components of the appropriate curve were substituted into the formula for $f$, the integration became a standard integration with respect to $t$. Second, the integral of $f$ over $C_1 \cup C_2$ was obtained by integrating $f$ over each section of the path and adding the results. Third, the integrals of $f$ over $C$ and $C_1 \cup C_2$ had different values. For most functions, the value of the integral along a path joining two points changes if you change the path between them. For some functions, however, the value remains the same, as we will see in Section 16.3.

## Mass and Moment Calculations

We treat coil springs and wires like masses distributed along smooth curves in space. The distribution is described by a continuous density function $\delta(x, y, z)$ (mass per unit length). The spring's or wire's mass, center of mass, and moments are then calculated with the formulas in Table 16.1. The formulas also apply to thin rods.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**TABLE 16.1** Mass and moment formulas for coil springs, thin rods, and wires lying along a smooth curve $C$ in space

**Mass:** $M = \int_C \delta(x, y, z)\, ds \qquad (\delta = \delta(x, y, z) = \text{density})$

**First moments about the coordinate planes:**

$$M_{yz} = \int_C x\,\delta\, ds, \qquad M_{xz} = \int_C y\,\delta\, ds, \qquad M_{xy} = \int_C z\,\delta\, ds$$

**Coordinates of the center of mass:**

$$\bar{x} = M_{yz}/M, \qquad \bar{y} = M_{xz}/M, \qquad \bar{z} = M_{xy}/M$$

**Moments of inertia about axes and other lines:**

$$I_x = \int_C (y^2 + z^2)\,\delta\, ds, \qquad I_y = \int_C (x^2 + z^2)\,\delta\, ds$$

$$I_z = \int_C (x^2 + y^2)\,\delta\, ds, \qquad I_L = \int_C r^2\,\delta\, ds$$

$r(x, y, z) =$ distance from the point $(x, y, z)$ to line $L$

**Radius of gyration about a line $L$:** $R_L = \sqrt{I_L/M}$

## EXAMPLE 3 Finding Mass, Center of Mass, Moment of Inertia, Radius of Gyration

A coil spring lies along the helix

$$\mathbf{r}(t) = (\cos 4t)\mathbf{i} + (\sin 4t)\mathbf{j} + t\mathbf{k}, \qquad 0 \le t \le 2\pi.$$

The spring's density is a constant, $\delta = 1$. Find the spring's mass and center of mass, and its moment of inertia and radius of gyration about the $z$-axis.

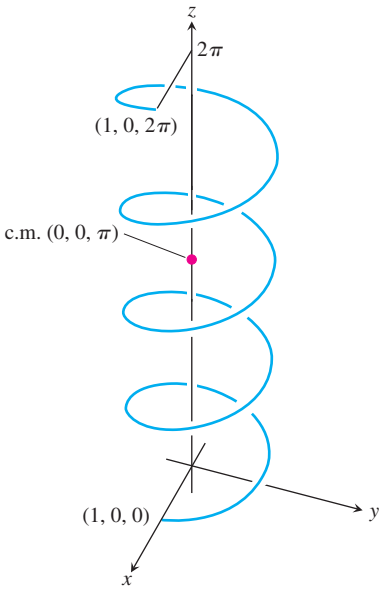

**FIGURE 16.4** The helical spring in Example 3.

**Solution** We sketch the spring (Figure 16.4). Because of the symmetries involved, the center of mass lies at the point $(0, 0, \pi)$ on the $z$-axis.

For the remaining calculations, we first find $|\mathbf{v}(t)|$:

$$|\mathbf{v}(t)| = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2}$$

$$= \sqrt{(-4\sin 4t)^2 + (4\cos 4t)^2 + 1} = \sqrt{17}.$$

We then evaluate the formulas from Table 16.1 using Equation (2):

$$M = \int_{\text{Helix}} \delta\, ds = \int_0^{2\pi} (1)\sqrt{17}\, dt = 2\pi\sqrt{17}$$

$$I_z = \int_{\text{Helix}} (x^2 + y^2)\delta\, ds = \int_0^{2\pi} (\cos^2 4t + \sin^2 4t)(1)\sqrt{17}\, dt$$

$$= \int_0^{2\pi} \sqrt{17}\, dt = 2\pi\sqrt{17}$$

$$R_z = \sqrt{I_z/M} = \sqrt{2\pi\sqrt{17}/(2\pi\sqrt{17})} = 1.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Notice that the radius of gyration about the $z$-axis is the radius of the cylinder around which the helix winds. ■

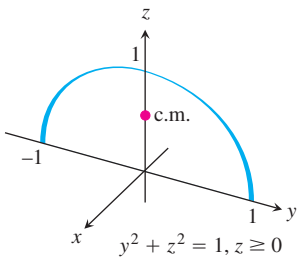

**FIGURE 16.5** Example 4 shows how to find the center of mass of a circular arch of variable density.

## EXAMPLE 4 Finding an Arch's Center of Mass

A slender metal arch, denser at the bottom than top, lies along the semicircle $y^2 + z^2 = 1, z \geq 0$, in the $yz$-plane (Figure 16.5). Find the center of the arch's mass if the density at the point $(x, y, z)$ on the arch is $\delta(x, y, z) = 2 - z$.

**Solution** We know that $\bar{x} = 0$ and $\bar{y} = 0$ because the arch lies in the $yz$-plane with its mass distributed symmetrically about the $z$-axis. To find $\bar{z}$, we parametrize the circle as

$$\mathbf{r}(t) = (\cos t)\mathbf{j} + (\sin t)\mathbf{k}, \qquad 0 \leq t \leq \pi.$$

For this parametrization,

$$|\mathbf{v}(t)| = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2} = \sqrt{(0)^2 + (-\sin t)^2 + (\cos t)^2} = 1.$$

The formulas in Table 16.1 then give

$$M = \int_C \delta\, ds = \int_C (2 - z)\, ds = \int_0^\pi (2 - \sin t)(1)\, dt = 2\pi - 2$$

$$M_{xy} = \int_C z\delta\, ds = \int_C z(2 - z)\, ds = \int_0^\pi (\sin t)(2 - \sin t)\, dt$$

$$= \int_0^\pi (2 \sin t - \sin^2 t)\, dt = \frac{8 - \pi}{2}$$

$$\bar{z} = \frac{M_{xy}}{M} = \frac{8 - \pi}{2} \cdot \frac{1}{2\pi - 2} = \frac{8 - \pi}{4\pi - 4} \approx 0.57.$$

With $\bar{z}$ to the nearest hundredth, the center of mass is (0, 0, 0.57). ■

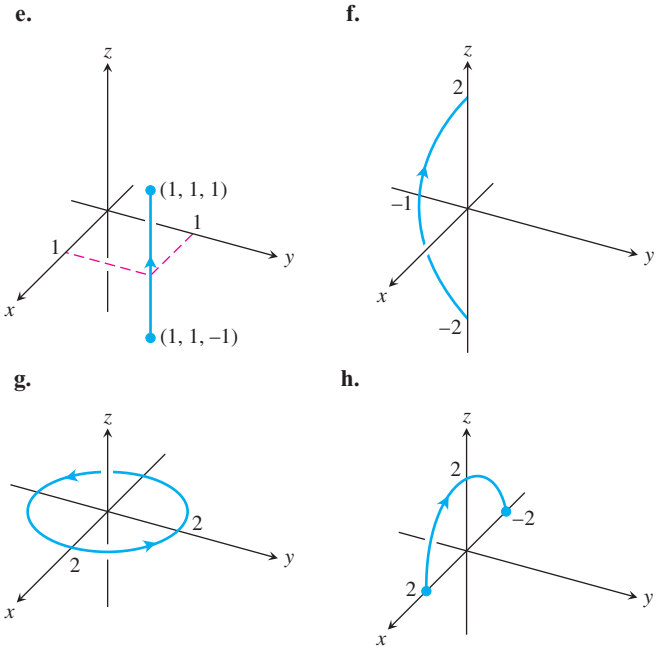

**FIGURE 16.6** The paths of integration for Exercises 15 and 16.

1. $\mathbf{r}(t) = t\mathbf{i} + (1 - t)\mathbf{j}, \quad 0 \le t \le 1$
2. $\mathbf{r}(t) = \mathbf{i} + \mathbf{j} + t\mathbf{k}, \quad -1 \le t \le 1$
3. $\mathbf{r}(t) = (2\cos t)\mathbf{i} + (2\sin t)\mathbf{j}, \quad 0 \le t \le 2\pi$
4. $\mathbf{r}(t) = t\mathbf{i}, \quad -1 \le t \le 1$
5. $\mathbf{r}(t) = t\mathbf{i} + t\mathbf{j} + t\mathbf{k}, \quad 0 \le t \le 2$
6. $\mathbf{r}(t) = t\mathbf{j} + (2 - 2t)\mathbf{k}, \quad 0 \le t \le 1$
7. $\mathbf{r}(t) = (t^2 - 1)\mathbf{j} + 2t\mathbf{k}, \quad -1 \le t \le 1$
8. $\mathbf{r}(t) = (2\cos t)\mathbf{i} + (2\sin t)\mathbf{k}, \quad 0 \le t \le \pi$

## Evaluating Line Integrals over Space Curves

9. Evaluate $\int_C (x + y)\,ds$ where $C$ is the straight-line segment $x = t, y = (1 - t), z = 0$, from (0, 1, 0) to (1, 0, 0).
10. Evaluate $\int_C (x - y + z - 2)\,ds$ where $C$ is the straight-line segment $x = t, y = (1 - t), z = 1$, from (0, 1, 1) to (1, 0, 1).
11. Evaluate $\int_C (xy + y + z)\,ds$ along the curve $\mathbf{r}(t) = 2t\mathbf{i} + t\mathbf{j} + (2 - 2t)\mathbf{k}, 0 \le t \le 1$.
12. Evaluate $\int_C \sqrt{x^2 + y^2}\,ds$ along the curve $\mathbf{r}(t) = (4\cos t)\mathbf{i} + (4\sin t)\mathbf{j} + 3t\mathbf{k}, -2\pi \le t \le 2\pi$.
13. Find the line integral of $f(x, y, z) = x + y + z$ over the straight-line segment from (1, 2, 3) to (0, −1, 1).
14. Find the line integral of $f(x, y, z) = \sqrt{3}/(x^2 + y^2 + z^2)$ over the curve $\mathbf{r}(t) = t\mathbf{i} + t\mathbf{j} + t\mathbf{k}, 1 \le t \le \infty$.
15. Integrate $f(x, y, z) = x + \sqrt{y} - z^2$ over the path from (0, 0, 0) to (1, 1, 1) (Figure 16.6a) given by

$$C_1: \quad \mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j}, \quad 0 \le t \le 1$$
$$C_2: \quad \mathbf{r}(t) = \mathbf{i} + \mathbf{j} + t\mathbf{k}, \quad 0 \le t \le 1$$

16. Integrate $f(x, y, z) = x + \sqrt{y} - z^2$ over the path from (0, 0, 0) to (1, 1, 1) (Figure 16.6b) given by

$$C_1: \quad \mathbf{r}(t) = t\mathbf{k}, \quad 0 \le t \le 1$$
$$C_2: \quad \mathbf{r}(t) = t\mathbf{j} + \mathbf{k}, \quad 0 \le t \le 1$$
$$C_3: \quad \mathbf{r}(t) = t\mathbf{i} + \mathbf{j} + \mathbf{k}, \quad 0 \le t \le 1$$

17. Integrate $f(x, y, z) = (x + y + z)/(x^2 + y^2 + z^2)$ over the path $\mathbf{r}(t) = t\mathbf{i} + t\mathbf{j} + t\mathbf{k}, 0 < a \le t \le b$.
18. Integrate $f(x, y, z) = -\sqrt{x^2 + z^2}$ over the circle

$$\mathbf{r}(t) = (a\cos t)\mathbf{j} + (a\sin t)\mathbf{k}, \qquad 0 \le t \le 2\pi.$$

## Line Integrals over Plane Curves

In Exercises 19–22, integrate $f$ over the given curve.

19. $f(x, y) = x^3/y, \quad C: \quad y = x^2/2, \quad 0 \le x \le 2$
20. $f(x, y) = (x + y^2)/\sqrt{1 + x^2}, \quad C: \quad y = x^2/2$ from (1, 1/2) to (0, 0)
21. $f(x, y) = x + y, \quad C: \quad x^2 + y^2 = 4$ in the first quadrant from (2, 0) to (0, 2)
22. $f(x, y) = x^2 - y, \quad C: \quad x^2 + y^2 = 4$ in the first quadrant from (0, 2) to $(\sqrt{2}, \sqrt{2})$

## Mass and Moments

23. **Mass of a wire** Find the mass of a wire that lies along the curve $\mathbf{r}(t) = (t^2 - 1)\mathbf{j} + 2t\mathbf{k}, 0 \le t \le 1$, if the density is $\delta = (3/2)t$.
24. **Center of mass of a curved wire** A wire of density $\delta(x, y, z) = 15\sqrt{y + 2}$ lies along the curve $\mathbf{r}(t) = (t^2 - 1)\mathbf{j} + 2t\mathbf{k}, -1 \le t \le 1$. Find its center of mass. Then sketch the curve and center of mass together.
25. **Mass of wire with variable density** Find the mass of a thin wire lying along the curve $\mathbf{r}(t) = \sqrt{2}t\mathbf{i} + \sqrt{2}t\mathbf{j} + (4 - t^2)\mathbf{k}, 0 \le t \le 1$, if the density is **(a)** $\delta = 3t$ and **(b)** $\delta = 1$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

**26. Center of mass of wire with variable density** Find the center of mass of a thin wire lying along the curve $\mathbf{r}(t) = t\mathbf{i} + 2t\mathbf{j} + (2/3)t^{3/2}\mathbf{k}$, $0 \le t \le 2$, if the density is $\delta = 3\sqrt{5 + t}$.

**27. Moment of inertia and radius of gyration of wire hoop** A circular wire hoop of constant density $\delta$ lies along the circle $x^2 + y^2 = a^2$ in the $xy$-plane. Find the hoop's moment of inertia and radius of gyration about the $z$-axis.

**28. Inertia and radii of gyration of slender rod** A slender rod of constant density lies along the line segment $\mathbf{r}(t) = t\mathbf{j} + (2 - 2t)\mathbf{k}$, $0 \le t \le 1$, in the $yz$-plane. Find the moments of inertia and radii of gyration of the rod about the three coordinate axes.

**29. Two springs of constant density** A spring of constant density $\delta$ lies along the helix

$$\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + t\mathbf{k}, \qquad 0 \le t \le 2\pi.$$

**a.** Find $I_z$ and $R_z$.

**b.** Suppose that you have another spring of constant density $\delta$ that is twice as long as the spring in part (a) and lies along the helix for $0 \le t \le 4\pi$. Do you expect $I_z$ and $R_z$ for the longer spring to be the same as those for the shorter one, or should they be different? Check your predictions by calculating $I_z$ and $R_z$ for the longer spring.

**30. Wire of constant density** A wire of constant density $\delta = 1$ lies along the curve

$$\mathbf{r}(t) = (t\cos t)\mathbf{i} + (t\sin t)\mathbf{j} + \left(2\sqrt{2}/3\right)t^{3/2}\mathbf{k}, \qquad 0 \le t \le 1.$$

Find $\bar{z}$, $I_z$, and $R_z$.

**31. The arch in Example 4** Find $I_x$ and $R_x$ for the arch in Example 4.

**32. Center of mass, moments of inertia, and radii of gyration for wire with variable density** Find the center of mass, and the moments of inertia and radii of gyration about the coordinate axes of a thin wire lying along the curve

$$\mathbf{r}(t) = t\mathbf{i} + \frac{2\sqrt{2}}{3}t^{3/2}\mathbf{j} + \frac{t^2}{2}\mathbf{k}, \qquad 0 \le t \le 2,$$

if the density is $\delta = 1/(t + 1)$

## COMPUTER EXPLORATIONS

## Evaluating Line Integrals Numerically

In Exercises 33–36, use a CAS to perform the following steps to evaluate the line integrals.

**a.** Find $ds = |\mathbf{v}(t)|\,dt$ for the path $\mathbf{r}(t) = g(t)\mathbf{i} + h(t)\mathbf{j} + k(t)\mathbf{k}$.

**b.** Express the integrand $f(g(t), h(t), k(t))|\mathbf{v}(t)|$ as a function of the parameter $t$.

**c.** Evaluate $\int_C f\,ds$ using Equation (2) in the text.

**33.** $f(x, y, z) = \sqrt{1 + 30x^2 + 10y}$; $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + 3t^2\mathbf{k}$, $0 \le t \le 2$

**34.** $f(x, y, z) = \sqrt{1 + x^3 + 5y^3}$; $\mathbf{r}(t) = t\mathbf{i} + \frac{1}{3}t^2\mathbf{j} + \sqrt{t}\mathbf{k}$, $0 \le t \le 2$

**35.** $f(x, y, z) = x\sqrt{y} - 3z^2$; $\mathbf{r}(t) = (\cos 2t)\mathbf{i} + (\sin 2t)\mathbf{j} + 5t\mathbf{k}$, $0 \le t \le 2\pi$

**36.** $f(x, y, z) = \left(1 + \frac{9}{4}z^{1/3}\right)^{1/4}$; $\mathbf{r}(t) = (\cos 2t)\mathbf{i} + (\sin 2t)\mathbf{j} + t^{5/2}\mathbf{k}$, $0 \le t \le 2\pi$

# 16.2 Vector Fields, Work, Circulation, and Flux

When we study physical phenomena that are represented by vectors, we replace integrals over closed intervals by integrals over paths through vector fields. We use such integrals to find the work done in moving an object along a path against a variable force (such as a vehicle sent into space against Earth's gravitational field) or to find the work done by a vector field in moving an object along a path through the field (such as the work done by an accelerator in raising the energy of a particle). We also use line integrals to find the rates at which fluids flow along and across curves.

## Vector Fields

Suppose a region in the plane or in space is occupied by a moving fluid such as air or water. Imagine that the fluid is made up of a very large number of particles, and that at any instant of time a particle has a velocity $\mathbf{v}$. If we take a picture of the velocities of some particles at

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

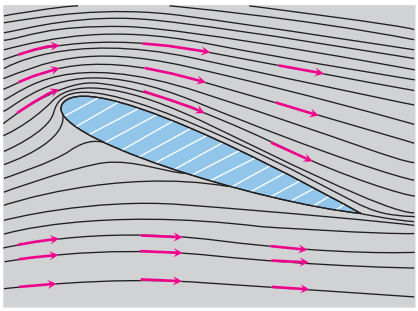

**FIGURE 16.7** Velocity vectors of a flow around an airfoil in a wind tunnel. The streamlines were made visible by kerosene smoke.

different position points at the same instant, we would expect to find that these velocities vary from position to position. We can think of a velocity vector as being attached to each point of the fluid. Such a fluid flow exemplifies a *vector field*. For example, Figure 16.7 shows a velocity vector field obtained by attaching a velocity vector to each point of air flowing around an airfoil in a wind tunnel. Figure 16.8 shows another vector field of velocity vectors along the streamlines of water moving through a contracting channel. In addition to vector fields associated with fluid flows, there are vector force fields that are associated with gravitational attraction (Figure 16.9), magnetic force fields, electric fields, and even purely mathematical fields.

Generally, a **vector field** on a domain in the plane or in space is a function that assigns a vector to each point in the domain. A field of three-dimensional vectors might have a formula like

$$\mathbf{F}(x, y, z) = M(x, y, z)\mathbf{i} + N(x, y, z)\mathbf{j} + P(x, y, z)\mathbf{k}.$$

The field is **continuous** if the **component functions** $M$, $N$, and $P$ are continuous, **differentiable** if $M$, $N$, and $P$ are differentiable, and so on. A field of two-dimensional vectors might have a formula like

$$\mathbf{F}(x, y) = M(x, y)\mathbf{i} + N(x, y)\mathbf{j}.$$

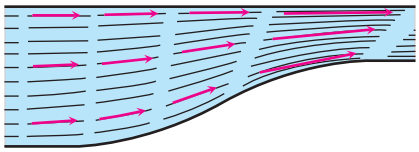

**FIGURE 16.8** Streamlines in a contracting channel. The water speeds up as the channel narrows and the velocity vectors increase in length.

If we attach a projectile's velocity vector to each point of the projectile's trajectory in the plane of motion, we have a two-dimensional field defined along the trajectory. If we attach the gradient vector of a scalar function to each point of a level surface of the function, we have a three-dimensional field on the surface. If we attach the velocity vector to each point of a flowing fluid, we have a three-dimensional field defined on a region in space. These and other fields are illustrated in Figures 16.10–16.15. Some of the illustrations give formulas for the fields as well.

To sketch the fields that had formulas, we picked a representative selection of domain points and sketched the vectors attached to them. The arrows representing the vectors are drawn with their tails, not their heads, at the points where the vector functions are

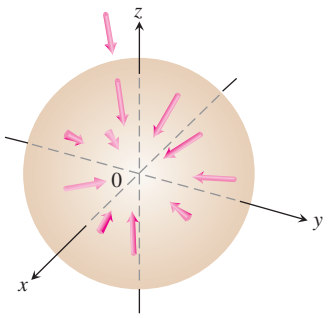

**FIGURE 16.9** Vectors in a gravitational field point toward the center of mass that gives the source of the field.

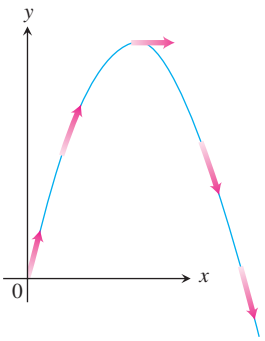

**FIGURE 16.10** The velocity vectors $\mathbf{v}(t)$ of a projectile's motion make a vector field along the trajectory.

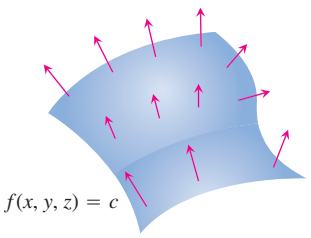

**FIGURE 16.11** The field of gradient vectors $\nabla f$ on a surface $f(x, y, z) = c$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

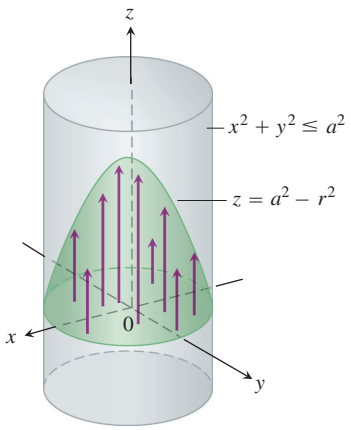

**FIGURE 16.12** The flow of fluid in a long cylindrical pipe. The vectors $\mathbf{v} = (a^2 - r^2)\mathbf{k}$ inside the cylinder that have their bases in the $xy$-plane have their tips on the paraboloid $z = a^2 - r^2$.

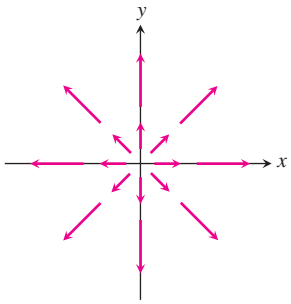

**FIGURE 16.13** The radial field $\mathbf{F} = x\mathbf{i} + y\mathbf{j}$ of position vectors of points in the plane. Notice the convention that an arrow is drawn with its tail, not its head, at the point where $\mathbf{F}$ is evaluated.

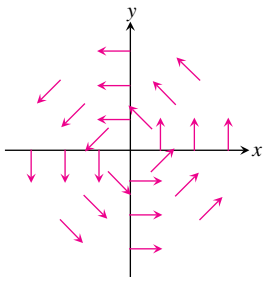

**FIGURE 16.14** The circumferential or "spin" field of unit vectors

$$\mathbf{F} = (-y\mathbf{i} + x\mathbf{j})/(x^2 + y^2)^{1/2}$$

in the plane. The field is not defined at the origin.

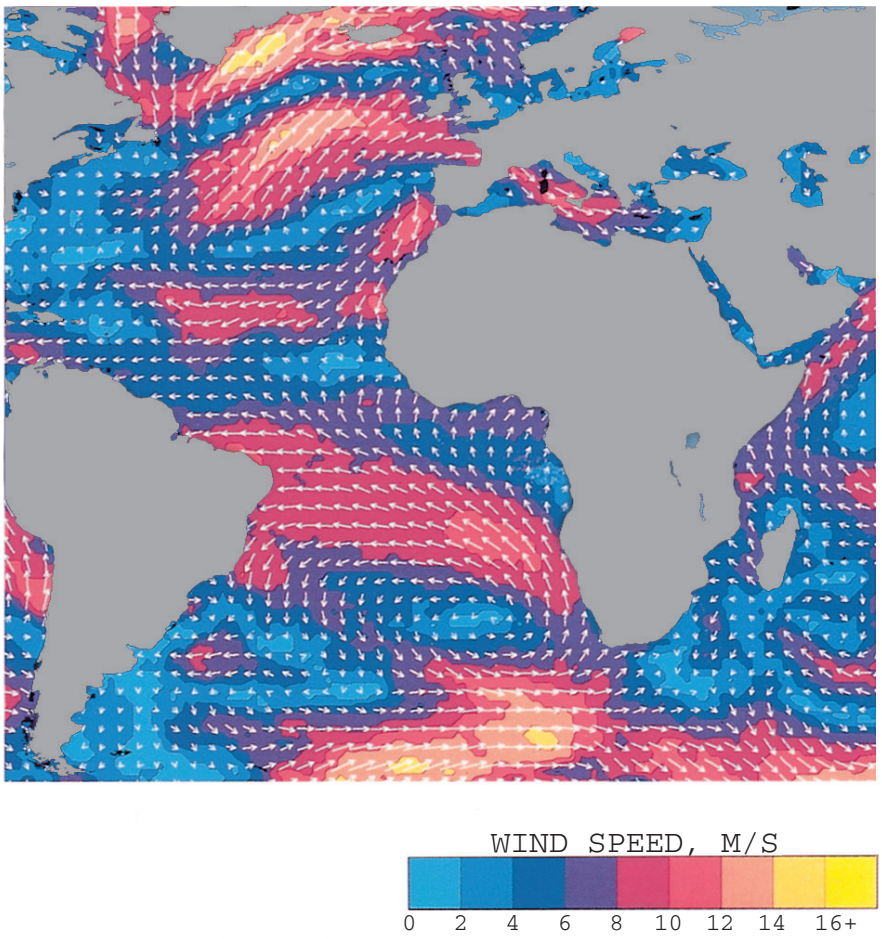

**FIGURE 16.15** NASA's *Seasat* used radar to take 350,000 wind measurements over the world's oceans. The arrows show wind direction; their length and the color contouring indicate speed. Notice the heavy storm south of Greenland.

evaluated. This is different from the way we draw position vectors of planets and projectiles, with their tails at the origin and their heads at the planet's and projectile's locations.

## Gradient Fields

**DEFINITION Gradient Field**

The **gradient field** of a differentiable function $f(x, y, z)$ is the field of gradient vectors

$$\nabla f = \frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j} + \frac{\partial f}{\partial z}\mathbf{k}.$$

**EXAMPLE 1** Finding a Gradient Field

Find the gradient field of $f(x, y, z) = xyz$.

**Solution** The gradient field of $f$ is the field $\mathbf{F} = \nabla f = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$. ■

As we will see in Section 16.3, gradient fields are of special importance in engineering, mathematics, and physics.

## Work Done by a Force over a Curve in Space

Suppose that the vector field $\mathbf{F} = M(x, y, z)\mathbf{i} + N(x, y, z)\mathbf{j} + P(x, y, z)\mathbf{k}$ represents a force throughout a region in space (it might be the force of gravity or an electromagnetic force of some kind) and that

$$\mathbf{r}(t) = g(t)\mathbf{i} + h(t)\mathbf{j} + k(t)\mathbf{k}, \qquad a \le t \le b,$$

is a smooth curve in the region. Then the integral of $\mathbf{F} \cdot \mathbf{T}$, the scalar component of $\mathbf{F}$ in the direction of the curve's unit tangent vector, over the curve is called the work done by $\mathbf{F}$ over the curve from $a$ to $b$ (Figure 16.16).

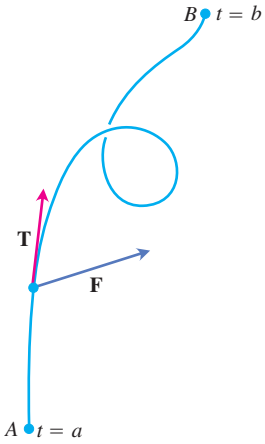

**FIGURE 16.16** The work done by a force $\mathbf{F}$ is the line integral of the scalar component $\mathbf{F} \cdot \mathbf{T}$ over the smooth curve from $A$ to $B$.

**DEFINITION Work over a Smooth Curve**

The **work** done by a force $\mathbf{F} = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$ over a smooth curve $\mathbf{r}(t)$ from $t = a$ to $t = b$ is

$$W = \int_{t=a}^{t=b} \mathbf{F} \cdot \mathbf{T}\, ds. \tag{1}$$

We motivate Equation (1) with the same kind of reasoning we used in Chapter 6 to derive the formula $W = \int_a^b F(x)\, dx$ for the work done by a continuous force of magnitude $F(x)$ directed along an interval of the $x$-axis. We divide the curve into short segments, apply the (constant-force) $\times$ (distance) formula for work to approximate the work over each curved segment, add the results to approximate the work over the entire curve, and calculate

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

the work as the limit of the approximating sums as the segments become shorter and more numerous. To find exactly what the limiting integral should be, we partition the parameter interval $[a, b]$ in the usual way and choose a point $c_k$ in each subinterval $[t_k, t_{k+1}]$. The partition of $[a, b]$ determines ("induces," we say) a partition of the curve, with the point $P_k$ being the tip of the position vector $\mathbf{r}(t_k)$ and $\Delta s_k$ being the length of the curve segment $P_kP_{k+1}$ (Figure 16.17).

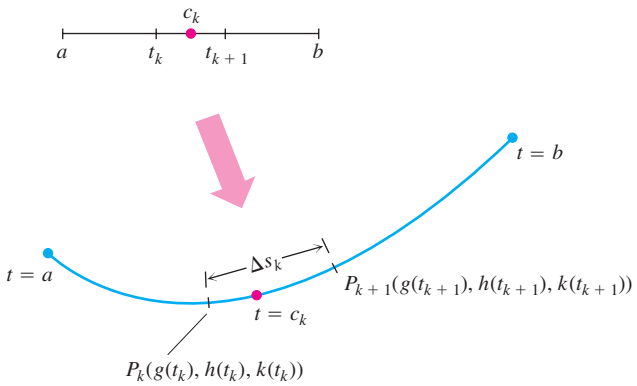

**FIGURE 16.17** Each partition of $[a, b]$ induces a partition of the curve $\mathbf{r}(t) = g(t)\mathbf{i} + h(t)\mathbf{j} + k(t)\mathbf{k}$.

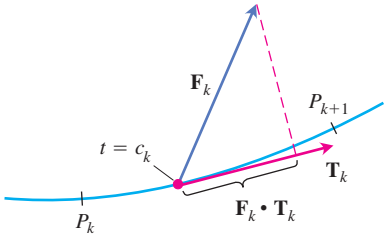

**FIGURE 16.18** An enlarged view of the curve segment $P_kP_{k+1}$ in Figure 16.17, showing the force and unit tangent vectors at the point on the curve where $t = c_k$.

If $\mathbf{F}_k$ denotes the value of $\mathbf{F}$ at the point on the curve corresponding to $t = c_k$ and $\mathbf{T}_k$ denotes the curve's unit tangent vector at this point, then $\mathbf{F}_k \cdot \mathbf{T}_k$ is the scalar component of $\mathbf{F}$ in the direction of $\mathbf{T}$ at $t = c_k$ (Figure 16.18). The work done by $\mathbf{F}$ along the curve segment $P_kP_{k+1}$ is approximately

$$\begin{pmatrix}\text{Force component in}\\ \text{direction of motion}\end{pmatrix} \times \begin{pmatrix}\text{distance}\\ \text{applied}\end{pmatrix} = \mathbf{F}_k \cdot \mathbf{T}_k \, \Delta s_k.$$

The work done by $\mathbf{F}$ along the curve from $t = a$ to $t = b$ is approximately

$$\sum_{k=1}^{n} \mathbf{F}_k \cdot \mathbf{T}_k \, \Delta s_k.$$

As the norm of the partition of $[a, b]$ approaches zero, the norm of the induced partition of the curve approaches zero and these sums approach the line integral

$$\int_{t=a}^{t=b} \mathbf{F} \cdot \mathbf{T} \, ds.$$

The sign of the number we calculate with this integral depends on the direction in which the curve is traversed as $t$ increases. If we reverse the direction of motion, we reverse the direction of $\mathbf{T}$ and change the sign of $\mathbf{F} \cdot \mathbf{T}$ and its integral.

Table 16.2 shows six ways to write the work integral in Equation (1). Despite their variety, the formulas in Table 16.2 are all evaluated the same way. In the table, $\mathbf{r}(t) = g(t)\mathbf{i} + h(t)\mathbf{j} + k(t)\mathbf{k} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ is a smooth curve, and

$$d\mathbf{r} = \frac{d\mathbf{r}}{dt}\,dt = dg\mathbf{i} + dh\mathbf{j} + dk\mathbf{k}$$

is its differential.

**TABLE 16.2** Six different ways to write the work integral

| | |
|---|---|
| $\mathbf{W} = \int_{t=a}^{t=b} \mathbf{F} \cdot \mathbf{T}\, ds$ | The definition |
| $= \int_{t=a}^{t=b} \mathbf{F} \cdot d\mathbf{r}$ | Compact differential form |
| $= \int_a^b \mathbf{F} \cdot \frac{d\mathbf{r}}{dt}\, dt$ | Expanded to include $dt$; emphasizes the parameter $t$ and velocity vector $d\mathbf{r}/dt$ |
| $= \int_a^b \left(M\frac{dg}{dt} + N\frac{dh}{dt} + P\frac{dk}{dt}\right) dt$ | Emphasizes the component functions |
| $= \int_a^b \left(M\frac{dx}{dt} + N\frac{dy}{dt} + P\frac{dz}{dt}\right) dt$ | Abbreviates the components of $\mathbf{r}$ |
| $= \int_a^b M\,dx + N\,dy + P\,dz$ | $dt$'s canceled; the most common form |

### Evaluating a Work Integral

To evaluate the work integral along a smooth curve $\mathbf{r}(t)$, take these steps:

1. Evaluate $\mathbf{F}$ on the curve as a function of the parameter $t$.
2. Find $d\mathbf{r}/dt$
3. Integrate $\mathbf{F} \cdot d\mathbf{r}/dt$ from $t = a$ to $t = b$.

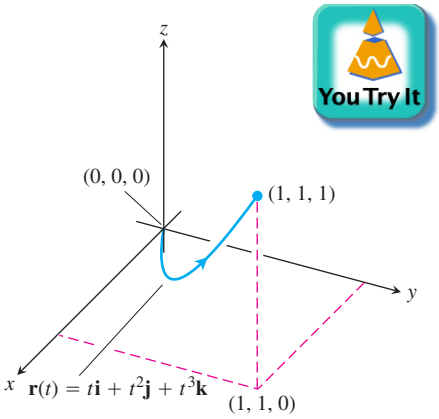

**FIGURE 16.19** The curve in Example 2.

**EXAMPLE 2** Finding Work Done by a Variable Force over a Space Curve

Find the work done by $\mathbf{F} = (y - x^2)\mathbf{i} + (z - y^2)\mathbf{j} + (x - z^2)\mathbf{k}$ over the curve $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k}$, $0 \le t \le 1$, from (0, 0, 0) to (1, 1, 1) (Figure 16.19).

**Solution** First we evaluate $\mathbf{F}$ on the curve:

$$\mathbf{F} = (y - x^2)\mathbf{i} + (z - y^2)\mathbf{j} + (x - z^2)\mathbf{k}$$

$$= (\underbrace{t^2 - t^2}_{0})\mathbf{i} + (t^3 - t^4)\mathbf{j} + (t - t^6)\mathbf{k}$$

Then we find $d\mathbf{r}/dt$,

$$\frac{d\mathbf{r}}{dt} = \frac{d}{dt}(t\mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k}) = \mathbf{i} + 2t\mathbf{j} + 3t^2\mathbf{k}$$

Finally, we find $\mathbf{F} \cdot d\mathbf{r}/dt$ and integrate from $t = 0$ to $t = 1$:

$$\mathbf{F} \cdot \frac{d\mathbf{r}}{dt} = [(t^3 - t^4)\mathbf{j} + (t - t^6)\mathbf{k}] \cdot (\mathbf{i} + 2t\mathbf{j} + 3t^2\mathbf{k})$$

$$= (t^3 - t^4)(2t) + (t - t^6)(3t^2) = 2t^4 - 2t^5 + 3t^3 - 3t^8,$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

so

$$\text{Work} = \int_0^1 (2t^4 - 2t^5 + 3t^3 - 3t^8)\, dt$$

$$= \left[\frac{2}{5}t^5 - \frac{2}{6}t^6 + \frac{3}{4}t^4 - \frac{3}{9}t^9\right]_0^1 = \frac{29}{60}.$$

## Flow Integrals and Circulation for Velocity Fields

Instead of being a force field, suppose that $\mathbf{F}$ represents the velocity field of a fluid flowing through a region in space (a tidal basin or the turbine chamber of a hydroelectric generator, for example). Under these circumstances, the integral of $\mathbf{F} \cdot \mathbf{T}$ along a curve in the region gives the fluid's flow along the curve.

**DEFINITIONS Flow Integral, Circulation**

If $\mathbf{r}(t)$ is a smooth curve in the domain of a continuous velocity field $\mathbf{F}$, the **flow** along the curve from $t = a$ to $t = b$ is

$$\text{Flow} = \int_a^b \mathbf{F} \cdot \mathbf{T}\, ds. \tag{2}$$

The integral in this case is called a **flow integral**. If the curve is a closed loop, the flow is called the **circulation** around the curve.

We evaluate flow integrals the same way we evaluate work integrals.

**EXAMPLE 3** Finding Flow Along a Helix

A fluid's velocity field is $\mathbf{F} = x\mathbf{i} + z\mathbf{j} + y\mathbf{k}$. Find the flow along the helix $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + t\mathbf{k}$, $0 \le t \le \pi/2$.

**Solution** We evaluate $\mathbf{F}$ on the curve,

$$\mathbf{F} = x\mathbf{i} + z\mathbf{j} + y\mathbf{k} = (\cos t)\mathbf{i} + t\mathbf{j} + (\sin t)\mathbf{k}$$

and then find $d\mathbf{r}/dt$:

$$\frac{d\mathbf{r}}{dt} = (-\sin t)\mathbf{i} + (\cos t)\mathbf{j} + \mathbf{k}.$$

Then we integrate $\mathbf{F} \cdot (d\mathbf{r}/dt)$ from $t = 0$ to $t = \dfrac{\pi}{2}$:

$$\mathbf{F} \cdot \frac{d\mathbf{r}}{dt} = (\cos t)(-\sin t) + (t)(\cos t) + (\sin t)(1)$$

$$= -\sin t \cos t + t \cos t + \sin t$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

so,

$$\text{Flow} = \int_{t=a}^{t=b} \mathbf{F} \cdot \frac{d\mathbf{r}}{dt}\, dt = \int_0^{\pi/2} (-\sin t \cos t + t \cos t + \sin t)\, dt$$

$$= \left[\frac{\cos^2 t}{2} + t \sin t\right]_0^{\pi/2} = \left(0 + \frac{\pi}{2}\right) - \left(\frac{1}{2} + 0\right) = \frac{\pi}{2} - \frac{1}{2}.$$

**EXAMPLE 4** Finding Circulation Around a Circle

Find the circulation of the field $\mathbf{F} = (x - y)\mathbf{i} + x\mathbf{j}$ around the circle $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j}$, $0 \le t \le 2\pi$.

**Solution** On the circle, $\mathbf{F} = (x - y)\mathbf{i} + x\mathbf{j} = (\cos t - \sin t)\mathbf{i} + (\cos t)\mathbf{j}$, and

$$\frac{d\mathbf{r}}{dt} = (-\sin t)\mathbf{i} + (\cos t)\mathbf{j}.$$

Then

$$\mathbf{F} \cdot \frac{d\mathbf{r}}{dt} = -\sin t \cos t + \underbrace{\sin^2 t + \cos^2 t}_{1}$$

gives

$$\text{Circulation} = \int_0^{2\pi} \mathbf{F} \cdot \frac{d\mathbf{r}}{dt}\, dt = \int_0^{2\pi} (1 - \sin t \cos t)\, dt$$

$$= \left[t - \frac{\sin^2 t}{2}\right]_0^{2\pi} = 2\pi.$$

## Flux Across a Plane Curve

To find the rate at which a fluid is entering or leaving a region enclosed by a smooth curve $C$ in the $xy$-plane, we calculate the line integral over $C$ of $\mathbf{F} \cdot \mathbf{n}$, the scalar component of the fluid's velocity field in the direction of the curve's outward-pointing normal vector. The value of this integral is the *flux* of $\mathbf{F}$ across $C$. *Flux* is Latin for *flow*, but many flux calculations involve no motion at all. If $\mathbf{F}$ were an electric field or a magnetic field, for instance, the integral of $\mathbf{F} \cdot \mathbf{n}$ would still be called the flux of the field across $C$.

**DEFINITION** **Flux Across a Closed Curve in the Plane**

If $C$ is a smooth closed curve in the domain of a continuous vector field $\mathbf{F} = M(x, y)\mathbf{i} + N(x, y)\mathbf{j}$ in the plane and if $\mathbf{n}$ is the outward-pointing unit normal vector on $C$, the **flux** of $\mathbf{F}$ across $C$ is

$$\text{Flux of } \mathbf{F} \text{ across } C = \int_C \mathbf{F} \cdot \mathbf{n}\, ds. \tag{3}$$

Notice the difference between flux and circulation. The flux of $\mathbf{F}$ across $C$ is the line integral with respect to arc length of $\mathbf{F} \cdot \mathbf{n}$, the scalar component of $\mathbf{F}$ in the direction of the

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

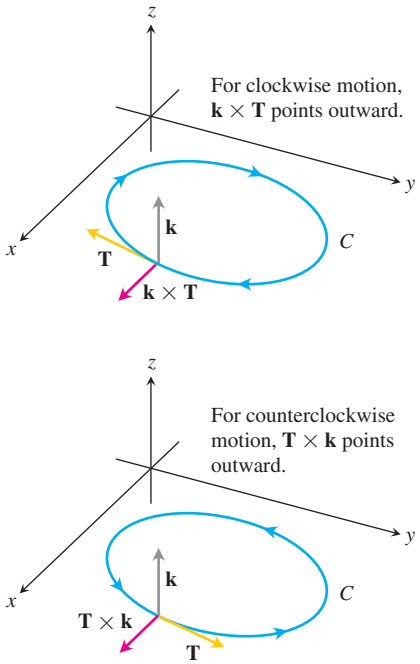

**FIGURE 16.20** To find an outward unit normal vector for a smooth curve $C$ in the $xy$-plane that is traversed counterclockwise as $t$ increases, we take $\mathbf{n} = \mathbf{T} \times \mathbf{k}$. For clockwise motion, we take $\mathbf{n} = \mathbf{k} \times \mathbf{T}$.

outward normal. The circulation of $\mathbf{F}$ around $C$ is the line integral with respect to arc length of $\mathbf{F} \cdot \mathbf{T}$, the scalar component of $\mathbf{F}$ in the direction of the unit tangent vector. Flux is the integral of the normal component of $\mathbf{F}$; circulation is the integral of the tangential component of $\mathbf{F}$.

To evaluate the integral in Equation (3), we begin with a smooth parametrization

$$x = g(t), \qquad y = h(t), \qquad a \le t \le b,$$

that traces the curve $C$ exactly once as $t$ increases from $a$ to $b$. We can find the outward unit normal vector $\mathbf{n}$ by crossing the curve's unit tangent vector $\mathbf{T}$ with the vector $\mathbf{k}$. But which order do we choose, $\mathbf{T} \times \mathbf{k}$ or $\mathbf{k} \times \mathbf{T}$? Which one points outward? It depends on which way $C$ is traversed as $t$ increases. If the motion is clockwise, $\mathbf{k} \times \mathbf{T}$ points outward; if the motion is counterclockwise, $\mathbf{T} \times \mathbf{k}$ points outward (Figure 16.20). The usual choice is $\mathbf{n} = \mathbf{T} \times \mathbf{k}$, the choice that assumes counterclockwise motion. Thus, although the value of the arc length integral in the definition of flux in Equation (3) does not depend on which way $C$ is traversed, the formulas we are about to derive for evaluating the integral in Equation (3) will assume counterclockwise motion.

In terms of components,

$$\mathbf{n} = \mathbf{T} \times \mathbf{k} = \left(\frac{dx}{ds}\mathbf{i} + \frac{dy}{ds}\mathbf{j}\right) \times \mathbf{k} = \frac{dy}{ds}\mathbf{i} - \frac{dx}{ds}\mathbf{j}.$$

If $\mathbf{F} = M(x, y)\mathbf{i} + N(x, y)\mathbf{j}$, then

$$\mathbf{F} \cdot \mathbf{n} = M(x, y)\frac{dy}{ds} - N(x, y)\frac{dx}{ds}.$$

Hence,

$$\int_C \mathbf{F} \cdot \mathbf{n}\, ds = \int_C \left(M\frac{dy}{ds} - N\frac{dx}{ds}\right) ds = \oint_C M\, dy - N\, dx.$$

We put a directed circle $\circlearrowleft$ on the last integral as a reminder that the integration around the closed curve $C$ is to be in the counterclockwise direction. To evaluate this integral, we express $M$, $dy$, $N$, and $dx$ in terms of $t$ and integrate from $t = a$ to $t = b$. We do not need to know either $\mathbf{n}$ or $ds$ to find the flux.

**Calculating Flux Across a Smooth Closed Plane Curve**

$$(\text{Flux of } \mathbf{F} = M\mathbf{i} + N\mathbf{j} \text{ across } C) = \oint_C M\, dy - N\, dx \tag{4}$$

The integral can be evaluated from any smooth parametrization $x = g(t), y = h(t)$, $a \le t \le b$, that traces $C$ counterclockwise exactly once.

**EXAMPLE 5** Finding Flux Across a Circle

Find the flux of $\mathbf{F} = (x - y)\mathbf{i} + x\mathbf{j}$ across the circle $x^2 + y^2 = 1$ in the $xy$-plane.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** The parametrization $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j}$, $0 \le t \le 2\pi$, traces the circle counterclockwise exactly once. We can therefore use this parametrization in Equation (4). With

$$M = x - y = \cos t - \sin t, \qquad dy = d(\sin t) = \cos t\, dt$$
$$N = x = \cos t, \qquad dx = d(\cos t) = -\sin t\, dt,$$

We find

$$\text{Flux} = \int_C M\, dy - N\, dx = \int_0^{2\pi} (\cos^2 t - \sin t \cos t + \cos t \sin t)\, dt \qquad \text{Equation (4)}$$
$$= \int_0^{2\pi} \cos^2 t\, dt = \int_0^{2\pi} \frac{1 + \cos 2t}{2}\, dt = \left[\frac{t}{2} + \frac{\sin 2t}{4}\right]_0^{2\pi} = \pi.$$

The flux of $\mathbf{F}$ across the circle is $\pi$. Since the answer is positive, the net flow across the curve is outward. A net inward flow would have given a negative flux. ■

# EXERCISES 16.2

## Vector and Gradient Fields

Find the gradient fields of the functions in Exercises 1–4.

1. $f(x, y, z) = (x^2 + y^2 + z^2)^{-1/2}$
2. $f(x, y, z) = \ln\sqrt{x^2 + y^2 + z^2}$
3. $g(x, y, z) = e^z - \ln(x^2 + y^2)$
4. $g(x, y, z) = xy + yz + xz$
5. Give a formula $\mathbf{F} = M(x, y)\mathbf{i} + N(x, y)\mathbf{j}$ for the vector field in the plane that has the property that $\mathbf{F}$ points toward the origin with magnitude inversely proportional to the square of the distance from $(x, y)$ to the origin. (The field is not defined at $(0, 0)$.)
6. Give a formula $\mathbf{F} = M(x, y)\mathbf{i} + N(x, y)\mathbf{j}$ for the vector field in the plane that has the properties that $\mathbf{F} = \mathbf{0}$ at $(0, 0)$ and that at any other point $(a, b)$, $\mathbf{F}$ is tangent to the circle $x^2 + y^2 = a^2 + b^2$ and points in the clockwise direction with magnitude $|\mathbf{F}| = \sqrt{a^2 + b^2}$.

## Work

In Exercises 7–12, find the work done by force $\mathbf{F}$ from $(0, 0, 0)$ to $(1, 1, 1)$ over each of the following paths (Figure 16.21):

**a.** The straight-line path $C_1$: $\mathbf{r}(t) = t\mathbf{i} + t\mathbf{j} + t\mathbf{k}, \quad 0 \le t \le 1$

**b.** The curved path $C_2$: $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + t^4\mathbf{k}, \quad 0 \le t \le 1$

**c.** The path $C_3 \cup C_4$ consisting of the line segment from $(0, 0, 0)$ to $(1, 1, 0)$ followed by the segment from $(1, 1, 0)$ to $(1, 1, 1)$

7. $\mathbf{F} = 3y\mathbf{i} + 2x\mathbf{j} + 4z\mathbf{k}$
8. $\mathbf{F} = [1/(x^2 + 1)]\mathbf{j}$
9. $\mathbf{F} = \sqrt{z}\mathbf{i} - 2x\mathbf{j} + \sqrt{y}\mathbf{k}$
10. $\mathbf{F} = xy\mathbf{i} + yz\mathbf{j} + xz\mathbf{k}$
11. $\mathbf{F} = (3x^2 - 3x)\mathbf{i} + 3z\mathbf{j} + \mathbf{k}$
12. $\mathbf{F} = (y + z)\mathbf{i} + (z + x)\mathbf{j} + (x + y)\mathbf{k}$

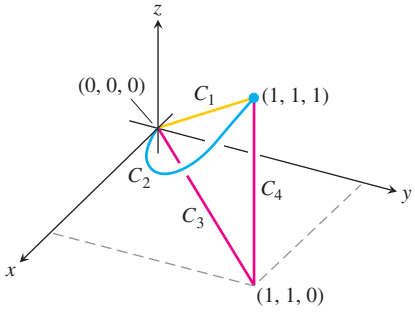

**FIGURE 16.21** The paths from $(0, 0, 0)$ to $(1, 1, 1)$.

In Exercises 13–16, find the work done by $\mathbf{F}$ over the curve in the direction of increasing $t$.

13. $\mathbf{F} = xy\mathbf{i} + y\mathbf{j} - yz\mathbf{k}$
    $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + t\mathbf{k}, \quad 0 \le t \le 1$
14. $\mathbf{F} = 2y\mathbf{i} + 3x\mathbf{j} + (x + y)\mathbf{k}$
    $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + (t/6)\mathbf{k}, \quad 0 \le t \le 2\pi$
15. $\mathbf{F} = z\mathbf{i} + x\mathbf{j} + y\mathbf{k}$
    $\mathbf{r}(t) = (\sin t)\mathbf{i} + (\cos t)\mathbf{j} + t\mathbf{k}, \quad 0 \le t \le 2\pi$
16. $\mathbf{F} = 6z\mathbf{i} + y^2\mathbf{j} + 12x\mathbf{k}$
    $\mathbf{r}(t) = (\sin t)\mathbf{i} + (\cos t)\mathbf{j} + (t/6)\mathbf{k}, \quad 0 \le t \le 2\pi$

## Line Integrals and Vector Fields in the Plane

17. Evaluate $\int_C xy\,dx + (x + y)\,dy$ along the curve $y = x^2$ from $(-1, 1)$ to $(2, 4)$.
18. Evaluate $\int_C (x - y)\,dx + (x + y)\,dy$ counterclockwise around the triangle with vertices $(0, 0)$, $(1, 0)$, and $(0, 1)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**19.** Evaluate $\int_C \mathbf{F} \cdot \mathbf{T}\, ds$ for the vector field $\mathbf{F} = x^2\mathbf{i} - y\mathbf{j}$ along the curve $x = y^2$ from $(4, 2)$ to $(1, -1)$.

**20.** Evaluate $\int_C \mathbf{F} \cdot d\mathbf{r}$ for the vector field $\mathbf{F} = y\mathbf{i} - x\mathbf{j}$ counterclockwise along the unit circle $x^2 + y^2 = 1$ from $(1, 0)$ to $(0, 1)$.

**21. Work** Find the work done by the force $\mathbf{F} = xy\mathbf{i} + (y - x)\mathbf{j}$ over the straight line from $(1, 1)$ to $(2, 3)$.

**22. Work** Find the work done by the gradient of $f(x, y) = (x + y)^2$ counterclockwise around the circle $x^2 + y^2 = 4$ from $(2, 0)$ to itself.

**23. Circulation and flux** Find the circulation and flux of the fields

$$\mathbf{F}_1 = x\mathbf{i} + y\mathbf{j} \quad \text{and} \quad \mathbf{F}_2 = -y\mathbf{i} + x\mathbf{j}$$

around and across each of the following curves.

**a.** The circle $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j}, \quad 0 \le t \le 2\pi$

**b.** The ellipse $\mathbf{r}(t) = (\cos t)\mathbf{i} + (4 \sin t)\mathbf{j}, \quad 0 \le t \le 2\pi$

**24. Flux across a circle** Find the flux of the fields

$$\mathbf{F}_1 = 2x\mathbf{i} - 3y\mathbf{j} \quad \text{and} \quad \mathbf{F}_2 = 2x\mathbf{i} + (x - y)\mathbf{j}$$

across the circle

$$\mathbf{r}(t) = (a \cos t)\mathbf{i} + (a \sin t)\mathbf{j}, \qquad 0 \le t \le 2\pi.$$

## Circulation and Flux

In Exercises 25–28, find the circulation and flux of the field $\mathbf{F}$ around and across the closed semicircular path that consists of the semicircular arch $\mathbf{r}_1(t) = (a \cos t)\mathbf{i} + (a \sin t)\mathbf{j}$, $0 \le t \le \pi$, followed by the line segment $\mathbf{r}_2(t) = t\mathbf{i}$, $-a \le t \le a$.

**25.** $\mathbf{F} = x\mathbf{i} + y\mathbf{j}$ **26.** $\mathbf{F} = x^2\mathbf{i} + y^2\mathbf{j}$

**27.** $\mathbf{F} = -y\mathbf{i} + x\mathbf{j}$ **28.** $\mathbf{F} = -y^2\mathbf{i} + x^2\mathbf{j}$

**29. Flow integrals** Find the flow of the velocity field $\mathbf{F} = (x + y)\mathbf{i} - (x^2 + y^2)\mathbf{j}$ along each of the following paths from $(1, 0)$ to $(-1, 0)$ in the $xy$-plane.

**a.** The upper half of the circle $x^2 + y^2 = 1$

**b.** The line segment from $(1, 0)$ to $(-1, 0)$

**c.** The line segment from $(1, 0)$ to $(0, -1)$ followed by the line segment from $(0, -1)$ to $(-1, 0)$.

**30. Flux across a triangle** Find the flux of the field $\mathbf{F}$ in Exercise 29 outward across the triangle with vertices $(1, 0)$, $(0, 1)$, $(-1, 0)$.

## Sketching and Finding Fields in the Plane

**31. Spin field** Draw the spin field

$$\mathbf{F} = -\frac{y}{\sqrt{x^2 + y^2}}\mathbf{i} + \frac{x}{\sqrt{x^2 + y^2}}\mathbf{j}$$

(see Figure 16.14) along with its horizontal and vertical components at a representative assortment of points on the circle $x^2 + y^2 = 4$.

**32. Radial field** Draw the radial field

$$\mathbf{F} = x\mathbf{i} + y\mathbf{j}$$

(see Figure 16.13) along with its horizontal and vertical components at a representative assortment of points on the circle $x^2 + y^2 = 1$.

**33. A field of tangent vectors**

**a.** Find a field $\mathbf{G} = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$ in the $xy$-plane with the property that at any point $(a, b) \neq (0, 0)$, $\mathbf{G}$ is a vector of magnitude $\sqrt{a^2 + b^2}$ tangent to the circle $x^2 + y^2 = a^2 + b^2$ and pointing in the counterclockwise direction. (The field is undefined at $(0, 0)$.)

**b.** How is $\mathbf{G}$ related to the spin field $\mathbf{F}$ in Figure 16.14?

**34. A field of tangent vectors**

**a.** Find a field $\mathbf{G} = P(x, y)\mathbf{i} + Q(x, y)\mathbf{j}$ in the $xy$-plane with the property that at any point $(a, b) \neq (0, 0)$, $\mathbf{G}$ is a unit vector tangent to the circle $x^2 + y^2 = a^2 + b^2$ and pointing in the clockwise direction.

**b.** How is $\mathbf{G}$ related to the spin field $\mathbf{F}$ in Figure 16.14?

**35. Unit vectors pointing toward the origin** Find a field $\mathbf{F} = M(x, y)\mathbf{i} + N(x, y)\mathbf{j}$ in the $xy$-plane with the property that at each point $(x, y) \neq (0, 0)$, $\mathbf{F}$ is a unit vector pointing toward the origin. (The field is undefined at $(0, 0)$.)

**36. Two "central" fields** Find a field $\mathbf{F} = M(x, y)\mathbf{i} + N(x, y)\mathbf{j}$ in the $xy$-plane with the property that at each point $(x, y) \neq (0, 0)$, $\mathbf{F}$ points toward the origin and $|\mathbf{F}|$ is **(a)** the distance from $(x, y)$ to the origin, **(b)** inversely proportional to the distance from $(x, y)$ to the origin. (The field is undefined at $(0, 0)$.)

## Flow Integrals in Space

In Exercises 37–40, $\mathbf{F}$ is the velocity field of a fluid flowing through a region in space. Find the flow along the given curve in the direction of increasing $t$.

**37.** $\mathbf{F} = -4xy\mathbf{i} + 8y\mathbf{j} + 2\mathbf{k}$

$\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + \mathbf{k}, \quad 0 \le t \le 2$

**38.** $\mathbf{F} = x^2\mathbf{i} + yz\mathbf{j} + y^2\mathbf{k}$

$r(t) = 3t\mathbf{j} + 4t\mathbf{k}, \quad 0 \le t \le 1$

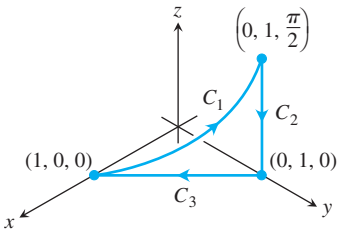
**39.** $\mathbf{F} = (x - z)\mathbf{i} + x\mathbf{k}$

$\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{k}, \quad 0 \le t \le \pi$

**40.** $\mathbf{F} = -y\mathbf{i} + x\mathbf{j} + 2\mathbf{k}$

$\mathbf{r}(t) = (-2 \cos t)\mathbf{i} + (2 \sin t)\mathbf{j} + 2t\mathbf{k}, \qquad 0 \le t \le 2\pi$

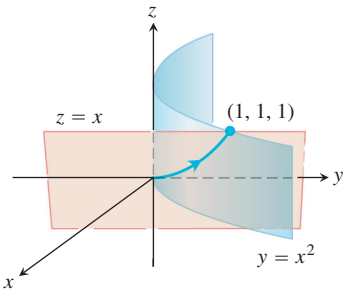
**41. Circulation** Find the circulation of $\mathbf{F} = 2x\mathbf{i} + 2z\mathbf{j} + 2y\mathbf{k}$ around the closed path consisting of the following three curves traversed in the direction of increasing $t$:



$C_1$: $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + t\mathbf{k}, \quad 0 \le t \le \pi/2$

$C_2$: $\mathbf{r}(t) = \mathbf{j} + (\pi/2)(1 - t)\mathbf{k}, \quad 0 \le t \le 1$

$C_3$: $\mathbf{r}(t) = t\mathbf{i} + (1 - t)\mathbf{j}, \quad 0 \le t \le 1$



Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

**42. Zero circulation** Let $C$ be the ellipse in which the plane $2x + 3y - z = 0$ meets the cylinder $x^2 + y^2 = 12$. Show, without evaluating either line integral directly, that the circulation of the field $\mathbf{F} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ around $C$ in either direction is zero.

**43. Flow along a curve** The field $\mathbf{F} = xy\mathbf{i} + y\mathbf{j} - yz\mathbf{k}$ is the velocity field of a flow in space. Find the flow from (0, 0, 0) to (1, 1, 1) along the curve of intersection of the cylinder $y = x^2$ and the plane $z = x$. (*Hint:* Use $t = x$ as the parameter.)

**44. Flow of a gradient field** Find the flow of the field $\mathbf{F} = \nabla(xy^2z^3)$:

**a.** Once around the curve $C$ in Exercise 42, clockwise as viewed from above

**b.** Along the line segment from (1, 1, 1) to (2, 1, −1),

## Theory and Examples

**45. Work and area** Suppose that $f(t)$ is differentiable and positive for $a \le t \le b$. Let $C$ be the path $\mathbf{r}(t) = t\mathbf{i} + f(t)\mathbf{j}$, $a \le t \le b$, and $\mathbf{F} = y\mathbf{i}$. Is there any relation between the value of the work integral

$$\int_C \mathbf{F} \cdot d\mathbf{r}$$

and the area of the region bounded by the $t$-axis, the graph of $f$, and the lines $t = a$ and $t = b$? Give reasons for your answer.

**46. Work done by a radial force with constant magnitude** A particle moves along the smooth curve $y = f(x)$ from $(a, f(a))$ to $(b, f(b))$. The force moving the particle has constant magnitude $k$ and always points away from the origin. Show that the work done by the force is

$$\int_C \mathbf{F} \cdot \mathbf{T}\, ds = k\left[(b^2 + (f(b))^2)^{1/2} - (a^2 + (f(a))^2)^{1/2}\right].$$

COMPUTER EXPLORATIONS

## Finding Work Numerically

In Exercises 47–52, use a CAS to perform the following steps for finding the work done by force $\mathbf{F}$ over the given path:

**a.** Find $d\mathbf{r}$ for the path $\mathbf{r}(t) = g(t)\mathbf{i} + h(t)\mathbf{j} + k(t)\mathbf{k}$.

**b.** Evaluate the force $\mathbf{F}$ along the path.

**c.** Evaluate $\displaystyle\int_C \mathbf{F} \cdot d\mathbf{r}$.

**47.** $\mathbf{F} = xy^6\mathbf{i} + 3x(xy^5 + 2)\mathbf{j}$; $\mathbf{r}(t) = (2\cos t)\mathbf{i} + (\sin t)\mathbf{j}$, $0 \le t \le 2\pi$

**48.** $\mathbf{F} = \dfrac{3}{1 + x^2}\mathbf{i} + \dfrac{2}{1 + y^2}\mathbf{j}$; $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j}$, $0 \le t \le \pi$

**49.** $\mathbf{F} = (y + yz\cos xyz)\mathbf{i} + (x^2 + xz\cos xyz)\mathbf{j} + (z + xy\cos xyz)\mathbf{k}$; $\mathbf{r}(t) = (2\cos t)\mathbf{i} + (3\sin t)\mathbf{j} + \mathbf{k}$, $0 \le t \le 2\pi$

**50.** $\mathbf{F} = 2xy\mathbf{i} - y^2\mathbf{j} + ze^x\mathbf{k}$; $\mathbf{r}(t) = -t\mathbf{i} + \sqrt{t}\mathbf{j} + 3t\mathbf{k}$, $1 \le t \le 4$

**51.** $\mathbf{F} = (2y + \sin x)\mathbf{i} + (z^2 + (1/3)\cos y)\mathbf{j} + x^4\mathbf{k}$; $\mathbf{r}(t) = (\sin t)\mathbf{i} + (\cos t)\mathbf{j} + (\sin 2t)\mathbf{k}$, $-\pi/2 \le t \le \pi/2$

**52.** $\mathbf{F} = (x^2y)\mathbf{i} + \dfrac{1}{3}x^3\mathbf{j} + xy\mathbf{k}$; $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + (2\sin^2 t - 1)\mathbf{k}$, $0 \le t \le 2\pi$

## 16.3 Path Independence, Potential Functions, and Conservative Fields

In gravitational and electric fields, the amount of work it takes to move a mass or a charge from one point to another depends only on the object's initial and final positions and not on the path taken in between. This section discusses the notion of path independence of work integrals and describes the properties of fields in which work integrals are path independent. Work integrals are often easier to evaluate if they are path independent.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Path Independence

If $A$ and $B$ are two points in an open region $D$ in space, the work $\int \mathbf{F} \cdot d\mathbf{r}$ done in moving a particle from $A$ to $B$ by a field $\mathbf{F}$ defined on $D$ usually depends on the path taken. For some special fields, however, the integral's value is the same for all paths from $A$ to $B$.

**DEFINITIONS Path Independence, Conservative Field**

Let $\mathbf{F}$ be a field defined on an open region $D$ in space, and suppose that for any two points $A$ and $B$ in $D$ the work $\int_A^B \mathbf{F} \cdot d\mathbf{r}$ done in moving from $A$ to $B$ is the same over all paths from $A$ to $B$. Then the integral $\int \mathbf{F} \cdot d\mathbf{r}$ is **path independent in $D$** and the field $\mathbf{F}$ is **conservative on $D$**.

The word *conservative* comes from physics, where it refers to fields in which the principle of conservation of energy holds (it does, in conservative fields).

Under differentiability conditions normally met in practice, a field $\mathbf{F}$ is conservative if and only if it is the gradient field of a scalar function $f$; that is, if and only if $\mathbf{F} = \nabla f$ for some $f$. The function $f$ then has a special name.

**DEFINITION Potential Function**

If $\mathbf{F}$ is a field defined on $D$ and $\mathbf{F} = \nabla f$ for some scalar function $f$ on $D$, then $f$ is called a **potential function for $\mathbf{F}$**.

An electric potential is a scalar function whose gradient field is an electric field. A gravitational potential is a scalar function whose gradient field is a gravitational field, and so on. As we will see, once we have found a potential function $f$ for a field $\mathbf{F}$, we can evaluate all the work integrals in the domain of $\mathbf{F}$ over any path between $A$ and $B$ by

$$\int_A^B \mathbf{F} \cdot d\mathbf{r} = \int_A^B \nabla f \cdot d\mathbf{r} = f(B) - f(A). \tag{1}$$

If you think of $\nabla f$ for functions of several variables as being something like the derivative $f'$ for functions of a single variable, then you see that Equation (1) is the vector calculus analogue of the Fundamental Theorem of Calculus formula

$$\int_a^b f'(x)\, dx = f(b) - f(a).$$

Conservative fields have other remarkable properties we will study as we go along. For example, saying that $\mathbf{F}$ is conservative on $D$ is equivalent to saying that the integral of $\mathbf{F}$ around every closed path in $D$ is zero. Naturally, certain conditions on the curves, fields, and domains must be satisfied for Equation (1) to be valid. We discuss these conditions below.

## Assumptions in Effect from Now On: Connectivity and Simple Connectivity

We assume that all curves are **piecewise smooth**, that is, made up of finitely many smooth pieces connected end to end, as discussed in Section 13.1. We also assume that

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

the components of $\mathbf{F}$ have continuous first partial derivatives. When $\mathbf{F} = \nabla f$, this continuity requirement guarantees that the mixed second derivatives of the potential function $f$ are equal, a result we will find revealing in studying conservative fields $\mathbf{F}$.

We assume $D$ to be an *open* region in space. This means that every point in $D$ is the center of an open ball that lies entirely in $D$. We assume $D$ to be **connected**, which in an open region means that every point can be connected to every other point by a smooth curve that lies in the region. Finally, we assume $D$ is **simply connected**, which means every loop in $D$ can be contracted to a point in $D$ without ever leaving $D$. (If $D$ consisted of space with a line segment removed, for example, $D$ would not be simply connected. There would be no way to contract a loop around the line segment to a point without leaving $D$.)

Connectivity and simple connectivity are not the same, and neither implies the other. Think of connected regions as being in "one piece" and simply connected regions as not having any "holes that catch loops." All of space itself is both connected and simply connected. Some of the results in this chapter can fail to hold if applied to domains where these conditions do not hold. For example, the component test for conservative fields, given later in this section, is not valid on domains that are not simply connected.

## Line Integrals in Conservative Fields

The following result provides a convenient way to evaluate a line integral in a conservative field. The result establishes that the value of the integral depends only on the endpoints and not on the specific path joining them.

**THEOREM 1 The Fundamental Theorem of Line Integrals**

1. Let $\mathbf{F} = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$ be a vector field whose components are continuous throughout an open connected region $D$ in space. Then there exists a differentiable function $f$ such that

$$\mathbf{F} = \nabla f = \frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j} + \frac{\partial f}{\partial z}\mathbf{k}$$

if and only if for all points $A$ and $B$ in $D$ the value of $\int_A^B \mathbf{F} \cdot d\mathbf{r}$ is independent of the path joining $A$ to $B$ in $D$.

2. If the integral is independent of the path from $A$ to $B$, its value is

$$\int_A^B \mathbf{F} \cdot d\mathbf{r} = f(B) - f(A).$$

**Proof that $\mathbf{F} = \nabla f$ Implies Path Independence of the Integral** Suppose that $A$ and $B$ are two points in $D$ and that $C$: $\mathbf{r}(t) = g(t)\mathbf{i} + h(t)\mathbf{j} + k(t)\mathbf{k}$, $a \le t \le b$, is a smooth curve in $D$ joining $A$ and $B$. Along the curve, $f$ is a differentiable function of $t$ and

$$\frac{df}{dt} = \frac{\partial f}{\partial x}\frac{dx}{dt} + \frac{\partial f}{\partial y}\frac{dy}{dt} + \frac{\partial f}{\partial z}\frac{dz}{dt}$$

Chain Rule with $x = g(t)$, $y = h(t)$, $z = k(t)$

$$= \nabla f \cdot \left(\frac{dx}{dt}\mathbf{i} + \frac{dy}{dt}\mathbf{j} + \frac{dz}{dt}\mathbf{k}\right) = \nabla f \cdot \frac{d\mathbf{r}}{dt} = \mathbf{F} \cdot \frac{d\mathbf{r}}{dt}.$$

Because $\mathbf{F} = \nabla f$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Therefore,

$$\int_C \mathbf{F} \cdot d\mathbf{r} = \int_{t=a}^{t=b} \mathbf{F} \cdot \frac{d\mathbf{r}}{dt}\, dt = \int_a^b \frac{df}{dt}\, dt$$

$$= f(g(t), h(t), k(t))\Big]_a^b = f(B) - f(A).$$

Thus, the value of the work integral depends only on the values of $f$ at $A$ and $B$ and not on the path in between. This proves Part 2 as well as the forward implication in Part 1. We omit the more technical proof of the reverse implication. ■

**EXAMPLE 1** Finding Work Done by a Conservative Field

Find the work done by the conservative field

$$\mathbf{F} = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k} = \nabla(xyz)$$

along any smooth curve $C$ joining the point $A(-1, 3, 9)$ to $B(1, 6, -4)$.

**Solution** With $f(x, y, z) = xyz$, we have

$$\int_A^B \mathbf{F} \cdot d\mathbf{r} = \int_A^B \nabla f \cdot d\mathbf{r} \qquad \mathbf{F} = \nabla f$$

$$= f(B) - f(A) \qquad \text{Fundamental Theorem, Part 2}$$

$$= xyz\big|_{(1,6,-4)} - xyz\big|_{(-1,3,9)}$$

$$= (1)(6)(-4) - (-1)(3)(9)$$

$$= -24 + 27 = 3.$$

■

**THEOREM 2 Closed-Loop Property of Conservative Fields**

The following statements are equivalent.

1. $\int \mathbf{F} \cdot d\mathbf{r} = 0$ around every closed loop in $D$.
2. The field $\mathbf{F}$ is conservative on $D$.

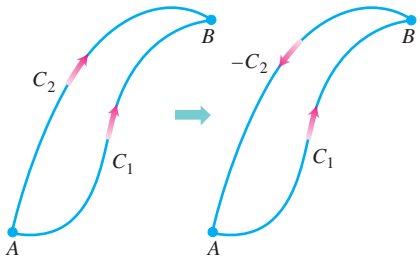

**FIGURE 16.22** If we have two paths from $A$ to $B$, one of them can be reversed to make a loop.

**Proof that Part 1 ⇒ Part 2** We want to show that for any two points $A$ and $B$ in $D$, the integral of $\mathbf{F} \cdot d\mathbf{r}$ has the same value over any two paths $C_1$ and $C_2$ from $A$ to $B$. We reverse the direction on $C_2$ to make a path $-C_2$ from $B$ to $A$ (Figure 16.22). Together, $C_1$ and $-C_2$ make a closed loop $C$, and

$$\int_{C_1} \mathbf{F} \cdot d\mathbf{r} - \int_{C_2} \mathbf{F} \cdot d\mathbf{r} = \int_{C_1} \mathbf{F} \cdot d\mathbf{r} + \int_{-C_2} \mathbf{F} \cdot d\mathbf{r} = \int_C \mathbf{F} \cdot d\mathbf{r} = 0.$$

Thus, the integrals over $C_1$ and $C_2$ give the same value. Note that the definition of line integral shows that changing the direction along a curve reverses the sign of the line integral.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

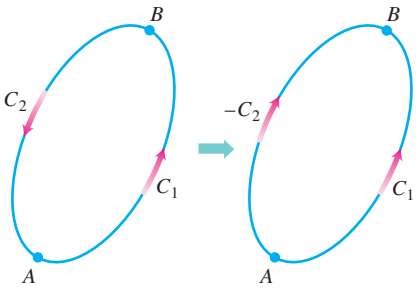

**FIGURE 16.23** If $A$ and $B$ lie on a loop, we can reverse part of the loop to make two paths from $A$ to $B$.

**Proof that Part 2 $\Rightarrow$ Part 1** We want to show that the integral of $\mathbf{F} \cdot d\mathbf{r}$ is zero over any closed loop $C$. We pick two points $A$ and $B$ on $C$ and use them to break $C$ into two pieces: $C_1$ from $A$ to $B$ followed by $C_2$ from $B$ back to $A$ (Figure 16.23). Then

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \int_{C_1} \mathbf{F} \cdot d\mathbf{r} + \int_{C_2} \mathbf{F} \cdot d\mathbf{r} = \int_A^B \mathbf{F} \cdot d\mathbf{r} - \int_A^B \mathbf{F} \cdot d\mathbf{r} = 0. \quad \blacksquare$$

The following diagram summarizes the results of Theorems 1 and 2.

$$\mathbf{F} = \nabla f \text{ on } D \quad \overset{\text{Theorem 1}}{\Leftrightarrow} \quad \mathbf{F} \text{ conservative on } D \quad \overset{\text{Theorem 2}}{\Leftrightarrow} \quad \oint_C \mathbf{F} \cdot d\mathbf{r} = 0 \text{ over any closed path in } D$$

Now that we see how convenient it is to evaluate line integrals in conservative fields, two questions remain.

1. How do we know when a given field $\mathbf{F}$ is conservative?
2. If $\mathbf{F}$ is in fact conservative, how do we find a potential function $f$ (so that $\mathbf{F} = \nabla f$)?

## Finding Potentials for Conservative Fields

The test for being conservative is the following. Keep in mind our assumption that the domain of $\mathbf{F}$ is connected and simply connected.

**Component Test for Conservative Fields**
Let $\mathbf{F} = M(x, y, z)\mathbf{i} + N(x, y, z)\mathbf{j} + P(x, y, z)\mathbf{k}$ be a field whose component functions have continuous first partial derivatives. Then, $\mathbf{F}$ is conservative if and only if

$$\frac{\partial P}{\partial y} = \frac{\partial N}{\partial z}, \qquad \frac{\partial M}{\partial z} = \frac{\partial P}{\partial x}, \qquad \text{and} \qquad \frac{\partial N}{\partial x} = \frac{\partial M}{\partial y}. \tag{2}$$

**Proof that Equations (2) hold if F is conservative** There is a potential function $f$ such that

$$\mathbf{F} = M\mathbf{i} + N\mathbf{j} + P\mathbf{k} = \frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j} + \frac{\partial f}{\partial z}\mathbf{k}.$$

Hence,

$$\frac{\partial P}{\partial y} = \frac{\partial}{\partial y}\left(\frac{\partial f}{\partial z}\right) = \frac{\partial^2 f}{\partial y\, \partial z} = \frac{\partial^2 f}{\partial z\, \partial y} = \frac{\partial}{\partial z}\left(\frac{\partial f}{\partial y}\right) = \frac{\partial N}{\partial z}.$$

Continuity implies that the mixed partial derivatives are equal.

The others in Equations (2) are proved similarly. $\blacksquare$

The second half of the proof, that Equations (2) imply that $\mathbf{F}$ is conservative, is a consequence of Stokes' Theorem, taken up in Section 16.7, and requires our assumption that the domain of $\mathbf{F}$ be simply connected.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Once we know that $\mathbf{F}$ is conservative, we usually want to find a potential function for $\mathbf{F}$. This requires solving the equation $\nabla f = \mathbf{F}$ or

$$\frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j} + \frac{\partial f}{\partial z}\mathbf{k} = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$$

for $f$. We accomplish this by integrating the three equations

$$\frac{\partial f}{\partial x} = M, \qquad \frac{\partial f}{\partial y} = N, \qquad \frac{\partial f}{\partial z} = P,$$

as illustrated in the next example.

**EXAMPLE 2** Finding a Potential Function

Show that $\mathbf{F} = (e^x \cos y + yz)\mathbf{i} + (xz - e^x \sin y)\mathbf{j} + (xy + z)\mathbf{k}$ is conservative and find a potential function for it.

**Solution** We apply the test in Equations (2) to

$$M = e^x \cos y + yz, \qquad N = xz - e^x \sin y, \qquad P = xy + z$$

and calculate

$$\frac{\partial P}{\partial y} = x = \frac{\partial N}{\partial z}, \qquad \frac{\partial M}{\partial z} = y = \frac{\partial P}{\partial x}, \qquad \frac{\partial N}{\partial x} = -e^x \sin y + z = \frac{\partial M}{\partial y}.$$

Together, these equalities tell us that there is a function $f$ with $\nabla f = \mathbf{F}$.

We find $f$ by integrating the equations

$$\frac{\partial f}{\partial x} = e^x \cos y + yz, \qquad \frac{\partial f}{\partial y} = xz - e^x \sin y, \qquad \frac{\partial f}{\partial z} = xy + z. \tag{3}$$

We integrate the first equation with respect to $x$, holding $y$ and $z$ fixed, to get

$$f(x, y, z) = e^x \cos y + xyz + g(y, z).$$

We write the constant of integration as a function of $y$ and $z$ because its value may change if $y$ and $z$ change. We then calculate $\partial f/\partial y$ from this equation and match it with the expression for $\partial f/\partial y$ in Equations (3). This gives

$$-e^x \sin y + xz + \frac{\partial g}{\partial y} = xz - e^x \sin y,$$

so $\partial g/\partial y = 0$. Therefore, $g$ is a function of $z$ alone, and

$$f(x, y, z) = e^x \cos y + xyz + h(z).$$

We now calculate $\partial f/\partial z$ from this equation and match it to the formula for $\partial f/\partial z$ in Equations (3). This gives

$$xy + \frac{dh}{dz} = xy + z, \qquad \text{or} \qquad \frac{dh}{dz} = z,$$

so

$$h(z) = \frac{z^2}{2} + C.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Hence,

$$f(x, y, z) = e^x \cos y + xyz + \frac{z^2}{2} + C.$$

We have infinitely many potential functions of $\mathbf{F}$, one for each value of $C$. ■

**EXAMPLE 3** Showing That a Field Is Not Conservative

Show that $\mathbf{F} = (2x - 3)\mathbf{i} - z\mathbf{j} + (\cos z)\mathbf{k}$ is not conservative.

**Solution** We apply the component test in Equations (2) and find immediately that

$$\frac{\partial P}{\partial y} = \frac{\partial}{\partial y}(\cos z) = 0, \qquad \frac{\partial N}{\partial z} = \frac{\partial}{\partial z}(-z) = -1.$$

The two are unequal, so $\mathbf{F}$ is not conservative. No further testing is required. ■

## Exact Differential Forms

As we see in the next section and again later on, it is often convenient to express work and circulation integrals in the "differential" form

$$\int_A^B M\,dx + N\,dy + P\,dz$$

mentioned in Section 16.2. Such integrals are relatively easy to evaluate if $M\,dx + N\,dy + P\,dz$ is the total differential of a function $f$. For then

$$\begin{aligned}\int_A^B M\,dx + N\,dy + P\,dz &= \int_A^B \frac{\partial f}{\partial x}dx + \frac{\partial f}{\partial y}dy + \frac{\partial f}{\partial z}dz \\ &= \int_A^B \nabla f \cdot d\mathbf{r} \\ &= f(B) - f(A). \qquad \text{Theorem 1}\end{aligned}$$

Thus,

$$\int_A^B df = f(B) - f(A),$$

just as with differentiable functions of a single variable.

**DEFINITIONS** **Exact Differential Form**

Any expression $M(x, y, z)\,dx + N(x, y, z)\,dy + P(x, y, z)\,dz$ is a **differential form**. A differential form is **exact** on a domain $D$ in space if

$$M\,dx + N\,dy + P\,dz = \frac{\partial f}{\partial x}dx + \frac{\partial f}{\partial y}dy + \frac{\partial f}{\partial z}dz = df$$

for some scalar function $f$ throughout $D$.

Notice that if $M\,dx + N\,dy + P\,dz = df$ on $D$, then $\mathbf{F} = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$ is the gradient field of $f$ on $D$. Conversely, if $\mathbf{F} = \nabla f$, then the form $M\,dx + N\,dy + P\,dz$ is exact. The test for the form's being exact is therefore the same as the test for $\mathbf{F}$'s being conservative.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Component Test for Exactness of $M\,dx + N\,dy + P\,dz$**

The differential form $M\,dx + N\,dy + P\,dz$ is exact if and only if

$$\frac{\partial P}{\partial y} = \frac{\partial N}{\partial z}, \qquad \frac{\partial M}{\partial z} = \frac{\partial P}{\partial x}, \qquad \text{and} \qquad \frac{\partial N}{\partial x} = \frac{\partial M}{\partial y}.$$

This is equivalent to saying that the field $\mathbf{F} = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$ is conservative.

**EXAMPLE 4** Showing That a Differential Form Is Exact

Show that $y\,dx + x\,dy + 4\,dz$ is exact and evaluate the integral

$$\int_{(1,1,1)}^{(2,3,-1)} y\,dx + x\,dy + 4\,dz$$

over the line segment from $(1, 1, 1)$ to $(2, 3, -1)$.

**Solution** We let $M = y, N = x, P = 4$ and apply the Test for Exactness:

$$\frac{\partial P}{\partial y} = 0 = \frac{\partial N}{\partial z}, \qquad \frac{\partial M}{\partial z} = 0 = \frac{\partial P}{\partial x}, \qquad \frac{\partial N}{\partial x} = 1 = \frac{\partial M}{\partial y}.$$

These equalities tell us that $y\,dx + x\,dy + 4\,dz$ is exact, so

$$y\,dx + x\,dy + 4\,dz = df$$

for some function $f$, and the integral's value is $f(2, 3, -1) - f(1, 1, 1)$.

We find $f$ up to a constant by integrating the equations

$$\frac{\partial f}{\partial x} = y, \qquad \frac{\partial f}{\partial y} = x, \qquad \frac{\partial f}{\partial z} = 4. \tag{4}$$

From the first equation we get

$$f(x, y, z) = xy + g(y, z).$$

The second equation tells us that

$$\frac{\partial f}{\partial y} = x + \frac{\partial g}{\partial y} = x, \qquad \text{or} \qquad \frac{\partial g}{\partial y} = 0.$$

Hence, $g$ is a function of $z$ alone, and

$$f(x, y, z) = xy + h(z).$$

The third of Equations (4) tells us that

$$\frac{\partial f}{\partial z} = 0 + \frac{dh}{dz} = 4, \qquad \text{or} \qquad h(z) = 4z + C.$$

Therefore,

$$f(x, y, z) = xy + 4z + C.$$

The value of the integral is

$$f(2, 3, -1) - f(1, 1, 1) = 2 + C - (5 + C) = -3.$$

■

# EXERCISES 16.3

## Testing for Conservative Fields

Which fields in Exercises 1–6 are conservative, and which are not?

1. $\mathbf{F} = yz\mathbf{i} + xz\mathbf{j} + xy\mathbf{k}$
2. $\mathbf{F} = (y \sin z)\mathbf{i} + (x \sin z)\mathbf{j} + (xy \cos z)\mathbf{k}$
3. $\mathbf{F} = y\mathbf{i} + (x + z)\mathbf{j} - y\mathbf{k}$
4. $\mathbf{F} = -y\mathbf{i} + x\mathbf{j}$
5. $\mathbf{F} = (z + y)\mathbf{i} + z\mathbf{j} + (y + x)\mathbf{k}$
6. $\mathbf{F} = (e^x \cos y)\mathbf{i} - (e^x \sin y)\mathbf{j} + z\mathbf{k}$

## Finding Potential Functions

In Exercises 7–12, find a potential function $f$ for the field $\mathbf{F}$.

7. $\mathbf{F} = 2x\mathbf{i} + 3y\mathbf{j} + 4z\mathbf{k}$
8. $\mathbf{F} = (y + z)\mathbf{i} + (x + z)\mathbf{j} + (x + y)\mathbf{k}$
9. $\mathbf{F} = e^{y+2z}(\mathbf{i} + x\mathbf{j} + 2x\mathbf{k})$
10. $\mathbf{F} = (y \sin z)\mathbf{i} + (x \sin z)\mathbf{j} + (xy \cos z)\mathbf{k}$
11. $\mathbf{F} = (\ln x + \sec^2(x + y))\mathbf{i} + \left(\sec^2(x + y) + \dfrac{y}{y^2 + z^2}\right)\mathbf{j} + \dfrac{z}{y^2 + z^2}\mathbf{k}$
12. $\mathbf{F} = \dfrac{y}{1 + x^2y^2}\mathbf{i} + \left(\dfrac{x}{1 + x^2y^2} + \dfrac{z}{\sqrt{1 - y^2z^2}}\right)\mathbf{j} + \left(\dfrac{y}{\sqrt{1 - y^2z^2}} + \dfrac{1}{z}\right)\mathbf{k}$

## Evaluating Line Integrals

In Exercises 13–17, show that the differential forms in the integrals are exact. Then evaluate the integrals.

13. $\displaystyle\int_{(0,0,0)}^{(2,3,-6)} 2x\,dx + 2y\,dy + 2z\,dz$
14. $\displaystyle\int_{(1,1,2)}^{(3,5,0)} yz\,dx + xz\,dy + xy\,dz$
15. $\displaystyle\int_{(0,0,0)}^{(1,2,3)} 2xy\,dx + (x^2 - z^2)\,dy - 2yz\,dz$
16. $\displaystyle\int_{(0,0,0)}^{(3,3,1)} 2x\,dx - y^2\,dy - \frac{4}{1 + z^2}\,dz$
17. $\displaystyle\int_{(1,0,0)}^{(0,1,1)} \sin y \cos x\,dx + \cos y \sin x\,dy + dz$

Although they are not defined on all of space $R^3$, the fields associated with Exercises 18–22 are simply connected and the Component Test can be used to show they are conservative. Find a potential function for each field and evaluate the integrals as in Example 4.

18. $\displaystyle\int_{(0,2,1)}^{(1,\pi/2,2)} 2\cos y\,dx + \left(\frac{1}{y} - 2x \sin y\right)dy + \frac{1}{z}\,dz$
19. $\displaystyle\int_{(1,1,1)}^{(1,2,3)} 3x^2\,dx + \frac{z^2}{y}\,dy + 2z \ln y\,dz$
20. $\displaystyle\int_{(1,2,1)}^{(2,1,1)} (2x \ln y - yz)\,dx + \left(\frac{x^2}{y} - xz\right)dy - xy\,dz$
21. $\displaystyle\int_{(1,1,1)}^{(2,2,2)} \frac{1}{y}\,dx + \left(\frac{1}{z} - \frac{x}{y^2}\right)dy - \frac{y}{z^2}\,dz$
22. $\displaystyle\int_{(-1,-1,-1)}^{(2,2,2)} \frac{2x\,dx + 2y\,dy + 2z\,dz}{x^2 + y^2 + z^2}$
23. **Revisiting Example 4** Evaluate the integral

$$\int_{(1,1,1)}^{(2,3,-1)} y\,dx + x\,dy + 4\,dz$$

from Example 4 by finding parametric equations for the line segment from (1, 1, 1) to (2, 3, −1) and evaluating the line integral of $\mathbf{F} = y\mathbf{i} + x\mathbf{j} + 4\mathbf{k}$ along the segment. Since $\mathbf{F}$ is conservative, the integral is independent of the path.

24. Evaluate

$$\int_C x^2\,dx + yz\,dy + (y^2/2)\,dz$$

along the line segment $C$ joining (0, 0, 0) to (0, 3, 4).

## Theory, Applications, and Examples

**Independence of path** Show that the values of the integrals in Exercises 25 and 26 do not depend on the path taken from $A$ to $B$.

25. $\displaystyle\int_A^B z^2\,dx + 2y\,dy + 2xz\,dz$
26. $\displaystyle\int_A^B \frac{x\,dx + y\,dy + z\,dz}{\sqrt{x^2 + y^2 + z^2}}$

In Exercises 27 and 28, find a potential function for $\mathbf{F}$.

27. $\mathbf{F} = \dfrac{2x}{y}\mathbf{i} + \left(\dfrac{1 - x^2}{y^2}\right)\mathbf{j}$
28. $\mathbf{F} = (e^x \ln y)\mathbf{i} + \left(\dfrac{e^x}{y} + \sin z\right)\mathbf{j} + (y \cos z)\mathbf{k}$
29. **Work along different paths** Find the work done by $\mathbf{F} = (x^2 + y)\mathbf{i} + (y^2 + x)\mathbf{j} + ze^z\mathbf{k}$ over the following paths from (1, 0, 0) to (1, 0, 1).
    a. The line segment $x = 1, y = 0, 0 \le z \le 1$
    b. The helix $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + (t/2\pi)\mathbf{k}$, $0 \le t \le 2\pi$
    c. The $x$-axis from (1, 0, 0) to (0, 0, 0) followed by the parabola $z = x^2, y = 0$ from (0, 0, 0) to (1, 0, 1)
30. **Work along different paths** Find the work done by $\mathbf{F} = e^{yz}\mathbf{i} + (xze^{yz} + z\cos y)\mathbf{j} + (xye^{yz} + \sin y)\mathbf{k}$ over the following paths from (1, 0, 1) to $(1, \pi/2, 0)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**a.** The line segment $x = 1, y = \pi t/2, z = 1 - t, 0 \le t \le 1$

**b.** The line segment from (1, 0, 1) to the origin followed by the line segment from the origin to $(1, \pi/2, 0)$

**c.** The line segment from (1, 0, 1) to (1, 0, 0), followed by the $x$-axis from (1, 0, 0) to the origin, followed by the parabola $y = \pi x^2/2, z = 0$ from there to $(1, \pi/2, 0)$

**31. Evaluating a work integral two ways** Let $\mathbf{F} = \nabla(x^3y^2)$ and let $C$ be the path in the $xy$-plane from $(-1, 1)$ to (1, 1) that consists of the line segment from $(-1, 1)$ to (0, 0) followed by the line segment from (0, 0) to (1, 1). Evaluate $\int_C \mathbf{F} \cdot d\mathbf{r}$ in two ways.

**a.** Find parametrizations for the segments that make up $C$ and evaluate the integral.

**b.** Using $f(x, y) = x^3y^2$ as a potential function for $\mathbf{F}$.

**32. Integral along different paths** Evaluate $\int_C 2x \cos y \, dx - x^2 \sin y \, dy$ along the following paths $C$ in the $xy$-plane.

**a.** The parabola $y = (x - 1)^2$ from (1, 0) to (0, 1)

**b.** The line segment from $(-1, \pi)$ to (1, 0)

**c.** The $x$-axis from $(-1, 0)$ to (1, 0)

**d.** The astroid $\mathbf{r}(t) = (\cos^3 t)\mathbf{i} + (\sin^3 t)\mathbf{j}$, $0 \le t \le 2\pi$, counterclockwise from (1, 0) back to (1, 0)

**33. a. Exact differential form** How are the constants $a$, $b$, and $c$ related if the following differential form is exact?

$$(ay^2 + 2czx)\,dx + y(bx + cz)\,dy + (ay^2 + cx^2)\,dz$$

**b. Gradient field** For what values of $b$ and $c$ will

$$\mathbf{F} = (y^2 + 2czx)\mathbf{i} + y(bx + cz)\mathbf{j} + (y^2 + cx^2)\mathbf{k}$$

be a gradient field?

**34. Gradient of a line integral** Suppose that $\mathbf{F} = \nabla f$ is a conservative vector field and

$$g(x, y, z) = \int_{(0,0,0)}^{(x,y,z)} \mathbf{F} \cdot d\mathbf{r}.$$

Show that $\nabla g = \mathbf{F}$.

**35. Path of least work** You have been asked to find the path along which a force field $\mathbf{F}$ will perform the least work in moving a particle between two locations. A quick calculation on your part shows $\mathbf{F}$ to be conservative. How should you respond? Give reasons for your answer.

**36. A revealing experiment** By experiment, you find that a force field $\mathbf{F}$ performs only half as much work in moving an object along path $C_1$ from $A$ to $B$ as it does in moving the object along path $C_2$ from $A$ to $B$. What can you conclude about $\mathbf{F}$? Give reasons for your answer.

**37. Work by a constant force** Show that the work done by a constant force field $\mathbf{F} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k}$ in moving a particle along any path from $A$ to $B$ is $W = \mathbf{F} \cdot \overrightarrow{AB}$.

**38. Gravitational field**

**a.** Find a potential function for the gravitational field

$$\mathbf{F} = -GmM\frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{(x^2 + y^2 + z^2)^{3/2}} \qquad (G, m, \text{and } M \text{ are constants}).$$

**b.** Let $P_1$ and $P_2$ be points at distance $s_1$ and $s_2$ from the origin. Show that the work done by the gravitational field in part (a) in moving a particle from $P_1$ to $P_2$ is

$$GmM\left(\frac{1}{s_2} - \frac{1}{s_1}\right).$$

# 16.4 Green's Theorem in the Plane

From Table 16.2 in Section 16.2, we know that every line integral $\int_C M\,dx + N\,dy$ can be written as a flow integral $\int_a^b \mathbf{F} \cdot \mathbf{T}\,ds$. If the integral is independent of path, so the field $\mathbf{F}$ is conservative (over a domain satisfying the basic assumptions), we can evaluate the integral easily from a potential function for the field. In this section we consider how to evaluate the integral if it is *not* associated with a conservative vector field, but is a flow or flux integral across a closed curve in the $xy$-plane. The means for doing so is a result known as Green's Theorem, which converts the line integral into a double integral over the region enclosed by the path.

We frame our discussion in terms of velocity fields of fluid flows because they are easy to picture. However, Green's Theorem applies to any vector field satisfying certain mathematical conditions. It does not depend for its validity on the field's having a particular physical interpretation.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

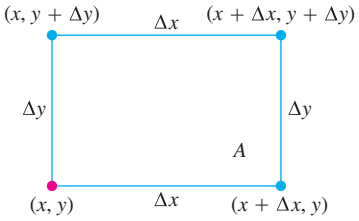

**FIGURE 16.24** The rectangle for defining the divergence (flux density) of a vector field at a point $(x, y)$.

## Divergence

We need two new ideas for Green's Theorem. The first is the idea of the *divergence* of a vector field at a point, sometimes called the *flux density* of the vector field by physicists and engineers. We obtain it in the following way.

Suppose that $\mathbf{F}(x, y) = M(x, y)\mathbf{i} + N(x, y)\mathbf{j}$ is the velocity field of a fluid flow in the plane and that the first partial derivatives of $M$ and $N$ are continuous at each point of a region $R$. Let $(x, y)$ be a point in $R$ and let $A$ be a small rectangle with one corner at $(x, y)$ that, along with its interior, lies entirely in $R$ (Figure 16.24). The sides of the rectangle, parallel to the coordinate axes, have lengths of $\Delta x$ and $\Delta y$. The rate at which fluid leaves the rectangle across the bottom edge is approximately

$$\mathbf{F}(x, y) \cdot (-\mathbf{j})\, \Delta x = -N(x, y)\Delta x.$$

This is the scalar component of the velocity at $(x, y)$ in the direction of the outward normal times the length of the segment. If the velocity is in meters per second, for example, the exit rate will be in meters per second times meters or square meters per second. The rates at which the fluid crosses the other three sides in the directions of their outward normals can be estimated in a similar way. All told, we have

| | | |
|---|---|---|
| **Exit Rates:** | Top: | $\mathbf{F}(x, y + \Delta y) \cdot \mathbf{j}\, \Delta x = N(x, y + \Delta y)\Delta x$ |
| | Bottom: | $\mathbf{F}(x, y) \cdot (-\mathbf{j})\, \Delta x = -N(x, y)\Delta x$ |
| | Right: | $\mathbf{F}(x + \Delta x, y) \cdot \mathbf{i}\, \Delta y = M(x + \Delta x, y)\Delta y$ |
| | Left: | $\mathbf{F}(x, y) \cdot (-\mathbf{i})\, \Delta y = -M(x, y)\Delta y.$ |

Combining opposite pairs gives

$$\text{Top and bottom:} \quad (N(x, y + \Delta y) - N(x, y))\Delta x \approx \left(\frac{\partial N}{\partial y}\Delta y\right)\Delta x$$

$$\text{Right and left:} \quad (M(x + \Delta x, y) - M(x, y))\Delta y \approx \left(\frac{\partial M}{\partial x}\Delta x\right)\Delta y.$$

Adding these last two equations gives

$$\text{Flux across rectangle boundary} \approx \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y}\right)\Delta x \Delta y.$$

We now divide by $\Delta x \Delta y$ to estimate the total flux per unit area or flux density for the rectangle:

$$\frac{\text{Flux across rectangle boundary}}{\text{rectangle area}} \approx \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y}\right).$$

Finally, we let $\Delta x$ and $\Delta y$ approach zero to define what we call the *flux density* of $\mathbf{F}$ at the point $(x, y)$. In mathematics, we call the flux density the *divergence* of $\mathbf{F}$. The symbol for it is div $\mathbf{F}$, pronounced "divergence of $\mathbf{F}$" or "div $\mathbf{F}$."

**DEFINITION Divergence (Flux Density)**

The **divergence (flux density)** of a vector field $\mathbf{F} = M\mathbf{i} + N\mathbf{j}$ at the point $(x, y)$ is

$$\text{div } \mathbf{F} = \frac{\partial M}{\partial x} + \frac{\partial N}{\partial y}. \tag{1}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

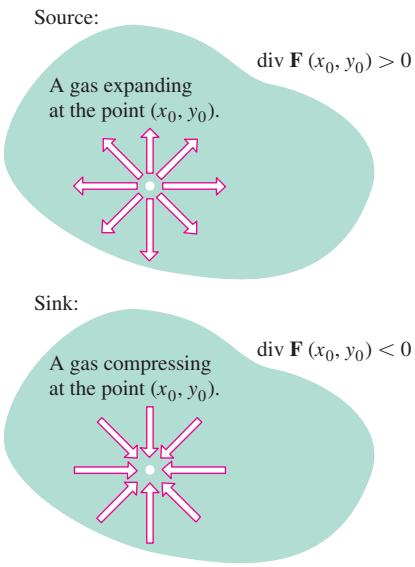

**FIGURE 16.25** If a gas is expanding at a point $(x_0, y_0)$, the lines of flow have positive divergence; if the gas is compressing, the divergence is negative.

Intuitively, if a gas is expanding at the point $(x_0, y_0)$, the lines of flow would diverge there (hence the name) and, since the gas would be flowing out of a small rectangle about $(x_0, y_0)$ the divergence of $\mathbf{F}$ at $(x_0, y_0)$ would be positive. If the gas were compressing instead of expanding, the divergence would be negative (see Figure 16.25).

**EXAMPLE 1** Finding Divergence

Find the divergence of $\mathbf{F}(x, y) = (x^2 - y)\mathbf{i} + (xy - y^2)\mathbf{j}$.

**Solution** We use the formula in Equation (1):

$$\begin{aligned}\text{div } \mathbf{F} &= \frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} = \frac{\partial}{\partial x}(x^2 - y) + \frac{\partial}{\partial y}(xy - y^2) \\ &= 2x + x - 2y = 3x - 2y.\end{aligned}$$

■

## Spin Around an Axis: The k-Component of Curl

The second idea we need for Green's Theorem has to do with measuring how a paddle wheel spins at a point in a fluid flowing in a plane region. This idea gives some sense of how the fluid is circulating around axes located at different points and perpendicular to the region. Physicists sometimes refer to this as the *circulation density* of a vector field $\mathbf{F}$ at a point. To obtain it, we return to the velocity field

$$\mathbf{F}(x, y) = M(x, y)\mathbf{i} + N(x, y)\mathbf{j}$$

and the rectangle $A$. The rectangle is redrawn here as Figure 16.26.

The counterclockwise circulation of $\mathbf{F}$ around the boundary of $A$ is the sum of flow rates along the sides. For the bottom edge, the flow rate is approximately

$$\mathbf{F}(x, y) \cdot \mathbf{i}\, \Delta x = M(x, y)\Delta x.$$

This is the scalar component of the velocity $\mathbf{F}(x, y)$ in the direction of the tangent vector $\mathbf{i}$ times the length of the segment. The rates of flow along the other sides in the counterclockwise direction are expressed in a similar way. In all, we have

| | |
|---|---|
| Top: | $\mathbf{F}(x, y + \Delta y) \cdot (-\mathbf{i})\, \Delta x = -M(x, y + \Delta y)\Delta x$ |
| Bottom: | $\mathbf{F}(x, y) \cdot \mathbf{i}\, \Delta x = M(x, y)\Delta x$ |
| Right: | $\mathbf{F}(x + \Delta x, y) \cdot \mathbf{j}\, \Delta y = N(x + \Delta x, y)\Delta y$ |
| Left: | $\mathbf{F}(x, y) \cdot (-\mathbf{j})\, \Delta y = -N(x, y)\Delta y.$ |

We add opposite pairs to get

Top and bottom:

$$-(M(x, y + \Delta y) - M(x, y))\Delta x \approx -\left(\frac{\partial M}{\partial y}\Delta y\right)\Delta x$$

Right and left:

$$(N(x + \Delta x, y) - N(x, y))\Delta y \approx \left(\frac{\partial N}{\partial x}\Delta x\right)\Delta y.$$

Adding these last two equations and dividing by $\Delta x \Delta y$ gives an estimate of the circulation density for the rectangle:

$$\frac{\text{Circulation around rectangle}}{\text{rectangle area}} \approx \frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}.$$

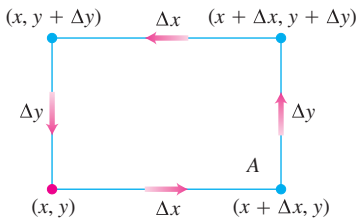

**FIGURE 16.26** The rectangle for defining the curl (circulation density) of a vector field at a point $(x, y)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

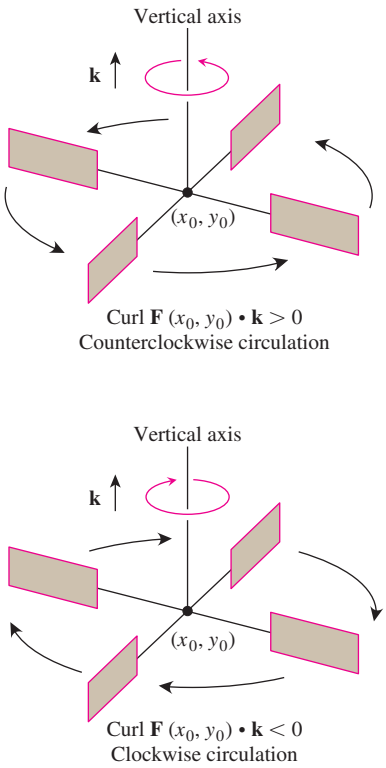

**FIGURE 16.27** In the flow of an incompressible fluid over a plane region, the **k**-component of the curl measures the rate of the fluid's rotation at a point. The **k**-component of the curl is positive at points where the rotation is counterclockwise and negative where the rotation is clockwise.

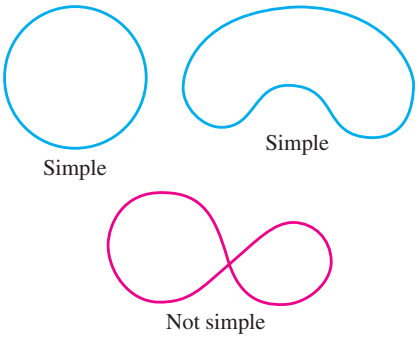

**FIGURE 16.28** In proving Green's Theorem, we distinguish between two kinds of closed curves, simple and not simple. Simple curves do not cross themselves. A circle is simple but a figure 8 is not.

We let $\Delta x$ and $\Delta y$ approach zero to define what we call the *circulation density* of $\mathbf{F}$ at the point $(x, y)$.

The positive orientation of the circulation density for the plane is the *counterclockwise* rotation around the vertical axis, looking downward on the $xy$-plane from the tip of the (vertical) unit vector $\mathbf{k}$ (Figure 16.27). The circulation value is actually the **k**-component of a more general circulation vector we define in Section 16.7, called the *curl* of the vector field $\mathbf{F}$. For Green's Theorem, we need only this **k**-component.

**DEFINITION k-Component of Curl (Circulation Density)**

**The k-component of the curl (circulation density)** of a vector field $\mathbf{F} = M\mathbf{i} + N\mathbf{j}$ at the point $(x, y)$ is the scalar

$$(\text{curl } \mathbf{F}) \cdot \mathbf{k} = \frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}. \tag{2}$$

If water is moving about a region in the $xy$-plane in a thin layer, then the **k**-component of the circulation, or curl, at a point $(x_0, y_0)$ gives a way to measure how fast and in what direction a small paddle wheel will spin if it is put into the water at $(x_0, y_0)$ with its axis perpendicular to the plane, parallel to $\mathbf{k}$ (Figure 16.27).

**EXAMPLE 2** Finding the **k**-Component of the Curl

Find the **k**-component of the curl for the vector field

$$\mathbf{F}(x, y) = (x^2 - y)\mathbf{i} + (xy - y^2)\mathbf{j}.$$

**Solution** We use the formula in Equation (2):

$$(\text{curl } \mathbf{F}) \cdot \mathbf{k} = \frac{\partial N}{\partial x} - \frac{\partial M}{\partial y} = \frac{\partial}{\partial x}(xy - y^2) - \frac{\partial}{\partial y}(x^2 - y) = y + 1. \quad \blacksquare$$

## Two Forms for Green's Theorem

In one form, Green's Theorem says that under suitable conditions the outward flux of a vector field across a simple closed curve in the plane (Figure 16.28) equals the double integral of the divergence of the field over the region enclosed by the curve. Recall the formulas for flux in Equations (3) and (4) in Section 16.2.

**THEOREM 3 Green's Theorem (Flux-Divergence or Normal Form)**

The outward flux of a field $\mathbf{F} = M\mathbf{i} + N\mathbf{j}$ across a simple closed curve $C$ equals the double integral of div $\mathbf{F}$ over the region $R$ enclosed by $C$.

$$\underbrace{\oint_C \mathbf{F} \cdot \mathbf{n}\, ds}_{\text{Outward flux}} = \oint_C M\, dy - N\, dx = \underbrace{\iint_R \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y}\right) dx\, dy}_{\text{Divergence integral}} \tag{3}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

In another form, Green's Theorem says that the counterclockwise circulation of a vector field around a simple closed curve is the double integral of the **k**-component of the curl of the field over the region enclosed by the curve. Recall the defining Equation (2) for circulation in Section 16.2.

**THEOREM 4 Green's Theorem (Circulation-Curl or Tangential Form)**

The counterclockwise circulation of a field $\mathbf{F} = M\mathbf{i} + N\mathbf{j}$ around a simple closed curve $C$ in the plane equals the double integral of $(\text{curl } \mathbf{F}) \cdot \mathbf{k}$ over the region $R$ enclosed by $C$.

$$\underbrace{\oint_C \mathbf{F} \cdot \mathbf{T}\, ds = \oint_C M\, dx + N\, dy}_{\text{Counterclockwise circulation}} = \underbrace{\iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dx\, dy}_{\text{Curl integral}} \tag{4}$$

The two forms of Green's Theorem are equivalent. Applying Equation (3) to the field $\mathbf{G}_1 = N\mathbf{i} - M\mathbf{j}$ gives Equation (4), and applying Equation (4) to $\mathbf{G}_2 = -N\mathbf{i} + M\mathbf{j}$ gives Equation (3).

## Mathematical Assumptions

We need two kinds of assumptions for Green's Theorem to hold. First, we need conditions on $M$ and $N$ to ensure the existence of the integrals. The usual assumptions are that $M$, $N$, and their first partial derivatives are continuous at every point of some open region containing $C$ and $R$. Second, we need geometric conditions on the curve $C$. It must be simple, closed, and made up of pieces along which we can integrate $M$ and $N$. The usual assumptions are that $C$ is piecewise smooth. The proof we give for Green's Theorem, however, assumes things about the shape of $R$ as well. You can find proofs that are less restrictive in more advanced texts. First let's look at examples.

**EXAMPLE 3** Supporting Green's Theorem

Verify both forms of Green's Theorem for the field

$$\mathbf{F}(x, y) = (x - y)\mathbf{i} + x\mathbf{j}$$

and the region $R$ bounded by the unit circle

$$C: \quad \mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j}, \qquad 0 \le t \le 2\pi.$$

**Solution** We have

$$M = \cos t - \sin t, \qquad dx = d(\cos t) = -\sin t\, dt,$$

$$N = \cos t, \qquad dy = d(\sin t) = \cos t\, dt,$$

$$\frac{\partial M}{\partial x} = 1, \qquad \frac{\partial M}{\partial y} = -1, \qquad \frac{\partial N}{\partial x} = 1, \qquad \frac{\partial N}{\partial y} = 0.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The two sides of Equation (3) are

$$\oint_C M\,dy - N\,dx = \int_{t=0}^{t=2\pi} (\cos t - \sin t)(\cos t\,dt) - (\cos t)(-\sin t\,dt)$$

$$= \int_0^{2\pi} \cos^2 t\,dt = \pi$$

$$\iint_R \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y}\right) dx\,dy = \iint_R (1 + 0)\,dx\,dy$$

$$= \iint_R dx\,dy = \text{area inside the unit circle} = \pi.$$

The two sides of Equation (4) are

$$\oint_C M\,dx + N\,dy = \int_{t=0}^{t=2\pi} (\cos t - \sin t)(-\sin t\,dt) + (\cos t)(\cos t\,dt)$$

$$= \int_0^{2\pi} (-\sin t \cos t + 1)\,dt = 2\pi$$

$$\iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dx\,dy = \iint_R (1 - (-1))\,dx\,dy = 2\iint_R dx\,dy = 2\pi.$$ ■

## Using Green's Theorem to Evaluate Line Integrals

If we construct a closed curve $C$ by piecing a number of different curves end to end, the process of evaluating a line integral over $C$ can be lengthy because there are so many different integrals to evaluate. If $C$ bounds a region $R$ to which Green's Theorem applies, however, we can use Green's Theorem to change the line integral around $C$ into one double integral over $R$.

**EXAMPLE 4** Evaluating a Line Integral Using Green's Theorem

Evaluate the integral

$$\oint_C xy\,dy - y^2\,dx,$$

where $C$ is the square cut from the first quadrant by the lines $x = 1$ and $y = 1$.

**Solution** We can use either form of Green's Theorem to change the line integral into a double integral over the square.

1. *With the Normal Form Equation* (3): Taking $M = xy$, $N = y^2$, and $C$ and $R$ as the square's boundary and interior gives

$$\oint_C xy\,dy - y^2\,dx = \iint_R (y + 2y)\,dx\,dy = \int_0^1 \int_0^1 3y\,dx\,dy$$

$$= \int_0^1 \left[3xy\right]_{x=0}^{x=1} dy = \int_0^1 3y\,dy = \frac{3}{2}y^2\Big]_0^1 = \frac{3}{2}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

2. *With the Tangential Form Equation* (4): Taking $M = -y^2$ and $N = xy$ gives the same result:

$$\oint_C -y^2\,dx + xy\,dy = \iint_R (y - (-2y))\,dx\,dy = \frac{3}{2}.$$

■

**EXAMPLE 5** Finding Outward Flux

Calculate the outward flux of the field $\mathbf{F}(x, y) = x\mathbf{i} + y^2\mathbf{j}$ across the square bounded by the lines $x = \pm 1$ and $y = \pm 1$.

**Solution** Calculating the flux with a line integral would take four integrations, one for each side of the square. With Green's Theorem, we can change the line integral to one double integral. With $M = x$, $N = y^2$, $C$ the square, and $R$ the square's interior, we have

$$\text{Flux} = \oint_C \mathbf{F}\cdot\mathbf{n}\,ds = \oint_C M\,dy - N\,dx$$

$$= \iint_R \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y}\right) dx\,dy \qquad \text{Green's Theorem}$$

$$= \int_{-1}^{1}\int_{-1}^{1} (1 + 2y)\,dx\,dy = \int_{-1}^{1} \Big[x + 2xy\Big]_{x=-1}^{x=1} dy$$

$$= \int_{-1}^{1} (2 + 4y)\,dy = \Big[2y + 2y^2\Big]_{-1}^{1} = 4.$$

■

## Proof of Green's Theorem for Special Regions

Let $C$ be a smooth simple closed curve in the $xy$-plane with the property that lines parallel to the axes cut it in no more than two points. Let $R$ be the region enclosed by $C$ and suppose that $M$, $N$, and their first partial derivatives are continuous at every point of some open region containing $C$ and $R$. We want to prove the circulation-curl form of Green's Theorem,

$$\oint_C M\,dx + N\,dy = \iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dx\,dy. \tag{5}$$

Figure 16.29 shows $C$ made up of two directed parts:

$$C_1\colon\ y = f_1(x),\quad a \le x \le b, \qquad C_2\colon\ y = f_2(x),\quad b \ge x \ge a.$$

For any $x$ between $a$ and $b$, we can integrate $\partial M/\partial y$ with respect to $y$ from $y = f_1(x)$ to $y = f_2(x)$ and obtain

$$\int_{f_1(x)}^{f_2(x)} \frac{\partial M}{\partial y}\,dy = M(x, y)\Big]_{y=f_1(x)}^{y=f_2(x)} = M(x, f_2(x)) - M(x, f_1(x)).$$

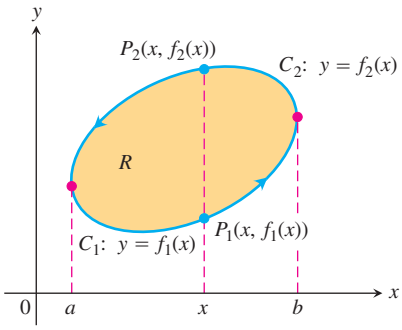

**FIGURE 16.29** The boundary curve $C$ is made up of $C_1$, the graph of $y = f_1(x)$, and $C_2$, the graph of $y = f_2(x)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We can then integrate this with respect to $x$ from $a$ to $b$:

$$\int_a^b \int_{f_1(x)}^{f_2(x)} \frac{\partial M}{\partial y}\, dy\, dx = \int_a^b [M(x, f_2(x)) - M(x, f_1(x))]\, dx$$

$$= -\int_b^a M(x, f_2(x))\, dx - \int_a^b M(x, f_1(x))\, dx$$

$$= -\int_{C_2} M\, dx - \int_{C_1} M\, dx$$

$$= -\oint_C M\, dx.$$

Therefore

$$\oint_C M\, dx = \iint_R \left(-\frac{\partial M}{\partial y}\right) dx\, dy. \tag{6}$$

Equation (6) is half the result we need for Equation (5). We derive the other half by integrating $\partial N/\partial x$ first with respect to $x$ and then with respect to $y$, as suggested by Figure 16.30. This shows the curve $C$ of Figure 16.29 decomposed into the two directed parts $C_1'$: $x = g_1(y)$, $d \geq y \geq c$ and $C_2'$: $x = g_2(y)$, $c \leq y \leq d$. The result of this double integration is

$$\oint_C N\, dy = \iint_R \frac{\partial N}{\partial x}\, dx\, dy. \tag{7}$$

Summing Equations (6) and (7) gives Equation (5). This concludes the proof. ■

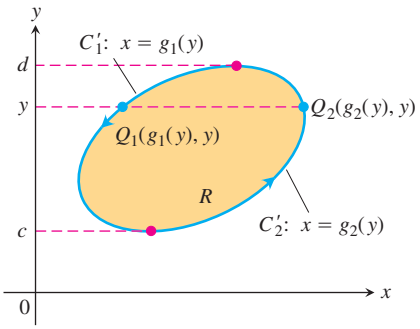

**FIGURE 16.30** The boundary curve $C$ is made up of $C_1'$, the graph of $x = g_1(y)$, and $C_2'$, the graph of $x = g_2(y)$.

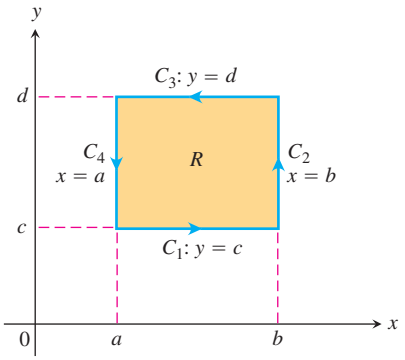

**FIGURE 16.31** To prove Green's Theorem for a rectangle, we divide the boundary into four directed line segments.

## Extending the Proof to Other Regions

The argument we just gave does not apply directly to the rectangular region in Figure 16.31 because the lines $x = a, x = b, y = c$, and $y = d$ meet the region's boundary in more than two points. If we divide the boundary $C$ into four directed line segments, however,

$$C_1\text{:}\quad y = c,\quad a \leq x \leq b, \qquad C_2\text{:}\quad x = b,\quad c \leq y \leq d$$

$$C_3\text{:}\quad y = d,\quad b \geq x \geq a, \qquad C_4\text{:}\quad x = a,\quad d \geq y \geq c,$$

we can modify the argument in the following way.

Proceeding as in the proof of Equation (7), we have

$$\int_c^d \int_a^b \frac{\partial N}{\partial x}\, dx\, dy = \int_c^d (N(b, y) - N(a, y))\, dy$$

$$= \int_c^d N(b, y)\, dy + \int_d^c N(a, y)\, dy$$

$$= \int_{C_2} N\, dy + \int_{C_4} N\, dy. \tag{8}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

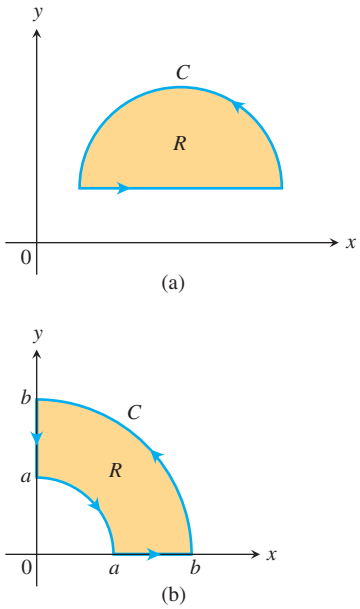

**FIGURE 16.32** Other regions to which Green's Theorem applies.

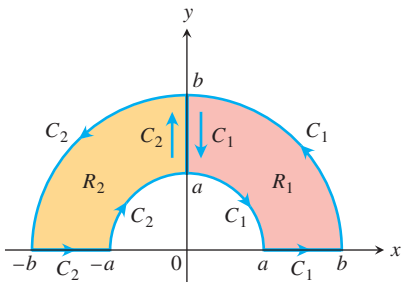

**FIGURE 16.33** A region $R$ that combines regions $R_1$ and $R_2$.

Because $y$ is constant along $C_1$ and $C_3$, $\int_{C_1} N\,dy = \int_{C_3} N\,dy = 0$, so we can add $\int_{C_1} N\,dy = \int_{C_3} N\,dy$ to the right-hand side of Equation (8) without changing the equality. Doing so, we have

$$\int_c^d \int_a^b \frac{\partial N}{\partial x}\,dx\,dy = \oint_C N\,dy. \tag{9}$$

Similarly, we can show that

$$\int_a^b \int_c^d \frac{\partial M}{\partial y}\,dy\,dx = -\oint_C M\,dx. \tag{10}$$

Subtracting Equation (10) from Equation (9), we again arrive at

$$\oint_C M\,dx + N\,dy = \iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dx\,dy.$$

Regions like those in Figure 16.32 can be handled with no greater difficulty. Equation (5) still applies. It also applies to the horseshoe-shaped region $R$ shown in Figure 16.33, as we see by putting together the regions $R_1$ and $R_2$ and their boundaries. Green's Theorem applies to $C_1$, $R_1$ and to $C_2$, $R_2$, yielding

$$\int_{C_1} M\,dx + N\,dy = \iint_{R_1} \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dx\,dy$$

$$\int_{C_2} M\,dx + N\,dy = \iint_{R_2} \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dx\,dy.$$

When we add these two equations, the line integral along the $y$-axis from $b$ to $a$ for $C_1$ cancels the integral over the same segment but in the opposite direction for $C_2$. Hence,

$$\oint_C M\,dx + N\,dy = \iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dx\,dy,$$

where $C$ consists of the two segments of the $x$-axis from $-b$ to $-a$ and from $a$ to $b$ and of the two semicircles, and where $R$ is the region inside $C$.

The device of adding line integrals over separate boundaries to build up an integral over a single boundary can be extended to any finite number of subregions. In Figure 16.34a let $C_1$ be the boundary, oriented counterclockwise, of the region $R_1$ in the first quadrant. Similarly, for the other three quadrants, $C_i$ is the boundary of the region $R_i$, $i = 2, 3, 4$. By Green's Theorem,

$$\oint_{C_i} M\,dx + N\,dy = \iint_{R_i} \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dx\,dy. \tag{11}$$

We sum Equation (11) over $i = 1, 2, 3, 4$, and get (Figure 16.34b):

$$\oint_{r=b} (M\,dx + N\,dy) + \oint_{r=a} (M\,dx + N\,dy) = \iint_{\cup R_i} \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dx\,dy. \tag{12}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

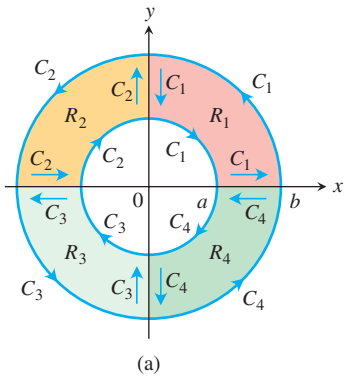

**FIGURE 16.34** The annular region $R$ combines four smaller regions. In polar coordinates, $r = a$ for the inner circle, $r = b$ for the outer circle, and $a \le r \le b$ for the region itself.

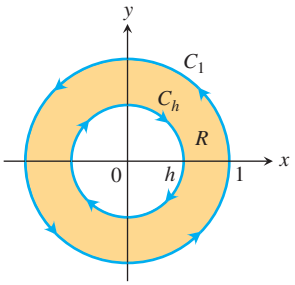

**FIGURE 16.35** Green's Theorem may be applied to the annular region $R$ by integrating along the boundaries as shown (Example 6).

Equation (12) says that the double integral of $(\partial N/\partial x) - (\partial M/\partial y)$ over the annular ring $R$ equals the line integral of $M\,dx + N\,dy$ over the complete boundary of $R$ in the direction that keeps $R$ on our left as we progress (Figure 16.34b).

## EXAMPLE 6 Verifying Green's Theorem for an Annular Ring

Verify the circulation form of Green's Theorem (Equation 4) on the annular ring $R$: $h^2 \le x^2 + y^2 \le 1$, $0 < h < 1$ (Figure 16.35), if

$$M = \frac{-y}{x^2 + y^2}, \qquad N = \frac{x}{x^2 + y^2}.$$

**Solution** The boundary of $R$ consists of the circle

$$C_1: \quad x = \cos t, \qquad y = \sin t, \qquad 0 \le t \le 2\pi,$$

traversed counterclockwise as $t$ increases, and the circle

$$C_h: \quad x = h\cos\theta, \qquad y = -h\sin\theta, \qquad 0 \le \theta \le 2\pi,$$

traversed clockwise as $\theta$ increases. The functions $M$ and $N$ and their partial derivatives are continuous throughout $R$. Moreover,

$$\frac{\partial M}{\partial y} = \frac{(x^2 + y^2)(-1) + y(2y)}{(x^2 + y^2)^2}$$

$$= \frac{y^2 - x^2}{(x^2 + y^2)^2} = \frac{\partial N}{\partial x},$$

so

$$\iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dx\,dy = \iint_R 0\,dx\,dy = 0.$$

The integral of $M\,dx + N\,dy$ over the boundary of $R$ is

$$\int_C M\,dx + N\,dy = \oint_{C_1} \frac{x\,dy - y\,dx}{x^2 + y^2} + \oint_{C_h} \frac{x\,dy - y\,dx}{x^2 + y^2}$$

$$= \int_0^{2\pi} (\cos^2 t + \sin^2 t)\,dt - \int_0^{2\pi} \frac{h^2(\cos^2\theta + \sin^2\theta)}{h^2}\,d\theta$$

$$= 2\pi - 2\pi = 0. \qquad \blacksquare$$

The functions $M$ and $N$ in Example 6 are discontinuous at (0, 0), so we cannot apply Green's Theorem to the circle $C_1$ and the region inside it. We must exclude the origin. We do so by excluding the points interior to $C_h$.

We could replace the circle $C_1$ in Example 6 by an ellipse or any other simple closed curve $K$ surrounding $C_h$ (Figure 16.36). The result would still be

$$\oint_K (M\,dx + N\,dy) + \oint_{C_h} (M\,dx + N\,dy) = \iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dy\,dx = 0,$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

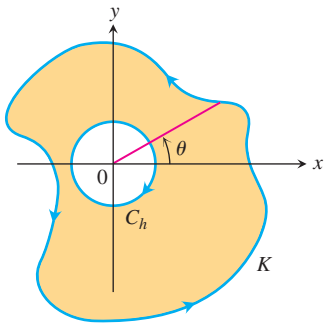

**FIGURE 16.36** The region bounded by the circle $C_h$ and the curve $K$.

which leads to the conclusion that

$$\oint_K (M\,dx + N\,dy) = 2\pi$$

for any such curve $K$. We can explain this result by changing to polar coordinates. With

$$x = r\cos\theta, \qquad y = r\sin\theta,$$
$$dx = -r\sin\theta\,d\theta + \cos\theta\,dr, \qquad dy = r\cos\theta\,d\theta + \sin\theta\,dr,$$

we have

$$\frac{x\,dy - y\,dx}{x^2 + y^2} = \frac{r^2(\cos^2\theta + \sin^2\theta)\,d\theta}{r^2} = d\theta,$$

and $\theta$ increases by $2\pi$ as we traverse $K$ once counterclockwise.

# EXERCISES 16.4

## Verifying Green's Theorem

In Exercises 1–4, verify the conclusion of Green's Theorem by evaluating both sides of Equations (3) and (4) for the field $\mathbf{F} = M\mathbf{i} + N\mathbf{j}$. Take the domains of integration in each case to be the disk $R$: $x^2 + y^2 \le a^2$ and its bounding circle $C$: $\mathbf{r} = (a\cos t)\mathbf{i} + (a\sin t)\mathbf{j}$, $0 \le t \le 2\pi$.

1. $\mathbf{F} = -y\mathbf{i} + x\mathbf{j}$
2. $\mathbf{F} = y\mathbf{i}$
3. $\mathbf{F} = 2x\mathbf{i} - 3y\mathbf{j}$
4. $\mathbf{F} = -x^2y\mathbf{i} + xy^2\mathbf{j}$

## Counterclockwise Circulation and Outward Flux

In Exercises 5–10, use Green's Theorem to find the counterclockwise circulation and outward flux for the field $\mathbf{F}$ and curve $C$.

5. $\mathbf{F} = (x - y)\mathbf{i} + (y - x)\mathbf{j}$
   $C$: The square bounded by $x = 0, x = 1, y = 0, y = 1$
6. $\mathbf{F} = (x^2 + 4y)\mathbf{i} + (x + y^2)\mathbf{j}$
   $C$: The square bounded by $x = 0, x = 1, y = 0, y = 1$
7. $\mathbf{F} = (y^2 - x^2)\mathbf{i} + (x^2 + y^2)\mathbf{j}$
   $C$: The triangle bounded by $y = 0, x = 3$, and $y = x$
8. $\mathbf{F} = (x + y)\mathbf{i} - (x^2 + y^2)\mathbf{j}$
   $C$: The triangle bounded by $y = 0, x = 1$, and $y = x$
9. $\mathbf{F} = (x + e^x \sin y)\mathbf{i} + (x + e^x \cos y)\mathbf{j}$
   $C$: The right-hand loop of the lemniscate $r^2 = \cos 2\theta$
10. $\mathbf{F} = \left(\tan^{-1}\dfrac{y}{x}\right)\mathbf{i} + \ln(x^2 + y^2)\mathbf{j}$
    $C$: The boundary of the region defined by the polar coordinate inequalities $1 \le r \le 2, 0 \le \theta \le \pi$
11. Find the counterclockwise circulation and outward flux of the field $\mathbf{F} = xy\mathbf{i} + y^2\mathbf{j}$ around and over the boundary of the region enclosed by the curves $y = x^2$ and $y = x$ in the first quadrant.
12. Find the counterclockwise circulation and the outward flux of the field $\mathbf{F} = (-\sin y)\mathbf{i} + (x\cos y)\mathbf{j}$ around and over the square cut from the first quadrant by the lines $x = \pi/2$ and $y = \pi/2$.
13. Find the outward flux of the field
$$\mathbf{F} = \left(3xy - \frac{x}{1 + y^2}\right)\mathbf{i} + (e^x + \tan^{-1} y)\mathbf{j}$$
across the cardioid $r = a(1 + \cos\theta)$, $a > 0$.
14. Find the counterclockwise circulation of $\mathbf{F} = (y + e^x \ln y)\mathbf{i} + (e^x/y)\mathbf{j}$ around the boundary of the region that is bounded above by the curve $y = 3 - x^2$ and below by the curve $y = x^4 + 1$.

## Work

In Exercises 15 and 16, find the work done by $\mathbf{F}$ in moving a particle once counterclockwise around the given curve.

15. $\mathbf{F} = 2xy^3\mathbf{i} + 4x^2y^2\mathbf{j}$
    $C$: The boundary of the "triangular" region in the first quadrant enclosed by the $x$-axis, the line $x = 1$, and the curve $y = x^3$
16. $\mathbf{F} = (4x - 2y)\mathbf{i} + (2x - 4y)\mathbf{j}$
    $C$: The circle $(x - 2)^2 + (y - 2)^2 = 4$

## Evaluating Line Integrals in the Plane

Apply Green's Theorem to evaluate the integrals in Exercises 17–20.

17. $\displaystyle\oint_C (y^2\,dx + x^2\,dy)$
    $C$: The triangle bounded by $x = 0, x + y = 1, y = 0$
18. $\displaystyle\oint_C (3y\,dx + 2x\,dy)$
    $C$: The boundary of $0 \le x \le \pi, 0 \le y \le \sin x$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**19.** $\oint_C (6y + x)\,dx + (y + 2x)\,dy$

$C$: The circle $(x - 2)^2 + (y - 3)^2 = 4$

**20.** $\oint_C (2x + y^2)\,dx + (2xy + 3y)\,dy$

$C$: Any simple closed curve in the plane for which Green's Theorem holds

## Calculating Area with Green's Theorem

If a simple closed curve $C$ in the plane and the region $R$ it encloses satisfy the hypotheses of Green's Theorem, the area of $R$ is given by

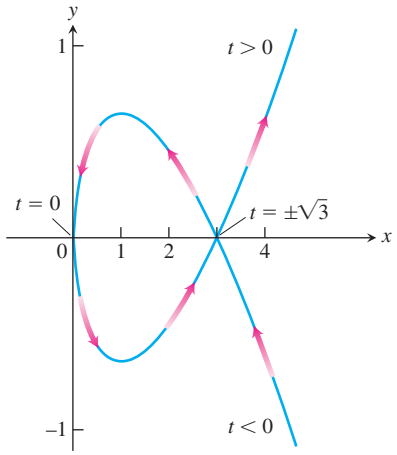
**Green's Theorem Area Formula**

$$\text{Area of } R = \frac{1}{2}\oint_C x\,dy - y\,dx \qquad (13)$$

The reason is that by Equation (3), run backward,

$$\text{Area of } R = \iint_R dy\,dx = \iint_R \left(\frac{1}{2} + \frac{1}{2}\right) dy\,dx$$

$$= \oint_C \frac{1}{2}x\,dy - \frac{1}{2}y\,dx\,.$$



Use the Green's Theorem area formula (Equation 13) to find the areas of the regions enclosed by the curves in Exercises 21–24.

**21.** The circle $\mathbf{r}(t) = (a\cos t)\mathbf{i} + (a\sin t)\mathbf{j}, \quad 0 \le t \le 2\pi$

**22.** The ellipse $\mathbf{r}(t) = (a\cos t)\mathbf{i} + (b\sin t)\mathbf{j}, \quad 0 \le t \le 2\pi$

**23.** The astroid $\mathbf{r}(t) = (\cos^3 t)\mathbf{i} + (\sin^3 t)\mathbf{j}, \quad 0 \le t \le 2\pi$

**24.** The curve $\mathbf{r}(t) = t^2\mathbf{i} + ((t^3/3) - t)\mathbf{j}, \quad -\sqrt{3} \le t \le \sqrt{3}$ (see accompanying figure).

## Theory and Examples

**25.** Let $C$ be the boundary of a region on which Green's Theorem holds. Use Green's Theorem to calculate

**a.** $\oint_C f(x)\,dx + g(y)\,dy$

**b.** $\oint_C ky\,dx + hx\,dy$ ($k$ and $h$ constants).

**26. Integral dependent only on area** Show that the value of

$$\oint_C xy^2\,dx + (x^2y + 2x)\,dy$$

around any square depends only on the area of the square and not on its location in the plane.

**27.** What is special about the integral

$$\oint_C 4x^3y\,dx + x^4\,dy?$$

Give reasons for your answer.

**28.** What is special about the integral

$$\oint_C -y^3\,dy + x^3\,dx?$$

Give reasons for your answer.

**29. Area as a line integral** Show that if $R$ is a region in the plane bounded by a piecewise-smooth simple closed curve $C$, then

$$\text{Area of } R = \oint_C x\,dy = -\oint_C y\,dx.$$

**30. Definite integral as a line integral** Suppose that a nonnegative function $y = f(x)$ has a continuous first derivative on $[a, b]$. Let $C$ be the boundary of the region in the $xy$-plane that is bounded below by the $x$-axis, above by the graph of $f$, and on the sides by the lines $x = a$ and $x = b$. Show that

$$\int_a^b f(x)\,dx = -\oint_C y\,dx.$$

**31. Area and the centroid** Let $A$ be the area and $\bar{x}$ the $x$-coordinate of the centroid of a region $R$ that is bounded by a piecewise-smooth simple closed curve $C$ in the $xy$-plane. Show that

$$\frac{1}{2}\oint_C x^2\,dy = -\oint_C xy\,dx = \frac{1}{3}\oint_C x^2\,dy - xy\,dx = A\bar{x}.$$

**32. Moment of inertia** Let $I_y$ be the moment of inertia about the $y$-axis of the region in Exercise 31. Show that

$$\frac{1}{3}\oint_C x^3\,dy = -\oint_C x^2y\,dx = \frac{1}{4}\oint_C x^3\,dy - x^2y\,dx = I_y.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**33. Green's Theorem and Laplace's equation** Assuming that all the necessary derivatives exist and are continuous, show that if $f(x, y)$ satisfies the Laplace equation

$$\frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} = 0,$$

then

$$\oint_C \frac{\partial f}{\partial y}\,dx - \frac{\partial f}{\partial x}\,dy = 0$$

for all closed curves $C$ to which Green's Theorem applies. (The converse is also true: If the line integral is always zero, then $f$ satisfies the Laplace equation.)

**34. Maximizing work** Among all smooth simple closed curves in the plane, oriented counterclockwise, find the one along which the work done by

$$\mathbf{F} = \left(\frac{1}{4}x^2y + \frac{1}{3}y^3\right)\mathbf{i} + x\mathbf{j}$$

is greatest. (*Hint:* Where is (curl $\mathbf{F}$) $\cdot\, \mathbf{k}$ positive?)

**35. Regions with many holes** Green's Theorem holds for a region $R$ with any finite number of holes as long as the bounding curves are smooth, simple, and closed and we integrate over each component of the boundary in the direction that keeps $R$ on our immediate left as we go along (Figure 16.37).

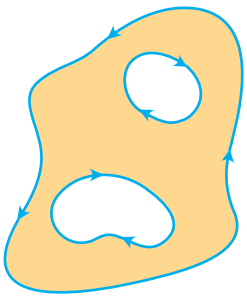


**FIGURE 16.37** Green's Theorem holds for regions with more than one hole (Exercise 35).

**a.** Let $f(x, y) = \ln(x^2 + y^2)$ and let $C$ be the circle $x^2 + y^2 = a^2$. Evaluate the flux integral

$$\oint_C \nabla f \cdot \mathbf{n}\,ds.$$

**b.** Let $K$ be an arbitrary smooth simple closed curve in the plane that does not pass through (0, 0). Use Green's Theorem to show that

$$\oint_K \nabla f \cdot \mathbf{n}\,ds$$

has two possible values, depending on whether (0, 0) lies inside $K$ or outside $K$.

**36. Bendixson's criterion** The *streamlines* of a planar fluid flow are the smooth curves traced by the fluid's individual particles. The vectors $\mathbf{F} = M(x, y)\mathbf{i} + N(x, y)\mathbf{j}$ of the flow's velocity field are the tangent vectors of the streamlines. Show that if the flow takes place over a simply connected region $R$ (no holes or missing points) and that if $M_x + N_y \neq 0$ throughout $R$, then none of the streamlines in $R$ is closed. In other words, no particle of fluid ever has a closed trajectory in $R$. The criterion $M_x + N_y \neq 0$ is called **Bendixson's criterion** for the nonexistence of closed trajectories.

**37.** Establish Equation (7) to finish the proof of the special case of Green's Theorem.

**38.** Establish Equation (10) to complete the argument for the extension of Green's Theorem.

**39. Curl component of conservative fields** Can anything be said about the curl component of a conservative two-dimensional vector field? Give reasons for your answer.

**40. Circulation of conservative fields** Does Green's Theorem give any information about the circulation of a conservative field? Does this agree with anything else you know? Give reasons for your answer.

## COMPUTER EXPLORATIONS

## Finding Circulation

In Exercises 41–44, use a CAS and Green's Theorem to find the counterclockwise circulation of the field $\mathbf{F}$ around the simple closed curve $C$. Perform the following CAS steps.

**a.** Plot $C$ in the $xy$-plane.

**b.** Determine the integrand $(\partial N/\partial x) - (\partial M/\partial y)$ for the curl form of Green's Theorem.

**c.** Determine the (double integral) limits of integration from your plot in part (a) and evaluate the curl integral for the circulation.

**41.** $\mathbf{F} = (2x - y)\mathbf{i} + (x + 3y)\mathbf{j}$, $C$: The ellipse $x^2 + 4y^2 = 4$

**42.** $\mathbf{F} = (2x^3 - y^3)\mathbf{i} + (x^3 + y^3)\mathbf{j}$, $C$: The ellipse $\dfrac{x^2}{4} + \dfrac{y^2}{9} = 1$

**43.** $\mathbf{F} = x^{-1}e^y\mathbf{i} + (e^y \ln x + 2x)\mathbf{j}$,

$C$: The boundary of the region defined by $y = 1 + x^4$ (below) and $y = 2$ (above)

**44.** $\mathbf{F} = xe^y\mathbf{i} + 4x^2 \ln y\,\mathbf{j}$,

$C$: The triangle with vertices (0, 0), (2, 0), and (0, 4)

# 16.5 Surface Area and Surface Integrals

We know how to integrate a function over a flat region in a plane, but what if the function is defined over a curved surface? To evaluate one of these so-called surface integrals, we rewrite it as a double integral over a region in a coordinate plane beneath the surface (Figure 16.38). Surface integrals are used to compute quantities such as the flow of liquid across a membrane or the upward force on a falling parachute.

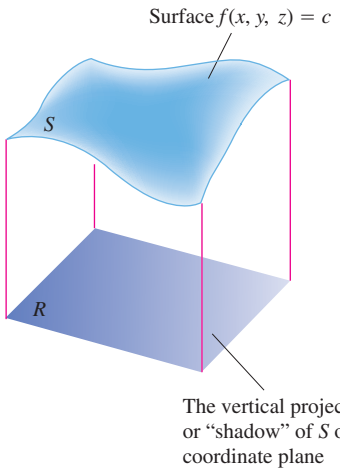

**FIGURE 16.38** As we soon see, the integral of a function $g(x, y, z)$ over a surface $S$ in space can be calculated by evaluating a related double integral over the vertical projection or "shadow" of $S$ on a coordinate plane.

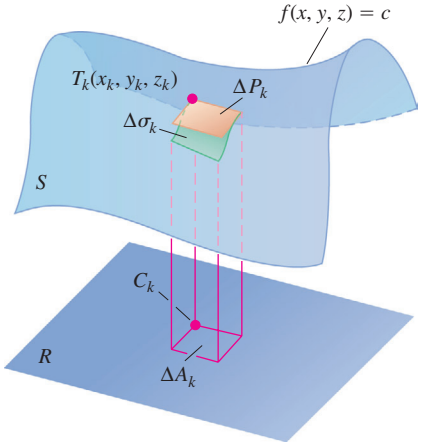

**FIGURE 16.39** A surface $S$ and its vertical projection onto a plane beneath it. You can think of $R$ as the shadow of $S$ on the plane. The tangent plane $\Delta P_k$ approximates the surface patch $\Delta\sigma_k$ above $\Delta A_k$.

## Surface Area

Figure 16.39 shows a surface $S$ lying above its "shadow" region $R$ in a plane beneath it. The surface is defined by the equation $f(x, y, z) = c$. If the surface is **smooth** ($\nabla f$ is continuous and never vanishes on $S$), we can define and calculate its area as a double integral over $R$. We assume that this projection of the surface onto its shadow $R$ is one-to-one. That is, each point in $R$ corresponds to exactly one point $(x, y, z)$ satisfying $f(x, y, z) = c$.

The first step in defining the area of $S$ is to partition the region $R$ into small rectangles $\Delta A_k$ of the kind we would use if we were defining an integral over $R$. Directly above each $\Delta A_k$ lies a patch of surface $\Delta\sigma_k$ that we may approximate by a parallelogram $\Delta P_k$ in the tangent plane to $S$ at a point $T_k(x_k, y_k, z_k)$ in $\Delta\sigma_k$. This parallelogram in the tangent plane projects directly onto $\Delta A_k$. To be specific, we choose the point $T_k(x_k, y_k, z_k)$ lying directly above the back corner $C_k$ of $\Delta A_k$, as shown in Figure 16.39. If the tangent plane is parallel to $R$, then $\Delta P_k$ will be congruent to $\Delta A_k$. Otherwise, it will be a parallelogram whose area is somewhat larger than the area of $\Delta A_k$.

Figure 16.40 gives a magnified view of $\Delta\sigma_k$ and $\Delta P_k$, showing the gradient vector $\nabla f(x_k, y_k, z_k)$ at $T_k$ and a unit vector $\mathbf{p}$ that is normal to $R$. The figure also shows the angle $\gamma_k$ between $\nabla f$ and $\mathbf{p}$. The other vectors in the picture, $\mathbf{u}_k$ and $\mathbf{v}_k$, lie along the edges of the patch $\Delta P_k$ in the tangent plane. Thus, both $\mathbf{u}_k \times \mathbf{v}_k$ and $\nabla f$ are normal to the tangent plane.

We now need to know from advanced vector geometry that $|(\mathbf{u}_k \times \mathbf{v}_k) \cdot \mathbf{p}|$ is the area of the projection of the parallelogram determined by $\mathbf{u}_k$ and $\mathbf{v}_k$ onto any plane whose normal is $\mathbf{p}$. (A proof is given in Appendix 8.) In our case, this translates into the statement

$$|(\mathbf{u}_k \times \mathbf{v}_k) \cdot \mathbf{p}| = \Delta A_k.$$

To simplify the notation in the derivation that follows, we are now denoting the *area* of the small rectangular region by $\Delta A_k$ as well. Likewise, $\Delta P_k$ will also denote the area of the portion of the tangent plane directly above this small region.

Now, $|\mathbf{u}_k \times \mathbf{v}_k|$ itself is the area $\Delta P_k$ (standard fact about cross products) so this last equation becomes

$$\underbrace{|\mathbf{u}_k \times \mathbf{v}_k|}_{\Delta P_k} \quad \underbrace{|\mathbf{p}|}_{1} \quad \underbrace{|\cos(\text{angle between } \mathbf{u}_k \times \mathbf{v}_k \text{ and } \mathbf{p})|}_{\text{Same as } |\cos\gamma_k| \text{ because } \nabla f \text{ and } \mathbf{u}_k \times \mathbf{v}_k \text{ are both normal to the tangent plane}} = \Delta A_k$$

or

$$\Delta P_k |\cos\gamma_k| = \Delta A_k$$

or

$$\Delta P_k = \frac{\Delta A_k}{|\cos\gamma_k|},$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

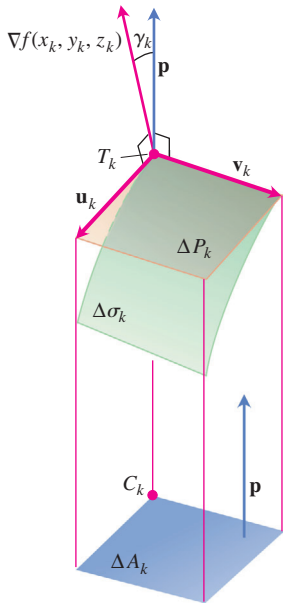

**FIGURE 16.40** Magnified view from the preceding figure. The vector $\mathbf{u}_k \times \mathbf{v}_k$ (not shown) is parallel to the vector $\nabla f$ because both vectors are normal to the plane of $\Delta P_k$.

provided $\cos \gamma_k \neq 0$. We will have $\cos \gamma_k \neq 0$ as long as $\nabla f$ is not parallel to the ground plane and $\nabla f \cdot \mathbf{p} \neq 0$.

Since the patches $\Delta P_k$ approximate the surface patches $\Delta\sigma_k$ that fit together to make $S$, the sum

$$\sum \Delta P_k = \sum \frac{\Delta A_k}{|\cos \gamma_k|} \tag{1}$$

looks like an approximation of what we might like to call the surface area of $S$. It also looks as if the approximation would improve if we refined the partition of $R$. In fact, the sums on the right-hand side of Equation (1) are approximating sums for the double integral

$$\iint_R \frac{1}{|\cos \gamma|}\, dA. \tag{2}$$

We therefore define the **area** of $S$ to be the value of this integral whenever it exists. For any surface $f(x, y, z) = c$, we have $|\nabla f \cdot \mathbf{p}| = |\nabla f|\,|\mathbf{p}|\,|\cos \gamma|$, so

$$\frac{1}{|\cos \gamma|} = \frac{|\nabla f|}{|\nabla f \cdot \mathbf{p}|}.$$

This combines with Equation (2) to give a practical formula for surface area.

**Formula for Surface Area**

The area of the surface $f(x, y, z) = c$ over a closed and bounded plane region $R$ is

$$\text{Surface area} = \iint_R \frac{|\nabla f|}{|\nabla f \cdot \mathbf{p}|}\, dA, \tag{3}$$

where $\mathbf{p}$ is a unit vector normal to $R$ and $\nabla f \cdot \mathbf{p} \neq 0$.

Thus, the area is the double integral over $R$ of the magnitude of $\nabla f$ divided by the magnitude of the scalar component of $\nabla f$ normal to $R$.

We reached Equation (3) under the assumption that $\nabla f \cdot \mathbf{p} \neq 0$ throughout $R$ and that $\nabla f$ is continuous. Whenever the integral exists, however, we define its value to be the area of the portion of the surface $f(x, y, z) = c$ that lies over $R$. (Recall that the projection is assumed to be one-to-one.)

In the exercises (see Equation 11), we show how Equation (3) simplifies if the surface is defined by $z = f(x, y)$.

**EXAMPLE 1** Finding Surface Area

Find the area of the surface cut from the bottom of the paraboloid $x^2 + y^2 - z = 0$ by the plane $z = 4$.

**Solution** We sketch the surface $S$ and the region $R$ below it in the $xy$-plane (Figure 16.41). The surface $S$ is part of the level surface $f(x, y, z) = x^2 + y^2 - z = 0$, and $R$ is the disk $x^2 + y^2 \leq 4$ in the $xy$-plane. To get a unit vector normal to the plane of $R$, we can take $\mathbf{p} = \mathbf{k}$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

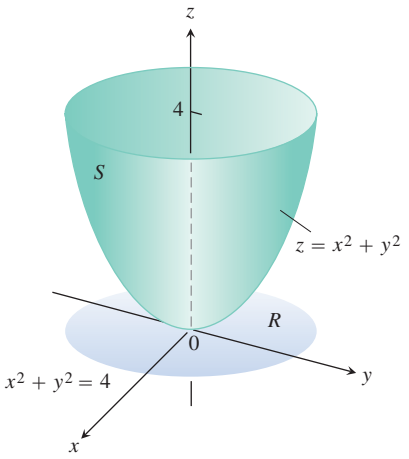

**FIGURE 16.41** The area of this parabolic surface is calculated in Example 1.

At any point $(x, y, z)$ on the surface, we have

$$\begin{aligned} f(x, y, z) &= x^2 + y^2 - z \\ \nabla f &= 2x\mathbf{i} + 2y\mathbf{j} - \mathbf{k} \\ |\nabla f| &= \sqrt{(2x)^2 + (2y)^2 + (-1)^2} \\ &= \sqrt{4x^2 + 4y^2 + 1} \\ |\nabla f \cdot \mathbf{p}| &= |\nabla f \cdot \mathbf{k}| = |-1| = 1. \end{aligned}$$

In the region $R$, $dA = dx\,dy$. Therefore,

$$\text{Surface area} = \iint_R \frac{|\nabla f|}{|\nabla f \cdot \mathbf{p}|}\,dA \qquad \text{Equation (3)}$$

$$= \iint_{x^2+y^2\le 4} \sqrt{4x^2 + 4y^2 + 1}\,dx\,dy$$

$$= \int_0^{2\pi}\int_0^2 \sqrt{4r^2 + 1}\,r\,dr\,d\theta \qquad \text{Polar coordinates}$$

$$= \int_0^{2\pi} \left[\frac{1}{12}(4r^2 + 1)^{3/2}\right]_0^2 d\theta$$

$$= \int_0^{2\pi} \frac{1}{12}(17^{3/2} - 1)\,d\theta = \frac{\pi}{6}\left(17\sqrt{17} - 1\right). \quad \blacksquare$$

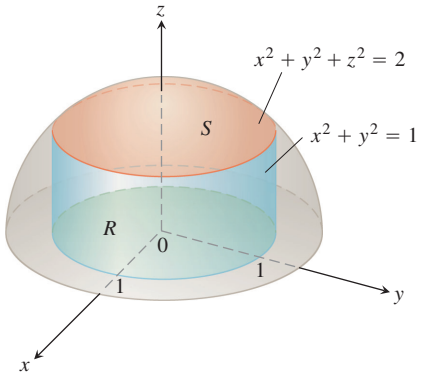

**FIGURE 16.42** The cap cut from the hemisphere by the cylinder projects vertically onto the disk $R$: $x^2 + y^2 \le 1$ in the $xy$-plane (Example 2).

## EXAMPLE 2 Finding Surface Area

Find the area of the cap cut from the hemisphere $x^2 + y^2 + z^2 = 2, z \ge 0$, by the cylinder $x^2 + y^2 = 1$ (Figure 16.42).

**Solution** The cap $S$ is part of the level surface $f(x, y, z) = x^2 + y^2 + z^2 = 2$. It projects one-to-one onto the disk $R$: $x^2 + y^2 \le 1$ in the $xy$-plane. The unit vector $\mathbf{p} = \mathbf{k}$ is normal to the plane of $R$.

At any point on the surface,

$$\begin{aligned} f(x, y, z) &= x^2 + y^2 + z^2 \\ \nabla f &= 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k} \\ |\nabla f| &= 2\sqrt{x^2 + y^2 + z^2} = 2\sqrt{2} \qquad \text{Because } x^2 + y^2 + z^2 = 2 \text{ at points of } S \\ |\nabla f \cdot \mathbf{p}| &= |\nabla f \cdot \mathbf{k}| = |2z| = 2z. \end{aligned}$$

Therefore,

$$\text{Surface area} = \iint_R \frac{|\nabla f|}{|\nabla f \cdot \mathbf{p}|}\,dA = \iint_R \frac{2\sqrt{2}}{2z}\,dA = \sqrt{2}\iint_R \frac{dA}{z}. \qquad (4)$$

What do we do about the $z$?

Since $z$ is the $z$-coordinate of a point on the sphere, we can express it in terms of $x$ and $y$ as

$$z = \sqrt{2 - x^2 - y^2}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We continue the work of Equation (4) with this substitution:

$$\text{Surface area} = \sqrt{2}\iint_R \frac{dA}{z} = \sqrt{2}\iint_{x^2+y^2\le 1} \frac{dA}{\sqrt{2-x^2-y^2}}$$

$$= \sqrt{2}\int_0^{2\pi}\int_0^1 \frac{r\,dr\,d\theta}{\sqrt{2-r^2}} \qquad \text{Polar coordinates}$$

$$= \sqrt{2}\int_0^{2\pi}\left[-(2-r^2)^{1/2}\right]_{r=0}^{r=1} d\theta$$

$$= \sqrt{2}\int_0^{2\pi}\left(\sqrt{2}-1\right)d\theta = 2\pi\left(2-\sqrt{2}\right).$$

## Surface Integrals

We now show how to integrate a function over a surface, using the ideas just developed for calculating surface area.

Suppose, for example, that we have an electrical charge distributed over a surface $f(x, y, z) = c$ like the one shown in Figure 16.43 and that the function $g(x, y, z)$ gives the charge per unit area (charge density) at each point on $S$. Then we may calculate the total charge on $S$ as an integral in the following way.

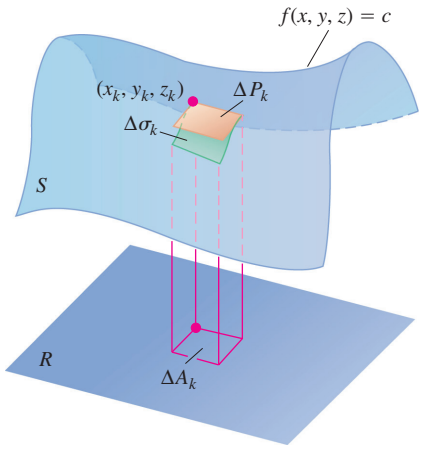

**FIGURE 16.43** If we know how an electrical charge $g(x, y, z)$ is distributed over a surface, we can find the total charge with a suitably modified surface integral.

We partition the shadow region $R$ on the ground plane beneath the surface into small rectangles of the kind we would use if we were defining the surface area of $S$. Then directly above each $\Delta A_k$ lies a patch of surface $\Delta\sigma_k$ that we approximate with a parallelogram-shaped portion of tangent plane, $\Delta P_k$. (See Figure 16.43.)

Up to this point the construction proceeds as in the definition of surface area, but now we take an additional step: We evaluate $g$ at $(x_k, y_k, z_k)$ and approximate the total charge on the surface path $\Delta\sigma_k$ by the product $g(x_k, y_k, z_k)\,\Delta P_k$. The rationale is that when the partition of $R$ is sufficiently fine, the value of $g$ throughout $\Delta\sigma_k$ is nearly constant and $\Delta P_k$ is nearly the same as $\Delta\sigma_k$. The total charge over $S$ is then approximated by the sum

$$\text{Total charge} \approx \sum g(x_k, y_k, z_k)\,\Delta P_k = \sum g(x_k, y_k, z_k)\,\frac{\Delta A_k}{|\cos\gamma_k|}.$$

If $f$, the function defining the surface $S$, and its first partial derivatives are continuous, and if $g$ is continuous over $S$, then the sums on the right-hand side of the last equation approach the limit

$$\iint_R g(x, y, z)\,\frac{dA}{|\cos\gamma|} = \iint_R g(x, y, z)\,\frac{|\nabla f|}{|\nabla f\cdot\mathbf{p}|}\,dA \tag{5}$$

as the partition of $R$ is refined in the usual way. This limit is called the integral of $g$ over the surface $S$ and is calculated as a double integral over $R$. The value of the integral is the total charge on the surface $S$.

As you might expect, the formula in Equation (5) defines the integral of *any* function $g$ over the surface $S$ as long as the integral exists.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**DEFINITION Surface Integral**

If $R$ is the shadow region of a surface $S$ defined by the equation $f(x, y, z) = c$, and $g$ is a continuous function defined at the points of $S$, then the **integral of $g$ over $S$** is the integral

$$\iint_R g(x, y, z) \frac{|\nabla f|}{|\nabla f \cdot \mathbf{p}|} \, dA, \tag{6}$$

where $\mathbf{p}$ is a unit vector normal to $R$ and $\nabla f \cdot \mathbf{p} \neq 0$. The integral itself is called a **surface integral**.

The integral in Equation (6) takes on different meanings in different applications. If $g$ has the constant value 1, the integral gives the area of $S$. If $g$ gives the mass density of a thin shell of material modeled by $S$, the integral gives the mass of the shell.

We can abbreviate the integral in Equation (6) by writing $d\sigma$ for $(|\nabla f|/|\nabla f \cdot \mathbf{p}|)\, dA$.

**The Surface Area Differential and the Differential Form for Surface Integrals**

$$d\sigma = \frac{|\nabla f|}{|\nabla f \cdot \mathbf{p}|} \, dA \qquad \iint_S g \, d\sigma \tag{7}$$

Surface area differential — Differential formula for surface integrals

Surface integrals behave like other double integrals, the integral of the sum of two functions being the sum of their integrals and so on. The domain Additivity Property takes the form

$$\iint_S g \, d\sigma = \iint_{S_1} g \, d\sigma + \iint_{S_2} g \, d\sigma + \cdots + \iint_{S_n} g \, d\sigma.$$

The idea is that if $S$ is partitioned by smooth curves into a finite number of nonoverlapping smooth patches (i.e., if $S$ is **piecewise smooth**), then the integral over $S$ is the sum of the integrals over the patches. Thus, the integral of a function over the surface of a cube is the sum of the integrals over the faces of the cube. We integrate over a turtle shell of welded plates by integrating one plate at a time and adding the results.

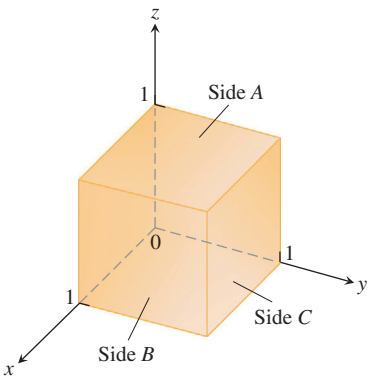

**FIGURE 16.44** The cube in Example 3.

**EXAMPLE 3** Integrating Over a Surface

Integrate $g(x, y, z) = xyz$ over the surface of the cube cut from the first octant by the planes $x = 1$, $y = 1$, and $z = 1$ (Figure 16.44).

**Solution** We integrate $xyz$ over each of the six sides and add the results. Since $xyz = 0$ on the sides that lie in the coordinate planes, the integral over the surface of the cube reduces to

$$\underset{\text{Cube surface}}{\iint} xyz \, d\sigma = \underset{\text{Side } A}{\iint} xyz \, d\sigma + \underset{\text{Side } B}{\iint} xyz \, d\sigma + \underset{\text{Side } C}{\iint} xyz \, d\sigma.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Side $A$ is the surface $f(x, y, z) = z = 1$ over the square region $R_{xy}$: $0 \le x \le 1$, $0 \le y \le 1$, in the $xy$-plane. For this surface and region,

$$\mathbf{p} = \mathbf{k}, \qquad \nabla f = \mathbf{k}, \qquad |\nabla f| = 1, \qquad |\nabla f \cdot \mathbf{p}| = |\mathbf{k} \cdot \mathbf{k}| = 1$$

$$d\sigma = \frac{|\nabla f|}{|\nabla f \cdot \mathbf{p}|}\, dA = \frac{1}{1}\, dx\, dy = dx\, dy$$

$$xyz = xy(1) = xy$$

and

$$\iint_{\text{Side } A} xyz\, d\sigma = \iint_{R_{xy}} xy\, dx\, dy = \int_0^1 \int_0^1 xy\, dx\, dy = \int_0^1 \frac{y}{2}\, dy = \frac{1}{4}.$$

Symmetry tells us that the integrals of $xyz$ over sides $B$ and $C$ are also $1/4$. Hence,

$$\iint_{\substack{\text{Cube}\\ \text{surface}}} xyz\, d\sigma = \frac{1}{4} + \frac{1}{4} + \frac{1}{4} = \frac{3}{4}.$$

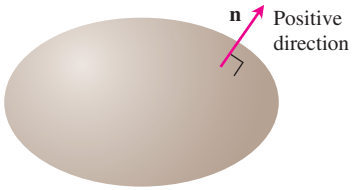

**FIGURE 16.45** Smooth closed surfaces in space are orientable. The outward unit normal vector defines the positive direction at each point.

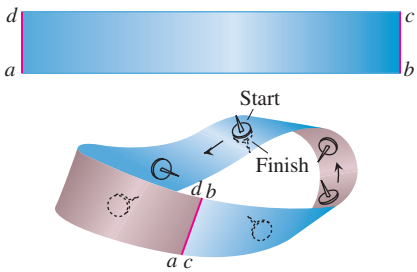

**FIGURE 16.46** To make a Möbius band, take a rectangular strip of paper $abcd$, give the end $bc$ a single twist, and paste the ends of the strip together to match $a$ with $c$ and $b$ with $d$. The Möbius band is a nonorientable or one-sided surface.

## Orientation

We call a smooth surface $S$ **orientable** or **two-sided** if it is possible to define a field $\mathbf{n}$ of unit normal vectors on $S$ that varies continuously with position. Any patch or subportion of an orientable surface is orientable. Spheres and other smooth closed surfaces in space (smooth surfaces that enclose solids) are orientable. By convention, we choose $\mathbf{n}$ on a closed surface to point outward.

Once $\mathbf{n}$ has been chosen, we say that we have **oriented** the surface, and we call the surface together with its normal field an **oriented surface**. The vector $\mathbf{n}$ at any point is called the **positive direction** at that point (Figure 16.45).

The Möbius band in Figure 16.46 is not orientable. No matter where you start to construct a continuous-unit normal field (shown as the shaft of a thumbtack in the figure), moving the vector continuously around the surface in the manner shown will return it to the starting point with a direction opposite to the one it had when it started out. The vector at that point cannot point both ways and yet it must if the field is to be continuous. We conclude that no such field exists.

## Surface Integral for Flux

Suppose that $\mathbf{F}$ is a continuous vector field defined over an oriented surface $S$ and that $\mathbf{n}$ is the chosen unit normal field on the surface. We call the integral of $\mathbf{F} \cdot \mathbf{n}$ over $S$ the flux of $\mathbf{F}$ across $S$ in the positive direction. Thus, the flux is the integral over $S$ of the scalar component of $\mathbf{F}$ in the direction of $\mathbf{n}$.

**DEFINITION Flux**

The **flux** of a three-dimensional vector field $\mathbf{F}$ across an oriented surface $S$ in the direction of $\mathbf{n}$ is

$$\text{Flux} = \iint_S \mathbf{F} \cdot \mathbf{n}\, d\sigma. \tag{8}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The definition is analogous to the flux of a two-dimensional field $\mathbf{F}$ across a plane curve $C$. In the plane (Section 16.2), the flux is

$$\int_C \mathbf{F} \cdot \mathbf{n}\, ds,$$

the integral of the scalar component of $\mathbf{F}$ normal to the curve.

If $\mathbf{F}$ is the velocity field of a three-dimensional fluid flow, the flux of $\mathbf{F}$ across $S$ is the net rate at which fluid is crossing $S$ in the chosen positive direction. We discuss such flows in more detail in Section 16.7.

If $\mathbf{S}$ is part of a level surface $g(x, y, z) = c$, then $\mathbf{n}$ may be taken to be one of the two fields

$$\mathbf{n} = \pm \frac{\nabla g}{|\nabla g|}, \tag{9}$$

depending on which one gives the preferred direction. The corresponding flux is

$$\begin{aligned} \text{Flux} &= \iint_S \mathbf{F} \cdot \mathbf{n}\, d\sigma \\ &= \iint_R \left( \mathbf{F} \cdot \frac{\pm \nabla g}{|\nabla g|} \right) \frac{|\nabla g|}{|\nabla g \cdot \mathbf{p}|}\, dA \qquad \text{Equations (9) and (7)} \qquad (8) \\ &= \iint_R \mathbf{F} \cdot \frac{\pm \nabla g}{|\nabla g \cdot \mathbf{p}|}\, dA. \qquad (10) \end{aligned}$$

**EXAMPLE 4** Finding Flux

Find the flux of $\mathbf{F} = yz\mathbf{j} + z^2\mathbf{k}$ outward through the surface $S$ cut from the cylinder $y^2 + z^2 = 1, z \geq 0$, by the planes $x = 0$ and $x = 1$.

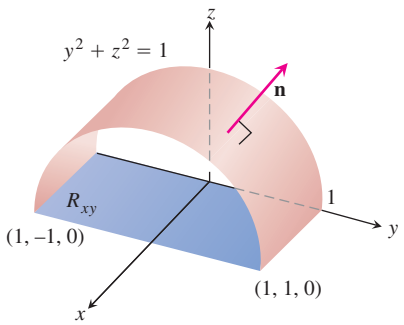

**FIGURE 16.47** Calculating the flux of a vector field outward through this surface. The area of the shadow region $R_{xy}$ is 2 (Example 4).

**Solution** The outward normal field on $S$ (Figure 16.47) may be calculated from the gradient of $g(x, y, z) = y^2 + z^2$ to be

$$\mathbf{n} = +\frac{\nabla g}{|\nabla g|} = \frac{2y\mathbf{j} + 2z\mathbf{k}}{\sqrt{4y^2 + 4z^2}} = \frac{2y\mathbf{j} + 2z\mathbf{k}}{2\sqrt{1}} = y\mathbf{j} + z\mathbf{k}.$$

With $\mathbf{p} = \mathbf{k}$, we also have

$$d\sigma = \frac{|\nabla g|}{|\nabla g \cdot \mathbf{k}|}\, dA = \frac{2}{|2z|}\, dA = \frac{1}{z}\, dA.$$

We can drop the absolute value bars because $z \geq 0$ on $S$.

The value of $\mathbf{F} \cdot \mathbf{n}$ on the surface is

$$\begin{aligned} \mathbf{F} \cdot \mathbf{n} &= (yz\mathbf{j} + z^2\mathbf{k}) \cdot (y\mathbf{j} + z\mathbf{k}) \\ &= y^2 z + z^3 = z(y^2 + z^2) \\ &= z. \qquad y^2 + z^2 = 1 \text{ on } S \end{aligned}$$

Therefore, the flux of $\mathbf{F}$ outward through $S$ is

$$\iint_S \mathbf{F} \cdot \mathbf{n}\, d\sigma = \iint_S (z)\left(\frac{1}{z}\, dA\right) = \iint_{R_{xy}} dA = \text{area}(R_{xy}) = 2. \quad \blacksquare$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Moments and Masses of Thin Shells

Thin shells of material like bowls, metal drums, and domes are modeled with surfaces. Their moments and masses are calculated with the formulas in Table 16.3.

**TABLE 16.3** Mass and moment formulas for very thin shells

**Mass:** $M = \iint_S \delta(x, y, z)\, d\sigma$ ($\delta(x, y, z)$ = density at $(x, y, z)$, mass per unit area)

**First moments about the coordinate planes:**

$$M_{yz} = \iint_S x\,\delta\, d\sigma, \qquad M_{xz} = \iint_S y\,\delta\, d\sigma, \qquad M_{xy} = \iint_S z\,\delta\, d\sigma$$

**Coordinates of center of mass:**

$$\bar{x} = M_{yz}/M, \qquad \bar{y} = M_{xz}/M, \qquad \bar{z} = M_{xy}/M$$

**Moments of inertia about coordinate axes:**

$$I_x = \iint_S (y^2 + z^2)\,\delta\, d\sigma, \qquad I_y = \iint_S (x^2 + z^2)\,\delta\, d\sigma,$$

$$I_z = \iint_S (x^2 + y^2)\,\delta\, d\sigma, \qquad I_L = \iint_S r^2\delta\, d\sigma,$$

$r(x, y, z)$ = distance from point $(x, y, z)$ to line $L$

**Radius of gyration about a line $L$:** $R_L = \sqrt{I_L/M}$

### EXAMPLE 5 Finding Center of Mass

Find the center of mass of a thin hemispherical shell of radius $a$ and constant density $\delta$.

**Solution** We model the shell with the hemisphere

$$f(x, y, z) = x^2 + y^2 + z^2 = a^2, \qquad z \geq 0$$

(Figure 16.48). The symmetry of the surface about the $z$-axis tells us that $\bar{x} = \bar{y} = 0$. It remains only to find $\bar{z}$ from the formula $\bar{z} = M_{xy}/M$.

The mass of the shell is

$$M = \iint_S \delta\, d\sigma = \delta \iint_S d\sigma = (\delta)(\text{area of } S) = 2\pi a^2\delta.$$

To evaluate the integral for $M_{xy}$, we take $\mathbf{p} = \mathbf{k}$ and calculate

$$|\nabla f| = |2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}| = 2\sqrt{x^2 + y^2 + z^2} = 2a$$

$$|\nabla f \cdot \mathbf{p}| = |\nabla f \cdot \mathbf{k}| = |2z| = 2z$$

$$d\sigma = \frac{|\nabla f|}{|\nabla f \cdot \mathbf{p}|}\, dA = \frac{a}{z}\, dA.$$

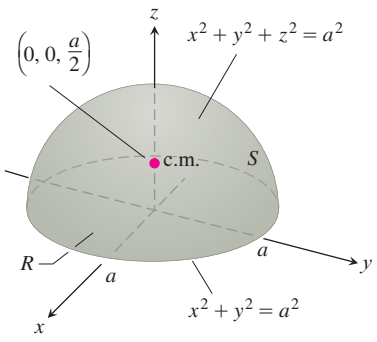

**FIGURE 16.48** The center of mass of a thin hemispherical shell of constant density lies on the axis of symmetry halfway from the base to the top (Example 5).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Then

$$M_{xy} = \iint_S z\delta \, d\sigma = \delta \iint_R z \frac{a}{z} \, dA = \delta a \iint_R dA = \delta a(\pi a^2) = \delta \pi a^3$$

$$\bar{z} = \frac{M_{xy}}{M} = \frac{\pi a^3 \delta}{2\pi a^2 \delta} = \frac{a}{2}.$$

The shell's center of mass is the point $(0, 0, a/2)$. ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# EXERCISES 16.5

## Surface Area

1. Find the area of the surface cut from the paraboloid $x^2 + y^2 - z = 0$ by the plane $z = 2$.
2. Find the area of the band cut from the paraboloid $x^2 + y^2 - z = 0$ by the planes $z = 2$ and $z = 6$.
3. Find the area of the region cut from the plane $x + 2y + 2z = 5$ by the cylinder whose walls are $x = y^2$ and $x = 2 - y^2$.
4. Find the area of the portion of the surface $x^2 - 2z = 0$ that lies above the triangle bounded by the lines $x = \sqrt{3}, y = 0$, and $y = x$ in the $xy$-plane.
5. Find the area of the surface $x^2 - 2y - 2z = 0$ that lies above the triangle bounded by the lines $x = 2, y = 0$, and $y = 3x$ in the $xy$-plane.
6. Find the area of the cap cut from the sphere $x^2 + y^2 + z^2 = 2$ by the cone $z = \sqrt{x^2 + y^2}$.
7. Find the area of the ellipse cut from the plane $z = cx$ ($c$ a constant) by the cylinder $x^2 + y^2 = 1$.
8. Find the area of the upper portion of the cylinder $x^2 + z^2 = 1$ that lies between the planes $x = \pm 1/2$ and $y = \pm 1/2$.
9. Find the area of the portion of the paraboloid $x = 4 - y^2 - z^2$ that lies above the ring $1 \le y^2 + z^2 \le 4$ in the $yz$-plane.
10. Find the area of the surface cut from the paraboloid $x^2 + y + z^2 = 2$ by the plane $y = 0$.
11. Find the area of the surface $x^2 - 2\ln x + \sqrt{15}y - z = 0$ above the square $R$: $1 \le x \le 2, 0 \le y \le 1$, in the $xy$-plane.
12. Find the area of the surface $2x^{3/2} + 2y^{3/2} - 3z = 0$ above the square $R$: $0 \le x \le 1, 0 \le y \le 1$, in the $xy$-plane.

## Surface Integrals

13. Integrate $g(x, y, z) = x + y + z$ over the surface of the cube cut from the first octant by the planes $x = a, y = a, z = a$.
14. Integrate $g(x, y, z) = y + z$ over the surface of the wedge in the first octant bounded by the coordinate planes and the planes $x = 2$ and $y + z = 1$.
15. Integrate $g(x, y, z) = xyz$ over the surface of the rectangular solid cut from the first octant by the planes $x = a, y = b$, and $z = c$.
16. Integrate $g(x, y, z) = xyz$ over the surface of the rectangular solid bounded by the planes $x = \pm a, y = \pm b$, and $z = \pm c$.
17. Integrate $g(x, y, z) = x + y + z$ over the portion of the plane $2x + 2y + z = 2$ that lies in the first octant.
18. Integrate $g(x, y, z) = x\sqrt{y^2 + 4}$ over the surface cut from the parabolic cylinder $y^2 + 4z = 16$ by the planes $x = 0, x = 1$, and $z = 0$.

## Flux Across a Surface

In Exercises 19 and 20, find the flux of the field $\mathbf{F}$ across the portion of the given surface in the specified direction.

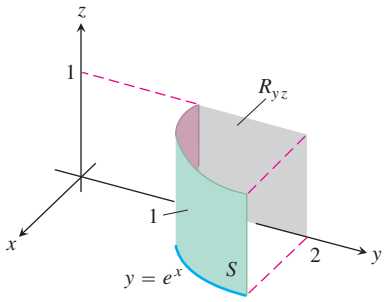
19. $\mathbf{F}(x, y, z) = -\mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$

    $S$: rectangular surface $z = 0, \quad 0 \le x \le 2, \quad 0 \le y \le 3,$ direction $\mathbf{k}$

20. $\mathbf{F}(x, y, z) = yx^2\mathbf{i} - 2\mathbf{j} + xz\mathbf{k}$

    $S$: rectangular surface $y = 0, \quad -1 \le x \le 2, \quad 2 \le z \le 7,$ direction $-\mathbf{j}$

In Exercises 21–26, find the flux of the field $\mathbf{F}$ across the portion of the sphere $x^2 + y^2 + z^2 = a^2$ in the first octant in the direction away from the origin.



21. $\mathbf{F}(x, y, z) = z\mathbf{k}$
22. $\mathbf{F}(x, y, z) = -y\mathbf{i} + x\mathbf{j}$
23. $\mathbf{F}(x, y, z) = y\mathbf{i} - x\mathbf{j} + \mathbf{k}$
24. $\mathbf{F}(x, y, z) = zx\mathbf{i} + zy\mathbf{j} + z^2\mathbf{k}$
25. $\mathbf{F}(x, y, z) = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$
26. $\mathbf{F}(x, y, z) = \dfrac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\sqrt{x^2 + y^2 + z^2}}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**27.** Find the flux of the field $\mathbf{F}(x, y, z) = z^2\mathbf{i} + x\mathbf{j} - 3z\mathbf{k}$ outward through the surface cut from the parabolic cylinder $z = 4 - y^2$ by the planes $x = 0, x = 1$, and $z = 0$.

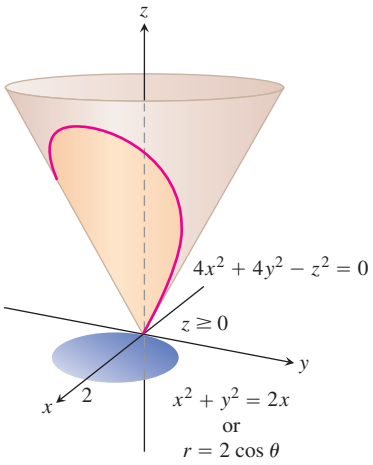
**28.** Find the flux of the field $\mathbf{F}(x, y, z) = 4x\mathbf{i} + 4y\mathbf{j} + 2\mathbf{k}$ outward (away from the $z$-axis) through the surface cut from the bottom of the paraboloid $z = x^2 + y^2$ by the plane $z = 1$.

**29.** Let $S$ be the portion of the cylinder $y = e^x$ in the first octant that projects parallel to the $x$-axis onto the rectangle $R_{yz}$: $1 \le y \le 2$, $0 \le z \le 1$ in the $yz$-plane (see the accompanying figure). Let $\mathbf{n}$ be the unit vector normal to $S$ that points away from the $yz$-plane. Find the flux of the field $\mathbf{F}(x, y, z) = -2\mathbf{i} + 2y\mathbf{j} + z\mathbf{k}$ across $S$ in the direction of $\mathbf{n}$.

**30.** Let $S$ be the portion of the cylinder $y = \ln x$ in the first octant whose projection parallel to the $y$-axis onto the $xz$-plane is the rectangle $R_{xz}$: $1 \le x \le e, 0 \le z \le 1$. Let $\mathbf{n}$ be the unit vector normal to $S$ that points away from the $xz$-plane. Find the flux of $\mathbf{F} = 2y\mathbf{j} + z\mathbf{k}$ through $S$ in the direction of $\mathbf{n}$.

**31.** Find the outward flux of the field $\mathbf{F} = 2xy\mathbf{i} + 2yz\mathbf{j} + 2xz\mathbf{k}$ across the surface of the cube cut from the first octant by the planes $x = a, y = a, z = a$.

**32.** Find the outward flux of the field $\mathbf{F} = xz\mathbf{i} + yz\mathbf{j} + \mathbf{k}$ across the surface of the upper cap cut from the solid sphere $x^2 + y^2 + z^2 \le 25$ by the plane $z = 3$.



## Moments and Masses

**33. Centroid** Find the centroid of the portion of the sphere $x^2 + y^2 + z^2 = a^2$ that lies in the first octant.

**34. Centroid** Find the centroid of the surface cut from the cylinder $y^2 + z^2 = 9, z \ge 0$, by the planes $x = 0$ and $x = 3$ (resembles the surface in Example 4).

**35. Thin shell of constant density** Find the center of mass and the moment of inertia and radius of gyration about the $z$-axis of a thin shell of constant density $\delta$ cut from the cone $x^2 + y^2 - z^2 = 0$ by the planes $z = 1$ and $z = 2$,

**36. Conical surface of constant density** Find the moment of inertia about the $z$-axis of a thin shell of constant density $\delta$ cut from the cone $4x^2 + 4y^2 - z^2 = 0, z \ge 0$, by the circular cylinder $x^2 + y^2 = 2x$ (see the accompanying figure).

**37. Spherical shells**

**a.** Find the moment of inertia about a diameter of a thin spherical shell of radius $a$ and constant density $\delta$. (Work with a hemispherical shell and double the result.)

**b.** Use the Parallel Axis Theorem (Exercises 15.5) and the result in part (a) to find the moment of inertia about a line tangent to the shell.

**38. a. Cones with and without ice cream** Find the centroid of the lateral surface of a solid cone of base radius $a$ and height $h$ (cone surface minus the base).

**b.** Use Pappus's formula (Exercises 15.5) and the result in part (a) to find the centroid of the complete surface of a solid cone (side plus base).

**c.** A cone of radius $a$ and height $h$ is joined to a hemisphere of radius $a$ to make a surface $S$ that resembles an ice cream cone. Use Pappus's formula and the results in part (a) and Example 5 to find the centroid of $S$. How high does the cone have to be to place the centroid in the plane shared by the bases of the hemisphere and cone?

## Special Formulas for Surface Area

If $S$ is the surface defined by a function $z = f(x, y)$ that has continuous first partial derivatives throughout a region $R_{xy}$ in the $xy$-plane (Figure 16.49), then $S$ is also the level surface $F(x, y, z) = 0$ of the function $F(x, y, z) = f(x, y) - z$. Taking the unit normal to $R_{xy}$ to be $\mathbf{p} = \mathbf{k}$ then gives

$$|\nabla F| = |f_x\mathbf{i} + f_y\mathbf{j} - \mathbf{k}| = \sqrt{f_x^2 + f_y^2 + 1}$$

$$|\nabla F \cdot \mathbf{p}| = |(f_x\mathbf{i} + f_y\mathbf{j} - \mathbf{k}) \cdot \mathbf{k}| = |-1| = 1$$

and

$$\iint_{R_{xy}} \frac{|\nabla F|}{|\nabla F \cdot \mathbf{p}|}\, dA = \iint_{R_{xy}} \sqrt{f_x^2 + f_y^2 + 1}\, dx\, dy, \qquad (11)$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Similarly, the area of a smooth surface $x = f(y, z)$ over a region $R_{yz}$ in the $yz$-plane is

$$A = \iint_{R_{yz}} \sqrt{f_y^2 + f_z^2 + 1}\, dy\, dz, \tag{12}$$

and the area of a smooth $y = f(x, z)$ over a region $R_{xz}$ in the $xz$-plane is

$$A = \iint_{R_{xz}} \sqrt{f_x^2 + f_z^2 + 1}\, dx\, dz. \tag{13}$$

Use Equations (11)–(13) to find the area of the surfaces in Exercises 39–44.

**39.** The surface cut from the bottom of the paraboloid $z = x^2 + y^2$ by the plane $z = 3$

**40.** The surface cut from the "nose" of the paraboloid $x = 1 - y^2 - z^2$ by the $yz$-plane

**41.** The portion of the cone $z = \sqrt{x^2 + y^2}$ that lies over the region between the circle $x^2 + y^2 = 1$ and the ellipse $9x^2 + 4y^2 = 36$ in the $xy$-plane. (*Hint:* Use formulas from geometry to find the area of the region.)

**42.** The triangle cut from the plane $2x + 6y + 3z = 6$ by the bounding planes of the first octant. Calculate the area three ways, once with each area formula

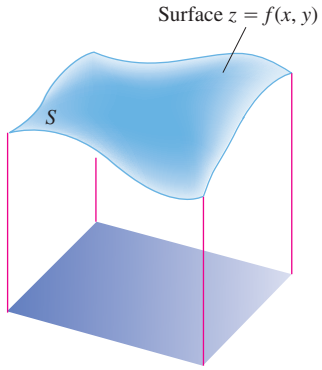


**FIGURE 16.49** For a surface $z = f(x, y)$, the surface area formula in Equation (3) takes the form

$$A = \iint_{R_{xy}} \sqrt{f_x^2 + f_y^2 + 1}\, dx\, dy.$$

**43.** The surface in the first octant cut from the cylinder $y = (2/3)z^{3/2}$ by the planes $x = 1$ and $y = 16/3$

**44.** The portion of the plane $y + z = 4$ that lies above the region cut from the first quadrant of the $xz$-plane by the parabola $x = 4 - z^2$

# 16.6 Parametrized Surfaces

We have defined curves in the plane in three different ways:

Explicit form: $y = f(x)$

Implicit form: $F(x, y) = 0$

Parametric vector form: $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j}, \quad a \le t \le b.$

We have analogous definitions of surfaces in space:

Explicit form: $z = f(x, y)$

Implicit form: $F(x, y, z) = 0.$

There is also a parametric form that gives the position of a point on the surface as a vector function of two variables. The present section extends the investigation of surface area and surface integrals to surfaces described parametrically.

## Parametrizations of Surfaces

Let

$$\mathbf{r}(u, v) = f(u, v)\mathbf{i} + g(u, v)\mathbf{j} + h(u, v)\mathbf{k} \tag{1}$$

be a continuous vector function that is defined on a region $R$ in the $uv$-plane and one-to-one on the interior of $R$ (Figure 16.50). We call the range of $\mathbf{r}$ the **surface** $S$ defined or traced by $\mathbf{r}$. Equation (1) together with the domain $R$ constitute a **parametrization** of the surface. The variables $u$ and $v$ are the **parameters**, and $R$ is the **parameter domain**.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

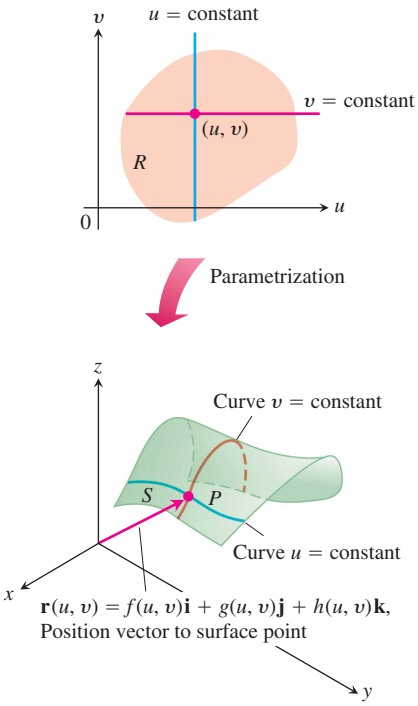

**FIGURE 16.50** A parametrized surface $S$ expressed as a vector function of two variables defined on a region $R$.

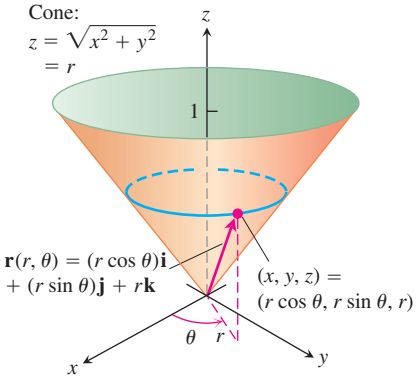

**FIGURE 16.51** The cone in Example 1 can be parametrized using cylindrical coordinates.

To simplify our discussion, we take $R$ to be a rectangle defined by inequalities of the form $a \le u \le b, c \le v \le d$. The requirement that $\mathbf{r}$ be one-to-one on the interior of $R$ ensures that $S$ does not cross itself. Notice that Equation (1) is the vector equivalent of *three* parametric equations:

$$x = f(u, v), \qquad y = g(u, v), \qquad z = h(u, v).$$

## EXAMPLE 1 Parametrizing a Cone

Find a parametrization of the cone

$$z = \sqrt{x^2 + y^2}, \qquad 0 \le z \le 1.$$

**Solution** Here, cylindrical coordinates provide everything we need. A typical point $(x, y, z)$ on the cone (Figure 16.51) has $x = r\cos\theta$, $y = r\sin\theta$, and $z = \sqrt{x^2 + y^2} = r$, with $0 \le r \le 1$ and $0 \le \theta \le 2\pi$. Taking $u = r$ and $v = \theta$ in Equation (1) gives the parametrization

$$\mathbf{r}(r, \theta) = (r\cos\theta)\mathbf{i} + (r\sin\theta)\mathbf{j} + r\mathbf{k}, \qquad 0 \le r \le 1, \quad 0 \le \theta \le 2\pi. \quad \blacksquare$$

## EXAMPLE 2 Parametrizing a Sphere

Find a parametrization of the sphere $x^2 + y^2 + z^2 = a^2$.

**Solution** Spherical coordinates provide what we need. A typical point $(x, y, z)$ on the sphere (Figure 16.52) has $x = a\sin\phi\cos\theta$, $y = a\sin\phi\sin\theta$, and $z = a\cos\phi$, $0 \le \phi \le \pi$, $0 \le \theta \le 2\pi$. Taking $u = \phi$ and $v = \theta$ in Equation (1) gives the parametrization

$$\mathbf{r}(\phi, \theta) = (a\sin\phi\cos\theta)\mathbf{i} + (a\sin\phi\sin\theta)\mathbf{j} + (a\cos\phi)\mathbf{k},$$
$$0 \le \phi \le \pi, \quad 0 \le \theta \le 2\pi. \quad \blacksquare$$

## EXAMPLE 3 Parametrizing a Cylinder

Find a parametrization of the cylinder

$$x^2 + (y - 3)^2 = 9, \qquad 0 \le z \le 5.$$

**Solution** In cylindrical coordinates, a point $(x, y, z)$ has $x = r\cos\theta$, $y = r\sin\theta$, and $z = z$. For points on the cylinder $x^2 + (y - 3)^2 = 9$ (Figure 16.53), the equation is the same as the polar equation for the cylinder's base in the $xy$-plane:

$$x^2 + (y^2 - 6y + 9) = 9$$
$$r^2 - 6r\sin\theta = 0$$

or

$$r = 6\sin\theta, \qquad 0 \le \theta \le \pi.$$

A typical point on the cylinder therefore has

$$x = r\cos\theta = 6\sin\theta\cos\theta = 3\sin 2\theta$$
$$y = r\sin\theta = 6\sin^2\theta$$
$$z = z.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

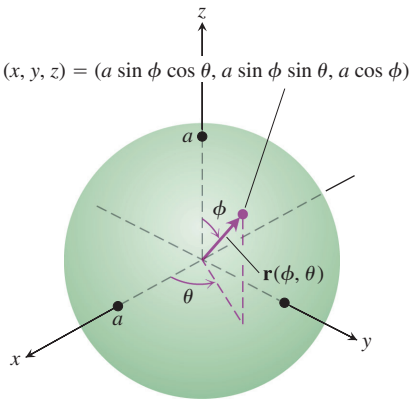

**FIGURE 16.52** The sphere in Example 2 can be parametrized using spherical coordinates.

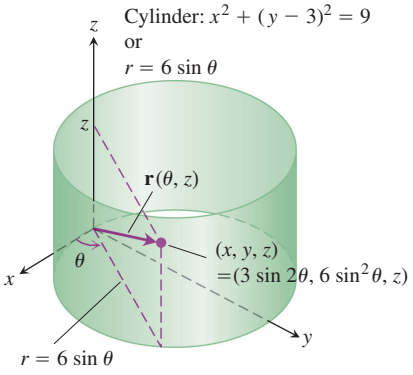

**FIGURE 16.53** The cylinder in Example 3 can be parametrized using cylindrical coordinates.

Taking $u = \theta$ and $v = z$ in Equation (1) gives the parametrization

$$\mathbf{r}(\theta, z) = (3 \sin 2\theta)\mathbf{i} + (6 \sin^2 \theta)\mathbf{j} + z\mathbf{k}, \quad 0 \le \theta \le \pi, \quad 0 \le z \le 5.$$ ■

## Surface Area

Our goal is to find a double integral for calculating the area of a curved surface $S$ based on the parametrization

$$\mathbf{r}(u, v) = f(u, v)\mathbf{i} + g(u, v)\mathbf{j} + h(u, v)\mathbf{k}, \qquad a \le u \le b, \quad c \le v \le d.$$

We need $S$ to be smooth for the construction we are about to carry out. The definition of smoothness involves the partial derivatives of $\mathbf{r}$ with respect to $u$ and $v$:

$$\mathbf{r}_u = \frac{\partial \mathbf{r}}{\partial u} = \frac{\partial f}{\partial u}\mathbf{i} + \frac{\partial g}{\partial u}\mathbf{j} + \frac{\partial h}{\partial u}\mathbf{k}$$

$$\mathbf{r}_v = \frac{\partial \mathbf{r}}{\partial v} = \frac{\partial f}{\partial v}\mathbf{i} + \frac{\partial g}{\partial v}\mathbf{j} + \frac{\partial h}{\partial v}\mathbf{k}.$$

**DEFINITION Smooth Parametrized Surface**

A parametrized surface $\mathbf{r}(u, v) = f(u, v)\mathbf{i} + g(u, v)\mathbf{j} + h(u, v)\mathbf{k}$ is **smooth** if $\mathbf{r}_u$ and $\mathbf{r}_v$ are continuous and $\mathbf{r}_u \times \mathbf{r}_v$ is never zero on the parameter domain.

The condition that $\mathbf{r}_u \times \mathbf{r}_v$ is never the zero vector in the definition of smoothness means that the two vectors $\mathbf{r}_u$ and $\mathbf{r}_v$ are nonzero and never lie along the same line, so they always determine a plane tangent to the surface.

Now consider a small rectangle $\Delta A_{uv}$ in $R$ with sides on the lines $u = u_0$, $u = u_0 + \Delta u$, $v = v_0$ and $v = v_0 + \Delta v$ (Figure 16.54). Each side of $\Delta A_{uv}$ maps to a curve on the surface $S$, and together these four curves bound a "curved area element" $\Delta\sigma_{uv}$. In the notation of the figure, the side $v = v_0$ maps to curve $C_1$, the side $u = u_0$ maps to $C_2$, and their common vertex $(u_0, v_0)$ maps to $P_0$.

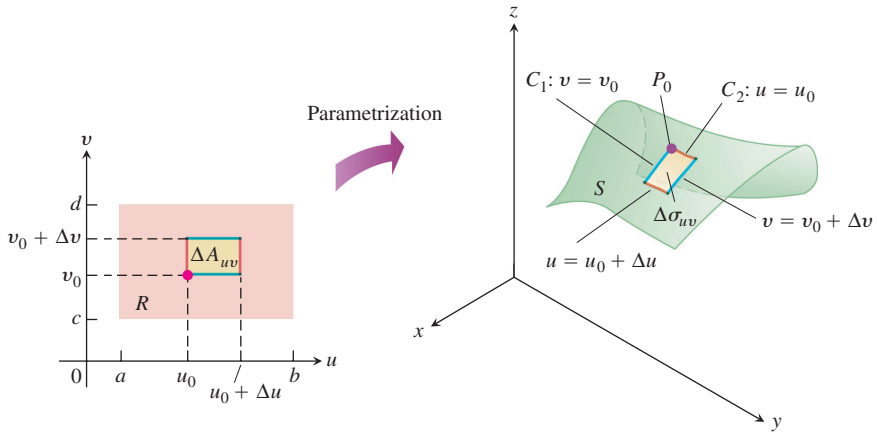

**FIGURE 16.54** A rectangular area element $\Delta A_{uv}$ in the $uv$-plane maps onto a curved area element $\Delta\sigma_{uv}$ on $S$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

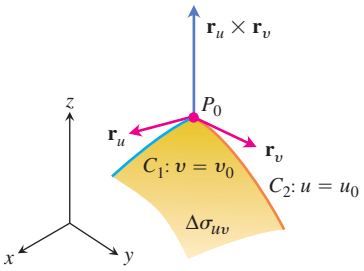

**FIGURE 16.55** A magnified view of a surface area element $\Delta\sigma_{uv}$.

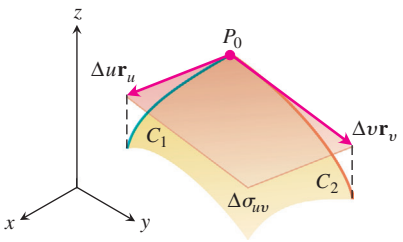

**FIGURE 16.56** The parallelogram determined by the vectors $\Delta u\mathbf{r}_u$ and $\Delta v\mathbf{r}_v$ approximates the surface area element $\Delta\sigma_{uv}$.

Figure 16.55 shows an enlarged view of $\Delta\sigma_{uv}$. The vector $\mathbf{r}_u(u_0, v_0)$ is tangent to $C_1$ at $P_0$. Likewise, $\mathbf{r}_v(u_0, v_0)$ is tangent to $C_2$ at $P_0$. The cross product $\mathbf{r}_u \times \mathbf{r}_v$ is normal to the surface at $P_0$. (Here is where we begin to use the assumption that $S$ is smooth. We want to be sure that $\mathbf{r}_u \times \mathbf{r}_v \neq \mathbf{0}$.)

We next approximate the surface element $\Delta\sigma_{uv}$ by the parallelogram on the tangent plane whose sides are determined by the vectors $\Delta u\mathbf{r}_u$ and $\Delta v\mathbf{r}_v$ (Figure 16.56). The area of this parallelogram is

$$|\Delta u\mathbf{r}_u \times \Delta v\mathbf{r}_v| = |\mathbf{r}_u \times \mathbf{r}_v|\,\Delta u\,\Delta v. \tag{2}$$

A partition of the region $R$ in the $uv$-plane by rectangular regions $\Delta A_{uv}$ generates a partition of the surface $S$ into surface area elements $\Delta\sigma_{uv}$. We approximate the area of each surface element $\Delta\sigma_{uv}$ by the parallelogram area in Equation (2) and sum these areas together to obtain an approximation of the area of $S$:

$$\sum_u \sum_v |\mathbf{r}_u \times \mathbf{r}_v|\,\Delta u\,\Delta v. \tag{3}$$

As $\Delta u$ and $\Delta v$ approach zero independently, the continuity of $\mathbf{r}_u$ and $\mathbf{r}_v$ guarantees that the sum in Equation (3) approaches the double integral $\int_c^d \int_a^b |\mathbf{r}_u \times \mathbf{r}_v|\,du\,dv$. This double integral defines the area of the surface $S$ and agrees with previous definitions of area, though it is more general.

**DEFINITION Area of a Smooth Surface**

The **area** of the smooth surface

$$\mathbf{r}(u, v) = f(u, v)\mathbf{i} + g(u, v)\mathbf{j} + h(u, v)\mathbf{k}, \qquad a \le u \le b, \quad c \le v \le d$$

is

$$A = \int_c^d \int_a^b |\mathbf{r}_u \times \mathbf{r}_v|\,du\,dv. \tag{4}$$

As in Section 16.5, we can abbreviate the integral in Equation (4) by writing $d\sigma$ for $|\mathbf{r}_u \times \mathbf{r}_v|\,du\,dv$.

**Surface Area Differential and Differential Formula for Surface Area**

$$d\sigma = |\mathbf{r}_u \times \mathbf{r}_v|\,du\,dv \qquad \iint_S d\sigma \tag{5}$$

Surface area differential — Differential formula for surface area

**EXAMPLE 4** Finding Surface Area (Cone)

Find the surface area of the cone in Example 1 (Figure 16.51).

**Solution** In Example 1, we found the parametrization

$$\mathbf{r}(r, \theta) = (r\cos\theta)\mathbf{i} + (r\sin\theta)\mathbf{j} + r\mathbf{k}, \qquad 0 \le r \le 1, \quad 0 \le \theta \le 2\pi.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

To apply Equation (4), we first find $\mathbf{r}_r \times \mathbf{r}_\theta$:

$$\mathbf{r}_r \times \mathbf{r}_\theta = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \cos\theta & \sin\theta & 1 \\ -r\sin\theta & r\cos\theta & 0 \end{vmatrix}$$
$$= -(r\cos\theta)\mathbf{i} - (r\sin\theta)\mathbf{j} + \underbrace{(r\cos^2\theta + r\sin^2\theta)}_{r}\mathbf{k}.$$

Thus, $|\mathbf{r}_r \times \mathbf{r}_\theta| = \sqrt{r^2\cos^2\theta + r^2\sin^2\theta + r^2} = \sqrt{2r^2} = \sqrt{2}r$. The area of the cone is

$$A = \int_0^{2\pi}\int_0^1 |\mathbf{r}_r \times \mathbf{r}_\theta|\, dr\, d\theta \qquad \text{Equation (4) with } u = r,\ v = \theta$$
$$= \int_0^{2\pi}\int_0^1 \sqrt{2}\, r\, dr\, d\theta = \int_0^{2\pi} \frac{\sqrt{2}}{2}\, d\theta = \frac{\sqrt{2}}{2}(2\pi) = \pi\sqrt{2} \text{ units squared.}$$ ■

**EXAMPLE 5** Finding Surface Area (Sphere)

Find the surface area of a sphere of radius $a$.

**Solution** We use the parametrization from Example 2:

$$\mathbf{r}(\phi, \theta) = (a\sin\phi\cos\theta)\mathbf{i} + (a\sin\phi\sin\theta)\mathbf{j} + (a\cos\phi)\mathbf{k},$$
$$0 \le \phi \le \pi, \quad 0 \le \theta \le 2\pi.$$

For $\mathbf{r}_\phi \times \mathbf{r}_\theta$, we get

$$\mathbf{r}_\phi \times \mathbf{r}_\theta = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a\cos\phi\cos\theta & a\cos\phi\sin\theta & -a\sin\phi \\ -a\sin\phi\sin\theta & a\sin\phi\cos\theta & 0 \end{vmatrix}$$
$$= (a^2\sin^2\phi\cos\theta)\mathbf{i} + (a^2\sin^2\phi\sin\theta)\mathbf{j} + (a^2\sin\phi\cos\phi)\mathbf{k}.$$

Thus,

$$|\mathbf{r}_\phi \times \mathbf{r}_\theta| = \sqrt{a^4\sin^4\phi\cos^2\theta + a^4\sin^4\phi\sin^2\theta + a^4\sin^2\phi\cos^2\phi}$$
$$= \sqrt{a^4\sin^4\phi + a^4\sin^2\phi\cos^2\phi} = \sqrt{a^4\sin^2\phi(\sin^2\phi + \cos^2\phi)}$$
$$= a^2\sqrt{\sin^2\phi} = a^2\sin\phi,$$

since $\sin\phi \ge 0$ for $0 \le \phi \le \pi$. Therefore, the area of the sphere is

$$A = \int_0^{2\pi}\int_0^{\pi} a^2\sin\phi\, d\phi\, d\theta$$
$$= \int_0^{2\pi}\Big[-a^2\cos\phi\Big]_0^{\pi} d\theta = \int_0^{2\pi} 2a^2\, d\theta = 4\pi a^2 \text{ units squared.}$$

This agrees with the well-known formula for the surface area of a sphere. ■

## Surface Integrals

Having found a formula for calculating the area of a parametrized surface, we can now integrate a function over the surface using the parametrized form.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**DEFINITION Parametric Surface Integral**

If $S$ is a smooth surface defined parametrically as $\mathbf{r}(u, v) = f(u, v)\mathbf{i} + g(u, v)\mathbf{j} + h(u, v)\mathbf{k}$, $a \le u \le b$, $c \le v \le d$, and $G(x, y, z)$ is a continuous function defined on $S$, then the **integral of $G$ over $S$** is

$$\iint_S G(x, y, z)\, d\sigma = \int_c^d \int_a^b G(f(u, v), g(u, v), h(u, v))|\mathbf{r}_u \times \mathbf{r}_v|\, du\, dv.$$

**EXAMPLE 6** Integrating Over a Surface Defined Parametrically

Integrate $G(x, y, z) = x^2$ over the cone $z = \sqrt{x^2 + y^2}$, $0 \le z \le 1$.

**Solution** Continuing the work in Examples 1 and 4, we have $|\mathbf{r}_r \times \mathbf{r}_\theta| = \sqrt{2}r$ and

$$\iint_S x^2\, d\sigma = \int_0^{2\pi} \int_0^1 \left(r^2 \cos^2\theta\right)\left(\sqrt{2}r\right) dr\, d\theta \qquad x = r\cos\theta$$

$$= \sqrt{2}\int_0^{2\pi} \int_0^1 r^3 \cos^2\theta\, dr\, d\theta$$

$$= \frac{\sqrt{2}}{4}\int_0^{2\pi} \cos^2\theta\, d\theta = \frac{\sqrt{2}}{4}\left[\frac{\theta}{2} + \frac{1}{4}\sin 2\theta\right]_0^{2\pi} = \frac{\pi\sqrt{2}}{4}.$$

**EXAMPLE 7** Finding Flux

Find the flux of $\mathbf{F} = yz\mathbf{i} + x\mathbf{j} - z^2\mathbf{k}$ outward through the parabolic cylinder $y = x^2$, $0 \le x \le 1$, $0 \le z \le 4$ (Figure 16.57).

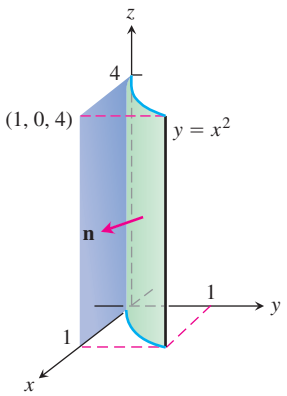

**FIGURE 16.57** Finding the flux through the surface of a parabolic cylinder (Example 7).

**Solution** On the surface we have $x = x$, $y = x^2$, and $z = z$, so we automatically have the parametrization $\mathbf{r}(x, z) = x\mathbf{i} + x^2\mathbf{j} + z\mathbf{k}$, $0 \le x \le 1$, $0 \le z \le 4$. The cross product of tangent vectors is

$$\mathbf{r}_x \times \mathbf{r}_z = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2x & 0 \\ 0 & 0 & 1 \end{vmatrix} = 2x\mathbf{i} - \mathbf{j}.$$

The unit normal pointing outward from the surface is

$$\mathbf{n} = \frac{\mathbf{r}_x \times \mathbf{r}_z}{|\mathbf{r}_x \times \mathbf{r}_z|} = \frac{2x\mathbf{i} - \mathbf{j}}{\sqrt{4x^2 + 1}}.$$

On the surface, $y = x^2$, so the vector field there is

$$\mathbf{F} = yz\mathbf{i} + x\mathbf{j} - z^2\mathbf{k} = x^2z\mathbf{i} + x\mathbf{j} - z^2\mathbf{k}.$$

Thus,

$$\mathbf{F} \cdot \mathbf{n} = \frac{1}{\sqrt{4x^2 + 1}}\left((x^2z)(2x) + (x)(-1) + (-z^2)(0)\right)$$

$$= \frac{2x^3z - x}{\sqrt{4x^2 + 1}}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The flux of $\mathbf{F}$ outward through the surface is

$$\iint_S \mathbf{F}\cdot\mathbf{n}\,d\sigma = \int_0^4\int_0^1 \frac{2x^3z - x}{\sqrt{4x^2+1}}\,|\mathbf{r}_x \times \mathbf{r}_z|\,dx\,dz$$

$$= \int_0^4\int_0^1 \frac{2x^3z - x}{\sqrt{4x^2+1}}\sqrt{4x^2+1}\,dx\,dz$$

$$= \int_0^4\int_0^1 (2x^3z - x)\,dx\,dz = \int_0^4 \left[\frac{1}{2}x^4z - \frac{1}{2}x^2\right]_{x=0}^{x=1} dz$$

$$= \int_0^4 \frac{1}{2}(z-1)\,dz = \frac{1}{4}(z-1)^2\Big]_0^4$$

$$= \frac{1}{4}(9) - \frac{1}{4}(1) = 2. \quad \blacksquare$$

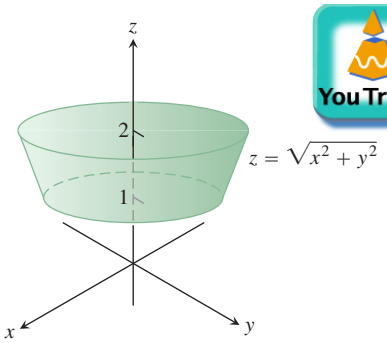

**FIGURE 16.58** The cone frustum formed when the cone $z = \sqrt{x^2+y^2}$ is cut by the planes $z = 1$ and $z = 2$ (Example 8).

## EXAMPLE 8 Finding a Center of Mass

Find the center of mass of a thin shell of constant density $\delta$ cut from the cone $z = \sqrt{x^2+y^2}$ by the planes $z = 1$ and $z = 2$ (Figure 16.58).

**Solution** The symmetry of the surface about the $z$-axis tells us that $\bar{x} = \bar{y} = 0$. We find $\bar{z} = M_{xy}/M$. Working as in Examples 1 and 4, we have

$$\mathbf{r}(r,\theta) = r\cos\theta\,\mathbf{i} + r\sin\theta\,\mathbf{j} + r\mathbf{k}, \qquad 1 \le r \le 2, \quad 0 \le \theta \le 2\pi,$$

and

$$|\mathbf{r}_r \times \mathbf{r}_\theta| = \sqrt{2}r.$$

Therefore,

$$M = \iint_S \delta\,d\sigma = \int_0^{2\pi}\int_1^2 \delta\sqrt{2}r\,dr\,d\theta$$

$$= \delta\sqrt{2}\int_0^{2\pi}\left[\frac{r^2}{2}\right]_1^2 d\theta = \delta\sqrt{2}\int_0^{2\pi}\left(2 - \frac{1}{2}\right)d\theta$$

$$= \delta\sqrt{2}\left[\frac{3\theta}{2}\right]_0^{2\pi} = 3\pi\delta\sqrt{2}$$

$$M_{xy} = \iint_S \delta z\,d\sigma = \int_0^{2\pi}\int_1^2 \delta r\sqrt{2}r\,dr\,d\theta$$

$$= \delta\sqrt{2}\int_0^{2\pi}\int_1^2 r^2\,dr\,d\theta = \delta\sqrt{2}\int_0^{2\pi}\left[\frac{r^3}{3}\right]_1^2 d\theta$$

$$= \delta\sqrt{2}\int_0^{2\pi}\frac{7}{3}\,d\theta = \frac{14}{3}\pi\delta\sqrt{2}$$

$$\bar{z} = \frac{M_{xy}}{M} = \frac{14\pi\delta\sqrt{2}}{3\left(3\pi\delta\sqrt{2}\right)} = \frac{14}{9}.$$

The shell's center of mass is the point $(0, 0, 14/9)$. $\blacksquare$

# EXERCISES 16.6

## Finding Parametrizations for Surfaces

In Exercises 1–16, find a parametrization of the surface. (There are many correct ways to do these, so your answers may not be the same as those in the back of the book.)

1. The paraboloid $z = x^2 + y^2, z \le 4$
2. The paraboloid $z = 9 - x^2 - y^2, z \ge 0$
3. **Cone frustum** The first-octant portion of the cone $z = \sqrt{x^2 + y^2}/2$ between the planes $z = 0$ and $z = 3$
4. **Cone frustum** The portion of the cone $z = 2\sqrt{x^2 + y^2}$ between the planes $z = 2$ and $z = 4$
5. **Spherical cap** The cap cut from the sphere $x^2 + y^2 + z^2 = 9$ by the cone $z = \sqrt{x^2 + y^2}$
6. **Spherical cap** The portion of the sphere $x^2 + y^2 + z^2 = 4$ in the first octant between the $xy$-plane and the cone $z = \sqrt{x^2 + y^2}$
7. **Spherical band** The portion of the sphere $x^2 + y^2 + z^2 = 3$ between the planes $z = \sqrt{3}/2$ and $z = -\sqrt{3}/2$
8. **Spherical cap** The upper portion cut from the sphere $x^2 + y^2 + z^2 = 8$ by the plane $z = -2$
9. **Parabolic cylinder between planes** The surface cut from the parabolic cylinder $z = 4 - y^2$ by the planes $x = 0, x = 2$, and $z = 0$
10. **Parabolic cylinder between planes** The surface cut from the parabolic cylinder $y = x^2$ by the planes $z = 0, z = 3$ and $y = 2$
11. **Circular cylinder band** The portion of the cylinder $y^2 + z^2 = 9$ between the planes $x = 0$ and $x = 3$
12. **Circular cylinder band** The portion of the cylinder $x^2 + z^2 = 4$ above the $xy$-plane between the planes $y = -2$ and $y = 2$
13. **Tilted plane inside cylinder** The portion of the plane $x + y + z = 1$
    a. Inside the cylinder $x^2 + y^2 = 9$
    b. Inside the cylinder $y^2 + z^2 = 9$
14. **Tilted plane inside cylinder** The portion of the plane $x - y + 2z = 2$
    a. Inside the cylinder $x^2 + z^2 = 3$
    b. Inside the cylinder $y^2 + z^2 = 2$
15. **Circular cylinder band** The portion of the cylinder $(x - 2)^2 + z^2 = 4$ between the planes $y = 0$ and $y = 3$
16. **Circular cylinder band** The portion of the cylinder $y^2 + (z - 5)^2 = 25$ between the planes $x = 0$ and $x = 10$

## Areas of Parametrized Surfaces

In Exercises 17–26, use a parametrization to express the area of the surface as a double integral. Then evaluate the integral. (There are many correct ways to set up the integrals, so your integrals may not be the same as those in the back of the book. They should have the same values, however.)

17. **Titled plane inside cylinder** The portion of the plane $y + 2z = 2$ inside the cylinder $x^2 + y^2 = 1$
18. **Plane inside cylinder** The portion of the plane $z = -x$ inside the cylinder $x^2 + y^2 = 4$
19. **Cone frustum** The portion of the cone $z = 2\sqrt{x^2 + y^2}$ between the planes $z = 2$ and $z = 6$
20. **Cone frustum** The portion of the cone $z = \sqrt{x^2 + y^2}/3$ between the planes $z = 1$ and $z = 4/3$
21. **Circular cylinder band** The portion of the cylinder $x^2 + y^2 = 1$ between the planes $z = 1$ and $z = 4$
22. **Circular cylinder band** The portion of the cylinder $x^2 + z^2 = 10$ between the planes $y = -1$ and $y = 1$
23. **Parabolic cap** The cap cut from the paraboloid $z = 2 - x^2 - y^2$ by the cone $z = \sqrt{x^2 + y^2}$
24. **Parabolic band** The portion of the paraboloid $z = x^2 + y^2$ between the planes $z = 1$ and $z = 4$
25. **Sawed-off sphere** The lower portion cut from the sphere $x^2 + y^2 + z^2 = 2$ by the cone $z = \sqrt{x^2 + y^2}$
26. **Spherical band** The portion of the sphere $x^2 + y^2 + z^2 = 4$ between the planes $z = -1$ and $z = \sqrt{3}$

## Integrals Over Parametrized Surfaces

In Exercises 27–34, integrate the given function over the given surface.

27. **Parabolic cylinder** $G(x, y, z) = x$, over the parabolic cylinder $y = x^2, 0 \le x \le 2, 0 \le z \le 3$
28. **Circular cylinder** $G(x, y, z) = z$, over the cylindrical surface $y^2 + z^2 = 4, z \ge 0, 1 \le x \le 4$
29. **Sphere** $G(x, y, z) = x^2$, over the unit sphere $x^2 + y^2 + z^2 = 1$
30. **Hemisphere** $G(x, y, z) = z^2$, over the hemisphere $x^2 + y^2 + z^2 = a^2, z \ge 0$
31. **Portion of plane** $F(x, y, z) = z$, over the portion of the plane $x + y + z = 4$ that lies above the square $0 \le x \le 1$, $0 \le y \le 1$, in the $xy$-plane
32. **Cone** $F(x, y, z) = z - x$, over the cone $z = \sqrt{x^2 + y^2}$, $0 \le z \le 1$
33. **Parabolic dome** $H(x, y, z) = x^2\sqrt{5 - 4z}$, over the parabolic dome $z = 1 - x^2 - y^2, z \ge 0$
34. **Spherical cap** $H(x, y, z) = yz$, over the part of the sphere $x^2 + y^2 + z^2 = 4$ that lies above the cone $z = \sqrt{x^2 + y^2}$

## Flux Across Parametrized Surfaces

In Exercises 35–44, use a parametrization to find the flux $\iint_S \mathbf{F} \cdot \mathbf{n}\, d\sigma$ across the surface in the given direction.

Exercises

**35. Parabolic cylinder** $\mathbf{F} = z^2\mathbf{i} + x\mathbf{j} - 3z\mathbf{k}$ outward (normal away from the $x$-axis) through the surface cut from the parabolic cylinder $z = 4 - y^2$ by the planes $x = 0, x = 1$, and $z = 0$

**36. Parabolic cylinder** $\mathbf{F} = x^2\mathbf{j} - xz\mathbf{k}$ outward (normal away from the $yz$-plane) through the surface cut from the parabolic cylinder $y = x^2, -1 \le x \le 1$, by the planes $z = 0$ and $z = 2$

**37. Sphere** $\mathbf{F} = z\mathbf{k}$ across the portion of the sphere $x^2 + y^2 + z^2 = a^2$ in the first octant in the direction away from the origin

**38. Sphere** $\mathbf{F} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ across the sphere $x^2 + y^2 + z^2 = a^2$ in the direction away from the origin

**39. Plane** $\mathbf{F} = 2xy\mathbf{i} + 2yz\mathbf{j} + 2xz\mathbf{k}$ upward across the portion of the plane $x + y + z = 2a$ that lies above the square $0 \le x \le a, 0 \le y \le a$, in the $xy$-plane

**40. Cylinder** $\mathbf{F} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ outward through the portion of the cylinder $x^2 + y^2 = 1$ cut by the planes $z = 0$ and $z = a$

**41. Cone** $\mathbf{F} = xy\mathbf{i} - z\mathbf{k}$ outward (normal away from the $z$-axis) through the cone $z = \sqrt{x^2 + y^2}, 0 \le z \le 1$

**42. Cone** $\mathbf{F} = y^2\mathbf{i} + xz\mathbf{j} - \mathbf{k}$ outward (normal away from the $z$-axis) through the cone $z = 2\sqrt{x^2 + y^2}, 0 \le z \le 2$

**43. Cone frustum** $\mathbf{F} = -x\mathbf{i} - y\mathbf{j} + z^2\mathbf{k}$ outward (normal away from the $z$-axis) through the portion of the cone $z = \sqrt{x^2 + y^2}$ between the planes $z = 1$ and $z = 2$

**44. Paraboloid** $\mathbf{F} = 4x\mathbf{i} + 4y\mathbf{j} + 2\mathbf{k}$ outward (normal way from the $z$-axis) through the surface cut from the bottom of the paraboloid $z = x^2 + y^2$ by the plane $z = 1$

## Moments and Masses

Exercises

**45.** Find the centroid of the portion of the sphere $x^2 + y^2 + z^2 = a^2$ that lies in the first octant.

**46.** Find the center of mass and the moment of inertia and radius of gyration about the $z$-axis of a thin shell of constant density $\delta$ cut from the cone $x^2 + y^2 - z^2 = 0$ by the planes $z = 1$ and $z = 2$.

**47.** Find the moment of inertia about the $z$-axis of a thin spherical shell $x^2 + y^2 + z^2 = a^2$ of constant density $\delta$.

**48.** Find the moment of inertia about the $z$-axis of a thin conical shell $z = \sqrt{x^2 + y^2}, 0 \le z \le 1$, of constant density $\delta$.

## Planes Tangent to Parametrized Surfaces

The tangent plane at a point $P_0(f(u_0, v_0), g(u_0, v_0), h(u_0, v_0))$ on a parametrized surface $\mathbf{r}(u, v) = f(u, v)\mathbf{i} + g(u, v)\mathbf{j} + h(u, v)\mathbf{k}$ is the plane through $P_0$ normal to the vector $\mathbf{r}_u(u_0, v_0) \times \mathbf{r}_v(u_0, v_0)$, the cross product of the tangent vectors $\mathbf{r}_u(u_0, v_0)$ and $\mathbf{r}_v(u_0, v_0)$ at $P_0$. In Exercises 49–52, find an equation for the plane tangent to the surface at $P_0$. Then find a Cartesian equation for the surface and sketch the surface and tangent plane together.

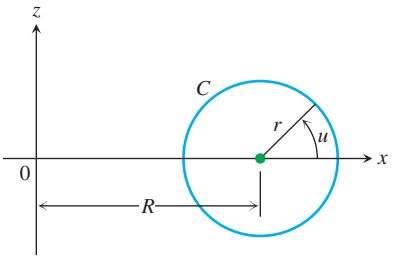
Exercises

**49. Cone** The cone $\mathbf{r}(r, \theta) = (r\cos\theta)\mathbf{i} + (r\sin\theta)\mathbf{j} + r\mathbf{k}, r \ge 0, 0 \le \theta \le 2\pi$ at the point $P_0\left(\sqrt{2}, \sqrt{2}, 2\right)$ corresponding to $(r, \theta) = (2, \pi/4)$

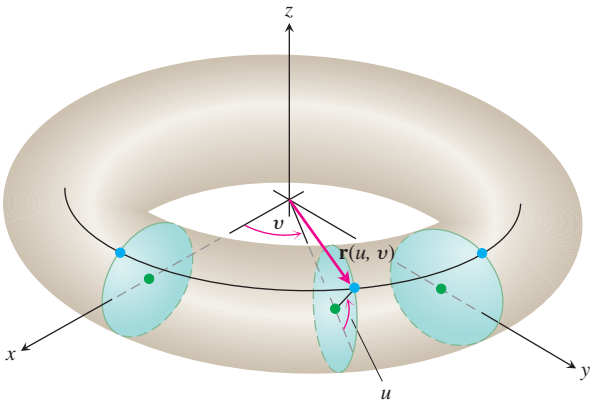
**50. Hemisphere** The hemisphere surface $\mathbf{r}(\phi, \theta) = (4\sin\phi\cos\theta)\mathbf{i} + (4\sin\phi\sin\theta)\mathbf{j} + (4\cos\phi)\mathbf{k}, 0 \le \phi \le \pi/2, 0 \le \theta \le 2\pi$, at the point $P_0\left(\sqrt{2}, \sqrt{2}, 2\sqrt{3}\right)$ corresponding to $(\phi, \theta) = (\pi/6, \pi/4)$

**51. Circular cylinder** The circular cylinder $\mathbf{r}(\theta, z) = (3\sin 2\theta)\mathbf{i} + (6\sin^2\theta)\mathbf{j} + z\mathbf{k}, 0 \le \theta \le \pi$, at the point $P_0\left(3\sqrt{3}/2, 9/2, 0\right)$ corresponding to $(\theta, z) = (\pi/3, 0)$ (See Example 3.)

**52. Parabolic cylinder** The parabolic cylinder surface $\mathbf{r}(x, y) = x\mathbf{i} + y\mathbf{j} - x^2\mathbf{k}, -\infty < x < \infty, -\infty < y < \infty$, at the point $P_0(1, 2, -1)$ corresponding to $(x, y) = (1, 2)$



## Further Examples of Parametrizations

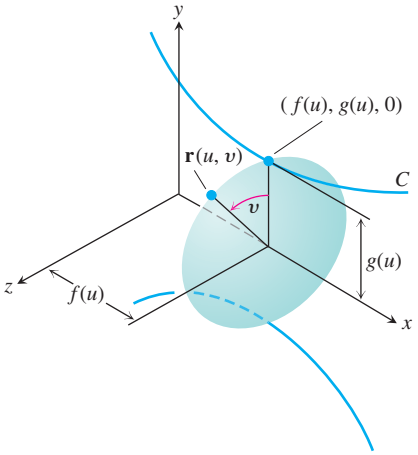


**53. a.** A *torus of revolution* (doughnut) is obtained by rotating a circle $C$ in the $xz$-plane about the $z$-axis in space. (See the accompanying figure.) If $C$ has radius $r > 0$ and center $(R, 0, 0)$, show that a parametrization of the torus is

$$\mathbf{r}(u, v) = ((R + r\cos u)\cos v)\mathbf{i} + ((R + r\cos u)\sin v)\mathbf{j} + (r\sin u)\mathbf{k},$$

where $0 \le u \le 2\pi$ and $0 \le v \le 2\pi$ are the angles in the figure.

**b.** Show that the surface area of the torus is $A = 4\pi^2 Rr$.



Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**54. Parametrization of a surface of revolution** Suppose that the parametrized curve $C$: $(f(u), g(u))$ is revolved about the $x$-axis, where $g(u) > 0$ for $a \le u \le b$.

**a.** Show that

$$\mathbf{r}(u, v) = f(u)\mathbf{i} + (g(u)\cos v)\mathbf{j} + (g(u)\sin v)\mathbf{k}$$

is a parametrization of the resulting surface of revolution, where $0 \le v \le 2\pi$ is the angle from the $xy$-plane to the point $\mathbf{r}(u, v)$ on the surface. (See the accompanying figure.) Notice that $f(u)$ measures distance *along* the axis of revolution and $g(u)$ measures distance *from* the axis of revolution.

**b.** Find a parametrization for the surface obtained by revolving the curve $x = y^2, y \ge 0$, about the $x$-axis.

**55. a. Parametrization of an ellipsoid** Recall the parametrization $x = a\cos\theta, y = b\sin\theta, 0 \le \theta \le 2\pi$ for the ellipse $(x^2/a^2) + (y^2/b^2) = 1$ (Section 3.5, Example 13). Using the angles $\theta$ and $\phi$ in spherical coordinates, show that

$$\mathbf{r}(\theta, \phi) = (a\cos\theta\cos\phi)\mathbf{i} + (b\sin\theta\cos\phi)\mathbf{j} + (c\sin\phi)\mathbf{k}$$

is a parametrization of the ellipsoid $(x^2/a^2) + (y^2/b^2) + (z^2/c^2) = 1$.

**b.** Write an integral for the surface area of the ellipsoid, but do not evaluate the integral.

**56. Hyperboloid of one sheet**

**a.** Find a parametrization for the hyperboloid of one sheet $x^2 + y^2 - z^2 = 1$ in terms of the angle $\theta$ associated with the circle $x^2 + y^2 = r^2$ and the hyperbolic parameter $u$ associated with the hyperbolic function $r^2 - z^2 = 1$. (See Section 7.8, Exercise 84.)

**b.** Generalize the result in part (a) to the hyperboloid $(x^2/a^2) + (y^2/b^2) - (z^2/c^2) = 1$.

**57.** (*Continuation of Exercise 56.*) Find a Cartesian equation for the plane tangent to the hyperboloid $x^2 + y^2 - z^2 = 25$ at the point $(x_0, y_0, 0)$, where $x_0^2 + y_0^2 = 25$.

**58. Hyperboloid of two sheets** Find a parametrization of the hyperboloid of two sheets $(z^2/c^2) - (x^2/a^2) - (y^2/b^2) = 1$.

# 16.7 Stokes' Theorem

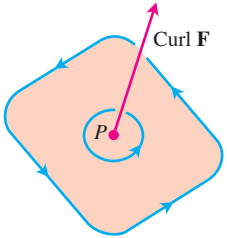

**FIGURE 16.59** The circulation vector at a point $P$ in a plane in a three-dimensional fluid flow. Notice its right-hand relation to the circulation line.

As we saw in Section 16.4, the circulation density or curl component of a two-dimensional field $\mathbf{F} = M\mathbf{i} + N\mathbf{j}$ at a point $(x, y)$ is described by the scalar quantity $(\partial N/\partial x - \partial M/\partial y)$. In three dimensions, the circulation around a point $P$ in a plane is described with a vector. This vector is normal to the plane of the circulation (Figure 16.59) and points in the direction that gives it a right-hand relation to the circulation line. The length of the vector gives the rate of the fluid's rotation, which usually varies as the circulation plane is tilted about $P$. It turns out that the vector of greatest circulation in a flow with velocity field $\mathbf{F} = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$ is the **curl vector**

$$\text{curl } \mathbf{F} = \left(\frac{\partial P}{\partial y} - \frac{\partial N}{\partial z}\right)\mathbf{i} + \left(\frac{\partial M}{\partial z} - \frac{\partial P}{\partial x}\right)\mathbf{j} + \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right)\mathbf{k}. \tag{1}$$

We get this information from Stokes' Theorem, the generalization of the circulation-curl form of Green's Theorem to space.

Notice that $(\text{curl } \mathbf{F}) \cdot \mathbf{k} = (\partial N/\partial x - \partial M/\partial y)$ is consistent with our definition in Section 16.4 when $\mathbf{F} = M(x, y)\mathbf{i} + N(x, y)\mathbf{j}$. The formula for curl $\mathbf{F}$ in Equation (1) is often written using the symbolic operator

$$\nabla = \mathbf{i}\frac{\partial}{\partial x} + \mathbf{j}\frac{\partial}{\partial y} + \mathbf{k}\frac{\partial}{\partial z}. \tag{2}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(The symbol $\nabla$ is pronounced "del.") The curl of $\mathbf{F}$ is $\nabla \times \mathbf{F}$:

$$\nabla \times \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \dfrac{\partial}{\partial x} & \dfrac{\partial}{\partial y} & \dfrac{\partial}{\partial z} \\ M & N & P \end{vmatrix}$$

$$= \left(\frac{\partial P}{\partial y} - \frac{\partial N}{\partial z}\right)\mathbf{i} + \left(\frac{\partial M}{\partial z} - \frac{\partial P}{\partial x}\right)\mathbf{j} + \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right)\mathbf{k}$$

$$= \text{curl } \mathbf{F}.$$

$$\text{curl } \mathbf{F} = \nabla \times \mathbf{F} \qquad (3)$$

**EXAMPLE 1** Finding Curl $\mathbf{F}$

Find the curl of $\mathbf{F} = (x^2 - y)\mathbf{i} + 4z\mathbf{j} + x^2\mathbf{k}$.

**Solution**

$$\text{curl } \mathbf{F} = \nabla \times \mathbf{F} \qquad \text{Equation (3)}$$

$$= \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \dfrac{\partial}{\partial x} & \dfrac{\partial}{\partial y} & \dfrac{\partial}{\partial z} \\ x^2 - y & 4z & x^2 \end{vmatrix}$$

$$= \left(\frac{\partial}{\partial y}(x^2) - \frac{\partial}{\partial z}(4z)\right)\mathbf{i} - \left(\frac{\partial}{\partial x}(x^2) - \frac{\partial}{\partial z}(x^2 - y)\right)\mathbf{j}$$

$$+ \left(\frac{\partial}{\partial x}(4z) - \frac{\partial}{\partial y}(x^2 - y)\right)\mathbf{k}$$

$$= (0 - 4)\mathbf{i} - (2x - 0)\mathbf{j} + (0 + 1)\mathbf{k}$$

$$= -4\mathbf{i} - 2x\mathbf{j} + \mathbf{k}$$

■

As we will see, the operator $\nabla$ has a number of other applications. For instance, when applied to a scalar function $f(x, y, z)$, it gives the gradient of $f$:

$$\nabla f = \frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j} + \frac{\partial f}{\partial z}\mathbf{k}.$$

This may now be read as "del $f$" as well as "grad $f$."

## Stokes' Theorem

Stokes' Theorem says that, under conditions normally met in practice, the circulation of a vector field around the boundary of an oriented surface in space in the direction counterclockwise with respect to the surface's unit normal vector field $\mathbf{n}$ (Figure 16.60) equals the integral of the normal component of the curl of the field over the surface.

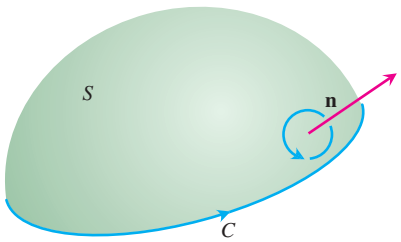

**FIGURE 16.60** The orientation of the bounding curve $C$ gives it a right-handed relation to the normal field $\mathbf{n}$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**THEOREM 5 Stokes' Theorem**

The circulation of a vector field $\mathbf{F} = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$ around the boundary $C$ of an oriented surface $S$ in the direction counterclockwise with respect to the surface's unit normal vector $\mathbf{n}$ equals the integral of $\nabla \times \mathbf{F} \cdot \mathbf{n}$ over $S$.

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n}\, d\sigma \tag{4}$$

Counterclockwise circulation — Curl integral

Notice from Equation (4) that if two different oriented surfaces $S_1$ and $S_2$ have the same boundary $C$, their curl integrals are equal:

$$\iint_{S_1} \nabla \times \mathbf{F} \cdot \mathbf{n}_1\, d\sigma = \iint_{S_2} \nabla \times \mathbf{F} \cdot \mathbf{n}_2\, d\sigma.$$

Both curl integrals equal the counterclockwise circulation integral on the left side of Equation (4) as long as the unit normal vectors $\mathbf{n}_1$ and $\mathbf{n}_2$ correctly orient the surfaces.

Naturally, we need some mathematical restrictions on $\mathbf{F}$, $C$, and $S$ to ensure the existence of the integrals in Stokes' equation. The usual restrictions are that all functions, vector fields, and their derivatives be continuous.

If $C$ is a curve in the $xy$-plane, oriented counterclockwise, and $R$ is the region in the $xy$-plane bounded by $C$, then $d\sigma = dx\, dy$ and

$$(\nabla \times \mathbf{F}) \cdot \mathbf{n} = (\nabla \times \mathbf{F}) \cdot \mathbf{k} = \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right).$$

Under these conditions, Stokes' equation becomes

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dx\, dy,$$

which is the circulation-curl form of the equation in Green's Theorem. Conversely, by reversing these steps we can rewrite the circulation-curl form of Green's Theorem for two-dimensional fields in del notation as

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_R \nabla \times \mathbf{F} \cdot \mathbf{k}\, dA. \tag{5}$$

See Figure 16.61.

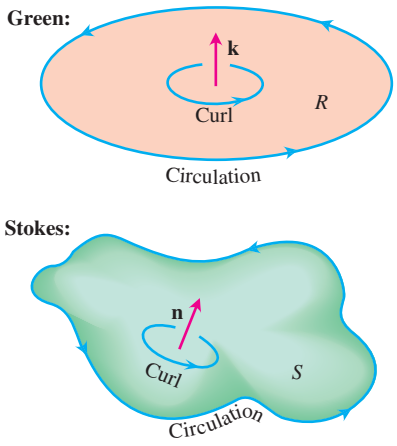

**FIGURE 16.61** Comparison of Green's Theorem and Stokes' Theorem.

**EXAMPLE 2** Verifying Stokes' Equation for a Hemisphere

Evaluate Equation (4) for the hemisphere $S$: $x^2 + y^2 + z^2 = 9, z \geq 0$, its bounding circle $C$: $x^2 + y^2 = 9, z = 0$, and the field $\mathbf{F} = y\mathbf{i} - x\mathbf{j}$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** We calculate the counterclockwise circulation around $C$ (as viewed from above) using the parametrization $\mathbf{r}(\theta) = (3\cos\theta)\mathbf{i} + (3\sin\theta)\mathbf{j}$, $0 \le \theta \le 2\pi$:

$$d\mathbf{r} = (-3\sin\theta\, d\theta)\mathbf{i} + (3\cos\theta\, d\theta)\mathbf{j}$$

$$\mathbf{F} = y\mathbf{i} - x\mathbf{j} = (3\sin\theta)\mathbf{i} - (3\cos\theta)\mathbf{j}$$

$$\mathbf{F}\cdot d\mathbf{r} = -9\sin^2\theta\, d\theta - 9\cos^2\theta\, d\theta = -9\, d\theta$$

$$\oint_C \mathbf{F}\cdot d\mathbf{r} = \int_0^{2\pi} -9\, d\theta = -18\pi.$$

For the curl integral of $\mathbf{F}$, we have

$$\nabla\times\mathbf{F} = \left(\frac{\partial P}{\partial y} - \frac{\partial N}{\partial z}\right)\mathbf{i} + \left(\frac{\partial M}{\partial z} - \frac{\partial P}{\partial x}\right)\mathbf{j} + \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right)\mathbf{k}$$

$$= (0-0)\mathbf{i} + (0-0)\mathbf{j} + (-1-1)\mathbf{k} = -2\mathbf{k}$$

$$\mathbf{n} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\sqrt{x^2+y^2+z^2}} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{3}$$ Outer unit normal

$$d\sigma = \frac{3}{z}\, dA$$ Section 16.5, Example 5, with $a = 3$

$$\nabla\times\mathbf{F}\cdot\mathbf{n}\, d\sigma = -\frac{2z}{3}\frac{3}{z}\, dA = -2\, dA$$

and

$$\iint_S \nabla\times\mathbf{F}\cdot\mathbf{n}\, d\sigma = \iint_{x^2+y^2\le 9} -2\, dA = -18\pi.$$

The circulation around the circle equals the integral of the curl over the hemisphere, as it should. ■

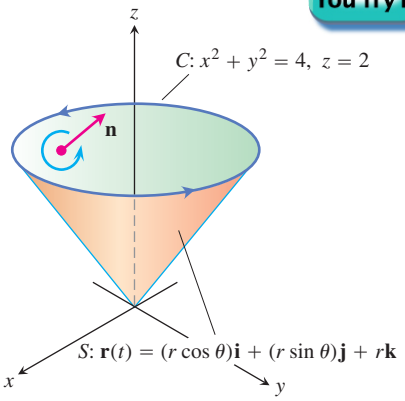

**FIGURE 16.62** The curve $C$ and cone $S$ in Example 3.

## EXAMPLE 3 Finding Circulation

Find the circulation of the field $\mathbf{F} = (x^2 - y)\mathbf{i} + 4z\mathbf{j} + x^2\mathbf{k}$ around the curve $C$ in which the plane $z = 2$ meets the cone $z = \sqrt{x^2+y^2}$, counterclockwise as viewed from above (Figure 16.62).

**Solution** Stokes' Theorem enables us to find the circulation by integrating over the surface of the cone. Traversing $C$ in the counterclockwise direction viewed from above corresponds to taking the *inner* normal $\mathbf{n}$ to the cone, the normal with a positive $z$-component.

We parametrize the cone as

$$\mathbf{r}(r,\theta) = (r\cos\theta)\mathbf{i} + (r\sin\theta)\mathbf{j} + r\mathbf{k}, \qquad 0 \le r \le 2, \quad 0 \le \theta \le 2\pi.$$

We then have

$$\mathbf{n} = \frac{\mathbf{r}_r \times \mathbf{r}_\theta}{|\mathbf{r}_r \times \mathbf{r}_\theta|} = \frac{-(r\cos\theta)\mathbf{i} - (r\sin\theta)\mathbf{j} + r\mathbf{k}}{r\sqrt{2}}$$ Section 16.6, Example 4

$$= \frac{1}{\sqrt{2}}\left(-(\cos\theta)\mathbf{i} - (\sin\theta)\mathbf{j} + \mathbf{k}\right)$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$$d\sigma = r\sqrt{2}\, dr\, d\theta \qquad \text{Section 16.6, Example 4}$$
$$\nabla \times \mathbf{F} = -4\mathbf{i} - 2x\mathbf{j} + \mathbf{k} \qquad \text{Example 1}$$
$$= -4\mathbf{i} - 2r\cos\theta\,\mathbf{j} + \mathbf{k}. \qquad x = r\cos\theta$$

Accordingly,

$$\nabla \times \mathbf{F} \cdot \mathbf{n} = \frac{1}{\sqrt{2}}\left(4\cos\theta + 2r\cos\theta\sin\theta + 1\right)$$
$$= \frac{1}{\sqrt{2}}\left(4\cos\theta + r\sin 2\theta + 1\right)$$

and the circulation is

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n}\, d\sigma \qquad \text{Stokes' Theorem, Equation (4)}$$
$$= \int_0^{2\pi}\int_0^2 \frac{1}{\sqrt{2}}\left(4\cos\theta + r\sin 2\theta + 1\right)\left(r\sqrt{2}\, dr\, d\theta\right) = 4\pi. \quad \blacksquare$$

## Paddle Wheel Interpretation of $\nabla \times \mathbf{F}$

Suppose that $\mathbf{v}(x, y, z)$ is the velocity of a moving fluid whose density at $(x, y, z)$ is $\delta(x, y, z)$ and let $\mathbf{F} = \delta\mathbf{v}$. Then

$$\oint_C \mathbf{F} \cdot d\mathbf{r}$$

is the circulation of the fluid around the closed curve $C$. By Stokes' Theorem, the circulation is equal to the flux of $\nabla \times \mathbf{F}$ through a surface $S$ spanning $C$:

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n}\, d\sigma.$$

Suppose we fix a point $Q$ in the domain of $\mathbf{F}$ and a direction $\mathbf{u}$ at $Q$. Let $C$ be a circle of radius $\rho$, with center at $Q$, whose plane is normal to $\mathbf{u}$. If $\nabla \times \mathbf{F}$ is continuous at $Q$, the average value of the $\mathbf{u}$-component of $\nabla \times \mathbf{F}$ over the circular disk $S$ bounded by $C$ approaches the $\mathbf{u}$-component of $\nabla \times \mathbf{F}$ at $Q$ as $\rho \to 0$:

$$(\nabla \times \mathbf{F} \cdot \mathbf{u})_Q = \lim_{p\to 0} \frac{1}{\pi\rho^2}\iint_S \nabla \times \mathbf{F} \cdot \mathbf{u}\, d\sigma.$$

If we replace the surface integral in this last equation by the circulation, we get

$$(\nabla \times \mathbf{F} \cdot \mathbf{u})_Q = \lim_{p\to 0} \frac{1}{\pi\rho^2}\oint_C \mathbf{F} \cdot d\mathbf{r}. \tag{6}$$

The left-hand side of Equation (6) has its maximum value when $\mathbf{u}$ is the direction of $\nabla \times \mathbf{F}$. When $\rho$ is small, the limit on the right-hand side of Equation (6) is approximately

$$\frac{1}{\pi\rho^2}\oint_C \mathbf{F} \cdot d\mathbf{r},$$

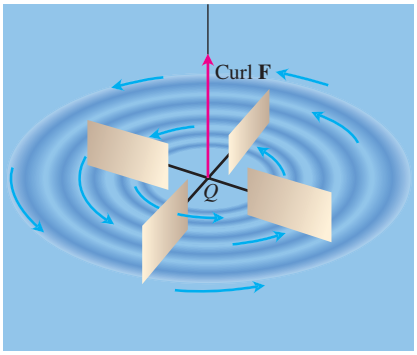

**FIGURE 16.63** The paddle wheel interpretation of curl **F**.

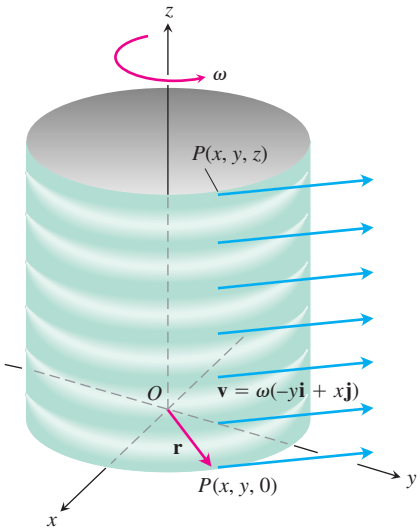

**FIGURE 16.64** A steady rotational flow parallel to the $xy$-plane, with constant angular velocity $\omega$ in the positive (counterclockwise) direction (Example 4).

which is the circulation around $C$ divided by the area of the disk (circulation density). Suppose that a small paddle wheel of radius $\rho$ is introduced into the fluid at $Q$, with its axle directed along $\mathbf{u}$. The circulation of the fluid around $C$ will affect the rate of spin of the paddle wheel. The wheel will spin fastest when the circulation integral is maximized; therefore it will spin fastest when the axle of the paddle wheel points in the direction of $\nabla \times \mathbf{F}$ (Figure 16.63).

### EXAMPLE 4 Relating $\nabla \times \mathbf{F}$ to Circulation Density

A fluid of constant density rotates around the $z$-axis with velocity $\mathbf{v} = \omega(-y\mathbf{i} + x\mathbf{j})$, where $\omega$ is a positive constant called the *angular velocity* of the rotation (Figure 16.64). If $\mathbf{F} = \mathbf{v}$, find $\nabla \times \mathbf{F}$ and relate it to the circulation density.

**Solution** With $\mathbf{F} = \mathbf{v} = -\omega y\mathbf{i} + \omega x\mathbf{j}$,

$$\nabla \times \mathbf{F} = \left(\frac{\partial P}{\partial y} - \frac{\partial N}{\partial z}\right)\mathbf{i} + \left(\frac{\partial M}{\partial z} - \frac{\partial P}{\partial x}\right)\mathbf{j} + \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right)\mathbf{k}$$

$$= (0 - 0)\mathbf{i} + (0 - 0)\mathbf{j} + (\omega - (-\omega))\mathbf{k} = 2\omega\mathbf{k}.$$

By Stokes' Theorem, the circulation of $\mathbf{F}$ around a circle $C$ of radius $\rho$ bounding a disk $S$ in a plane normal to $\nabla \times \mathbf{F}$, say the $xy$-plane, is

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n}\, d\sigma = \iint_S 2\omega\mathbf{k} \cdot \mathbf{k}\, dx\, dy = (2\omega)(\pi\rho^2).$$

Thus,

$$(\nabla \times \mathbf{F}) \cdot \mathbf{k} = 2\omega = \frac{1}{\pi\rho^2} \oint_C \mathbf{F} \cdot d\mathbf{r},$$

consistent with Equation (6) when $\mathbf{u} = \mathbf{k}$. ■

### EXAMPLE 5 Applying Stokes' Theorem

Use Stokes' Theorem to evaluate $\int_C \mathbf{F} \cdot d\mathbf{r}$, if $\mathbf{F} = xz\mathbf{i} + xy\mathbf{j} + 3xz\mathbf{k}$ and $C$ is the boundary of the portion of the plane $2x + y + z = 2$ in the first octant, traversed counterclockwise as viewed from above (Figure 16.65).

**Solution** The plane is the level surface $f(x, y, z) = 2$ of the function $f(x, y, z) = 2x + y + z$. The unit normal vector

$$\mathbf{n} = \frac{\nabla f}{|\nabla f|} = \frac{(2\mathbf{i} + \mathbf{j} + \mathbf{k})}{|2\mathbf{i} + \mathbf{j} + \mathbf{k}|} = \frac{1}{\sqrt{6}}\left(2\mathbf{i} + \mathbf{j} + \mathbf{k}\right)$$

is consistent with the counterclockwise motion around $C$. To apply Stokes' Theorem, we find

$$\text{curl } \mathbf{F} = \nabla \times \mathbf{F} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \dfrac{\partial}{\partial x} & \dfrac{\partial}{\partial y} & \dfrac{\partial}{\partial z} \\ xz & xy & 3xz \end{vmatrix} = (x - 3z)\mathbf{j} + y\mathbf{k}.$$

On the plane, $z$ equals $2 - 2x - y$, so

$$\nabla \times \mathbf{F} = (x - 3(2 - 2x - y))\mathbf{j} + y\mathbf{k} = (7x + 3y - 6)\mathbf{j} + y\mathbf{k}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

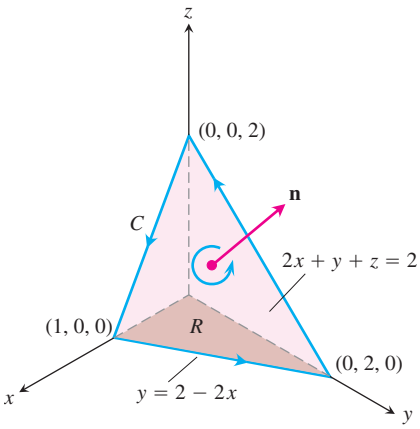

**FIGURE 16.65** The planar surface in Example 5.

and

$$\nabla \times \mathbf{F} \cdot \mathbf{n} = \frac{1}{\sqrt{6}}\left(7x + 3y - 6 + y\right) = \frac{1}{\sqrt{6}}\left(7x + 4y - 6\right).$$

The surface area element is

$$d\sigma = \frac{|\nabla f|}{|\nabla f \cdot \mathbf{k}|}\, dA = \frac{\sqrt{6}}{1}\, dx\, dy.$$

The circulation is

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n}\, d\sigma \qquad \text{Stokes' Theorem, Equation (4)}$$

$$= \int_0^1 \int_0^{2-2x} \frac{1}{\sqrt{6}}\left(7x + 4y - 6\right)\sqrt{6}\, dy\, dx$$

$$= \int_0^1 \int_0^{2-2x} (7x + 4y - 6)\, dy\, dx = -1. \quad \blacksquare$$

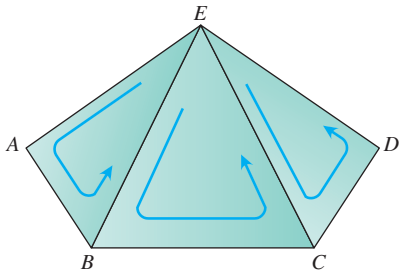

**FIGURE 16.66** Part of a polyhedral surface.

## Proof of Stokes' Theorem for Polyhedral Surfaces

Let $S$ be a polyhedral surface consisting of a finite number of plane regions. (See Figure 16.66 for an example.) We apply Green's Theorem to each separate panel of $S$. There are two types of panels:

1. Those that are surrounded on all sides by other panels
2. Those that have one or more edges that are not adjacent to other panels.

The boundary $\Delta$ of $S$ consists of those edges of the type 2 panels that are not adjacent to other panels. In Figure 16.66, the triangles $EAB$, $BCE$, and $CDE$ represent a part of $S$, with $ABCD$ part of the boundary $\Delta$. Applying Green's Theorem to the three triangles in turn and adding the results, we get

$$\left(\oint_{EAB} + \oint_{BCE} + \oint_{CDE}\right)\mathbf{F} \cdot d\mathbf{r} = \left(\iint_{EAB} + \iint_{BCE} + \iint_{CDE}\right)\nabla \times \mathbf{F} \cdot \mathbf{n}\, d\sigma. \qquad (7)$$

The three line integrals on the left-hand side of Equation (7) combine into a single line integral taken around the periphery $ABCDE$ because the integrals along interior segments cancel in pairs. For example, the integral along segment $BE$ in triangle $ABE$ is opposite in sign to the integral along the same segment in triangle $EBC$. The same holds for segment $CE$. Hence, Equation (7) reduces to

$$\oint_{ABCDE} \mathbf{F} \cdot d\mathbf{r} = \iint_{ABCDE} \nabla \times \mathbf{F} \cdot \mathbf{n}\, d\sigma.$$

When we apply Green's Theorem to all the panels and add the results, we get

$$\oint_{\Delta} \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n}\, d\sigma.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

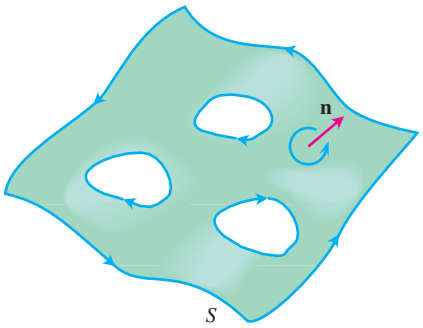

**FIGURE 16.67** Stokes' Theorem also holds for oriented surfaces with holes.

This is Stokes' Theorem for a polyhedral surface $S$. You can find proofs for more general surfaces in advanced calculus texts.

## Stokes' Theorem for Surfaces with Holes

Stokes' Theorem can be extended to an oriented surface $S$ that has one or more holes (Figure 16.67), in a way analogous to the extension of Green's Theorem: The surface integral over $S$ of the normal component of $\nabla \times \mathbf{F}$ equals the sum of the line integrals around all the boundary curves of the tangential component of $\mathbf{F}$, where the curves are to be traced in the direction induced by the orientation of $S$.

## An Important Identity

The following identity arises frequently in mathematics and the physical sciences.

$$\text{curl grad } f = \mathbf{0} \qquad \text{or} \qquad \nabla \times \nabla f = \mathbf{0} \tag{8}$$

This identity holds for any function $f(x, y, z)$ whose second partial derivatives are continuous. The proof goes like this:

$$\nabla \times \nabla f = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \dfrac{\partial}{\partial x} & \dfrac{\partial}{\partial y} & \dfrac{\partial}{\partial z} \\ \dfrac{\partial f}{\partial x} & \dfrac{\partial f}{\partial y} & \dfrac{\partial f}{\partial z} \end{vmatrix} = (f_{zy} - f_{yz})\mathbf{i} - (f_{zx} - f_{xz})\mathbf{j} + (f_{yx} - f_{xy})\mathbf{k}.$$

If the second partial derivatives are continuous, the mixed second derivatives in parentheses are equal (Theorem 2, Section 14.3) and the vector is zero.

## Conservative Fields and Stokes' Theorem

In Section 16.3, we found that a field $\mathbf{F}$ is conservative in an open region $D$ in space is equivalent to the integral of $\mathbf{F}$ around every closed loop in $D$ being zero. This, in turn, is equivalent in *simply connected* open regions to saying that $\nabla \times \mathbf{F} = \mathbf{0}$.

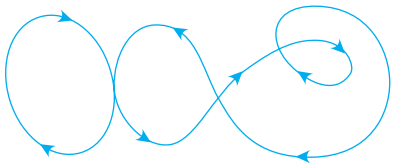
**THEOREM 6 Curl F = 0 Related to the Closed-Loop Property**

If $\nabla \times \mathbf{F} = \mathbf{0}$ at every point of a simply connected open region $D$ in space, then on any piecewise-smooth closed path $C$ in $D$,

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = 0.$$

**Sketch of a Proof** Theorem 6 is usually proved in two steps. The first step is for simple closed curves. A theorem from topology, a branch of advanced mathematics, states that

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



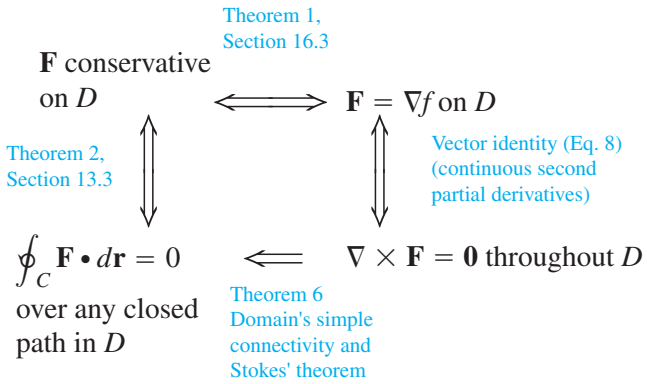


**FIGURE 16.68** In a simply connected open region in space, differentiable curves that cross themselves can be divided into loops to which Stokes' Theorem applies.

every differentiable simple closed curve $C$ in a simply connected open region $D$ is the boundary of a smooth two-sided surface $S$ that also lies in $D$. Hence, by Stokes' Theorem,

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n}\, d\sigma = 0.$$

The second step is for curves that cross themselves, like the one in Figure 16.68. The idea is to break these into simple loops spanned by orientable surfaces, apply Stokes' Theorem one loop at a time, and add the results. ■

The following diagram summarizes the results for conservative fields defined on connected, simply connected open regions.

# EXERCISES 16.7

## Using Stokes' Theorem to Calculate Circulation

In Exercises 1–6, use the surface integral in Stokes' Theorem to calculate the circulation of the field **F** around the curve $C$ in the indicated direction.

1. $\mathbf{F} = x^2\mathbf{i} + 2x\mathbf{j} + z^2\mathbf{k}$

   $C$: The ellipse $4x^2 + y^2 = 4$ in the $xy$-plane, counterclockwise when viewed from above

2. $\mathbf{F} = 2y\mathbf{i} + 3x\mathbf{j} - z^2\mathbf{k}$

   $C$: The circle $x^2 + y^2 = 9$ in the $xy$-plane, counterclockwise when viewed from above

3. $\mathbf{F} = y\mathbf{i} + xz\mathbf{j} + x^2\mathbf{k}$

   $C$: The boundary of the triangle cut from the plane $x + y + z = 1$ by the first octant, counterclockwise when viewed from above

4. $\mathbf{F} = (y^2 + z^2)\mathbf{i} + (x^2 + z^2)\mathbf{j} + (x^2 + y^2)\mathbf{k}$

   $C$: The boundary of the triangle cut from the plane $x + y + z = 1$ by the first octant, counterclockwise when viewed from above

5. $\mathbf{F} = (y^2 + z^2)\mathbf{i} + (x^2 + y^2)\mathbf{j} + (x^2 + y^2)\mathbf{k}$

   $C$: The square bounded by the lines $x = \pm 1$ and $y = \pm 1$ in the $xy$-plane, counterclockwise when viewed from above

6. $\mathbf{F} = x^2y^3\mathbf{i} + \mathbf{j} + z\mathbf{k}$

   $C$: The intersection of the cylinder $x^2 + y^2 = 4$ and the hemisphere $x^2 + y^2 + z^2 = 16, z \geq 0$, counterclockwise when viewed from above

## Flux of the Curl

7. Let **n** be the outer unit normal of the elliptical shell

$$S: \quad 4x^2 + 9y^2 + 36z^2 = 36, \qquad z \geq 0,$$

   and let

$$\mathbf{F} = y\mathbf{i} + x^2\mathbf{j} + (x^2 + y^4)^{3/2} \sin e^{\sqrt{xyz}}\,\mathbf{k}.$$

   Find the value of

$$\iint_S \nabla \times \mathbf{F} \cdot \mathbf{n}\, d\sigma.$$

   (*Hint:* One parametrization of the ellipse at the base of the shell is $x = 3\cos t, y = 2\sin t, 0 \leq t \leq 2\pi$.)

8. Let **n** be the outer unit normal (normal away from the origin) of the parabolic shell

$$S: \quad 4x^2 + y + z^2 = 4, \qquad y \geq 0,$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

and let

$$\mathbf{F} = \left(-z + \frac{1}{2+x}\right)\mathbf{i} + (\tan^{-1} y)\mathbf{j} + \left(x + \frac{1}{4+z}\right)\mathbf{k}.$$

Find the value of

$$\iint_S \nabla \times \mathbf{F} \cdot \mathbf{n}\, d\sigma.$$

**9.** Let $S$ be the cylinder $x^2 + y^2 = a^2, 0 \le z \le h$, together with its top, $x^2 + y^2 \le a^2, z = h$. Let $\mathbf{F} = -y\mathbf{i} + x\mathbf{j} + x^2\mathbf{k}$. Use Stokes' Theorem to find the flux of $\nabla \times \mathbf{F}$ outward through $S$.

**10.** Evaluate

$$\iint_S \nabla \times (y\mathbf{i}) \cdot \mathbf{n}\, d\sigma,$$

where $S$ is the hemisphere $x^2 + y^2 + z^2 = 1, z \ge 0$.

**11. Flux of curl F** Show that

$$\iint_S \nabla \times \mathbf{F} \cdot \mathbf{n}\, d\sigma$$

has the same value for all oriented surfaces $S$ that span $C$ and that induce the same positive direction on $C$.

**12.** Let $\mathbf{F}$ be a differentiable vector field defined on a region containing a smooth closed oriented surface $S$ and its interior. Let $\mathbf{n}$ be the unit normal vector field on $S$. Suppose that $S$ is the union of two surfaces $S_1$ and $S_2$ joined along a smooth simple closed curve $C$. Can anything be said about

$$\iint_S \nabla \times \mathbf{F} \cdot \mathbf{n}\, d\sigma?$$

Give reasons for your answer.

## Stokes' Theorem for Parametrized Surfaces

In Exercises 13–18, use the surface integral in Stokes' Theorem to calculate the flux of the curl of the field $\mathbf{F}$ across the surface $S$ in the direction of the outward unit normal $\mathbf{n}$.

**13.** $\mathbf{F} = 2z\mathbf{i} + 3x\mathbf{j} + 5y\mathbf{k}$

$S$: $\mathbf{r}(r, \theta) = (r\cos\theta)\mathbf{i} + (r\sin\theta)\mathbf{j} + (4 - r^2)\mathbf{k}$, $0 \le r \le 2$, $0 \le \theta \le 2\pi$

**14.** $\mathbf{F} = (y - z)\mathbf{i} + (z - x)\mathbf{j} + (x + z)\mathbf{k}$

$S$: $\mathbf{r}(r, \theta) = (r\cos\theta)\mathbf{i} + (r\sin\theta)\mathbf{j} + (9 - r^2)\mathbf{k}$, $0 \le r \le 3$, $0 \le \theta \le 2\pi$

**15.** $\mathbf{F} = x^2y\mathbf{i} + 2y^3z\mathbf{j} + 3z\mathbf{k}$

$S$: $\mathbf{r}(r, \theta) = (r\cos\theta)\mathbf{i} + (r\sin\theta)\mathbf{j} + r\mathbf{k}$, $0 \le r \le 1$, $0 \le \theta \le 2\pi$

**16.** $\mathbf{F} = (x - y)\mathbf{i} + (y - z)\mathbf{j} + (z - x)\mathbf{k}$

$S$: $\mathbf{r}(r, \theta) = (r\cos\theta)\mathbf{i} + (r\sin\theta)\mathbf{j} + (5 - r)\mathbf{k}$, $0 \le r \le 5$, $0 \le \theta \le 2\pi$

**17.** $\mathbf{F} = 3y\mathbf{i} + (5 - 2x)\mathbf{j} + (z^2 - 2)\mathbf{k}$

$S$: $\mathbf{r}(\phi, \theta) = \left(\sqrt{3}\sin\phi\cos\theta\right)\mathbf{i} + \left(\sqrt{3}\sin\phi\sin\theta\right)\mathbf{j} + \left(\sqrt{3}\cos\phi\right)\mathbf{k}$, $0 \le \phi \le \pi/2$, $0 \le \theta \le 2\pi$

**18.** $\mathbf{F} = y^2\mathbf{i} + z^2\mathbf{j} + x\mathbf{k}$

$S$: $\mathbf{r}(\phi, \theta) = (2\sin\phi\cos\theta)\mathbf{i} + (2\sin\phi\sin\theta)\mathbf{j} + (2\cos\phi)\mathbf{k}$, $0 \le \phi \le \pi/2$, $0 \le \theta \le 2\pi$

## Theory and Examples

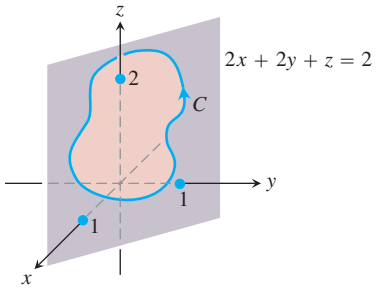
**19. Zero circulation** Use the identity $\nabla \times \nabla f = \mathbf{0}$ (Equation (8) in the text) and Stokes' Theorem to show that the circulations of the following fields around the boundary of any smooth orientable surface in space are zero.

**a.** $\mathbf{F} = 2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k}$

**b.** $\mathbf{F} = \nabla(xy^2z^3)$

**c.** $\mathbf{F} = \nabla \times (x\mathbf{i} + y\mathbf{j} + z\mathbf{k})$

**d.** $\mathbf{F} = \nabla f$



**20. Zero circulation** Let $f(x, y, z) = (x^2 + y^2 + z^2)^{-1/2}$. Show that the clockwise circulation of the field $\mathbf{F} = \nabla f$ around the circle $x^2 + y^2 = a^2$ in the $xy$-plane is zero

**a.** by taking $\mathbf{r} = (a\cos t)\mathbf{i} + (a\sin t)\mathbf{j}$, $0 \le t \le 2\pi$, and integrating $\mathbf{F} \cdot d\mathbf{r}$ over the circle.

**b.** by applying Stokes' Theorem.

**21.** Let $C$ be a simple closed smooth curve in the plane $2x + 2y + z = 2$, oriented as shown here. Show that

$$\oint_C 2y\, dx + 3z\, dy - x\, dz$$

depends only on the area of the region enclosed by $C$ and not on the position or shape of $C$.

**22.** Show that if $\mathbf{F} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$, then $\nabla \times \mathbf{F} = \mathbf{0}$.

**23.** Find a vector field with twice-differentiable components whose curl is $x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ or prove that no such field exists.

**24.** Does Stokes' Theorem say anything special about circulation in a field whose curl is zero? Give reasons for your answer.

**25.** Let $R$ be a region in the $xy$-plane that is bounded by a piecewise-smooth simple closed curve $C$ and suppose that the moments of

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

inertia of $R$ about the $x$- and $y$-axes are known to be $I_x$ and $I_y$. Evaluate the integral

$$\oint_C \nabla(r^4) \cdot \mathbf{n}\, ds,$$

where $r = \sqrt{x^2 + y^2}$, in terms of $I_x$ and $I_y$.

**26. Zero curl, yet field not conservative** Show that the curl of

$$\mathbf{F} = \frac{-y}{x^2 + y^2}\mathbf{i} + \frac{x}{x^2 + y^2}\mathbf{j} + z\mathbf{k}$$

is zero but that

$$\oint_C \mathbf{F} \cdot d\mathbf{r}$$

is not zero if $C$ is the circle $x^2 + y^2 = 1$ in the $xy$-plane. (Theorem 6 does not apply here because the domain of $\mathbf{F}$ is not simply connected. The field $\mathbf{F}$ is not defined along the $z$-axis so there is no way to contract $C$ to a point without leaving the domain of $\mathbf{F}$.)

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# 16.8 The Divergence Theorem and a Unified Theory

The divergence form of Green's Theorem in the plane states that the net outward flux of a vector field across a simple closed curve can be calculated by integrating the divergence of the field over the region enclosed by the curve. The corresponding theorem in three dimensions, called the Divergence Theorem, states that the net outward flux of a vector field across a closed surface in space can be calculated by integrating the divergence of the field over the region enclosed by the surface. In this section, we prove the Divergence Theorem and show how it simplifies the calculation of flux. We also derive Gauss's law for flux in an electric field and the continuity equation of hydrodynamics. Finally, we unify the chapter's vector integral theorems into a single fundamental theorem.

## Divergence in Three Dimensions

The **divergence** of a vector field $\mathbf{F} = M(x, y, z)\mathbf{i} + N(x, y, z)\mathbf{j} + P(x, y, z)\mathbf{k}$ is the scalar function

$$\text{div } \mathbf{F} = \nabla \cdot \mathbf{F} = \frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} + \frac{\partial P}{\partial z}. \tag{1}$$

The symbol "div **F**" is read as "divergence of **F**" or "div **F**." The notation $\nabla \cdot \mathbf{F}$ is read "del dot **F**."

Div **F** has the same physical interpretation in three dimensions that it does in two. If **F** is the velocity field of a fluid flow, the value of div **F** at a point $(x, y, z)$ is the rate at which fluid is being piped in or drained away at $(x, y, z)$. The divergence is the flux per unit volume or flux density at the point.

**EXAMPLE 1** Finding Divergence

Find the divergence of $\mathbf{F} = 2xz\mathbf{i} - xy\mathbf{j} - z\mathbf{k}$.

**Solution** The divergence of **F** is

$$\nabla \cdot \mathbf{F} = \frac{\partial}{\partial x}(2xz) + \frac{\partial}{\partial y}(-xy) + \frac{\partial}{\partial z}(-z) = 2z - x - 1. \quad \blacksquare$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Divergence Theorem

The Divergence Theorem says that under suitable conditions, the outward flux of a vector field across a closed surface (oriented outward) equals the triple integral of the divergence of the field over the region enclosed by the surface.

**THEOREM 7 Divergence Theorem**

The flux of a vector field $\mathbf{F}$ across a closed oriented surface $S$ in the direction of the surface's outward unit normal field $\mathbf{n}$ equals the integral of $\nabla \cdot \mathbf{F}$ over the region $D$ enclosed by the surface:

$$\iint_S \mathbf{F} \cdot \mathbf{n}\, d\sigma = \iiint_D \nabla \cdot \mathbf{F}\, dV. \tag{2}$$

Outward flux — Divergence integral

**EXAMPLE 2** Supporting the Divergence Theorem

Evaluate both sides of Equation (2) for the field $\mathbf{F} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ over the sphere $x^2 + y^2 + z^2 = a^2$.

**Solution** The outer unit normal to $S$, calculated from the gradient of $f(x, y, z) = x^2 + y^2 + z^2 - a^2$, is

$$\mathbf{n} = \frac{2(x\mathbf{i} + y\mathbf{j} + z\mathbf{k})}{\sqrt{4(x^2 + y^2 + z^2)}} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{a}.$$

Hence,

$$\mathbf{F} \cdot \mathbf{n}\, d\sigma = \frac{x^2 + y^2 + z^2}{a}\, d\sigma = \frac{a^2}{a}\, d\sigma = a\, d\sigma$$

because $x^2 + y^2 + z^2 = a^2$ on the surface. Therefore,

$$\iint_S \mathbf{F} \cdot \mathbf{n}\, d\sigma = \iint_S a\, d\sigma = a \iint_S d\sigma = a(4\pi a^2) = 4\pi a^3.$$

The divergence of $\mathbf{F}$ is

$$\nabla \cdot \mathbf{F} = \frac{\partial}{\partial x}(x) + \frac{\partial}{\partial y}(y) + \frac{\partial}{\partial z}(z) = 3,$$

so

$$\iiint_D \nabla \cdot \mathbf{F}\, dV = \iiint_D 3\, dV = 3\left(\frac{4}{3}\pi a^3\right) = 4\pi a^3.$$

■

**EXAMPLE 3** Finding Flux

Find the flux of $\mathbf{F} = xy\mathbf{i} + yz\mathbf{j} + xz\mathbf{k}$ outward through the surface of the cube cut from the first octant by the planes $x = 1$, $y = 1$, and $z = 1$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** Instead of calculating the flux as a sum of six separate integrals, one for each face of the cube, we can calculate the flux by integrating the divergence

$$\nabla \cdot \mathbf{F} = \frac{\partial}{\partial x}(xy) + \frac{\partial}{\partial y}(yz) + \frac{\partial}{\partial z}(xz) = y + z + x$$

over the cube's interior:

$$\text{Flux} = \iint_{\substack{\text{Cube}\\ \text{surface}}} \mathbf{F} \cdot \mathbf{n}\, d\sigma = \iiint_{\substack{\text{Cube}\\ \text{interior}}} \nabla \cdot \mathbf{F}\, dV \qquad \text{The Divergence Theorem}$$

$$= \int_0^1 \int_0^1 \int_0^1 (x + y + z)\, dx\, dy\, dz = \frac{3}{2}. \qquad \text{Routine integration}$$

■

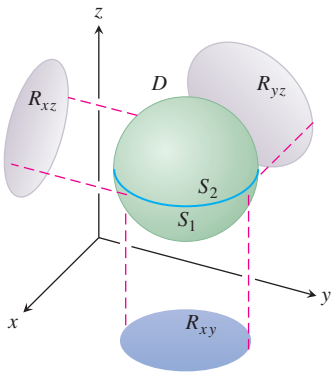


**FIGURE 16.69** We first prove the Divergence Theorem for the kind of three-dimensional region shown here. We then extend the theorem to other regions.

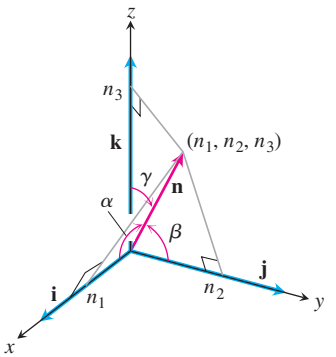

**FIGURE 16.70** The scalar components of the unit normal vector **n** are the cosines of the angles $\alpha$, $\beta$, and $\gamma$ that it makes with **i**, **j**, and **k**.

## Proof of the Divergence Theorem for Special Regions

To prove the Divergence Theorem, we assume that the components of **F** have continuous first partial derivatives. We also assume that $D$ is a convex region with no holes or bubbles, such as a solid sphere, cube, or ellipsoid, and that $S$ is a piecewise smooth surface. In addition, we assume that any line perpendicular to the $xy$-plane at an interior point of the region $R_{xy}$ that is the projection of $D$ on the $xy$-plane intersects the surface $S$ in exactly two points, producing surfaces

$$S_1: \quad z = f_1(x, y), \qquad (x, y) \text{ in } R_{xy}$$

$$S_2: \quad z = f_2(x, y), \qquad (x, y) \text{ in } R_{xy},$$

with $f_1 \le f_2$. We make similar assumptions about the projection of $D$ onto the other coordinate planes. See Figure 16.69.

The components of the unit normal vector $\mathbf{n} = n_1\mathbf{i} + n_2\mathbf{j} + n_3\mathbf{k}$ are the cosines of the angles $\alpha$, $\beta$, and $\gamma$ that **n** makes with **i**, **j**, and **k** (Figure 16.70). This is true because all the vectors involved are unit vectors. We have

$$n_1 = \mathbf{n} \cdot \mathbf{i} = |\mathbf{n}|\,|\mathbf{i}| \cos\alpha = \cos\alpha$$

$$n_2 = \mathbf{n} \cdot \mathbf{j} = |\mathbf{n}|\,|\mathbf{j}| \cos\beta = \cos\beta$$

$$n_3 = \mathbf{n} \cdot \mathbf{k} = |\mathbf{n}|\,|\mathbf{k}| \cos\gamma = \cos\gamma$$

Thus,

$$\mathbf{n} = (\cos\alpha)\mathbf{i} + (\cos\beta)\mathbf{j} + (\cos\gamma)\mathbf{k}$$

and

$$\mathbf{F} \cdot \mathbf{n} = M\cos\alpha + N\cos\beta + P\cos\gamma.$$

In component form, the Divergence Theorem states that

$$\iint_S (M\cos\alpha + N\cos\beta + P\cos\gamma)\, d\sigma = \iiint_D \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y} + \frac{\partial P}{\partial z}\right) dx\, dy\, dz.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

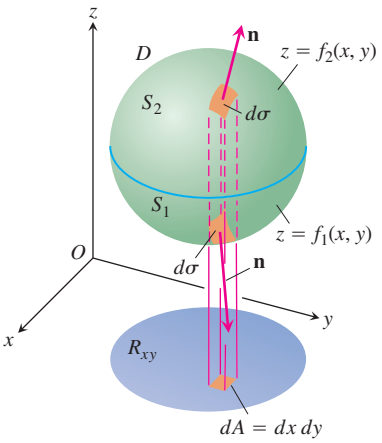

**FIGURE 16.71** The three-dimensional region $D$ enclosed by the surfaces $S_1$ and $S_2$ shown here projects vertically onto a two-dimensional region $R_{xy}$ in the $xy$-plane.

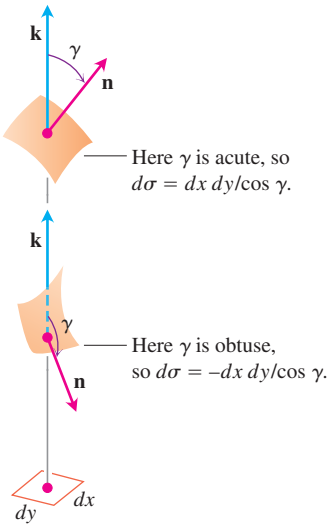

**FIGURE 16.72** An enlarged view of the area patches in Figure 16.71. The relations $d\sigma = \pm dx\,dy/\cos\gamma$ are derived in Section 16.5.

We prove the theorem by proving the three following equalities:

$$\iint_S M\cos\alpha\,d\sigma = \iiint_D \frac{\partial M}{\partial x}\,dx\,dy\,dz \tag{3}$$

$$\iint_S N\cos\beta\,d\sigma = \iiint_D \frac{\partial N}{\partial y}\,dx\,dy\,dz \tag{4}$$

$$\iint_S P\cos\gamma\,d\sigma = \iiint_D \frac{\partial P}{\partial z}\,dx\,dy\,dz \tag{5}$$

**Proof of Equation (5)** We prove Equation (5) by converting the surface integral on the left to a double integral over the projection $R_{xy}$ of $D$ on the $xy$-plane (Figure 16.71). The surface $S$ consists of an upper part $S_2$ whose equation is $z = f_2(x, y)$ and a lower part $S_1$ whose equation is $z = f_1(x, y)$. On $S_2$, the outer normal $\mathbf{n}$ has a positive $\mathbf{k}$-component and

$$\cos\gamma\,d\sigma = dx\,dy \qquad \text{because} \qquad d\sigma = \frac{dA}{|\cos\gamma|} = \frac{dx\,dy}{\cos\gamma}.$$

See Figure 16.72. On $S_1$, the outer normal $\mathbf{n}$ has a negative $\mathbf{k}$-component and

$$\cos\gamma\,d\sigma = -dx\,dy.$$

Therefore,

$$\begin{aligned}
\iint_S P\cos\gamma\,d\sigma &= \iint_{S_2} P\cos\gamma\,d\sigma + \iint_{S_1} P\cos\gamma\,d\sigma \\
&= \iint_{R_{xy}} P(x, y, f_2(x, y))\,dx\,dy - \iint_{R_{xy}} P(x, y, f_1(x, y))\,dx\,dy \\
&= \iint_{R_{xy}} [P(x, y, f_2(x, y)) - P(x, y, f_1(x, y))]\,dx\,dy \\
&= \iint_{R_{xy}} \left[\int_{f_1(x,y)}^{f_2(x,y)} \frac{\partial P}{\partial z}\,dz\right] dx\,dy = \iiint_D \frac{\partial P}{\partial z}\,dz\,dx\,dy.
\end{aligned}$$

This proves Equation (5). ■

The proofs for Equations (3) and (4) follow the same pattern; or just permute $x, y, z$; $M, N, P$; $\alpha, \beta, \gamma$, in order, and get those results from Equation (5).

## Divergence Theorem for Other Regions

The Divergence Theorem can be extended to regions that can be partitioned into a finite number of simple regions of the type just discussed and to regions that can be defined as limits of simpler regions in certain ways. For example, suppose that $D$ is the region between two concentric spheres and that $\mathbf{F}$ has continuously differentiable components throughout $D$ and on the bounding surfaces. Split $D$ by an equatorial plane and apply the

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

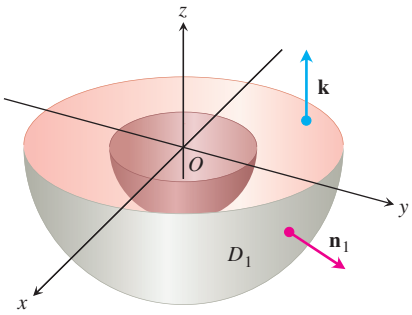

**FIGURE 16.73** The lower half of the solid region between two concentric spheres.

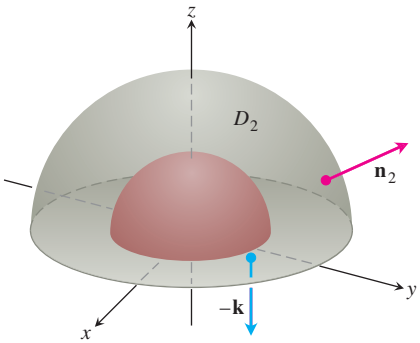

**FIGURE 16.74** The upper half of the solid region between two concentric spheres.

Divergence Theorem to each half separately. The bottom half, $D_1$, is shown in Figure 16.73. The surface $S_1$ that bounds $D_1$ consists of an outer hemisphere, a plane washer-shaped base, and an inner hemisphere. The Divergence Theorem says that

$$\iint_{S_1} \mathbf{F} \cdot \mathbf{n}_1 \, d\sigma_1 = \iiint_{D_1} \nabla \cdot \mathbf{F} \, dV_1. \tag{6}$$

The unit normal $\mathbf{n}_1$ that points outward from $D_1$ points away from the origin along the outer surface, equals $\mathbf{k}$ along the flat base, and points toward the origin along the inner surface. Next apply the Divergence Theorem to $D_2$, and its surface $S_2$ (Figure 16.74):

$$\iint_{S_2} \mathbf{F} \cdot \mathbf{n}_2 \, d\sigma_2 = \iiint_{D_2} \nabla \cdot \mathbf{F} \, dV_2. \tag{7}$$

As we follow $\mathbf{n}_2$ over $S_2$, pointing outward from $D_2$, we see that $\mathbf{n}_2$ equals $-\mathbf{k}$ along the washer-shaped base in the $xy$-plane, points away from the origin on the outer sphere, and points toward the origin on the inner sphere. When we add Equations (6) and (7), the integrals over the flat base cancel because of the opposite signs of $\mathbf{n}_1$ and $\mathbf{n}_2$. We thus arrive at the result

$$\iint_{S} \mathbf{F} \cdot \mathbf{n} \, d\sigma = \iiint_{D} \nabla \cdot \mathbf{F} \, dV,$$

with $D$ the region between the spheres, $S$ the boundary of $D$ consisting of two spheres, and $\mathbf{n}$ the unit normal to $S$ directed outward from $D$.

## EXAMPLE 4 Finding Outward Flux

Find the net outward flux of the field

$$\mathbf{F} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\rho^3}, \qquad \rho = \sqrt{x^2 + y^2 + z^2}$$

across the boundary of the region $D$: $0 < a^2 \le x^2 + y^2 + z^2 \le b^2$.

**Solution** The flux can be calculated by integrating $\nabla \cdot \mathbf{F}$ over $D$. We have

$$\frac{\partial \rho}{\partial x} = \frac{1}{2}(x^2 + y^2 + z^2)^{-1/2}(2x) = \frac{x}{\rho}$$

and

$$\frac{\partial M}{\partial x} = \frac{\partial}{\partial x}(x\rho^{-3}) = \rho^{-3} - 3x\rho^{-4}\frac{\partial \rho}{\partial x} = \frac{1}{\rho^3} - \frac{3x^2}{\rho^5}.$$

Similarly,

$$\frac{\partial N}{\partial y} = \frac{1}{\rho^3} - \frac{3y^2}{\rho^5} \quad \text{and} \quad \frac{\partial P}{\partial z} = \frac{1}{\rho^3} - \frac{3z^2}{\rho^5}.$$

Hence,

$$\operatorname{div} \mathbf{F} = \frac{3}{\rho^3} - \frac{3}{\rho^5}(x^2 + y^2 + z^2) = \frac{3}{\rho^3} - \frac{3\rho^2}{\rho^5} = 0$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

and

$$\iiint_D \nabla \cdot \mathbf{F}\, dV = 0.$$

So the integral of $\nabla \cdot \mathbf{F}$ over $D$ is zero and the net outward flux across the boundary of $D$ is zero. There is more to learn from this example, though. The flux leaving $D$ across the inner sphere $S_a$ is the negative of the flux leaving $D$ across the outer sphere $S_b$ (because the sum of these fluxes is zero). Hence, the flux of $\mathbf{F}$ across $S_a$ in the direction away from the origin equals the flux of $\mathbf{F}$ across $S_b$ in the direction away from the origin. Thus, the flux of $\mathbf{F}$ across a sphere centered at the origin is independent of the radius of the sphere. What is this flux?

To find it, we evaluate the flux integral directly. The outward unit normal on the sphere of radius $a$ is

$$\mathbf{n} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\sqrt{x^2 + y^2 + z^2}} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{a}.$$

Hence, on the sphere,

$$\mathbf{F} \cdot \mathbf{n} = \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{a^3} \cdot \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{a} = \frac{x^2 + y^2 + z^2}{a^4} = \frac{a^2}{a^4} = \frac{1}{a^2}$$

and

$$\iint_{S_a} \mathbf{F} \cdot \mathbf{n}\, d\sigma = \frac{1}{a^2} \iint_{S_a} d\sigma = \frac{1}{a^2}(4\pi a^2) = 4\pi.$$

The outward flux of $\mathbf{F}$ across any sphere centered at the origin is $4\pi$. ■

## Gauss's Law: One of the Four Great Laws of Electromagnetic Theory

There is still more to be learned from Example 4. In electromagnetic theory, the electric field created by a point charge $q$ located at the origin is

$$\mathbf{E}(x, y, z) = \frac{1}{4\pi\epsilon_0} \frac{q}{|\mathbf{r}|^2} \left(\frac{\mathbf{r}}{|\mathbf{r}|}\right) = \frac{q}{4\pi\epsilon_0} \frac{\mathbf{r}}{|\mathbf{r}|^3} = \frac{q}{4\pi\epsilon_0} \frac{x\mathbf{i} + y\mathbf{j} + z\mathbf{k}}{\rho^3},$$

where $\epsilon_0$ is a physical constant, $\mathbf{r}$ is the position vector of the point $(x, y, z)$, and $\rho = |\mathbf{r}| = \sqrt{x^2 + y^2 + z^2}$. In the notation of Example 4,

$$\mathbf{E} = \frac{q}{4\pi\epsilon_0} \mathbf{F}.$$

The calculations in Example 4 show that the outward flux of $\mathbf{E}$ across any sphere centered at the origin is $q/\epsilon_0$, but this result is not confined to spheres. The outward flux of $\mathbf{E}$ across any closed surface $S$ that encloses the origin (and to which the Divergence Theorem applies) is also $q/\epsilon_0$. To see why, we have only to imagine a large sphere $S_a$ centered at the origin and enclosing the surface $S$. Since

$$\nabla \cdot \mathbf{E} = \nabla \cdot \frac{q}{4\pi\epsilon_0} \mathbf{F} = \frac{q}{4\pi\epsilon_0} \nabla \cdot \mathbf{F} = 0$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

when $\rho > 0$, the integral of $\nabla \cdot \mathbf{E}$ over the region $D$ between $S$ and $S_a$ is zero. Hence, by the Divergence Theorem,

$$\iint_{\substack{\text{Boundary} \\ \text{of } D}} \mathbf{E} \cdot \mathbf{n} \, d\sigma = 0,$$

and the flux of $\mathbf{E}$ across $S$ in the direction away from the origin must be the same as the flux of $\mathbf{E}$ across $S_a$ in the direction away from the origin, which is $q/\epsilon_0$. This statement, called *Gauss's Law*, also applies to charge distributions that are more general than the one assumed here, as you will see in nearly any physics text.

$$\text{Gauss's law:} \quad \iint_S \mathbf{E} \cdot \mathbf{n} \, d\sigma = \frac{q}{\epsilon_0}$$

## Continuity Equation of Hydrodynamics

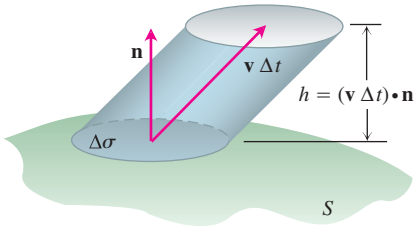

**FIGURE 16.75** The fluid that flows upward through the patch $\Delta\sigma$ in a short time $\Delta t$ fills a "cylinder" whose volume is approximately base $\times$ height $=$ $\mathbf{v} \cdot \mathbf{n} \, \Delta\sigma \, \Delta t$.

Let $D$ be a region in space bounded by a closed oriented surface $S$. If $\mathbf{v}(x, y, z)$ is the velocity field of a fluid flowing smoothly through $D$, $\delta = \delta(t, x, y, z)$ is the fluid's density at $(x, y, z)$ at time $t$, and $\mathbf{F} = \delta\mathbf{v}$, then the **continuity equation** of hydrodynamics states that

$$\nabla \cdot \mathbf{F} + \frac{\partial \delta}{\partial t} = 0.$$

If the functions involved have continuous first partial derivatives, the equation evolves naturally from the Divergence Theorem, as we now see.

First, the integral

$$\iint_S \mathbf{F} \cdot \mathbf{n} \, d\sigma$$

is the rate at which mass leaves $D$ across $S$ (leaves because $\mathbf{n}$ is the outer normal). To see why, consider a patch of area $\Delta\sigma$ on the surface (Figure 16.75). In a short time interval $\Delta t$, the volume $\Delta V$ of fluid that flows across the patch is approximately equal to the volume of a cylinder with base area $\Delta\sigma$ and height $(\mathbf{v}\Delta t) \cdot \mathbf{n}$, where $\mathbf{v}$ is a velocity vector rooted at a point of the patch:

$$\Delta V \approx \mathbf{v} \cdot \mathbf{n} \, \Delta\sigma \, \Delta t.$$

The mass of this volume of fluid is about

$$\Delta m \approx \delta\mathbf{v} \cdot \mathbf{n} \, \Delta\sigma \, \Delta t,$$

so the rate at which mass is flowing out of $D$ across the patch is about

$$\frac{\Delta m}{\Delta t} \approx \delta\mathbf{v} \cdot \mathbf{n} \, \Delta\sigma.$$

This leads to the approximation

$$\frac{\sum \Delta m}{\Delta t} \approx \sum \delta\mathbf{v} \cdot \mathbf{n} \, \Delta\sigma$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

as an estimate of the average rate at which mass flows across $S$. Finally, letting $\Delta\sigma \to 0$ and $\Delta t \to 0$ gives the instantaneous rate at which mass leaves $D$ across $S$ as

$$\frac{dm}{dt} = \iint_S \delta \mathbf{v} \cdot \mathbf{n}\, d\sigma,$$

which for our particular flow is

$$\frac{dm}{dt} = \iint_S \mathbf{F} \cdot \mathbf{n}\, d\sigma.$$

Now let $B$ be a solid sphere centered at a point $Q$ in the flow. The average value of $\nabla \cdot \mathbf{F}$ over $B$ is

$$\frac{1}{\text{volume of } B} \iiint_B \nabla \cdot \mathbf{F}\, dV.$$

It is a consequence of the continuity of the divergence that $\nabla \cdot \mathbf{F}$ actually takes on this value at some point $P$ in $B$. Thus,

$$(\nabla \cdot \mathbf{F})_P = \frac{1}{\text{volume of } B} \iiint_B \nabla \cdot \mathbf{F}\, dV = \frac{\displaystyle\iint_S \mathbf{F} \cdot \mathbf{n}\, d\sigma}{\text{volume of } B}$$

$$= \frac{\text{rate at which mass leaves } B \text{ across its surface } S}{\text{volume of } B} \tag{8}$$

The fraction on the right describes decrease in mass per unit volume.

Now let the radius of $B$ approach zero while the center $Q$ stays fixed. The left side of Equation (8) converges to $(\nabla \cdot \mathbf{F})_Q$, the right side to $(-\partial\delta/\partial t)_Q$. The equality of these two limits is the continuity equation

$$\nabla \cdot \mathbf{F} = -\frac{\partial \delta}{\partial t}.$$

The continuity equation "explains" $\nabla \cdot \mathbf{F}$: The divergence of $\mathbf{F}$ at a point is the rate at which the density of the fluid is decreasing there.

The Divergence Theorem

$$\iint_S \mathbf{F} \cdot \mathbf{n}\, d\sigma = \iiint_D \nabla \cdot \mathbf{F}\, dV$$

now says that the net decrease in density of the fluid in region $D$ is accounted for by the mass transported across the surface $S$. So, the theorem is a statement about conservation of mass (Exercise 31).

## Unifying the Integral Theorems

If we think of a two-dimensional field $\mathbf{F} = M(x, y)\mathbf{i} + N(x, y)\mathbf{j}$ as a three-dimensional field whose $\mathbf{k}$-component is zero, then $\nabla \cdot \mathbf{F} = (\partial M/\partial x) + (\partial N/\partial y)$ and the normal form of Green's Theorem can be written as

$$\oint_C \mathbf{F} \cdot \mathbf{n}\, ds = \iint_R \left(\frac{\partial M}{\partial x} + \frac{\partial N}{\partial y}\right) dx\, dy = \iint_R \nabla \cdot \mathbf{F}\, dA.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Similarly, $\nabla \times \mathbf{F} \cdot \mathbf{k} = (\partial N/\partial x) - (\partial M/\partial y)$, so the tangential form of Green's Theorem can be written as

$$\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_R \left(\frac{\partial N}{\partial x} - \frac{\partial M}{\partial y}\right) dx\, dy = \iint_R \nabla \times \mathbf{F} \cdot \mathbf{k}\, dA.$$

With the equations of Green's Theorem now in del notation, we can see their relationships to the equations in Stokes' Theorem and the Divergence Theorem.

**Green's Theorem and Its Generalization to Three Dimensions**

**Normal form of Green's Theorem:** $\displaystyle\oint_C \mathbf{F} \cdot \mathbf{n}\, ds = \iint_R \nabla \cdot \mathbf{F}\, dA$

**Divergence Theorem:** $\displaystyle\iint_S \mathbf{F} \cdot \mathbf{n}\, d\sigma = \iiint_D \nabla \cdot \mathbf{F}\, dV$

**Tangential form of Green's Theorem:** $\displaystyle\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_R \nabla \times \mathbf{F} \cdot \mathbf{k}\, dA$

**Stokes' Theorem:** $\displaystyle\oint_C \mathbf{F} \cdot d\mathbf{r} = \iint_S \nabla \times \mathbf{F} \cdot \mathbf{n}\, d\sigma$

Notice how Stokes' Theorem generalizes the tangential (curl) form of Green's Theorem from a flat surface in the plane to a surface in three-dimensional space. In each case, the integral of the normal component of curl $\mathbf{F}$ over the interior of the surface equals the circulation of $\mathbf{F}$ around the boundary.

Likewise, the Divergence Theorem generalizes the normal (flux) form of Green's Theorem from a two-dimensional region in the plane to a three-dimensional region in space. In each case, the integral of $\nabla \cdot \mathbf{F}$ over the interior of the region equals the total flux of the field across the boundary.

There is still more to be learned here. All these results can be thought of as forms of a *single fundamental theorem*. Think back to the Fundamental Theorem of Calculus in Section 5.3. It says that if $f(x)$ is differentiable on $(a, b)$ and continuous on $[a, b]$, then

$$\int_a^b \frac{df}{dx}\, dx = f(b) - f(a).$$

**FIGURE 16.76** The outward unit normals at the boundary of $[a, b]$ in one-dimensional space.

If we let $\mathbf{F} = f(x)\mathbf{i}$ throughout $[a, b]$, then $(df/dx) = \nabla \cdot \mathbf{F}$. If we define the unit vector field $\mathbf{n}$ normal to the boundary of $[a, b]$ to be $\mathbf{i}$ at $b$ and $-\mathbf{i}$ at $a$ (Figure 16.76), then

$$\begin{aligned} f(b) - f(a) &= f(b)\mathbf{i} \cdot (\mathbf{i}) + f(a)\mathbf{i} \cdot (-\mathbf{i}) \\ &= \mathbf{F}(b) \cdot \mathbf{n} + \mathbf{F}(a) \cdot \mathbf{n} \\ &= \text{total outward flux of } \mathbf{F} \text{ across the boundary of } [a, b]. \end{aligned}$$

The Fundamental Theorem now says that

$$\mathbf{F}(b) \cdot \mathbf{n} + \mathbf{F}(a) \cdot \mathbf{n} = \int_{[a,b]} \nabla \cdot \mathbf{F}\, dx.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The Fundamental Theorem of Calculus, the normal form of Green's Theorem, and the Divergence Theorem all say that the integral of the differential operator $\nabla\cdot$ operating on a field $\mathbf{F}$ over a region equals the sum of the normal field components over the boundary of the region. (Here we are interpreting the line integral in Green's Theorem and the surface integral in the Divergence Theorem as "sums" over the boundary.)

Stokes' Theorem and the tangential form of Green's Theorem say that, when things are properly oriented, the integral of the normal component of the curl operating on a field equals the sum of the tangential field components on the boundary of the surface.

The beauty of these interpretations is the observance of a single unifying principle, which we might state as follows.

> The integral of a differential operator acting on a field over a region equals the sum of the field components appropriate to the operator over the boundary of the region.

# EXERCISES 16.8

## Calculating Divergence

In Exercises 1–4, find the divergence of the field.

1. The spin field in Figure 16.14.
2. The radial field in Figure 16.13.
3. The gravitational field in Figure 16.9.
4. The velocity field in Figure 16.12.

## Using the Divergence Theorem to Calculate Outward Flux

In Exercises 5–16, use the Divergence Theorem to find the outward flux of $\mathbf{F}$ across the boundary of the region $D$.

5. **Cube** $\mathbf{F} = (y - x)\mathbf{i} + (z - y)\mathbf{j} + (y - x)\mathbf{k}$

   $D$: The cube bounded by the planes $x = \pm 1, y = \pm 1$, and $z = \pm 1$

6. $\mathbf{F} = x^2\mathbf{i} + y^2\mathbf{j} + z^2\mathbf{k}$

   a. **Cube** $D$: The cube cut from the first octant by the planes $x = 1, y = 1$, and $z = 1$

   b. **Cube** $D$: The cube bounded by the planes $x = \pm 1$, $y = \pm 1$, and $z = \pm 1$

   c. **Cylindrical can** $D$: The region cut from the solid cylinder $x^2 + y^2 \le 4$ by the planes $z = 0$ and $z = 1$

7. **Cylinder and paraboloid** $\mathbf{F} = y\mathbf{i} + xy\mathbf{j} - z\mathbf{k}$

   $D$: The region inside the solid cylinder $x^2 + y^2 \le 4$ between the plane $z = 0$ and the paraboloid $z = x^2 + y^2$

8. **Sphere** $\mathbf{F} = x^2\mathbf{i} + xz\mathbf{j} + 3z\mathbf{k}$

   $D$: The solid sphere $x^2 + y^2 + z^2 \le 4$

9. **Portion of sphere** $\mathbf{F} = x^2\mathbf{i} - 2xy\mathbf{j} + 3xz\mathbf{k}$

   $D$: The region cut from the first octant by the sphere $x^2 + y^2 + z^2 = 4$

10. **Cylindrical can** $\mathbf{F} = (6x^2 + 2xy)\mathbf{i} + (2y + x^2z)\mathbf{j} + 4x^2y^3\mathbf{k}$

    $D$: The region cut from the first octant by the cylinder $x^2 + y^2 = 4$ and the plane $z = 3$

11. **Wedge** $\mathbf{F} = 2xz\mathbf{i} - xy\mathbf{j} - z^2\mathbf{k}$

    $D$: The wedge cut from the first octant by the plane $y + z = 4$ and the elliptical cylinder $4x^2 + y^2 = 16$

12. **Sphere** $\mathbf{F} = x^3\mathbf{i} + y^3\mathbf{j} + z^3\mathbf{k}$

    $D$: The solid sphere $x^2 + y^2 + z^2 \le a^2$

13. **Thick sphere** $\mathbf{F} = \sqrt{x^2 + y^2 + z^2}\,(x\mathbf{i} + y\mathbf{j} + z\mathbf{k})$

    $D$: The region $1 \le x^2 + y^2 + z^2 \le 2$

14. **Thick sphere** $\mathbf{F} = (x\mathbf{i} + y\mathbf{j} + z\mathbf{k})/\sqrt{x^2 + y^2 + z^2}$

    $D$: The region $1 \le x^2 + y^2 + z^2 \le 4$

15. **Thick sphere** $\mathbf{F} = (5x^3 + 12xy^2)\mathbf{i} + (y^3 + e^y \sin z)\mathbf{j} + (5z^3 + e^y \cos z)\mathbf{k}$

    $D$: The solid region between the spheres $x^2 + y^2 + z^2 = 1$ and $x^2 + y^2 + z^2 = 2$

16. **Thick cylinder** $\mathbf{F} = \ln(x^2 + y^2)\mathbf{i} - \left(\frac{2z}{x}\tan^{-1}\frac{y}{x}\right)\mathbf{j} + z\sqrt{x^2 + y^2}\,\mathbf{k}$

    $D$: The thick-walled cylinder $1 \le x^2 + y^2 \le 2, \quad -1 \le z \le 2$

## Properties of Curl and Divergence

**17. div (curl $G$) is zero**

**a.** Show that if the necessary partial derivatives of the components of the field $\mathbf{G} = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$ are continuous, then $\nabla \cdot \nabla \times \mathbf{G} = 0$.

**b.** What, if anything, can you conclude about the flux of the field $\nabla \times \mathbf{G}$ across a closed surface? Give reasons for your answer.

**18.** Let $\mathbf{F}_1$ and $\mathbf{F}_2$ be differentiable vector fields and let $a$ and $b$ be arbitrary real constants. Verify the following identities.

**a.** $\nabla \cdot (a\mathbf{F}_1 + b\mathbf{F}_2) = a\nabla \cdot \mathbf{F}_1 + b\nabla \cdot \mathbf{F}_2$

**b.** $\nabla \times (a\mathbf{F}_1 + b\mathbf{F}_2) = a\nabla \times \mathbf{F}_1 + b\nabla \times \mathbf{F}_2$

**c.** $\nabla \cdot (\mathbf{F}_1 \times \mathbf{F}_2) = \mathbf{F}_2 \cdot \nabla \times \mathbf{F}_1 - \mathbf{F}_1 \cdot \nabla \times \mathbf{F}_2$

**19.** Let $\mathbf{F}$ be a differentiable vector field and let $g(x, y, z)$ be a differentiable scalar function. Verify the following identities.

**a.** $\nabla \cdot (g\mathbf{F}) = g\nabla \cdot \mathbf{F} + \nabla g \cdot \mathbf{F}$

**b.** $\nabla \times (g\mathbf{F}) = g\nabla \times \mathbf{F} + \nabla g \times \mathbf{F}$

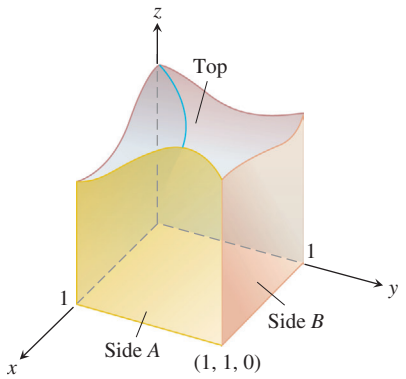
**20.** If $\mathbf{F} = M\mathbf{i} + N\mathbf{j} + P\mathbf{k}$ is a differentiable vector field, we define the notation $\mathbf{F} \cdot \nabla$ to mean

$$M\frac{\partial}{\partial x} + N\frac{\partial}{\partial y} + P\frac{\partial}{\partial z}.$$

For differentiable vector fields $\mathbf{F}_1$ and $\mathbf{F}_2$, verify the following identities.

**a.** $\nabla \times (\mathbf{F}_1 \times \mathbf{F}_2) = (\mathbf{F}_2 \cdot \nabla)\mathbf{F}_1 - (\mathbf{F}_1 \cdot \nabla)\mathbf{F}_2 + (\nabla \cdot \mathbf{F}_2)\mathbf{F}_1 - (\nabla \cdot \mathbf{F}_1)\mathbf{F}_2$

**b.** $\nabla(\mathbf{F}_1 \cdot \mathbf{F}_2) = (\mathbf{F}_1 \cdot \nabla)\mathbf{F}_2 + (\mathbf{F}_2 \cdot \nabla)\mathbf{F}_1 + \mathbf{F}_1 \times (\nabla \times \mathbf{F}_2) + \mathbf{F}_2 \times (\nabla \times \mathbf{F}_1)$



## Theory and Examples

**21.** Let $\mathbf{F}$ be a field whose components have continuous first partial derivatives throughout a portion of space containing a region $D$ bounded by a smooth closed surface $S$. If $|\mathbf{F}| \le 1$, can any bound be placed on the size of

$$\iiint_D \nabla \cdot \mathbf{F}\, dV\,?$$

Give reasons for your answer.

**22.** The base of the closed cubelike surface shown here is the unit square in the $xy$-plane. The four sides lie in the planes $x = 0, x = 1, y = 0$, and $y = 1$. The top is an arbitrary smooth surface whose identity is unknown. Let $\mathbf{F} = x\mathbf{i} - 2y\mathbf{j} + (z + 3)\mathbf{k}$ and suppose the outward flux of $\mathbf{F}$ through side $A$ is 1 and through side $B$ is $-3$. Can you conclude anything about the outward flux through the top? Give reasons for your answer.

**23.** **a.** Show that the flux of the position vector field $\mathbf{F} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ outward through a smooth closed surface $S$ is three times the volume of the region enclosed by the surface.

**b.** Let $\mathbf{n}$ be the outward unit normal vector field on $S$. Show that it is not possible for $\mathbf{F}$ to be orthogonal to $\mathbf{n}$ at every point of $S$.

**24. Maximum flux** Among all rectangular solids defined by the inequalities $0 \le x \le a, 0 \le y \le b, 0 \le z \le 1$, find the one for which the total flux of $\mathbf{F} = (-x^2 - 4xy)\mathbf{i} - 6yz\mathbf{j} + 12z\mathbf{k}$ outward through the six sides is greatest. What *is* the greatest flux?

**25. Volume of a solid region** Let $\mathbf{F} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ and suppose that the surface $S$ and region $D$ satisfy the hypotheses of the Divergence Theorem. Show that the volume of $D$ is given by the formula

$$\text{Volume of } D = \frac{1}{3}\iint_S \mathbf{F} \cdot \mathbf{n}\, d\sigma.$$

**26. Flux of a constant field** Show that the outward flux of a constant vector field $\mathbf{F} = \mathbf{C}$ across any closed surface to which the Divergence Theorem applies is zero.

**27. Harmonic functions** A function $f(x, y, z)$ is said to be *harmonic* in a region $D$ in space if it satisfies the Laplace equation

$$\nabla^2 f = \nabla \cdot \nabla f = \frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} + \frac{\partial^2 f}{\partial z^2} = 0$$

throughout $D$.

**a.** Suppose that $f$ is harmonic throughout a bounded region $D$ enclosed by a smooth surface $S$ and that $\mathbf{n}$ is the chosen unit normal vector on $S$. Show that the integral over $S$ of $\nabla f \cdot \mathbf{n}$, the derivative of $f$ in the direction of $\mathbf{n}$, is zero.

**b.** Show that if $f$ is harmonic on $D$, then

$$\iint_S f\, \nabla f \cdot \mathbf{n}\, d\sigma = \iiint_D |\nabla f|^2\, dV.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**28. Flux of a gradient field** Let $S$ be the surface of the portion of the solid sphere $x^2 + y^2 + z^2 \le a^2$ that lies in the first octant and let $f(x, y, z) = \ln\sqrt{x^2 + y^2 + z^2}$. Calculate

$$\iint_S \nabla f \cdot \mathbf{n}\, d\sigma.$$

($\nabla f \cdot \mathbf{n}$ is the derivative of $f$ in the direction of $\mathbf{n}$.)

**29. Green's first formula** Suppose that $f$ and $g$ are scalar functions with continuous first- and second-order partial derivatives throughout a region $D$ that is bounded by a closed piecewise-smooth surface $S$. Show that

$$\iint_S f\, \nabla g \cdot \mathbf{n}\, d\sigma = \iiint_D (f\, \nabla^2 g + \nabla f \cdot \nabla g)\, dV. \tag{9}$$

Equation (9) is **Green's first formula**. (*Hint:* Apply the Divergence Theorem to the field $\mathbf{F} = f\, \nabla g$.)

**30. Green's second formula** (*Continuation of Exercise 29.*) Interchange $f$ and $g$ in Equation (9) to obtain a similar formula. Then subtract this formula from Equation (9) to show that

$$\iint_S (f\, \nabla g - g \nabla f) \cdot \mathbf{n}\, d\sigma = \iiint_D (f\, \nabla^2 g - g \nabla^2 f)\, dV. \tag{10}$$

This equation is **Green's second formula**.

**31. Conservation of mass** Let $\mathbf{v}(t, x, y, z)$ be a continuously differentiable vector field over the region $D$ in space and let $p(t, x, y, z)$ be a continuously differentiable scalar function. The variable $t$ represents the time domain. The Law of Conservation of Mass asserts that

$$\frac{d}{dt} \iiint_D p(t, x, y, z)\, dV = -\iint_S p\mathbf{v} \cdot \mathbf{n}\, d\sigma,$$

where $S$ is the surface enclosing $D$.

**a.** Give a physical interpretation of the conservation of mass law if $\mathbf{v}$ is a velocity flow field and $p$ represents the density of the fluid at point $(x, y, z)$ at time $t$.

**b.** Use the Divergence Theorem and Leibniz's Rule,

$$\frac{d}{dt} \iiint_D p(t, x, y, z)\, dV = \iiint_D \frac{\partial p}{\partial t}\, dV,$$

to show that the Law of Conservation of Mass is equivalent to the continuity equation,

$$\nabla \cdot p\mathbf{v} + \frac{\partial p}{\partial t} = 0.$$

(In the first term $\nabla \cdot p\mathbf{v}$, the variable $t$ is held fixed, and in the second term $\partial p/\partial t$, it is assumed that the point $(x, y, z)$ in $D$ is held fixed.)

**32. The heat diffusion equation** Let $T(t, x, y, z)$ be a function with continuous second derivatives giving the temperature at time $t$ at the point $(x, y, z)$ of a solid occupying a region $D$ in space. If the solid's heat capacity and mass density are denoted by the constants $c$ and $\rho$, respectively, the quantity $c\rho T$ is called the solid's **heat energy per unit volume**.

**a.** Explain why $-\nabla T$ points in the direction of heat flow.

**b.** Let $-k\nabla T$ denote the **energy flux vector**. (Here the constant $k$ is called the **conductivity**.) Assuming the Law of Conservation of Mass with $-k\nabla T = \mathbf{v}$ and $c\rho T = p$ in Exercise 31, derive the diffusion (heat) equation

$$\frac{\partial T}{\partial t} = K \nabla^2 T,$$

where $K = k/(c\rho) > 0$ is the *diffusivity* constant. (Notice that if $T(t, x)$ represents the temperature at time $t$ at position $x$ in a uniform conducting rod with perfectly insulated sides, then $\nabla^2 T = \partial^2 T/\partial x^2$ and the diffusion equation reduces to the one-dimensional heat equation in Chapter 14's Additional Exercises.)

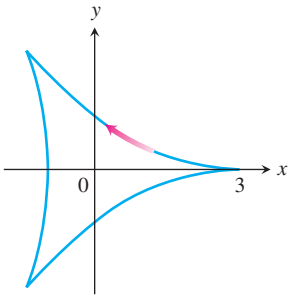
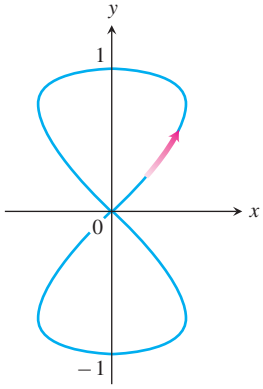
# Chapter 16 Additional and Advanced Exercises

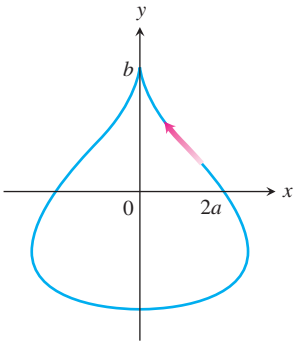


## Finding Areas with Green's Theorem

Use the Green's Theorem area formula, Equation (13) in Exercises 16.4, to find the areas of the regions enclosed by the curves in Exercises 1–4.



**1.** The limaçon $x = 2\cos t - \cos 2t$, $y = 2\sin t - \sin 2t$, $0 \le t \le 2\pi$



**2.** The deltoid $x = 2\cos t + \cos 2t$, $y = 2\sin t - \sin 2t$, $0 \le t \le 2\pi$

**3.** The eight curve $x = (1/2)\sin 2t$, $y = \sin t$, $0 \le t \le \pi$ (one loop)

**4.** The teardrop $x = 2a\cos t - a\sin 2t$, $y = b\sin t$, $0 \le t \le 2\pi$

## Theory and Applications

**5. a.** Give an example of a vector field $\mathbf{F}(x, y, z)$ that has value $\mathbf{0}$ at only one point and such that curl $\mathbf{F}$ is nonzero everywhere. Be sure to identify the point and compute the curl.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**b.** Give an example of a vector field $\mathbf{F}(x, y, z)$ that has value $\mathbf{0}$ on precisely one line and such that curl $\mathbf{F}$ is nonzero everywhere. Be sure to identify the line and compute the curl.

**c.** Give an example of a vector field $\mathbf{F}(x, y, z)$ that has value $\mathbf{0}$ on a surface and such that curl $\mathbf{F}$ is nonzero everywhere. Be sure to identify the surface and compute the curl.

**6.** Find all points $(a, b, c)$ on the sphere $x^2 + y^2 + z^2 = R^2$ where the vector field $\mathbf{F} = yz^2\mathbf{i} + xz^2\mathbf{j} + 2xyz\mathbf{k}$ is normal to the surface and $\mathbf{F}(a, b, c) \neq \mathbf{0}$.

**7.** Find the mass of a spherical shell of radius $R$ such that at each point $(x, y, z)$ on the surface the mass density $\delta(x, y, z)$ is its distance to some fixed point $(a, b, c)$ of the surface.

**8.** Find the mass of a helicoid

$$\mathbf{r}(r, \theta) = (r\cos\theta)\mathbf{i} + (r\sin\theta)\mathbf{j} + \theta\mathbf{k},$$

$0 \le r \le 1, 0 \le \theta \le 2\pi$, if the density function is $\delta(x, y, z) = 2\sqrt{x^2 + y^2}$. See Practice Exercise 27 for a figure.

**9.** Among all rectangular regions $0 \le x \le a, 0 \le y \le b$, find the one for which the total outward flux of $\mathbf{F} = (x^2 + 4xy)\mathbf{i} - 6y\mathbf{j}$ across the four sides is least. What *is* the least flux?

**10.** Find an equation for the plane through the origin such that the circulation of the flow field $\mathbf{F} = z\mathbf{i} + x\mathbf{j} + y\mathbf{k}$ around the circle of intersection of the plane with the sphere $x^2 + y^2 + z^2 = 4$ is a maximum.

**11.** A string lies along the circle $x^2 + y^2 = 4$ from (2, 0) to (0, 2) in the first quadrant. The density of the string is $\rho(x, y) = xy$

**a.** Partition the string into a finite number of subarcs to show that the work done by gravity to move the string straight down to the $x$-axis is given by

$$\text{Work} = \lim_{n\to\infty} \sum_{k=1}^{n} g\, x_k y_k^2 \Delta s_k = \int_C g\, xy^2\, ds,$$

where $g$ is the gravitational constant.

**b.** Find the total work done by evaluating the line integral in part (a).

**c.** Show that the total work done equals the work required to move the string's center of mass $(\bar{x}, \bar{y})$ straight down to the $x$-axis.

**12.** A thin sheet lies along the portion of the plane $x + y + z = 1$ in the first octant. The density of the sheet is $\delta(x, y, z) = xy$.

**a.** Partition the sheet into a finite number of subpieces to show that the work done by gravity to move the sheet straight down to the $xy$-plane is given by

$$\text{Work} = \lim_{n\to\infty} \sum_{k=1}^{n} g\, x_k y_k z_k\, \Delta\sigma_k = \iint_S g\, xyz\, d\sigma,$$

where $g$ is the gravitational constant.

**b.** Find the total work done by evaluating the surface integral in part (a).

**c.** Show that the total work done equals the work required to move the sheet's center of mass $(\bar{x}, \bar{y}, \bar{z})$ straight down to the $xy$-plane.

**13. Archimedes' principle** If an object such as a ball is placed in a liquid, it will either sink to the bottom, float, or sink a certain distance and remain suspended in the liquid. Suppose a fluid has constant weight density $w$ and that the fluid's surface coincides with the plane $z = 4$. A spherical ball remains suspended in the fluid and occupies the region $x^2 + y^2 + (z - 2)^2 \le 1$.

**a.** Show that the surface integral giving the magnitude of the total force on the ball due to the fluid's pressure is

$$\text{Force} = \lim_{n\to\infty} \sum_{k=1}^{n} w(4 - z_k)\, \Delta\sigma_k = \iint_S w(4 - z)\, d\sigma.$$

**b.** Since the ball is not moving, it is being held up by the buoyant force of the liquid. Show that the magnitude of the buoyant force on the sphere is

$$\text{Buoyant force} = \iint_S w(z - 4)\mathbf{k}\cdot\mathbf{n}\, d\sigma,$$

where $\mathbf{n}$ is the outer unit normal at $(x, y, z)$. This illustrates Archimedes' principle that the magnitude of the buoyant force on a submerged solid equals the weight of the displaced fluid.

**c.** Use the Divergence Theorem to find the magnitude of the buoyant force in part (b).

**14. Fluid force on a curved surface** A cone in the shape of the surface $z = \sqrt{x^2 + y^2}, 0 \le z \le 2$ is filled with a liquid of constant weight density $w$. Assuming the $xy$-plane is "ground level," show that the total force on the portion of the cone from $z = 1$ to $z = 2$ due to liquid pressure is the surface integral

$$F = \iint_S w(2 - z)\, d\sigma.$$

Evaluate the integral.

**15. Faraday's Law** If $\mathbf{E}(t, x, y, z)$ and $\mathbf{B}(t, x, y, z)$ represent the electric and magnetic fields at point $(x, y, z)$ at time $t$, a basic principle of electromagnetic theory says that $\nabla \times \mathbf{E} = -\partial\mathbf{B}/\partial t$. In this expression $\nabla \times \mathbf{E}$ is computed with $t$ held fixed and $\partial\mathbf{B}/\partial t$ is calculated with $(x, y, z)$ fixed. Use Stokes' Theorem to derive Faraday's Law

$$\oint_C \mathbf{E}\cdot d\mathbf{r} = -\frac{\partial}{\partial t}\iint_S \mathbf{B}\cdot\mathbf{n}\, d\sigma,$$

where $C$ represents a wire loop through which current flows counterclockwise with respect to the surface's unit normal $\mathbf{n}$, giving rise to the voltage

$$\oint_C \mathbf{E}\cdot d\mathbf{r}$$

around $C$. The surface integral on the right side of the equation is called the *magnetic flux*, and $S$ is any oriented surface with boundary $C$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**16.** Let

$$\mathbf{F} = -\frac{GmM}{|\mathbf{r}|^3}\mathbf{r}$$

be the gravitational force field defined for $\mathbf{r} \neq \mathbf{0}$. Use Gauss's Law in Section 16.8 to show that there is no continuously differentiable vector field $\mathbf{H}$ satisfying $\mathbf{F} = \nabla \times \mathbf{H}$.

**17.** If $f(x, y, z)$ and $g(x, y, z)$ are continuously differentiable scalar functions defined over the oriented surface $S$ with boundary curve $C$, prove that

$$\iint_S (\nabla f \times \nabla g) \cdot \mathbf{n}\, d\sigma = \oint_C f\, \nabla g \cdot d\mathbf{r}.$$

**18.** Suppose that $\nabla \cdot \mathbf{F}_1 = \nabla \cdot \mathbf{F}_2$ and $\nabla \times \mathbf{F}_1 = \nabla \times \mathbf{F}_2$ over a region $D$ enclosed by the oriented surface $S$ with outward unit normal $\mathbf{n}$ and that $\mathbf{F}_1 \cdot \mathbf{n} = \mathbf{F}_2 \cdot \mathbf{n}$ on $S$. Prove that $\mathbf{F}_1 = \mathbf{F}_2$ throughout $D$.

**19.** Prove or disprove that if $\nabla \cdot \mathbf{F} = 0$ and $\nabla \times \mathbf{F} = \mathbf{0}$, then $\mathbf{F} = \mathbf{0}$.

**20.** Let $S$ be an oriented surface parametrized by $\mathbf{r}(u, v)$. Define the notation $d\boldsymbol{\sigma} = \mathbf{r}_u\, du \times \mathbf{r}_v\, dv$ so that $d\boldsymbol{\sigma}$ is a vector normal to the surface. Also, the magnitude $d\sigma = |d\boldsymbol{\sigma}|$ is the element of surface area (by Equation 5 in Section 16.6). Derive the identity

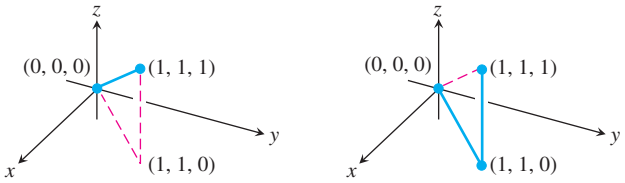
$$d\sigma = (EG - F^2)^{1/2}\, du\, dv$$

where

$$E = |\mathbf{r}_u|^2, \quad F = \mathbf{r}_u \cdot \mathbf{r}_v, \quad \text{and} \quad G = |\mathbf{r}_v|^2.$$

**21.** Show that the volume $V$ of a region $D$ in space enclosed by the oriented surface $S$ with outward normal $\mathbf{n}$ satisfies the identity

$$V = \frac{1}{3}\iint_S \mathbf{r} \cdot \mathbf{n}\, d\sigma,$$



where $\mathbf{r}$ is the position vector of the point $(x, y, z)$ in $D$.

# Chapter 16 Practice Exercises

## Evaluating Line Integrals

**1.** The accompanying figure shows two polygonal paths in space joining the origin to the point (1, 1, 1). Integrate $f(x, y, z) = 2x - 3y^2 - 2z + 3$ over each path.

**2.** The accompanying figure shows three polygonal paths joining the origin to the point (1, 1, 1). Integrate $f(x, y, z) = x^2 + y - z$ over each path.

**3.** Integrate $f(x, y, z) = \sqrt{x^2 + z^2}$ over the circle

$$\mathbf{r}(t) = (a \cos t)\mathbf{j} + (a \sin t)\mathbf{k}, \qquad 0 \le t \le 2\pi.$$

**4.** Integrate $f(x, y, z) = \sqrt{x^2 + y^2}$ over the involute curve

$$\mathbf{r}(t) = (\cos t + t \sin t)\mathbf{i} + (\sin t - t \cos t)\mathbf{j}, \qquad 0 \le t \le \sqrt{3}.$$

Evaluate the integrals in Exercises 5 and 6.

**5.** $\displaystyle\int_{(-1,1,1)}^{(4,-3,0)} \frac{dx + dy + dz}{\sqrt{x + y + z}}$

**6.** $\displaystyle\int_{(1,1,1)}^{(10,3,3)} dx - \sqrt{\frac{z}{y}}\,dy - \sqrt{\frac{y}{z}}\,dz$

**7.** Integrate $\mathbf{F} = -(y \sin z)\mathbf{i} + (x \sin z)\mathbf{j} + (xy \cos z)\mathbf{k}$ around the circle cut from the sphere $x^2 + y^2 + z^2 = 5$ by the plane $z = -1$, clockwise as viewed from above.

**8.** Integrate $\mathbf{F} = 3x^2y\mathbf{i} + (x^3 + 1)\mathbf{j} + 9z^2\mathbf{k}$ around the circle cut from the sphere $x^2 + y^2 + z^2 = 9$ by the plane $x = 2$.

Evaluate the integrals in Exercises 9 and 10.

**9.** $\displaystyle\int_C 8x \sin y\,dx - 8y \cos x\,dy$

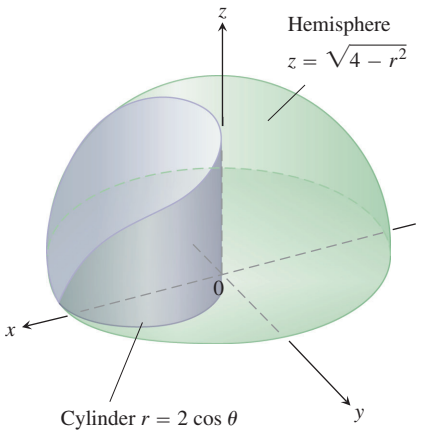
$C$ is the square cut from the first quadrant by the lines $x = \pi/2$ and $y = \pi/2$.

**10.** $\displaystyle\int_C y^2\,dx + x^2\,dy$

$C$ is the circle $x^2 + y^2 = 4$.

## Evaluating Surface Integrals

**11. Area of an elliptical region** Find the area of the elliptical region cut from the plane $x + y + z = 1$ by the cylinder $x^2 + y^2 = 1$.



**12. Area of a parabolic cap** Find the area of the cap cut from the paraboloid $y^2 + z^2 = 3x$ by the plane $x = 1$.

**13. Area of a spherical cap** Find the area of the cap cut from the top of the sphere $x^2 + y^2 + z^2 = 1$ by the plane $z = \sqrt{2}/2$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**14. a. Hemisphere cut by cylinder** Find the area of the surface cut from the hemisphere $x^2 + y^2 + z^2 = 4, z \geq 0$, by the cylinder $x^2 + y^2 = 2x$.

**b.** Find the area of the portion of the cylinder that lies inside the hemisphere. (*Hint:* Project onto the $xz$-plane. Or evaluate the integral $\int h\, ds$, where $h$ is the altitude of the cylinder and $ds$ is the element of arc length on the circle $x^2 + y^2 = 2x$ in the $xy$-plane.)

**15. Area of a triangle** Find the area of the triangle in which the plane $(x/a) + (y/b) + (z/c) = 1\ (a, b, c > 0)$ intersects the first octant. Check your answer with an appropriate vector calculation.

**16. Parabolic cylinder cut by planes** Integrate

**a.** $g(x, y, z) = \dfrac{yz}{\sqrt{4y^2 + 1}}$ **b.** $g(x, y, z) = \dfrac{z}{\sqrt{4y^2 + 1}}$

over the surface cut from the parabolic cylinder $y^2 - z = 1$ by the planes $x = 0, x = 3$, and $z = 0$.

**17. Circular cylinder cut by planes** Integrate $g(x, y, z) = x^4y(y^2 + z^2)$ over the portion of the cylinder $y^2 + z^2 = 25$ that lies in the first octant between the planes $x = 0$ and $x = 1$ and above the plane $z = 3$.

**18. Area of Wyoming** The state of Wyoming is bounded by the meridians 111°3′ and 104°3′ west longitude and by the circles 41° and 45° north latitude. Assuming that Earth is a sphere of radius $R = 3959$ mi, find the area of Wyoming.

## Parametrized Surfaces

Find the parametrizations for the surfaces in Exercises 19–24. (There are many ways to do these, so your answers may not be the same as those in the back of the book.)

**19. Spherical band** The portion of the sphere $x^2 + y^2 + z^2 = 36$ between the planes $z = -3$ and $z = 3\sqrt{3}$

**20. Parabolic cap** The portion of the paraboloid $z = -(x^2 + y^2)/2$ above the plane $z = -2$

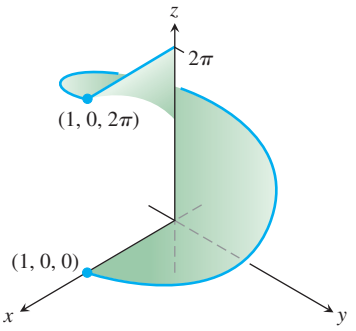
**21. Cone** The cone $z = 1 + \sqrt{x^2 + y^2}, z \leq 3$

**22. Plane above square** The portion of the plane $4x + 2y + 4z = 12$ that lies above the square $0 \leq x \leq 2, 0 \leq y \leq 2$ in the first quadrant

**23. Portion of paraboloid** The portion of the paraboloid $y = 2(x^2 + z^2),\ y \leq 2$, that lies above the $xy$-plane

**24. Portion of hemisphere** The portion of the hemisphere $x^2 + y^2 + z^2 = 10, y \geq 0$, in the first octant

**25. Surface area** Find the area of the surface



$$\mathbf{r}(u, v) = (u + v)\mathbf{i} + (u - v)\mathbf{j} + v\mathbf{k},$$
$$0 \leq u \leq 1, \quad 0 \leq v \leq 1.$$

**26. Surface integral** Integrate $f(x, y, z) = xy - z^2$ over the surface in Exercise 25.

**27. Area of a helicoid** Find the surface area of the helicoid

$$\mathbf{r}(r, \theta) = (r\cos\theta)\mathbf{i} + (r\sin\theta)\mathbf{j} + \theta\mathbf{k}, \quad 0 \leq \theta \leq 2\pi, \quad 0 \leq r \leq 1,$$

in the accompanying figure.

**28. Surface integral** Evaluate the integral $\iint_S \sqrt{x^2 + y^2 + 1}\, d\sigma$, where $S$ is the helicoid in Exercise 27.

## Conservative Fields

Which of the fields in Exercises 29–32 are conservative, and which are not?

**29.** $\mathbf{F} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$

**30.** $\mathbf{F} = (x\mathbf{i} + y\mathbf{j} + z\mathbf{k})/(x^2 + y^2 + z^2)^{3/2}$

**31.** $\mathbf{F} = xe^y\mathbf{i} + ye^z\mathbf{j} + ze^x\mathbf{k}$

**32.** $\mathbf{F} = (\mathbf{i} + z\mathbf{j} + y\mathbf{k})/(x + yz)$

Find potential functions for the fields in Exercises 33 and 34.

**33.** $\mathbf{F} = 2\mathbf{i} + (2y + z)\mathbf{j} + (y + 1)\mathbf{k}$

**34.** $\mathbf{F} = (z\cos xz)\mathbf{i} + e^y\mathbf{j} + (x\cos xz)\mathbf{k}$

## Work and Circulation

In Exercises 35 and 36, find the work done by each field along the paths from (0, 0, 0) to (1, 1, 1) in Exercise 1.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**35.** $\mathbf{F} = 2xy\mathbf{i} + \mathbf{j} + x^2\mathbf{k}$ **36.** $\mathbf{F} = 2xy\mathbf{i} + x^2\mathbf{j} + \mathbf{k}$

**37. Finding work in two ways** Find the work done by

$$\mathbf{F} = \frac{x\mathbf{i} + y\mathbf{j}}{(x^2 + y^2)^{3/2}}$$

over the plane curve $\mathbf{r}(t) = (e^t \cos t)\mathbf{i} + (e^t \sin t)\mathbf{j}$ from the point $(1, 0)$ to the point $(e^{2\pi}, 0)$ in two ways:

**a.** By using the parametrization of the curve to evaluate the work integral

**b.** By evaluating a potential function for $\mathbf{F}$.

**38. Flow along different paths** Find the flow of the field $\mathbf{F} = \nabla(x^2 z e^y)$

**a.** Once around the ellipse $C$ in which the plane $x + y + z = 1$ intersects the cylinder $x^2 + z^2 = 25$, clockwise as viewed from the positive $y$-axis

**b.** Along the curved boundary of the helicoid in Exercise 27 from $(1, 0, 0)$ to $(1, 0, 2\pi)$.

In Exercises 39 and 40, use the surface integral in Stokes' Theorem to find the circulation of the field $\mathbf{F}$ around the curve $C$ in the indicated direction.

**39. Circulation around an ellipse** $\mathbf{F} = y^2\mathbf{i} - y\mathbf{j} + 3z^2\mathbf{k}$

$C$: The ellipse in which the plane $2x + 6y - 3z = 6$ meets the cylinder $x^2 + y^2 = 1$, counterclockwise as viewed from above

**40. Circulation around a circle** $\mathbf{F} = (x^2 + y)\mathbf{i} + (x + y)\mathbf{j} + (4y^2 - z)\mathbf{k}$

$C$: The circle in which the plane $z = -y$ meets the sphere $x^2 + y^2 + z^2 = 4$, counterclockwise as viewed from above

## Mass and Moments

**41. Wire with different densities** Find the mass of a thin wire lying along the curve $\mathbf{r}(t) = \sqrt{2}t\mathbf{i} + \sqrt{2}t\mathbf{j} + (4 - t^2)\mathbf{k}$, $0 \le t \le 1$, if the density at $t$ is **(a)** $\delta = 3t$ and **(b)** $\delta = 1$.

**42. Wire with variable density** Find the center of mass of a thin wire lying along the curve $\mathbf{r}(t) = t\mathbf{i} + 2t\mathbf{j} + (2/3)t^{3/2}\mathbf{k}$, $0 \le t \le 2$, if the density at $t$ is $\delta = 3\sqrt{5 + t}$.

**43. Wire with variable density** Find the center of mass and the moments of inertia and radii of gyration about the coordinate axes of a thin wire lying along the curve

$$\mathbf{r}(t) = t\mathbf{i} + \frac{2\sqrt{2}}{3}t^{3/2}\mathbf{j} + \frac{t^2}{2}\mathbf{k}, \qquad 0 \le t \le 2,$$

if the density at $t$ is $\delta = 1/(t + 1)$.

**44. Center of mass of an arch** A slender metal arch lies along the semicircle $y = \sqrt{a^2 - x^2}$ in the $xy$-plane. The density at the point $(x, y)$ on the arch is $\delta(x, y) = 2a - y$. Find the center of mass.

**45. Wire with constant density** A wire of constant density $\delta = 1$ lies along the curve $\mathbf{r}(t) = (e^t \cos t)\mathbf{i} + (e^t \sin t)\mathbf{j} + e^t\mathbf{k}$, $0 \le t \le \ln 2$. Find $\bar{z}$, $I_z$, and $R_z$.

**46. Helical wire with constant density** Find the mass and center of mass of a wire of constant density $\delta$ that lies along the helix $\mathbf{r}(t) = (2 \sin t)\mathbf{i} + (2 \cos t)\mathbf{j} + 3t\mathbf{k}$, $0 \le t \le 2\pi$.

**47. Inertia, radius of gyration, center of mass of a shell** Find $I_z$, $R_z$, and the center of mass of a thin shell of density $\delta(x, y, z) = z$ cut from the upper portion of the sphere $x^2 + y^2 + z^2 = 25$ by the plane $z = 3$.

**48. Moment of inertia of a cube** Find the moment of inertia about the $z$-axis of the surface of the cube cut from the first octant by the planes $x = 1$, $y = 1$, and $z = 1$ if the density is $\delta = 1$.

## Flux Across a Plane Curve or Surface

Use Green's Theorem to find the counterclockwise circulation and outward flux for the fields and curves in Exercises 49 and 50.

**49. Square** $\mathbf{F} = (2xy + x)\mathbf{i} + (xy - y)\mathbf{j}$

$C$: The square bounded by $x = 0, x = 1, y = 0, y = 1$

**50. Triangle** $\mathbf{F} = (y - 6x^2)\mathbf{i} + (x + y^2)\mathbf{j}$

$C$: The triangle made by the lines $y = 0$, $y = x$, and $x = 1$

**51. Zero line integral** Show that

$$\oint_C \ln x \sin y\, dy - \frac{\cos y}{x}\, dx = 0$$

for any closed curve $C$ to which Green's Theorem applies.

**52. a. Outward flux and area** Show that the outward flux of the position vector field $\mathbf{F} = x\mathbf{i} + y\mathbf{j}$ across any closed curve to which Green's Theorem applies is twice the area of the region enclosed by the curve.

**b.** Let $\mathbf{n}$ be the outward unit normal vector to a closed curve to which Green's Theorem applies. Show that it is not possible for $\mathbf{F} = x\mathbf{i} + y\mathbf{j}$ to be orthogonal to $\mathbf{n}$ at every point of $C$.

In Exercises 53–56, find the outward flux of $\mathbf{F}$ across the boundary of $D$.

**53. Cube** $\mathbf{F} = 2xy\mathbf{i} + 2yz\mathbf{j} + 2xz\mathbf{k}$

$D$: The cube cut from the first octant by the planes $x = 1, y = 1, z = 1$

**54. Spherical cap** $\mathbf{F} = xz\mathbf{i} + yz\mathbf{j} + \mathbf{k}$

$D$: The entire surface of the upper cap cut from the solid sphere $x^2 + y^2 + z^2 \le 25$ by the plane $z = 3$

**55. Spherical cap** $\mathbf{F} = -2x\mathbf{i} - 3y\mathbf{j} + z\mathbf{k}$

$D$: The upper region cut from the solid sphere $x^2 + y^2 + z^2 \le 2$ by the paraboloid $z = x^2 + y^2$

**56. Cone and cylinder** $\mathbf{F} = (6x + y)\mathbf{i} - (x + z)\mathbf{j} + 4yz\mathbf{k}$

$D$: The region in the first octant bounded by the cone $z = \sqrt{x^2 + y^2}$, the cylinder $x^2 + y^2 = 1$, and the coordinate planes

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**57. Hemisphere, cylinder, and plane** Let $S$ be the surface that is bounded on the left by the hemisphere $x^2 + y^2 + z^2 = a^2, y \leq 0$, in the middle by the cylinder $x^2 + z^2 = a^2, 0 \leq y \leq a$, and on the right by the plane $y = a$. Find the flux of $\mathbf{F} = y\mathbf{i} + z\mathbf{j} + x\mathbf{k}$ outward across $S$.

**58. Cylinder and planes** Find the outward flux of the field $\mathbf{F} = 3xz^2\mathbf{i} + y\mathbf{j} - z^3\mathbf{k}$ across the surface of the solid in the first octant that is bounded by the cylinder $x^2 + 4y^2 = 16$ and the planes $y = 2z, x = 0$, and $z = 0$.

**59. Cylindrical can** Use the Divergence Theorem to find the flux of $\mathbf{F} = xy^2\mathbf{i} + x^2y\mathbf{j} + y\mathbf{k}$ outward through the surface of the region enclosed by the cylinder $x^2 + y^2 = 1$ and the planes $z = 1$ and $z = -1$.

**60. Hemisphere** Find the flux of $\mathbf{F} = (3z + 1)\mathbf{k}$ upward across the hemisphere $x^2 + y^2 + z^2 = a^2, z \geq 0$ **(a)** with the Divergence Theorem and **(b)** by evaluating the flux integral directly.

## Chapter 16 Questions to Guide Your Review

1. What are line integrals? How are they evaluated? Give examples.
2. How can you use line integrals to find the centers of mass of springs? Explain.
3. What is a vector field? A gradient field? Give examples.
4. How do you calculate the work done by a force in moving a particle along a curve? Give an example.
5. What are flow, circulation, and flux?
6. What is special about path independent fields?
7. How can you tell when a field is conservative?
8. What is a potential function? Show by example how to find a potential function for a conservative field.
9. What is a differential form? What does it mean for such a form to be exact? How do you test for exactness? Give examples.
10. What is the divergence of a vector field? How can you interpret it?
11. What is the curl of a vector field? How can you interpret it?
12. What is Green's theorem? How can you interpret it?
13. How do you calculate the area of a curved surface in space? Give an example.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**14.** What is an oriented surface? How do you calculate the flux of a three-dimensional vector field across an oriented surface? Give an example.

**15.** What are surface integrals? What can you calculate with them? Give an example.

**16.** What is a parametrized surface? How do you find the area of such a surface? Give examples.

**17.** How do you integrate a function over a parametrized surface? Give an example.

**18.** What is Stokes' Theorem? How can you interpret it?

**19.** Summarize the chapter's results on conservative fields.

**20.** What is the Divergence Theorem? How can you interpret it?

**21.** How does the Divergence Theorem generalize Green's Theorem?

**22.** How does Stokes' Theorem generalize Green's Theorem?

**23.** How can Green's Theorem, Stokes' Theorem, and the Divergence Theorem be thought of as forms of a single fundamental theorem?

Chapter

# 15 First-Order Differential Equations

**OVERVIEW** In Section 4.8 we introduced differential equations of the form $dy/dx = f(x)$, where $f$ is given and $y$ is an unknown function of $x$. When $f$ is continuous over some interval, we found the general solution $y(x)$ by integration, $y = \int f(x)\,dx$. In Section 6.5 we solved separable differential equations. Such equations arise when investigating exponential growth or decay, for example. In this chapter we study some other types of *first-order* differential equations. They involve only first derivatives of the unknown function.

## 15.1 Solutions, Slope Fields, and Picard's Theorem

We begin this section by defining general differential equations involving first derivatives. We then look at slope fields, which give a geometric picture of the solutions to such equations. Finally we present Picard's Theorem, which gives conditions under which *first-order* differential equations have exactly one solution.

### General First-Order Differential Equations and Solutions

A **first-order differential equation** is an equation

$$\frac{dy}{dx} = f(x, y) \tag{1}$$

in which $f(x, y)$ is a function of two variables defined on a region in the $xy$-plane. The equation is of *first order* because it involves only the first derivative $dy/dx$ (and not higher-order derivatives). We point out that the equations

$$y' = f(x, y) \quad \text{and} \quad \frac{d}{dx}y = f(x, y),$$

are equivalent to Equation (1) and all three forms will be used interchangeably in the text.

A **solution** of Equation (1) is a differentiable function $y = y(x)$ defined on an interval $I$ of $x$-values (perhaps infinite) such that

$$\frac{d}{dx}y(x) = f(x, y(x))$$

on that interval. That is, when $y(x)$ and its derivative $y'(x)$ are substituted into Equation (1), the resulting equation is true for all $x$ over the interval $I$. The **general solution** to a first-order differential equation is a solution that contains all possible solutions. The general

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

solution always contains an arbitrary constant, but having this property doesn't mean a solution is the general solution. That is, a solution may contain an arbitrary constant without being the general solution. Establishing that a solution *is* the general solution may require deeper results from the theory of differential equations and is best studied in a more advanced course.

**EXAMPLE 1** Show that every member of the family of functions

$$y = \frac{C}{x} + 2$$

is a solution of the first-order differential equation

$$\frac{dy}{dx} = \frac{1}{x}(2 - y)$$

on the interval $(0, \infty)$, where $C$ is any constant.

**Solution** Differentiating $y = C/x + 2$ gives

$$\frac{dy}{dx} = C\frac{d}{dx}\left(\frac{1}{x}\right) + 0 = -\frac{C}{x^2}.$$

Thus we need only verify that for all $x \in (0, \infty)$,

$$-\frac{C}{x^2} = \frac{1}{x}\left[2 - \left(\frac{C}{x} + 2\right)\right].$$

This last equation follows immediately by expanding the expression on the right-hand side:

$$\frac{1}{x}\left[2 - \left(\frac{C}{x} + 2\right)\right] = \frac{1}{x}\left(-\frac{C}{x}\right) = -\frac{C}{x^2}.$$

Therefore, for every value of $C$, the function $y = C/x + 2$ is a solution of the differential equation. ■

As was the case in finding antiderivatives, we often need a *particular* rather than the general solution to a first-order differential equation $y' = f(x, y)$. The **particular solution** satisfying the initial condition $y(x_0) = y_0$ is the solution $y = y(x)$ whose value is $y_0$ when $x = x_0$. Thus the graph of the particular solution passes through the point $(x_0, y_0)$ in the $xy$-plane. A **first-order initial value problem** is a differential equation $y' = f(x, y)$ whose solution must satisfy an initial condition $y(x_0) = y_0$.

**EXAMPLE 2** Show that the function

$$y = (x + 1) - \frac{1}{3}e^x$$

is a solution to the first-order initial value problem

$$\frac{dy}{dx} = y - x, \qquad y(0) = \frac{2}{3}.$$

**Solution** The equation

$$\frac{dy}{dx} = y - x$$

is a first-order differential equation with $f(x, y) = y - x$.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

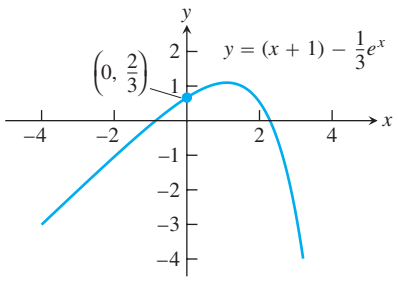

**FIGURE 15.1** Graph of the solution $y = (x + 1) - \frac{1}{3}e^x$ to the differential equation $dy/dx = y - x$, with initial condition $y(0) = \frac{2}{3}$ (Example 2).

*On the left side of the equation:*

$$\frac{dy}{dx} = \frac{d}{dx}\left(x + 1 - \frac{1}{3}e^x\right) = 1 - \frac{1}{3}e^x.$$

*On the right side of the equation:*

$$y - x = (x + 1) - \frac{1}{3}e^x - x = 1 - \frac{1}{3}e^x.$$

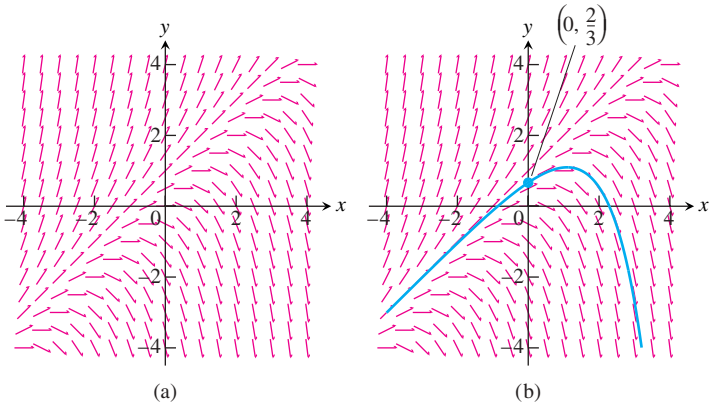
The function satisfies the initial condition because

$$y(0) = \left[(x + 1) - \frac{1}{3}e^x\right]_{x=0} = 1 - \frac{1}{3} = \frac{2}{3}.$$

The graph of the function is shown in Figure 15.1. ■

## Slope Fields: Viewing Solution Curves

Each time we specify an initial condition $y(x_0) = y_0$ for the solution of a differential equation $y' = f(x, y)$, the **solution curve** (graph of the solution) is required to pass through the point $(x_0, y_0)$ and to have slope $f(x_0, y_0)$ there. We can picture these slopes graphically by drawing short line segments of slope $f(x, y)$ at selected points $(x, y)$ in the region of the $xy$-plane that constitutes the domain of $f$. Each segment has the same slope as the solution curve through $(x, y)$ and so is tangent to the curve there. The resulting picture is called a **slope field** (or **direction field**) and gives a visualization of the general shape of the solution curves. Figure 15.2a shows a slope field, with a particular solution sketched into it in Figure 15.2b. We see how these line segments indicate the direction the solution curve takes at each point it passes through.



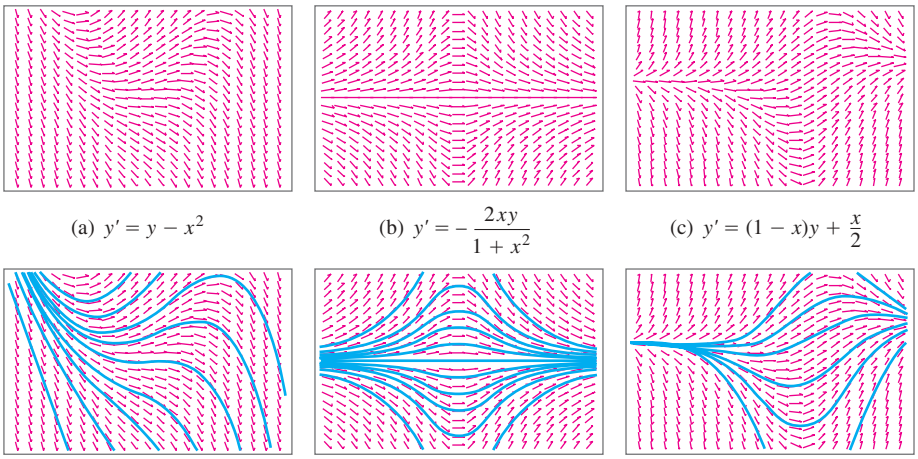


**FIGURE 15.2** (a) Slope field for $\frac{dy}{dx} = y - x$. (b) The particular solution curve through the point $\left(0, \frac{2}{3}\right)$ (Example 2).

Figure 15.3 shows three slope fields and we see how the solution curves behave by following the tangent line segments in these fields.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

(a) $y' = y - x^2$ (b) $y' = -\dfrac{2xy}{1+x^2}$ (c) $y' = (1-x)y + \dfrac{x}{2}$

**FIGURE 15.3** Slope fields (top row) and selected solution curves (bottom row). In computer renditions, slope segments are sometimes portrayed with arrows, as they are here. This is not to be taken as an indication that slopes have directions, however, for they do not.

Constructing a slope field with pencil and paper can be quite tedious. All our examples were generated by a computer.

## The Existence of Solutions

A basic question in the study of first-order initial value problems concerns whether a solution even exists. A second important question asks whether there can be more than one solution. Some conditions must be imposed to assure the existence of exactly one solution, as illustrated in the next example.

**EXAMPLE 3** The initial value problem

$$\frac{dy}{dx} = y^{4/5}, \qquad y(0) = 0$$

has more than one solution. One solution is the constant function $y(x) = 0$ for which the graph lies along the $x$-axis. A second solution is found by separating variables and integrating, as we did in Section 6.5. This leads to

$$y = \left(\frac{x}{5}\right)^5.$$

The two solutions $y = 0$ and $y = (x/5)^5$ both satisfy the initial condition $y(0) = 0$ (Figure 15.4).

We have found a differential equation with multiple solutions satisfying the same initial condition. This differential equation has even more solutions. For instance, two additional solutions are

$$y = \begin{cases} 0, & \text{for } x \le 0 \\ \left(\dfrac{x}{5}\right)^5, & \text{for } x > 0 \end{cases}$$

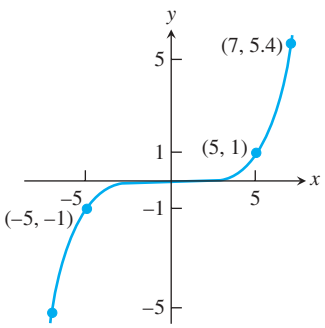

**FIGURE 15.4** The graph of the solution $y = (x/5)^5$ to the initial value problem in Example 3. Another solution is $y = 0$.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

and

$$y = \begin{cases} \left(\frac{x}{5}\right)^5, & \text{for } x \le 0 \\ 0, & \text{for } x > 0 \end{cases}.$$

In many applications it is desirable to know that there is exactly one solution to an initial value problem. Such a solution is said to be *unique.* Picard's Theorem gives conditions under which there is precisely one solution. It guarantees both the existence and uniqueness of a solution.

**THEOREM 1—Picard's Theorem** Suppose that both $f(x, y)$ and its partial derivative $\partial f/\partial y$ are continuous on the interior of a rectangle $R$, and that $(x_0, y_0)$ is an interior point of $R$. Then the initial value problem

$$\frac{dy}{dx} = f(x, y), \qquad y(x_0) = y_0 \tag{2}$$

has a unique solution $y = y(x)$ for $x$ in some open interval containing $x_0$.

The differential equation in Example 3 fails to satisfy the conditions of Picard's Theorem. Although the function $f(x, y) = y^{4/5}$ from Example 3 is continuous in the entire $xy$-plane, the partial derivative $\partial f/\partial y = (4/5)\, y^{-1/5}$ fails to be continuous at the point (0, 0) specified by the initial condition. Thus we found the possibility of more than one solution to the given initial value problem. Moreover, the partial derivative $\partial f/\partial y$ is not even defined where $y = 0$. However, the initial value problem of Example 3 does have unique solutions whenever the initial condition $y(x_0) = y_0$ has $y_0 \neq 0$.

## Picard's Iteration Scheme

Picard's Theorem is proved by applying *Picard's iteration scheme*, which we now introduce. We begin by noticing that any solution to the initial value problem of Equations (2) must also satisfy the *integral equation*

$$y(x) = y_0 + \int_{x_0}^{x} f(t, y(t))\, dt \tag{3}$$

because

$$\int_{x_0}^{x} \frac{dy}{dt}\, dt = y(x) - y(x_0).$$

The converse is also true: If $y(x)$ satisfies Equation (3), then $y' = f(x, y(x))$ and $y(x_0) = y_0$. So Equations (2) may be replaced by Equation (3). This sets the stage for Picard's interation

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

method: In the integrand in Equation (3), replace $y(t)$ by the constant $y_0$, then integrate and call the resulting right-hand side of Equation (3) $y_1(x)$:

$$y_1(x) = y_0 + \int_{x_0}^{x} f(t, y_0)\, dt. \tag{4}$$

This starts the process. To keep it going, we use the iterative formulas

$$y_{n+1}(x) = y_0 + \int_{x_0}^{x} f(t, y_n(t))\, dt. \tag{5}$$

The proof of Picard's Theorem consists of showing that this process produces a sequence of functions $\{y_n(x)\}$ that converge to a function $y(x)$ that satisfies Equations (2) and (3) for values of $x$ sufficiently near $x_0$. (The proof also shows that the solution is unique; that is, no other method will lead to a different solution.)

The following examples illustrate the Picard iteration scheme, but in most practical cases the computations soon become too burdensome to continue.

**EXAMPLE 4** Illustrate the Picard iteration scheme for the initial value problem

$$y' = x - y, \qquad y(0) = 1.$$

**Solution** For the problem at hand, $f(x, y) = x - y$, and Equation (4) becomes

$$y_1(x) = 1 + \int_0^x (t - 1)\, dt \qquad y_0 = 1$$

$$= 1 + \frac{x^2}{2} - x.$$

If we now use Equation (5) with $n = 1$, we get

$$y_2(x) = 1 + \int_0^x \left(t - 1 - \frac{t^2}{2} + t\right) dt \qquad \text{Substitute } y_1 \text{ for } y \text{ in } f(t, y).$$

$$= 1 - x + x^2 - \frac{x^3}{6}.$$

The next iteration, with $n = 2$, gives

$$y_3(x) = 1 + \int_0^x \left(t - 1 + t - t^2 + \frac{t^3}{6}\right) dt \qquad \text{Substitute } y_2 \text{ for } y \text{ in } f(t, y).$$

$$= 1 - x + x^2 - \frac{x^3}{3} + \frac{x^4}{4!}.$$

In this example it is possible to find the exact solution because

$$\frac{dy}{dx} + y = x$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

is a first-order differential equation that is linear in $y$. You will learn how to find the general solution

$$y = x - 1 + Ce^{-x}$$

in the next section. The solution of the initial value problem is then

$$y = x - 1 + 2e^{-x}.$$

If we substitute the Maclaurin series for $e^{-x}$ in this particular solution, we get

$$\begin{aligned} y &= x - 1 + 2\left(1 - x + \frac{x^2}{2!} - \frac{x^3}{3!} + \frac{x^4}{4!} - \cdots\right) \\ &= 1 - x + x^2 - \frac{x^3}{3} + 2\left(\frac{x^4}{4!} - \frac{x^5}{5!} + \cdots\right), \end{aligned}$$

and we see that the Picard scheme producing $y_3(x)$ has given us the first four terms of this expansion. ■

In the next example we cannot find a solution in terms of elementary functions. The Picard scheme is one way we could get an idea of how the solution behaves near the initial point.

**EXAMPLE 5** Find $y_n(x)$ for $n = 0, 1, 2$, and 3 for the initial value problem

$$y' = x^2 + y^2, \qquad y(0) = 0.$$

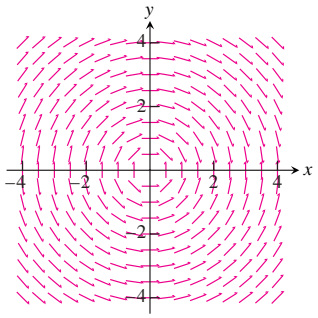
**Solution** By definition, $y_0(x) = y(0) = 0$. The other functions $y_n(x)$ are generated by the integral representation

$$\begin{aligned} y_{n+1}(x) &= 0 + \int_0^x \left[t^2 + (y_n(t))^2\right] dt \\ &= \frac{x^3}{3} + \int_0^x (y_n(t))^2 \, dt. \end{aligned}$$

We successively calculate

$$y_1(x) = \frac{x^3}{3},$$

$$y_2(x) = \frac{x^3}{3} + \frac{x^7}{63},$$



$$y_3(x) = \frac{x^3}{3} + \frac{x^7}{63} + \frac{2x^{11}}{2079} + \frac{x^{15}}{59535}.$$ ■

In Section 15.4 we introduce numerical methods for solving initial value problems like those in Examples 4 and 5.

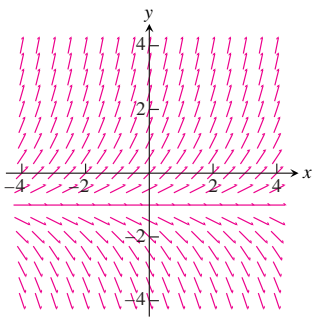
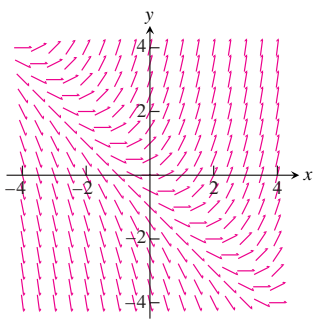
## EXERCISES 15.1



In Exercises 1–4, match the differential equations with their slope fields, graphed here.



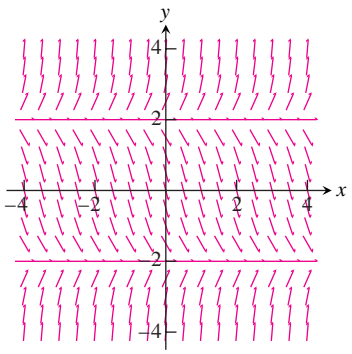
(a)

(b)

(c)

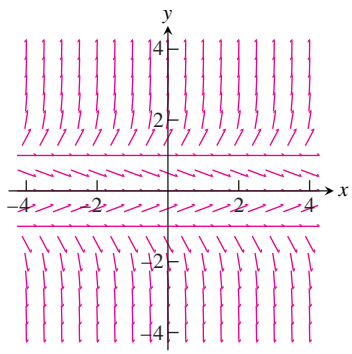
(d)

**1.** $y' = x + y$



**2.** $y' = y + 1$

**3.** $y' = -\dfrac{x}{y}$



**4.** $y' = y^2 - x^2$

In Exercises 5 and 6, copy the slope fields and sketch in some of the solution curves.

**5.** $y' = (y + 2)(y - 2)$

**6.** $y' = y(y + 1)(y - 1)$

In Exercises 7–10, write an equivalent first-order differential equation and initial condition for $y$.

**7.** $y = -1 + \displaystyle\int_1^x (t - y(t))\, dt$

**8.** $y = \displaystyle\int_1^x \frac{1}{t}\, dt$

**9.** $y = 2 - \displaystyle\int_0^x (1 + y(t)) \sin t\, dt$

**10.** $y = 1 + \displaystyle\int_0^x y(t)\, dt$

Use Picard's iteration scheme to find $y_n(x)$ for $n = 0, 1, 2, 3$ in Exercises 11–16.

**11.** $y' = x, \quad y(1) = 2$

**12.** $y' = y, \quad y(0) = 1$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**13.** $y' = xy, \quad y(1) = 1$

**14.** $y' = x + y, \quad y(0) = 0$

**15.** $y' = x + y, \quad y(0) = 1$

**16.** $y' = 2x - y, \quad y(-1) = 1$

**17.** Show that the solution of the initial value problem

$$y' = x + y, \quad y(x_0) = y_0$$

is

$$y = -1 - x + (1 + x_0 + y_0)\, e^{x - x_0}.$$

**18.** What integral equation is equivalent to the initial value problem $y' = f(x)$, $y(x_0) = y_0$?

### COMPUTER EXPLORATIONS

In Exercises 19–24, obtain a slope field and add to it graphs of the solution curves passing through the given points.

**19.** $y' = y$ with

**a.** $(0, 1)$ **b.** $(0, 2)$ **c.** $(0, -1)$

**20.** $y' = 2(y - 4)$ with

**a.** $(0, 1)$ **b.** $(0, 4)$ **c.** $(0, 5)$

**21.** $y' = y(x + y)$ with

**a.** $(0, 1)$ **b.** $(0, -2)$ **c.** $(0, 1/4)$ **d.** $(-1, -1)$

**22.** $y' = y^2$ with

**a.** $(0, 1)$ **b.** $(0, 2)$ **c.** $(0, -1)$ **d.** $(0, 0)$

**23.** $y' = (y - 1)(x + 2)$ with

**a.** $(0, -1)$ **b.** $(0, 1)$ **c.** $(0, 3)$ **d.** $(1, -1)$

**24.** $y' = \dfrac{xy}{x^2 + 4}$ with

**a.** $(0, 2)$ **b.** $(0, -6)$ **c.** $\left(-2\sqrt{3}, -4\right)$

In Exercises 25 and 26, obtain a slope field and graph the particular solution over the specified interval. Use your CAS DE solver to find the general solution of the differential equation.

**25. A logistic equation** $y' = y(2 - y), \quad y(0) = 1/2;$ $0 \le x \le 4, \quad 0 \le y \le 3$

**26.** $y' = (\sin x)(\sin y), \quad y(0) = 2; \quad -6 \le x \le 6, \quad -6 \le y \le 6$

Exercises 27 and 28 have no explicit solution in terms of elementary functions. Use a CAS to explore graphically each of the differential equations.

**27.** $y' = \cos(2x - y), \quad y(0) = 2; \quad 0 \le x \le 5, \quad 0 \le y \le 5$

**28. A Gompertz equation** $y' = y(1/2 - \ln y), \quad y(0) = 1/3;$ $0 \le x \le 4, \quad 0 \le y \le 3$

**29.** Use a CAS to find the solutions of $y' + y = f(x)$ subject to the initial condition $y(0) = 0$, if $f(x)$ is

**a.** $2x$ **b.** $\sin 2x$ **c.** $3e^{x/2}$ **d.** $2e^{-x/2}\cos 2x$.

Graph all four solutions over the interval $-2 \le x \le 6$ to compare the results.

**30. a.** Use a CAS to plot the slope field of the differential equation

$$y' = \frac{3x^2 + 4x + 2}{2(y - 1)}$$

over the region $-3 \le x \le 3$ and $-3 \le y \le 3$.

**b.** Separate the variables and use a CAS integrator to find the general solution in implicit form.

**c.** Using a CAS implicit function grapher, plot solution curves for the arbitrary constant values $C = -6, -4, -2, 0, 2, 4, 6$.

**d.** Find and graph the solution that satisfies the initial condition $y(0) = -1$.

## 15.2 First-Order Linear Equations

A first-order **linear** differential equation is one that can be written in the form

$$\frac{dy}{dx} + P(x)y = Q(x), \tag{1}$$

where $P$ and $Q$ are continuous functions of $x$. Equation (1) is the linear equation's **standard form**. Since the exponential growth/decay equation $dy/dx = ky$ (Section 6.5) can be put in the standard form

$$\frac{dy}{dx} - ky = 0,$$

we see it is a linear equation with $P(x) = -k$ and $Q(x) = 0$. Equation (1) is *linear* (in $y$) because $y$ and its derivative $dy/dx$ occur only to the first power, are not multiplied together, nor do they appear as the argument of a function (such as $\sin y$, $e^y$, or $\sqrt{dy/dx}$).

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**EXAMPLE 1** Put the following equation in standard form:

$$x\frac{dy}{dx} = x^2 + 3y, \qquad x > 0.$$

**Solution**

$$x\frac{dy}{dx} = x^2 + 3y$$

$$\frac{dy}{dx} = x + \frac{3}{x}y \qquad \text{Divide by } x$$

$$\frac{dy}{dx} - \frac{3}{x}y = x \qquad \text{Standard form with } P(x) = -3/x \text{ and } Q(x) = x$$

Notice that $P(x)$ is $-3/x$, not $+3/x$. The standard form is $y' + P(x)y = Q(x)$, so the minus sign is part of the formula for $P(x)$. ■

## Solving Linear Equations

We solve the equation

$$\frac{dy}{dx} + P(x)y = Q(x) \tag{2}$$

by multiplying both sides by a *positive* function $v(x)$ that transforms the left-hand side into the derivative of the product $v(x) \cdot y$. We will show how to find $v$ in a moment, but first we want to show how, once found, it provides the solution we seek.

Here is why multiplying by $v(x)$ works:

$$\frac{dy}{dx} + P(x)y = Q(x) \qquad \text{Original equation is in standard form.}$$

$$v(x)\frac{dy}{dx} + P(x)v(x)y = v(x)Q(x) \qquad \text{Multiply by positive } v(x).$$

$$\frac{d}{dx}(v(x)\cdot y) = v(x)Q(x) \qquad v(x) \text{ is chosen to make } v\frac{dy}{dx} + Pvy = \frac{d}{dx}(v\cdot y).$$

$$v(x)\cdot y = \int v(x)Q(x)\,dx \qquad \text{Integrate with respect to } x.$$

$$y = \frac{1}{v(x)}\int v(x)Q(x)\,dx \tag{3}$$

Equation (3) expresses the solution of Equation (2) in terms of the function $v(x)$ and $Q(x)$. We call $v(x)$ an **integrating factor** for Equation (2) because its presence makes the equation integrable.

Why doesn't the formula for $P(x)$ appear in the solution as well? It does, but indirectly, in the construction of the positive function $v(x)$. We have

$$\frac{d}{dx}(vy) = v\frac{dy}{dx} + Pvy \qquad \text{Condition imposed on } v$$

$$v\frac{dy}{dx} + y\frac{dv}{dx} = v\frac{dy}{dx} + Pvy \qquad \text{Product Rule for derivatives}$$

$$y\frac{dv}{dx} = Pvy \qquad \text{The terms } v\frac{dy}{dx} \text{ cancel.}$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

This last equation will hold if

$$\frac{dv}{dx} = Pv$$

$$\frac{dv}{v} = P\,dx \qquad \text{Variables separated, } v > 0$$

$$\int \frac{dv}{v} = \int P\,dx \qquad \text{Integrate both sides.}$$

$$\ln v = \int P\,dx \qquad \text{Since } v > 0\text{, we do not need absolute value signs in } \ln v.$$

$$e^{\ln v} = e^{\int P\,dx} \qquad \text{Exponentiate both sides to solve for } v.$$

$$v = e^{\int P\,dx} \tag{4}$$

Thus a formula for the general solution to Equation (1) is given by Equation (3), where $v(x)$ is given by Equation (4). However, rather than memorizing the formula, just remember how to find the integrating factor once you have the standard form so $P(x)$ is correctly identified.

> To solve the linear equation $y' + P(x)y = Q(x)$, multiply both sides by the integrating factor $v(x) = e^{\int P(x)\,dx}$ and integrate both sides.

When you integrate the left-hand side product in this procedure, you always obtain the product $v(x)y$ of the integrating factor and solution function $y$ because of the way $v$ is defined.

**EXAMPLE 2** Solve the equation

$$x\frac{dy}{dx} = x^2 + 3y, \qquad x > 0.$$

HISTORICAL BIOGRAPHY

Adrien Marie Legendre
(1752–1833)

**Solution** First we put the equation in standard form (Example 1):

$$\frac{dy}{dx} - \frac{3}{x}y = x,$$

so $P(x) = -3/x$ is identified.

The integrating factor is

$$v(x) = e^{\int P(x)\,dx} = e^{\int (-3/x)\,dx}$$

$$= e^{-3\ln|x|} \qquad \text{Constant of integration is 0, so } v \text{ is as simple as possible.}$$

$$= e^{-3\ln x} \qquad x > 0$$

$$= e^{\ln x^{-3}} = \frac{1}{x^3}.$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

Next we multiply both sides of the standard form by $v(x)$ and integrate:

$$\frac{1}{x^3}\cdot\left(\frac{dy}{dx}-\frac{3}{x}y\right)=\frac{1}{x^3}\cdot x$$

$$\frac{1}{x^3}\frac{dy}{dx}-\frac{3}{x^4}y=\frac{1}{x^2}$$

$$\frac{d}{dx}\left(\frac{1}{x^3}y\right)=\frac{1}{x^2} \qquad \text{Left-hand side is } \frac{d}{dx}(v\cdot y).$$

$$\frac{1}{x^3}y=\int\frac{1}{x^2}\,dx \qquad \text{Integrate both sides.}$$

$$\frac{1}{x^3}y=-\frac{1}{x}+C.$$

Solving this last equation for $y$ gives the general solution:

$$y=x^3\left(-\frac{1}{x}+C\right)=-x^2+Cx^3, \qquad x>0. \quad \blacksquare$$

**EXAMPLE 3** Find the particular solution of

$$3xy'-y=\ln x+1, \qquad x>0,$$

satisfying $y(1)=-2$.

**Solution** With $x>0$, we write the equation in standard form:

$$y'-\frac{1}{3x}y=\frac{\ln x+1}{3x}.$$

Then the integrating factor is given by

$$v=e^{\int -dx/3x}=e^{(-1/3)\ln x}=x^{-1/3}. \qquad x>0$$

Thus

$$x^{-1/3}y=\frac{1}{3}\int(\ln x+1)x^{-4/3}\,dx. \qquad \text{Left-hand side is } vy.$$

Integration by parts of the right-hand side gives

$$x^{-1/3}y=-x^{-1/3}(\ln x+1)+\int x^{-4/3}\,dx+C.$$

Therefore

$$x^{-1/3}y=-x^{-1/3}(\ln x+1)-3x^{-1/3}+C$$

or, solving for $y$,

$$y=-(\ln x+4)+Cx^{1/3}.$$

When $x=1$ and $y=-2$ this last equation becomes

$$-2=-(0+4)+C,$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

so

$$C = 2.$$

Substitution into the equation for $y$ gives the particular solution

$$y = 2x^{1/3} - \ln x - 4.$$ ■

In solving the linear equation in Example 2, we integrated both sides of the equation after multiplying each side by the integrating factor. However, we can shorten the amount of work, as in Example 3, by remembering that the left-hand side *always* integrates into the product $v(x) \cdot y$ of the integrating factor times the solution function. From Equation (3) this means that

$$v(x)y = \int v(x)Q(x)\,dx.$$

We need only integrate the product of the integrating factor $v(x)$ with the right-hand side $Q(x)$ of Equation (1) and then equate the result with $v(x)y$ to obtain the general solution. Nevertheless, to emphasize the role of $v(x)$ in the solution process, we sometimes follow the complete procedure as illustrated in Example 2.

Observe that if the function $Q(x)$ is identically zero in the standard form given by Equation (1), the linear equation is separable:

$$\frac{dy}{dx} + P(x)y = Q(x)$$

$$\frac{dy}{dx} + P(x)y = 0 \qquad Q(x) \equiv 0$$

$$dy = -P(x)\,dx \qquad \text{Separating the variables}$$

We now present two applied problems modeled by a first-order linear differential equation.

## *RL* Circuits

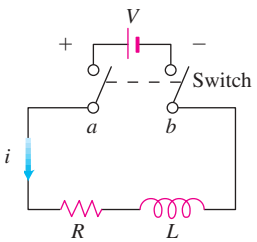


**FIGURE 15.5** The *RL* circuit in Example 4.

The diagram in Figure 15.5 represents an electrical circuit whose total resistance is a constant $R$ ohms and whose self-inductance, shown as a coil, is $L$ henries, also a constant. There is a switch whose terminals at $a$ and $b$ can be closed to connect a constant electrical source of $V$ volts.

Ohm's Law, $V = RI$, has to be modified for such a circuit. The modified form is

$$L\frac{di}{dt} + Ri = V, \tag{5}$$

where $i$ is the intensity of the current in amperes and $t$ is the time in seconds. By solving this equation, we can predict how the current will flow after the switch is closed.

**EXAMPLE 4** The switch in the *RL* circuit in Figure 15.5 is closed at time $t = 0$. How will the current flow as a function of time?

**Solution** Equation (5) is a first-order linear differential equation for $i$ as a function of $t$. Its standard form is

$$\frac{di}{dt} + \frac{R}{L}i = \frac{V}{L}, \tag{6}$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

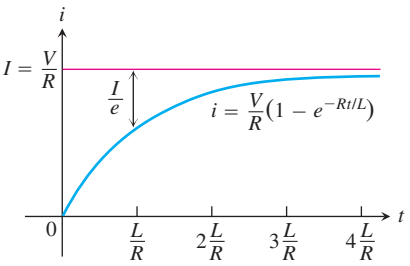

**FIGURE 15.6** The growth of the current in the $RL$ circuit in Example 4. $I$ is the current's steady-state value. The number $t = L/R$ is the time constant of the circuit. The current gets to within 5% of its steady-state value in 3 time constants (Exercise 31).

and the corresponding solution, given that $i = 0$ when $t = 0$, is

$$i = \frac{V}{R} - \frac{V}{R}e^{-(R/L)t} \tag{7}$$

(Exercise 32). Since $R$ and $L$ are positive, $-(R/L)$ is negative and $e^{-(R/L)t} \to 0$ as $t \to \infty$. Thus,

$$\lim_{t\to\infty} i = \lim_{t\to\infty}\left(\frac{V}{R} - \frac{V}{R}e^{-(R/L)t}\right) = \frac{V}{R} - \frac{V}{R}\cdot 0 = \frac{V}{R}.$$

At any given time, the current is theoretically less than $V/R$, but as time passes, the current approaches the **steady-state value** $V/R$. According to the equation

$$L\frac{di}{dt} + Ri = V,$$

$I = V/R$ is the current that will flow in the circuit if either $L = 0$ (no inductance) or $di/dt = 0$ (steady current, $i$ = constant) (Figure 15.6).

Equation (7) expresses the solution of Equation (6) as the sum of two terms: a **steady-state solution** $V/R$ and a **transient solution** $-(V/R)e^{-(R/L)t}$ that tends to zero as $t \to \infty$. ■

## Mixture Problems

A chemical in a liquid solution (or dispersed in a gas) runs into a container holding the liquid (or the gas) with, possibly, a specified amount of the chemical dissolved as well. The mixture is kept uniform by stirring and flows out of the container at a known rate. In this process, it is often important to know the concentration of the chemical in the container at any given time. The differential equation describing the process is based on the formula

$$\begin{pmatrix}\text{Rate of change}\\ \text{of amount}\\ \text{in container}\end{pmatrix} = \begin{pmatrix}\text{rate at which}\\ \text{chemical}\\ \text{arrives}\end{pmatrix} - \begin{pmatrix}\text{rate at which}\\ \text{chemical}\\ \text{departs.}\end{pmatrix} \tag{8}$$

If $y(t)$ is the amount of chemical in the container at time $t$ and $V(t)$ is the total volume of liquid in the container at time $t$, then the departure rate of the chemical at time $t$ is

$$\begin{aligned}\text{Departure rate} &= \frac{y(t)}{V(t)}\cdot(\text{outflow rate})\\ &= \begin{pmatrix}\text{concentration in}\\ \text{container at time } t\end{pmatrix}\cdot(\text{outflow rate}).\end{aligned} \tag{9}$$

Accordingly, Equation (8) becomes

$$\frac{dy}{dt} = (\text{chemical's arrival rate}) - \frac{y(t)}{V(t)}\cdot(\text{outflow rate}). \tag{10}$$

If, say, $y$ is measured in pounds, $V$ in gallons, and $t$ in minutes, the units in Equation (10) are

$$\frac{\text{pounds}}{\text{minutes}} = \frac{\text{pounds}}{\text{minutes}} - \frac{\text{pounds}}{\text{gallons}}\cdot\frac{\text{gallons}}{\text{minutes}}.$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**EXAMPLE 5** In an oil refinery, a storage tank contains 2000 gal of gasoline that initially has 100 lb of an additive dissolved in it. In preparation for winter weather, gasoline containing 2 lb of additive per gallon is pumped into the tank at a rate of 40 gal/min. The well-mixed solution is pumped out at a rate of 45 gal/min. How much of the additive is in the tank 20 min after the pumping process begins (Figure 15.7)?

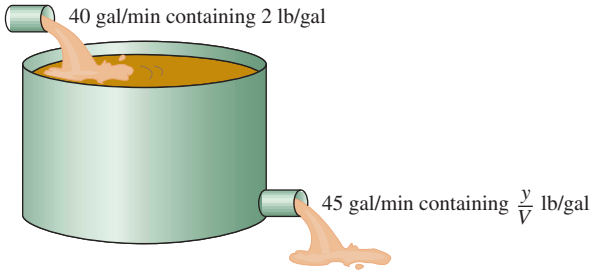

**FIGURE 15.7** The storage tank in Example 5 mixes input liquid with stored liquid to produce an output liquid.

**Solution** Let $y$ be the amount (in pounds) of additive in the tank at time $t$. We know that $y = 100$ when $t = 0$. The number of gallons of gasoline and additive in solution in the tank at any time $t$ is

$$V(t) = 2000 \text{ gal} + \left(40\frac{\text{gal}}{\text{min}} - 45\frac{\text{gal}}{\text{min}}\right)(t \text{ min})$$
$$= (2000 - 5t) \text{ gal}.$$

Therefore,

$$\text{Rate out} = \frac{y(t)}{V(t)} \cdot \text{outflow rate} \qquad \text{Eq. (9)}$$
$$= \left(\frac{y}{2000 - 5t}\right)45 \qquad \text{Outflow rate is 45 gal/min and } v = 2000 - 5t.$$
$$= \frac{45y}{2000 - 5t}\frac{\text{lb}}{\text{min}}.$$

Also,

$$\text{Rate in} = \left(2\frac{\text{lb}}{\text{gal}}\right)\left(40\frac{\text{gal}}{\text{min}}\right)$$
$$= 80\frac{\text{lb}}{\text{min}}. \qquad \text{Eq. (10)}$$

The differential equation modeling the mixture process is

$$\frac{dy}{dt} = 80 - \frac{45y}{2000 - 5t}$$

in pounds per minute.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

To solve this differential equation, we first write it in standard form:

$$\frac{dy}{dt} + \frac{45}{2000 - 5t}\, y = 80.$$

Thus, $P(t) = 45/(2000 - 5t)$ and $Q(t) = 80$. The integrating factor is

$$\begin{aligned} v(t) = e^{\int P\, dt} &= e^{\int \frac{45}{2000-5t}\, dt} \\ &= e^{-9 \ln (2000-5t)} \qquad 2000 - 5t > 0 \\ &= (2000 - 5t)^{-9}. \end{aligned}$$

Multiplying both sides of the standard equation by $v(t)$ and integrating both sides gives

$$(2000 - 5t)^{-9} \cdot \left(\frac{dy}{dt} + \frac{45}{2000 - 5t}\, y\right) = 80(2000 - 5t)^{-9}$$

$$(2000 - 5t)^{-9} \frac{dy}{dt} + 45(2000 - 5t)^{-10}\, y = 80(2000 - 5t)^{-9}$$

$$\frac{d}{dt}\left[(2000 - 5t)^{-9} y\right] = 80(2000 - 5t)^{-9}$$

$$(2000 - 5t)^{-9} y = \int 80(2000 - 5t)^{-9}\, dt$$

$$(2000 - 5t)^{-9} y = 80 \cdot \frac{(2000 - 5t)^{-8}}{(-8)(-5)} + C.$$

The general solution is

$$y = 2(2000 - 5t) + C(2000 - 5t)^9.$$

Because $y = 100$ when $t = 0$, we can determine the value of $C$:

$$100 = 2(2000 - 0) + C(2000 - 0)^9$$

$$C = -\frac{3900}{(2000)^9}.$$

The particular solution of the initial value problem is

$$y = 2(2000 - 5t) - \frac{3900}{(2000)^9}(2000 - 5t)^9.$$

The amount of additive 20 min after the pumping begins is

$$y(20) = 2[2000 - 5(20)] - \frac{3900}{(2000)^9}[2000 - 5(20)]^9 \approx 1342 \text{ lb}. \quad \blacksquare$$

## EXERCISES 15.2

Solve the differential equations in Exercises 1–14.

**1.** $x\dfrac{dy}{dx} + y = e^x, \quad x > 0$

**2.** $e^x\dfrac{dy}{dx} + 2e^x y = 1$

**3.** $xy' + 3y = \dfrac{\sin x}{x^2}, \quad x > 0$

**4.** $y' + (\tan x)y = \cos^2 x, \quad -\pi/2 < x < \pi/2$

**5.** $x\dfrac{dy}{dx} + 2y = 1 - \dfrac{1}{x}, \quad x > 0$

**6.** $(1 + x)y' + y = \sqrt{x}$

**7.** $2y' = e^{x/2} + y$

**8.** $e^{2x}y' + 2e^{2x}y = 2x$

**9.** $xy' - y = 2x\ln x$

**10.** $x\dfrac{dy}{dx} = \dfrac{\cos x}{x} - 2y, \quad x > 0$

**11.** $(t - 1)^3\dfrac{ds}{dt} + 4(t - 1)^2 s = t + 1, \quad t > 1$

**12.** $(t + 1)\dfrac{ds}{dt} + 2s = 3(t + 1) + \dfrac{1}{(t + 1)^2}, \quad t > -1$

**13.** $\sin\theta\dfrac{dr}{d\theta} + (\cos\theta)r = \tan\theta, \quad 0 < \theta < \pi/2$

**14.** $\tan\theta\dfrac{dr}{d\theta} + r = \sin^2\theta, \quad 0 < \theta < \pi/2$

Solve the initial value problems in Exercises 15–20.

**15.** $\dfrac{dy}{dt} + 2y = 3, \quad y(0) = 1$

**16.** $t\dfrac{dy}{dt} + 2y = t^3, \quad t > 0, \quad y(2) = 1$

**17.** $\theta\dfrac{dy}{d\theta} + y = \sin\theta, \quad \theta > 0, \quad y(\pi/2) = 1$

**18.** $\theta\dfrac{dy}{d\theta} - 2y = \theta^3\sec\theta\tan\theta, \quad \theta > 0, \quad y(\pi/3) = 2$

**19.** $(x + 1)\dfrac{dy}{dx} - 2(x^2 + x)y = \dfrac{e^{x^2}}{x + 1}, \quad x > -1, \quad y(0) = 5$

**20.** $\dfrac{dy}{dx} + xy = x, \quad y(0) = -6$

**21.** Solve the exponential growth/decay initial value problem for $y$ as a function of $t$ thinking of the differential equation as a first-order linear equation with $P(x) = -k$ and $Q(x) = 0$:

$$\frac{dy}{dt} = ky \quad (k \text{ constant}), \quad y(0) = y_0$$

**22.** Solve the following initial value problem for $u$ as a function of $t$:

$$\frac{du}{dt} + \frac{k}{m}u = 0 \quad (k \text{ and } m \text{ positive constants}), \quad u(0) = u_0$$

**a.** as a first-order linear equation.

**b.** as a separable equation.

**23.** Is either of the following equations correct? Give reasons for your answers.

**a.** $x\displaystyle\int \frac{1}{x}\,dx = x\ln|x| + C$ **b.** $x\displaystyle\int \frac{1}{x}\,dx = x\ln|x| + Cx$

**24.** Is either of the following equations correct? Give reasons for your answers.

**a.** $\dfrac{1}{\cos x}\displaystyle\int \cos x\,dx = \tan x + C$

**b.** $\dfrac{1}{\cos x}\displaystyle\int \cos x\,dx = \tan x + \dfrac{C}{\cos x}$

**25. Salt mixture** A tank initially contains 100 gal of brine in which 50 lb of salt are dissolved. A brine containing 2 lb/gal of salt runs into the tank at the rate of 5 gal/min. The mixture is kept uniform by stirring and flows out of the tank at the rate of 4 gal/min.

**a.** At what rate (pounds per minute) does salt enter the tank at time $t$?

**b.** What is the volume of brine in the tank at time $t$?

**c.** At what rate (pounds per minute) does salt leave the tank at time $t$?

**d.** Write down and solve the initial value problem describing the mixing process.

**e.** Find the concentration of salt in the tank 25 min after the process starts.

**26. Mixture problem** A 200-gal tank is half full of distilled water. At time $t = 0$, a solution containing 0.5 lb/gal of concentrate enters the tank at the rate of 5 gal/min, and the well-stirred mixture is withdrawn at the rate of 3 gal/min.

**a.** At what time will the tank be full?

**b.** At the time the tank is full, how many pounds of concentrate will it contain?

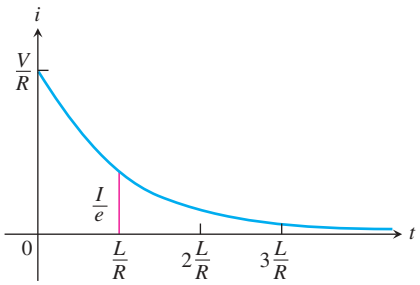
**27. Fertilizer mixture** A tank contains 100 gal of fresh water. A solution containing 1 lb/gal of soluble lawn fertilizer runs into the tank at the rate of 1 gal/min, and the mixture is pumped out of the tank at the rate of 3 gal/min. Find the maximum amount of fertilizer in the tank and the time required to reach the maximum.

**28. Carbon monoxide pollution** An executive conference room of a corporation contains 4500 $ft^3$ of air initially free of carbon monoxide. Starting at time $t = 0$, cigarette smoke containing 4% carbon monoxide is blown into the room at the rate of 0.3 $ft^3$/min. A ceiling fan keeps the air in the room well circulated and the air leaves the room at the same rate of 0.3 $ft^3$/min. Find the time when the concentration of carbon monoxide in the room reaches 0.01%.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**29. Current in a closed *RL* circuit** How many seconds after the switch in an *RL* circuit is closed will it take the current $i$ to reach half of its steady-state value? Notice that the time depends on $R$ and $L$ and not on how much voltage is applied.

**30. Current in an open *RL* circuit** If the switch is thrown open after the current in an *RL* circuit has built up to its steady-state value $I = V/R$, the decaying current (graphed here) obeys the equation



$$L\frac{di}{dt} + Ri = 0,$$

which is Equation (5) with $V = 0$.

**a.** Solve the equation to express $i$ as a function of $t$.

**b.** How long after the switch is thrown will it take the current to fall to half its original value?

**c.** Show that the value of the current when $t = L/R$ is $I/e$. (The significance of this time is explained in the next exercise.)

**31. Time constants** Engineers call the number $L/R$ the *time constant* of the *RL* circuit in Figure 15.6. The significance of the time constant is that the current will reach 95% of its final value within 3 time constants of the time the switch is closed (Figure 15.6). Thus, the time constant gives a built-in measure of how rapidly an individual circuit will reach equilibrium.

**a.** Find the value of $i$ in Equation (7) that corresponds to $t = 3L/R$ and show that it is about 95% of the steady-state value $I = V/R$.

**b.** Approximately what percentage of the steady-state current will be flowing in the circuit 2 time constants after the switch is closed (i.e., when $t = 2L/R$)?

**32. Derivation of Equation (7) in Example 4**

**a.** Show that the solution of the equation

$$\frac{di}{dt} + \frac{R}{L}i = \frac{V}{L}$$

is

$$i = \frac{V}{R} + Ce^{-(R/L)t}.$$

**b.** Then use the initial condition $i(0) = 0$ to determine the value of $C$. This will complete the derivation of Equation (7).

**c.** Show that $i = V/R$ is a solution of Equation (6) and that $i = Ce^{-(R/L)t}$ satisfies the equation

$$\frac{di}{dt} + \frac{R}{L}i = 0.$$

## Historical Biography

James Bernoulli
(1654–1705)

A **Bernoulli differential equation** is of the form

$$\frac{dy}{dx} + P(x)y = Q(x)y^n.$$

Observe that, if $n = 0$ or 1, the Bernoulli equation is linear. For other values of $n$, the substitution $u = y^{1-n}$ transforms the Bernoulli equation into the linear equation

$$\frac{du}{dx} + (1 - n)P(x)u = (1 - n)Q(x).$$

For example, in the equation

$$\frac{dy}{dx} - y = e^{-x}y^2$$

we have $n = 2$, so that $u = y^{1-2} = y^{-1}$ and $du/dx = -y^{-2}\,dy/dx$. Then $dy/dx = -y^2\,du/dx = -u^{-2}\,du/dx$. Substitution into the original equation gives

$$-u^{-2}\frac{du}{dx} - u^{-1} = e^{-x}u^{-2}$$

or, equivalently,

$$\frac{du}{dx} + u = -e^{-x}.$$

This last equation is linear in the (unknown) dependent variable $u$.

Solve the differential equations in Exercises 33–36.

**33.** $y' - y = -y^2$ **34.** $y' - y = xy^2$

**35.** $xy' + y = y^{-2}$ **36.** $x^2y' + 2xy = y^3$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

# 15.3 Applications

We now look at three applications of first-order differential equations. The first application analyzes an object moving along a straight line while subject to a force opposing its motion. The second is a model of population growth. The last application considers a curve or curves intersecting each curve in a second family of curves *orthogonally* (that is, at right angles).

## Resistance Proportional to Velocity

In some cases it is reasonable to assume that the resistance encountered by a moving object, such as a car coasting to a stop, is proportional to the object's velocity. The faster the object moves, the more its forward progress is resisted by the air through which it passes. Picture the object as a mass $m$ moving along a coordinate line with position function $s$ and velocity $v$ at time $t$. From Newton's second law of motion, the resisting force opposing the motion is

$$\text{Force} = \text{mass} \times \text{acceleration} = m\frac{dv}{dt}.$$

If the resisting force is proportional to velocity, we have

$$m\frac{dv}{dt} = -kv \qquad \text{or} \qquad \frac{dv}{dt} = -\frac{k}{m}v \qquad (k > 0).$$

This is a separable differential equation representing exponential change. The solution to the equation with initial condition $v = v_0$ at $t = 0$ is (Section 6.5)

$$v = v_0 e^{-(k/m)t}. \tag{1}$$

What can we learn from Equation (1)? For one thing, we can see that if $m$ is something large, like the mass of a 20,000-ton ore boat in Lake Erie, it will take a long time for the velocity to approach zero (because $t$ must be large in the exponent of the equation in order to make $kt/m$ large enough for $v$ to be small). We can learn even more if we integrate Equation (1) to find the position $s$ as a function of time $t$.

Suppose that a body is coasting to a stop and the only force acting on it is a resistance proportional to its speed. How far will it coast? To find out, we start with Equation (1) and solve the initial value problem

$$\frac{ds}{dt} = v_0 e^{-(k/m)t}, \qquad s(0) = 0.$$

Integrating with respect to $t$ gives

$$s = -\frac{v_0 m}{k} e^{-(k/m)t} + C.$$

Substituting $s = 0$ when $t = 0$ gives

$$0 = -\frac{v_0 m}{k} + C \qquad \text{and} \qquad C = \frac{v_0 m}{k}.$$

The body's position at time $t$ is therefore

$$s(t) = -\frac{v_0 m}{k} e^{-(k/m)t} + \frac{v_0 m}{k} = \frac{v_0 m}{k}(1 - e^{-(k/m)t}). \tag{2}$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

To find how far the body will coast, we find the limit of $s(t)$ as $t \to \infty$. Since $-(k/m) < 0$, we know that $e^{-(k/m)t} \to 0$ as $t \to \infty$, so that

$$\lim_{t\to\infty} s(t) = \lim_{t\to\infty} \frac{v_0 m}{k}(1 - e^{-(k/m)t})$$
$$= \frac{v_0 m}{k}(1 - 0) = \frac{v_0 m}{k}.$$

Thus,

$$\text{Distance coasted} = \frac{v_0 m}{k}. \tag{3}$$

The number $v_0 m/k$ is only an upper bound (albeit a useful one). It is true to life in one respect, at least: if $m$ is large, it will take a lot of energy to stop the body.

In the English system, where weight is measured in pounds, mass is measured in **slugs**. Thus,

$$\text{Pounds} = \text{slugs} \times 32,$$

assuming the gravitational constant is 32 ft/sec$^2$.

**EXAMPLE 1** For a 192-lb ice skater, the $k$ in Equation (1) is about 1/3 slug/sec and $m = 192/32 = 6$ slugs. How long will it take the skater to coast from 11 ft/sec (7.5 mph) to 1 ft/sec? How far will the skater coast before coming to a complete stop?

**Solution** We answer the first question by solving Equation (1) for $t$:

$$11e^{-t/18} = 1 \qquad \text{Eq. (1) with } k = 1/3,\ m = 6,\ v_0 = 11,\ v = 1$$
$$e^{-t/18} = 1/11$$
$$-t/18 = \ln(1/11) = -\ln 11$$
$$t = 18 \ln 11 \approx 43 \text{ sec}.$$

We answer the second question with Equation (3):

$$\text{Distance coasted} = \frac{v_0 m}{k} = \frac{11 \cdot 6}{1/3}$$
$$= 198 \text{ ft}.$$

■

## Modeling Population Growth

In Section 6.5 we modeled population growth with the Law of Exponential Change:

$$\frac{dP}{dt} = kP, \qquad P(0) = P_0$$

where $P$ is the population at time $t$, $k > 0$ is a constant growth rate, and $P_0$ is the size of the population at time $t = 0$. In Section 6.5 we found the solution $P = P_0 e^{kt}$ to this model.

To assess the model, notice that the exponential growth differential equation says that

$$\frac{dP/dt}{P} = k \tag{4}$$

is constant. This rate is called the **relative growth rate**. Now, Table 15.1 gives the world population at midyear for the years 1980 to 1989. Taking $dt = 1$ and $dP \approx \Delta P$, we see from the table that the relative growth rate in Equation (4) is approximately the constant 0.017. Thus, based on the tabled data with $t = 0$ representing 1980, $t = 1$ representing 1981, and so forth, the world population could be modeled by the initial value problem,

$$\frac{dP}{dt} = 0.017P, \qquad P(0) = 4454.$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

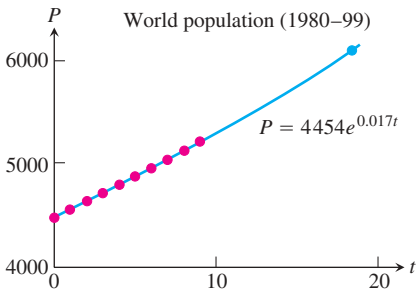


**FIGURE 15.8** Notice that the value of the solution $P = 4454e^{0.017t}$ is 6152.16 when $t = 19$, which is slightly higher than the actual population in 1999.

**TABLE 15.1** World population (midyear)

| Year | Population (millions) | $\Delta P/P$ |
|---|---|---|
| 1980 | 4454 | $76/4454 \approx 0.0171$ |
| 1981 | 4530 | $80/4530 \approx 0.0177$ |
| 1982 | 4610 | $80/4610 \approx 0.0174$ |
| 1983 | 4690 | $80/4690 \approx 0.0171$ |
| 1984 | 4770 | $81/4770 \approx 0.0170$ |
| 1985 | 4851 | $82/4851 \approx 0.0169$ |
| 1986 | 4933 | $85/4933 \approx 0.0172$ |
| 1987 | 5018 | $87/5018 \approx 0.0173$ |
| 1988 | 5105 | $85/5105 \approx 0.0167$ |
| 1989 | 5190 | |

*Source*: U.S. Bureau of the Census (Sept., 1999): www.census.gov/ipc/www/worldpop.html.

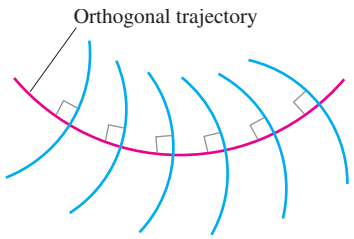

**FIGURE 15.9** An orthogonal trajectory intersects the family of curves at right angles, or orthogonally.

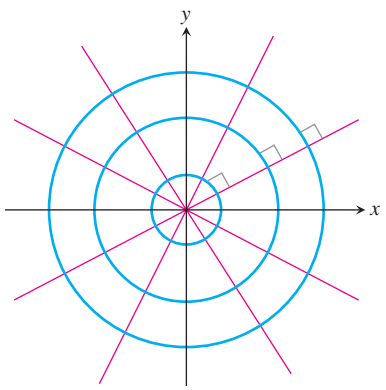

**FIGURE 15.10** Every straight line through the origin is orthogonal to the family of circles centered at the origin.

The solution to this initial value problem gives the population function $P = 4454e^{0.017t}$. In year 1999 (so $t = 19$), the solution predicts the world population in midyear to be about 6152 million, or 6.15 billion (Figure 15.8), which is more than the actual population of 6001 million from the U.S. Bureau of the Census. In Section 15.5 we propose a more realistic model considering environmental factors affecting the growth rate.

## Orthogonal Trajectories

An **orthogonal trajectory** of a family of curves is a curve that intersects each curve of the family at right angles, or *orthogonally* (Figure 15.9). For instance, each straight line through the origin is an orthogonal trajectory of the family of circles $x^2 + y^2 = a^2$, centered at the origin (Figure 15.10). Such mutually orthogonal systems of curves are of particular importance in physical problems related to electrical potential, where the curves in one family correspond to flow of electric current and those in the other family correspond to curves of constant potential. They also occur in hydrodynamics and heat-flow problems.

**EXAMPLE 2** Find the orthogonal trajectories of the family of curves $xy = a$, where $a \neq 0$ is an arbitrary constant.

**Solution** The curves $xy = a$ form a family of hyperbolas with asymptotes $y = \pm x$. First we find the slopes of each curve in this family, or their $dy/dx$ values. Differentiating $xy = a$ implicitly gives

$$x\frac{dy}{dx} + y = 0 \qquad \text{or} \qquad \frac{dy}{dx} = -\frac{y}{x}.$$

Thus the slope of the tangent line at any point $(x, y)$ on one of the hyperbolas $xy = a$ is $y' = -y/x$. On an orthogonal trajectory the slope of the tangent line at this same point

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

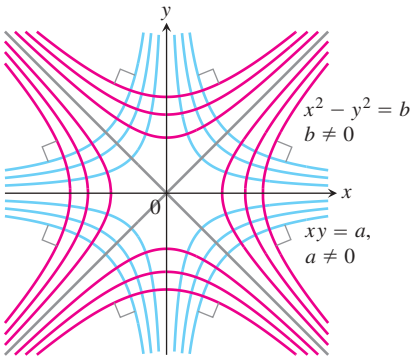

**FIGURE 15.11** Each curve is orthogonal to every curve it meets in the other family (Example 2).

must be the negative reciprocal, or $x/y$. Therefore, the orthogonal trajectories must satisfy the differential equation

$$\frac{dy}{dx} = \frac{x}{y}.$$

This differential equation is separable and we solve it as in Section 6.5:

$$y\,dy = x\,dx \qquad \text{Separate variables.}$$

$$\int y\,dy = \int x\,dx \qquad \text{Integrate both sides.}$$

$$\frac{1}{2}y^2 = \frac{1}{2}x^2 + C$$

$$y^2 - x^2 = b, \tag{5}$$

where $b = 2C$ is an arbitrary constant. The orthogonal trajectories are the family of hyperbolas given by Equation (5) and sketched in Figure 15.11. ■

## EXERCISES 15.3

1. **Coasting bicycle** A 66-kg cyclist on a 7-kg bicycle starts coasting on level ground at 9 m/sec. The $k$ in Equation (1) is about 3.9 kg/sec.
   **a.** About how far will the cyclist coast before reaching a complete stop?
   **b.** How long will it take the cyclist's speed to drop to 1 m/sec?
2. **Coasting battleship** Suppose that an Iowa class battleship has mass around 51,000 metric tons (51,000,000 kg) and a $k$ value in Equation (1) of about 59,000 kg/sec. Assume that the ship loses power when it is moving at a speed of 9 m/sec.
   **a.** About how far will the ship coast before it is dead in the water?
   **b.** About how long will it take the ship's speed to drop to 1 m/sec?
3. The data in Table 15.2 were collected with a motion detector and a CBL™ by Valerie Sharritts, a mathematics teacher at St. Francis DeSales High School in Columbus, Ohio. The table shows the distance $s$ (meters) coasted on in-line skates in $t$ sec by her daughter Ashley when she was 10 years old. Find a model for Ashley's position given by the data in Table 15.2 in the form of Equation (2). Her initial velocity was $v_0 = 2.75$ m/sec, her mass $m = 39.92$ kg (she weighed 88 lb), and her total coasting distance was 4.91 m.
4. **Coasting to a stop** Table 15.3 shows the distance $s$ (meters) coasted on in-line skates in terms of time $t$ (seconds) by Kelly Schmitzer. Find a model for her position in the form of Equation (2). Her initial velocity was $v_0 = 0.80$ m/sec, her mass $m = 49.90$ kg (110 lb), and her total coasting distance was 1.32 m.

In Exercises 5–10, find the orthogonal trajectories of the family of curves. Sketch several members of each family.

**5.** $y = mx$ **6.** $y = cx^2$

**7.** $kx^2 + y^2 = 1$ **8.** $2x^2 + y^2 = c^2$

**9.** $y = ce^{-x}$ **10.** $y = e^{kx}$

**11.** Show that the curves $2x^2 + 3y^2 = 5$ and $y^2 = x^3$ are orthogonal.

**12.** Find the family of solutions of the given differential equation and the family of orthogonal trajectories. Sketch both families.

**a.** $x\,dx + y\,dy = 0$ **b.** $x\,dy - 2y\,dx = 0$

**13.** Suppose $a$ and $b$ are positive numbers. Sketch the parabolas

$$y^2 = 4a^2 - 4ax \quad \text{and} \quad y^2 = 4b^2 + 4bx$$

in the same diagram. Show that they intersect at $\left(a - b, \pm 2\sqrt{ab}\right)$, and that each "$a$-parabola" is orthogonal to every "$b$-parabola."

# 15.4 Euler's Method

HISTORICAL BIOGRAPHY

Leonhard Euler
(1703–1783)

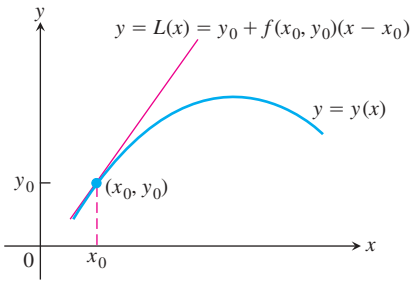

**FIGURE 15.12** The linearization $L(x)$ of $y = y(x)$ at $x = x_0$.

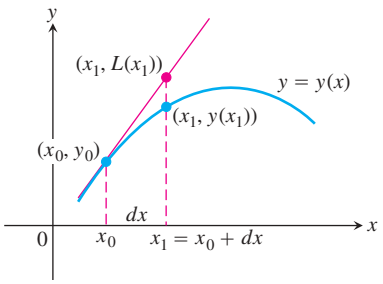

**FIGURE 15.13** The first Euler step approximates $y(x_1)$ with $y_1 = L(x_1)$.

If we do not require or cannot immediately find an *exact* solution for an initial value problem $y' = f(x, y), y(x_0) = y_0$, we can often use a computer to generate a table of approximate numerical values of $y$ for values of $x$ in an appropriate interval. Such a table is called a **numerical solution** of the problem, and the method by which we generate the table is called a **numerical method**. Numerical methods are generally fast and accurate, and they are often the methods of choice when exact formulas are unnecessary, unavailable, or overly complicated. In this section, we study one such method, called *Euler's method*, upon which many other numerical methods are based.

## Euler's Method

Given a differential equation $dy/dx = f(x, y)$ and an initial condition $y(x_0) = y_0$, we can approximate the solution $y = y(x)$ by its linearization

$$L(x) = y(x_0) + y'(x_0)(x - x_0) \quad \text{or} \quad L(x) = y_0 + f(x_0, y_0)(x - x_0).$$

The function $L(x)$ gives a good approximation to the solution $y(x)$ in a short interval about $x_0$ (Figure 15.12). The basis of Euler's method is to patch together a string of linearizations to approximate the curve over a longer stretch. Here is how the method works.

We know the point $(x_0, y_0)$ lies on the solution curve. Suppose that we specify a new value for the independent variable to be $x_1 = x_0 + dx$. (Recall that $dx = \Delta x$ in the definition of differentials.) If the increment $dx$ is small, then

$$y_1 = L(x_1) = y_0 + f(x_0, y_0)\,dx$$

is a good approximation to the exact solution value $y = y(x_1)$. So from the point $(x_0, y_0)$, which lies *exactly* on the solution curve, we have obtained the point $(x_1, y_1)$, which lies very close to the point $(x_1, y(x_1))$ on the solution curve (Figure 15.13).

Using the point $(x_1, y_1)$ and the slope $f(x_1, y_1)$ of the solution curve through $(x_1, y_1)$, we take a second step. Setting $x_2 = x_1 + dx$, we use the linearization of the solution curve through $(x_1, y_1)$ to calculate

$$y_2 = y_1 + f(x_1, y_1)\,dx.$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

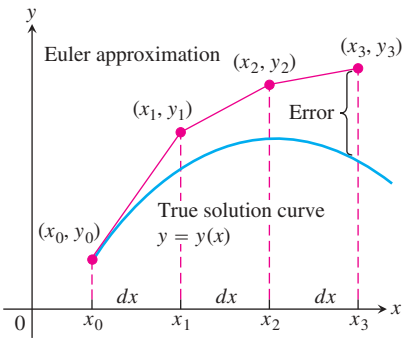

**FIGURE 15.14** Three steps in the Euler approximation to the solution of the initial value problem $y' = f(x, y), y(x_0) = y_0$. As we take more steps, the errors involved usually accumulate, but not in the exaggerated way shown here.

This gives the next approximation $(x_2, y_2)$ to values along the solution curve $y = y(x)$ (Figure 15.14). Continuing in this fashion, we take a third step from the point $(x_2, y_2)$ with slope $f(x_2, y_2)$ to obtain the third approximation

$$y_3 = y_2 + f(x_2, y_2)\, dx,$$

and so on. We are literally building an approximation to one of the solutions by following the direction of the slope field of the differential equation.

The steps in Figure 15.14 are drawn large to illustrate the construction process, so the approximation looks crude. In practice, $dx$ would be small enough to make the red curve hug the blue one and give a good approximation throughout.

**EXAMPLE 1** Find the first three approximations $y_1, y_2, y_3$ using Euler's method for the initial value problem

$$y' = 1 + y, \qquad y(0) = 1,$$

starting at $x_0 = 0$ with $dx = 0.1$.

**Solution** We have $x_0 = 0, y_0 = 1, x_1 = x_0 + dx = 0.1, x_2 = x_0 + 2dx = 0.2,$ and $x_3 = x_0 + 3\,dx = 0.3$.

$$\begin{aligned}
\textit{First:} \quad y_1 &= y_0 + f(x_0, y_0)\, dx \\
&= y_0 + (1 + y_0)\, dx \\
&= 1 + (1 + 1)(0.1) = 1.2 \\
\textit{Second:} \quad y_2 &= y_1 + f(x_1, y_1)\, dx \\
&= y_1 + (1 + y_1)\, dx \\
&= 1.2 + (1 + 1.2)(0.1) = 1.42 \\
\textit{Third:} \quad y_3 &= y_2 + f(x_2, y_2)\, dx \\
&= y_2 + (1 + y_2)\, dx \\
&= 1.42 + (1 + 1.42)(0.1) = 1.662
\end{aligned}$$

■

The step-by-step process used in Example 1 can be continued easily. Using equally spaced values for the independent variable in the table and generating $n$ of them, set

$$\begin{aligned}
x_1 &= x_0 + dx \\
x_2 &= x_1 + dx \\
&\vdots \\
x_n &= x_{n-1} + dx.
\end{aligned}$$

Then calculate the approximations to the solution,

$$\begin{aligned}
y_1 &= y_0 + f(x_0, y_0)\, dx \\
y_2 &= y_1 + f(x_1, y_1)\, dx \\
&\vdots \\
y_n &= y_{n-1} + f(x_{n-1}, y_{n-1})\, dx.
\end{aligned}$$

The number of steps $n$ can be as large as we like, but errors can accumulate if $n$ is too large.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

Euler's method is easy to implement on a computer or calculator. A computer program generates a table of numerical solutions to an initial value problem, allowing us to input $x_0$ and $y_0$, the number of steps $n$, and the step size $dx$. It then calculates the approximate solution values $y_1, y_2, \ldots, y_n$ in iterative fashion, as just described.

Solving the separable equation in Example 1, we find that the exact solution to the initial value problem is $y = 2e^x - 1$. We use this information in Example 2.

**EXAMPLE 2** Use Euler's method to solve

$$y' = 1 + y, \qquad y(0) = 1,$$

on the interval $0 \le x \le 1$, starting at $x_0 = 0$ and taking **(a)** $dx = 0.1$, **(b)** $dx = 0.05$. Compare the approximations with the values of the exact solution $y = 2e^x - 1$.

**Solution**

**(a)** We used a computer to generate the approximate values in Table 15.4. The "error" column is obtained by subtracting the unrounded Euler values from the unrounded values found using the exact solution. All entries are then rounded to four decimal places.

**TABLE 15.4** Euler solution of $y' = 1 + y$, $y(0) = 1$, step size $dx = 0.1$

| $x$ | $y$ (Euler) | $y$ (exact) | Error |
|---|---|---|---|
| 0 | 1 | 1 | 0 |
| 0.1 | 1.2 | 1.2103 | 0.0103 |
| 0.2 | 1.42 | 1.4428 | 0.0228 |
| 0.3 | 1.662 | 1.6997 | 0.0377 |
| 0.4 | 1.9282 | 1.9836 | 0.0554 |
| 0.5 | 2.2210 | 2.2974 | 0.0764 |

| 0.9 | 3.7159 | 3.9192 | 0.2033 |
| 1.0 | 4.1875 | 4.4366 | 0.2491 |

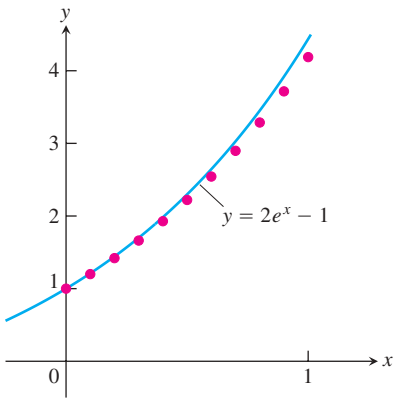

**FIGURE 15.15** The graph of $y = 2e^x - 1$ superimposed on a scatterplot of the Euler approximations shown in Table 15.4 (Example 2).

By the time we reach $x = 1$ (after 10 steps), the error is about 5.6% of the exact solution. A plot of the exact solution curve with the scatterplot of Euler solution points from Table 15.4 is shown in Figure 15.15.

**(b)** One way to try to reduce the error is to decrease the step size. Table 15.5 shows the results and their comparisons with the exact solutions when we decrease the step size to 0.05, doubling the number of steps to 20. As in Table 15.4, all computations are performed before rounding. This time when we reach $x = 1$, the relative error is only about 2.9%.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**TABLE 15.5** Euler solution of $y' = 1 + y$, $y(0) = 1$, step size $dx = 0.05$

| $x$ | $y$ (Euler) | $y$ (exact) | Error |
|---|---|---|---|
| 0 | 1 | 1 | 0 |
| 0.05 | 1.1 | 1.1025 | 0.0025 |
| 0.10 | 1.205 | 1.2103 | 0.0053 |
| 0.15 | 1.3153 | 1.3237 | 0.0084 |
| 0.20 | 1.4310 | 1.4428 | 0.0118 |
| 0.25 | 1.5526 | 1.5681 | 0.0155 |
| 0.30 | 1.6802 | 1.6997 | 0.0195 |
| 0.35 | 1.8142 | 1.8381 | 0.0239 |
| 0.40 | 1.9549 | 1.9836 | 0.0287 |
| 0.45 | 2.1027 | 2.1366 | 0.0340 |
| 0.50 | 2.2578 | 2.2974 | 0.0397 |
| 0.55 | 2.4207 | 2.4665 | 0.0458 |
| 0.60 | 2.5917 | 2.6442 | 0.0525 |
| 0.65 | 2.7713 | 2.8311 | 0.0598 |
| 0.70 | 2.9599 | 3.0275 | 0.0676 |
| 0.75 | 3.1579 | 3.2340 | 0.0761 |
| 0.80 | 3.3657 | 3.4511 | 0.0853 |
| 0.85 | 3.5840 | 3.6793 | 0.0953 |
| 0.90 | 3.8132 | 3.9192 | 0.1060 |
| 0.95 | 4.0539 | 4.1714 | 0.1175 |
| 1.00 | 4.3066 | 4.4366 | 0.1300 |

It might be tempting to reduce the step size even further in Example 2 to obtain greater accuracy. Each additional calculation, however, not only requires additional computer time but more importantly adds to the buildup of round-off errors due to the approximate representations of numbers inside the computer.

The analysis of error and the investigation of methods to reduce it when making numerical calculations are important but are appropriate for a more advanced course. There are numerical methods more accurate than Euler's method, as you can see in a further study of differential equations. We study one improvement here.

## Improved Euler's Method

HISTORICAL BIOGRAPHY

Carl Runge
(1856–1927)

We can improve on Euler's method by taking an average of two slopes. We first estimate $y_n$ as in the original Euler method, but denote it by $z_n$. We then take the average of $f(x_{n-1}, y_{n-1})$ and $f(x_n, z_n)$ in place of $f(x_{n-1}, y_{n-1})$ in the next step. Thus, we calculate the next approximation $y_n$ using

$$z_n = y_{n-1} + f(x_{n-1}, y_{n-1})\,dx$$

$$y_n = y_{n-1} + \left[\frac{f(x_{n-1}, y_{n-1}) + f(x_n, z_n)}{2}\right] dx.$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**EXAMPLE 3** Use the improved Euler's method to solve

$$y' = 1 + y, \qquad y(0) = 1,$$

on the interval $0 \le x \le 1$, starting at $x_0 = 0$ and taking $dx = 0.1$. Compare the approximations with the values of the exact solution $y = 2e^x - 1$.

**Solution** We used a computer to generate the approximate values in Table 15.6. The "error" column is obtained by subtracting the unrounded improved Euler values from the unrounded values found using the exact solution. All entries are then rounded to four decimal places.

**TABLE 15.6** Improved Euler solution of $y' = 1 + y$, $y(0) = 1$, step size $dx = 0.1$

| $x$ | $y$ (improved Euler) | $y$ (exact) | Error |
|---|---|---|---|
| 0 | 1 | 1 | 0 |
| 0.1 | 1.21 | 1.2103 | 0.0003 |
| 0.2 | 1.4421 | 1.4428 | 0.0008 |
| 0.3 | 1.6985 | 1.6997 | 0.0013 |
| 0.4 | 1.9818 | 1.9836 | 0.0018 |
| 0.5 | 2.2949 | 2.2974 | 0.0025 |
| 0.6 | 2.6409 | 2.6442 | 0.0034 |
| 0.7 | 3.0231 | 3.0275 | 0.0044 |
| 0.8 | 3.4456 | 3.4511 | 0.0055 |
| 0.9 | 3.9124 | 3.9192 | 0.0068 |
| 1.0 | 4.4282 | 4.4366 | 0.0084 |

By the time we reach $x = 1$ (after 10 steps), the relative error is about 0.19%. ■

By comparing Tables 15.4 and 15.6, we see that the improved Euler's method is considerably more accurate than the regular Euler's method, at least for the initial value problem $y' = 1 + y$, $y(0) = 1$.

## EXERCISES 15.4

In Exercises 1–6, use Euler's method to calculate the first three approximations to the given initial value problem for the specified increment size. Calculate the exact solution and investigate the accuracy of your approximations. Round your results to four decimal places.

**1.** $y' = 1 - \dfrac{y}{x}, \quad y(2) = -1, \quad dx = 0.5$

**2.** $y' = x(1 - y), \quad y(1) = 0, \quad dx = 0.2$

**3.** $y' = 2xy + 2y, \quad y(0) = 3, \quad dx = 0.2$

**4.** $y' = y^2(1 + 2x), \quad y(-1) = 1, \quad dx = 0.5$

T **5.** $y' = 2xe^{x^2}, \quad y(0) = 2, \quad dx = 0.1$

T **6.** $y' = y + e^x - 2, \quad y(0) = 2, \quad dx = 0.5$

**7.** Use the Euler method with $dx = 0.2$ to estimate $y(1)$ if $y' = y$ and $y(0) = 1$. What is the exact value of $y(1)$?

**8.** Use the Euler method with $dx = 0.2$ to estimate $y(2)$ if $y' = y/x$ and $y(1) = 2$. What is the exact value of $y(2)$?

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

T **9.** Use the Euler method with $dx = 0.5$ to estimate $y(5)$ if $y' = y^2/\sqrt{x}$ and $y(1) = -1$. What is the exact value of $y(5)$?

T **10.** Use the Euler method with $dx = 1/3$ to estimate $y(2)$ if $y' = y - e^{2x}$ and $y(0) = 1$. What is the exact value of $y(2)$?

In Exercises 11 and 12, use the improved Euler's method to calculate the first three approximations to the given initial value problem. Compare the approximations with the values of the exact solution.

**11.** $y' = 2y(x + 1), \quad y(0) = 3, \quad dx = 0.2$
(See Exercise 3 for the exact solution.)

**12.** $y' = x(1 - y), \quad y(1) = 0, \quad dx = 0.2$
(See Exercise 2 for the exact solution.)

### COMPUTER EXPLORATIONS

In Exercises 13–16, use Euler's method with the specified step size to estimate the value of the solution at the given point $x^*$. Find the value of the exact solution at $x^*$.

**13.** $y' = 2xe^{x^2}, \quad y(0) = 2, \quad dx = 0.1, \quad x^* = 1$

**14.** $y' = y + e^x - 2, \quad y(0) = 2, \quad dx = 0.5, \quad x^* = 2$

**15.** $y' = \sqrt{x}/y, \quad y > 0, \quad y(0) = 1, \quad dx = 0.1, \quad x^* = 1$

**16.** $y' = 1 + y^2, \quad y(0) = 0, \quad dx = 0.1, \quad x^* = 1$

In Exercises 17 and 18, **(a)** find the exact solution of the initial value problem. Then compare the accuracy of the approximation with $y(x^*)$ using Euler's method starting at $x_0$ with step size **(b)** 0.2, **(c)** 0.1, and **(d)** 0.05.

**17.** $y' = 2y^2(x - 1), \quad y(2) = -1/2, \quad x_0 = 2, \quad x^* = 3$

**18.** $y' = y - 1, \quad y(0) = 3, \quad x_0 = 0, \quad x^* = 1$

In Exercises 19 and 20, compare the accuracy of the approximation with $y(x^*)$ using the improved Euler's method starting at $x_0$ with step size

**a.** 0.2 **b.** 0.1 **c.** 0.05

**d.** Describe what happens to the error as the step size decreases.

**19.** $y' = 2y^2(x - 1), \quad y(2) = -1/2, \quad x_0 = 2, \quad x^* = 3$
(See Exercise 17 for the exact solution.)

**20.** $y' = y - 1, \quad y(0) = 3, \quad x_0 = 0, \quad x^* = 1$
(See Exercise 18 for the exact solution.)

Use a CAS to explore graphically each of the differential equations in Exercises 21–24. Perform the following steps to help with your explorations.

**a.** Plot a slope field for the differential equation in the given $xy$-window.

**b.** Find the general solution of the differential equation using your CAS DE solver.

**c.** Graph the solutions for the values of the arbitrary constant $C = -2, -1, 0, 1, 2$ superimposed on your slope field plot.

**d.** Find and graph the solution that satisfies the specified initial condition over the interval $[0, b]$.

**e.** Find the Euler numerical approximation to the solution of the initial value problem with 4 subintervals of the $x$-interval and plot the Euler approximation superimposed on the graph produced in part (d).

**f.** Repeat part (e) for 8, 16, and 32 subintervals. Plot these three Euler approximations superimposed on the graph from part (e).

**g.** Find the error ($y$(exact) $-$ $y$(Euler)) at the specified point $x = b$ for each of your four Euler approximations. Discuss the improvement in the percentage error.

**21.** $y' = x + y, \quad y(0) = -7/10; \quad -4 \le x \le 4, \quad -4 \le y \le 4; \quad b = 1$

**22.** $y' = -x/y, \quad y(0) = 2; \quad -3 \le x \le 3, \quad -3 \le y \le 3; \quad b = 2$

**23. A logistic equation** $y' = y(2 - y), \quad y(0) = 1/2; \quad 0 \le x \le 4, \quad 0 \le y \le 3; \quad b = 3$

**24.** $y' = (\sin x)(\sin y), \quad y(0) = 2; \quad -6 \le x \le 6, \quad -6 \le y \le 6; \quad b = 3\pi/2$

## 15.5 Graphical Solutions of Autonomous Equations

In Chapter 4 we learned that the sign of the first derivative tells where the graph of a function is increasing and where it is decreasing. The sign of the second derivative tells the concavity of the graph. We can build on our knowledge of how derivatives determine the shape of a graph to solve differential equations graphically. The starting ideas for doing so are the notions of *phase line* and *equilibrium value*. We arrive at these notions by investigating what happens when the derivative of a differentiable function is zero from a point of view different from that studied in Chapter 4.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

## Equilibrium Values and Phase Lines

When we differentiate implicitly the equation

$$\frac{1}{5}\ln(5y - 15) = x + 1$$

we obtain

$$\frac{1}{5}\left(\frac{5}{5y - 15}\right)\frac{dy}{dx} = 1.$$

Solving for $y' = dy/dx$ we find $y' = 5y - 15 = 5(y - 3)$. In this case the derivative $y'$ is a function of $y$ only (the dependent variable) and is zero when $y = 3$.

A differential equation for which $dy/dx$ is a function of $y$ only is called an **autonomous** differential equation. Let's investigate what happens when the derivative in an autonomous equation equals zero. We assume any derivatives are continuous.

**DEFINITION** If $dy/dx = g(y)$ is an autonomous differential equation, then the values of $y$ for which $dy/dx = 0$ are called **equilibrium values** or **rest points**.

Thus, equilibrium values are those at which no change occurs in the dependent variable, so $y$ is at *rest*. The emphasis is on the value of $y$ where $dy/dx = 0$, not the value of $x$, as we studied in Chapter 4. For example, the equilibrium values for the autonomous differential equation

$$\frac{dy}{dx} = (y + 1)(y - 2)$$

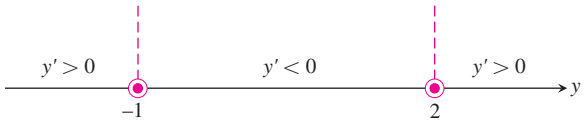
are $y = -1$ and $y = 2$.

To construct a graphical solution to an autonomous differential equation, we first make a **phase line** for the equation, a plot on the $y$-axis that shows the equation's equilibrium values along with the intervals where $dy/dx$ and $d^2y/dx^2$ are positive and negative. Then we know where the solutions are increasing and decreasing, and the concavity of the solution curves. These are the essential features we found in Section 4.4, so we can determine the shapes of the solution curves without having to find formulas for them.

**EXAMPLE 1** Draw a phase line for the equation

$$\frac{dy}{dx} = (y + 1)(y - 2)$$

and use it to sketch solutions to the equation.



**Solution**

**1.** *Draw a number line for y and mark the equilibrium values* $y = -1$ *and* $y = 2$, *where* $dy/dx = 0$.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**2.** *Identify and label the intervals where* $y' > 0$ *and* $y' < 0$. This step resembles what we did in Section 4.3, only now we are marking the $y$-axis instead of the $x$-axis.

We can encapsulate the information about the sign of $y'$ on the phase line itself. Since $y' > 0$ on the interval to the left of $y = -1$, a solution of the differential equation with a $y$-value less than $-1$ will increase from there toward $y = -1$. We display this information by drawing an arrow on the interval pointing to $-1$.

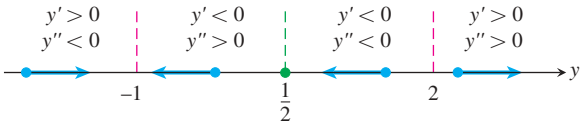
Similarly, $y' < 0$ between $y = -1$ and $y = 2$, so any solution with a value in this interval will decrease toward $y = -1$.

For $y > 2$, we have $y' > 0$, so a solution with a $y$-value greater than 2 will increase from there without bound.

In short, solution curves below the horizontal line $y = -1$ in the $xy$-plane rise toward $y = -1$. Solution curves between the lines $y = -1$ and $y = 2$ fall away from $y = 2$ toward $y = -1$. Solution curves above $y = 2$ rise away from $y = 2$ and keep going up.

**3.** *Calculate* $y''$ *and mark the intervals where* $y'' > 0$ *and* $y'' < 0$. To find $y''$, we differentiate $y'$ *with respect to* $x$, using implicit differentiation.

$$y' = (y + 1)(y - 2) = y^2 - y - 2 \qquad \text{Formula for } y' \ldots$$



$$y'' = \frac{d}{dx}(y') = \frac{d}{dx}(y^2 - y - 2)$$

$$= 2yy' - y' \qquad \text{differentiated implicitly with respect to } x.$$

$$= (2y - 1)y'$$

$$= (2y - 1)(y + 1)(y - 2).$$

From this formula, we see that $y''$ changes sign at $y = -1, y = 1/2$, and $y = 2$. We add the sign information to the phase line.

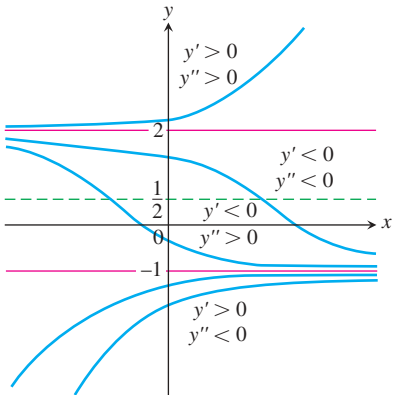


**FIGURE 15.16** Graphical solutions from Example 1 include the horizontal lines $y = -1$ and $y = 2$ through the equilibrium values. From Theorem 1, no two solution curves will ever cross or touch each other.

**4.** *Sketch an assortment of solution curves in the xy-plane.* The horizontal lines $y = -1, y = 1/2$, and $y = 2$ partition the plane into horizontal bands in which we know the signs of $y'$ and $y''$. In each band, this information tells us whether the solution curves rise or fall and how they bend as $x$ increases (Figure 15.16).

The "equilibrium lines" $y = -1$ and $y = 2$ are also solution curves. (The constant functions $y = -1$ and $y = 2$ satisfy the differential equation.) Solution curves

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

that cross the line $y = 1/2$ have an inflection point there. The concavity changes from concave down (above the line) to concave up (below the line).

As predicted in Step 2, solutions in the middle and lower bands approach the equilibrium value $y = -1$ as $x$ increases. Solutions in the upper band rise steadily away from the value $y = 2$. ■

## Stable and Unstable Equilibria

Look at Figure 15.16 once more, in particular at the behavior of the solution curves near the equilibrium values. Once a solution curve has a value near $y = -1$, it tends steadily toward that value; $y = -1$ is a **stable equilibrium**. The behavior near $y = 2$ is just the opposite: all solutions except the equilibrium solution $y = 2$ itself move *away* from it as $x$ increases. We call $y = 2$ an **unstable equilibrium**. If the solution is *at* that value, it stays, but if it is off by any amount, no matter how small, it moves away. (Sometimes an equilibrium value is unstable because a solution moves away from it only on one side of the point.)

Now that we know what to look for, we can already see this behavior on the initial phase line. The arrows lead away from $y = 2$ and, once to the left of $y = 2$, toward $y = -1$.

We now present several applied examples for which we can sketch a family of solution curves to the differential equation models using the method in Example 1.

In Section 6.5 we solved analytically the differential equation

$$\frac{dH}{dt} = -k(H - H_S), \qquad k > 0$$

modeling Newton's law of cooling. Here $H$ is the temperature (amount of heat) of an object at time $t$ and $H_S$ is the constant temperature of the surrounding medium. Our first example uses a phase line analysis to understand the graphical behavior of this temperature model over time.

**EXAMPLE 2** What happens to the temperature of the soup when a cup of hot soup is placed on a table in a room? We know the soup cools down, but what does a typical temperature curve look like as a function of time?

**Solution** Suppose that the surrounding medium has a constant Celsius temperature of 15°C. We can then express the difference in temperature as $H(t) - 15$. Assuming $H$ is a differentiable function of time $t$, by Newton's law of cooling, there is a constant of proportionality $k > 0$ such that

$$\frac{dH}{dt} = -k(H - 15) \tag{1}$$

(*minus* $k$ to give a negative derivative when $H > 15$).

Since $dH/dt = 0$ at $H = 15$, the temperature 15°C is an equilibrium value. If $H > 15$, Equation (1) tells us that $(H - 15) > 0$ and $dH/dt < 0$. If the object is hotter than the room, it will get cooler. Similarly, if $H < 15$, then $(H - 15) < 0$ and $dH/dt > 0$. An object cooler than the room will warm up. Thus, the behavior described by Equation (1) agrees with our intuition of how temperature should behave. These observations are captured in the initial phase line diagram in Figure 15.17. The value $H = 15$ is a stable equilibrium.

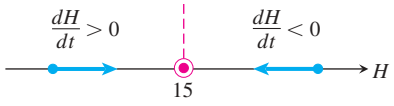

**FIGURE 15.17** First step in constructing the phase line for Newton's law of cooling in Example 2. The temperature tends towards the equilibrium (surrounding-medium) value in the long run.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

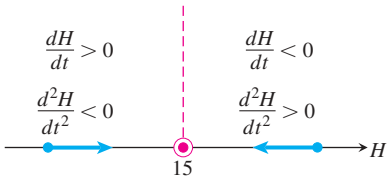

**FIGURE 15.18** The complete phase line for Newton's law of cooling (Example 2).

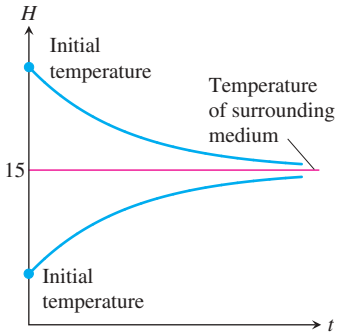

**FIGURE 15.19** Temperature versus time. Regardless of initial temperature, the object's temperature $H(t)$ tends toward 15°C, the temperature of the surrounding medium.

We determine the concavity of the solution curves by differentiating both sides of Equation (1) with respect to $t$:

$$\frac{d}{dt}\left(\frac{dH}{dt}\right) = \frac{d}{dt}(-k(H - 15))$$

$$\frac{d^2H}{dt^2} = -k\frac{dH}{dt}.$$

Since $-k$ is negative, we see that $d^2H/dt^2$ is positive when $dH/dt < 0$ and negative when $dH/dt > 0$. Figure 15.18 adds this information to the phase line.

The completed phase line shows that if the temperature of the object is above the equilibrium value of 15°C, the graph of $H(t)$ will be decreasing and concave upward. If the temperature is below 15°C (the temperature of the surrounding medium), the graph of $H(t)$ will be increasing and concave downward. We use this information to sketch typical solution curves (Figure 15.19).

From the upper solution curve in Figure 15.19, we see that as the object cools down, the rate at which it cools slows down because $dH/dt$ approaches zero. This observation is implicit in Newton's law of cooling and contained in the differential equation, but the flattening of the graph as time advances gives an immediate visual representation of the phenomenon. The ability to discern physical behavior from graphs is a powerful tool in understanding real-world systems. ■

**EXAMPLE 3** Galileo and Newton both observed that the rate of change in momentum encountered by a moving object is equal to the net force applied to it. In mathematical terms,

$$F = \frac{d}{dt}(mv) \tag{2}$$

where $F$ is the force and $m$ and $v$ the object's mass and velocity. If $m$ varies with time, as it will if the object is a rocket burning fuel, the right-hand side of Equation (2) expands to

$$m\frac{dv}{dt} + v\frac{dm}{dt}$$

using the Product Rule. In many situations, however, $m$ is constant, $dm/dt = 0$, and Equation (2) takes the simpler form

$$F = m\frac{dv}{dt} \quad \text{or} \quad F = ma, \tag{3}$$

known as *Newton's second law of motion* (see Section 15.3).

In free fall, the constant acceleration due to gravity is denoted by $g$ and the one force acting downward on the falling body is

$$F_p = mg,$$

the propulsion due to gravity. If, however, we think of a real body falling through the air—say, a penny from a great height or a parachutist from an even greater height—we know that at some point air resistance is a factor in the speed of the fall. A more realistic model of free fall would include air resistance, shown as a force $F_r$ in the schematic diagram in Figure 15.20.

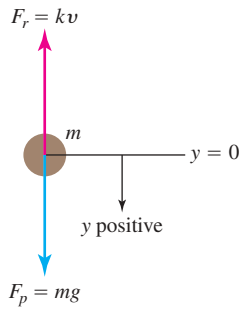

**FIGURE 15.20** An object falling under the influence of gravity with a resistive force assumed to be proportional to the velocity.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

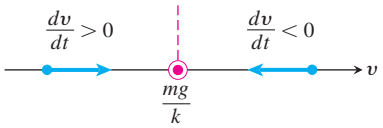

**FIGURE 15.21** Initial phase line for Example 3.

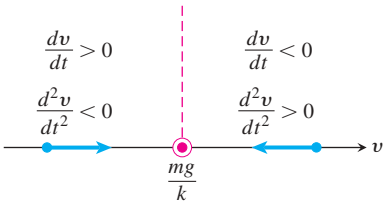

**FIGURE 15.22** The completed phase line for Example 3.

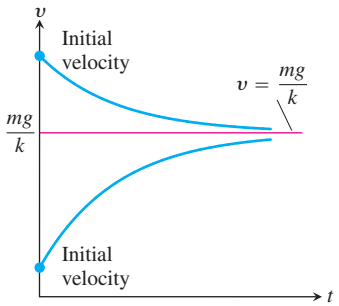

**FIGURE 15.23** Typical velocity curves in Example 3. The value $v = mg/k$ is the terminal velocity.

For low speeds well below the speed of sound, physical experiments have shown that $F_r$ is approximately proportional to the body's velocity. The net force on the falling body is therefore

$$F = F_p - F_r,$$

giving

$$m\frac{dv}{dt} = mg - kv$$

$$\frac{dv}{dt} = g - \frac{k}{m}v. \tag{4}$$

We can use a phase line to analyze the velocity functions that solve this differential equation.

The equilibrium point, obtained by setting the right-hand side of Equation (4) equal to zero, is

$$v = \frac{mg}{k}.$$

If the body is initially moving faster than this, $dv/dt$ is negative and the body slows down. If the body is moving at a velocity below $mg/k$, then $dv/dt > 0$ and the body speeds up. These observations are captured in the initial phase line diagram in Figure 15.21.

We determine the concavity of the solution curves by differentiating both sides of Equation (4) with respect to $t$:

$$\frac{d^2v}{dt^2} = \frac{d}{dt}\left(g - \frac{k}{m}v\right) = -\frac{k}{m}\frac{dv}{dt}.$$

We see that $d^2v/dt^2 < 0$ when $v < mg/k$ and $d^2v/dt^2 > 0$ when $v > mg/k$. Figure 15.22 adds this information to the phase line. Notice the similarity to the phase line for Newton's law of cooling (Figure 15.18). The solution curves are similar as well (Figure 15.23).

Figure 15.23 shows two typical solution curves. Regardless of the initial velocity, we see the body's velocity tending toward the limiting value $v = mg/k$. This value, a stable equilibrium point, is called the body's **terminal velocity**. Skydivers can vary their terminal velocity from 95 mph to 180 mph by changing the amount of body area opposing the fall. ■

**EXAMPLE 4** In Section 15.3 we examined population growth using the model of exponential change. That is, if $P$ represents the number of individuals and we neglect departures and arrivals, then

$$\frac{dP}{dt} = kP, \tag{5}$$

where $k > 0$ is the birthrate minus the death rate per individual per unit time.

Because the natural environment has only a limited number of resources to sustain life, it is reasonable to assume that only a maximum population $M$ can be accommodated. As the population approaches this **limiting population** or **carrying capacity**, resources become less abundant and the growth rate $k$ decreases. A simple relationship exhibiting this behavior is

$$k = r(M - P),$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

where $r > 0$ is a constant. Notice that $k$ decreases as $P$ increases toward $M$ and that $k$ is negative if $P$ is greater than $M$. Substituting $r(M - P)$ for $k$ in Equation (5) gives the differential equation

$$\frac{dP}{dt} = r(M - P)P = rMP - rP^2. \tag{6}$$

The model given by Equation (6) is referred to as **logistic growth**.

We can forecast the behavior of the population over time by analyzing the phase line for Equation (6). The equilibrium values are $P = M$ and $P = 0$, and we can see that $dP/dt > 0$ if $0 < P < M$ and $dP/dt < 0$ if $P > M$. These observations are recorded on the phase line in Figure 15.24.

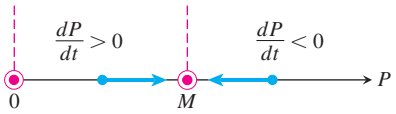

**FIGURE 15.24** The initial phase line for Equation 6.

We determine the concavity of the population curves by differentiating both sides of Equation (6) with respect to $t$:

$$\begin{aligned}\frac{d^2P}{dt^2} &= \frac{d}{dt}(rMP - rP^2)\\ &= rM\frac{dP}{dt} - 2rP\frac{dP}{dt}\\ &= r(M - 2P)\frac{dP}{dt}.\end{aligned} \tag{7}$$

If $P = M/2$, then $d^2P/dt^2 = 0$. If $P < M/2$, then $(M - 2P)$ and $dP/dt$ are positive and $d^2P/dt^2 > 0$. If $M/2 < P < M$, then $(M - 2P) < 0$, $dP/dt > 0$, and $d^2P/dt^2 < 0$. If $P > M$, then $(M - 2P)$ and $dP/dt$ are both negative and $d^2P/dt^2 > 0$. We add this information to the phase line (Figure 15.25).

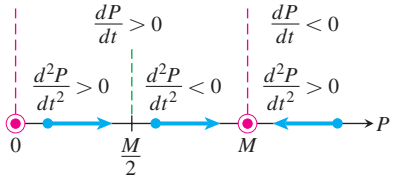

**FIGURE 15.25** The completed phase line for logistic growth (Equation 6).

The lines $P = M/2$ and $P = M$ divide the first quadrant of the $tP$-plane into horizontal bands in which we know the signs of both $dP/dt$ and $d^2P/dt^2$. In each band, we know how the solution curves rise and fall, and how they bend as time passes. The equilibrium lines $P = 0$ and $P = M$ are both population curves. Population curves crossing the line $P = M/2$ have an inflection point there, giving them a **sigmoid** shape (curved in two directions like a letter S). Figure 15.26 displays typical population curves. ■

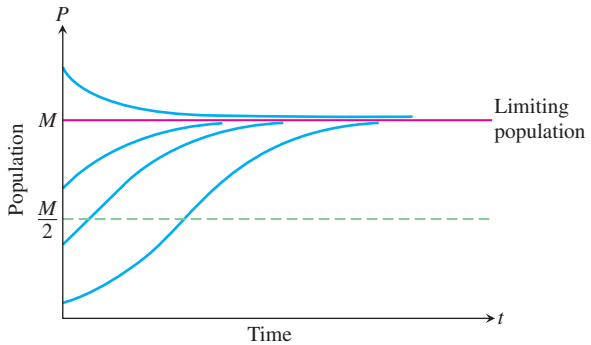

**FIGURE 15.26** Population curves in Example 4.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

## EXERCISES 15.5

In Exercises 1–8,

**a.** Identify the equilibrium values. Which are stable and which are unstable?

**b.** Construct a phase line. Identify the signs of $y'$ and $y''$.

**c.** Sketch several solution curves.

**1.** $\dfrac{dy}{dx} = (y + 2)(y - 3)$

**2.** $\dfrac{dy}{dx} = y^2 - 4$

**3.** $\dfrac{dy}{dx} = y^3 - y$

**4.** $\dfrac{dy}{dx} = y^2 - 2y$

**5.** $y' = \sqrt{y}, \quad y > 0$

**6.** $y' = y - \sqrt{y}, \quad y > 0$

**7.** $y' = (y - 1)(y - 2)(y - 3)$

**8.** $y' = y^3 - y^2$

The autonomous differential equations in Exercises 9–12 represent models for population growth. For each exercise, use a phase line analysis to sketch solution curves for $P(t)$, selecting different starting values $P(0)$ (as in Example 4). Which equilibria are stable, and which are unstable?

**9.** $\dfrac{dP}{dt} = 1 - 2P$

**10.** $\dfrac{dP}{dt} = P(1 - 2P)$

**11.** $\dfrac{dP}{dt} = 2P(P - 3)$

**12.** $\dfrac{dP}{dt} = 3P(1 - P)\left(P - \dfrac{1}{2}\right)$

**13. Catastrophic continuation of Example 4** Suppose that a healthy population of some species is growing in a limited environment and that the current population $P_0$ is fairly close to the carrying capacity $M_0$. You might imagine a population of fish living in a freshwater lake in a wilderness area. Suddenly a catastrophe such as the Mount St. Helens volcanic eruption contaminates the lake and destroys a significant part of the food and oxygen on which the fish depend. The result is a new environment with a carrying capacity $M_1$ considerably less than $M_0$ and, in fact, less than the current population $P_0$. Starting at some time before the catastrophe, sketch a "before-and-after" curve that shows how the fish population responds to the change in environment.

**14. Controlling a population** The fish and game department in a certain state is planning to issue hunting permits to control the deer population (one deer per permit). It is known that if the deer population falls below a certain level $m$, the deer will become extinct. It is also known that if the deer population rises above the carrying capacity $M$, the population will decrease back to $M$ through disease and malnutrition.

**a.** Discuss the reasonableness of the following model for the growth rate of the deer population as a function of time:

$$\frac{dP}{dt} = rP(M - P)(P - m),$$

where $P$ is the population of the deer and $r$ is a positive constant of proportionality. Include a phase line.

**b.** Explain how this model differs from the logistic model $dP/dt = rP(M - P)$. Is it better or worse than the logistic model?

**c.** Show that if $P > M$ for all $t$, then $\lim_{t\to\infty} P(t) = M$.

**d.** What happens if $P < m$ for all $t$?

**e.** Discuss the solutions to the differential equation. What are the equilibrium points of the model? Explain the dependence of the steady-state value of $P$ on the initial values of $P$. About how many permits should be issued?

**15. Skydiving** If a body of mass $m$ falling from rest under the action of gravity encounters an air resistance proportional to the square of velocity, then the body's velocity $t$ seconds into the fall satisfies the equation.

$$m\frac{dv}{dt} = mg - kv^2, \qquad k > 0$$

where $k$ is a constant that depends on the body's aerodynamic properties and the density of the air. (We assume that the fall is too short to be affected by changes in the air's density.)

**a.** Draw a phase line for the equation.

**b.** Sketch a typical velocity curve.

**c.** For a 160-lb skydiver ($mg = 160$) and with time in seconds and distance in feet, a typical value of $k$ is 0.005. What is the diver's terminal velocity?

**16. Resistance proportional to $\sqrt{v}$** A body of mass $m$ is projected vertically downward with initial velocity $v_0$. Assume that the resisting force is proportional to the square root of the velocity and find the terminal velocity from a graphical analysis.

**17. Sailing** A sailboat is running along a straight course with the wind providing a constant forward force of 50 lb. The only other force acting on the boat is resistance as the boat moves through the water. The resisting force is numerically equal to five times the boat's speed, and the initial velocity is 1 ft/sec. What is the maximum velocity in feet per second of the boat under this wind?

**18. The spread of information** Sociologists recognize a phenomenon called *social diffusion*, which is the spreading of a piece of information, technological innovation, or cultural fad among a population. The members of the population can be divided into two classes: those who have the information and those who do not. In a fixed population whose size is known, it is reasonable to assume that the rate of diffusion is proportional to the number who have the information times the number yet to receive it. If $X$ denotes the number of individuals who have the information in a population of $N$ people, then a mathematical model for social diffusion is given by

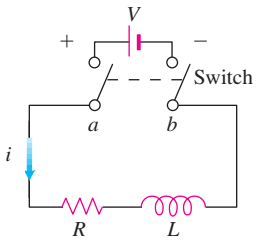
$$\frac{dX}{dt} = kX(N - X),$$

where $t$ represents time in days and $k$ is a positive constant.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**a.** Discuss the reasonableness of the model.

**b.** Construct a phase line identifying the signs of $X'$ and $X''$.



**c.** Sketch representative solution curves.

**d.** Predict the value of $X$ for which the information is spreading most rapidly. How many people eventually receive the information?

**19. Current in an *RL*-circuit** The accompanying diagram represents an electrical circuit whose total resistance is a constant $R$ ohms and whose self-inductance, shown as a coil, is $L$ henries, also a constant. There is a switch whose terminals at $a$ and $b$ can be closed to connect a constant electrical source of $V$ volts. From Section 15.2, we have

$$L\frac{di}{dt} + Ri = V,$$

where $i$ is the intensity of the current in amperes and $t$ is the time in seconds.

Use a phase line analysis to sketch the solution curve assuming that the switch in the $RL$-circuit is closed at time $t = 0$. What happens to the current as $t \to \infty$? This value is called the *steady-state solution.*

**20. A pearl in shampoo** Suppose that a pearl is sinking in a thick fluid, like shampoo, subject to a frictional force opposing its fall and proportional to its velocity. Suppose that there is also a resistive buoyant force exerted by the shampoo. According to *Archimedes' principle*, the buoyant force equals the weight of the fluid displaced by the pearl. Using $m$ for the mass of the pearl and $P$ for the mass of the shampoo displaced by the pearl as it descends, complete the following steps.

**a.** Draw a schematic diagram showing the forces acting on the pearl as it sinks, as in Figure 15.20.

**b.** Using $v(t)$ for the pearl's velocity as a function of time $t$, write a differential equation modeling the velocity of the pearl as a falling body.

**c.** Construct a phase line displaying the signs of $v'$ and $v''$.

**d.** Sketch typical solution curves.

**e.** What is the terminal velocity of the pearl?

## 15.6 Systems of Equations and Phase Planes

In some situations we are led to consider not one, but several first-order differential equations. Such a collection is called a **system** of differential equations. In this section we present an approach to understanding systems through a graphical procedure known as a *phase-plane analysis*. We present this analysis in the context of modeling the populations of trout and bass living in a common pond.

### Phase Planes

A general system of two first-order differential equations may take the form

$$\frac{dx}{dt} = F(x, y),$$
$$\frac{dy}{dt} = G(x, y).$$

Such a system of equations is called **autonomous** because $dx/dt$ and $dy/dt$ do not depend on the independent variable time $t$, but only on the dependent variables $x$ and $y$. A **solution**

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

of such a system consists of a pair of functions $x(t)$ and $y(t)$ that satisfies both of the differential equations simultaneously for every $t$ over some time interval (finite or infinite).

We cannot look at just one of these equations in isolation to find solutions $x(t)$ or $y(t)$ since each derivative depends on both $x$ and $y$. To gain insight into the solutions, we look at both dependent variables together by plotting the points $(x(t), y(t))$ in the $xy$-plane starting at some specified point. Therefore the solution functions are considered as parametric equations (with parameter $t$), and a corresponding solution curve through the specified point is called a **trajectory** of the system. The $xy$-plane itself, in which these trajectories reside, is referred to as the **phase plane**. Thus we consider both solutions together and study the behavior of all the solution trajectories in the phase plane. It can be proved that two trajectories can never cross or touch each other.

## A Competitive-Hunter Model

Imagine two species of fish, say trout and bass, competing for the same limited resources in a certain pond. We let $x(t)$ represent the number of trout and $y(t)$ the number of bass living in the pond at time $t$. In reality $x(t)$ and $y(t)$ are always integer valued, but we will approximate them with real-valued differentiable functions. This allows us to apply the methods of differential equations.

Several factors affect the rates of change of these populations. As time passes, each species breeds, so we assume its population increases proportionally to its size. Taken by itself, this would lead to exponential growth in each of the two populations. However, there is a countervailing effect from the fact that the two species are in competition. A large number of bass tends to cause a decrease in the number of trout, and vice-versa. Our model takes the size of this effect to be proportional to the frequency with which the two species interact, which in turn is proportional to $xy$, the product of the two populations. These considerations lead to the following model for the growth of the trout and bass in the pond:

$$\frac{dx}{dt} = (a - by)x, \tag{1a}$$

$$\frac{dy}{dt} = (m - nx)y. \tag{1b}$$

Here $x(t)$ represents the trout population, $y(t)$ the bass population, and $a$, $b$, $m$, $n$ are positive constants. A solution of this system then consists of a pair of functions $x(t)$ and $y(t)$ that gives the population of each fish species at time $t$. Each equation in (1) contains both of the unknown functions $x$ and $y$, so we are unable to solve them individually. Instead, we will use a graphical analysis to study the solution trajectories of this **competitive-hunter model**.

We now examine the nature of the phase plane in the trout-bass population model. We will be interested in the 1st quadrant of the $xy$-plane, where $x \geq 0$ and $y \geq 0$, since populations cannot be negative. First, we determine where the bass and trout populations are both constant. Noting that the $(x(t), y(t))$ values remain unchanged when $dx/dt = 0$ and $dy/dt = 0$, Equations (1a and 1b) then become

$$(a - by)x = 0,$$
$$(m - nx)y = 0.$$

This pair of simultaneous equations has two solutions: $(x, y) = (0, 0)$ and $(x, y) = (m/n, a/b)$. At these $(x, y)$ values, called **equilibrium** or **rest points**, the two populations remain at constant values over all time. The point $(0, 0)$ represents a pond containing no members of either fish species; the point $(m/n, a/b)$ corresponds to a pond with an unchanging number of each fish species.

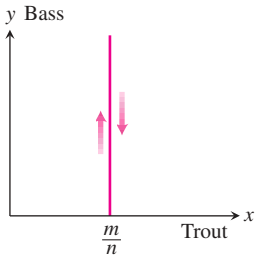

**FIGURE 15.28** To the left of the line $x = m/n$ the trajectories move upward, and to the right they move downward.

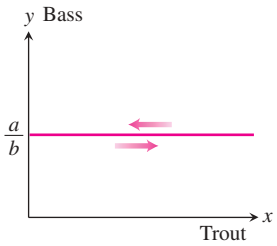

**FIGURE 15.29** Above the line $y = a/b$ the trajectories move to the left, and below it they move to the right.

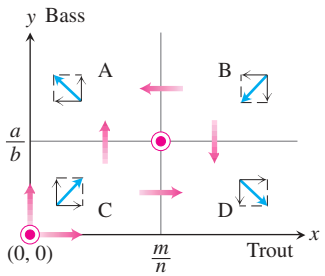

**FIGURE 15.30** Composite graphical analysis of the trajectory directions in the four regions determined by $x = m/n$ and $y = a/b$.

Next, we note that if $y = a/b$, then Equation (1a) implies $dx/dt = 0$, so the trout population $x(t)$ is constant. Similarly, if $x = m/n$, then Equation (1b) implies $dy/dt = 0$, and the bass population $y(t)$ is constant. This information is recorded in Figure 15.27.

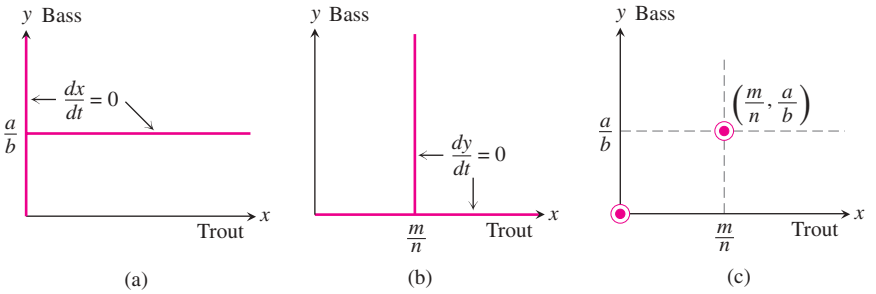

**FIGURE 15.27** Rest points in the competitive-hunter model given by Equations (1a and 1b).

In setting up our competitive-hunter model, precise values of the constants $a$, $b$, $m$, $n$ will not generally be known. Nonetheless, we can analyze the system of Equations (1) to learn the nature of its solution trajectories. We begin by determining the signs of $dx/dt$ and $dy/dt$ throughout the phase plane. Although $x(t)$ represents the number of trout and $y(t)$ the number of bass at time $t$, we are thinking of the pair of values $(x(t), y(t))$ as a point tracing out a trajectory curve in the phase plane. When $dx/dt$ is positive, $x(t)$ is increasing and the point is moving to the right in the phase plane. If $dx/dt$ is negative, the point is moving to the left. Likewise, the point is moving upward where $dy/dt$ is positive and downward where $dy/dt$ is negative.

We saw that $dy/dt = 0$ along the vertical line $x = m/n$. To the left of this line, $dy/dt$ is positive since $dy/dt = (m - nx)y$ and $x < m/n$. So the trajectories on this side of the line are directed upward. To the right of this line, $dy/dt$ is negative and the trajectories point downward. The directions of the associated trajectories are indicated in Figure 15.28. Similarly, above the horizontal line $y = a/b$, we have $dx/dt < 0$ and the trajectories head leftward; below this line they head rightward, as shown in Figure 15.29. Combining this information gives four distinct regions in the plane $A$, $B$, $C$, $D$, with their respective trajectory directions shown in Figure 15.30.

Next, we examine what happens near the two equilibrium points. The trajectories near $(0, 0)$ point away from it, upward and to the right. The behavior near the equilibrium point $(m/n, a/b)$ depends on the region in which a trajectory begins. If it starts in region $B$, for instance, then it will move downward and leftward towards the equilibrium point. Depending on where the trajectory begins, it may move downward into region $D$, leftward into region $A$, or perhaps straight into the equilibrium point. If it enters into regions $A$ or $D$, then it will continue to move away from the rest point. We say that both rest points are **unstable**, meaning (in this setting) there are trajectories near each point that head away from them. These features are indicated in Figure 15.31.

It turns out that in each of the half-planes above and below the line $y = a/b$, there is exactly one trajectory approaching the equilibrium point $(m/n, a/b)$ (see Exercise 7). Above these two trajectories the bass population increases and below them it decreases. The two trajectories approaching the equilibrium point are suggested in Figure 15.32.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

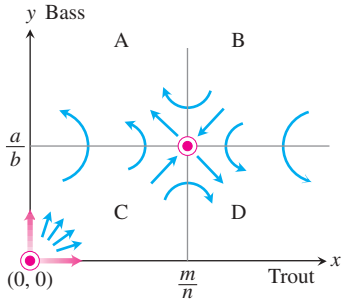

**FIGURE 15.31** Motion along the trajectories near the rest points (0, 0) and $(m/n, a/b)$.

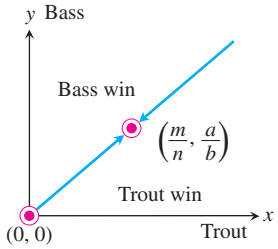

**FIGURE 15.32** Qualitative results of analyzing the competitive-hunter model. There are exactly two trajectories approaching the point $(m/n, a/b)$.

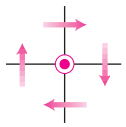

**FIGURE 15.33** Trajectory direction near the rest point (0, 0).

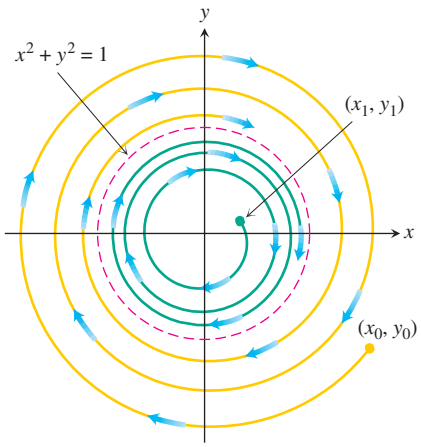

**FIGURE 15.35** The solution $x^2 + y^2 = 1$ is a limit cycle.

Our graphical analysis leads us to conclude that, under the assumptions of the competitive-hunter model, it is unlikely that both species will reach equilibrium levels. This is because it would be almost impossible for the fish populations to move exactly along one of the two approaching trajectories for all time. Furthermore, the initial populations point $(x_0, y_0)$ determines which of the two species is likely to survive over time, and mutual coexistence of the species is highly improbable.

## Limitations of the Phase-Plane Analysis Method

Unlike the situation for the competitive-hunter model, it is not always possible to determine the behavior of trajectories near a rest point. For example, suppose we know that the trajectories near a rest point, chosen here to be the origin (0, 0), behave as in Figure 15.33. The information provided by Figure 15.33 is not sufficient to distinguish between the three possible trajectories shown in Figure 15.34. Even if we could determine that a trajectory near an equilibrium point resembles that of Figure 15.34c, we would still not know how the other trajectories behave. It could happen that a trajectory closer to the origin behaves like the motions displayed in Figure 15.34a or 15.34b. The spiraling trajectory in Figure 15.34b can never actually reach the rest point in a finite time period.

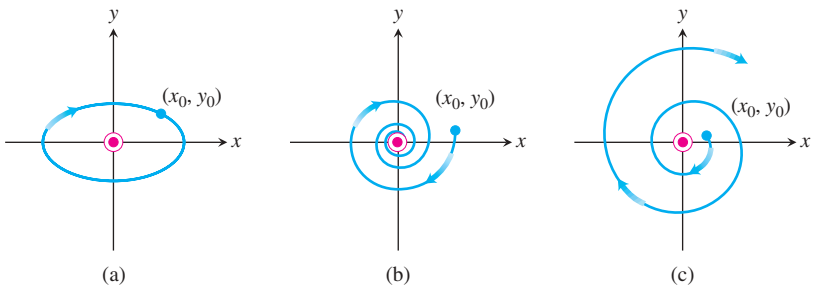

**FIGURE 15.34** Three possible trajectory motions: (a) periodic motion, (b) motion toward an asymptotically stable rest point, and (c) motion near an unstable rest point.

## Another Type of Behavior

The system

$$\frac{dx}{dt} = y + x - x(x^2 + y^2), \tag{2a}$$

$$\frac{dy}{dt} = -x + y - y(x^2 + y^2) \tag{2b}$$

can be shown to have only one equilibrium point at (0, 0). Yet any trajectory starting on the unit circle traverses it clockwise because, when $x^2 + y^2 = 1$, we have $dy/dx = -x/y$ (see Exercise 2). If a trajectory starts inside the unit circle, it spirals outward, asymptotically approaching the circle as $t \to \infty$. If a trajectory starts outside the unit circle, it spirals inward, again asymptotically approaching the circle as $t \to \infty$. The circle $x^2 + y^2 = 1$ is called a **limit cycle** of the system (Figure 15.35). In this system, the values of $x$ and $y$ eventually become periodic.

## EXERCISES 15.6

**1.** List three important considerations that are ignored in the competitive-hunter model as presented in the text.

**2.** For the system (2a and 2b), show that any trajectory starting on the unit circle $x^2 + y^2 = 1$ will traverse the unit circle in a periodic solution. First introduce polar coordinates and rewrite the system as $dr/dt = r(1 - r^2)$ and $d\theta/dt = 1$.

**3.** Develop a model for the growth of trout and bass assuming that in isolation trout demonstrate exponential decay [so that $a < 0$ in Equations (1a and 1b)] and that the bass population grows logistically with a population limit $M$. Analyze graphically the motion in the vicinity of the rest points in your model. Is coexistence possible?

**4.** How might the competitive-hunter model be validated? Include a discussion of how the various constants $a$, $b$, $m$, and $n$ might be estimated. How could state conservation authorities use the model to ensure the survival of both species?

**5.** Consider another competitive-hunter model defined by

$$\frac{dx}{dt} = a\left(1 - \frac{x}{k_1}\right)x - bxy,$$

$$\frac{dy}{dt} = m\left(1 - \frac{y}{k_2}\right)y - nxy,$$

where $x$ and $y$ represent trout and bass populations, respectively.

**a.** What assumptions are implicitly being made about the growth of trout and bass in the absence of competition?

**b.** Interpret the constants $a$, $b$, $m$, $n$, $k_1$, and $k_2$ in terms of the physical problem.

**c.** Perform a graphical analysis:

**i.** Find the possible equilibrium levels.

**ii.** Determine whether coexistence is possible.

**iii.** Pick several typical starting points and sketch typical trajectories in the phase plane.

**iv.** Interpret the outcomes predicted by your graphical analysis in terms of the constants $a$, $b$, $m$, $n$, $k_1$, and $k_2$.

*Note:* When you get to part (iii), you should realize that five cases exist. You will need to analyze all five cases.

**6.** Consider the following economic model. Let $P$ be the price of a single item on the market. Let $Q$ be the quantity of the item available on the market. Both $P$ and $Q$ are functions of time. If one considers price and quantity as two interacting species, the following model might be proposed:

$$\frac{dP}{dt} = aP\left(\frac{b}{Q} - P\right),$$

$$\frac{dQ}{dt} = cQ(fP - Q),$$

where $a$, $b$, $c$, and $f$ are positive constants. Justify and discuss the adequacy of the model.

**a.** If $a = 1$, $b = 20{,}000$, $c = 1$, and $f = 30$, find the equilibrium points of this system. If possible, classify each equilibrium point with respect to its stability. If a point cannot be readily classified, give some explanation.

**b.** Perform a graphical stability analysis to determine what will happen to the levels of $P$ and $Q$ as time increases.

**c.** Give an economic interpretation of the curves that determine the equilibrium points.

**7.** Show that the two trajectories leading to $(m/n, a/b)$ shown in Figure 15.32 are unique by carrying out the following steps.

**a.** From system (1a and 1b) derive the following equation:

$$\frac{dy}{dx} = \frac{(m - nx)y}{(a - by)x}.$$

**b.** Separate variables, integrate, and exponentiate to obtain

$$y^a e^{-by} = Kx^m e^{-nx}$$

where $K$ is a constant of integration.

**c.** Let $f(y) = y^a/e^{by}$ and $g(x) = x^m/e^{nx}$. Show that $f(y)$ has a unique maximum of $M_y = (a/eb)^a$ when $y = a/b$ as shown in Figure 15.36. Similarly, show that $g(x)$ has a unique maximum $M_x = (m/en)^m$ when $x = m/n$, also shown in Figure 15.36.

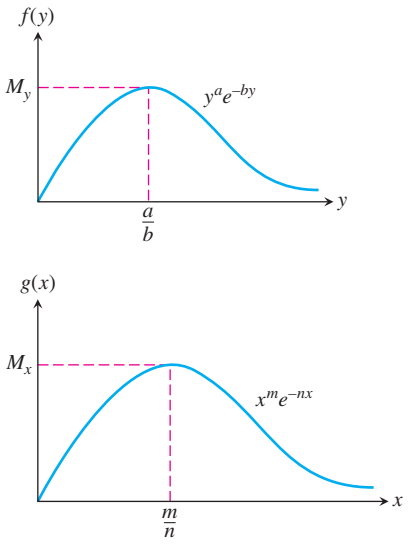

**FIGURE 15.36** Graphs of the functions $f(y) = y^a/e^{by}$ and $g(x) = x^m/e^{nx}$.

**d.** Consider what happens as $(x, y)$ approaches $(m/n, a/b)$. Take limits in part (b) as $x \to m/n$ and $y \to a/b$ to show that either

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

$$\lim_{\substack{x \to m/n \\ y \to a/b}} \left[ \left( \frac{y^a}{e^{by}} \right) \left( \frac{e^{nx}}{x^m} \right) \right] = K$$

or $M_y/M_x = K$. Thus any solution trajectory that approaches $(m/n, a/b)$ must satisfy

$$\frac{y^a}{e^{by}} = \left( \frac{M_y}{M_x} \right) \left( \frac{x^m}{e^{nx}} \right).$$

**e.** Show that only one trajectory can approach $(m/n, a/b)$ from below the line $y = a/b$. Pick $y_0 < a/b$. From Figure 15.36 you can see that $f(y_0) < M_y$, which implies that

$$\frac{M_y}{M_x} \left( \frac{x^m}{e^{nx}} \right) = {y_0}^a / e^{by_0} < M_y.$$

This in turn implies that

$$\frac{x^m}{e^{nx}} < M_x.$$

Figure 15.36 tells you that for $g(x)$ there is a unique value $x_0 < m/n$ satisfying this last inequality. That is, for each $y < a/b$ there is a unique value of $x$ satisfying the equation in part (d). Thus there can exist only one trajectory solution approaching $(m/n, a/b)$ from below, as shown in Figure 15.37.

**f.** Use a similar argument to show that the solution trajectory leading to $(m/n, a/b)$ is unique if $y_0 > a/b$.

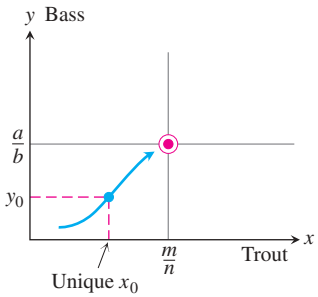

**FIGURE 15.37** For any $y < a/b$ only one solution trajectory leads to the rest point $(m/n, a/b)$.

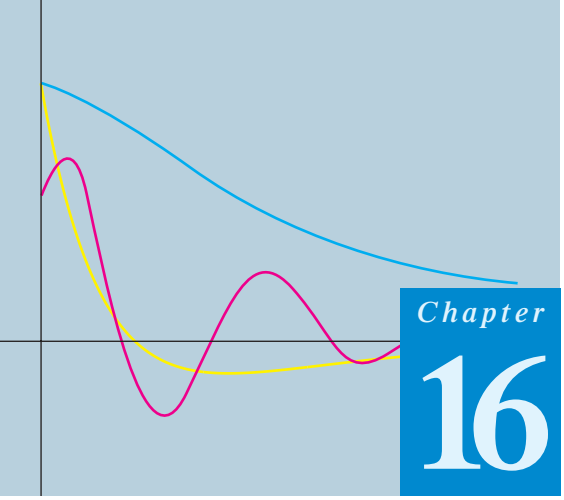

**8.** Show that the second-order differential equation $y'' = F(x, y, y')$ can be reduced to a system of two first-order differential equations

$$\frac{dy}{dx} = z,$$

$$\frac{dz}{dx} = F(x, y, z).$$

Can something similar be done to the $n$th-order differential equation $y^{(n)} = F\left(x, y, y', y'', \ldots, y^{(n-1)}\right)$?

Chapter

# 16 SECOND-ORDER DIFFERENTIAL EQUATIONS

**OVERVIEW** In this chapter we extend our study of differential equations to those of *second order*. Second-order differential equations arise in many applications in the sciences and engineering. For instance, they can be applied to the study of vibrating springs and electric circuits. You will learn how to solve such differential equations by several methods in this chapter.

## 16.1 Second-Order Linear Equations

An equation of the form

$$P(x)y''(x) + Q(x)y'(x) + R(x)y(x) = G(x), \tag{1}$$

which is linear in $y$ and its derivatives, is called a **second-order linear differential equation**. We assume that the functions $P$, $Q$, $R$, and $G$ are continuous throughout some open interval $I$. If $G(x)$ is identically zero on $I$, the equation is said to be **homogeneous**; otherwise it is called **nonhomogeneous**. Therefore, the form of a second-order linear homogeneous differential equation is

$$P(x)y'' + Q(x)y' + R(x)y = 0. \tag{2}$$

We also assume that $P(x)$ is never zero for any $x \in I$.

Two fundamental results are important to solving Equation (2). The first of these says that if we know two solutions $y_1$ and $y_2$ of the linear homogeneous equation, then any **linear combination** $y = c_1y_1 + c_2y_2$ is also a solution for any constants $c_1$ and $c_2$.

**THEOREM 1—The Superposition Principle** If $y_1(x)$ and $y_2(x)$ are two solutions to the linear homogeneous equation (2), then for any constants $c_1$ and $c_2$, the function

$$y(x) = c_1y_1(x) + c_2y_2(x)$$

is also a solution to Equation (2).

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**Proof** Substituting $y$ into Equation (2), we have

$$\begin{aligned} &P(x)y'' + Q(x)y' + R(x)y \\ &\quad = P(x)(c_1y_1 + c_2y_2)'' + Q(x)(c_1y_1 + c_2y_2)' + R(x)(c_1y_1 + c_2y_2) \\ &\quad = P(x)(c_1y_1'' + c_2y_2'') + Q(x)(c_1y_1' + c_2y_2') + R(x)(c_1y_1 + c_2y_2) \\ &\quad = \underbrace{c_1(P(x)y_1'' + Q(x)y_1' + R(x)y_1)}_{=0,\ y_1 \text{ is a solution}} + \underbrace{c_2(P(x)y_2'' + Q(x)y_2' + R(x)y_2)}_{=0,\ y_2 \text{ is a solution}} \\ &\quad = c_1(0) + c_2(0) = 0. \end{aligned}$$

Therefore, $y = c_1y_1 + c_2y_2$ is a solution of Equation (2). ■

Theorem 1 immediately establishes the following facts concerning solutions to the linear homogeneous equation.

1. A sum of two solutions $y_1 + y_2$ to Equation (2) is also a solution. (Choose $c_1 = c_2 = 1$.)
2. A constant multiple $ky_1$ of any solution $y_1$ to Equation (2) is also a solution. (Choose $c_1 = k$ and $c_2 = 0$.)
3. The **trivial solution** $y(x) \equiv 0$ is always a solution to the linear homogeneous equation. (Choose $c_1 = c_2 = 0$.)

The second fundamental result about solutions to the linear homogeneous equation concerns its **general solution** or solution containing all solutions. This result says that there are two solutions $y_1$ and $y_2$ such that any solution is some linear combination of them for suitable values of the constants $c_1$ and $c_2$. However, not just any pair of solutions will do. The solutions must be **linearly independent**, which means that neither $y_1$ nor $y_2$ is a constant multiple of the other. For example, the functions $f(x) = e^x$ and $g(x) = xe^x$ are linearly independent, whereas $f(x) = x^2$ and $g(x) = 7x^2$ are not (so they are linearly dependent). These results on linear independence and the following theorem are proved in more advanced courses.

**THEOREM 2** If $P$, $Q$, and $R$ are continuous over the open interval $I$ and $P(x)$ is never zero on $I$, then the linear homogeneous equation (2) has two linearly independent solutions $y_1$ and $y_2$ on $I$. Moreover, if $y_1$ and $y_2$ are *any* two linearly independent solutions of Equation (2), then the general solution is given by

$$y(x) = c_1y_1(x) + c_2y_2(x),$$

where $c_1$ and $c_2$ are arbitrary constants.

We now turn our attention to finding two linearly independent solutions to the special case of Equation (2), where $P$, $Q$, and $R$ are constant functions.

## Constant-Coefficient Homogeneous Equations

Suppose we wish to solve the second-order homogeneous differential equation

$$ay'' + by' + cy = 0, \tag{3}$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

where $a$, $b$, and $c$ are constants. To solve Equation (3), we seek a function which when multiplied by a constant and added to a constant times its first derivative plus a constant times its second derivative sums identically to zero. One function that behaves this way is the exponential function $y = e^{rx}$, when $r$ is a constant. Two differentiations of this exponential function give $y' = re^{rx}$ and $y'' = r^2e^{rx}$, which are just constant multiples of the original exponential. If we substitute $y = e^{rx}$ into Equation (3), we obtain

$$ar^2e^{rx} + bre^{rx} + ce^{rx} = 0.$$

Since the exponential function is never zero, we can divide this last equation through by $e^{rx}$. Thus, $y = e^{rx}$ is a solution to Equation (3) if and only if $r$ is a solution to the algebraic equation

$$ar^2 + br + c = 0. \tag{4}$$

Equation (4) is called the **auxiliary equation** (or **characteristic equation**) of the differential equation $ay'' + by' + cy = 0$. The auxiliary equation is a quadratic equation with roots

$$r_1 = \frac{-b + \sqrt{b^2 - 4ac}}{2a} \quad \text{and} \quad r_2 = \frac{-b - \sqrt{b^2 - 4ac}}{2a}.$$

There are three cases to consider which depend on the value of the discriminant $b^2 - 4ac$.

**Case 1: $b^2 - 4ac > 0$.** In this case the auxiliary equation has two real and unequal roots $r_1$ and $r_2$. Then $y_1 = e^{r_1x}$ and $y_2 = e^{r_2x}$ are two linearly independent solutions to Equation (3) because $e^{r_2x}$ is not a constant multiple of $e^{r_1x}$ (see Exercise 61). From Theorem 2 we conclude the following result.

**THEOREM 3** If $r_1$ and $r_2$ are two real and unequal roots to the auxiliary equation $ar^2 + br + c = 0$, then

$$y = c_1e^{r_1x} + c_2e^{r_2x}$$

is the general solution to $ay'' + by' + cy = 0$.

**EXAMPLE 1** Find the general solution of the differential equation

$$y'' - y' - 6y = 0.$$

**Solution** Substitution of $y = e^{rx}$ into the differential equation yields the auxiliary equation

$$r^2 - r - 6 = 0,$$

which factors as

$$(r - 3)(r + 2) = 0.$$

The roots are $r_1 = 3$ and $r_2 = -2$. Thus, the general solution is

$$y = c_1e^{3x} + c_2e^{-2x}.$$ ■

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**Case 2: $b^2 - 4ac = 0$.** In this case $r_1 = r_2 = -b/2a$. To simplify the notation, let $r = -b/2a$. Then we have one solution $y_1 = e^{rx}$ with $2ar + b = 0$. Since multiplication of $e^{rx}$ by a constant fails to produce a second linearly independent solution, suppose we try multiplying by a *function* instead. The simplest such function would be $u(x) = x$, so let's see if $y_2 = xe^{rx}$ is also a solution. Substituting $y_2$ into the differential equation gives

$$\begin{aligned} ay_2'' + by_2' + cy_2 &= a(2re^{rx} + r^2xe^{rx}) + b(e^{rx} + rxe^{rx}) + cxe^{rx} \\ &= (2ar + b)e^{rx} + (ar^2 + br + c)xe^{rx} \\ &= 0(e^{rx}) + (0)xe^{rx} = 0. \end{aligned}$$

The first term is zero because $r = -b/2a$; the second term is zero because $r$ solves the auxiliary equation. The functions $y_1 = e^{rx}$ and $y_2 = xe^{rx}$ are linearly independent (see Exercise 62). From Theorem 2 we conclude the following result.

**THEOREM 4** If $r$ is the only (repeated) real root to the auxiliary equation $ar^2 + br + c = 0$, then

$$y = c_1e^{rx} + c_2xe^{rx}$$

is the general solution to $ay'' + by' + cy = 0$.

**EXAMPLE 2** Find the general solution to

$$y'' + 4y' + 4y = 0.$$

**Solution** The auxiliary equation is

$$r^2 + 4r + 4 = 0,$$

which factors into

$$(r + 2)^2 = 0.$$

Thus, $r = -2$ is a double root. Therefore, the general solution is

$$y = c_1e^{-2x} + c_2xe^{-2x}.$$ ■

**Case 3: $b^2 - 4ac < 0$.** In this case the auxiliary equation has two complex roots $r_1 = \alpha + i\beta$ and $r_2 = \alpha - i\beta$, where $\alpha$ and $\beta$ are real numbers and $i^2 = -1$. (These real numbers are $\alpha = -b/2a$ and $\beta = \sqrt{4ac - b^2}/2a$.) These two complex roots then give rise to two linearly independent solutions

$$y_1 = e^{(\alpha+i\beta)x} = e^{\alpha x}(\cos \beta x + i \sin \beta x) \quad \text{and} \quad y_2 = e^{(\alpha-i\beta)x} = e^{\alpha x}(\cos \beta x - i \sin \beta x).$$

(The expressions involving the sine and cosine terms follow from Euler's identity in Section 8.9.) However, the solutions $y_1$ and $y_2$ are *complex valued* rather than real valued. Nevertheless, because of the superposition principle (Theorem 1), we can obtain from them the two real-valued solutions

$$y_3 = \frac{1}{2}y_1 + \frac{1}{2}y_2 = e^{\alpha x}\cos \beta x \qquad \text{and} \qquad y_4 = \frac{1}{2i}y_1 - \frac{1}{2i}y_2 = e^{\alpha x}\sin \beta x.$$

The functions $y_3$ and $y_4$ are linearly independent (see Exercise 63). From Theorem 2 we conclude the following result.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**THEOREM 5** If $r_1 = \alpha + i\beta$ and $r_2 = \alpha - i\beta$ are two complex roots to the auxiliary equation $ar^2 + br + c = 0$, then

$$y = e^{\alpha x}(c_1 \cos \beta x + c_2 \sin \beta x)$$

is the general solution to $ay'' + by' + cy = 0$.

**EXAMPLE 3** Find the general solution to the differential equation

$$y'' - 4y' + 5y = 0.$$

**Solution** The auxiliary equation is

$$r^2 - 4r + 5 = 0.$$

The roots are the complex pair $r = (4 \pm \sqrt{16 - 20})/2$ or $r_1 = 2 + i$ and $r_2 = 2 - i$. Thus, $\alpha = 2$ and $\beta = 1$ give the general solution

$$y = e^{2x}(c_1 \cos x + c_2 \sin x).$$ ■

## Initial Value and Boundary Value Problems

To determine a unique solution to a first-order linear differential equation, it was sufficient to specify the value of the solution at a single point. Since the general solution to a second-order equation contains two arbitrary constants, it is necessary to specify two conditions. One way of doing this is to specify the value of the solution function and the value of its derivative at a single point: $y(x_0) = y_0$ and $y'(x_0) = y_1$. These conditions are called **initial conditions**. The following result is proved in more advanced texts and guarantees the existence of a unique solution for both homogeneous and nonhomogeneous second-order linear initial value problems.

**THEOREM 6** If $P$, $Q$, $R$, and $G$ are continuous throughout an open interval $I$, then there exists one and only one function $y(x)$ satisfying both the differential equation

$$P(x)y''(x) + Q(x)y'(x) + R(x)y(x) = G(x)$$

on the interval $I$, and the initial conditions

$$y(x_0) = y_0 \qquad \text{and} \qquad y'(x_0) = y_1$$

at the specified point $x_0 \in I$.

It is important to realize that any real values can be assigned to $y_0$ and $y_1$ and Theorem 6 applies. Here is an example of an initial value problem for a homogeneous equation.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

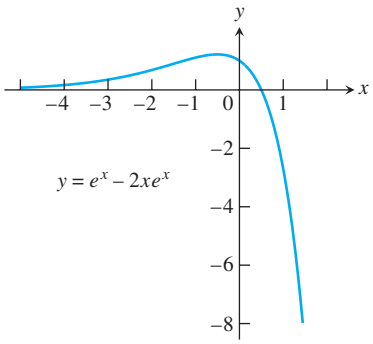

**FIGURE 16.1** Particular solution curve for Example 4.

**EXAMPLE 4** Find the particular solution to the initial value problem

$$y'' - 2y' + y = 0, \qquad y(0) = 1, \quad y'(0) = -1.$$

**Solution** The auxiliary equation is

$$r^2 - 2r + 1 = (r - 1)^2 = 0.$$

The repeated real root is $r = 1$, giving the general solution

$$y = c_1 e^x + c_2 x e^x.$$

Then,

$$y' = c_1 e^x + c_2(x + 1)e^x.$$

From the initial conditions we have

$$1 = c_1 + c_2 \cdot 0 \qquad \text{and} \qquad -1 = c_1 + c_2 \cdot 1.$$

Thus, $c_1 = 1$ and $c_2 = -2$. The unique solution satisfying the initial conditions is

$$y = e^x - 2xe^x.$$

The solution curve is shown in Figure 16.1. ■

Another approach to determine the values of the two arbitrary constants in the general solution to a second-order differential equation is to specify the values of the solution function at *two different points* in the interval $I$. That is, we solve the differential equation subject to the **boundary values**

$$y(x_1) = y_1 \qquad \text{and} \qquad y(x_2) = y_2,$$

where $x_1$ and $x_2$ both belong to $I$. Here again the values for $y_1$ and $y_2$ can be any real numbers. The differential equation together with specified boundary values is called a **boundary value problem**. Unlike the result stated in Theorem 6, boundary value problems do not always possess a solution or more than one solution may exist (see Exercise 65). These problems are studied in more advanced texts, but here is an example for which there is a unique solution.

**EXAMPLE 5** Solve the boundary value problem

$$y'' + 4y = 0, \qquad y(0) = 0, \quad y\left(\frac{\pi}{12}\right) = 1.$$

**Solution** The auxiliary equation is $r^2 + 4 = 0$, which has the complex roots $r = \pm 2i$. The general solution to the differential equation is

$$y = c_1 \cos 2x + c_2 \sin 2x.$$

The boundary conditions are satisfied if

$$y(0) = c_1 \cdot 1 + c_2 \cdot 0 = 0$$

$$y\left(\frac{\pi}{12}\right) = c_1 \cos\left(\frac{\pi}{6}\right) + c_2 \sin\left(\frac{\pi}{6}\right) = 1.$$

It follows that $c_1 = 0$ and $c_2 = 2$. The solution to the boundary value problem is

$$y = 2 \sin 2x.$$

## EXERCISES 16.1

In Exercises 1–30, find the general solution of the given equation.

**1.** $y'' - y' - 12y = 0$
**2.** $3y'' - y' = 0$
**3.** $y'' + 3y' - 4y = 0$
**4.** $y'' - 9y = 0$
**5.** $y'' - 4y = 0$
**6.** $y'' - 64y = 0$
**7.** $2y'' - y' - 3y = 0$
**8.** $9y'' - y = 0$
**9.** $8y'' - 10y' - 3y = 0$
**10.** $3y'' - 20y' + 12y = 0$
**11.** $y'' + 9y = 0$
**12.** $y'' + 4y' + 5y = 0$
**13.** $y'' + 25y = 0$
**14.** $y'' + y = 0$
**15.** $y'' - 2y' + 5y = 0$
**16.** $y'' + 16y = 0$
**17.** $y'' + 2y' + 4y = 0$
**18.** $y'' - 2y' + 3y = 0$
**19.** $y'' + 4y' + 9y = 0$
**20.** $4y'' - 4y' + 13y = 0$
**21.** $y'' = 0$
**22.** $y'' + 8y' + 16y = 0$
**23.** $\dfrac{d^2y}{dx^2} + 4\dfrac{dy}{dx} + 4y = 0$
**24.** $\dfrac{d^2y}{dx^2} - 6\dfrac{dy}{dx} + 9y = 0$
**25.** $\dfrac{d^2y}{dx^2} + 6\dfrac{dy}{dx} + 9y = 0$
**26.** $4\dfrac{d^2y}{dx^2} - 12\dfrac{dy}{dx} + 9y = 0$
**27.** $4\dfrac{d^2y}{dx^2} + 4\dfrac{dy}{dx} + y = 0$
**28.** $4\dfrac{d^2y}{dx^2} - 4\dfrac{dy}{dx} + y = 0$
**29.** $9\dfrac{d^2y}{dx^2} + 6\dfrac{dy}{dx} + y = 0$
**30.** $9\dfrac{d^2y}{dx^2} - 12\dfrac{dy}{dx} + 4y = 0$

In Exercises 31–40, find the unique solution of the second-order initial value problem.

**31.** $y'' + 6y' + 5y = 0, \quad y(0) = 0, \; y'(0) = 3$
**32.** $y'' + 16y = 0, \quad y(0) = 2, \; y'(0) = -2$
**33.** $y'' + 12y = 0, \quad y(0) = 0, \; y'(0) = 1$
**34.** $12y'' + 5y' - 2y = 0, \quad y(0) = 1, \; y'(0) = -1$
**35.** $y'' + 8y = 0, \quad y(0) = -1, \; y'(0) = 2$
**36.** $y'' + 4y' + 4y = 0, \quad y(0) = 0, \; y'(0) = 1$
**37.** $y'' - 4y' + 4y = 0, \quad y(0) = 1, \; y'(0) = 0$
**38.** $4y'' - 4y' + y = 0, \quad y(0) = 4, \; y'(0) = 4$
**39.** $4\dfrac{d^2y}{dx^2} + 12\dfrac{dy}{dx} + 9y = 0, \quad y(0) = 2, \quad \dfrac{dy}{dx}(0) = 1$
**40.** $9\dfrac{d^2y}{dx^2} - 12\dfrac{dy}{dx} + 4y = 0, \quad y(0) = -1, \quad \dfrac{dy}{dx}(0) = 1$

In Exercises 41–55, find the general solution.

**41.** $y'' - 2y' - 3y = 0$
**42.** $6y'' - y' - y = 0$
**43.** $4y'' + 4y' + y = 0$
**44.** $9y'' + 12y' + 4y = 0$
**45.** $4y'' + 20y = 0$
**46.** $y'' + 2y' + 2y = 0$
**47.** $25y'' + 10y' + y = 0$
**48.** $6y'' + 13y' - 5y = 0$
**49.** $4y'' + 4y' + 5y = 0$
**50.** $y'' + 4y' + 6y = 0$
**51.** $16y'' - 24y' + 9y = 0$
**52.** $6y'' - 5y' - 6y = 0$
**53.** $9y'' + 24y' + 16y = 0$
**54.** $4y'' + 16y' + 52y = 0$
**55.** $6y'' - 5y' - 4y = 0$

In Exercises 56–60, solve the initial value problem.

**56.** $y'' - 2y' + 2y = 0, \quad y(0) = 0, \; y'(0) = 2$
**57.** $y'' + 2y' + y = 0, \quad y(0) = 1, \; y'(0) = 1$
**58.** $4y'' - 4y' + y = 0, \quad y(0) = -1, \; y'(0) = 2$
**59.** $3y'' + y' - 14y = 0, \quad y(0) = 2, \; y'(0) = -1$
**60.** $4y'' + 4y' + 5y = 0, \quad y(\pi) = 1, \; y'(\pi) = 0$

**61.** Prove that the two solution functions in Theorem 3 are linearly independent.

**62.** Prove that the two solution functions in Theorem 4 are linearly independent.

**63.** Prove that the two solution functions in Theorem 5 are linearly independent.

**64.** Prove that if $y_1$ and $y_2$ are linearly independent solutions to the homogeneous equation (2), then the functions $y_3 = y_1 + y_2$ and $y_4 = y_1 - y_2$ are also linearly independent solutions.

**65.** **a.** Show that there is no solution to the boundary value problem

$$y'' + 4y = 0, \quad y(0) = 0, \; y(\pi) = 1.$$

**b.** Show that there are infinitely many solutions to the boundary value problem

$$y'' + 4y = 0, \quad y(0) = 0, \; y(\pi) = 0.$$

**66.** Show that if $a$, $b$, and $c$ are positive constants, then all solutions of the homogeneous differential equation

$$ay'' + by' + cy = 0$$

approach zero as $x \to \infty$.

# 16.2 Nonhomogeneous Linear Equations

In this section we study two methods for solving second-order linear nonhomogeneous differential equations with constant coefficients. These are the methods of *undetermined coefficients* and *variation of parameters*. We begin by considering the form of the general solution.

## Form of the General Solution

Suppose we wish to solve the nonhomogeneous equation

$$ay'' + by' + cy = G(x), \tag{1}$$

where $a$, $b$, and $c$ are constants and $G$ is continuous over some open interval $I$. Let $y_c = c_1y_1 + c_2y_2$ be the general solution to the associated **complementary equation**

$$ay'' + by' + cy = 0. \tag{2}$$

(We learned how to find $y_c$ in Section 16.1.) Now suppose we could somehow come up with a particular function $y_p$ that solves the nonhomogeneous equation (1). Then the sum

$$y = y_c + y_p \tag{3}$$

also solves the nonhomogeneous equation (1) because

$$\begin{aligned} a(y_c + y_p)'' + b(y_c + y_p)' + c(y_c + y_p) &= (ay_c'' + by_c' + cy_c) + (ay_p'' + by_p' + cy_p) \\ &= 0 + G(x) \qquad y_c \text{ solves Eq. (2) and } y_p \text{ solves Eq. (1)} \\ &= G(x). \end{aligned}$$

Moreover, if $y = y(x)$ is the general solution to the nonhomogeneous equation (1), it must have the form of Equation (3). The reason for this last statement follows from the observation that for any function $y_p$ satisfying Equation (1), we have

$$\begin{aligned} a(y - y_p)'' + b(y - y_p)' + c(y - y_p) &= (ay'' + by' + cy) - (ay_p'' + by_p' + cy_p) \\ &= G(x) - G(x) = 0. \end{aligned}$$

Thus, $y_c = y - y_p$ is the general solution to the homogeneous equation (2). We have established the following result.

**THEOREM 7** The general solution $y = y(x)$ to the nonhomogeneous differential equation (1) has the form

$$y = y_c + y_p,$$

where the **complementary solution** $y_c$ is the general solution to the associated homogeneous equation (2) and $y_p$ is any **particular solution** to the nonhomogeneous equation (1).

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

## The Method of Undetermined Coefficients

This method for finding a particular solution $y_p$ to nonhomogeneous equation (1) applies to special cases for which $G(x)$ is a sum of terms of various polynomials $p(x)$ multiplying an exponential with possibly sine or cosine factors. That is, $G(x)$ is a sum of terms of the following forms:

$$p_1(x)e^{rx}, \qquad p_2(x)e^{\alpha x}\cos \beta x, \qquad p_3(x)e^{\alpha x}\sin \beta x.$$

For instance, $1 - x$, $e^{2x}$, $xe^x$, $\cos x$, and $5e^x - \sin 2x$ represent functions in this category. (Essentially these are functions solving homogeneous linear differential equations with constant coefficients, but the equations may be of order higher than two.) We now present several examples illustrating the method.

**EXAMPLE 1** Solve the nonhomogeneous equation $y'' - 2y' - 3y = 1 - x^2$.

**Solution** The auxiliary equation for the complementary equation $y'' - 2y' - 3y = 0$ is

$$r^2 - 2r - 3 = (r + 1)(r - 3) = 0.$$

It has the roots $r = -1$ and $r = 3$ giving the complementary solution

$$y_c = c_1e^{-x} + c_2e^{3x}.$$

Now $G(x) = 1 - x^2$ is a polynomial of degree 2. It would be reasonable to assume that a particular solution to the given nonhomogeneous equation is also a polynomial of degree 2 because if $y$ is a polynomial of degree 2, then $y'' - 2y' - 3y$ is also a polynomial of degree 2. So we seek a particular solution of the form

$$y_p = Ax^2 + Bx + C.$$

We need to determine the unknown coefficients $A$, $B$, and $C$. When we substitute the polynomial $y_p$ and its derivatives into the given nonhomogeneous equation, we obtain

$$2A - 2(2Ax + B) - 3(Ax^2 + Bx + C) = 1 - x^2$$

or, collecting terms with like powers of $x$,

$$-3Ax^2 + (-4A - 3B)x + (2A - 2B - 3C) = 1 - x^2.$$

This last equation holds for all values of $x$ if its two sides are identical polynomials of degree 2. Thus, we equate corresponding powers of $x$ to get

$$-3A = -1, \qquad -4A - 3B = 0, \qquad \text{and} \qquad 2A - 2B - 3C = 1.$$

These equations imply in turn that $A = 1/3$, $B = -4/9$, and $C = 5/27$. Substituting these values into the quadratic expression for our particular solution gives

$$y_p = \frac{1}{3}x^2 - \frac{4}{9}x + \frac{5}{27}.$$

By Theorem 7, the general solution to the nonhomogeneous equation is

$$y = y_c + y_p = c_1e^{-x} + c_2e^{3x} + \frac{1}{3}x^2 - \frac{4}{9}x + \frac{5}{27}.$$ ■

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**EXAMPLE 2** Find a particular solution of $y'' - y' = 2 \sin x$.

**Solution** If we try to find a particular solution of the form

$$y_p = A \sin x$$

and substitute the derivatives of $y_p$ in the given equation, we find that $A$ must satisfy the equation

$$-A \sin x + A \cos x = 2 \sin x$$

for all values of $x$. Since this requires $A$ to equal both $-2$ and 0 at the same time, we conclude that the nonhomogeneous differential equation has no solution of the form $A \sin x$.

It turns out that the required form is the sum

$$y_p = A \sin x + B \cos x.$$

The result of substituting the derivatives of this new trial solution into the differential equation is

$$-A \sin x - B \cos x - (A \cos x - B \sin x) = 2 \sin x$$

or

$$(B - A) \sin x - (A + B) \cos x = 2 \sin x.$$

This last equation must be an identity. Equating the coefficients for like terms on each side then gives

$$B - A = 2 \qquad \text{and} \qquad A + B = 0.$$

Simultaneous solution of these two equations gives $A = -1$ and $B = 1$. Our particular solution is

$$y_p = \cos x - \sin x.$$ ■

**EXAMPLE 3** Find a particular solution of $y'' - 3y' + 2y = 5e^x$.

**Solution** If we substitute

$$y_p = Ae^x$$

and its derivatives in the differential equation, we find that

$$Ae^x - 3Ae^x + 2Ae^x = 5e^x$$

or

$$0 = 5e^x.$$

However, the exponential function is never zero. The trouble can be traced to the fact that $y = e^x$ is already a solution of the related homogeneous equation

$$y'' - 3y' + 2y = 0.$$

The auxiliary equation is

$$r^2 - 3r + 2 = (r - 1)(r - 2) = 0,$$

which has $r = 1$ as a root. So we would expect $Ae^x$ to become zero when substituted into the left-hand side of the differential equation.

The appropriate way to modify the trial solution in this case is to multiply $Ae^x$ by $x$. Thus, our new trial solution is

$$y_p = Axe^x.$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

The result of substituting the derivatives of this new candidate into the differential equation is

$$(Axe^x + 2Ae^x) - 3(Axe^x + Ae^x) + 2Axe^x = 5e^x$$

or

$$-Ae^x = 5e^x.$$

Thus, $A = -5$ gives our sought-after particular solution

$$y_p = -5xe^x.$$ ■

**EXAMPLE 4** Find a particular solution of $y'' - 6y' + 9y = e^{3x}$.

**Solution** The auxiliary equation for the complementary equation

$$r^2 - 6r + 9 = (r - 3)^2 = 0$$

has $r = 3$ as a repeated root. The appropriate choice for $y_p$ in this case is neither $Ae^{3x}$ nor $Axe^{3x}$ because the complementary solution contains both of those terms already. Thus, we choose a term containing the next higher power of $x$ as a factor. When we substitute

$$y_p = Ax^2e^{3x}$$

and its derivatives in the given differential equation, we get

$$(9Ax^2e^{3x} + 12Axe^{3x} + 2Ae^{3x}) - 6(3Ax^2e^{3x} + 2Axe^{3x}) + 9Ax^2e^{3x} = e^{3x}$$

or

$$2Ae^{3x} = e^{3x}.$$

Thus, $A = 1/2$, and the particular solution is

$$y_p = \frac{1}{2}x^2e^{3x}.$$ ■

When we wish to find a particular solution of Equation (1) and the function $G(x)$ is the sum of two or more terms, we choose a trial function for each term in $G(x)$ and add them.

**EXAMPLE 5** Find the general solution to $y'' - y' = 5e^x - \sin 2x$.

**Solution** We first check the auxiliary equation

$$r^2 - r = 0.$$

Its roots are $r = 1$ and $r = 0$. Therefore, the complementary solution to the associated homogeneous equation is

$$y_c = c_1e^x + c_2.$$

We now seek a particular solution $y_p$. That is, we seek a function that will produce $5e^x - \sin 2x$ when substituted into the left-hand side of the given differential equation. One part of $y_p$ is to produce $5e^x$, the other $-\sin 2x$.

Since any function of the form $c_1e^x$ is a solution of the associated homogeneous equation, we choose our trial solution $y_p$ to be the sum

$$y_p = Axe^x + B\cos 2x + C\sin 2x,$$

including $xe^x$ where we might otherwise have included only $e^x$. When the derivatives of $y_p$ are substituted into the differential equation, the resulting equation is

$$(Axe^x + 2Ae^x - 4B\cos 2x - 4C\sin 2x)$$
$$- (Axe^x + Ae^x - 2B\sin 2x + 2C\cos 2x) = 5e^x - \sin 2x$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

or

$$Ae^x - (4B + 2C)\cos 2x + (2B - 4C)\sin 2x = 5e^x - \sin 2x.$$

This equation will hold if

$$A = 5, \qquad 4B + 2C = 0, \qquad 2B - 4C = -1,$$

or $A = 5$, $B = -1/10$, and $C = 1/5$. Our particular solution is

$$y_p = 5xe^x - \frac{1}{10}\cos 2x + \frac{1}{5}\sin 2x.$$

The general solution to the differential equation is

$$y = y_c + y_p = c_1e^x + c_2 + 5xe^x - \frac{1}{10}\cos 2x + \frac{1}{5}\sin 2x. \quad \blacksquare$$

You may find the following table helpful in solving the problems at the end of this section.

**TABLE 16.1** The method of undetermined coefficients for selected equations of the form

$$ay'' + by' + cy = G(x).$$

| If $G(x)$ has a term that is a constant multiple of . . . | And if | Then include this expression in the trial function for $y_p$. |
|---|---|---|
| $e^{rx}$ | $r$ is not a root of the auxiliary equation | $Ae^{rx}$ |
| | $r$ is a single root of the auxiliary equation | $Axe^{rx}$ |
| | $r$ is a double root of the auxiliary equation | $Ax^2e^{rx}$ |
| $\sin kx$, $\cos kx$ | $k$ is not a root of the auxiliary equation | $B\cos kx + C\sin kx$ |
| $px^2 + qx + m$ | 0 is not a root of the auxiliary equation | $Dx^2 + Ex + F$ |
| | 0 is a single root of the auxiliary equation | $Dx^3 + Ex^2 + Fx$ |
| | 0 is a double root of the auxiliary equation | $Dx^4 + Ex^3 + Fx^2$ |

## The Method of Variation of Parameters

This is a general method for finding a particular solution of the nonhomogeneous equation (1) once the general solution of the associated homogeneous equation is known. The method consists of replacing the constants $c_1$ and $c_2$ in the complementary solution by functions $v_1 = v_1(x)$ and $v_2 = v_2(x)$ and requiring (in a way to be explained) that the

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

resulting expression satisfy the nonhomogeneous equation (1). There are two functions to be determined, and requiring that Equation (1) be satisfied is only one condition. As a second condition, we also require that

$$v_1'y_1 + v_2'y_2 = 0. \tag{4}$$

Then we have

$$\begin{aligned} y &= v_1y_1 + v_2y_2, \\ y' &= v_1y_1' + v_2y_2', \\ y'' &= v_1y_1'' + v_2y_2'' + v_1'y_1' + v_2'y_2'. \end{aligned}$$

If we substitute these expressions into the left-hand side of Equation (1), we obtain

$$v_1(ay_1'' + by_1' + cy_1) + v_2(ay_2'' + by_2' + cy_2) + a(v_1'y_1' + v_2'y_2') = G(x).$$

The first two parenthetical terms are zero since $y_1$ and $y_2$ are solutions of the associated homogeneous equation (2). So the nonhomogeneous equation (1) is satisfied if, in addition to Equation (4), we require that

$$a(v_1'y_1' + v_2'y_2') = G(x). \tag{5}$$

Equations (4) and (5) can be solved together as a pair

$$\begin{aligned} v_1'y_1 + v_2'y_2 &= 0, \\ v_1'y_1' + v_2'y_2' &= \frac{G(x)}{a} \end{aligned}$$

for the unknown functions $v_1'$ and $v_2'$. The usual procedure for solving this simple system is to use the *method of determinants* (also known as *Cramer's Rule*), which will be demonstrated in the examples to follow. Once the derivative functions $v_1'$ and $v_2'$ are known, the two functions $v_1 = v_1(x)$ and $v_2 = v_2(x)$ can be found by integration. Here is a summary of the method.

### Variation of Parameters Procedure

To use the method of variation of parameters to find a particular solution to the nonhomogeneous equation

$$ay'' + by' + cy = G(x),$$

we can work directly with the Equations (4) and (5). It is not necessary to rederive them. The steps are as follows.

1. Solve the associated homogeneous equation
$$ay'' + by' + cy = 0$$
to find the functions $y_1$ and $y_2$.
2. Solve the equations
$$\begin{aligned} v_1'y_1 + v_2'y_2 &= 0, \\ v_1'y_1' + v_2'y_2' &= \frac{G(x)}{a} \end{aligned}$$
simultaneously for the derivative functions $v_1'$ and $v_2'$.
3. Integrate $v_1'$ and $v_2'$ to find the functions $v_1 = v_1(x)$ and $v_2 = v_2(x)$.
4. Write down the particular solution to nonhomogeneous equation (1) as
$$y_p = v_1y_1 + v_2y_2.$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**EXAMPLE 6** Find the general solution to the equation

$$y'' + y = \tan x.$$

**Solution** The solution of the homogeneous equation

$$y'' + y = 0$$

is given by

$$y_c = c_1 \cos x + c_2 \sin x.$$

Since $y_1(x) = \cos x$ and $y_2(x) = \sin x$, the conditions to be satisfied in Equations (4) and (5) are

$$\begin{aligned} v_1' \cos x + v_2' \sin x &= 0, \\ -v_1' \sin x + v_2' \cos x &= \tan x. \qquad a = 1 \end{aligned}$$

Solution of this system gives

$$v_1' = \frac{\begin{vmatrix} 0 & \sin x \\ \tan x & \cos x \end{vmatrix}}{\begin{vmatrix} \cos x & \sin x \\ -\sin x & \cos x \end{vmatrix}} = \frac{-\tan x \sin x}{\cos^2 x + \sin^2 x} = \frac{-\sin^2 x}{\cos x}.$$

Likewise,

$$v_2' = \frac{\begin{vmatrix} \cos x & 0 \\ -\sin x & \tan x \end{vmatrix}}{\begin{vmatrix} \cos x & \sin x \\ -\sin x & \cos x \end{vmatrix}} = \sin x.$$

After integrating $v_1'$ and $v_2'$, we have

$$\begin{aligned} v_1(x) &= \int \frac{-\sin^2 x}{\cos x}\, dx \\ &= -\int (\sec x - \cos x)\, dx \\ &= -\ln|\sec x + \tan x| + \sin x, \end{aligned}$$

and

$$v_2(x) = \int \sin x\, dx = -\cos x.$$

Note that we have omitted the constants of integration in determining $v_1$ and $v_2$. They would merely be absorbed into the arbitrary constants in the complementary solution.

Substituting $v_1$ and $v_2$ into the expression for $y_p$ in Step 4 gives

$$\begin{aligned} y_p &= [-\ln|\sec x + \tan x| + \sin x] \cos x + (-\cos x) \sin x \\ &= (-\cos x) \ln|\sec x + \tan x|. \end{aligned}$$

The general solution is

$$y = c_1 \cos x + c_2 \sin x - (\cos x) \ln|\sec x + \tan x|. \quad \blacksquare$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**EXAMPLE 7** Solve the nonhomogeneous equation

$$y'' + y' - 2y = xe^x.$$

**Solution** The auxiliary equation is

$$r^2 + r - 2 = (r + 2)(r - 1) = 0$$

giving the complementary solution

$$y_c = c_1e^{-2x} + c_2e^x.$$

The conditions to be satisfied in Equations (4) and (5) are

$$\begin{aligned} v_1'e^{-2x} + v_2'e^x &= 0, \\ -2v_1'e^{-2x} + v_2'e^x &= xe^x. \end{aligned} \qquad a = 1$$

Solving the above system for $v_1'$ and $v_2'$ gives

$$v_1' = \frac{\begin{vmatrix} 0 & e^x \\ xe^x & e^x \end{vmatrix}}{\begin{vmatrix} e^{-2x} & e^x \\ -2e^{-2x} & e^x \end{vmatrix}} = \frac{-xe^{2x}}{3e^{-x}} = -\frac{1}{3}xe^{3x}.$$

Likewise,

$$v_2' = \frac{\begin{vmatrix} e^{-2x} & 0 \\ -2e^{-2x} & xe^x \end{vmatrix}}{3e^{-x}} = \frac{xe^{-x}}{3e^{-x}} = \frac{x}{3}.$$

Integrating to obtain the parameter functions, we have

$$\begin{aligned} v_1(x) &= \int -\frac{1}{3}xe^{3x}\,dx \\ &= -\frac{1}{3}\left(\frac{xe^{3x}}{3} - \int \frac{e^{3x}}{3}\,dx\right) \\ &= \frac{1}{27}(1 - 3x)e^{3x}, \end{aligned}$$

and

$$v_2(x) = \int \frac{x}{3}\,dx = \frac{x^2}{6}.$$

Therefore,

$$\begin{aligned} y_p &= \left[\frac{(1 - 3x)e^{3x}}{27}\right]e^{-2x} + \left(\frac{x^2}{6}\right)e^x \\ &= \frac{1}{27}e^x - \frac{1}{9}xe^x + \frac{1}{6}x^2e^x. \end{aligned}$$

The general solution to the differential equation is

$$y = c_1e^{-2x} + c_2e^x - \frac{1}{9}xe^x + \frac{1}{6}x^2e^x,$$

where the term $(1/27)e^x$ in $y_p$ has been absorbed into the term $c_2e^x$ in the complementary solution. ■

## EXERCISES 16.2

Solve the equations in Exercises 1–16 by the method of undetermined coefficients.

**1.** $y'' - 3y' - 10y = -3$

**2.** $y'' - 3y' - 10y = 2x - 3$

**3.** $y'' - y' = \sin x$

**4.** $y'' + 2y' + y = x^2$

**5.** $y'' + y = \cos 3x$

**6.** $y'' + y = e^{2x}$

**7.** $y'' - y' - 2y = 20 \cos x$

**8.** $y'' + y = 2x + 3e^x$

**9.** $y'' - y = e^x + x^2$

**10.** $y'' + 2y' + y = 6 \sin 2x$

**11.** $y'' - y' - 6y = e^{-x} - 7 \cos x$

**12.** $y'' + 3y' + 2y = e^{-x} + e^{-2x} - x$

**13.** $\dfrac{d^2y}{dx^2} + 5\dfrac{dy}{dx} = 15x^2$

**14.** $\dfrac{d^2y}{dx^2} - \dfrac{dy}{dx} = -8x + 3$

**15.** $\dfrac{d^2y}{dx^2} - 3\dfrac{dy}{dx} = e^{3x} - 12x$

**16.** $\dfrac{d^2y}{dx^2} + 7\dfrac{dy}{dx} = 42x^2 + 5x + 1$

Solve the equations in Exercises 17–28 by variation of parameters.

**17.** $y'' + y' = x$

**18.** $y'' + y = \tan x, \quad -\dfrac{\pi}{2} < x < \dfrac{\pi}{2}$

**19.** $y'' + y = \sin x$

**20.** $y'' + 2y' + y = e^x$

**21.** $y'' + 2y' + y = e^{-x}$

**22.** $y'' - y = x$

**23.** $y'' - y = e^x$

**24.** $y'' - y = \sin x$

**25.** $y'' + 4y' + 5y = 10$

**26.** $y'' - y' = 2^x$

**27.** $\dfrac{d^2y}{dx^2} + y = \sec x, \quad -\dfrac{\pi}{2} < x < \dfrac{\pi}{2}$

**28.** $\dfrac{d^2y}{dx^2} - \dfrac{dy}{dx} = e^x \cos x, \quad x > 0$

In each of Exercises 29–32, the given differential equation has a particular solution $y_p$ of the form given. Determine the coefficients in $y_p$. Then solve the differential equation.

**29.** $y'' - 5y' = xe^{5x}, \quad y_p = Ax^2e^{5x} + Bxe^{5x}$

**30.** $y'' - y' = \cos x + \sin x, \quad y_p = A \cos x + B \sin x$

**31.** $y'' + y = 2 \cos x + \sin x, \quad y_p = Ax \cos x + Bx \sin x$

**32.** $y'' + y' - 2y = xe^x, \quad y_p = Ax^2e^x + Bxe^x$

In Exercises 33–36, solve the given differential equations **(a)** by variation of parameters, and **(b)** by the method of undetermined coefficients.

**33.** $\dfrac{d^2y}{dx^2} - \dfrac{dy}{dx} = e^x + e^{-x}$

**34.** $\dfrac{d^2y}{dx^2} - 4\dfrac{dy}{dx} + 4y = 2e^{2x}$

**35.** $\dfrac{d^2y}{dx^2} - 4\dfrac{dy}{dx} - 5y = e^x + 4$

**36.** $\dfrac{d^2y}{dx^2} - 9\dfrac{dy}{dx} = 9e^{9x}$

Solve the differential equations in Exercises 37–46. Some of the equations can be solved by the method of undetermined coefficients, but others cannot.

**37.** $y'' + y = \cot x, \quad 0 < x < \pi$

**38.** $y'' + y = \csc x, \quad 0 < x < \pi$

**39.** $y'' - 8y' = e^{8x}$

**40.** $y'' + 4y = \sin x$

**41.** $y'' - y' = x^3$

**42.** $y'' + 4y' + 5y = x + 2$

**43.** $y'' + 2y' = x^2 - e^x$

**44.** $y'' + 9y = 9x - \cos x$

**45.** $y'' + y = \sec x \tan x, \quad -\dfrac{\pi}{2} < x < \dfrac{\pi}{2}$

**46.** $y'' - 3y' + 2y = e^x - e^{2x}$

The method of undetermined coefficients can sometimes be used to solve first-order ordinary differential equations. Use the method to solve the equations in Exercises 47–50.

**47.** $y' - 3y = e^x$

**48.** $y' + 4y = x$

**49.** $y' - 3y = 5e^{3x}$

**50.** $y' + y = \sin x$

Solve the differential equations in Exercises 51 and 52 subject to the given initial conditions.

**51.** $\dfrac{d^2y}{dx^2} + y = \sec^2 x, \quad -\dfrac{\pi}{2} < x < \dfrac{\pi}{2}; \quad y(0) = y'(0) = 1$

**52.** $\dfrac{d^2y}{dx^2} + y = e^{2x}; \quad y(0) = 0, \; y'(0) = \dfrac{2}{5}$

In Exercises 53–58, verify that the given function is a particular solution to the specified nonhomogeneous equation. Find the general solution and evaluate its arbitrary constants to find the unique solution satisfying the equation and the given initial conditions.

**53.** $y'' + y' = x, \quad y_p = \dfrac{x^2}{2} - x, \quad y(0) = 0, \; y'(0) = 0$

**54.** $y'' + y = x, \quad y_p = 2 \sin x + x, \quad y(0) = 0, \; y'(0) = 0$

**55.** $\dfrac{1}{2}y'' + y' + y = 4e^x(\cos x - \sin x)$,
$y_p = 2e^x \cos x, \quad y(0) = 0, \; y'(0) = 1$

**56.** $y'' - y' - 2y = 1 - 2x, \quad y_p = x - 1, \quad y(0) = 0, \; y'(0) = 1$

**57.** $y'' - 2y' + y = 2e^x, \quad y_p = x^2e^x, \quad y(0) = 1, \; y'(0) = 0$

**58.** $y'' - 2y' + y = x^{-1}e^x, \; x > 0$,
$y_p = xe^x \ln x, \quad y(1) = e, \; y'(1) = 0$

In Exercises 59 and 60, two linearly independent solutions $y_1$ and $y_2$ are given to the associated homogeneous equation of the variable-coefficient nonhomogeneous equation. Use the method of variation of parameters to find a particular solution to the nonhomogeneous equation. Assume $x > 0$ in each exercise.

**59.** $x^2y'' + 2xy' - 2y = x^2, \quad y_1 = x^{-2}, \; y_2 = x$

**60.** $x^2y'' + xy' - y = x, \quad y_1 = x^{-1}, \; y_2 = x$

# 16.3 Applications

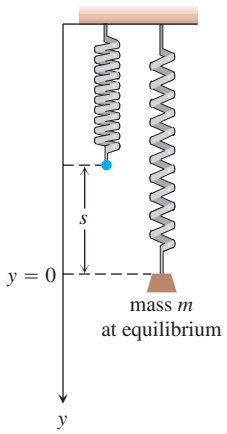

**FIGURE 16.2** Mass $m$ stretches a spring by length $s$ to the equilibrium position at $y = 0$.

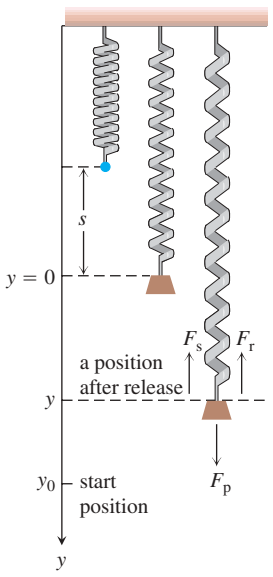

**FIGURE 16.3** The propulsion force (weight) $F_p$ pulls the mass downward, but the spring restoring force $F_s$ and frictional force $F_r$ pull the mass upward. The motion starts at $y = y_0$ with the mass vibrating up and down.

In this section we apply second-order differential equations to the study of vibrating springs and electric circuits.

## Vibrations

A spring has its upper end fastened to a rigid support, as shown in Figure 16.2. An object of mass $m$ is suspended from the spring and stretches it a length $s$ when the spring comes to rest in an equilibrium position. According to Hooke's Law (Section 6.6), the tension force in the spring is $ks$, where $k$ is the spring constant. The force due to gravity pulling down on the spring is $mg$, and equilibrium requires that

$$ks = mg. \tag{1}$$

Suppose that the object is pulled down an additional amount $y_0$ beyond the equilibrium position and then released. We want to study the object's motion, that is, the vertical position of its center of mass at any future time.

Let $y$, with positive direction downward, denote the displacement position of the object away from the equilibrium position $y = 0$ at any time $t$ after the motion has started. Then the forces acting on the object are (see Figure 16.3)

$F_p = mg$, the propulsion force due to gravity,

$F_s = k(s + y)$, the restoring force of the spring's tension,

$F_r = \delta \dfrac{dy}{dt}$, a frictional force assumed proportional to velocity.

The frictional force tends to retard the motion of the object. The resultant of these forces is $F = F_p - F_s - F_r$, and by Newton's second law $F = ma$, we must then have

$$m\frac{d^2y}{dt^2} = mg - ks - ky - \delta\frac{dy}{dt}.$$

By Equation (1), $mg - ks = 0$, so this last equation becomes

$$m\frac{d^2y}{dt^2} + \delta\frac{dy}{dt} + ky = 0, \tag{2}$$

subject to the initial conditions $y(0) = y_0$ and $y'(0) = 0$. (Here we use the prime notation to denote differentiation with respect to time $t$.)

You might expect that the motion predicted by Equation (2) will be oscillatory about the equilibrium position $y = 0$ and eventually damp to zero because of the retarding frictional force. This is indeed the case, and we will show how the constants $m$, $\delta$, and $k$ determine the nature of the damping. You will also see that if there is no friction (so $\delta = 0$), then the object will simply oscillate indefinitely.

## Simple Harmonic Motion

Suppose first that there is no retarding frictional force. Then $\delta = 0$ and there is no damping. If we substitute $\omega = \sqrt{k/m}$ to simplify our calculations, then the second-order equation (2) becomes

$$y'' + \omega^2 y = 0, \quad \text{with} \quad y(0) = y_0 \quad \text{and} \quad y'(0) = 0.$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

The auxiliary equation is

$$r^2 + \omega^2 = 0,$$

having the imaginary roots $r = \pm\omega i$. The general solution to the differential equation in (2) is

$$y = c_1 \cos \omega t + c_2 \sin \omega t. \tag{3}$$

To fit the initial conditions, we compute

$$y' = -c_1\omega \sin \omega t + c_2\omega \cos \omega t$$

and then substitute the conditions. This yields $c_1 = y_0$ and $c_2 = 0$. The particular solution

$$y = y_0 \cos \omega t \tag{4}$$

describes the motion of the object. Equation (4) represents **simple harmonic motion** of amplitude $y_0$ and period $T = 2\pi/\omega$.

The general solution given by Equation (3) can be combined into a single term by using the trigonometric identity

$$\sin(\omega t + \phi) = \cos \omega t \sin \phi + \sin \omega t \cos \phi.$$

To apply the identity, we take (see Figure 16.4)

$$c_1 = C \sin \phi \qquad \text{and} \qquad c_2 = C \cos \phi,$$

where

$$C = \sqrt{c_1^2 + c_2^2} \qquad \text{and} \qquad \phi = \tan^{-1} \frac{c_1}{c_2}.$$

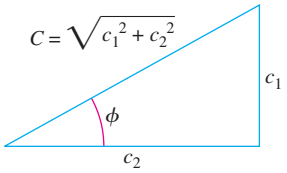

**FIGURE 16.4** $c_1 = C \sin \phi$ and $c_2 = C \cos \phi$.

Then the general solution in Equation (3) can be written in the alternative form

$$y = C \sin(\omega t + \phi). \tag{5}$$

Here $C$ and $\phi$ may be taken as two new arbitrary constants, replacing the two constants $c_1$ and $c_2$. Equation (5) represents simple harmonic motion of amplitude $C$ and period $T = 2\pi/\omega$. The angle $\omega t + \phi$ is called the **phase angle**, and $\phi$ may be interpreted as its initial value. A graph of the simple harmonic motion represented by Equation (5) is given in Figure 16.5.

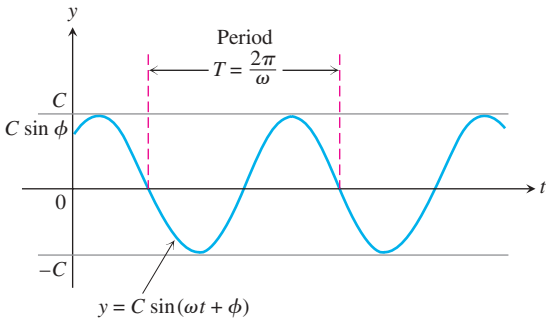

**FIGURE 16.5** Simple harmonic motion of amplitude $C$ and period $T$ with initial phase angle $\phi$ (Equation 5).

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

## Damped Motion

Assume now that there is friction in the spring system, so $\delta \neq 0$. If we substitute $\omega = \sqrt{k/m}$ and $2b = \delta/m$, then the differential equation (2) is

$$y'' + 2by' + \omega^2 y = 0. \tag{6}$$

The auxiliary equation is

$$r^2 + 2br + \omega^2 = 0,$$

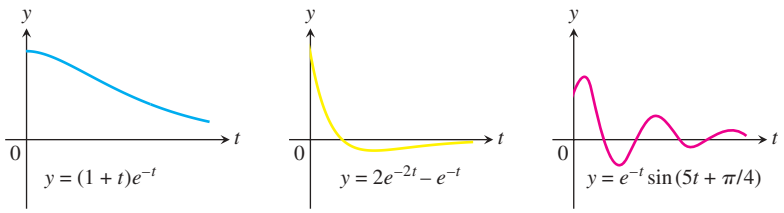
with roots $r = -b \pm \sqrt{b^2 - \omega^2}$. Three cases now present themselves, depending upon the relative sizes of $b$ and $\omega$.

**Case 1: $b = \omega$.** The double root of the auxiliary equation is real and equals $r = \omega$. The general solution to Equation (6) is

$$y = (c_1 + c_2 t)e^{-\omega t}.$$

This situation of motion is called **critical damping** and is not oscillatory. Figure 16.6a shows an example of this kind of damped motion.

**Case 2: $b > \omega$.** The roots of the auxiliary equation are real and unequal, given by $r_1 = -b + \sqrt{b^2 - \omega^2}$ and $r_2 = -b - \sqrt{b^2 - \omega^2}$. The general solution to Equation (6) is given by



$$y = c_1 e^{\left(-b+\sqrt{b^2-\omega^2}\right)t} + c_2 e^{\left(-b-\sqrt{b^2-\omega^2}\right)t}.$$

Here again the motion is not oscillatory and both $r_1$ and $r_2$ are negative. Thus $y$ approaches zero as time goes on. This motion is referred to as **overdamping** (see Figure 16.6b).

**Case 3: $b < \omega$.** The roots to the auxiliary equation are complex and given by $r = -b \pm i\sqrt{\omega^2 - b^2}$. The general solution to Equation (6) is given by

$$y = e^{-bt}\left(c_1 \cos\sqrt{\omega^2 - b^2}\, t + c_2 \sin\sqrt{\omega^2 - b^2}\, t\right).$$

This situation, called **underdamping**, represents damped oscillatory motion. It is analogous to simple harmonic motion of period $T = 2\pi/\sqrt{\omega^2 - b^2}$ except that the amplitude is not constant but damped by the factor $e^{-bt}$. Therefore, the motion tends to zero as $t$ increases, so the vibrations tend to die out as time goes on. Notice that the period $T = 2\pi/\sqrt{\omega^2 - b^2}$ is larger than the period $T_0 = 2\pi/\omega$ in the friction-free system. Moreover, the larger the value of $b = \delta/2m$ in the exponential damping factor, the more quickly the vibrations tend to become unnoticeable. A curve illustrating underdamped motion is shown in Figure 16.6c.

(a) Critical damping (b) Overdamping (c) Underdamping

**FIGURE 16.6** Three examples of damped vibratory motion for a spring system with friction, so $\delta \neq 0$.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

An external force $F(t)$ can also be added to the spring system modeled by Equation (2). The forcing function may represent an external disturbance on the system. For instance, if the equation models an automobile suspension system, the forcing function might represent periodic bumps or potholes in the road affecting the performance of the suspension system; or it might represent the effects of winds when modeling the vertical motion of a suspension bridge. Inclusion of a forcing function results in the second-order nonhomogeneous equation

$$m\frac{d^2y}{dt^2} + \delta\frac{dy}{dt} + ky = F(t). \tag{7}$$

We leave the study of such spring systems to a more advanced course.

## Electric Circuits

The basic quantity in electricity is the **charge** $q$ (analogous to the idea of mass). In an electric field we use the flow of charge, or **current** $I = dq/dt$, as we might use velocity in a gravitational field. There are many similarities between motion in a gravitational field and the flow of electrons (the carriers of charge) in an electric field.

Consider the electric circuit shown in Figure 16.7. It consists of four components: voltage source, resistor, inductor, and capacitor. Think of electrical flow as being like a fluid flow, where the voltage source is the pump and the resistor, inductor, and capacitor tend to block the flow. A battery or generator is an example of a source, producing a voltage that causes the current to flow through the circuit when the switch is closed. An electric light bulb or appliance would provide resistance. The inductance is due to a magnetic field that opposes any change in the current as it flows through a coil. The capacitance is normally created by two metal plates that alternate charges and thus reverse the current flow. The following symbols specify the quantities relevant to the circuit:

- $q$: charge at a cross section of a conductor measured in **coulombs** (abbreviated c);
- $I$: current or rate of change of charge $dq/dt$ (flow of electrons) at a cross section of a conductor measured in **amperes** (abbreviated A);
- $E$: electric (potential) source measured in **volts** (abbreviated V);
- $V$: difference in potential between two points along the conductor measured in **volts** (V).

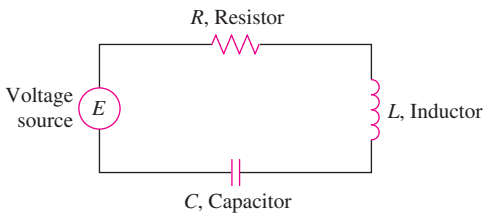


**FIGURE 16.7** An electric circuit.

Ohm observed that the current $I$ flowing through a resistor, caused by a potential difference across it, is (approximately) proportional to the potential difference (voltage drop). He named his constant of proportionality $1/R$ and called $R$ the **resistance**. So *Ohm's law* is

$$I = \frac{1}{R}V.$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

Similarly, it is known from physics that the voltage drops across an inductor and a capacitor are

$$L\frac{dI}{dt} \quad \text{and} \quad \frac{q}{C},$$

where $L$ is the **inductance** and $C$ is the **capacitance** (with $q$ the charge on the capacitor).

The German physicist Gustav R. Kirchhoff (1824–1887) formulated the law that the sum of the voltage drops in a closed circuit is equal to the supplied voltage $E(t)$. Symbolically, this says that

$$RI + L\frac{dI}{dt} + \frac{q}{C} = E(t).$$

Since $I = dq/dt$, Kirchhoff's law becomes

$$L\frac{d^2q}{dt^2} + R\frac{dq}{dt} + \frac{1}{C}q = E(t). \tag{8}$$

The second-order differential equation (8), which models an electric circuit, has exactly the same form as Equation (7) modeling vibratory motion. Both models can be solved using the methods developed in Section 16.2.

## Summary

The following chart summarizes our analogies for the physics of motion of an object in a spring system versus the flow of charged particles in an electrical circuit.

### Linear Second-Order Constant-Coefficient Models

| Mechanical System | | Electrical System | |
|---|---|---|---|
| $my'' + \delta y' + ky = F(t)$ | | $Lq'' + Rq' + \frac{1}{C}q = E(t)$ | |
| $y$: | displacement | $q$: | charge |
| $y'$: | velocity | $q'$: | current |
| $y''$: | acceleration | $q''$: | change in current |
| $m$: | mass | $L$: | inductance |
| $\delta$: | damping constant | $R$: | resistance |
| $k$: | spring constant | $1/C$: | where $C$ is the capacitance |
| $F(t)$: | forcing function | $E(t)$: | voltage source |

# EXERCISES 16.3

**1.** A 16-lb weight is attached to the lower end of a coil spring suspended from the ceiling and having a spring constant of 1 lb/ft. The resistance in the spring-mass system is numerically equal to the instantaneous velocity. At $t = 0$ the weight is set in motion from a position 2 ft below its equilibrium position by giving it a downward velocity of 2 ft/sec. Write an initial value problem that models the given situation.

**2.** An 8-lb weight stretches a spring 4 ft. The spring–mass system resides in a medium offering a resistance to the motion that is numerically equal to 1.5 times the instantaneous velocity. If the weight is released at a position 2 ft above its equilibrium position with a downward velocity of 3 ft/sec, write an initial value problem modeling the given situation.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**3.** A 20-lb weight is hung on an 18-in. spring and stretches it 6 in. The weight is pulled down 5 in. and 5 lb are added to the weight. If the weight is now released with a downward velocity of $v_0$ in./sec, write an initial value problem modeling the vertical displacement.

**4.** A 10-lb weight is suspended by a spring that is stretched 2 in. by the weight. Assume a resistance whose magnitude is $20/\sqrt{g}$ lb times the instantaneous velocity $v$ in feet per second. If the weight is pulled down 3 in. below its equilibrium position and released, formulate an initial value problem modeling the behavior of the spring–mass system.

**5.** An (open) electrical circuit consists of an inductor, a resistor, and a capacitor. There is an initial charge of 2 coulombs on the capacitor. At the instant the circuit is closed, a current of 3 amperes is present and a voltage of $E(t) = 20 \cos t$ is applied. In this circuit the voltage drop across the resistor is 4 times the instantaneous change in the charge, the voltage drop across the capacitor is 10 times the charge, and the voltage drop across the inductor is 2 times the instantaneous change in the current. Write an initial value problem to model the circuit.

**6.** An inductor of 2 henrys is connected in series with a resistor of 12 ohms, a capacitor of 1/16 farad, and a 300 volt battery. Initially, the charge on the capacitor is zero and the current is zero. Formulate an initial value problem modeling this electrical circuit.

Mechanical units in the British and metric systems may be helpful in doing the following problems.

| Unit | British System | MKS System |
|---|---|---|
| Distance | Feet (ft) | Meters (m) |
| Mass | Slugs | Kilograms (kg) |
| Time | Seconds (sec) | Seconds (sec) |
| Force | Pounds (lb) | Newtons (N) |
| $g$(earth) | 32 ft/sec$^2$ | 9.81 m/sec$^2$ |

**7.** A 16-lb weight is attached to the lower end of a coil spring suspended from the ceiling and having a spring constant of 1 lb/ft. The resistance in the spring–mass system is numerically equal to the instantaneous velocity. At $t = 0$ the weight is set in motion from a position 2 ft below its equilibrium position by giving it a downward velocity of 2 ft/sec. At the end of $\pi$ sec, determine whether the mass is above or below the equilibrium position and by what distance.

**8.** An 8-lb weight stretches a spring 4 ft. The spring–mass system resides in a medium offering a resistance to the motion equal to 1.5 times the instantaneous velocity. If the weight is released at a position 2 ft above its equilibrium position with a downward velocity of 3 ft/sec, find its position relative to the equilibrium position 2 sec later.

**9.** A 20-lb weight is hung on an 18-in. spring stretching it 6 in. The weight is pulled down 5 in. and 5 lb are added to the weight. If the weight is now released with a downward velocity of $v_0$ in./sec, find the position of mass relative to the equilibrium in terms of $v_0$ and valid for any time $t \geq 0$.

**10.** A mass of 1 slug is attached to a spring whose constant is 25/4 lb/ft. Initially the mass is released 1 ft above the equilibrium position with a downward velocity of 3 ft/sec, and the subsequent motion takes place in a medium that offers a damping force numerically equal to 3 times the instantaneous velocity. An external force $f(t)$ is driving the system, but assume that initially $f(t) \equiv 0$. Formulate and solve an initial value problem that models the given system. Interpret your results.

**11.** A 10-lb weight is suspended by a spring that is stretched 2 in. by the weight. Assume a resistance whose magnitude is $40/\sqrt{g}$ lb times the instantaneous velocity in feet per second. If the weight is pulled down 3 in. below its equilibrium position and released, find the time required to reach the equilibrium position for the first time.

**12.** A weight stretches a spring 6 in. It is set in motion at a point 2 in. below its equilibrium position with a downward velocity of 2 in./sec.

**a.** When does the weight return to its starting position?

**b.** When does it reach its highest point?

**c.** Show that the maximum velocity is $2\sqrt{2g + 1}$ in./sec.

**13.** A weight of 10 lb stretches a spring 10 in. The weight is drawn down 2 in. below its equilibrium position and given an initial velocity of 4 in./sec. An identical spring has a different weight attached to it. This second weight is drawn down from its equilibrium position a distance equal to the amplitude of the first motion and then given an initial velocity of 2 ft/sec. If the amplitude of the second motion is twice that of the first, what weight is attached to the second spring?

**14.** A weight stretches one spring 3 in. and a second weight stretches another spring 9 in. If both weights are simultaneously pulled down 1 in. below their respective equilibrium positions and then released, find the first time after $t = 0$ when their velocities are equal.

**15.** A weight of 16 lb stretches a spring 4 ft. The weight is pulled down 5 ft below the equilibrium position and then released. What initial velocity $v_0$ given to the weight would have the effect of doubling the amplitude of the vibration?

**16.** A mass weighing 8 lb stretches a spring 3 in. The spring–mass system resides in a medium with a damping constant of 2 lb-sec/ft. If the mass is released from its equilibrium position with a velocity of 4 in./sec in the downward direction, find the time required for the mass to return to its equilibrium position for the first time.

**17.** A weight suspended from a spring executes damped vibrations with a period of 2 sec. If the damping factor decreases by 90% in 10 sec, find the acceleration of the weight when it is 3 in. below its equilibrium position and is moving upward with a speed of 2 ft/sec.

**18.** A 10-lb weight stretches a spring 2 ft. If the weight is pulled down 6 in. below its equilibrium position and released, find the highest point reached by the weight. Assume the spring–mass system resides in a medium offering a resistance of $10/\sqrt{g}$ lb times the instantaneous velocity in feet per second.

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**19.** An *LRC* circuit is set up with an inductance of 1/5 henry, a resistance of 1 ohm, and a capacitance of 5/6 farad. Assuming the initial charge is 2 coulombs and the initial current is 4 amperes, find the solution function describing the charge on the capacitor at any time. What is the charge on the capacitor after a long period of time?

**20.** An (open) electrical circuit consists of an inductor, a resistor, and a capacitor. There is an initial charge of 2 coulombs on the capacitor. At the instant the circuit is closed, a current of 3 amperes is present but no external voltage is being applied. In this circuit the voltage drops at three points are numerically related as follows: across the capacitor, 10 times the charge; across the resistor, 4 times the instantaneous change in the charge; and across the inductor, 2 times the instantaneous change in the current. Find the charge on the capacitor as a function of time.

**21.** A 16-lb weight stretches a spring 4 ft. This spring–mass system is in a medium with a damping constant of 4.5 lb-sec/ft, and an external force given by $f(t) = 4 + e^{-2t}$ (in pounds) is being applied. What is the solution function describing the position of the mass at any time if the mass is released from 2 ft below the equilibrium position with an initial velocity of 4 ft/sec downward?

**22.** A 10-kg mass is attached to a spring having a spring constant of 140 N/m. The mass is started in motion from the equilibrium position with an initial velocity of 1 m/sec in the upward direction and with an applied external force given by $f(t) = 5 \sin t$ (in newtons). The mass is in a viscous medium with a coefficient of resistance equal to 90 N-sec/m. Formulate an initial value problem that models the given system; solve the model and interpret the results.

**23.** A 2-kg mass is attached to the lower end of a coil spring suspended from the ceiling. The mass comes to rest in its equilibrium position thereby stretching the spring 1.96 m. The mass is in a viscous medium that offers a resistance in newtons numerically equal to 4 times the instantaneous velocity measured in meters per second. The mass is then pulled down 2 m below its equilibrium position and released with a downward velocity of 3 m/sec. At this same instant an external force given by $f(t) = 20 \cos t$ (in newtons) is applied to the system. At the end of $\pi$ sec determine if the mass is above or below its equilibrium position and by how much.

**24.** An 8-lb weight stretches a spring 4 ft. The spring–mass system resides in a medium offering a resistance to the motion equal to 1.5 times the instantaneous velocity, and an external force given by $f(t) = 6 + e^{-t}$ (in pounds) is being applied. If the weight is released at a position 2 ft above its equilibrium position with downward velocity of 3 ft/sec, find its position relative to the equilibrium after 2 sec have elapsed.

**25.** Suppose $L = 10$ henrys, $R = 10$ ohms, $C = 1/500$ farads, $E = 100$ volts, $q(0) = 10$ coulombs, and $q'(0) = i(0) = 0$. Formulate and solve an initial value problem that models the given *LRC* circuit. Interpret your results.

**26.** A series circuit consisting of an inductor, a resistor, and a capacitor is open. There is an initial charge of 2 coulombs on the capacitor, and 3 amperes of current is present in the circuit at the instant the circuit is closed. A voltage given by $E(t) = 20 \cos t$ is applied. In this circuit the voltage drops are numerically equal to the following: across the resistor to 4 times the instantaneous change in the charge, across the capacitor to 10 times the charge, and across the inductor to 2 times the instantaneous change in the current. Find the charge on the capacitor as a function of time. Determine the charge on the capacitor and the current at time $t = 10$.

## 16.4 Euler Equations

In Section 16.1 we introduced the second-order linear homogeneous differential equation

$$P(x)y''(x) + Q(x)y'(x) + R(x)y(x) = 0$$

and showed how to solve this equation when the coefficients $P$, $Q$, and $R$ are constants. If the coefficients are not constant, we cannot generally solve this differential equation in terms of elementary functions we have studied in calculus. In this section you will learn how to solve the equation when the coefficients have the special forms

$$P(x) = ax^2, \qquad Q(x) = bx, \qquad \text{and} \qquad R(x) = c,$$

where $a$, $b$, and $c$ are constants. These special types of equations are called **Euler equations**, in honor of Leonhard Euler who studied them and showed how to solve them. Such equations arise in the study of mechanical vibrations.

### The General Solution of Euler Equations

Consider the Euler equation

$$ax^2y'' + bxy' + cy = 0, \quad x > 0. \tag{1}$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

To solve Equation (1), we first make the change of variables

$$z = \ln x \qquad \text{and} \qquad y(x) = Y(z).$$

We next use the chain rule to find the derivatives $y'(x)$ and $y''(x)$:

$$y'(x) = \frac{d}{dx}Y(z) = \frac{d}{dz}Y(z)\frac{dz}{dx} = Y'(z)\frac{1}{x}$$

and

$$y''(x) = \frac{d}{dx}y'(x) = \frac{d}{dx}Y'(z)\frac{1}{x} = -\frac{1}{x^2}Y'(z) + \frac{1}{x}Y''(z)\frac{dz}{dx} = -\frac{1}{x^2}Y'(z) + \frac{1}{x^2}Y''(z).$$

Substituting these two derivatives into the left-hand side of Equation (1), we find

$$ax^2y'' + bxy' + cy = ax^2\left(-\frac{1}{x^2}Y'(z) + \frac{1}{x^2}Y''(z)\right) + bx\left(\frac{1}{x}Y'(z)\right) + cY(z)$$

$$= aY''(z) + (b - a)Y'(z) + cY(z).$$

Therefore, the substitutions give us the second-order linear differential equation with constant coefficients

$$aY''(z) + (b - a)Y'(z) + cY(z) = 0. \tag{2}$$

We can solve Equation (2) using the method of Section 16.1. That is, we find the roots to the associated auxiliary equation

$$ar^2 + (b - a)r + c = 0 \tag{3}$$

to find the general solution for $Y(z)$. After finding $Y(z)$, we can determine $y(x)$ from the substitution $z = \ln x$.

**EXAMPLE 1** Find the general solution of the equation $x^2y'' + 2xy' - 2y = 0$.

**Solution** This is an Euler equation with $a = 1$, $b = 2$, and $c = -2$. The auxiliary equation (3) for $Y(z)$ is

$$r^2 + (2 - 1)r - 2 = (r - 1)(r + 2) = 0,$$

with roots $r = -2$ and $r = 1$. The solution for $Y(z)$ is given by

$$Y(z) = c_1e^{-2z} + c_2e^{z}.$$

Substituting $z = \ln x$ gives the general solution for $y(x)$:

$$y(x) = c_1e^{-2\ln x} + c_2e^{\ln x} = c_1x^{-2} + c_2x$$ ■

**EXAMPLE 2** Solve the Euler equation $x^2y'' - 5xy' + 9y = 0$.

**Solution** Since $a = 1$, $b = -5$, and $c = 9$, the auxiliary equation (3) for $Y(z)$ is

$$r^2 + (-5 - 1)r + 9 = (r - 3)^2 = 0.$$

The auxiliary equation has the double root $r = 3$ giving

$$Y(z) = c_1e^{3z} + c_2ze^{3z}.$$

Substituting $z = \ln x$ into this expression gives the general solution

$$y(x) = c_1e^{3\ln x} + c_2\ln x\, e^{3\ln x} = c_1x^3 + c_2x^3\ln x$$ ■

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**EXAMPLE 3** Find the particular solution to $x^2y'' - 3xy' + 68y = 0$ that satisfies the initial conditions $y(1) = 0$ and $y'(1) = 1$.

**Solution** Here $a = 1$, $b = -3$, and $c = 68$ substituted into the auxiliary equation (3) gives

$$r^2 - 4r + 68 = 0.$$

The roots are $r = 2 + 8i$ and $r = 2 - 8i$ giving the solution

$$Y(z) = e^{2z}(c_1 \cos 8z + c_2 \sin 8z).$$

Substituting $z = \ln x$ into this expression gives

$$y(x) = e^{2\ln x}\big(c_1 \cos(8 \ln x) + c_2 \sin(8 \ln x)\big).$$

From the initial condition $y(1) = 0$, we see that $c_1 = 0$ and

$$y(x) = c_2 x^2 \sin(8 \ln x).$$

To fit the second initial condition, we need the derivative

$$y'(x) = c_2\big(8x \cos(8 \ln x) + 2x \sin(8 \ln x)\big).$$

Since $y'(1) = 1$, we immediately obtain $c_2 = 1/8$. Therefore, the particular solution satisfying both initial conditions is

$$y(x) = \frac{1}{8}x^2 \sin(8 \ln x).$$

Since $-1 \le \sin(8 \ln x) \le 1$, the solution satisfies

$$-\frac{x^2}{8} \le y(x) \le \frac{x^2}{8}.$$

A graph of the solution is shown in Figure 16.8. ■

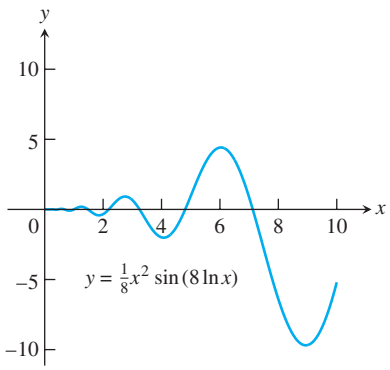

**FIGURE 16.8** Graph of the solution to Example 3.

## 16.4 EXERCISES

In Exercises 1–24, find the general solution to the given Euler equation. Assume $x > 0$ throughout.

**1.** $x^2y'' + 2xy' - 2y = 0$
**2.** $x^2y'' + xy' - 4y = 0$
**3.** $x^2y'' - 6y = 0$
**4.** $x^2y'' + xy' - y = 0$
**5.** $x^2y'' - 5xy' + 8y = 0$
**6.** $2x^2y'' + 7xy' + 2y = 0$
**7.** $3x^2y'' + 4xy' = 0$
**8.** $x^2y'' + 6xy' + 4y = 0$
**9.** $x^2y'' - xy' + y = 0$
**10.** $x^2y'' - xy' + 2y = 0$
**11.** $x^2y'' - xy' + 5y = 0$
**12.** $x^2y'' + 7xy' + 13y = 0$
**13.** $x^2y'' + 3xy' + 10y = 0$
**14.** $x^2y'' - 5xy' + 10y = 0$
**15.** $4x^2y'' + 8xy' + 5y = 0$
**16.** $4x^2y'' - 4xy' + 5y = 0$
**17.** $x^2y'' + 3xy' + y = 0$
**18.** $x^2y'' - 3xy' + 9y = 0$
**19.** $x^2y'' + xy' = 0$
**20.** $4x^2y'' + y = 0$
**21.** $9x^2y'' + 15xy' + y = 0$
**22.** $16x^2y'' - 8xy' + 9y = 0$
**23.** $16x^2y'' + 56xy' + 25y = 0$
**24.** $4x^2y'' - 16xy' + 25y = 0$

In Exercises 25–30, solve the given initial value problem.

**25.** $x^2y'' + 3xy' - 3y = 0, \quad y(1) = 1, \; y'(1) = -1$
**26.** $6x^2y'' + 7xy' - 2y = 0, \quad y(1) = 0, \; y'(1) = 1$
**27.** $x^2y'' - xy' + y = 0, \quad y(1) = 1, \; y'(1) = 1$
**28.** $x^2y'' + 7xy' + 9y = 0, \quad y(1) = 1, \; y'(1) = 0$
**29.** $x^2y'' - xy' + 2y = 0, \quad y(1) = -1, \; y'(1) = 1$
**30.** $x^2y'' + 3xy' + 5y = 0, \quad y(1) = 1, \; y'(1) = 0$

# 16.5 Power-Series Solutions

In this section we extend our study of second-order linear homogeneous equations with variable coefficients. With the Euler equations in Section 16.4, the power of the variable $x$ in the nonconstant coefficient had to match the order of the derivative with which it was paired: $x^2$ with $y''$, $x^1$ with $y'$, and $x^0\,(=1)$ with $y$. Here we drop that requirement so we can solve more general equations.

## Method of Solution

The **power-series method** for solving a second-order homogeneous differential equation consists of finding the coefficients of a power series

$$y(x) = \sum_{n=0}^{\infty} c_n x^n = c_0 + c_1 x + c_2 x^2 + \cdots \tag{1}$$

which solves the equation. To apply the method we substitute the series and its derivatives into the differential equation to determine the coefficients $c_0, c_1, c_2, \ldots$. The technique for finding the coefficients is similar to that used in the method of undetermined coefficients presented in Section 16.2.

In our first example we demonstrate the method in the setting of a simple equation whose general solution we already know. This is to help you become more comfortable with solutions expressed in series form.

**EXAMPLE 1** Solve the equation $y'' + y = 0$ by the power-series method.

**Solution** We assume the series solution takes the form of

$$y = \sum_{n=0}^{\infty} c_n x^n$$

and calculate the derivatives

$$y' = \sum_{n=1}^{\infty} n c_n x^{n-1} \quad \text{and} \quad y'' = \sum_{n=2}^{\infty} n(n-1) c_n x^{n-2}.$$

Substitution of these forms into the second-order equation gives us

$$\sum_{n=2}^{\infty} n(n-1) c_n x^{n-2} + \sum_{n=0}^{\infty} c_n x^n = 0.$$

Next, we equate the coefficients of each power of $x$ to zero as summarized in the following table.

| Power of $x$ | Coefficient Equation | | |
|---|---|---|---|
| $x^0$ | $2(1)c_2 + c_0 = 0$ | or | $c_2 = -\frac{1}{2} c_0$ |
| $x^1$ | $3(2)c_3 + c_1 = 0$ | or | $c_3 = -\frac{1}{3 \cdot 2} c_1$ |
| $x^2$ | $4(3)c_4 + c_2 = 0$ | or | $c_4 = -\frac{1}{4 \cdot 3} c_2$ |
| $x^3$ | $5(4)c_5 + c_3 = 0$ | or | $c_5 = -\frac{1}{5 \cdot 4} c_3$ |
| $x^4$ | $6(5)c_6 + c_4 = 0$ | or | $c_6 = -\frac{1}{6 \cdot 5} c_4$ |
| $\vdots$ | $\vdots$ | | $\vdots$ |
| $x^{n-2}$ | $n(n-1)c_n + c_{n-2} = 0$ | or | $c_n = -\frac{1}{n(n-1)} c_{n-2}$ |

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

From the table we notice that the coefficients with even indices ($n = 2k, k = 1, 2, 3, \ldots$) are related to each other and the coefficients with odd indices ($n = 2k + 1$) are also interrelated. We treat each group in turn.

*Even indices:* Here $n = 2k$, so the power is $x^{2k-2}$. From the last line of the table, we have

$$2k(2k - 1)c_{2k} + c_{2k-2} = 0$$

or

$$c_{2k} = -\frac{1}{2k(2k - 1)} c_{2k-2}.$$

From this recursive relation we find

$$\begin{aligned} c_{2k} &= \left[-\frac{1}{2k(2k - 1)}\right]\left[-\frac{1}{(2k - 2)(2k - 3)}\right] \cdots \left[-\frac{1}{4(3)}\right]\left[-\frac{1}{2}\right]c_0 \\ &= \frac{(-1)^k}{(2k)!} c_0. \end{aligned}$$

*Odd indices:* Here $n = 2k + 1$, so the power is $x^{2k-1}$. Substituting this into the last line of the table yields

$$(2k + 1)(2k)c_{2k+1} + c_{2k-1} = 0$$

or

$$c_{2k+1} = -\frac{1}{(2k + 1)(2k)} c_{2k-1}.$$

Thus,

$$\begin{aligned} c_{2k+1} &= \left[-\frac{1}{(2k + 1)(2k)}\right]\left[-\frac{1}{(2k - 1)(2k - 2)}\right] \cdots \left[-\frac{1}{5(4)}\right]\left[-\frac{1}{3(2)}\right]c_1 \\ &= \frac{(-1)^k}{(2k + 1)!} c_1. \end{aligned}$$

Writing the power series by grouping its even and odd powers together and substituting for the coefficients yields

$$\begin{aligned} y &= \sum_{n=0}^{\infty} c_n x^n \\ &= \sum_{k=0}^{\infty} c_{2k} x^{2k} + \sum_{k=0}^{\infty} c_{2k+1} x^{2k+1} \\ &= c_0 \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k)!} x^{2k} + c_1 \sum_{k=0}^{\infty} \frac{(-1)^k}{(2k + 1)!} x^{2k+1}. \end{aligned}$$

From Table 8.1 in Section 8.10, we see that the first series on the right-hand side of the last equation represents the cosine function and the second series represents the sine. Thus, the general solution to $y'' + y = 0$ is

$$y = c_0 \cos x + c_1 \sin x.$$ ■

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

**EXAMPLE 2** Find the general solution to $y'' + xy' + y = 0$.

**Solution** We assume the series solution form

$$y = \sum_{n=0}^{\infty} c_n x^n$$

and calculate the derivatives

$$y' = \sum_{n=1}^{\infty} n c_n x^{n-1} \quad \text{and} \quad y'' = \sum_{n=2}^{\infty} n(n-1) c_n x^{n-2}.$$

Substitution of these forms into the second-order equation yields

$$\sum_{n=2}^{\infty} n(n-1) c_n x^{n-2} + \sum_{n=1}^{\infty} n c_n x^n + \sum_{n=0}^{\infty} c_n x^n = 0$$

We equate the coefficients of each power of $x$ to zero as summarized in the following table.

| **Power of $x$** | **Coefficient Equation** | | |
|---|---|---|---|
| $x^0$ | $2(1)c_2 + c_0 = 0$ | or | $c_2 = -\frac{1}{2} c_0$ |
| $x^1$ | $3(2)c_3 + c_1 + c_1 = 0$ | or | $c_3 = -\frac{1}{3} c_1$ |
| $x^2$ | $4(3)c_4 + 2c_2 + c_2 = 0$ | or | $c_4 = -\frac{1}{4} c_2$ |
| $x^3$ | $5(4)c_5 + 3c_3 + c_3 = 0$ | or | $c_5 = -\frac{1}{5} c_3$ |
| $x^4$ | $6(5)c_6 + 4c_4 + c_4 = 0$ | or | $c_6 = -\frac{1}{6} c_4$ |
| $\vdots$ | $\vdots$ | | $\vdots$ |
| $x^n$ | $(n+2)(n+1)c_{n+2} + (n+1)c_n = 0$ | or | $c_{n+2} = -\dfrac{1}{n+2} c_n$ |

From the table notice that the coefficients with even indices are interrelated and the coefficients with odd indices are also interrelated.

*Even indices:* Here $n = 2k - 2$, so the power is $x^{2k-2}$. From the last line in the table, we have

$$c_{2k} = -\frac{1}{2k} c_{2k-2}.$$

From this recurrence relation we obtain

$$\begin{aligned} c_{2k} &= \left(-\frac{1}{2k}\right)\left(-\frac{1}{2k-2}\right)\cdots\left(-\frac{1}{6}\right)\left(-\frac{1}{4}\right)\left(-\frac{1}{2}\right)c_0 \\ &= \frac{(-1)^k}{(2)(4)(6)\cdots(2k)} c_0. \end{aligned}$$

*Odd indices:* Here $n = 2k - 1$, so the power is $x^{2k-1}$. From the last line in the table, we have

$$c_{2k+1} = -\frac{1}{2k+1} c_{2k-1}.$$

From this recurrence relation we obtain

$$\begin{aligned} c_{2k+1} &= \left(-\frac{1}{2k+1}\right)\left(-\frac{1}{2k-1}\right)\cdots\left(-\frac{1}{5}\right)\left(-\frac{1}{3}\right)c_1 \\ &= \frac{(-1)^k}{(3)(5)\cdots(2k+1)} c_1. \end{aligned}$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

Writing the power series by grouping its even and odd powers and substituting for the coefficients yields

$$y = \sum_{k=0}^{\infty} c_{2k}x^{2k} + \sum_{k=0}^{\infty} c_{2k+1}x^{2k+1}$$
$$= c_0\sum_{k=0}^{\infty} \frac{(-1)^k}{(2)(4)\cdots(2k)}x^{2k} + c_1\sum_{k=0}^{\infty} \frac{(-1)^k}{(3)(5)\cdots(2k+1)}x^{2k+1}.$$ ■

**EXAMPLE 3** Find the general solution to

$$(1 - x^2)y'' - 6xy' - 4y = 0, \qquad |x| < 1.$$

**Solution** Notice that the leading coefficient is zero when $x = \pm 1$. Thus, we assume the solution interval $I$: $-1 < x < 1$. Substitution of the series form

$$y = \sum_{n=0}^{\infty} c_n x^n$$

and its derivatives gives us

$$(1 - x^2)\sum_{n=2}^{\infty} n(n-1)c_n x^{n-2} - 6\sum_{n=1}^{\infty} nc_n x^n - 4\sum_{n=0}^{\infty} c_n x^n = 0,$$
$$\sum_{n=2}^{\infty} n(n-1)c_n x^{n-2} - \sum_{n=2}^{\infty} n(n-1)c_n x^n - 6\sum_{n=1}^{\infty} nc_n x^n - 4\sum_{n=0}^{\infty} c_n x^n = 0.$$

Next, we equate the coefficients of each power of $x$ to zero as summarized in the following table.

| **Power of $x$** | **Coefficient Equation** | | |
|---|---|---|---|
| $x^0$ | $2(1)c_2 - 4c_0 = 0$ | or | $c_2 = \frac{4}{2}c_0$ |
| $x^1$ | $3(2)c_3 - 6(1)c_1 - 4c_1 = 0$ | or | $c_3 = \frac{5}{3}c_1$ |
| $x^2$ | $4(3)c_4 - 2(1)c_2 - 6(2)c_2 - 4c_2 = 0$ | or | $c_4 = \frac{6}{4}c_2$ |
| $x^3$ | $5(4)c_5 - 3(2)c_3 - 6(3)c_3 - 4c_3 = 0$ | or | $c_5 = \frac{7}{5}c_3$ |
| $\vdots$ | $\vdots$ | | $\vdots$ |
| $x^n$ | $(n+2)(n+1)c_{n+2} - [n(n-1) + 6n + 4]c_n = 0$ | | |
| | $(n+2)(n+1)c_{n+2} - (n+4)(n+1)c_n = 0$ | or | $c_{n+2} = \frac{n+4}{n+2}c_n$ |

Again we notice that the coefficients with even indices are interrelated and those with odd indices are interrelated.

*Even indices:* Here $n = 2k - 2$, so the power is $x^{2k}$. From the right-hand column and last line of the table, we get

$$c_{2k} = \frac{2k+2}{2k}c_{2k-2}$$
$$= \left(\frac{2k+2}{2k}\right)\left(\frac{2k}{2k-2}\right)\left(\frac{2k-2}{2k-4}\right)\cdots\frac{6}{4}\left(\frac{4}{2}\right)c_0$$
$$= (k+1)c_0.$$

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

*Odd indices:* Here $n = 2k - 1$, so the power is $x^{2k+1}$. The right-hand column and last line of the table gives us

$$\begin{aligned} c_{2k+1} &= \frac{2k+3}{2k+1} c_{2k-1} \\ &= \left(\frac{2k+3}{2k+1}\right)\left(\frac{2k+1}{2k-1}\right)\left(\frac{2k-1}{2k-3}\right)\cdots\frac{7}{5}\left(\frac{5}{3}\right)c_1 \\ &= \frac{2k+3}{3} c_1. \end{aligned}$$

The general solution is

$$\begin{aligned} y &= \sum_{n=0}^{\infty} c_n x^n \\ &= \sum_{k=0}^{\infty} c_{2k} x^{2k} + \sum_{k=0}^{\infty} c_{2k+1} x^{2k+1} \\ &= c_0 \sum_{k=0}^{\infty} (k+1) x^{2k} + c_1 \sum_{k=0}^{\infty} \frac{2k+3}{3} x^{2k+1}. \end{aligned}$$

■

**EXAMPLE 4** Find the general solution to $y'' - 2xy' + y = 0$.

**Solution** Assuming that

$$y = \sum_{n=0}^{\infty} c_n x^n,$$

substitution into the differential equation gives us

$$\sum_{n=2}^{\infty} n(n-1) c_n x^{n-2} - 2\sum_{n=1}^{\infty} n c_n x^n + \sum_{n=0}^{\infty} c_n x^n = 0.$$

We next determine the coefficients, listing them in the following table.

| Power of $x$ | Coefficient Equation | | |
|---|---|---|---|
| $x^0$ | $2(1)c_2 + c_0 = 0$ | or | $c_2 = -\frac{1}{2} c_0$ |
| $x^1$ | $3(2)c_3 - 2c_1 + c_1 = 0$ | or | $c_3 = \frac{1}{3 \cdot 2} c_1$ |
| $x^2$ | $4(3)c_4 - 4c_2 + c_2 = 0$ | or | $c_4 = \frac{3}{4 \cdot 3} c_2$ |
| $x^3$ | $5(4)c_5 - 6c_3 + c_3 = 0$ | or | $c_5 = \frac{5}{5 \cdot 4} c_3$ |
| $x^4$ | $6(5)c_6 - 8c_4 + c_4 = 0$ | or | $c_6 = \frac{7}{6 \cdot 5} c_4$ |
| $\vdots$ | $\vdots$ | | $\vdots$ |
| $x^n$ | $(n+2)(n+1)c_{n+2} - (2n-1)c_n = 0$ | or | $c_{n+2} = \frac{2n-1}{(n+2)(n+1)} c_n$ |

Copyright © 2006 Pearson Education, Inc. Publishing as Pearson Addison-Wesley.

From the recursive relation

$$c_{n+2} = \frac{2n - 1}{(n + 2)(n + 1)}\, c_n,$$

we write out the first few terms of each series for the general solution:

$$y = c_0\left(1 - \frac{1}{2}x^2 - \frac{3}{4!}x^4 - \frac{21}{6!}x^6 - \cdots\right) + c_1\left(x + \frac{1}{3!}x^3 + \frac{5}{5!}x^5 + \frac{45}{7!}x^7 + \cdots\right).$$

## EXERCISES 16.5

In Exercises 1–18, use power series to find the general solution of the differential equation.

**1.** $y'' + 2y' = 0$

**2.** $y'' + 2y' + y = 0$

**3.** $y'' + 4y = 0$

**4.** $y'' - 3y' + 2y = 0$

**5.** $x^2y'' - 2xy' + 2y = 0$

**6.** $y'' - xy' + y = 0$

**7.** $(1 + x)y'' - y = 0$

**8.** $(1 - x^2)y'' - 4xy' + 6y = 0$

**9.** $(x^2 - 1)y'' + 2xy' - 2y = 0$

**10.** $y'' + y' - x^2y = 0$

**11.** $(x^2 - 1)y'' - 6y = 0$

**12.** $xy'' - (x + 2)y' + 2y = 0$

**13.** $(x^2 - 1)y'' + 4xy' + 2y = 0$

**14.** $y'' - 2xy' + 4y = 0$

**15.** $y'' - 2xy' + 3y = 0$

**16.** $(1 - x^2)y'' - xy' + 4y = 0$

**17.** $y'' - xy' + 3y = 0$

**18.** $x^2y'' - 4xy' + 6y = 0$

# APPENDICES

## A.1 Mathematical Induction

Many formulas, like

$$1 + 2 + \cdots + n = \frac{n(n + 1)}{2},$$

can be shown to hold for every positive integer $n$ by applying an axiom called the *mathematical induction principle*. A proof that uses this axiom is called a *proof by mathematical induction* or a *proof by induction*.

The steps in proving a formula by induction are the following:

1. Check that the formula holds for $n = 1$.
2. Prove that if the formula holds for any positive integer $n = k$, then it also holds for the next integer, $n = k + 1$.

The induction axiom says that once these steps are completed, the formula holds for all positive integers $n$. By Step 1 it holds for $n = 1$. By Step 2 it holds for $n = 2$, and therefore by Step 2 also for $n = 3$, and by Step 2 again for $n = 4$, and so on. If the first domino falls, and the $k$th domino always knocks over the $(k + 1)$st when it falls, all the dominoes fall.

From another point of view, suppose we have a sequence of statements $S_1$, $S_2, \ldots, S_n, \ldots$, one for each positive integer. Suppose we can show that assuming any one of the statements to be true implies that the next statement in line is true. Suppose that we can also show that $S_1$ is true. Then we may conclude that the statements are true from $S_1$ on.

**EXAMPLE 1** Use mathematical induction to prove that for every positive integer $n$,

$$1 + 2 + \cdots + n = \frac{n(n + 1)}{2}.$$

**Solution** We accomplish the proof by carrying out the two steps above.

1. The formula holds for $n = 1$ because

$$1 = \frac{1(1 + 1)}{2}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**2.** If the formula holds for $n = k$, does it also hold for $n = k + 1$? The answer is yes, as we now show. If

$$1 + 2 + \cdots + k = \frac{k(k + 1)}{2},$$

then

$$1 + 2 + \cdots + k + (k + 1) = \frac{k(k + 1)}{2} + (k + 1) = \frac{k^2 + k + 2k + 2}{2}$$
$$= \frac{(k + 1)(k + 2)}{2} = \frac{(k + 1)((k + 1) + 1)}{2}.$$

The last expression in this string of equalities is the expression $n(n + 1)/2$ for $n = (k + 1)$.

The mathematical induction principle now guarantees the original formula for all positive integers $n$. ■

In Example 4 of Section 5.2 we gave another proof for the formula giving the sum of the first $n$ integers. However, proof by mathematical induction is more general. It can be used to find the sums of the squares and cubes of the first $n$ integers (Exercises 9 and 10). Here is another example.

**EXAMPLE 2** Show by mathematical induction that for all positive integers $n$,

$$\frac{1}{2^1} + \frac{1}{2^2} + \cdots + \frac{1}{2^n} = 1 - \frac{1}{2^n}.$$

**Solution** We accomplish the proof by carrying out the two steps of mathematical induction.

**1.** The formula holds for $n = 1$ because

$$\frac{1}{2^1} = 1 - \frac{1}{2^1}.$$

**2.** If

$$\frac{1}{2^1} + \frac{1}{2^2} + \cdots + \frac{1}{2^k} = 1 - \frac{1}{2^k},$$

then

$$\frac{1}{2^1} + \frac{1}{2^2} + \cdots + \frac{1}{2^k} + \frac{1}{2^{k+1}} = 1 - \frac{1}{2^k} + \frac{1}{2^{k+1}} = 1 - \frac{1 \cdot 2}{2^k \cdot 2} + \frac{1}{2^{k+1}}$$
$$= 1 - \frac{2}{2^{k+1}} + \frac{1}{2^{k+1}} = 1 - \frac{1}{2^{k+1}}.$$

Thus, the original formula holds for $n = (k + 1)$ whenever it holds for $n = k$.

With these steps verified, the mathematical induction principle now guarantees the formula for every positive integer $n$. ■

## Other Starting Integers

Instead of starting at $n = 1$ some induction arguments start at another integer. The steps for such an argument are as follows.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

1. Check that the formula holds for $n = n_1$ (the first appropriate integer).
2. Prove that if the formula holds for any integer $n = k \geq n_1$, then it also holds for $n = (k + 1)$.

Once these steps are completed, the mathematical induction principle guarantees the formula for all $n \geq n_1$.

**EXAMPLE 3** Show that $n! > 3^n$ if $n$ is large enough.

**Solution** How large is large enough? We experiment:

| $n$ | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
|---|---|---|---|---|---|---|---|
| $n!$ | 1 | 2 | 6 | 24 | 120 | 720 | 5040 |
| $3^n$ | 3 | 9 | 27 | 81 | 243 | 729 | 2187 |

It looks as if $n! > 3^n$ for $n \geq 7$. To be sure, we apply mathematical induction. We take $n_1 = 7$ in Step 1 and complete Step 2.

Suppose $k! > 3^k$ for some $k \geq 7$. Then

$$(k + 1)! = (k + 1)(k!) > (k + 1)3^k > 7 \cdot 3^k > 3^{k+1}.$$

Thus, for $k \geq 7$,

$$k! > 3^k \quad \text{implies} \quad (k + 1)! > 3^{k+1}.$$

The mathematical induction principle now guarantees $n! \geq 3^n$ for all $n \geq 7$. ■

## EXERCISES A.1

1. Assuming that the triangle inequality $|a + b| \leq |a| + |b|$ holds for any two numbers $a$ and $b$, show that

$$|x_1 + x_2 + \cdots + x_n| \leq |x_1| + |x_2| + \cdots + |x_n|$$

for any $n$ numbers.

2. Show that if $r \neq 1$, then

$$1 + r + r^2 + \cdots + r^n = \frac{1 - r^{n+1}}{1 - r}$$

for every positive integer $n$.

3. Use the Product Rule, $\frac{d}{dx}(uv) = u\frac{dv}{dx} + v\frac{du}{dx}$, and the fact that $\frac{d}{dx}(x) = 1$ to show that $\frac{d}{dx}(x^n) = nx^{n-1}$ for every positive integer $n$.

4. Suppose that a function $f(x)$ has the property that $f(x_1x_2) = f(x_1) + f(x_2)$ for any two positive numbers $x_1$ and $x_2$. Show that

$$f(x_1x_2 \cdots x_n) = f(x_1) + f(x_2) + \cdots + f(x_n)$$

for the product of any $n$ positive numbers $x_1, x_2 \ldots, x_n$.

5. Show that

$$\frac{2}{3^1} + \frac{2}{3^2} + \cdots + \frac{2}{3^n} = 1 - \frac{1}{3^n}$$

for all positive integers $n$.

6. Show that $n! > n^3$ if $n$ is large enough.
7. Show that $2^n > n^2$ if $n$ is large enough.
8. Show that $2^n \geq 1/8$ for $n \geq -3$.
9. **Sums of squares** Show that the sum of the squares of the first $n$ positive integers is

$$\frac{n\left(n + \frac{1}{2}\right)(n + 1)}{3}.$$

10. **Sums of cubes** Show that the sum of the cubes of the first $n$ positive integers is $(n(n + 1)/2)^2$.
11. **Rules for finite sums** Show that the following finite sum rules hold for every positive integer $n$.

**a.** $\sum_{k=1}^{n}(a_k + b_k) = \sum_{k=1}^{n} a_k + \sum_{k=1}^{n} b_k$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**b.** $\sum_{k=1}^{n}(a_k - b_k) = \sum_{k=1}^{n} a_k - \sum_{k=1}^{n} b_k$

**c.** $\sum_{k=1}^{n} ca_k = c \cdot \sum_{k=1}^{n} a_k$ (Any number $c$)

**d.** $\sum_{k=1}^{n} a_k = n \cdot c$ (if $a_k$ has the constant value $c$)

**12.** Show that $|x^n| = |x|^n$ for every positive integer $n$ and every real number $x$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# A.2 Proofs of Limit Theorems

This appendix proves Theorem 1, Parts 2–5, and Theorem 4 from Section 2.2.

**THEOREM 1 Limit Laws**

If $L$, $M$, $c$, and $k$ are real numbers and

$$\lim_{x\to c} f(x) = L \quad \text{and} \quad \lim_{x\to c} g(x) = M, \quad \text{then}$$

1. *Sum Rule:* $\lim_{x\to c}\big(f(x) + g(x)\big) = L + M$
2. *Difference Rule:* $\lim_{x\to c}\big(f(x) - g(x)\big) = L - M$
3. *Product Rule:* $\lim_{x\to c}\big(f(x)\cdot g(x)\big) = L\cdot M$
4. *Constant Multiple Rule:* $\lim_{x\to c}\big(kf(x)\big) = kL$ (any number $k$)
5. *Quotient Rule:* $\lim_{x\to c}\dfrac{f(x)}{g(x)} = \dfrac{L}{M}$, if $M \neq 0$
6. *Power Rule:* If $r$ and $s$ are integers with no common factor and $s \neq 0$, then
$$\lim_{x\to c}\big(f(x)\big)^{r/s} = L^{r/s}$$
provided that $L^{r/s}$ is a real number. (If $s$ is even, we assume that $L > 0$.)

We proved the Sum Rule in Section 2.3 and the Power Rule is proved in more advanced texts. We obtain the Difference Rule by replacing $g(x)$ by $-g(x)$ and $M$ by $-M$ in the Sum Rule. The Constant Multiple Rule is the special case $g(x) = k$ of the Product Rule. This leaves only the Product and Quotient Rules.

**Proof of the Limit Product Rule** We show that for any $\epsilon > 0$ there exists a $\delta > 0$ such that for all $x$ in the intersection $D$ of the domains of $f$ and $g$,

$$0 < |x - c| < \delta \quad \Rightarrow \quad |f(x)g(x) - LM| < \epsilon.$$

Suppose then that $\epsilon$ is a positive number, and write $f(x)$ and $g(x)$ as

$$f(x) = L + (f(x) - L), \qquad g(x) = M + (g(x) - M).$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Multiply these expressions together and subtract $LM$:

$$\begin{aligned} f(x)\cdot g(x) - LM &= (L + (f(x) - L))(M + (g(x) - M)) - LM \\ &= LM + L(g(x) - M) + M(f(x) - L) \\ &\quad + (f(x) - L)(g(x) - M) - LM \\ &= L(g(x) - M) + M(f(x) - L) + (f(x) - L)(g(x) - M). \end{aligned} \tag{1}$$

Since $f$ and $g$ have limits $L$ and $M$ as $x \to c$, there exist positive numbers $\delta_1$, $\delta_2$, $\delta_3$, and $\delta_4$ such that for all $x$ in $D$

$$\begin{aligned} 0 < |x - c| < \delta_1 &\quad\Rightarrow\quad |f(x) - L| < \sqrt{\epsilon/3} \\ 0 < |x - c| < \delta_2 &\quad\Rightarrow\quad |g(x) - M| < \sqrt{\epsilon/3} \\ 0 < |x - c| < \delta_3 &\quad\Rightarrow\quad |f(x) - L| < \epsilon/(3(1 + |M|)) \\ 0 < |x - c| < \delta_4 &\quad\Rightarrow\quad |g(x) - M| < \epsilon/(3(1 + |L|)) \end{aligned} \tag{2}$$

If we take $\delta$ to be the smallest numbers $\delta_1$ through $\delta_4$, the inequalities on the right-hand side of the Implications (2) will hold simultaneously for $0 < |x - c| < \delta$. Therefore, for all $x$ in $D$, $0 < |x - c| < \delta$ implies

$$\begin{aligned} &|f(x)\cdot g(x) - LM| && \text{Triangle inequality applied to Equation (1)} \\ &\le |L||g(x) - M| + |M||f(x) - L| + |f(x) - L||g(x) - M| \\ &\le (1 + |L|)|g(x) - M| + (1 + |M|)|f(x) - L| + |f(x) - L||g(x) - M| \\ &< \frac{\epsilon}{3} + \frac{\epsilon}{3} + \sqrt{\frac{\epsilon}{3}}\sqrt{\frac{\epsilon}{3}} = \epsilon. && \text{Values from (2)} \end{aligned}$$

This completes the proof of the Limit Product Rule. ■

**Proof of the Limit Quotient Rule** We show that $\lim_{x\to c}(1/g(x)) = 1/M$. We can then conclude that

$$\lim_{x\to c}\frac{f(x)}{g(x)} = \lim_{x\to c}\left(f(x)\cdot\frac{1}{g(x)}\right) = \lim_{x\to c} f(x)\cdot\lim_{x\to c}\frac{1}{g(x)} = L\cdot\frac{1}{M} = \frac{L}{M}$$

by the Limit Product Rule.

Let $\epsilon > 0$ be given. To show that $\lim_{x\to c}(1/g(x)) = 1/M$, we need to show that there exists a $\delta > 0$ such that for all $x$.

$$0 < |x - c| < \delta \quad\Rightarrow\quad \left|\frac{1}{g(x)} - \frac{1}{M}\right| < \epsilon.$$

Since $|M| > 0$, there exists a positive number $\delta_1$ such that for all $x$

$$0 < |x - c| < \delta_1 \quad\Rightarrow\quad |g(x) - M| < \frac{M}{2}. \tag{3}$$

For any numbers $A$ and $B$ it can be shown that $|A| - |B| \le |A - B|$ and $|B| - |A| \le |A - B|$, from which it follows that $||A| - |B|| \le |A - B|$. With $A = g(x)$ and $B = M$, this becomes

$$||g(x)| - |M|| \le |g(x) - M|,$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

which can be combined with the inequality on the right in Implication (3) to get, in turn,

$$\begin{aligned} \big||g(x)| - |M|\big| &< \frac{|M|}{2} \\ -\frac{|M|}{2} < |g(x)| - |M| &< \frac{|M|}{2} \\ \frac{|M|}{2} < |g(x)| &< \frac{3|M|}{2} \\ |M| < 2|g(x)| &< 3|M| \\ \frac{1}{|g(x)|} < \frac{2}{|M|} &< \frac{3}{|g(x)|} \end{aligned} \tag{4}$$

Therefore, $0 < |x - c| < \delta_1$ implies that

$$\begin{aligned} \left|\frac{1}{g(x)} - \frac{1}{M}\right| = \left|\frac{M - g(x)}{Mg(x)}\right| &\le \frac{1}{|M|} \cdot \frac{1}{|g(x)|} \cdot |M - g(x)| \\ &< \frac{1}{|M|} \cdot \frac{2}{|M|} \cdot |M - g(x)|. \quad \text{Inequality (4)} \end{aligned} \tag{5}$$

Since $(1/2)|M|^2\epsilon > 0$, there exists a number $\delta_2 > 0$ such that for all $x$

$$0 < |x - c| < \delta_2 \quad \Rightarrow \quad |M - g(x)| < \frac{\epsilon}{2}|M|^2. \tag{6}$$

If we take $\delta$ to be the smaller of $\delta_1$ and $\delta_2$, the conclusions in (5) and (6) both hold for all $x$ such that $0 < |x - c| < \delta$. Combining these conclusions gives

$$0 < |x - c| < \delta \quad \Rightarrow \quad \left|\frac{1}{g(x)} - \frac{1}{M}\right| < \epsilon.$$

This concludes the proof of the Limit Quotient Rule. ■

**THEOREM 4 The Sandwich Theorem**

Suppose that $g(x) \le f(x) \le h(x)$ for all $x$ in some open interval $I$ containing $c$, except possibly at $x = c$ itself. Suppose also that $\lim_{x\to c} g(x) = \lim_{x\to c} h(x) = L$. Then $\lim_{x\to c} f(x) = L$.

**Proof for Right-Hand Limits** Suppose $\lim_{x\to c^+} g(x) = \lim_{x\to c^+} h(x) = L$. Then for any $\epsilon > 0$ there exists a $\delta > 0$ such that for all $x$ the interval $c < x < c + \delta$ is contained in $I$ and the inequality implies

$$L - \epsilon < g(x) < L + \epsilon \qquad \text{and} \qquad L - \epsilon < h(x) < L + \epsilon.$$

These inequalities combine with the inequality $g(x) \le f(x) \le h(x)$ to give

$$\begin{aligned} L - \epsilon < g(x) \le f(x) \le h(x) &< L + \epsilon, \\ L - \epsilon < f(x) &< L + \epsilon, \\ -\epsilon < f(x) - L &< \epsilon. \end{aligned}$$

Therefore, for all $x$, the inequality $c < x < c + \delta$ implies $|f(x) - L| < \epsilon$. ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Proof for Left-Hand Limits** Suppose $\lim_{x\to c^-} g(x) = \lim_{x\to c^-} h(x) = L$. Then for any $\epsilon > 0$ there exists a $\delta > 0$ such that for all $x$ the interval $c - \delta < x < c$ is contained in $I$ and the inequality implies

$$L - \epsilon < g(x) < L + \epsilon \qquad \text{and} \qquad L - \epsilon < h(x) < L + \epsilon.$$

We conclude as before that for all $x$, $c - \delta < x < c$ implies $|f(x) - L| < \epsilon$. ■

**Proof for Two-Sided Limits** If $\lim_{x\to c} g(x) = \lim_{x\to c} h(x) = L$, then $g(x)$ and $h(x)$ both approach $L$ as $x \to c^+$ and as $x \to c^-$; so $\lim_{x\to c^+} f(x) = L$ and $\lim_{x\to c^-} f(x) = L$. Hence $\lim_{x\to c} f(x)$ exists and equals $L$. ■

## EXERCISES A.2

1. Suppose that functions $f_1(x)$, $f_2(x)$, and $f_3(x)$ have limits $L_1$, $L_2$, and $L_3$, respectively, as $x \to c$. Show that their sum has limit $L_1 + L_2 + L_3$. Use mathematical induction (Appendix 1) to generalize this result to the sum of any finite number of functions.
2. Use mathematical induction and the Limit Product Rule in Theorem 1 to show that if functions $f_1(x), f_2(x), \ldots, f_n(x)$ have limits $L_1, L_2, \ldots, L_n$ as $x \to c$, then
$$\lim_{x\to c} f_1(x) f_2(x) \cdot \cdots \cdot f_n(x) = L_1 \cdot L_2 \cdot \cdots \cdot L_n.$$
3. Use the fact that $\lim_{x\to c} x = c$ and the result of Exercise 2 to show that $\lim_{x\to c} x^n = c^n$ for any integer $n > 1$.
4. **Limits of polynomials** Use the fact that $\lim_{x\to c}(k) = k$ for any number $k$ together with the results of Exercises 1 and 3 to show that $\lim_{x\to c} f(x) = f(c)$ for any polynomial function
$$f(x) = a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0.$$
5. **Limits of rational functions** Use Theorem 1 and the result of Exercise 4 to show that if $f(x)$ and $g(x)$ are polynomial functions and $g(c) \neq 0$, then
$$\lim_{x\to c} \frac{f(x)}{g(x)} = \frac{f(c)}{g(c)}.$$
6. **Composites of continuous functions** Figure A.1 gives the diagram for a proof that the composite of two continuous functions is continuous. Reconstruct the proof from the diagram. The statement to be proved is this: If $f$ is continuous at $x = c$ and $g$ is continuous at $f(c)$, then $g \circ f$ is continuous at $c$.

   Assume that $c$ is an interior point of the domain of $f$ and that $f(c)$ is an interior point of the domain of $g$. This will make the limits involved two-sided. (The arguments for the cases that involve one-sided limits are similar.)

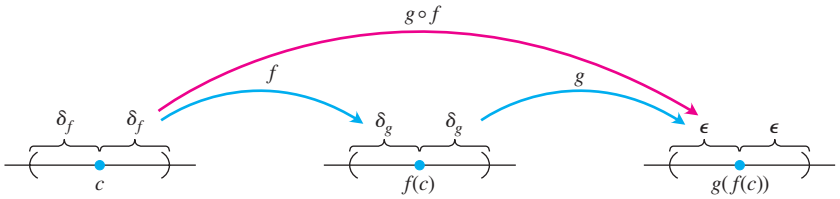

**FIGURE A.1** The diagram for a proof that the composite of two continuous functions is continuous.

# A.3 Commonly Occurring Limits

This appendix verifies limits (4)–(6) in Theorem 5 of Section 11.1.

**Limit 4: If $|x| < 1$, $\lim_{n \to \infty} x^n = 0$** We need to show that to each $\epsilon > 0$ there corresponds an integer $N$ so large that $|x^n| < \epsilon$ for all $n$ greater than $N$. Since $\epsilon^{1/n} \to 1$, while

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$|x| < 1$, there exists an integer $N$ for which $\epsilon^{1/N} > |x|$. In other words,

$$|x^N| = |x|^N < \epsilon. \tag{1}$$

This is the integer we seek because, if $|x| < 1$, then

$$|x^n| < |x^N| \quad \text{for all } n > N. \tag{2}$$

Combining (1) and (2) produces $|x^n| < \epsilon$ for all $n > N$, concluding the proof. ■

**Limit 5: For any number $x$, $\lim_{n\to\infty}\left(1 + \frac{x}{n}\right)^n = e^x$** Let

$$a_n = \left(1 + \frac{x}{n}\right)^n.$$

Then

$$\ln a_n = \ln\left(1 + \frac{x}{n}\right)^n = n \ln\left(1 + \frac{x}{n}\right) \to x,$$

as we can see by the following application of l'Hôpital's Rule, in which we differentiate with respect to $n$:

$$\lim_{n\to\infty} n \ln\left(1 + \frac{x}{n}\right) = \lim_{n\to\infty} \frac{\ln(1 + x/n)}{1/n}$$

$$= \lim_{n\to\infty} \frac{\left(\frac{1}{1 + x/n}\right)\cdot\left(-\frac{x}{n^2}\right)}{-1/n^2} = \lim_{n\to\infty} \frac{x}{1 + x/n} = x.$$

Apply Theorem 4, Section 11.1, with $f(x) = e^x$ to conclude that

$$\left(1 + \frac{x}{n}\right)^n = a_n = e^{\ln a_n} \to e^x.$$ ■

**Limit 6: For any number $x$, $\lim_{n\to\infty} \frac{x^n}{n!} = 0$** Since

$$-\frac{|x|^n}{n!} \le \frac{x^n}{n!} \le \frac{|x|^n}{n!},$$

all we need to show is that $|x|^n/n! \to 0$. We can then apply the Sandwich Theorem for Sequences (Section 11.1, Theorem 2) to conclude that $x^n/n! \to 0$.

The first step in showing that $|x|^n/n! \to 0$ is to choose an integer $M > |x|$, so that $(|x|/M) < 1$. By Limit 4, just proved, we then have $(|x|/M)^n \to 0$. We then restrict our attention to values of $n > M$. For these values of $n$, we can write

$$\frac{|x|^n}{n!} = \frac{|x|^n}{1\cdot 2\cdot \cdots \cdot M \cdot \underbrace{(M+1)(M+2)\cdot \cdots \cdot n}_{(n - M) \text{ factors}}}$$

$$\le \frac{|x|^n}{M! M^{n-M}} = \frac{|x|^n M^M}{M! M^n} = \frac{M^M}{M!}\left(\frac{|x|}{M}\right)^n.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Thus,

$$0 \le \frac{|x|^n}{n!} \le \frac{M^M}{M!}\left(\frac{|x|}{M}\right)^n.$$

Now, the constant $M^M/M!$ does not change as $n$ increases. Thus the Sandwich Theorem tells us that $|x|^n/n! \to 0$ because $(|x|/M)^n \to 0$. ■

# A.4 Theory of the Real Numbers

A rigorous development of calculus is based on properties of the real numbers. Many results about functions, derivatives, and integrals would be false if stated for functions defined only on the rational numbers. In this appendix we briefly examine some basic concepts of the theory of the reals that hint at what might be learned in a deeper, more theoretical study of calculus.

Three types of properties make the real numbers what they are. These are the **algebraic**, **order**, and **completeness** properties. The algebraic properties involve addition and multiplication, subtraction and division. They apply to rational or complex numbers as well as to the reals.

The structure of numbers is built around a set with addition and multiplication operations. The following properties are required of addition and multiplication.

**A1** $a + (b + c) = (a + b) + c$ for all $a, b, c$.

**A2** $a + b = b + a$ for all $a, b, c$.

**A3** There is a number called "0" such that $a + 0 = a$ for all $a$.

**A4** For each number $a$, there is a $b$ such that $a + b = 0$.

**M1** $a(bc) = (ab)c$ for all $a, b, c$.

**M2** $ab = ba$ for all $a, b$.

**M3** There is a number called "1" such that $a \cdot 1 = a$ for all $a$.

**M4** For each nonzero $a$, there is a $b$ such that $ab = 1$.

**D** $a(b + c) = ab + bc$ for all $a, b, c$.

A1 and M1 are *associative laws*, A2 and M2 are *commutativity laws*, A3 and M3 are *identity laws*, and D is the *distributive law*. Sets that have these algebraic properties are examples of **fields**, and are studied in depth in the area of theoretical mathematics called abstract algebra.

The **order** properties allow us to compare the size of any two numbers. The order properties are

**O1** For any $a$ and $b$, either $a \le b$ or $b \le a$ or both.

**O2** If $a \le b$ and $b \le a$ then $a = b$.

**O3** If $a \le b$ and $b \le c$ then $a \le c$.

**O4** If $a \le b$ then $a + c \le b + c$.

**O5** If $a \le b$ and $0 \le c$ then $ac \le bc$.

O3 is the *transitivity law*, and O4 and O5 relate ordering to addition and multiplication.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We can order the reals, the integers, and the rational numbers, but we cannot order the complex numbers (see Appendix A.5). There is no reasonable way to decide whether a number like $i = \sqrt{-1}$ is bigger or smaller than zero. A field in which the size of any two elements can be compared as above is called an **ordered field**. Both the rational numbers and the real numbers are ordered fields, and there are many others.

We can think of real numbers geometrically, lining them up as points on a line. The **completeness property** says that the real numbers correspond to all points on the line, with no "holes" or "gaps." The rationals, in contrast, omit points such as $\sqrt{2}$ and $\pi$, and the integers even leave out fractions like $1/2$. The reals, having the completeness property, omit no points.

What exactly do we mean by this vague idea of missing holes? To answer this we must give a more precise description of completeness. A number $M$ is an **upper bound** for a set of numbers if all numbers in the set are smaller than or equal to $M$. $M$ is a **least upper bound** if it is the smallest upper bound. For example, $M = 2$ is an upper bound for the negative numbers. So is $M = 1$, showing that 2 is not a least upper bound. The least upper bound for the set of negative numbers is $M = 0$. We define a **complete** ordered field to be one in which every nonempty set bounded above has a least upper bound.

If we work with just the rational numbers, the set of numbers less than $\sqrt{2}$ is bounded, but it does not have a rational least upper bound, since any rational upper bound $M$ can be replaced by a slightly smaller rational number that is still larger than $\sqrt{2}$. So the rationals are not complete. In the real numbers, a set that is bounded above always has a least upper bound. The reals are a complete ordered field.

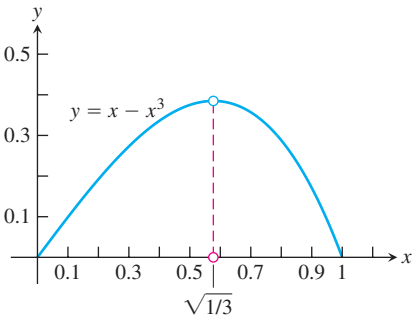

**FIGURE A.2** The maximum value of $y = x - x^3$ on $[0, 1]$ occurs at the irrational number $x = \sqrt{1/3}$.

The completeness property is at the heart of many results in calculus. One example occurs when searching for a maximum value for a function on a closed interval $[a, b]$, as in Section 4.1. The function $y = x - x^3$ has a maximum value on $[0, 1]$ at the point $x$ satisfying $1 - 3x^2 = 0$, or $x = \sqrt{1/3}$. If we limited our consideration to functions defined only on rational numbers, we would have to conclude that the function has no maximum, since $\sqrt{1/3}$ is irrational (Figure A.2). The Extreme Value Theorem (Section 4.1), which implies that continuous functions on closed intervals $[a, b]$ have a maximum value, is not true for functions defined only on the rationals.

The Intermediate Value Theorem implies that a continuous function $f$ on an interval $[a, b]$ with $f(a) < 0$ and $f(b) > 0$ must be zero somewhere in $[a, b]$. The function values cannot jump from negative to positive without there being some point $x$ in $[a, b]$ where $f(x) = 0$. The Intermediate Value Theorem also relies on the completeness of the real numbers and is false for continuous functions defined only on the rationals. The function $f(x) = 3x^2 - 1$ has $f(0) = -1$ and $f(1) = 2$, but if we consider $f$ only on the rational numbers, it never equals zero. The only value of $x$ for which $f(x) = 0$ is $x = \sqrt{1/3}$, an irrational number.

We have captured the desired properties of the reals by saying that the real numbers are a complete ordered field. But we're not quite finished. Greek mathematicians in the school of Pythagoras tried to impose another property on the numbers of the real line, the condition that all numbers are ratios of integers. They learned that their effort was doomed when they discovered irrational numbers such as $\sqrt{2}$. How do we know that our efforts to specify the real numbers are not also flawed, for some unseen reason? The artist Escher drew optical illusions of spiral staircases that went up and up until they rejoined themselves at the bottom. An engineer trying to build such a staircase would find that no structure realized the plans the architect had drawn. Could it be that our design for the reals contains some subtle contradiction, and that no construction of such a number system can be made?

We resolve this issue by giving a specific description of the real numbers and verifying that the algebraic, order, and completeness properties are satisfied in this model. This

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

is called a **construction** of the reals, and just as stairs can be built with wood, stone, or steel, there are several approaches to constructing the reals. One construction treats the reals as all the infinite decimals,

$$a.d_1d_2d_3d_4\ldots$$

In this approach a real number is an integer $a$ followed by a sequence of decimal digits $d_1, d_2, d_3, \ldots$, each between 0 and 9. This sequence may stop, or repeat in a periodic pattern, or keep going forever with no pattern. In this form, $2.00$, $0.3333333\ldots$ and $3.1415926535898\ldots$ represent three familiar real numbers. The real meaning of the dots "$\ldots$" following these digits requires development of the theory of sequences and series, as in Chapter 11. Each real number is constructed as the limit of a sequence of rational numbers given by its finite decimal approximations. An infinite decimal is then the same as a series

$$a + \frac{d_1}{10} + \frac{d_2}{100} + \cdots.$$

This decimal construction of the real numbers is not entirely straightforward. It's easy enough to check that it gives numbers that satisfy the completeness and order properties, but verifying the algebraic properties is rather involved. Even adding or multiplying two numbers requires an infinite number of operations. Making sense of division requires a careful argument involving limits of rational approximations to infinite decimals.

A different approach was taken by Richard Dedekind (1831–1916), a German mathematician, who gave the first rigorous construction of the real numbers in 1872. Given any real number $x$, we can divide the rational numbers into two sets: those less than or equal to $x$ and those greater. Dedekind cleverly reversed this reasoning and defined a real number to be a division of the rational numbers into two such sets. This seems like a strange approach, but such indirect methods of constructing new structures from old are common in theoretical mathematics.

These and other approaches (see Appendix A.5) can be used to construct a system of numbers having the desired algebraic, order, and completeness properties. A final issue that arises is whether all the constructions give the same thing. Is it possible that different constructions result in different number systems satisfying all the required properties? If yes, which of these is the real numbers? Fortunately, the answer turns out to be no. The reals are the only number system satisfying the algebraic, order, and completeness properties.

Confusion about the nature of real numbers and about limits caused considerable controversy in the early development of calculus. Calculus pioneers such as Newton, Leibniz, and their successors, when looking at what happens to the difference quotient

$$\frac{\Delta y}{\Delta x} = \frac{f(x + \Delta x) - f(x)}{\Delta x}$$

as each of $\Delta y$ and $\Delta x$ approach zero, talked about the resulting derivative being a quotient of two infinitely small quantities. These "infinitesimals," written $dx$ and $dy$, were thought to be some new kind of number, smaller than any fixed number but not zero. Similarly, a definite integral was thought of as a sum of an infinite number of infinitesimals

$$f(x) \cdot dx$$

as $x$ varied over a closed interval. While the approximating difference quotients $\Delta y/\Delta x$ were understood much as today, it was the quotient of infinitesimal quantities, rather than

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

a limit, that was thought to encapsulate the meaning of the derivative. This way of thinking led to logical difficulties, as attempted definitions and manipulations of infinitesimals ran into contradictions and inconsistencies. The more concrete and computable difference quotients did not cause such trouble, but they were thought of merely as useful calculation tools. Difference quotients were used to work out the numerical value of the derivative and to derive general formulas for calculation, but were not considered to be at the heart of the question of what the derivative actually was. Today we realize that the logical problems associated with infinitesimals can be avoided by *defining* the derivative to be the limit of its approximating difference quotients. The ambiguities of the old approach are no longer present, and in the standard theory of calculus, infinitesimals are neither needed nor used.

# A.5 Complex Numbers

Complex numbers are expressions of the form $a + ib$, where $a$ and $b$ are real numbers and $i$ is a symbol for $\sqrt{-1}$. Unfortunately, the words "real" and "imaginary" have connotations that somehow place $\sqrt{-1}$ in a less favorable position in our minds than $\sqrt{2}$. As a matter of fact, a good deal of imagination, in the sense of *inventiveness*, has been required to construct the *real* number system, which forms the basis of the calculus (see Appendix A.4). In this appendix we review the various stages of this invention. The further invention of a complex number system is then presented.

## The Development of the Real Numbers

The earliest stage of number development was the recognition of the **counting numbers** $1, 2, 3, \ldots$, which we now call the **natural numbers** or the **positive integers**. Certain simple arithmetical operations can be performed with these numbers without getting outside the system. That is, the system of positive integers is **closed** under the operations of addition and multiplication. By this we mean that if $m$ and $n$ are any positive integers, then

$$m + n = p \qquad \text{and} \qquad mn = q \tag{1}$$

are also positive integers. Given the two positive integers on the left side of either equation in (1), we can find the corresponding positive integer on the right side. More than this, we can sometimes specify the positive integers $m$ and $p$ and find a positive integer $n$ such that $m + n = p$. For instance, $3 + n = 7$ can be solved when the only numbers we know are the positive integers. But the equation $7 + n = 3$ cannot be solved unless the number system is enlarged.

The number zero and the negative integers were invented to solve equations like $7 + n = 3$. In a civilization that recognizes all the **integers**

$$\ldots, -3, -2, -1, 0, 1, 2, 3, \ldots, \tag{2}$$

an educated person can always find the missing integer that solves the equation $m + n = p$ when given the other two integers in the equation.

Suppose our educated people also know how to multiply any two of the integers in the list (2). If, in Equations (1), they are given $m$ and $q$, they discover that sometimes they can find $n$ and sometimes they cannot. Using their imagination, they may be

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

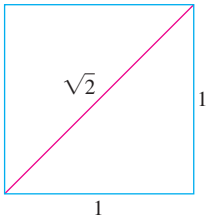

**FIGURE A.3** With a straightedge and compass, it is possible to construct a segment of irrational length.

inspired to invent still more numbers and introduce fractions, which are just ordered pairs $m/n$ of integers $m$ and $n$. The number zero has special properties that may bother them for a while, but they ultimately discover that it is handy to have all ratios of integers $m/n$, excluding only those having zero in the denominator. This system, called the set of **rational numbers**, is now rich enough for them to perform the **rational operations** of arithmetic:

**1. (a)** addition
**(b)** subtraction

**2. (a)** multiplication
**(b)** division

on any two numbers in the system, *except that they cannot divide by zero* because it is meaningless.

The geometry of the unit square (Figure A.3) and the Pythagorean theorem showed that they could construct a geometric line segment that, in terms of some basic unit of length, has length equal to $\sqrt{2}$. Thus they could solve the equation

$$x^2 = 2$$

by a geometric construction. But then they discovered that the line segment representing $\sqrt{2}$ is an incommensurable quantity. This means that $\sqrt{2}$ cannot be expressed as the ratio of two *integer* multiples of some unit of length. That is, our educated people could not find a rational number solution of the equation $x^2 = 2$.

There *is* no rational number whose square is 2. To see why, suppose that there were such a rational number. Then we could find integers $p$ and $q$ with no common factor other than 1, and such that

$$p^2 = 2q^2. \tag{3}$$

Since $p$ and $q$ are integers, $p$ must be even; otherwise its product with itself would be odd. In symbols, $p = 2p_1$, where $p_1$ is an integer. This leads to $2p_1^2 = q^2$ which says $q$ must be even, say $q = 2q_1$, where $q_1$ is an integer. This makes 2 a factor of both $p$ and $q$, contrary to our choice of $p$ and $q$ as integers with no common factor other than 1. Hence there is no rational number whose square is 2.

Although our educated people could not find a rational solution of the equation $x^2 = 2$, they could get a sequence of rational numbers

$$\frac{1}{1}, \quad \frac{7}{5}, \quad \frac{41}{29}, \quad \frac{239}{169}, \quad \cdots, \tag{4}$$

whose squares form a sequence

$$\frac{1}{1}, \quad \frac{49}{25}, \quad \frac{1681}{841}, \quad \frac{57{,}121}{28{,}561}, \quad \cdots, \tag{5}$$

that converges to 2 as its limit. This time their imagination suggested that they needed the concept of a limit of a sequence of rational numbers. If we accept the fact that an increasing sequence that is bounded from above always approaches a limit (Theorem 6, Section 11.1) and observe that the sequence in (4) has these properties, then we want it to have a limit $L$. This would also mean, from (5), that $L^2 = 2$, and hence $L$ is *not* one of our rational numbers. If to the rational numbers we further add the limits of all bounded increasing sequences of rational numbers, we arrive at the system of all "real" numbers. The word *real* is placed in quotes because there is nothing that is either "more real" or "less real" about this system than there is about any other mathematical system.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## The Complex Numbers

Imagination was called upon at many stages during the development of the real number system. In fact, the art of invention was needed at least three times in constructing the systems we have discussed so far:

1. The *first invented* system: the set of *all integers* as constructed from the counting numbers.
2. The *second invented* system: the set of *rational numbers* $m/n$ as constructed from the integers.
3. The *third invented* system: the set of all *real numbers* $x$ as constructed from the rational numbers.

These invented systems form a hierarchy in which each system contains the previous system. Each system is also richer than its predecessor in that it permits additional operations to be performed without going outside the system:

1. In the system of all integers, we can solve all equations of the form
$$x + a = 0, \tag{6}$$
where $a$ can be any integer.
2. In the system of all rational numbers, we can solve all equations of the form
$$ax + b = 0, \tag{7}$$
provided $a$ and $b$ are rational numbers and $a \neq 0$.
3. In the system of all real numbers, we can solve all of Equations (6) and (7) and, in addition, all quadratic equations
$$ax^2 + bx + c = 0 \quad \text{having} \quad a \neq 0 \quad \text{and} \quad b^2 - 4ac \geq 0. \tag{8}$$

You are probably familiar with the formula that gives the solutions of Equation (8), namely,
$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}, \tag{9}$$
and are familiar with the further fact that when the discriminant, $b^2 - 4ac$, is negative, the solutions in Equation (9) do *not* belong to any of the systems discussed above. In fact, the very simple quadratic equation
$$x^2 + 1 = 0$$
is impossible to solve if the only number systems that can be used are the three invented systems mentioned so far.

Thus we come to the *fourth invented* system, the set of *all complex numbers* $a + ib$. We could dispense entirely with the symbol $i$ and use the ordered pair notation $(a, b)$. Since, under algebraic operations, the numbers $a$ and $b$ are treated somewhat differently, it is essential to keep the *order* straight. We therefore might say that the **complex number system** consists of the set of all ordered pairs of real numbers $(a, b)$, together with the rules by which they are to be equated, added, multiplied, and so on, listed below. We will use both the $(a, b)$ notation and the notation $a + ib$ in the discussion that follows. We call $a$ the **real part** and $b$ the **imaginary part** of the complex number $(a, b)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We make the following definitions.

| | |
|---|---|
| *Equality* | |
| $a + ib = c + id$ if and only if $a = c$ and $b = d$. | Two complex numbers $(a, b)$ and $(c, d)$ are *equal* if and only if $a = c$ and $b = d$. |
| *Addition* | |
| $(a + ib) + (c + id) = (a + c) + i(b + d)$ | The *sum* of the two complex numbers $(a, b)$ and $(c, d)$ is the complex number $(a + c, b + d)$. |
| *Multiplication* | |
| $(a + ib)(c + id) = (ac - bd) + i(ad + bc)$ | The *product* of two complex numbers $(a, b)$ and $(c, d)$ is the complex number $(ac - bd, ad + bc)$. |
| $c(a + ib) = ac + i(bc)$ | The product of a real number $c$ and the complex number $(a, b)$ is the complex number $(ac, bc)$. |

The set of all complex numbers $(a, b)$ in which the second number $b$ is zero has all the properties of the set of real numbers $a$. For example, addition and multiplication of $(a, 0)$ and $(c, 0)$ give

$$(a, 0) + (c, 0) = (a + c, 0),$$

$$(a, 0) \cdot (c, 0) = (ac, 0),$$

which are numbers of the same type with imaginary part equal to zero. Also, if we multiply a "real number" $(a, 0)$ and the complex number $(c, d)$, we get

$$(a, 0) \cdot (c, d) = (ac, ad) = a(c, d).$$

In particular, the complex number $(0, 0)$ plays the role of *zero* in the complex number system, and the complex number $(1, 0)$ plays the role of *unity* or *one*.

The number pair $(0, 1)$, which has real part equal to zero and imaginary part equal to one, has the property that its square,

$$(0, 1)(0, 1) = (-1, 0),$$

has real part equal to minus one and imaginary part equal to zero. Therefore, in the system of complex numbers $(a, b)$ there is a number $x = (0, 1)$ whose square can be added to unity $= (1, 0)$ to produce zero $= (0, 0)$, that is,

$$(0, 1)^2 + (1, 0) = (0, 0).$$

The equation

$$x^2 + 1 = 0$$

therefore has a solution $x = (0, 1)$ in this new number system.

You are probably more familiar with the $a + ib$ notation than you are with the notation $(a, b)$. And since the laws of algebra for the ordered pairs enable us to write

$$(a, b) = (a, 0) + (0, b) = a(1, 0) + b(0, 1),$$

while $(1, 0)$ behaves like unity and $(0, 1)$ behaves like a square root of minus one, we need not hesitate to write $a + ib$ in place of $(a, b)$. The $i$ associated with $b$ is like a tracer element

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

that tags the imaginary part of $a + ib$. We can pass at will from the realm of ordered pairs $(a, b)$ to the realm of expressions $a + ib$, and conversely. But there is nothing less "real" about the symbol $(0, 1) = i$ than there is about the symbol $(1, 0) = 1$, once we have learned the laws of algebra in the complex number system of ordered pairs $(a, b)$.

To reduce any rational combination of complex numbers to a single complex number, we apply the laws of elementary algebra, replacing $i^2$ wherever it appears by $-1$. Of course, we cannot divide by the complex number $(0, 0) = 0 + i0$. But if $a + ib \neq 0$, then we may carry out a division as follows:

$$\frac{c + id}{a + ib} = \frac{(c + id)(a - ib)}{(a + ib)(a - ib)} = \frac{(ac + bd) + i(ad - bc)}{a^2 + b^2}.$$

The result is a complex number $x + iy$ with

$$x = \frac{ac + bd}{a^2 + b^2}, \qquad y = \frac{ad - bc}{a^2 + b^2},$$

and $a^2 + b^2 \neq 0$, since $a + ib = (a, b) \neq (0, 0)$.

The number $a - ib$ that is used as multiplier to clear the $i$ from the denominator is called the **complex conjugate** of $a + ib$. It is customary to use $\bar{z}$ (read "$z$ bar") to denote the complex conjugate of $z$; thus

$$z = a + ib, \qquad \bar{z} = a - ib.$$

Multiplying the numerator and denominator of the fraction $(c + id)/(a + ib)$ by the complex conjugate of the denominator will always replace the denominator by a real number.

**EXAMPLE 1** Arithmetic Operations with Complex Numbers

**(a)** $(2 + 3i) + (6 - 2i) = (2 + 6) + (3 - 2)i = 8 + i$

**(b)** $(2 + 3i) - (6 - 2i) = (2 - 6) + (3 - (-2))i = -4 + 5i$

**(c)** $(2 + 3i)(6 - 2i) = (2)(6) + (2)(-2i) + (3i)(6) + (3i)(-2i)$

$$= 12 - 4i + 18i - 6i^2 = 12 + 14i + 6 = 18 + 14i$$

**(d)** $$\frac{2 + 3i}{6 - 2i} = \frac{2 + 3i}{6 - 2i}\frac{6 + 2i}{6 + 2i}$$

$$= \frac{12 + 4i + 18i + 6i^2}{36 + 12i - 12i - 4i^2}$$

$$= \frac{6 + 22i}{40} = \frac{3}{20} + \frac{11}{20}i$$

■

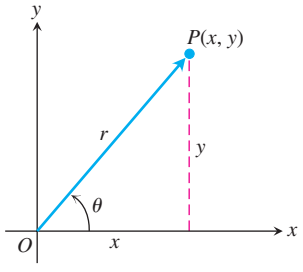

**FIGURE A.4** This Argand diagram represents $z = x + iy$ both as a point $P(x, y)$ and as a vector $\overrightarrow{OP}$.

## Argand Diagrams

There are two geometric representations of the complex number $z = x + iy$:

1. as the point $P(x, y)$ in the $xy$-plane
2. as the vector $\overrightarrow{OP}$ from the origin to $P$.

In each representation, the $x$-axis is called the **real axis** and the $y$-axis is the **imaginary axis**. Both representations are **Argand diagrams** for $x + iy$ (Figure A.4).

In terms of the polar coordinates of $x$ and $y$, we have

$$x = r\cos\theta, \qquad y = r\sin\theta,$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

and

$$z = x + iy = r(\cos\theta + i\sin\theta). \tag{10}$$

We define the **absolute value** of a complex number $x + iy$ to be the length $r$ of a vector $\overrightarrow{OP}$ from the origin to $P(x, y)$. We denote the absolute value by vertical bars; thus,

$$|x + iy| = \sqrt{x^2 + y^2}.$$

If we always choose the polar coordinates $r$ and $\theta$ so that $r$ is nonnegative, then

$$r = |x + iy|.$$

The polar angle $\theta$ is called the **argument** of $z$ and is written $\theta = \arg z$. Of course, any integer multiple of $2\pi$ may be added to $\theta$ to produce another appropriate angle.

The following equation gives a useful formula connecting a complex number $z$, its conjugate $\bar{z}$, and its absolute value $|z|$, namely,

$$z \cdot \bar{z} = |z|^2.$$

## Euler's Formula

The identity

$$e^{i\theta} = \cos\theta + i\sin\theta,$$

called **Euler's formula**, enables us to rewrite Equation (10) as

$$z = re^{i\theta}.$$

This formula, in turn, leads to the following rules for calculating products, quotients, powers, and roots of complex numbers. It also leads to Argand diagrams for $e^{i\theta}$. Since $\cos\theta + i\sin\theta$ is what we get from Equation (10) by taking $r = 1$, we can say that $e^{i\theta}$ is represented by a unit vector that makes an angle $\theta$ with the positive $x$-axis, as shown in Figure A.5.

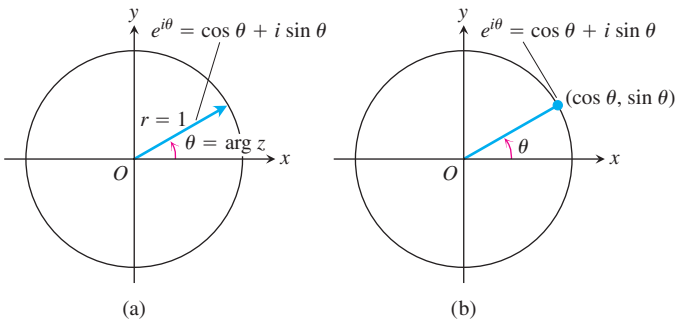

**FIGURE A.5** Argand diagrams for $e^{i\theta} = \cos\theta + i\sin\theta$ (a) as a vector and (b) as a point.

## Products

To multiply two complex numbers, we multiply their absolute values and add their angles. Let

$$z_1 = r_1 e^{i\theta_1}, \qquad z_2 = r_2 e^{i\theta_2}, \tag{11}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

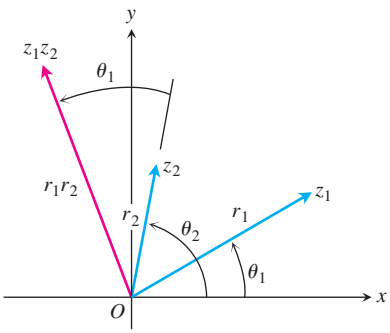

**FIGURE A.6** When $z_1$ and $z_2$ are multiplied, $|z_1z_2| = r_1 \cdot r_2$ and $\arg(z_1z_2) = \theta_1 + \theta_2$.

so that

$$|z_1| = r_1, \qquad \arg z_1 = \theta_1; \qquad |z_2| = r_2, \qquad \arg z_2 = \theta_2.$$

Then

$$z_1z_2 = r_1e^{i\theta_1} \cdot r_2e^{i\theta_2} = r_1r_2e^{i(\theta_1+\theta_2)}$$

and hence

$$\begin{aligned} |z_1z_2| &= r_1r_2 = |z_1| \cdot |z_2| \\ \arg(z_1z_2) &= \theta_1 + \theta_2 = \arg z_1 + \arg z_2. \end{aligned} \tag{12}$$

Thus, the product of two complex numbers is represented by a vector whose length is the product of the lengths of the two factors and whose argument is the sum of their arguments (Figure A.6). In particular, from Equation (12) a vector may be rotated counterclockwise through an angle $\theta$ by multiplying it by $e^{i\theta}$. Multiplication by $i$ rotates 90°, by $-1$ rotates 180°, by $-i$ rotates 270°, and so on.

**EXAMPLE 2** Finding a Product of Complex Numbers

Let $z_1 = 1 + i, z_2 = \sqrt{3} - i$. We plot these complex numbers in an Argand diagram (Figure A.7) from which we read off the polar representations

$$z_1 = \sqrt{2}e^{i\pi/4}, \qquad z_2 = 2e^{-i\pi/6}.$$

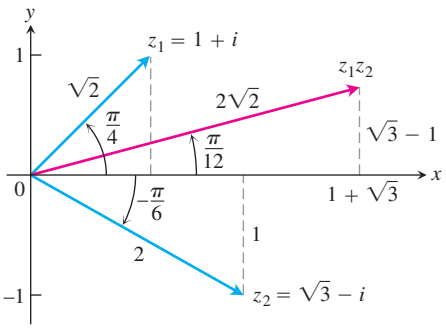

**FIGURE A.7** To multiply two complex numbers, multiply their absolute values and add their arguments.

Then

$$z_1z_2 = 2\sqrt{2}\exp\left(\frac{i\pi}{4} - \frac{i\pi}{6}\right) = 2\sqrt{2}\exp\left(\frac{i\pi}{12}\right)$$

$$= 2\sqrt{2}\left(\cos\frac{\pi}{12} + i\sin\frac{\pi}{12}\right) \approx 2.73 + 0.73i.$$

The notation $\exp(A)$ stands for $e^A$. ■

## Quotients

Suppose $r_2 \neq 0$ in Equation (11). Then

$$\frac{z_1}{z_2} = \frac{r_1e^{i\theta_1}}{r_2e^{i\theta_2}} = \frac{r_1}{r_2}e^{i(\theta_1-\theta_2)}.$$

Hence

$$\left|\frac{z_1}{z_2}\right| = \frac{r_1}{r_2} = \frac{|z_1|}{|z_2|} \quad \text{and} \quad \arg\left(\frac{z_1}{z_2}\right) = \theta_1 - \theta_2 = \arg z_1 - \arg z_2.$$

That is, we divide lengths and subtract angles for the quotient of complex numbers.

**EXAMPLE 3** Let $z_1 = 1 + i$ and $z_2 = \sqrt{3} - i$, as in Example 2. Then

$$\frac{1+i}{\sqrt{3}-i} = \frac{\sqrt{2}e^{i\pi/4}}{2e^{-i\pi/6}} = \frac{\sqrt{2}}{2}e^{5\pi i/12} \approx 0.707\left(\cos\frac{5\pi}{12} + i\sin\frac{5\pi}{12}\right)$$

$$\approx 0.183 + 0.683i.$$

■

## Powers

If $n$ is a positive integer, we may apply the product formulas in Equation (12) to find

$$z^n = z \cdot z \cdot \cdots \cdot z. \qquad n \text{ factors}$$

With $z = re^{i\theta}$, we obtain

$$z^n = (re^{i\theta})^n = r^n e^{i(\theta+\theta+\cdots+\theta)} \qquad n \text{ summands}$$

$$= r^n e^{in\theta}. \tag{13}$$

The length $r = |z|$ is raised to the $n$th power and the angle $\theta = \arg z$ is multiplied by $n$.

If we take $r = 1$ in Equation (13), we obtain De Moivre's Theorem.

**De Moivre's Theorem**

$$(\cos\theta + i\sin\theta)^n = \cos n\theta + i\sin n\theta. \tag{14}$$

If we expand the left side of De Moivre's equation above by the Binomial Theorem and reduce it to the form $a + ib$, we obtain formulas for $\cos n\theta$ and $\sin n\theta$ as polynomials of degree $n$ in $\cos\theta$ and $\sin\theta$.

**EXAMPLE 4** If $n = 3$ in Equation (14), we have

$$(\cos\theta + i\sin\theta)^3 = \cos 3\theta + i\sin 3\theta.$$

The left side of this equation expands to

$$\cos^3\theta + 3i\cos^2\theta\sin\theta - 3\cos\theta\sin^2\theta - i\sin^3\theta.$$

The real part of this must equal $\cos 3\theta$ and the imaginary part must equal $\sin 3\theta$. Therefore,

$$\cos 3\theta = \cos^3\theta - 3\cos\theta\sin^2\theta,$$

$$\sin 3\theta = 3\cos^2\theta\sin\theta - \sin^3\theta. \qquad \blacksquare$$

## Roots

If $z = re^{i\theta}$ is a complex number different from zero and $n$ is a positive integer, then there are precisely $n$ different complex numbers $w_0, w_1, \ldots, w_{n-1}$, that are $n$th roots of $z$. To see why, let $w = \rho e^{i\alpha}$ be an $n$th root of $z = re^{i\theta}$, so that

$$w^n = z$$

or

$$\rho^n e^{in\alpha} = re^{i\theta}.$$

Then

$$\rho = \sqrt[n]{r}$$

is the real, positive $n$th root of $r$. For the argument, although we cannot say that $n\alpha$ and $\theta$ must be equal, we can say that they may differ only by an integer multiple of $2\pi$. That is,

$$n\alpha = \theta + 2k\pi, \qquad k = 0, \pm 1, \pm 2, \ldots.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

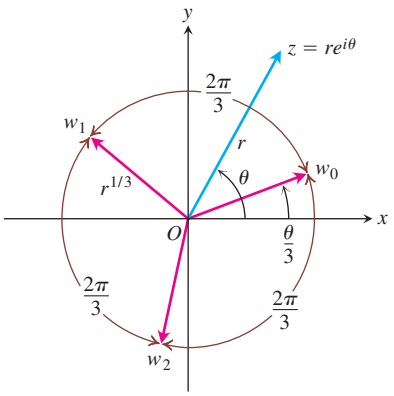

**FIGURE A.8** The three cube roots of $z = re^{i\theta}$.

Therefore,

$$\alpha = \frac{\theta}{n} + k\frac{2\pi}{n}.$$

Hence, all the $n$th roots of $z = re^{i\theta}$ are given by

$$\sqrt[n]{re^{i\theta}} = \sqrt[n]{r}\exp i\left(\frac{\theta}{n} + k\frac{2\pi}{n}\right), \qquad k = 0, \pm 1, \pm 2, \ldots . \tag{15}$$

There might appear to be infinitely many different answers corresponding to the infinitely many possible values of $k$, but $k = n + m$ gives the same answer as $k = m$ in Equation (15). Thus, we need only take $n$ consecutive values for $k$ to obtain all the different $n$th roots of $z$. For convenience, we take

$$k = 0, 1, 2, \ldots, n - 1.$$

All the $n$th roots of $re^{i\theta}$ lie on a circle centered at the origin and having radius equal to the real, positive $n$th root of $r$. One of them has argument $\alpha = \theta/n$. The others are uniformly spaced around the circle, each being separated from its neighbors by an angle equal to $2\pi/n$. Figure A.8 illustrates the placement of the three cube roots, $w_0$, $w_1$, $w_2$, of the complex number $z = re^{i\theta}$.

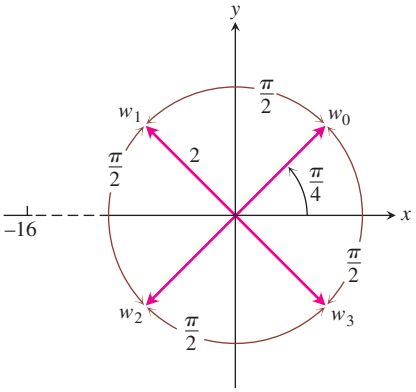

**FIGURE A.9** The four fourth roots of $-16$.

### EXAMPLE 5 Finding Fourth Roots

Find the four fourth roots of $-16$.

**Solution** As our first step, we plot the number $-16$ in an Argand diagram (Figure A.9) and determine its polar representation $re^{i\theta}$. Here, $z = -16$, $r = +16$, and $\theta = \pi$. One of the fourth roots of $16e^{i\pi}$ is $2e^{i\pi/4}$. We obtain others by successive additions of $2\pi/4 = \pi/2$ to the argument of this first one. Hence,

$$\sqrt[4]{16\exp i\pi} = 2\exp i\left(\frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}\right),$$

and the four roots are

$$w_0 = 2\left[\cos\frac{\pi}{4} + i\sin\frac{\pi}{4}\right] = \sqrt{2}(1 + i)$$

$$w_1 = 2\left[\cos\frac{3\pi}{4} + i\sin\frac{3\pi}{4}\right] = \sqrt{2}(-1 + i)$$

$$w_2 = 2\left[\cos\frac{5\pi}{4} + i\sin\frac{5\pi}{4}\right] = \sqrt{2}(-1 - i)$$

$$w_3 = 2\left[\cos\frac{7\pi}{4} + i\sin\frac{7\pi}{4}\right] = \sqrt{2}(1 - i).$$

■

## The Fundamental Theorem of Algebra

One might say that the invention of $\sqrt{-1}$ is all well and good and leads to a number system that is richer than the real number system alone; but where will this process end? Are

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

we also going to invent still more systems so as to obtain $\sqrt[4]{-1}$, $\sqrt[6]{-1}$, and so on? But it turns out this is not necessary. These numbers are already expressible in terms of the complex number system $a + ib$. In fact, the Fundamental Theorem of Algebra says that with the introduction of the complex numbers we now have enough numbers to factor every polynomial into a product of linear factors and so enough numbers to solve every possible polynomial equation.

**The Fundamental Theorem of Algebra**

Every polynomial equation of the form

$$a_n z^n + a_{n-1} z^{n-1} + \cdots + a_1 z + a_0 = 0,$$

in which the coefficients $a_0, a_1, \ldots, a_n$ are any complex numbers, whose degree $n$ is greater than or equal to one, and whose leading coefficient $a_n$ is not zero, has exactly $n$ roots in the complex number system, provided each multiple root of multiplicity $m$ is counted as $m$ roots.

A proof of this theorem can be found in almost any text on the theory of functions of a complex variable.

## Operations with Complex Numbers

**1. How computers multiply complex numbers** Find $(a, b) \cdot (c, d) = (ac - bd, ad + bc)$.

**a.** $(2, 3) \cdot (4, -2)$ **b.** $(2, -1) \cdot (-2, 3)$

**c.** $(-1, -2) \cdot (2, 1)$

(This is how complex numbers are multiplied by computers.)

**2.** Solve the following equations for the real numbers, $x$ and $y$.

**a.** $(3 + 4i)^2 - 2(x - iy) = x + iy$

**b.** $\left(\dfrac{1 + i}{1 - i}\right)^2 + \dfrac{1}{x + iy} = 1 + i$

**c.** $(3 - 2i)(x + iy) = 2(x - 2iy) + 2i - 1$

## Graphing and Geometry

**3.** How may the following complex numbers be obtained from $z = x + iy$ geometrically? Sketch.

**a.** $\bar{z}$ **b.** $\overline{(-z)}$

**c.** $-z$ **d.** $1/z$

**4.** Show that the distance between the two points $z_1$ and $z_2$ in an Argand diagram is $|z_1 - z_2|$.

In Exercises 5–10, graph the points $z = x + iy$ that satisfy the given conditions.

**5. a.** $|z| = 2$ **b.** $|z| < 2$ **c.** $|z| > 2$

**6.** $|z - 1| = 2$ **7.** $|z + 1| = 1$

**8.** $|z + 1| = |z - 1|$ **9.** $|z + i| = |z - 1|$

**10.** $|z + 1| \geq |z|$

Express the complex numbers in Exercises 11–14 in the form $re^{i\theta}$, with $r \geq 0$ and $-\pi < \theta \leq \pi$. Draw an Argand diagram for each calculation.

**11.** $\left(1 + \sqrt{-3}\right)^2$ **12.** $\dfrac{1 + i}{1 - i}$

**13.** $\dfrac{1 + i\sqrt{3}}{1 - i\sqrt{3}}$ **14.** $(2 + 3i)(1 - 2i)$

## Powers and Roots

Use De Moivre's Theorem to express the trigonometric functions in Exercises 15 and 16 in terms of $\cos\theta$ and $\sin\theta$.

# A.6 The Distributive Law for Vector Cross Products

In this appendix, we prove the Distributive Law

$$\mathbf{u} \times (\mathbf{v} + \mathbf{w}) = \mathbf{u} \times \mathbf{v} + \mathbf{u} \times \mathbf{w}$$

which is Property 2 in Section 12.4.

**Proof** To derive the Distributive Law, we construct $\mathbf{u} \times \mathbf{v}$ a new way. We draw $\mathbf{u}$ and $\mathbf{v}$ from the common point $O$ and construct a plane $M$ perpendicular to $\mathbf{u}$ at $O$ (Figure A.10). We then project $\mathbf{v}$ orthogonally onto $M$, yielding a vector $\mathbf{v}'$ with length $|\mathbf{v}| \sin\theta$. We rotate $\mathbf{v}'$ 90° about $\mathbf{u}$ in the positive sense to produce a vector $\mathbf{v}''$. Finally, we multiply $\mathbf{v}''$ by the

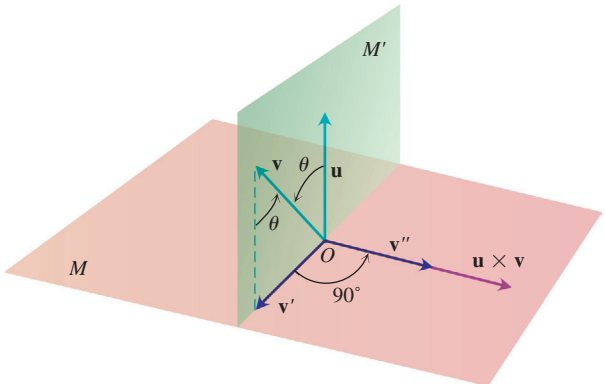

**FIGURE A.10** As explained in the text, $\mathbf{u} \times \mathbf{v} = |\mathbf{u}|\mathbf{v}''$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

length of $\mathbf{u}$. The resulting vector $|\mathbf{u}|\mathbf{v}''$ is equal to $\mathbf{u} \times \mathbf{v}$ since $\mathbf{v}''$ has the same direction as $\mathbf{u} \times \mathbf{v}$ by its construction (Figure A.10) and

$$|\mathbf{u}||\mathbf{v}''| = |\mathbf{u}||\mathbf{v}'| = |\mathbf{u}||\mathbf{v}| \sin\theta = |\mathbf{u} \times \mathbf{v}|.$$

Now each of these three operations, namely,

1. projection onto $M$
2. rotation about $\mathbf{u}$ through 90°
3. multiplication by the scalar $|\mathbf{u}|$

when applied to a triangle whose plane is not parallel to $\mathbf{u}$, will produce another triangle. If we start with the triangle whose sides are $\mathbf{v}$, $\mathbf{w}$, and $\mathbf{v} + \mathbf{w}$ (Figure A.11) and apply these three steps, we successively obtain the following:

1. A triangle whose sides are $\mathbf{v}'$, $\mathbf{w}'$, and $(\mathbf{v} + \mathbf{w})'$ satisfying the vector equation
$$\mathbf{v}' + \mathbf{w}' = (\mathbf{v} + \mathbf{w})'$$

2. A triangle whose sides are $\mathbf{v}''$, $\mathbf{w}''$, and $(\mathbf{v} + \mathbf{w})''$ satisfying the vector equation
$$\mathbf{v}'' + \mathbf{w}'' = (\mathbf{v} + \mathbf{w})''$$
(the double prime on each vector has the same meaning as in Figure A.10)

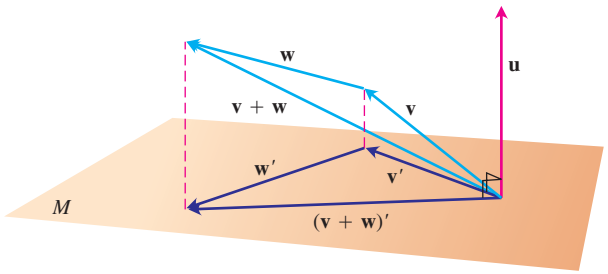

**FIGURE A.11** The vectors, $\mathbf{v}$, $\mathbf{w}$, $\mathbf{v} + \mathbf{w}$, and their projections onto a plane perpendicular to $\mathbf{u}$.

3. A triangle whose sides are $|\mathbf{u}|\mathbf{v}''$, $|\mathbf{u}|\mathbf{w}''$, and $|\mathbf{u}|(\mathbf{v} + \mathbf{w})''$ satisfying the vector equation
$$|\mathbf{u}|\mathbf{v}'' + |\mathbf{u}|\mathbf{w}'' = |\mathbf{u}|(\mathbf{v} + \mathbf{w})''.$$

Substituting $|\mathbf{u}|\mathbf{v}'' = \mathbf{u} \times \mathbf{v}$, $|\mathbf{u}|\mathbf{w}'' = \mathbf{u} \times \mathbf{w}$, and $|\mathbf{u}|(\mathbf{v} + \mathbf{w})'' = \mathbf{u} \times (\mathbf{v} + \mathbf{w})$ from our discussion above into this last equation gives

$$\mathbf{u} \times \mathbf{v} + \mathbf{u} \times \mathbf{w} = \mathbf{u} \times (\mathbf{v} + \mathbf{w}),$$

which is the law we wanted to establish. ■

# A.7 The Mixed Derivative Theorem and the Increment Theorem

This appendix derives the Mixed Derivative Theorem (Theorem 2, Section 14.3) and the Increment Theorem for Functions of Two Variables (Theorem 3, Section 14.3). Euler first published the Mixed Derivative Theorem in 1734, in a series of papers he wrote on hydrodynamics.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**THEOREM 2 The Mixed Derivative Theorem**

If $f(x, y)$ and its partial derivatives $f_x$, $f_y$, $f_{xy}$, and $f_{yx}$ are defined throughout an open region containing a point $(a, b)$ and are all continuous at $(a, b)$, then $f_{xy}(a, b) = f_{yx}(a, b)$.

**Proof** The equality of $f_{xy}(a, b)$ and $f_{yx}(a, b)$ can be established by four applications of the Mean Value Theorem (Theorem 4, Section 4.2). By hypothesis, the point $(a, b)$ lies in the interior of a rectangle $R$ in the $xy$-plane on which $f$, $f_x$, $f_y$, $f_{xy}$, and $f_{yx}$ are all defined. We let $h$ and $k$ be the numbers such that the point $(a + h, b + k)$ also lies in $R$, and we consider the difference

$$\Delta = F(a + h) - F(a), \tag{1}$$

where

$$F(x) = f(x, b + k) - f(x, b). \tag{2}$$

We apply the Mean Value Theorem to $F$, which is continuous because it is differentiable. Then Equation (1) becomes

$$\Delta = hF'(c_1), \tag{3}$$

where $c_1$ lies between $a$ and $a + h$. From Equation (2).

$$F'(x) = f_x(x, b + k) - f_x(x, b),$$

so Equation (3) becomes

$$\Delta = h[f_x(c_1, b + k) - f_x(c_1, b)]. \tag{4}$$

Now we apply the Mean Value Theorem to the function $g(y) = f_x(c_1, y)$ and have

$$g(b + k) - g(b) = kg'(d_1),$$

or

$$f_x(c_1, b + k) - f_x(c_1, b) = kf_{xy}(c_1, d_1)$$

for some $d_1$ between $b$ and $b + k$. By substituting this into Equation (4), we get

$$\Delta = hkf_{xy}(c_1, d_1) \tag{5}$$

for some point $(c_1, d_1)$ in the rectangle $R'$ whose vertices are the four points $(a, b)$, $(a + h, b)$, $(a + h, b + k)$, and $(a, b + k)$. (See Figure A.12.)

By substituting from Equation (2) into Equation (1), we may also write

$$\begin{aligned}\Delta &= f(a + h, b + k) - f(a + h, b) - f(a, b + k) + f(a, b)\\ &= [f(a + h, b + k) - f(a, b + k)] - [f(a + h, b) - f(a, b)]\\ &= \phi(b + k) - \phi(b),\end{aligned} \tag{6}$$

where

$$\phi(y) = f(a + h, y) - f(a, y). \tag{7}$$

The Mean Value Theorem applied to Equation (6) now gives

$$\Delta = k\phi'(d_2) \tag{8}$$

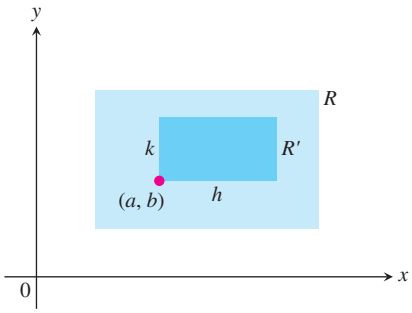

**FIGURE A.12** The key to proving $f_{xy}(a, b) = f_{yx}(a, b)$ is that no matter how small $R'$ is, $f_{xy}$ and $f_{yx}$ take on equal values somewhere inside $R'$ (although not necessarily at the same point).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

for some $d_2$ between $b$ and $b + k$. By Equation (7),

$$\phi'(y) = f_y(a + h, y) - f_y(a, y). \tag{9}$$

Substituting from Equation (9) into Equation (8) gives

$$\Delta = k[f_y(a + h, d_2) - f_y(a, d_2)].$$

Finally, we apply the Mean Value Theorem to the expression in brackets and get

$$\Delta = khf_{yx}(c_2, d_2) \tag{10}$$

for some $c_2$ between $a$ and $a + h$.

Together, Equations (5) and (10) show that

$$f_{xy}(c_1, d_1) = f_{yx}(c_2, d_2), \tag{11}$$

where $(c_1, d_1)$ and $(c_2, d_2)$ both lie in the rectangle $R'$ (Figure A.12). Equation (11) is not quite the result we want, since it says only that $f_{xy}$ has the same value at $(c_1, d_1)$ that $f_{yx}$ has at $(c_2, d_2)$. The numbers $h$ and $k$ in our discussion, however, may be made as small as we wish. The hypothesis that $f_{xy}$ and $f_{yx}$ are both continuous at $(a, b)$ means that $f_{xy}(c_1, d_1) = f_{xy}(a, b) + \epsilon_1$ and $f_{yx}(c_2, d_2) = f_{yx}(a, b) + \epsilon_2$, where each of $\epsilon_1, \epsilon_2 \to 0$ as both $h, k \to 0$. Hence, if we let $h$ and $k \to 0$, we have $f_{xy}(a, b) = f_{yx}(a, b)$. ■

The equality of $f_{xy}(a, b)$ and $f_{yx}(a, b)$ can be proved with hypotheses weaker than the ones we assumed. For example, it is enough for $f$, $f_x$, and $f_y$ to exist in $R$ and for $f_{xy}$ to be continuous at $(a, b)$. Then $f_{yx}$ will exist at $(a, b)$ and equal $f_{xy}$ at that point.

**THEOREM 3 The Increment Theorem for Functions of Two Variables**

Suppose that the first partial derivatives of $z = f(x, y)$ are defined throughout an open region $R$ containing the point $(x_0, y_0)$ and that $f_x$ and $f_y$ are continuous at $(x_0, y_0)$. Then the change $\Delta z = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0)$ in the value of $f$ that results from moving from $(x_0, y_0)$ to another point $(x_0 + \Delta x, y_0 + \Delta y)$ in $R$ satisfies an equation of the form

$$\Delta z = f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \epsilon_1 \Delta x + \epsilon_2 \Delta y,$$

in which each of $\epsilon_1, \epsilon_2 \to 0$ as both $\Delta x, \Delta y \to 0$.

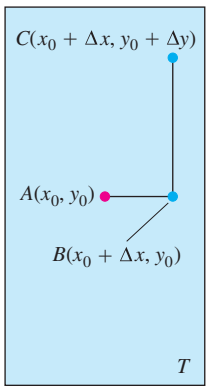

**FIGURE A.13** The rectangular region $T$ in the proof of the Increment Theorem. The figure is drawn for $\Delta x$ and $\Delta y$ positive, but either increment might be zero or negative.

**Proof** We work within a rectangle $T$ centered at $A(x_0, y_0)$ and lying within $R$, and we assume that $\Delta x$ and $\Delta y$ are already so small that the line segment joining $A$ to $B(x_0 + \Delta x, y_0)$ and the line segment joining $B$ to $C(x_0 + \Delta x, y_0 + \Delta y)$ lie in the interior of $T$ (Figure A.13).

We may think of $\Delta z$ as the sum $\Delta z = \Delta z_1 + \Delta z_2$ of two increments, where

$$\Delta z_1 = f(x_0 + \Delta x, y_0) - f(x_0, y_0)$$

is the change in the value of $f$ from $A$ to $B$ and

$$\Delta z_2 = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0 + \Delta x, y_0)$$

is the change in the value of $f$ from $B$ to $C$ (Figure A.14).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

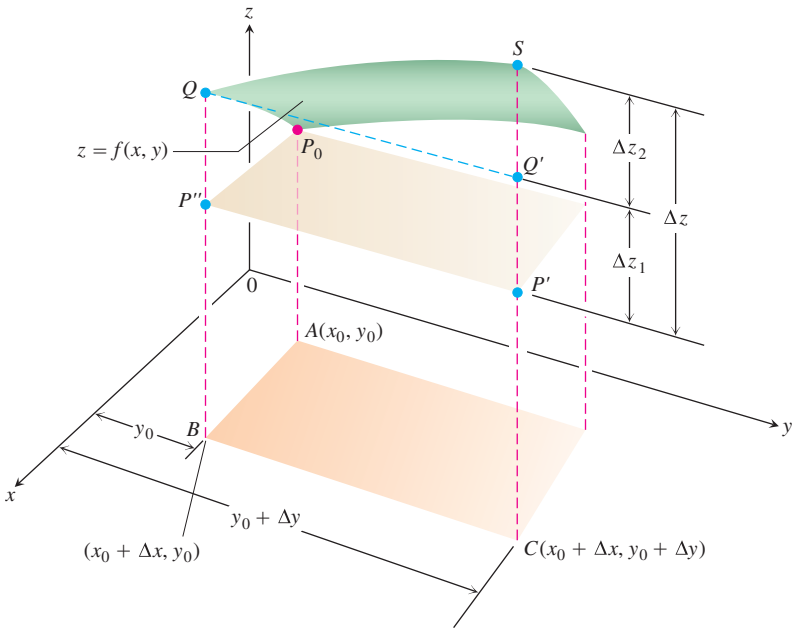

**FIGURE A.14** Part of the surface $z = f(x, y)$ near $P_0(x_0, y_0, f(x_0, y_0))$. The points $P_0$, $P'$, and $P''$ have the same height $z_0 = f(x_0, y_0)$ above the $xy$-plane. The change in $z$ is $\Delta z = P'S$. The change

$$\Delta z_1 = f(x_0 + \Delta x, y_0) - f(x_0, y_0),$$

shown as $P''Q = P'Q'$, is caused by changing $x$ from $x_0$ to $x_0 + \Delta x$ while holding $y$ equal to $y_0$. Then, with $x$ held equal to $x_0 + \Delta x$,

$$\Delta z_2 = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0 + \Delta x, y_0)$$

is the change in $z$ caused by changing $y_0$ from $y_0 + \Delta y$, which is represented by $Q'S$? The total change in $z$ is the sum of $\Delta z_1$ and $\Delta z_2$.

On the closed interval of $x$-values joining $x_0$ to $x_0 + \Delta x$, the function $F(x) = f(x, y_0)$ is a differentiable (and hence continuous) function of $x$, with derivative

$$F'(x) = f_x(x, y_0).$$

By the Mean Value Theorem (Theorem 4, Section 4.2), there is an $x$-value $c$ between $x_0$ and $x_0 + \Delta x$ at which

$$F(x_0 + \Delta x) - F(x_0) = F'(c)\Delta x$$

or

$$f(x_0 + \Delta x, y_0) - f(x_0, y_0) = f_x(c, y_0)\Delta x$$

or

$$\Delta z_1 = f_x(c, y_0)\Delta x. \tag{12}$$

Similarly, $G(y) = f(x_0 + \Delta x, y)$ is a differentiable (and hence continuous) function of $y$ on the closed $y$-interval joining $y_0$ and $y_0 + \Delta y$, with derivative

$$G'(y) = f_y(x_0 + \Delta x, y).$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Hence, there is a $y$-value $d$ between $y_0$ and $y_0 + \Delta y$ at which

$$G(y_0 + \Delta y) - G(y_0) = G'(d)\Delta y$$

or

$$f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0 + \Delta x, y) = f_y(x_0 + \Delta x, d)\Delta y$$

or

$$\Delta z_2 = f_y(x_0 + \Delta x, d)\Delta y. \tag{13}$$

Now, as both $\Delta x$ and $\Delta y \to 0$, we know that $c \to x_0$ and $d \to y_0$. Therefore, since $f_x$ and $f_y$ are continuous at $(x_0, y_0)$, the quantities

$$\begin{aligned} \epsilon_1 &= f_x(c, y_0) - f_x(x_0, y_0), \\ \epsilon_2 &= f_y(x_0 + \Delta x, d) - f_y(x_0, y_0) \end{aligned} \tag{14}$$

both approach zero as both $\Delta x$ and $\Delta y \to 0$.

Finally,

$$\begin{aligned} \Delta z &= \Delta z_1 + \Delta z_2 \\ &= f_x(c, y_0)\Delta x + f_y(x_0 + \Delta x, d)\Delta y && \text{From Equations (12) and (13)} \\ &= [f_x(x_0, y_0) + \epsilon_1]\Delta x + [f_y(x_0, y_0) + \epsilon_2]\Delta y && \text{From Equation (14)} \\ &= f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \epsilon_1\Delta x + \epsilon_2\Delta y, \end{aligned}$$

where both $\epsilon_1$ and $\epsilon_2 \to 0$ as both $\Delta x$ and $\Delta y \to 0$, which is what we set out to prove. ■

Analogous results hold for functions of any finite number of independent variables. Suppose that the first partial derivatives of $w = f(x, y, z)$ are defined throughout an open region containing the point $(x_0, y_0, z_0)$ and that $f_x$, $f_y$, and $f_z$ are continuous at $(x_0, y_0, z_0)$. Then

$$\begin{aligned} \Delta w &= f(x_0 + \Delta x, y_0 + \Delta y, z_0 + \Delta z) - f(x_0, y_0, z_0) \\ &= f_x\Delta x + f_y\Delta y + f_z\Delta z + \epsilon_1\Delta x + \epsilon_2\Delta y + \epsilon_3\Delta z, \end{aligned} \tag{15}$$

where $\epsilon_1, \epsilon_2, \epsilon_3 \to 0$ as $\Delta x$, $\Delta y$, and $\Delta z \to 0$.

The partial derivatives $f_x, f_y, f_z$ in Equation (15) are to be evaluated at the point $(x_0, y_0, z_0)$.

Equation (15) can be proved by treating $\Delta w$ as the sum of three increments,

$$\Delta w_1 = f(x_0 + \Delta x, y_0, z_0) - f(x_0, y_0, z_0) \tag{16}$$

$$\Delta w_2 = f(x_0 + \Delta x, y_0 + \Delta y, z_0) - f(x_0 + \Delta x, y_0, z_0) \tag{17}$$

$$\Delta w_3 = f(x_0 + \Delta x, y_0 + \Delta y, z_0 + \Delta z) - f(x_0 + \Delta x, y_0 + \Delta y, z_0), \tag{18}$$

and applying the Mean Value Theorem to each of these separately. Two coordinates remain constant and only one varies in each of these partial increments $\Delta w_1$, $\Delta w_2$, $\Delta w_3$. In Equation (17), for example, only $y$ varies, since $x$ is held equal to $x_0 + \Delta x$ and $z$ is held equal to $z_0$. Since $f(x_0 + \Delta x, y, z_0)$ is a continuous function of $y$ with a derivative $f_y$, it is subject to the Mean Value Theorem, and we have

$$\Delta w_2 = f_y(x_0 + \Delta x, y_1, z_0)\Delta y$$

for some $y_1$ between $y_0$ and $y_0 + \Delta y$.

# A.8 The Area of a Parallelogram's Projection on a Plane

This appendix proves the result needed in Section 16.5 that $|(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{p}|$ is the area of the projection of the parallelogram with sides determined by $\mathbf{u}$ and $\mathbf{v}$ onto any plane whose normal is $\mathbf{p}$. (See Figure A.15.)

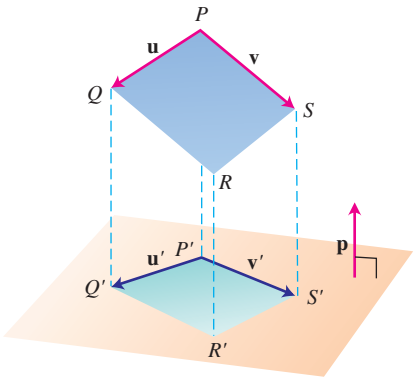

**FIGURE A.15** The parallelogram determined by two vectors $\mathbf{u}$ and $\mathbf{v}$ in space and the orthogonal projection of the parallelogram onto a plane. The projection lines, orthogonal to the plane, lie parallel to the unit normal vector $\mathbf{p}$.

**THEOREM**

The area of the orthogonal projection of the parallelogram determined by two vectors $\mathbf{u}$ and $\mathbf{v}$ in space onto a plane with unit normal vector $\mathbf{p}$ is

$$\text{Area} = |(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{p}|.$$

**Proof** In the notation of Figure A.15, which shows a typical parallelogram determined by vectors $\mathbf{u}$ and $\mathbf{v}$ and its orthogonal projection onto a plane with unit normal vector $\mathbf{p}$,

$$\begin{aligned} \mathbf{u} &= \overrightarrow{PP'} + \mathbf{u}' + \overrightarrow{Q'Q} \\ &= \mathbf{u}' + \overrightarrow{PP'} - \overrightarrow{QQ'} && (\overrightarrow{Q'Q} = -\overrightarrow{QQ'}) \\ &= \mathbf{u}' + s\mathbf{p}. && \text{(For some scalar } s \text{ because } (\overrightarrow{PP'} - \overrightarrow{QQ'}) \text{ is parallel to } \mathbf{p}) \end{aligned}$$

Similarly,

$$\mathbf{v} = \mathbf{v}' + t\mathbf{p}$$

for some scalar $t$. Hence,

$$\begin{aligned} \mathbf{u} \times \mathbf{v} &= (\mathbf{u}' + s\mathbf{p}) \times (\mathbf{v}' + t\mathbf{p}) \\ &= (\mathbf{u}' \times \mathbf{v}') + s(\mathbf{p} \times \mathbf{v}') + t(\mathbf{u}' \times \mathbf{p}) + st\underbrace{(\mathbf{p} \times \mathbf{p})}_{0}. \end{aligned} \tag{1}$$

The vectors $\mathbf{p} \times \mathbf{v}'$ and $\mathbf{u}' \times \mathbf{p}$ are both orthogonal to $\mathbf{p}$. Hence, when we dot both sides of Equation (1) with $\mathbf{p}$, the only nonzero term on the right is $(\mathbf{u}' \times \mathbf{v}') \cdot \mathbf{p}$. That is,

$$(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{p} = (\mathbf{u}' \times \mathbf{v}') \cdot \mathbf{p}.$$

In particular,

$$|(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{p}| = |(\mathbf{u}' \times \mathbf{v}') \cdot \mathbf{p}|. \tag{2}$$

The absolute value on the right is the volume of the box determined by $\mathbf{u}'$, $\mathbf{v}'$, and $\mathbf{p}$. The height of this particular box is $|\mathbf{p}| = 1$, so the box's volume is numerically the same as its base area, the area of parallelogram $P'Q'R'S'$. Combining this observation with Equation (2) gives

$$\text{Area of } P'Q'R'S' = |(\mathbf{u}' \times \mathbf{v}') \cdot \mathbf{p}| = |(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{p}|,$$

which says that the area of the orthogonal projection of the parallelogram determined by $\mathbf{u}$ and $\mathbf{v}$ onto a plane with unit normal vector $\mathbf{p}$ is $|(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{p}|$. This is what we set out to prove. ■

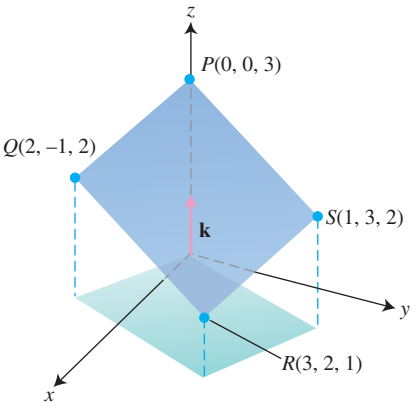

**FIGURE A.16** Example 1 calculates the area of the orthogonal projection of parallelogram $PQRS$ on the $xy$-plane.

**EXAMPLE 1** Finding the Area of a Projection

Find the area of the orthogonal projection onto the $xy$-plane of the parallelogram determined by the points $P(0, 0, 3)$, $Q(2, -1, 2)$, $R(3, 2, 1)$, and $S(1, 3, 2)$ (Figure A.16).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** With

$$\mathbf{u} = \overrightarrow{PQ} = 2\mathbf{i} - \mathbf{j} - \mathbf{k}, \qquad \mathbf{v} = \overrightarrow{PS} = \mathbf{i} + 3\mathbf{j} - \mathbf{k}, \qquad \text{and} \qquad \mathbf{p} = \mathbf{k},$$

we have

$$(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{p} = \begin{vmatrix} 2 & -1 & -1 \\ 1 & 3 & -1 \\ 0 & 0 & 1 \end{vmatrix} = \begin{vmatrix} 2 & -1 \\ 1 & 3 \end{vmatrix} = 7,$$

so the area is $|(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{p}| = |7| = 7$. ■

# A.9 Basic Algebra, Geometry, and Trigonometry Formulas

## Algebra

### Arithmetic Operations

$$a(b + c) = ab + ac, \qquad \frac{a}{b} \cdot \frac{c}{d} = \frac{ac}{bd}$$

$$\frac{a}{b} + \frac{c}{d} = \frac{ad + bc}{bd}, \qquad \frac{a/b}{c/d} = \frac{a}{b} \cdot \frac{d}{c}$$

### Laws of Signs

$$-(-a) = a, \qquad \frac{-a}{b} = -\frac{a}{b} = \frac{a}{-b}$$

**Zero** Division by zero is not defined.

$$\text{If } a \neq 0\text{: } \frac{0}{a} = 0, \quad a^0 = 1, \quad 0^a = 0$$

$$\text{For any number } a\text{: } a \cdot 0 = 0 \cdot a = 0$$

### Laws of Exponents

$$a^m a^n = a^{m+n}, \qquad (ab)^m = a^m b^m, \qquad (a^m)^n = a^{mn}, \qquad a^{m/n} = \sqrt[n]{a^m} = \left(\sqrt[n]{a}\right)^m$$

If $a \neq 0$,

$$\frac{a^m}{a^n} = a^{m-n}, \quad a^0 = 1, \quad a^{-m} = \frac{1}{a^m}.$$

**The Binomial Theorem** For any positive integer $n$,

$$(a + b)^n = a^n + na^{n-1}b + \frac{n(n-1)}{1 \cdot 2}a^{n-2}b^2 + \frac{n(n-1)(n-2)}{1 \cdot 2 \cdot 3}a^{n-3}b^3 + \cdots + nab^{n-1} + b^n.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

For instance,

$$(a+b)^2 = a^2 + 2ab + b^2, \qquad (a-b)^2 = a^2 - 2ab + b^2$$

$$(a+b)^3 = a^3 + 3a^2b + 3ab^2 + b^3, \qquad (a-b)^3 = a^2 - 3a^2b + 3ab^2 - b^3.$$

**Factoring the Difference of Like Integer Powers, $n > 1$**

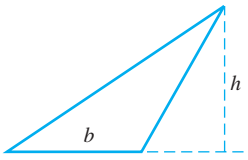
$$a^n - b^n = (a-b)(a^{n-1} + a^{n-2}b + a^{n-3}b^2 + \cdots + ab^{n-2} + b^{n-1})$$

For instance,

$$a^2 - b^2 = (a-b)(a+b),$$
$$a^3 - b^3 = (a-b)(a^2 + ab + b^2),$$
$$a^4 - b^4 = (a-b)(a^3 + a^2b + ab^2 + b^3).$$

**Completing the Square** If $a \neq 0$,

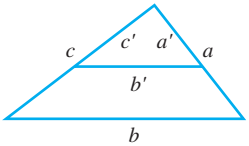
$$\begin{aligned} ax^2 + bx + c &= a\left(x^2 + \frac{b}{a}x\right) + c \\ &= a\left(x^2 + \frac{b}{a}x + \frac{b^2}{4a^2} - \frac{b^2}{4a^2}\right) + c \\ &= a\left(x^2 + \frac{b}{a}x + \frac{b^2}{4a^2}\right) + a\left(-\frac{b^2}{4a^2}\right) + c \\ &= \underbrace{a\left(x^2 + \frac{b}{a}x + \frac{b^2}{4a^2}\right)}_{\text{This is } \left(x + \frac{b}{2a}\right)^2.} + \underbrace{c - \frac{b^2}{4a}}_{\text{Call this part } C.} \\ &= au^2 + C \qquad (u = x + (b/2a)) \end{aligned}$$



**The Quadratic Formula** If $a \neq 0$ and $ax^2 + bx + c = 0$, then

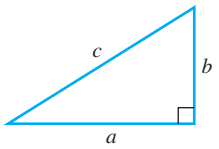
$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}.$$

## Geometry



Formulas for area, circumference, and volume: ($A$ = area, $B$ = area of base, $C$ = circumference, $S$ = lateral area or surface area, $V$ = volume)

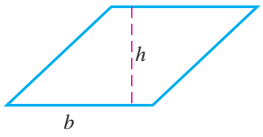
**Triangle**



$$A = \frac{1}{2}bh$$

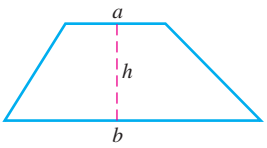
**Similar Triangles**

$$\frac{a'}{a} = \frac{b'}{b} = \frac{c'}{c}$$



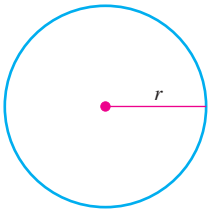
**Pythagorean Theorem**

$$a^2 + b^2 = c^2$$



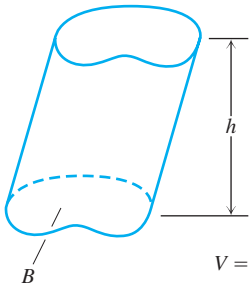
Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Parallelogram**



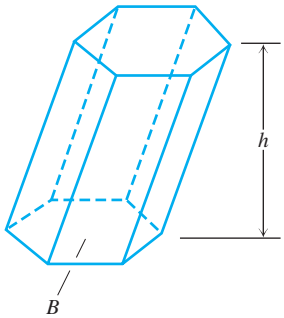
$A = bh$

**Trapezoid**

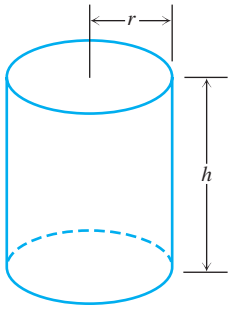


$A = \frac{1}{2}(a + b)h$

**Circle**

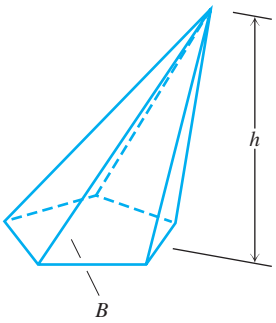


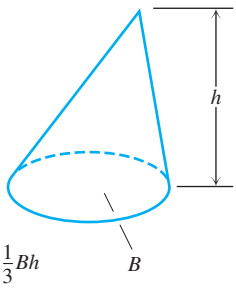
$A = \pi r^2$,
$C = 2\pi r$



**Any Cylinder or Prism with Parallel Bases**

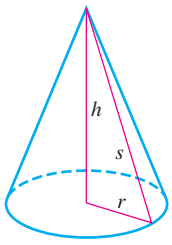
$V = Bh$



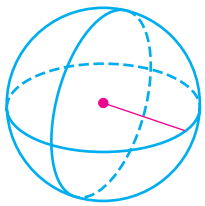


**Right Circular Cylinder**

$V = \pi r^2 h$
$S = 2\pi rh =$ Area of side



**Any Cone or Pyramid**



$V = \frac{1}{3}Bh$

**Right Circular Cone**

$V = \frac{1}{3}\pi r^2 h$
$S = \pi rs =$ Area of side

**Sphere**

$V = \frac{4}{3}\pi r^3$, $S = 4\pi r^2$

# CHAPTER 1 PRELIMINARIES

## 1.1 REAL NUMBERS AND THE REAL LINE

1. Executing long division, $\frac{1}{9} = 0.\overline{1}$, $\frac{2}{9} = 0.\overline{2}$, $\frac{3}{9} = 0.\overline{3}$, $\frac{8}{9} = 0.\overline{8}$, $\frac{9}{9} = 0.\overline{9}$

2. Executing long division, $\frac{1}{11} = 0.\overline{09}$, $\frac{2}{11} = 0.\overline{18}$, $\frac{3}{11} = 0.\overline{27}$, $\frac{9}{11} = 0.\overline{81}$, $\frac{11}{11} = 0.\overline{99}$

3. NT = necessarily true, NNT = Not necessarily true. Given: $2 < x < 6$.
   a) NNT. 5 is a counter example.
   b) NT. $2 < x < 6 \Rightarrow 2 - 2 < x - 2 < 6 - 2 \Rightarrow 0 < x - 2 < 2$.
   c) NT. $2 < x < 6 \Rightarrow 2/2 < x/2 < 6/2 \Rightarrow 1 < x < 3$.
   d) NT. $2 < x < 6 \Rightarrow 1/2 > 1/x > 1/6 \Rightarrow 1/6 < 1/x < 1/2$.
   e) NT. $2 < x < 6 \Rightarrow 1/2 > 1/x > 1/6 \Rightarrow 1/6 < 1/x < 1/2 \Rightarrow 6(1/6) < 6(1/x) < 6(1/2) \Rightarrow 1 < 6/x < 3$.
   f) NT. $2 < x < 6 \Rightarrow x < 6 \Rightarrow (x - 4) < 2$ and $2 < x < 6 \Rightarrow x > 2 \Rightarrow -x < -2 \Rightarrow -x + 4 < 2 \Rightarrow -(x - 4) < 2$.
   The pair of inequalities $(x - 4) < 2$ and $-(x - 4) < 2 \Rightarrow |x - 4| < 2$.
   g) NT. $2 < x < 6 \Rightarrow -2 > -x > -6 \Rightarrow -6 < -x < -2$. But $-2 < 2$. So $-6 < -x < -2 < 2$ or $-6 < -x < 2$.
   h) NT. $2 < x < 6 \Rightarrow -1(2) > -1(x) < -1(6) \Rightarrow -6 < -x < -2$

4. NT = necessarily true, NNT = Not necessarily true. Given: $-1 < y - 5 < 1$.
   a) NT. $-1 < y - 5 < 1 \Rightarrow -1 + 5 < y - 5 + 5 < 1 + 5 \Rightarrow 4 < y < 6$.
   b) NNT. $y = 5$ is a counter example. (Actually, never true given that $4 < y < 6$)
   c) NT. From a), $-1 < y - 5 < 1, \Rightarrow 4 < y < 6 \Rightarrow y > 4$.
   d) NT. From a), $-1 < y - 5 < 1, \Rightarrow 4 < y < 6 \Rightarrow y < 6$.
   e) NT. $-1 < y - 5 < 1 \Rightarrow -1 + 1 < y - 5 + 1 < 1 + 1 \Rightarrow 0 < y - 4 < 2$.
   f) NT. $-1 < y - 5 < 1 \Rightarrow (1/2)(-1 + 5) < (1/2)(y - 5 + 5) < (1/2)(1 + 5) \Rightarrow 2 < y/2 < 3$.
   g) NT. From a), $4 < y < 6 \Rightarrow 1/4 > 1/y > 1/6 \Rightarrow 1/6 < 1/y < 1/4$.
   h) NT. $-1 < y - 5 < 1 \Rightarrow y - 5 > -1 \Rightarrow y > 4 \Rightarrow -y < -4 \Rightarrow -y + 5 < 1 \Rightarrow -(y - 5) < 1$.
   Also, $-1 < y - 5 < 1 \Rightarrow y - 5 < 1$. The pair of inequalities $-(y - 5) < 1$ and $(y - 5) < 1 \Rightarrow |y - 5| < 1$.

5. $-2x > 4 \Rightarrow x < -2$

6. $8 - 3x \geq 5 \Rightarrow -3x \geq -3 \Rightarrow x \leq 1$

7. $5x - 3 \leq 7 - 3x \Rightarrow 8x \leq 10 \Rightarrow x \leq \frac{5}{4}$

8. $3(2 - x) > 2(3 + x) \Rightarrow 6 - 3x > 6 + 2x$
   $\Rightarrow 0 > 5x \Rightarrow 0 > x$

9. $2x - \frac{1}{2} \geq 7x + \frac{7}{6} \Rightarrow -\frac{1}{2} - \frac{7}{6} \geq 5x$
   $\Rightarrow \frac{1}{5}\left(-\frac{10}{6}\right) \geq x$ or $-\frac{1}{3} \geq x$

10. $\frac{6-x}{4} < \frac{3x-4}{2} \Rightarrow 12 - 2x < 12x - 16$
    $\Rightarrow 28 < 14x \Rightarrow 2 < x$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

11. $\frac{4}{5}(x-2) < \frac{1}{3}(x-6) \Rightarrow 12(x-2) < 5(x-6)$
$\Rightarrow 12x - 24 < 5x - 30 \Rightarrow 7x < -6$ or $x < -\frac{6}{7}$

12. $-\frac{x+5}{2} \le \frac{12+3x}{4} \Rightarrow -(4x+20) \le 24 + 6x$
$\Rightarrow -44 \le 10x \Rightarrow -\frac{22}{5} \le x$

13. $y = 3$ or $y = -3$

14. $y - 3 = 7$ or $y - 3 = -7 \Rightarrow y = 10$ or $y = -4$

15. $2t + 5 = 4$ or $2t + 5 = -4 \Rightarrow 2t = -1$ or $2t = -9 \Rightarrow t = -\frac{1}{2}$ or $t = -\frac{9}{2}$

16. $1 - t = 1$ or $1 - t = -1 \Rightarrow -t = 0$ or $-t = -2 \Rightarrow t = 0$ or $t = 2$

17. $8 - 3s = \frac{9}{2}$ or $8 - 3s = -\frac{9}{2} \Rightarrow -3s = -\frac{7}{2}$ or $-3s = -\frac{25}{2} \Rightarrow s = \frac{7}{6}$ or $s = \frac{25}{6}$

18. $\frac{s}{2} - 1 = 1$ or $\frac{s}{2} - 1 = -1 \Rightarrow \frac{s}{2} = 2$ or $\frac{s}{2} = 0 \Rightarrow s = 4$ or $s = 0$

19. $-2 < x < 2$; solution interval $(-2, 2)$

20. $-2 \le x \le 2$; solution interval $[-2, 2]$

21. $-3 \le t - 1 \le 3 \Rightarrow -2 \le t \le 4$; solution interval $[-2, 4]$

22. $-1 < t + 2 < 1 \Rightarrow -3 < t < -1$;
solution interval $(-3, -1)$

23. $-4 < 3y - 7 < 4 \Rightarrow 3 < 3y < 11 \Rightarrow 1 < y < \frac{11}{3}$;
solution interval $\left(1, \frac{11}{3}\right)$

24. $-1 < 2y + 5 < 1 \Rightarrow -6 < 2y < -4 \Rightarrow -3 < y < -2$;
solution interval $(-3, -2)$

25. $-1 \le \frac{z}{5} - 1 \le 1 \Rightarrow 0 \le \frac{z}{5} \le 2 \Rightarrow 0 \le z \le 10$;
solution interval $[0, 10]$

26. $-2 \le \frac{3z}{2} - 1 \le 2 \Rightarrow -1 \le \frac{3z}{2} \le 3 \Rightarrow -\frac{2}{3} \le z \le 2$;
solution interval $\left[-\frac{2}{3}, 2\right]$

27. $-\frac{1}{2} < 3 - \frac{1}{x} < \frac{1}{2} \Rightarrow -\frac{7}{2} < -\frac{1}{x} < -\frac{5}{2} \Rightarrow \frac{7}{2} > \frac{1}{x} > \frac{5}{2}$
$\Rightarrow \frac{2}{7} < x < \frac{2}{5}$; solution interval $\left(\frac{2}{7}, \frac{2}{5}\right)$

28. $-3 < \frac{2}{x} - 4 < 3 \Rightarrow 1 < \frac{2}{x} < 7 \Rightarrow 1 > \frac{x}{2} > \frac{1}{7}$
$\Rightarrow 2 > x > \frac{2}{7} \Rightarrow \frac{2}{7} < x < 2$; solution interval $\left(\frac{2}{7}, 2\right)$

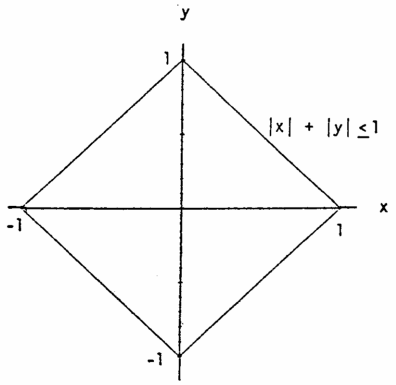
41. $x^2 - x < 0 \Rightarrow x^2 - x + \frac{1}{4} < \frac{1}{4} \Rightarrow \left(x - \frac{1}{2}\right)^2 < \frac{1}{4} \Rightarrow \left|x - \frac{1}{2}\right| < \frac{1}{2} \Rightarrow -\frac{1}{2} < x - \frac{1}{2} < \frac{1}{2} \Rightarrow 0 < x < 1.$
So the solution is the interval $(0, 1)$

42. $x^2 - x - 2 \geq 0 \Rightarrow x^2 - x + \frac{1}{4} \geq \frac{9}{4} \Rightarrow \left|x - \frac{1}{2}\right| \geq \frac{3}{2} \Rightarrow x - \frac{1}{2} \geq \frac{3}{2}$ or $-\left(x - \frac{1}{2}\right) \geq \frac{3}{2} \Rightarrow x \geq 2$ or $x \leq -1.$
The solution interval is $(-\infty, -1] \cup [2, \infty)$

43. True if $a \geq 0$; False if $a < 0$.



44. $|x - 1| = 1 - x \Leftrightarrow |-(x - 1)| = 1 - x \Leftrightarrow 1 - x \geq 0 \Leftrightarrow x \leq 1$

45. (1) $|a + b| = (a + b)$ or $|a + b| = -(a + b)$;
both squared equal $(a + b)^2$
(2) $ab \leq |ab| = |a|\,|b|$
(3) $|a| = a$ or $|a| = -a$, so $|a|^2 = a^2$; likewise, $|b|^2 = b^2$
(4) $x^2 \leq y^2$ implies $\sqrt{x^2} \leq \sqrt{y^2}$ or $x \leq y$ for all nonnegative real numbers x and y. Let $x = |a + b|$ and $y = |a| + |b|$ so that $|a + b|^2 \leq (|a| + |b|)^2 \Rightarrow |a + b| \leq |a| + |b|$.

46. If $a \geq 0$ and $b \geq 0$, then $ab \geq 0$ and $|ab| = ab = |a|\,|b|$.
If $a < 0$ and $b < 0$, then $ab > 0$ and $|ab| = ab = (-a)(-b) = |a|\,|b|$.
If $a \geq 0$ and $b < 0$, then $ab \leq 0$ and $|ab| = -(ab) = (a)(-b) = |a|\,|b|$.
If $a < 0$ and $b \geq 0$, then $ab \leq 0$ and $|ab| = -(ab) = (-a)(b) = |a|\,|b|$.

47. $-3 \leq x \leq 3$ and $x > -\frac{1}{2} \Rightarrow -\frac{1}{2} < x \leq 3.$

48. Graph of $|x| + |y| \leq 1$ is the interior of "diamond-shaped" region.

49. Let $\delta$ be a real number $> 0$ and $f(x) = 2x + 1$. Suppose that $|x - 1| < \delta$. Then $|x - 1| < \delta \Rightarrow 2|x - 1| < 2\delta \Rightarrow |2x - 2| < 2\delta \Rightarrow |(2x + 1) - 3| < 2\delta \Rightarrow |f(x) - f(1)| < 2\delta$

50. Let $\epsilon > 0$ be any positive number and $f(x) = 2x + 3$. Suppose that $|x - 0| < \epsilon/2$. Then $2|x - 0| < \epsilon$ and $|2x + 3 - 3| < \epsilon$. But $f(x) = 2x + 3$ and $f(0) = 3$. Thus $|f(x) - f(0)| < \epsilon$.

51. Consider: i) $a > 0$; ii) $a < 0$; iii) $a = 0$.
i) For $a > 0$, $|a| = a$ by definition. Now, $a > 0 \Rightarrow -a < 0$. Let $-a = b$. By definition, $|b| = -b$. Since $b = -a$, $|-a| = -(-a) = a$ and $|a| = |-a| = a$.
ii) For $a < 0$, $|a| = -a$. Now, $a < 0 \Rightarrow -a > 0$. Let $-a = b$. By definition, $|b| = b$ and thus $|-a| = -a$. So again $|a| = |-a|$.
iii) By definition $|0| = 0$ and since $-0 = 0$, $|-0| = 0$. Thus, by i), ii), and iii) $|a| = |-a|$ for any real number.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

52. i) Prove $|x| > 0 \Rightarrow x > a$ or $x < -a$ for any positive number, a.
For $x \geq 0, |x| = x. |x| > a \Rightarrow x > a$.
For $x < 0, |x| = -x. |x| > a \Rightarrow -x > a \Rightarrow x < -a$.
ii) Prove $x > a$ or $x < -a \Rightarrow |x| > 0$ for any positive number, a.
$a > 0$ and $x > a \Rightarrow |x| = x$. So $x > a \Rightarrow |x| > a$.
For $a > 0, -a < 0$ and $x < -a \Rightarrow x < 0 \Rightarrow |x| = -x$. So $x < -a \Rightarrow -x > a \Rightarrow |x| > a$.

53. a) $1 = 1 \Rightarrow |1| = 1 \Rightarrow \left|b \cdot \frac{1}{b}\right| = \frac{|b|}{|b|} \Rightarrow |b| \cdot \left|\frac{1}{b}\right| = \frac{|b|}{|b|} \Rightarrow \frac{|b| \cdot \left|\frac{1}{b}\right|}{|b|} = \frac{|b|}{|b| \cdot |b|} \Rightarrow \left|\frac{1}{b}\right| = \frac{1}{|b|}$

b) $\frac{|a|}{|b|} = \left|a \cdot \frac{1}{b}\right| = |a| \cdot \left|\frac{1}{b}\right| = |a| \cdot \frac{1}{|b|} = \frac{|a|}{|b|}$

54. Prove $S_n = |a^n| = |a|^n$ for any real number a and any positive integer n.
$|a^1| = |a|^1 = a$, so $S_1$ is true. Now, assume that $S_k = |a^k| = |a|^k$ is true form some positive integer $k$. Since $|a^1| = |a|^1$ and $|a^k| = |a|^k$, we have $|a^{k+1}| = |a^k \cdot a^1| = |a^k||a^1| = |a|^k |a|^1 = |a|^{k+1}$. Thus, $S_{k+1} = |a^{k+1}| = |a|^{k+1}$ is also true. Thus by the Principle of Mathematical Induction, $S_n = |a^n| = |a|^n$ is true for all n positive integers.

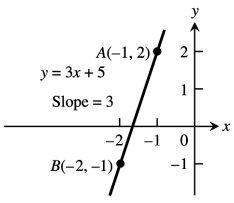
## 1.2 LINES, CIRCLES, AND PARABOLAS

1. $\Delta x = -1 - (-3) = 2, \Delta y = -2 - 2 = -4; d = \sqrt{(\Delta x)^2 + (\Delta y)^2} = \sqrt{4 + 16} = 2\sqrt{5}$

2. $\Delta x = -3 - (-1) = -2, \Delta y = 2 - (-2) = 4; d = \sqrt{(-2)^2 + 4^2} = 2\sqrt{5}$

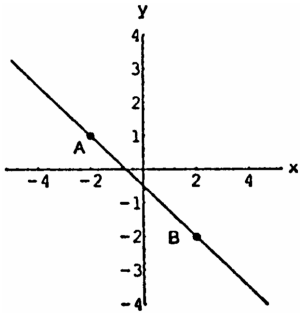
3. $\Delta x = -8.1 - (-3.2) = -4.9, \Delta y = -2 - (-2) = 0; d = \sqrt{(-4.9)^2 + 0^2} = 4.9$

4. $\Delta x = 0 - \sqrt{2} = -\sqrt{2}, \Delta y = 1.5 - 4 = -2.5; d = \sqrt{\left(-\sqrt{2}\right)^2 + (-2.5)^2} = \sqrt{8.25}$



5. Circle with center $(0, 0)$ and radius 1.

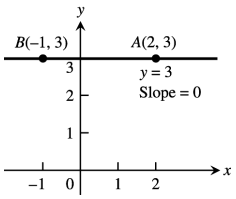
6. Circle with center $(0, 0)$ and radius $\sqrt{2}$.



7. Disk (i.e., circle together with its interior points) with center $(0, 0)$ and radius $\sqrt{3}$.

8. The origin (a single point).

9. $m = \frac{\Delta y}{\Delta x} = \frac{-1-2}{-2-(-1)} = 3$
perpendicular slope $= -\frac{1}{3}$



10. $m = \frac{\Delta y}{\Delta x} = \frac{-2-1}{2-(-2)} = -\frac{3}{4}$
perpendicular slope $= \frac{4}{3}$

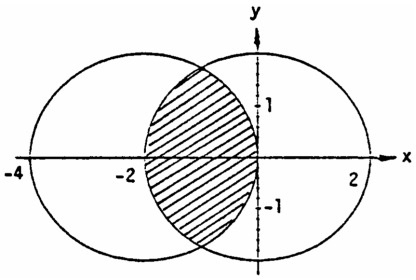
$\Rightarrow y = \frac{1}{2}(-1)^2 + (-1) + 4 = \frac{7}{2}$
$\Rightarrow V = \left(-1, \frac{7}{2}\right)$. If $x = 0$ then $y = 4$.
Also, $y = 0 \Rightarrow \frac{1}{2}x^2 + x + 4 = 0$
$\Rightarrow x = \frac{-1 \pm \sqrt{-7}}{1} \Rightarrow$ no x intercepts.
Axis of parabola is $x = -1$.

60. $x = -\frac{b}{2a} = -\frac{2}{2(-1/4)} = 4$
$\Rightarrow y = -\frac{1}{4}(4)^2 + 2(4) + 4 = 8$
$\Rightarrow V = (4, 8)$. If $x = 0$ then $y = 4$.
Also, $y = 0 \Rightarrow -\frac{1}{4}x^2 + 2x + 4 = 0$
$\Rightarrow x = \frac{-2 \pm \sqrt{8}}{-1/2} = 4 \pm 4\sqrt{2}$.
Axis of parabola is $x = 4$.

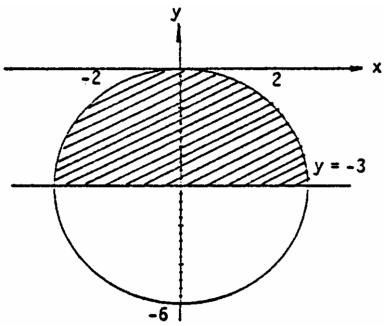
61. The points that lie outside the circle with center $(0, 0)$ and radius $\sqrt{7}$.

62. The points that lie inside the circle with center $(0, 0)$ and radius $\sqrt{5}$.



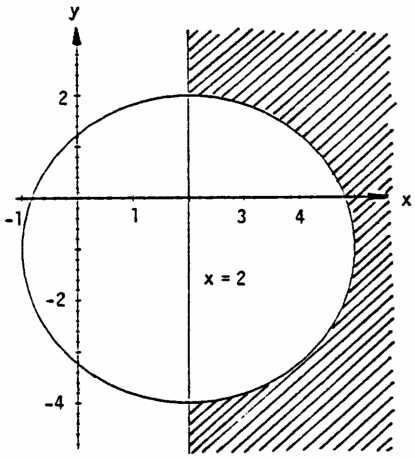
63. The points that lie on or inside the circle with center $(1, 0)$ and radius 2.

64. The points lying on or outside the circle with center $(0, 2)$ and radius 2.



65. The points lying outside the circle with center $(0, 0)$ and radius 1, but inside the circle with center $(0, 0)$, and radius 2 (i.e., a washer).

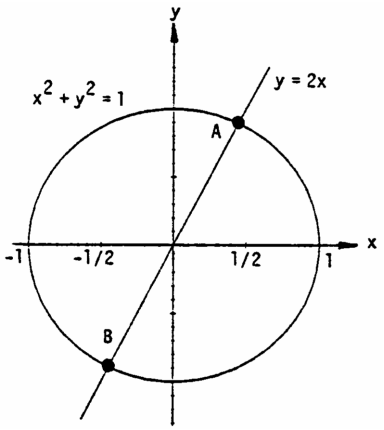
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



66. The points on or inside the circle centered at $(0, 0)$ with radius 2 and on or inside the circle centered at $(-2, 0)$ with radius 2.

67. $x^2 + y^2 + 6y < 0 \Rightarrow x^2 + (y + 3)^2 < 9$. The interior points of the circle centered at $(0, -3)$ with radius 3, but above the line $y = -3$.

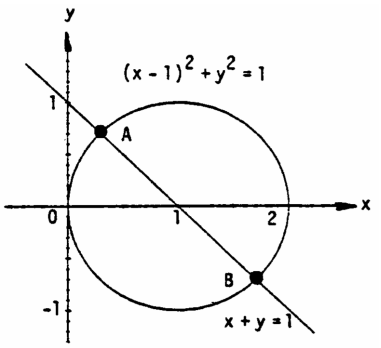
68. $x^2 + y^2 - 4x + 2y > 4 \Rightarrow (x - 2)^2 + (y + 1)^2 > 9$. The points exterior to the circle centered at $(2, -1)$ with radius 3 and to the right of the line $x = 2$.



69. $(x + 2)^2 + (y - 1)^2 < 6$

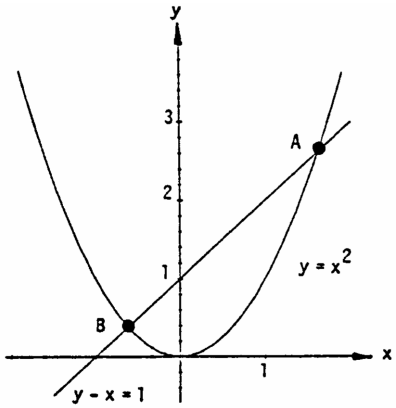
70. $(x + 4)^2 + (y - 2)^2 > 16$

71. $x^2 + y^2 \leq 2, x \geq 1$

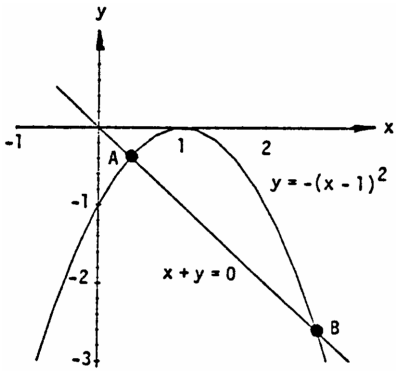


72. $x^2 + y^2 > 4, (x - 1)^2 + (y - 3)^2 < 10$

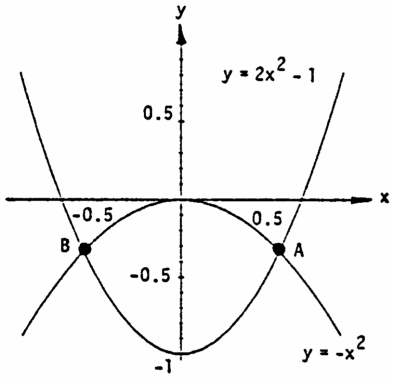
73. $x^2 + y^2 = 1$ and $y = 2x \Rightarrow 1 = x^2 + 4x^2 = 5x^2$ $\Rightarrow \left(x = \frac{1}{\sqrt{5}} \text{ and } y = \frac{2}{\sqrt{5}}\right)$ or $\left(x = -\frac{1}{\sqrt{5}} \text{ and } y = -\frac{2}{\sqrt{5}}\right)$. Thus, A $\left(\frac{1}{\sqrt{5}}, \frac{2}{\sqrt{5}}\right)$, B $\left(-\frac{1}{\sqrt{5}}, -\frac{2}{\sqrt{5}}\right)$ are the points of intersection.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

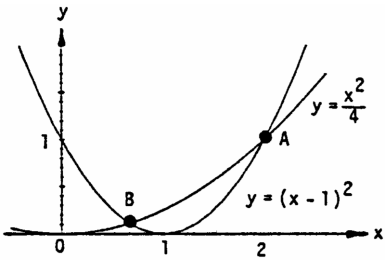


74. $x + y = 1$ and $(x-1)^2 + y^2 = 1$
$\Rightarrow 1 = (-y)^2 + y^2 = 2y^2$
$\Rightarrow \left(y = \frac{1}{\sqrt{2}} \text{ and } x = 1 - \frac{1}{\sqrt{2}}\right)$ or
$\left(y = -\frac{1}{\sqrt{2}} \text{ and } x = 1 + \frac{1}{\sqrt{2}}\right)$. Thus,
A $\left(1 - \frac{1}{\sqrt{2}}, \frac{1}{\sqrt{2}}\right)$ and B $\left(1 + \frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{2}}\right)$
are intersection points.

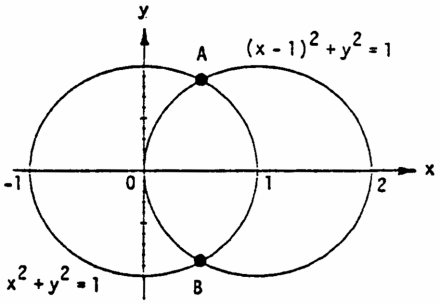


75. $y - x = 1$ and $y = x^2 \Rightarrow x^2 - x = 1$
$\Rightarrow x^2 - x - 1 = 0 \Rightarrow x = \frac{1 \pm \sqrt{5}}{2}$.
If $x = \frac{1+\sqrt{5}}{2}$, then $y = x + 1 = \frac{3+\sqrt{5}}{2}$.
If $x = \frac{1-\sqrt{5}}{2}$, then $y = x + 1 = \frac{3-\sqrt{5}}{2}$.
Thus, A $\left(\frac{1+\sqrt{5}}{2}, \frac{3+\sqrt{5}}{2}\right)$ and B $\left(\frac{1-\sqrt{5}}{2}, \frac{3-\sqrt{5}}{2}\right)$
are the intersection points.

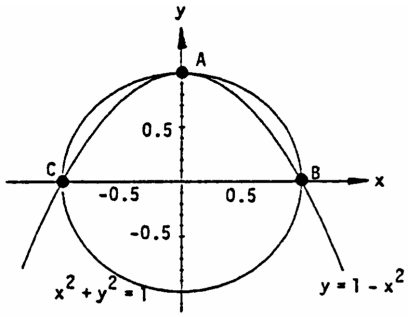
76. $y = -x$ and $y = -(x-1)^2 \Rightarrow (x-1)^2 = x$
$\Rightarrow x^2 - 3x + 1 = 0 \Rightarrow x = \frac{3 \pm \sqrt{5}}{2}$. If
$x = \frac{3-\sqrt{5}}{2}$, then $y = -x = \frac{\sqrt{5}-3}{2}$. If
$x = \frac{3+\sqrt{5}}{2}$, then $y = -x = -\frac{3+\sqrt{5}}{2}$.
Thus, A $\left(\frac{3-\sqrt{5}}{2}, \frac{\sqrt{5}-3}{2}\right)$ and B $\left(\frac{3+\sqrt{5}}{2}, -\frac{3+\sqrt{5}}{2}\right)$
are the intersection points.



77. $y = 2x^2 - 1 = -x^2 \Rightarrow 3x^2 = 1$
$\Rightarrow x = \frac{1}{\sqrt{3}}$ and $y = -\frac{1}{3}$ or $x = -\frac{1}{\sqrt{3}}$ and $y = -\frac{1}{3}$.
Thus, A $\left(\frac{1}{\sqrt{3}}, -\frac{1}{3}\right)$ and B $\left(-\frac{1}{\sqrt{3}}, -\frac{1}{3}\right)$ are the
intersection points.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

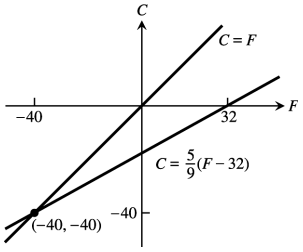


78. $y = \frac{x^2}{4} = (x-1)^2 \Rightarrow 0 = \frac{3x^2}{4} - 2x + 1$
$\Rightarrow 0 = 3x^2 - 8x + 4 = (3x-2)(x-2)$
$\Rightarrow x = 2$ and $y = \frac{x^2}{4} = 1$, or $x = \frac{2}{3}$ and $y = \frac{x^2}{4} = \frac{1}{9}$. Thus, A(2, 1) and B $\left(\frac{2}{3}, \frac{1}{9}\right)$ are the intersection points.

79. $x^2 + y^2 = 1 = (x-1)^2 + y^2$
$\Rightarrow x^2 = (x-1)^2 = x^2 - 2x + 1$
$\Rightarrow 0 = -2x + 1 \Rightarrow x = \frac{1}{2}$. Hence $y^2 = 1 - x^2 = \frac{3}{4}$ or $y = \pm\frac{\sqrt{3}}{2}$. Thus, A $\left(\frac{1}{2}, \frac{\sqrt{3}}{2}\right)$ and B $\left(\frac{1}{2}, -\frac{\sqrt{3}}{2}\right)$ are the intersection points.

80. $x^2 + y^2 = 1 = x^2 + y \Rightarrow y^2 = y$
$\Rightarrow y(y-1) = 0 \Rightarrow y = 0$ or $y = 1$.
If $y = 1$, then $x^2 = 1 - y^2 = 0$ or $x = 0$.
If $y = 0$, then $x^2 = 1 - y^2 = 1$ or $x = \pm 1$.
Thus, A(0, 1), B(1, 0), and C(−1, 0) are the intersection points.

81. (a) A ≈ (69°, 0 in), B ≈ (68°, .4 in) $\Rightarrow m = \frac{68° - 69°}{.4 - 0} \approx -2.5°/\text{in}$.
(b) A ≈ (68°, .4 in), B ≈ (10°, 4 in) $\Rightarrow m = \frac{10° - 68°}{4 - .4} \approx -16.1°/\text{in}$.
(c) A ≈ (10°, 4 in), B ≈ (5°, 4.6 in) $\Rightarrow m = \frac{5° - 10°}{4.6 - 4} \approx -8.3°/\text{in}$.



82. The time rate of heat transfer across a material, $\frac{\Delta Q}{\Delta t}$, is directly proportional to the cross-sectional area, A, of the material, to the temperature gradient across the material, $\frac{\Delta T}{\Delta x}$ (the slopes from the previous problem), and to a constant characteristic of the material. $\frac{\Delta Q}{\Delta t} = -kA\frac{\Delta T}{\Delta x} \Rightarrow k = -\frac{\frac{\Delta Q}{\Delta t}/A}{\frac{\Delta T}{\Delta x}}$. Note that $\frac{\Delta Q}{\Delta t}$ and $\frac{\Delta T}{\Delta x}$ are of opposite sign because heat flow is toward lower temperature. So a small value of k corresponds to low heat flow through the material and thus the material is a good insulator.Since all three materials have the same cross section and the heat flow across each is the same (temperatures are not changing), we may define another constant, K, characteristics of the material: $K = -\frac{1}{\frac{\Delta T}{\Delta x}}$. Using the values of $\frac{\Delta T}{\Delta x}$ from the prevous problem, fiberglass has the smallest K at 0.06 and thus is the best insulator. Likewise, the wallboard is the poorest insulator, with K = 0.4.

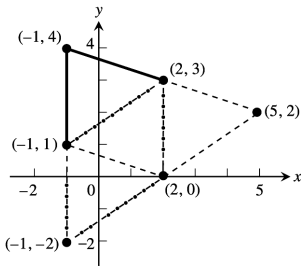
83. $p = kd + 1$ and $p = 10.94$ at $d = 100 \Rightarrow k = \frac{10.94 - 1}{100} = 0.0994$. Then $p = 0.0994d + 1$ is the diver's pressure equation so that $d = 50 \Rightarrow p = (0.0994)(50) + 1 = 5.97$ atmospheres.

84. The line of incidence passes through $(0, 1)$ and $(1, 0) \Rightarrow$ The line of reflection passes through $(1, 0)$ and $(2, 1)$
$\Rightarrow m = \frac{1-0}{2-1} = 1 \Rightarrow y - 0 = 1(x - 1) \Rightarrow y = x - 1$ is the line of reflection.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

85. $C = \frac{5}{9}(F - 32)$ and $C = F \Rightarrow F = \frac{5}{9}F - \frac{160}{9} \Rightarrow \frac{4}{9}F = -\frac{160}{9}$ or $F = -40°$ gives the same numerical reading.

86. $m = \frac{37.1}{100} = \frac{14}{\Delta x} \Rightarrow \Delta x = \frac{14}{.371}$. Therefore, distance between first and last rows is $\sqrt{(14)^2 + \left(\frac{14}{.371}\right)^2} \approx 40.25$ ft.



87. length AB $= \sqrt{(5-1)^2 + (5-2)^2} = \sqrt{16+9} = 5$
length AC $= \sqrt{(4-1)^2 + (-2-2)^2} = \sqrt{9+16} = 5$
length BC $= \sqrt{(4-5)^2 + (-2-5)^2} = \sqrt{1+49} = \sqrt{50} = 5\sqrt{2} \neq 5$

88. length AB $= \sqrt{(1-0)^2 + \left(\sqrt{3}-0\right)^2} = \sqrt{1+3} = 2$
length AC $= \sqrt{(2-0)^2 + (0-0)^2} = \sqrt{4+0} = 2$
length BC $= \sqrt{(2-1)^2 + \left(0-\sqrt{3}\right)^2} = \sqrt{1+3} = 2$

89. Length AB $= \sqrt{(\Delta x)^2 + (\Delta y)^2} = \sqrt{1^2 + 4^2} = \sqrt{17}$ and length BC $= \sqrt{(\Delta x)^2 + (\Delta y)^2} = \sqrt{4^2 + 1^2} = \sqrt{17}$. Also, slope AB $= \frac{4}{-1}$ and slope BC $= \frac{1}{4}$, so AB $\perp$ BC. Thus, the points are vertices of a square. The coordinate increments from the fourth vertex D(x, y) to A must equal the increments from C to B $\Rightarrow 2 - x = \Delta x = 4$ and $-1 - y = \Delta y = 1 \Rightarrow x = -2$ and $y = -2$. Thus D$(-2, -2)$ is the fourth vertex.

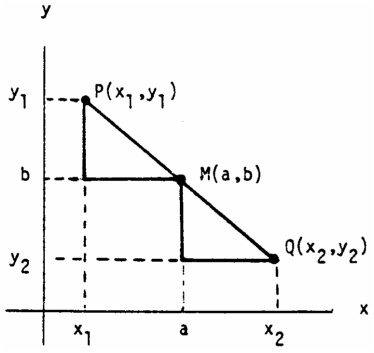
90. Let A $= (x, 2)$ and C $= (9, y) \Rightarrow$ B $= (x, y)$. Then $9 - x = |AD|$ and $2 - y = |DC| \Rightarrow 2(9 - x) + 2(2 - y) = 56$ and $9 - x = 3(2 - y) \Rightarrow 2(3(2 - y)) + 2(2 - y) = 56 \Rightarrow y = -5 \Rightarrow 9 - x = 3(2 - (-5)) \Rightarrow x = -12$. Therefore, A $= (-12, 2)$, C $= (9, -5)$, and B $= (-12, -5)$.

91. Let A$(-1, 1)$, B$(2, 3)$, and C$(2, 0)$ denote the points. Since BC is vertical and has length $|BC| = 3$, let $D_1(-1, 4)$ be located vertically upward from A and $D_2(-1, -2)$ be located vertically downward from A so that $|BC| = |AD_1| = |AD_2| = 3$. Denote the point $D_3(x, y)$. Since the slope of AB equals the slope of $CD_3$ we have $\frac{y-3}{x-2} = -\frac{1}{3} \Rightarrow 3y - 9 = -x + 2$ or $x + 3y = 11$. Likewise, the slope of AC equals the slope of $BD_3$ so that $\frac{y-0}{x-2} = \frac{2}{3} \Rightarrow 3y = 2x - 4$ or $2x - 3y = 4$.

Solving the system of equations $\left.\begin{matrix} x + 3y = 11 \\ 2x - 3y = 4 \end{matrix}\right\}$ we find $x = 5$ and $y = 2$ yielding the vertex $D_3(5, 2)$.

92. Let $(x, y)$, $x \neq 0$ and/or $y \neq 0$ be a point on the coordinate plane. The slope, m, of the segment $(0, 0)$ to $(x, y)$ is $\frac{y}{x}$. A 90° rotation gives a segment with slope $m' = -\frac{1}{m} = -\frac{x}{y}$. If this segment has length equal to the original segment, its endpoint will be $(-y, x)$ or $(y, -x)$, the first of these corresponds to a counter-clockwise rotation, the latter to a clockwise rotation.
(a) $(-1, 4)$; (b) $(3, -2)$; (c) $(5, 2)$; (d) $(0, x)$;

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



(e) $(-y, 0)$; (f) $(-y, x)$; (g) $(3, -10)$

93. $2x + ky = 3$ has slope $-\frac{2}{k}$ and $4x + y = 1$ has slope $-4$. The lines are perpendicular when $-\frac{2}{k}(-4) = -1$ or $k = -8$ and parallel when $-\frac{2}{k} = -4$ or $k = \frac{1}{2}$.

94. At the point of intersection, $2x + 4y = 6$ and $2x - 3y = -1$. Subtracting these equations we find $7y = 7$ or $y = 1$. Substitution into either equation gives $x = 1 \Rightarrow (1, 1)$ is the intersection point. The line through $(1, 1)$ and $(1, 2)$ is vertical with equation $x = 1$.

95. Let M(a, b) be the midpoint. Since the two triangles shown in the figure are congruent, the value a must lie midway between $x_1$ and $x_2$, so $a = \frac{x_1+x_2}{2}$.

Similarly, $b = \frac{y_1+y_2}{2}$.

96. (a) L has slope 1 so M is the line through P(2, 1) with slope $-1$; or the line $y = -x + 3$. At the intersection point, Q, we have equal y-values, $y = x + 2 = -x + 3$. Thus, $2x = 1$ or $x = \frac{1}{2}$. Hence Q has coordinates $\left(\frac{1}{2}, \frac{5}{2}\right)$. The distance from P to L = the distance from P to Q $= \sqrt{\left(\frac{3}{2}\right)^2 + \left(-\frac{3}{2}\right)^2} = \sqrt{\frac{18}{4}} = \frac{3\sqrt{2}}{2}$.

(b) L has slope $-\frac{4}{3}$ so M has slope $\frac{3}{4}$ and M has the equation $4y - 3x = 12$. We can rewrite the equations of the lines as L: $x + \frac{3}{4}y = 3$ and M: $-x + \frac{4}{3}y = 4$. Adding these we get $\frac{25}{12}y = 7$ so $y = \frac{84}{25}$. Substitution into either equation gives $x = \frac{4}{3}\left(\frac{84}{25}\right) - 4 = \frac{12}{25}$ so that Q $\left(\frac{12}{25}, \frac{84}{25}\right)$ is the point of intersection. The distance from P to L $= \sqrt{\left(4 - \frac{12}{25}\right)^2 + \left(6 - \frac{84}{25}\right)^2} = \frac{22}{5}$.

(c) M is a horizontal line with equation $y = b$. The intersection point of L and M is $Q(-1, b)$. Thus, the distance from P to L is $\sqrt{(a+1)^2 + 0^2} = |a + 1|$.

(d) If $B = 0$ and $A \neq 0$, then the distance from P to L is $\left|\frac{C}{A} - x_0\right|$ as in (c). Similarly, if $A = 0$ and $B \neq 0$, the distance is $\left|\frac{C}{B} - y_0\right|$. If both A and B are $\neq 0$ then L has slope $-\frac{A}{B}$ so M has slope $\frac{B}{A}$. Thus,
L: $Ax + By = C$ and M: $-Bx + Ay = -Bx_0 + Ay_0$. Solving these equations simultaneously we find the point of intersection Q(x, y) with $x = \frac{AC-B(Ay_0-Bx_0)}{A^2+B^2}$ and $y = \frac{BC+A(Ay_0-Bx_0)}{A^2+B^2}$. The distance from P to Q equals $\sqrt{(\Delta x)^2 + (\Delta y)^2}$, where $(\Delta x)^2 = \left(\frac{x_0(A^2+B^2)-AC+ABy_0-B^2x_0}{A^2+B^2}\right)^2$
$= \frac{A^2(Ax_0+By_0+C)^2}{(A^2+B^2)^2}$, and $(\Delta y)^2 = \left(\frac{y_0(A^2+B^2)-BC-A^2y_0+ABx_0}{A^2+B^2}\right)^2 = \frac{B^2(Ax_0+By_0+C)^2}{(A^2+B^2)^2}$.
Thus, $\sqrt{(\Delta x)^2 + (\Delta y)^2} = \sqrt{\frac{(Ax_0+By_0+C)^2}{A^2+B^2}} = \frac{|Ax_0+By_0+C|}{\sqrt{A^2+B^2}}$.

## 1.3 FUNCTIONS AND THEIR GRAPHS

1. domain $= (-\infty, \infty)$; range $= [1, \infty)$

2. domain $= [0, \infty)$; range $= (-\infty, 1]$

3. domain $= (0, \infty)$; y in range $\Rightarrow y = \frac{1}{\sqrt{t}}$, $t > 0 \Rightarrow y^2 = \frac{1}{t}$ and $y > 0 \Rightarrow$ y can be any positive real number $\Rightarrow$ range $= (0, \infty)$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

4. domain $= [0, \infty)$; y in range $\Rightarrow$ $y = \frac{1}{1+\sqrt{t}}$, $t > 0$. If $t = 0$, then $y = 1$ and as t increases, y becomes a smaller and smaller positive real number $\Rightarrow$ range $= (0, 1]$.

5. $4 - z^2 = (2 - z)(2 + z) \geq 0 \Leftrightarrow z \in [-2, 2]$ = domain. Largest value is $g(0) = \sqrt{4} = 2$ and smallest value is $g(-2) = g(2) = \sqrt{0} = 0 \Rightarrow$ range $= [0, 2]$.

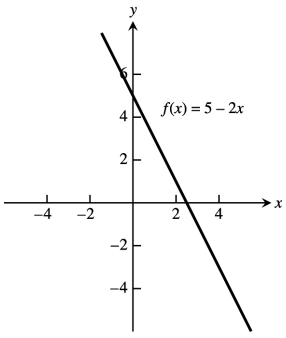
6. domain $= (-2, 2)$ from Exercise 5; smallest value is $g(0) = \frac{1}{2}$ and as $0 < z$ increases to 2, g(z) gets larger and larger (also true as $z < 0$ decreases to $-2$) $\Rightarrow$ range $= \left[\frac{1}{2}, \infty\right)$.

7. (a) Not the graph of a function of x since it fails the vertical line test.
   (b) Is the graph of a function of x since any vertical line intersects the graph at most once.

8. (a) Not the graph of a function of x since it fails the vertical line test.
   (b) Not the graph of a function of x since it fails the vertical line test.

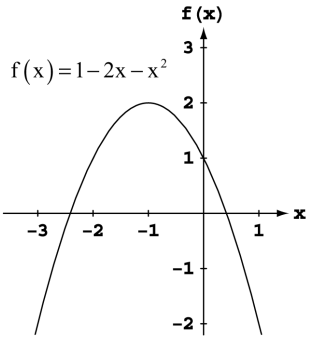
9. $y = \sqrt{\left(\frac{1}{x}\right) - 1} \Rightarrow \frac{1}{x} - 1 \geq 0 \Rightarrow x \leq 1$ and $x > 0$. So,
   (a) No ($x > 0$); (b) No; division by 0 undefined;
   (c) No; if $x \geq 1$, $\frac{1}{x} < 1 \Rightarrow \frac{1}{x} - 1 < 0$; (d) $(0, 1]$

10. $y = \sqrt{2 - \sqrt{x}} \Rightarrow 2 - \sqrt{x} \geq 0 \Rightarrow \sqrt{x} \geq 0$ and $\sqrt{x} \leq 2$. $\sqrt{x} \geq 0 \Rightarrow x \geq 0$ and $\sqrt{x} \leq 2 \Rightarrow x \leq 4$. So, $0 \leq x \leq 4$.
    (a) No; (b) No; (c) $[0, 4]$



11. base $= x$; $(\text{height})^2 + \left(\frac{x}{2}\right)^2 = x^2 \Rightarrow$ height $= \frac{\sqrt{3}}{2}x$; area is $a(x) = \frac{1}{2}$ (base)(height) $= \frac{1}{2}(x)\left(\frac{\sqrt{3}}{2}x\right) = \frac{\sqrt{3}}{4}x^2$; perimeter is $p(x) = x + x + x = 3x$.

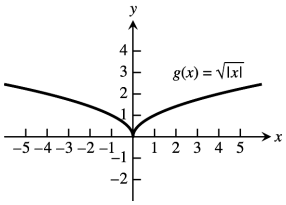
12. s = side length $\Rightarrow$ $s^2 + s^2 = d^2 \Rightarrow s = \frac{d}{\sqrt{2}}$; and area is $a = s^2 \Rightarrow a = \frac{1}{2}d^2$



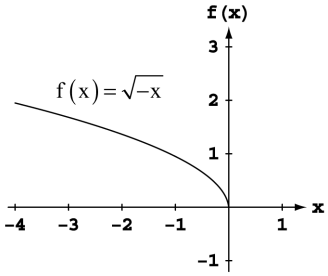
13. Let D = diagonal of a face of the cube and $\ell$ = the length of an edge. Then $\ell^2 + D^2 = d^2$ and (by Exercise 10) $D^2 = 2\ell^2 \Rightarrow 3\ell^2 = d^2 \Rightarrow \ell = \frac{d}{\sqrt{3}}$. The surface area is $6\ell^2 = \frac{6d^2}{3} = 2d^2$ and the volume is $\ell^3 = \left(\frac{d^2}{3}\right)^{3/2} = \frac{d^3}{3\sqrt{3}}$.

14. The coordinates of P are $\left(x, \sqrt{x}\right)$ so the slope of the line joining P to the origin is $m = \frac{\sqrt{x}}{x} = \frac{1}{\sqrt{x}}$ $(x > 0)$. Thus, $\left(x, \sqrt{x}\right) = \left(\frac{1}{m^2}, \frac{1}{m}\right)$.

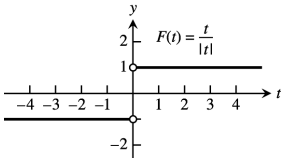
15. The domain is $(-\infty, \infty)$.



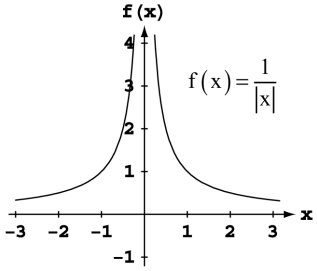
16. The domain is $(-\infty, \infty)$.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

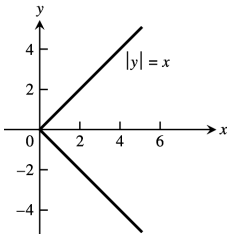


17. The domain is $(-\infty, \infty)$.



18. The domain is $(-\infty, 0]$.

19. The domain is $(-\infty, 0) \cup (0, \infty)$.



20. The domain is $(-\infty, 0) \cup (0, \infty)$.

$$f(x) = \begin{cases} \frac{1}{2}x & -2 \le x \le 0 \\ -2x + 2 & 0 < x \le 1 \\ -1 & 1 < x \le 3 \end{cases}$$

30. (a) Line through $\left(\frac{T}{2}, 0\right)$ and $(T, 1)$: $m = \frac{1-0}{T-(T/2)} = \frac{2}{T}$, so $y = \frac{2}{T}\left(x - \frac{T}{2}\right) + 0 = \frac{2}{T}x - 1$

$$f(x) = \begin{cases} 0, & 0 \le x \le \frac{T}{2} \\ \frac{2}{T}x - 1, & \frac{T}{2} < x \le T \end{cases}$$

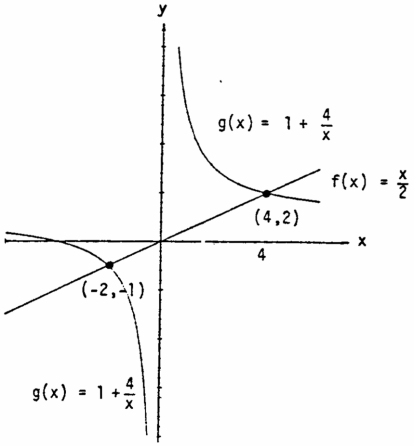
(b) $$f(x) = \begin{cases} A, & 0 \le x < \frac{T}{2} \\ -A, & \frac{T}{2} \le x < T \\ A, & T \le x < \frac{3T}{2} \\ -A, & \frac{3T}{2} \le x \le 2T \end{cases}$$

31. (a) From the graph, $\frac{x}{2} > 1 + \frac{4}{x} \Rightarrow x \in (-2, 0) \cup (4, \infty)$

(b) $\frac{x}{2} > 1 + \frac{4}{x} \Rightarrow \frac{x}{2} - 1 - \frac{4}{x} > 0$

$x > 0$: $\frac{x}{2} - 1 - \frac{4}{x} > 0 \Rightarrow \frac{x^2-2x-8}{2x} > 0 \Rightarrow \frac{(x-4)(x+2)}{2x} > 0$

$\Rightarrow x > 4$ since x is positive;



$x < 0$: $\frac{x}{2} - 1 - \frac{4}{x} > 0 \Rightarrow \frac{x^2-2x-8}{2x} < 0 \Rightarrow \frac{(x-4)(x+2)}{2x} < 0$

$\Rightarrow x < -2$ since x is negative;

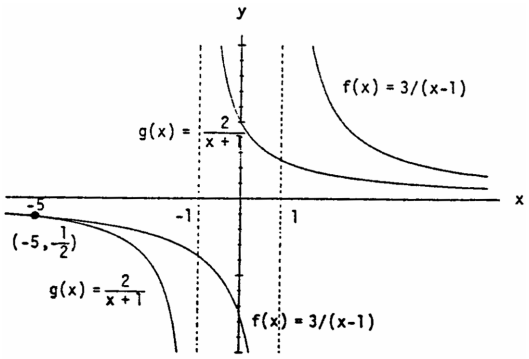
sign of $(x - 4)(x + 2)$

Solution interval: $(-2, 0) \cup (4, \infty)$

32. (a) From the graph, $\frac{3}{x-1} < \frac{2}{x+1} \Rightarrow x \in (-\infty, -5) \cup (-1, 1)$

(b) Case $x < -1$: $\frac{3}{x-1} < \frac{2}{x+1} \Rightarrow \frac{3(x+1)}{x-1} > 2$

$\Rightarrow 3x + 3 < 2x - 2 \Rightarrow x < -5$.



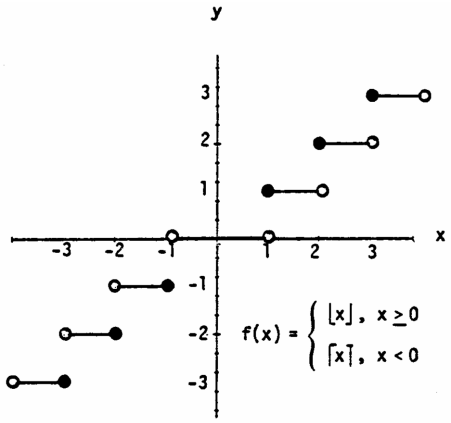
Thus, $x \in (-\infty, -5)$ solves the inequality.

Case $-1 < x < 1$: $\frac{3}{x-1} < \frac{2}{x+1} \Rightarrow \frac{3(x+1)}{x-1} < 2$

$\Rightarrow 3x + 3 > 2x - 2 \Rightarrow x > -5$ which is true if $x > -1$. Thus, $x \in (-1, 1)$ solves the inequality.

Case $1 < x$: $\frac{3}{x-1} < \frac{2}{x+1} \Rightarrow 3x + 3 < 2x - 2 \Rightarrow x < -5$ which is never true if $1 < x$, so no solution here.

In conclusion, $x \in (-\infty, -5) \cup (-1, 1)$.



33. (a) $\lfloor x \rfloor = 0$ for $x \in [0, 1)$ (b) $\lceil x \rceil = 0$ for $x \in (-1, 0]$

34. $\lfloor x \rfloor = \lceil x \rceil$ only when x is an integer.

35. For any real number x, $n \le x \le n + 1$, where n is an integer. Now: $n \le x \le n + 1 \Rightarrow -(n + 1) \le -x \le -n$. By definition: $\lceil -x \rceil = -n$ and $\lfloor x \rfloor = n \Rightarrow -\lfloor x \rfloor = -n$. So $\lceil -x \rceil = -\lfloor x \rfloor$ for all $x \in \Re$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

36. To find f(x) you delete the decimal or fractional portion of x, leaving only the integer part.

37. $v = f(x) = x(14 - 2x)(22 - 2x) = 4x^3 - 72x^2 + 308x;\ 0 < x < 7.$

38. (a) Let h = height of the triangle. Since the triangle is isosceles, $\overline{AB}^2 + \overline{AB}^2 = 2^2 \Rightarrow \overline{AB} = \sqrt{2}$. So,
$h^2 + 1^2 = \left(\sqrt{2}\right)^2 \Rightarrow h = 1 \Rightarrow$ B is at $(0,\ 1) \Rightarrow$ slope of AB $= -1 \Rightarrow$ The equation of AB is
$y = f(x) = -x + 1;\ x \in [0,\ 1]$.
(b) $A(x) = 2x\,y = 2x(-x + 1) = -2x^2 + 2x;\ x \in [0,\ 1]$.

39. (a) Because the circumference of the original circle was $8\pi$ and a piece of length x was removed.
(b) $r = \frac{8\pi - x}{2\pi} = 4 - \frac{x}{2\pi}$
(c) $h = \sqrt{16 - r^2} = \sqrt{16 - \left(4 - \frac{x}{2\pi}\right)^2} = \sqrt{16 - \left(16 - \frac{4x}{\pi} + \frac{x^2}{4\pi^2}\right)} = \sqrt{\frac{4x}{\pi} - \frac{x^2}{4\pi^2}} = \sqrt{\frac{16\pi x}{4\pi^2} - \frac{x^2}{4\pi^2}} = \frac{\sqrt{16\pi x - x^2}}{2\pi}$
(d) $V = \frac{1}{3}\pi r^2 h = \frac{1}{3}\pi\left(\frac{8\pi - x}{2\pi}\right)^2 \cdot \frac{\sqrt{16\pi x - x^2}}{2\pi} = \frac{(8\pi - x)^2\sqrt{16\pi x - x^2}}{24\pi^2}$

40. (a) Note that 2 mi = 10,560 ft, so there are $\sqrt{800^2 + x^2}$ feet of river cable at \$180 per foot and $(10,\ 560 - x)$ feet of land cable at \$100 per foot. The cost is $C(x) = 180\sqrt{800^2 + x^2} + 100(10,\ 560 - x)$.
(b) $C(0) = \$1,200,000$
$C(500) \approx \$1,175,812$
$C(1000) \approx \$1,186,512$
$C(1500) \approx \$1,212,000$
$C(2000) \approx \$1,243,732$
$C(2500) \approx \$1,278,479$
$C(3000) \approx \$1,314,870$
Values beyond this are all larger. It would appear that the least expensive location is less than 2000 feet from the point P.

41. A curve symmetric about the x-axis will not pass the vertical line test because the points $(x,\ y)$ and $(x,\ -y)$ lie on the same vertical line. The graph of the function $y = f(x) = 0$ is the x-axis, a horizontal line for which there is a single y-value, 0, for any x.

42. Pick 11, for example: $11 + 5 = 16 \to 2 \cdot 16 = 32 \to 32 - 6 = 26 \to \frac{26}{2} = 13 \to 13 - 2 = 11$, the original number.
$f(x) = \frac{2(x+5)-6}{2} - 2 = x$, the number you started with.

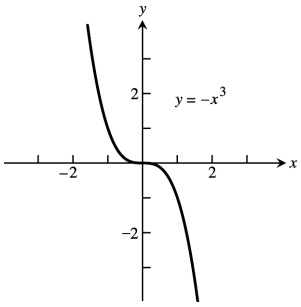
## 1.4 IDENTIFYING FUNCTIONS; MATHEMATICAL MODELS

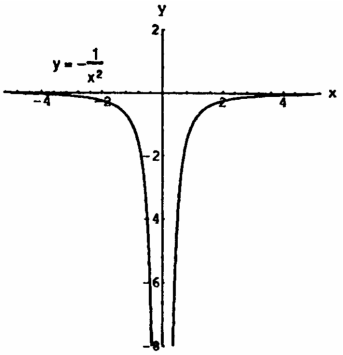
1. (a) linear, polynomial of degree 1, algebraic.
   (b) power, algebraic.
   (c) rational, algebraic.
   (d) exponential.

2. (a) polynomial of degree 4, algebraic.
   (b) exponential.
   (c) algebraic.
   (d) power, algebraic.



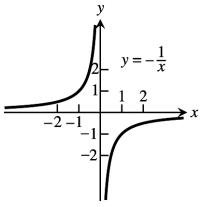
3. (a) rational, algebraic.
   (b) algebraic.
   (c) trigonometric.
   (d) logarithmic.

4. (a) logarithmic.
   (b) algebraic.
   (c) exponential.
   (d) trigonometric.

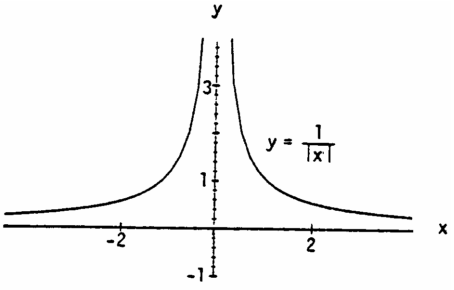


5. (a) Graph h because it is an even function and rises less rapidly than does Graph g.
   (b) Graph f because it is an odd function.
   (c) Graph g because it is an even function and rises more rapidly than does Graph h.

6. (a) Graph f because it is linear.
   (b) Graph g because it contains $(0, 1)$.
   (c) Graph h because it is a nonlinear odd function.

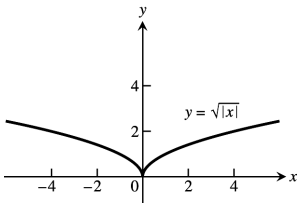


7. Symmetric about the origin
   Dec: $-\infty < x < \infty$
   Inc: nowhere

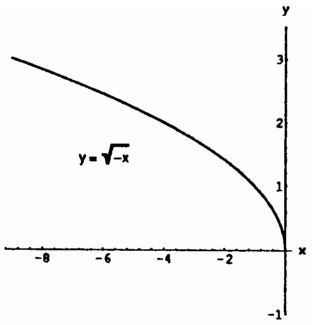


8. Symmetric about the y-axis
   Dec: $-\infty < x < 0$
   Inc: $0 < x < \infty$

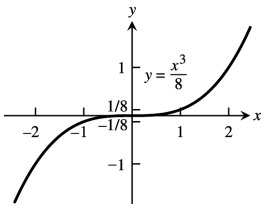
9. Symmetric about the origin
   Dec: nowhere
   Inc: $-\infty < x < 0$
   $0 < x < \infty$



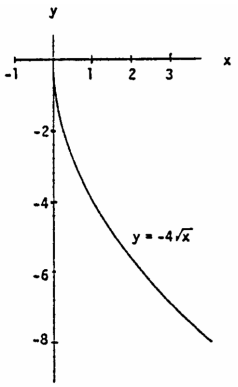
10. Symmetric about the y-axis
    Dec: $0 < x < \infty$
    Inc: $-\infty < x < 0$



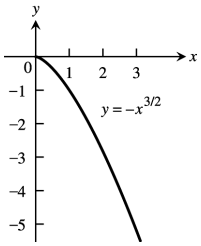
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



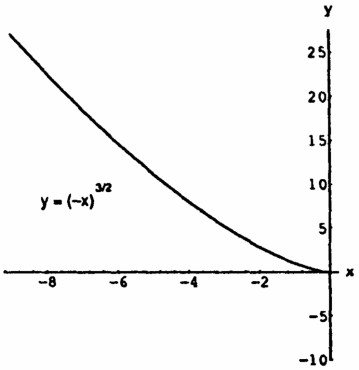
11. Symmetric about the y-axis
Dec: $-\infty < x \leq 0$
Inc: $0 < x < \infty$



12. No symmetry
Dec: $-\infty < x \leq 0$
Inc: nowhere

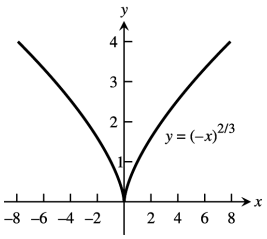


13. Symmetric about the origin
Dec: nowhere
Inc: $-\infty < x < \infty$

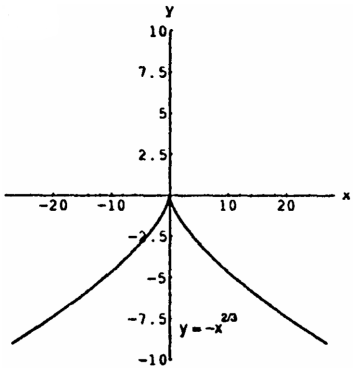


14. No symmetry
Dec: $0 \leq x < \infty$
Inc: nowhere

15. No symmetry
Dec: $0 \leq x < \infty$
Inc: nowhere



16. No symmetry
Dec: $-\infty < x \leq 0$
Inc: nowhere



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

17. Symmetric about the y-axis
Dec: $-\infty < x \leq 0$
Inc: $0 < x < \infty$

18. Symmetric about the y-axis
Dec: $0 \leq x < \infty$
Inc: $-\infty < x < 0$

19. Since a horizontal line not through the origin is symmetric with respect to the y-axis, but not with respect to the origin, the function is even.

20. $f(x) = x^{-5} = \frac{1}{x^5}$ and $f(-x) = (-x)^{-5} = \frac{1}{(-x)^5} = -\left(\frac{1}{x^5}\right) = -f(x)$. Thus the function is odd.

21. Since $f(x) = x^2 + 1 = (-x)^2 + 1 = -f(x)$. The function is even.

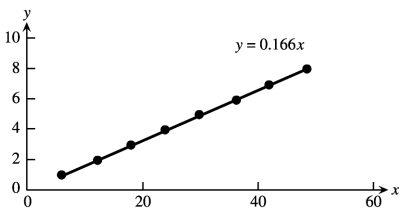
22. Since $[f(x) = x^2 + x] \neq [f(-x) = (-x)^2 - x]$ and $[f(x) = x^2 + x] \neq [-f(x) = -(x)^2 - x]$ the function is neither even nor odd.

23. Since $g(x) = x^3 + x$, $g(-x) = -x^3 - x = -(x^3 + x) = -g(x)$. So the function is odd.

24. $g(x) = x^4 + 3x^2 + 1 = (-x)^4 + 3(-x)^2 - 1 = g(-x)$, thus the function is even.

25. $g(x) = \frac{1}{x^2 - 1} = \frac{1}{(-x)^2 - 1} = g(-x)$. Thus the function is even.

26. $g(x) = \frac{x}{x^2 - 1}$; $g(-x) = -\frac{x}{x^2 - 1} = g(-x)$. So the function is odd.

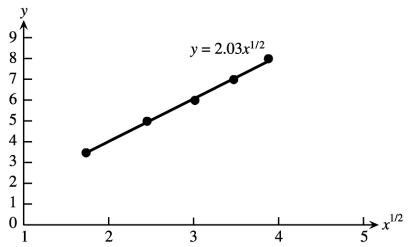


27. $h(t) = \frac{1}{t - 1}$; $h(-t) = \frac{1}{-t - 1}$; $-h(t) = \frac{1}{1 - t}$. Since $h(t) \neq -h(t)$ and $h(t) \neq h(-t)$, the function is neither even nor odd.

28. Since $|t^3| = |(-t)^3|$, $h(t) = h(-t)$ and the function is even.

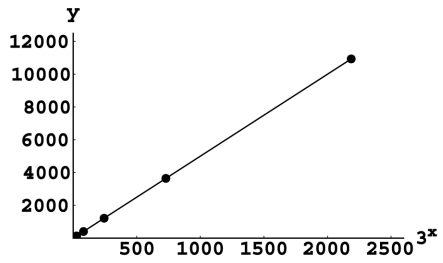
29. $h(t) = 2t + 1$, $h(-t) = -2t + 1$. So $h(t) \neq h(-t)$. $-h(t) = -2t - 1$, so $h(t) \neq -h(t)$. The function is neither even nor odd.

30. $h(t) = 2|t| + 1$ and $h(-t) = 2|-t| + 1 = 2|t| + 1$. So $h(t) = h(-t)$ and the function is even.

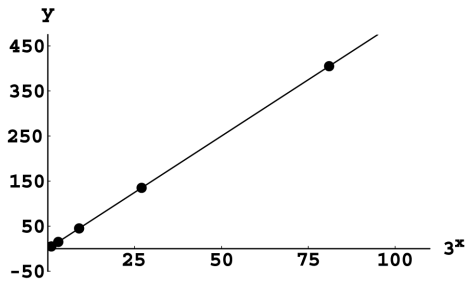


31. (a)

The graph supports the assumption that y is proportional to x. The constant of proportionality is estimated from the slope of the regression line, which is 0.166.

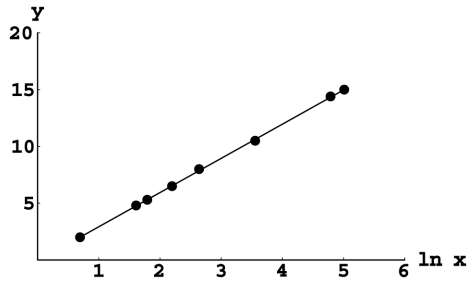


Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

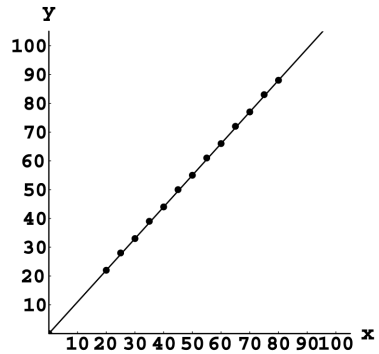


(b)

The graph supports the assumption that y is proportional to $x^{1/2}$. The constant of proportionality is estimated from the slope of the regression line, which is 2.03.

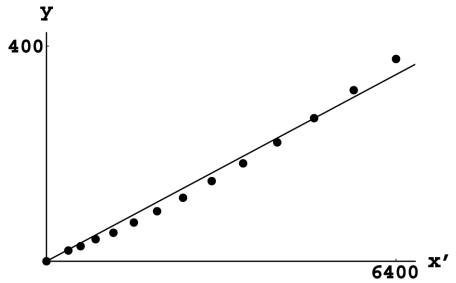


32. (a) Because of the wide range of values of the data, two graphs are needed to observe all of the points in relation to the regression line.



The graphs support the assumption that y is proportional to $3^x$. The constant of proportionality is estimated from the slope of the regression line, which is 5.00.

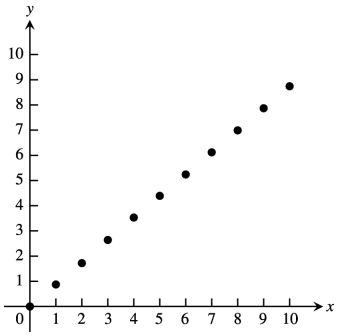
(b) The graph supports the assumption that y is proportional to ln x. The constant of proportionality is extimated from the slope of the regression line, which is 2.99.



33. (a) The scatterplot of y = reaction distance versus x = speed is

Answers for the constant of proportionality may vary. The constant of proportionality is the slope of the line, which is approximately 1.1.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

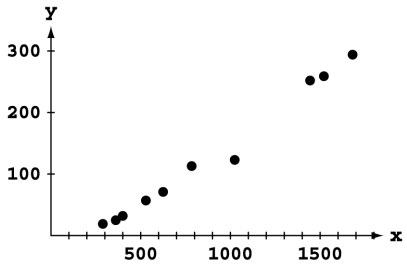


(b) Calculate $x' =$ speed squared. The scatterplot of $x'$ versus $y =$ braking distance is:

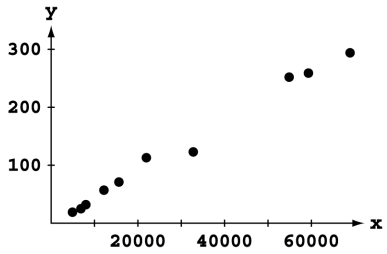
Answers for the constant of proportionality may vary. The constant of proportionality is the slope of the line, which is approximately 0.059.

34. Kepler's 3rd Law is $T(\text{days}) = 0.41R^{3/2}$, R in millions of miles. "Quaoar" is $4 \times 10^9$ miles from Earth, or about $4 \times 10^9 + 93 \times 10^6 \approx 4 \times 10^9$ miles from the sun. Let $R = 4000$ (millions of miles) and $T = (0.41)(4000)^{3/2}$ days $\approx 103,723$ days.

35. (a)



The hypothesis is reasonable.



(b) The constant of proportionality is the slope of the line $\approx \frac{8.741 - 0}{10 - 0}$ in./unit mass $= 0.874$ in./unit mass.

(c) y(in.) $= (0.87 \text{ in./unit mass})(13 \text{ unit mass}) = 11.31$ in.

36. (a)

(b)

Graph (b) suggests that $y = k x^3$ is the better model. This graph is more linear than is graph (a).

## 1.5 COMBINING FUNCTIONS; SHIFTING AND SCALING GRAPHS

1. $D_f: -\infty < x < \infty$, $D_g: x \geq 1 \Rightarrow D_{f+g} = D_{fg}: x \geq 1$. $R_f: -\infty < y < \infty$, $R_g: y \geq 0$, $R_{f+g}: y \geq 1$, $R_{fg}: y \geq 0$

2. $D_f: x + 1 \geq 0 \Rightarrow x \geq -1$, $D_g: x - 1 \geq 0 \Rightarrow x \geq 1$. Therefore $D_{f+g} = D_{fg}: x \geq 1$.
   $R_f = R_g: y \geq 0$, $R_{f+g}: y \geq \sqrt{2}$, $R_{fg}: y \geq 0$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

3. $D_f: -\infty < x < \infty$, $D_g: -\infty < x < \infty \Rightarrow D_{f/g}: -\infty < x < \infty$ since $g(x) \neq 0$ for any x; $D_{g/f}: -\infty < x < \infty$ since $f(x) \neq 0$ for any x. $R_f: y = 2$, $R_g: y \geq 1$, $R_{f/g}: 0 < y \leq 2$, $R_{g/f}: y \geq \frac{1}{2}$

4. $D_f: -\infty < x < \infty$, $D_g: x \geq 0 \Rightarrow D_{f/g}: x \geq 0$ since $g(x) \neq 0$ for any $x \geq 0$; $D_{g/f}: x \geq 0$ since $f(x) \neq 0$ for any $x \geq 0$. $R_f: y = 1$, $R_g: y \geq 1$, $R_{f/g}: 0 < y \leq 1$, $R_{g/f}: y \geq 1$

5. (a) $f(g(0)) = f(-3) = 2$
   (b) $g(f(0)) = g(5) = 22$
   (c) $f(g(x)) = f(x^2 - 3) = x^2 - 3 + 5 = x^2 + 2$
   (d) $g(f(x)) = g(x + 5) = (x + 5)^2 - 3 = x^2 + 10x + 22$
   (e) $f(f(-5)) = f(0) = 5$
   (f) $g(g(2)) = g(1) = -2$
   (g) $f(f(x)) = f(x + 5) = (x + 5) + 5 = x + 10$
   (h) $g(g(x)) = g(x^2 - 3) = (x^2 - 3)^2 - 3 = x^4 - 6x^2 + 6$

6. (a) $f\left(g\left(\frac{1}{2}\right)\right) = f\left(\frac{2}{3}\right) = -\frac{1}{3}$
   (b) $g\left(f\left(\frac{1}{2}\right)\right) = g\left(-\frac{1}{2}\right) = 2$
   (c) $f(g(x)) = f\left(\frac{1}{x+1}\right) = \frac{1}{x+1} - 1 = \frac{-x}{x+1}$
   (d) $g(f(x)) = g(x - 1) = \frac{1}{(x-1)+1} = \frac{1}{x}$
   (e) $f(f(2)) = f(1) = 0$
   (f) $g(g(2)) = g\left(\frac{1}{3}\right) = \frac{1}{\frac{4}{3}} = \frac{3}{4}$
   (g) $f(f(x)) = f(x - 1) = (x - 1) - 1 = x - 2$
   (h) $g(g(x)) = g\left(\frac{1}{x+1}\right) = \frac{1}{\frac{1}{x+1}+1} = \frac{x+1}{x+2}$ $(x \neq -1$ and $x \neq -2)$

7. (a) $u(v(f(x))) = u\left(v\left(\frac{1}{x}\right)\right) = u\left(\frac{1}{x^2}\right) = 4\left(\frac{1}{x}\right)^2 - 5 = \frac{4}{x^2} - 5$

51. $y = 3x^2 - 3$

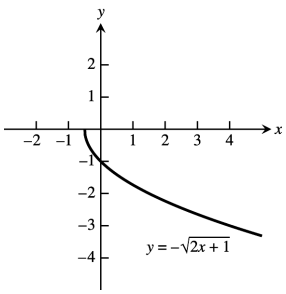
52. $y = (2x)^2 - 1 = 4x^2 - 1$

53. $y = \frac{1}{2}\left(1 + \frac{1}{x^2}\right) = \frac{1}{2} + \frac{1}{2x^2}$

54. $y = 1 + \frac{1}{(x/3)^2} = 1 + \frac{9}{x^2}$

55. $y = \sqrt{4x + 1}$

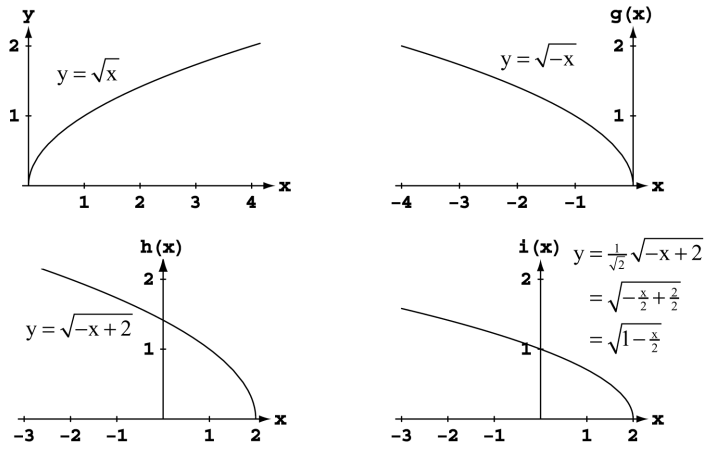
56. $y = 3\sqrt{x + 1}$



57. $y = \sqrt{4 - \left(\frac{x}{2}\right)^2} = \frac{1}{2}\sqrt{16 - x^2}$

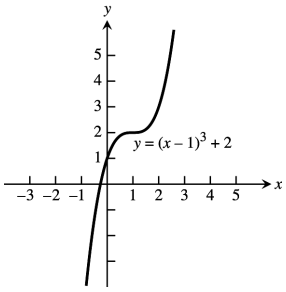
58. $y = \frac{1}{3}\sqrt{4 - x^2}$

59. $y = 1 - (3x)^3 = 1 - 27x^3$

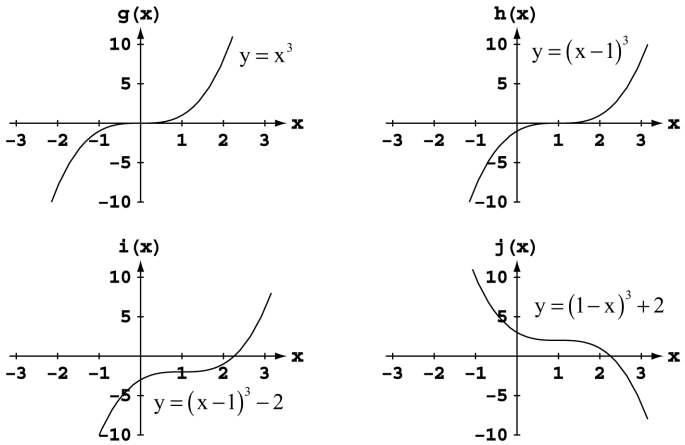


60. $y = 1 - \left(\frac{x}{2}\right)^3 = 1 - \frac{x^3}{8}$

61. Let $y = -\sqrt{2x + 1} = f(x)$ and let $g(x) = x^{1/2}$, $h(x) = \left(x + \frac{1}{2}\right)^{1/2}$, $i(x) = \sqrt{2}\left(x + \frac{1}{2}\right)^{1/2}$, and $j(x) = -\left[\sqrt{2}\left(x + \frac{1}{2}\right)^{1/2}\right] = f(x)$. The graph of $h(x)$ is the graph of $g(x)$ shifted left $\frac{1}{2}$ unit; the graph of $i(x)$ is the graph of $h(x)$ stretched vertically by a factor of $\sqrt{2}$; and the graph of $j(x) = f(x)$ is the graph of $i(x)$ reflected across the x-axis.

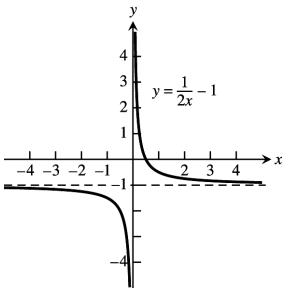


Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

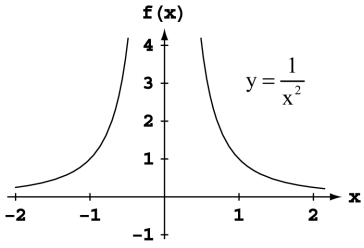


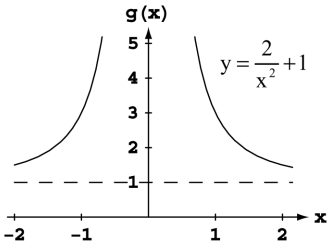
62. Let $y = \sqrt{1 - \frac{x}{2}} = f(x)$. Let $g(x) = (-x)^{1/2}$, $h(x) = (-x + 2)^{1/2}$, and $i(x) = \frac{1}{\sqrt{2}}(-x + 2)^{1/2} = \sqrt{1 - \frac{x}{2}} = f(x)$. The graph of $g(x)$ is the graph of $y = \sqrt{x}$ reflected across the x-axis. The graph of $h(x)$ is the graph of $g(x)$ shifted right two units. And the graph of $i(x)$ is the graph of $h(x)$ compressed vertically by a factor of $\sqrt{2}$.

63. $y = f(x) = x^3$. Shift $f(x)$ one unit right followed by a shift two units up to get $g(x) = (x - 1)^3 + 2$.



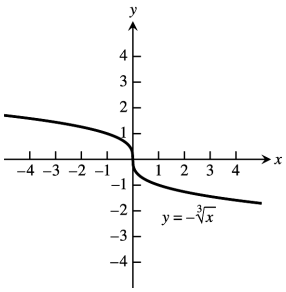
64. $y = (1 - x)^3 + 2 = -[(x - 1)^3 + (-2)] = f(x)$. Let $g(x) = x^3$, $h(x) = (x - 1)^3$, $i(x) = (x - 1)^3 + (-2)$, and $j(x) = -[(x - 1)^3 + (-2)]$. The graph of $h(x)$ is the graph of $g(x)$ shifted right one unit; the graph of $i(x)$ is the graph of $h(x)$ shifted down two units; and the graph of $f(x)$ is the graph of $i(x)$ reflected across the x-axis.



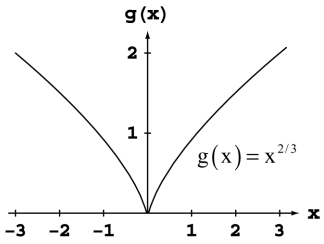


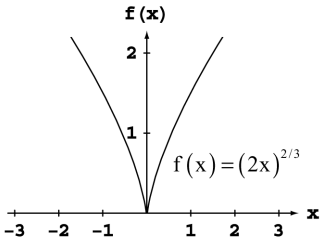
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

65. Compress the graph of $f(x) = \frac{1}{x}$ horizontally by a factor of 2 to get $g(x) = \frac{1}{2x}$. Then shift $g(x)$ vertically down 1 unit to get $h(x) = \frac{1}{2x} - 1$.

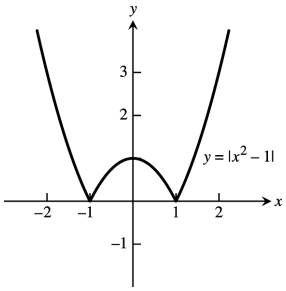


66. Let $f(x) = \frac{1}{x^2}$ and $g(x) = \frac{2}{x^2} + 1 = \frac{1}{\left(\frac{x^2}{2}\right)} + 1 = \frac{1}{\left(x/\sqrt{2}\right)^2} + 1 = \frac{1}{\left[\left(1/\sqrt{2}\right)x\right]^2} + 1$. Since $\sqrt{2} \approx 1.4$, we see that the graph of $f(x)$ stretched horizontally by a factor of 1.4 and shifted up 1 unit is the graph of $g(x)$.





67. Reflect the graph of $y = f(x) = \sqrt[3]{x}$ across the x-axis to get $g(x) = -\sqrt[3]{x}$.



68. $y = f(x) = (-2x)^{2/3} = [(-1)(2)x]^{2/3} = (-1)^{2/3}(2x)^{2/3} = (2x)^{2/3}$. So the graph of $f(x)$ is the graph of $g(x) = x^{2/3}$ compressed horizontally by a factor of 2.

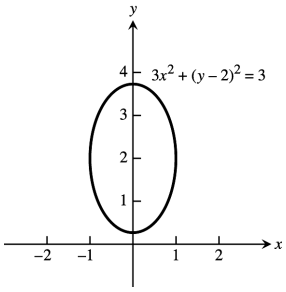
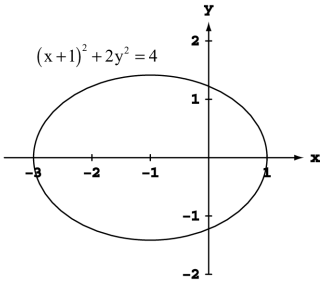
70.

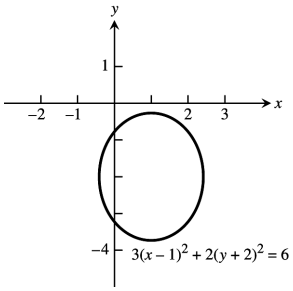


71. $9x^2 + 25y^2 = 225 \Rightarrow \frac{x^2}{5^2} + \frac{y^2}{3^2} = 1$

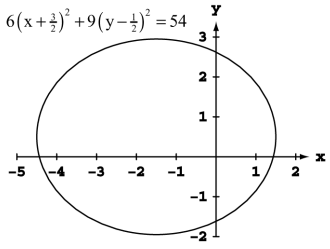


72. $16x^2 + 7y^2 = 112 \Rightarrow \frac{x^2}{\left(\sqrt{7}\right)^2} + \frac{y^2}{4^2} = 1$

73. $3x^2 + (y-2)^2 = 3 \Rightarrow \frac{x^2}{1^2} + \frac{(y-2)^2}{\left(\sqrt{3}\right)^2} = 1$

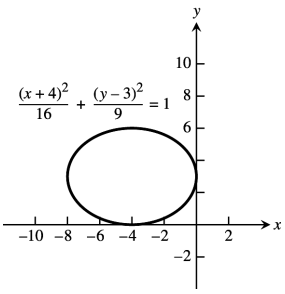


74. $(x+1)^2 + 2y^2 = 4 \Rightarrow \frac{[x-(-1)]^2}{2^2} + \frac{y^2}{\left(\sqrt{2}\right)^2} = 1$



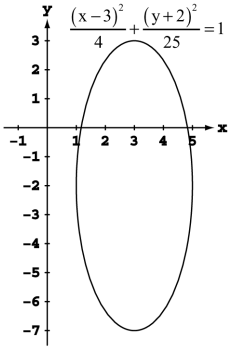
75. $3(x-1)^2 + 2(y+2)^2 = 6$

$\Rightarrow \frac{(x-1)^2}{\left(\sqrt{2}\right)^2} + \frac{[y-(-2)]^2}{\left(\sqrt{3}\right)^2} = 1$



76. $6\left(x+\frac{3}{2}\right)^2 + 9\left(y-\frac{1}{2}\right)^2 = 54$

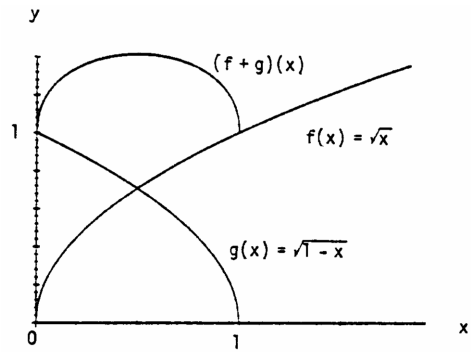
$\Rightarrow \frac{\left[x-\left(-\frac{3}{2}\right)\right]^2}{3^2} + \frac{\left(y-\frac{1}{2}\right)^2}{\left(\sqrt{6}\right)^2} = 1$



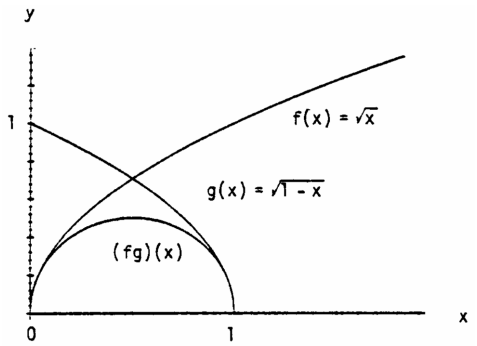
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

77. $\frac{x^2}{16} + \frac{y^2}{9} = 1$ has its center at $(0, 0)$. Shiftinig 4 units left and 3 units up gives the center at $(h, k) = (-4, 3)$. So the equation is $\frac{[x-(-4)]^2}{4^2} + \frac{(y-3)^2}{3^2} = 1 \Rightarrow \frac{(x+4)^2}{4^2} + \frac{(y-3)^2}{3^2} = 1$. Center, C, is $(-4, 3)$, and major axis, $\overline{AB}$, is the segment from $(-8, 3)$ to $(0, 3)$.

78. The ellipse $\frac{x^2}{4} + \frac{y^2}{25} = 1$ has center $(h, k) = (0, 0)$. Shifting the ellipse 3 units right and 2 units down produces an ellipse with center at $(h, k) = (3, -2)$ and an equation $\frac{(x-3)^2}{4} + \frac{[y-(-2)]^2}{25} = 1$. Center, C, is $(3, -2)$, and $\overline{AB}$, the segment from $(3, 3)$ to $(3, -7)$ is the major axis.



79. (a) $(fg)(-x) = f(-x)g(-x) = f(x)(-g(x)) = -(fg)(x)$, odd
(b) $\left(\frac{f}{g}\right)(-x) = \frac{f(-x)}{g(-x)} = \frac{f(x)}{-g(x)} = -\left(\frac{f}{g}\right)(x)$, odd
(c) $\left(\frac{g}{f}\right)(-x) = \frac{g(-x)}{f(-x)} = \frac{-g(x)}{f(x)} = -\left(\frac{g}{f}\right)(x)$, odd
(d) $f^2(-x) = f(-x)f(-x) = f(x)f(x) = f^2(x)$, even
(e) $g^2(-x) = (g(-x))^2 = (-g(x))^2 = g^2(x)$, even
(f) $(f \circ g)(-x) = f(g(-x)) = f(-g(x)) = f(g(x)) = (f \circ g)(x)$, even
(g) $(g \circ f)(-x) = g(f(-x)) = g(f(x)) = (g \circ f)(x)$, even
(h) $(f \circ f)(-x) = f(f(-x)) = f(f(x)) = (f \circ f)(x)$, even
(i) $(g \circ g)(-x) = g(g(-x)) = g(-g(x)) = -g(g(x)) = -(g \circ g)(x)$, odd



80. Yes, $f(x) = 0$ is both even and odd since $f(-x) = 0 = f(x)$ and $f(-x) = 0 = -f(x)$.

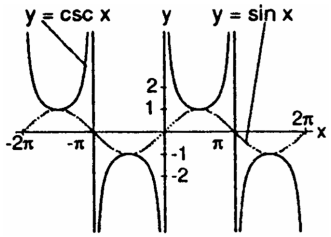
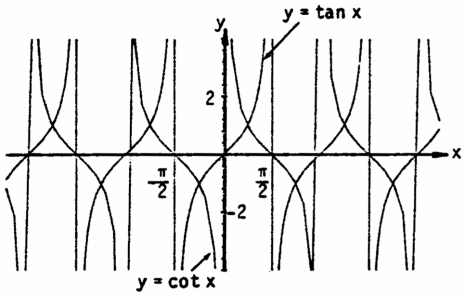
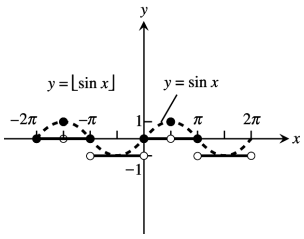
26. period $= 4\pi$, symmetric about the origin



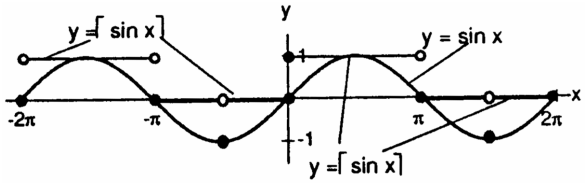
27. (a) Cos x and sec x are positive in QI and QIV and negative in QII and QIII. Sec x is undefined when cos x is 0. The range of sec x is $(-\infty, -1] \cup [1, \infty)$; the range of cos x is $[-1, 1]$.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



(b) Sin x and csc x are positive in QI and QII and negative in QIII and QIV. Csc x is undefined when sin x is 0. The range of csc x is $(-\infty, -1] \cup [1, \infty)$; the range of sin x is $[-1, 1]$.



28. Since $\cot x = \frac{1}{\tan x}$, cot x is undefined when $\tan x = 0$ and is zero when tan x is undefined. As tan x approaches zero through positive values, cot x approaches infinity. Also, cot x approaches negative infinity as tan x approaches zero through negative values.

29. D: $-\infty < x < \infty$; R: $y = -1, 0, 1$

30. D: $-\infty < x < \infty$; R: $y = -1, 0, 1$

31. $\cos\left(x - \frac{\pi}{2}\right) = \cos x \cos\left(-\frac{\pi}{2}\right) - \sin x \sin\left(-\frac{\pi}{2}\right) = (\cos x)(0) - (\sin x)(-1) = \sin x$

32. $\cos\left(x + \frac{\pi}{2}\right) = \cos x \cos\left(\frac{\pi}{2}\right) - \sin x \sin\left(\frac{\pi}{2}\right) = (\cos x)(0) - (\sin x)(1) = -\sin x$

33. $\sin\left(x + \frac{\pi}{2}\right) = \sin x \cos\left(\frac{\pi}{2}\right) + \cos x \sin\left(\frac{\pi}{2}\right) = (\sin x)(0) + (\cos x)(1) = \cos x$

34. $\sin\left(x - \frac{\pi}{2}\right) = \sin x \cos\left(-\frac{\pi}{2}\right) + \cos x \sin\left(-\frac{\pi}{2}\right) = (\sin x)(0) + (\cos x)(-1) = -\cos x$

35. $\cos(A - B) = \cos(A + (-B)) = \cos A \cos(-B) - \sin A \sin(-B) = \cos A \cos B - \sin A(-\sin B)$
$= \cos A \cos B + \sin A \sin B$

36. $\sin(A - B) = \sin(A + (-B)) = \sin A \cos(-B) + \cos A \sin(-B) = \sin A \cos B + \cos A(-\sin B)$
$= \sin A \cos B - \cos A \sin B$

37. If $B = A$, $A - B = 0 \Rightarrow \cos(A - B) = \cos 0 = 1$. Also $\cos(A - B) = \cos(A - A) = \cos A \cos A + \sin A \sin A$ $= \cos^2 A + \sin^2 A$. Therefore, $\cos^2 A + \sin^2 A = 1$.

38. If $B = 2\pi$, then $\cos(A + 2\pi) = \cos A \cos 2\pi - \sin A \sin 2\pi = (\cos A)(1) - (\sin A)(0) = \cos A$ and $\sin(A + 2\pi) = \sin A \cos 2\pi + \cos A \sin 2\pi = (\sin A)(1) + (\cos A)(0) = \sin A$. The result agrees with the fact that the cosine and sine functions have period $2\pi$.

39. $\cos(\pi + x) = \cos \pi \cos x - \sin \pi \sin x = (-1)(\cos x) - (0)(\sin x) = -\cos x$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

41. $\sin\left(\frac{3\pi}{2} - x\right) = \sin\left(\frac{3\pi}{2}\right)\cos(-x) + \cos\left(\frac{3\pi}{2}\right)\sin(-x) = (-1)(\cos x) + (0)(\sin(-x)) = -\cos x$

42. $\cos\left(\frac{3\pi}{2} + x\right) = \cos\left(\frac{3\pi}{2}\right)\cos x - \sin\left(\frac{3\pi}{2}\right)\sin x = (0)(\cos x) - (-1)(\sin x) = \sin x$

43. $\sin\frac{7\pi}{12} = \sin\left(\frac{\pi}{4} + \frac{\pi}{3}\right) = \sin\frac{\pi}{4}\cos\frac{\pi}{3} + \cos\frac{\pi}{4}\sin\frac{\pi}{3} = \left(\frac{\sqrt{2}}{2}\right)\left(\frac{1}{2}\right) + \left(\frac{\sqrt{2}}{2}\right)\left(\frac{\sqrt{3}}{2}\right) = \frac{\sqrt{6}+\sqrt{2}}{4}$

44. $\cos\frac{11\pi}{12} = \cos\left(\frac{\pi}{4} + \frac{2\pi}{3}\right) = \cos\frac{\pi}{4}\cos\frac{2\pi}{3} - \sin\frac{\pi}{4}\sin\frac{2\pi}{3} = \left(\frac{\sqrt{2}}{2}\right)\left(-\frac{1}{2}\right) - \left(\frac{\sqrt{2}}{2}\right)\left(\frac{\sqrt{3}}{2}\right) = -\frac{\sqrt{2}+\sqrt{6}}{4}$

45. $\cos\frac{\pi}{12} = \cos\left(\frac{\pi}{3} - \frac{\pi}{4}\right) = \cos\frac{\pi}{3}\cos\left(-\frac{\pi}{4}\right) - \sin\frac{\pi}{3}\sin\left(-\frac{\pi}{4}\right) = \left(\frac{1}{2}\right)\left(\frac{\sqrt{2}}{2}\right) - \left(\frac{\sqrt{3}}{2}\right)\left(-\frac{\sqrt{2}}{2}\right) = \frac{1+\sqrt{3}}{2\sqrt{2}}$

46. $\sin\frac{5\pi}{12} = \sin\left(\frac{2\pi}{3} - \frac{\pi}{4}\right) = \sin\left(\frac{2\pi}{3}\right)\cos\left(-\frac{\pi}{4}\right) + \cos\left(\frac{2\pi}{3}\right)\sin\left(-\frac{\pi}{4}\right) = \left(\frac{\sqrt{3}}{2}\right)\left(\frac{\sqrt{2}}{2}\right) + \left(-\frac{1}{2}\right)\left(-\frac{\sqrt{2}}{2}\right) = \frac{1+\sqrt{3}}{2\sqrt{2}}$

47. $\cos^2\frac{\pi}{8} = \frac{1+\cos\left(\frac{2\pi}{8}\right)}{2} = \frac{1+\frac{\sqrt{2}}{2}}{2} = \frac{2+\sqrt{2}}{4}$

48. $\cos^2\frac{\pi}{12} = \frac{1+\cos\left(\frac{2\pi}{12}\right)}{2} = \frac{1+\frac{\sqrt{3}}{2}}{2} = \frac{2+\sqrt{3}}{4}$

49. $\sin^2\frac{\pi}{12} = \frac{1-\cos\left(\frac{2\pi}{12}\right)}{2} = \frac{1-\frac{\sqrt{3}}{2}}{2} = \frac{2-\sqrt{3}}{4}$

50. $\sin^2\frac{\pi}{8} = \frac{1-\cos\left(\frac{2\pi}{8}\right)}{2} = \frac{1-\frac{\sqrt{2}}{2}}{2} = \frac{2-\sqrt{2}}{4}$

51. $\tan(A+B) = \frac{\sin(A+B)}{\cos(A+B)} = \frac{\sin A\cos B + \cos A\cos B}{\cos A\cos B - \sin A\sin B} = \frac{\frac{\sin A\cos B}{\cos A\cos B} + \frac{\cos A\sin B}{\cos A\cos B}}{\frac{\cos A\cos B}{\cos A\cos B} - \frac{\sin A\sin B}{\cos A\cos B}} = \frac{\tan A + \tan B}{1 - \tan A\tan B}$

52. $\tan(A-B) = \frac{\sin(A-B)}{\cos(A-B)} = \frac{\sin A\cos B - \cos A\cos B}{\cos A\cos B + \sin A\sin B} = \frac{\frac{\sin A\cos B}{\cos A\cos B} - \frac{\cos A\sin B}{\cos A\cos B}}{\frac{\cos A\cos B}{\cos A\cos B} + \frac{\sin A\sin B}{\cos A\cos B}} = \frac{\tan A - \tan B}{1 + \tan A\tan B}$

53. According to the figure in the text, we have the following: By the law of cosines, $c^2 = a^2 + b^2 - 2ab\cos\theta$ $= 1^2 + 1^2 - 2\cos(A-B) = 2 - 2\cos(A-B)$. By distance formula, $c^2 = (\cos A - \cos B)^2 + (\sin A - \sin B)^2$ $= \cos^2 A - 2\cos A\cos B + \cos^2 B + \sin^2 A - 2\sin A\sin B + \sin^2 B = 2 - 2(\cos A\cos B + \sin A\sin B)$. Thus $c^2 = 2 - 2\cos(A-B) = 2 - 2(\cos A\cos B + \sin A\sin B) \Rightarrow \cos(A-B) = \cos A\cos B + \sin A\sin B$.

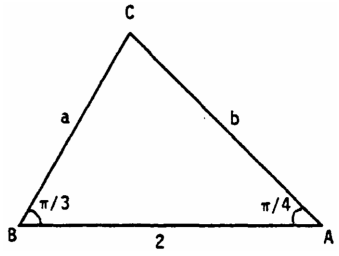
54. (a) $\cos(A-B) = \cos A\cos B + \sin A\sin B$
$\sin\theta = \cos\left(\frac{\pi}{2} - \theta\right)$ and $\cos\theta = \sin\left(\frac{\pi}{2} - \theta\right)$
Let $\theta = A + B$
$\sin(A+B) = \cos\left[\frac{\pi}{2} - (A+B)\right] = \cos\left[\left(\frac{\pi}{2} - A\right) - B\right] = \cos\left(\frac{\pi}{2} - A\right)\cos B + \sin\left(\frac{\pi}{2} - A\right)\sin B$
$= \sin A\cos B + \cos A\sin B$

(b) $\cos(A-B) = \cos A\cos B + \sin A\sin B$
$\cos(A-(-B)) = \cos A\cos(-B) + \sin A\sin(-B)$
$\Rightarrow \cos(A+B) = \cos A\cos(-B) + \sin A\sin(-B) = \cos A\cos B + \sin A(-\sin B)$
$= \cos A\cos B - \sin A\sin B$
Because the cosine function is even and the sine functions is odd.

55. $c^2 = a^2 + b^2 - 2ab\cos C = 2^2 + 3^2 - 2(2)(3)\cos(60°) = 4 + 9 - 12\cos(60°) = 13 - 12\left(\frac{1}{2}\right) = 7.$
Thus, $c = \sqrt{7} \approx 2.65$.

56. $c^2 = a^2 + b^2 - 2ab\cos C = 2^2 + 3^2 - 2(2)(3)\cos(40°) = 13 - 12\cos(40°)$. Thus, $c = \sqrt{13 - 12\cos 40°} \approx 1.951$.

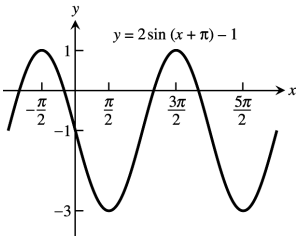
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



57. From the figures in the text, we see that $\sin B = \frac{h}{c}$. If C is an acute angle, then $\sin C = \frac{h}{b}$. On the other hand, if C is obtuse (as in the figure on the right), then $\sin C = \sin(\pi - C) = \frac{h}{b}$. Thus, in either case, $h = b \sin C = c \sin B \Rightarrow ah = ab \sin C = ac \sin B$.

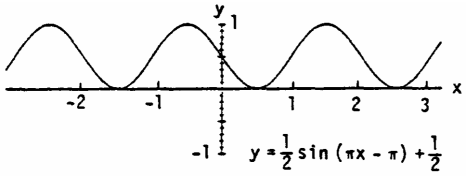
By the law of cosines, $\cos C = \frac{a^2+b^2-c^2}{2ab}$ and $\cos B = \frac{a^2+c^2-b^2}{2ac}$. Moreover, since the sum of the interior angles of a triangle is $\pi$, we have $\sin A = \sin(\pi - (B + C)) = \sin(B + C) = \sin B \cos C + \cos B \sin C$
$= \left(\frac{h}{c}\right)\left[\frac{a^2+b^2-c^2}{2ab}\right] + \left[\frac{a^2+c^2-b^2}{2ac}\right]\left(\frac{h}{b}\right) = \left(\frac{h}{2abc}\right)(2a^2 + b^2 - c^2 + c^2 - b^2) = \frac{ah}{bc} \Rightarrow ah = bc \sin A$.

Combining our results we have $ah = ab \sin C$, $ah = ac \sin B$, and $ah = bc \sin A$. Dividing by abc gives $\frac{h}{bc} = \underbrace{\frac{\sin A}{a} = \frac{\sin C}{c} = \frac{\sin B}{b}}_{\text{law of sines}}$.



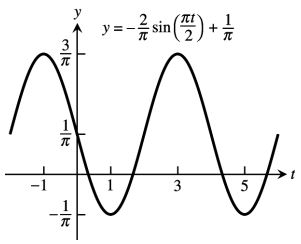
58. By the law of sines, $\frac{\sin A}{2} = \frac{\sin B}{3} = \frac{\sqrt{3}/2}{c}$. By Exercise 55 we know that $c = \sqrt{7}$. Thus $\sin B = \frac{3\sqrt{3}}{2\sqrt{7}} \simeq 0.982$.

59. From the figure at the right and the law of cosines,
$b^2 = a^2 + 2^2 - 2(2a)\cos B$
$= a^2 + 4 - 4a\left(\frac{1}{2}\right) = a^2 - 2a + 4$.
Applying the law of sines to the figure, $\frac{\sin A}{a} = \frac{\sin B}{b}$
$\Rightarrow \frac{\sqrt{2}/2}{a} = \frac{\sqrt{3}/2}{b} \Rightarrow b = \sqrt{\frac{3}{2}}\,a$. Thus, combining results,
$a^2 - 2a + 4 = b^2 = \frac{3}{2}a^2 \Rightarrow 0 = \frac{1}{2}a^2 + 2a - 4$
$\Rightarrow 0 = a^2 + 4a - 8$. From the quadratic formula and the fact that $a > 0$, we have
$a = \frac{-4+\sqrt{4^2-4(1)(-8)}}{2} = \frac{4\sqrt{3}-4}{2} \simeq 1.464$.

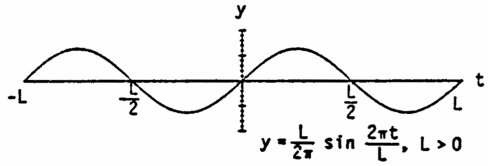


60. (a) The graphs of $y = \sin x$ and $y = x$ nearly coincide when x is near the origin (when the calculator is in radians mode).
(b) In degree mode, when x is near zero degrees the sine of x is much closer to zero than x itself. The curves look like intersecting straight lines near the origin when the calculator is in degree mode.

61. $A = 2, B = 2\pi, C = -\pi, D = -1$



62. $A = \frac{1}{2}, B = 2, C = 1, D = \frac{1}{2}$



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

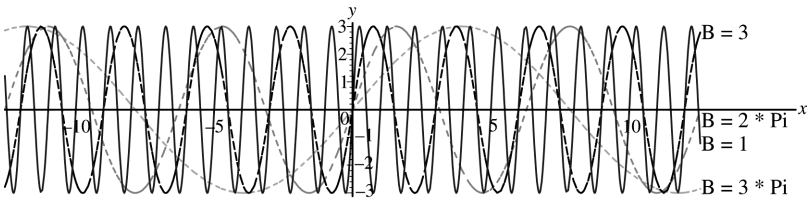
63. $A = -\frac{2}{\pi}$, $B = 4$, $C = 0$, $D = \frac{1}{\pi}$

64. $A = \frac{L}{2\pi}$, $B = L$, $C = 0$, $D = 0$

65. (a) amplitude $= |A| = 37$
(b) period $= |B| = 365$
(c) right horizontal shift $= C = 101$
(d) upward vertical shift $= D = 25$

66. (a) It is highest when the value of the sine is 1 at $f(101) = 37\sin(0) + 25 = 62°$ F.
The lowest mean daily temp is $37(-1) + 25 = -12°$ F.
(b) The average of the highest and lowest mean daily temperatures $= \frac{62°+(-12)°}{2} = 25°$ F.
The average of the sine function is its horizontal axis, $y = 25$.

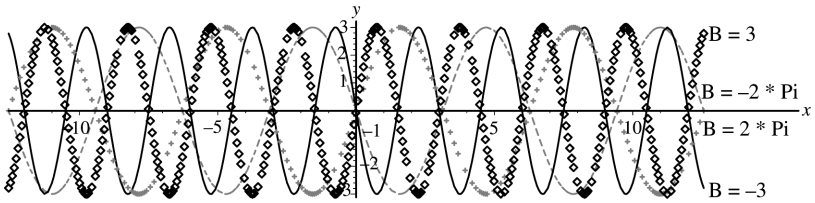
67-70. Example CAS commands:



Maple

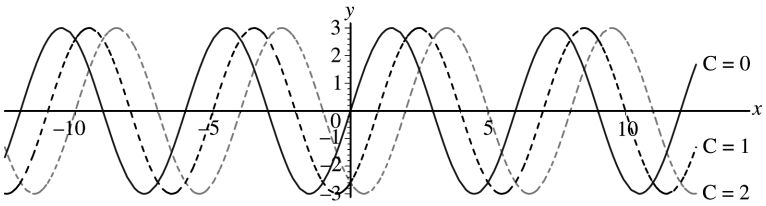
```
f := x -> A*sin((2*Pi/B)*(x-C))+D1;
A:=3; C:=0; D1:=0;
f_list := [seq( f(x), B=[1,3,2*Pi,5*Pi] )];
plot( f_list, x=-4*Pi..4*Pi, scaling=constrained,
      color=[red,blue,green,cyan], linestyle=[1,3,4,7],
      legend=["B=1","B=3","B=2*Pi","B=3*Pi"],
      title="#67 (Section 1.6)" );
```

Mathematica



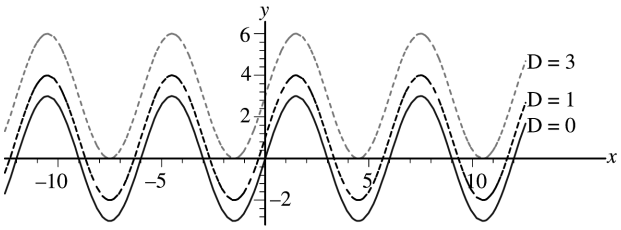
```
Clear[a, b, c, d, f, x]
f[x_]:=a  Sin[2π/b (x − c)] + d
Plot[f[x]/.{a → 3, b → 1, c → 0, d → 0}, {x, −4π, 4π }]
```

67. (a) The graph stretches horizontally.

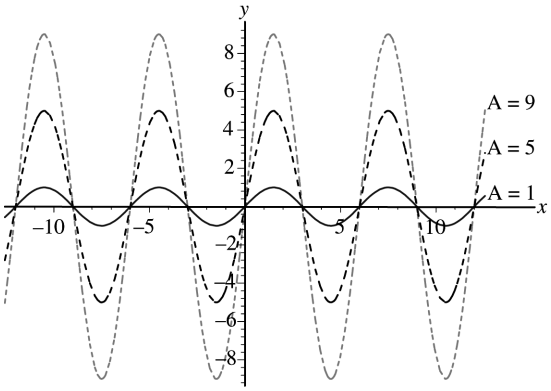


Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(b) The period remains the same: period $= |\,B\,|$. The graph has a horizontal shift of $\frac{1}{2}$ period.



68. (a) The graph is shifted right C units.

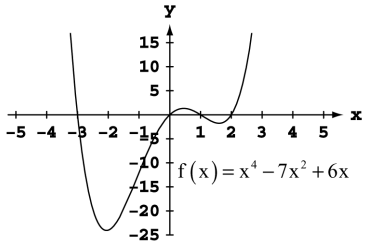


(b) The graph is shifted left C units.

(c) A shift of $\pm$ one period will produce no apparent shift. $|\,C\,| = 6$

69. The graph shifts upwards $|\,D\,|$units for $D > 0$ and down $|\,D\,|$units for $D < 0$.

70. (a) The graph stretches $|\,A\,|$ units.



(b) For $A < 0$, the graph is inverted.

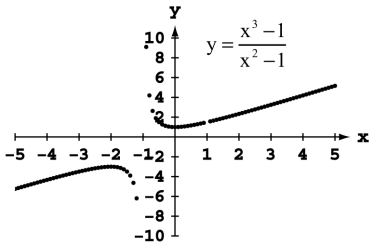
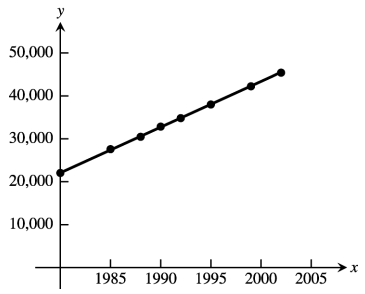
37.



38.

39.

40.



41. (a) $y = 1059.14x - 2074972$

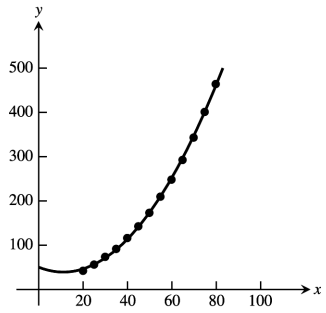
(b) $m = 1059.14$ dollars/year, which is the yearly increase in compensation.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(c)

(d) Answers may vary slightly. $y = (1059.14)(2010) - 2074972 = \$53,899$

42. (a) Let C = cost and x = year.
$C = (7960.71)x - 1.6 \times 10^7$



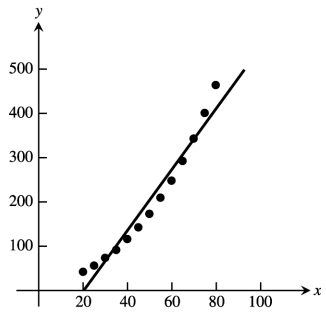
(b) Slope represents increase in cost per year

(c) $C = (2637.14)x - 5.2 \times 10^6$

(d) The median price is rising faster in the northeast (the slope is larger).

43. (a) Let x represent the speed in miles per hour and d the stopping distance in feet. The quadratic regression function is $d = 0.0866x^2 - 1.97x + 50.1$.

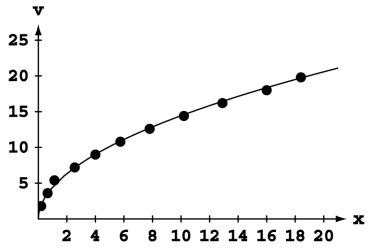
(b)



(c) From the graph in part (b), the stopping distance is about 370 feet when the vehicle is 72 mph and it is about 525 feet when the speed is 85 mph.

Algebraically: $d_{\text{quadratic}}(72) = 0.0866(72)^2 - 1.97(72) + 50.1 = 367.6$ ft.

$d_{\text{quadratic}}(85) = 0.0866(85)^2 - 1.97(85) + 50.1 = 522.8$ ft.



(d) The linear regression function is $d = 6.89x - 140.4 \Rightarrow d_{\text{linear}}(72) = 6.89(72) - 140.4 = 355.7$ ft and $d_{\text{linear}}(85) = 6.89(85) - 140.4 = 445.2$ ft. The linear regression line is shown on the graph in part (b). The quadratic regression curve clearly gives the better fit.

44. (a) The power regression function is $y = 4.44647x^{0.511414}$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(b)

(c) 15.2 km/h

(d) The linear regression function is $y = 0.913675x + 4.189976$ and it is shown on the graph in part (b). The linear regession function gives a speed of 14.2 km/h when $y = 11$ m. The power regression curve in part (a) better fits the data.

## CHAPTER 1 PRACTICE EXERCISES

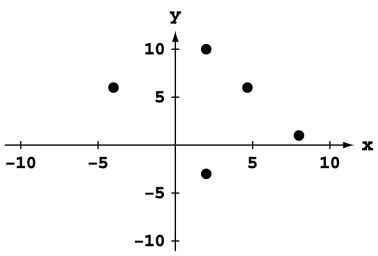
1. $7 + 2x \geq 3 \Rightarrow 2x \geq -4 \Rightarrow x \geq -2$

2. $-3x < 10 \Rightarrow x > -\frac{10}{3}$

3. $\frac{1}{5}(x-1) < \frac{1}{4}(x-2) \Rightarrow 4(x-1) < 5(x-2)$
$\Rightarrow 4x - 4 < 5x - 10 \Rightarrow 6 < x$

4. $\frac{x-3}{2} \geq -\frac{4+x}{3} \Rightarrow 3(x-3) \geq -2(4+x)$
$\Rightarrow 3x - 9 \geq -8 - 2x \Rightarrow 5x \geq 1 \Rightarrow x \geq \frac{1}{5}$

5. $|x+1| = 7 \Rightarrow x + 1 = 7$ or $-(x+1) = 7 \Rightarrow x = 6$ or $x = -8$



6. $|y-3| < 4 \Rightarrow -4 < y - 3 < 4 \Rightarrow -1 < y < 7$

7. $\left|1 - \frac{x}{2}\right| > \frac{3}{2} \Rightarrow 1 - \frac{x}{2} < -\frac{3}{2}$ or $1 - \frac{x}{2} > \frac{3}{2} \Rightarrow -\frac{x}{2} < -\frac{5}{2}$ or $-\frac{x}{2} > \frac{1}{2} \Rightarrow -x < -5$ or $-x > 1$
$\Rightarrow x > 5$ or $x < -1$

8. $\left|\frac{2x+7}{3}\right| \leq 5 \Rightarrow -5 \leq \frac{2x+7}{3} \leq 5 \Rightarrow -15 \leq 2x + 7 \leq 15 \Rightarrow -22 \leq 2x \leq 8 \Rightarrow -11 \leq x \leq 4$

9. Since the particle moved to the y-axis, $-2 + \Delta x = 0 \Rightarrow \Delta x = 2$. Since $\Delta y = 3\Delta x = 6$, the new coordinates are $(x + \Delta x, y + \Delta y) = (-2 + 2, 5 + 6) = (0, 11)$.

10. (a)

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(b)

| line | slope |
|---|---|
| AB | $\frac{10-1}{2-8} = \frac{9}{-6} = -\frac{3}{2}$ |
| BC | $\frac{10-6}{2-(-4)} = \frac{4}{6} = \frac{2}{3}$ |
| CD | $\frac{6-(-3)}{-4-2} = \frac{9}{-6} = -\frac{3}{2}$ |
| DA | $\frac{1-(-3)}{8-2} = \frac{4}{6} = \frac{2}{3}$ |
| CE | $\frac{6-6}{-4-\frac{14}{3}} = 0$ |
| BD | is vertical and has no slope |

(c) Yes; A, B, C and D form a parallelogram.

(d) Yes. The line AB has equation $y - 1 = -\frac{3}{2}(x - 8)$. Replacing x by $\frac{14}{3}$ gives $y = -\frac{3}{2}\left(\frac{14}{3} - 8\right) + 1$ $= -\frac{3}{2}\left(-\frac{10}{3}\right) + 1 = 5 + 1 = 6$. Thus, $E\left(\frac{14}{3}, 6\right)$ lies on the line AB and the points A, B and E are collinear.

(e) The line CD has equation $y + 3 = -\frac{3}{2}(x - 2)$ or $y = -\frac{3}{2}x$. Thus the line passes through the origin.

11. The triangle ABC is neither an isosceles triangle nor is it a right triangle. The lengths of AB, BC and AC are $\sqrt{53}$, $\sqrt{72}$ and $\sqrt{65}$, respectively. The slopes of AB, BC and AC are $\frac{7}{2}$, $-1$ and $\frac{1}{8}$, respectively.

12. $P(x, 3x + 1)$ is a point on the line $y = 3x + 1$. If the distance from P to $(0, 0)$ equals the distance from P to $(-3, 4)$, then $x^2 + (3x + 1)^2 = (x + 3)^2 + (3 - 3x)^2 \Rightarrow x^2 + 9x^2 + 6x + 1 = x^2 + 6x + 9 + 9 - 18x + 9x^2$ $\Rightarrow 18x = 17$ or $x = \frac{17}{18} \Rightarrow y = 3x + 1 = 3\left(\frac{17}{18}\right) + 1 = \frac{23}{6}$. Thus the point is $P\left(\frac{17}{18}, \frac{23}{6}\right)$.

13. $y = 3(x - 1) + (-6) \Rightarrow y = 3x - 9$

14. $y = -\frac{1}{2}(x + 1) + 2 \Rightarrow y = -\frac{1}{2}x + \frac{3}{2}$

15. $x = 0$

16. $m = \frac{-2-6}{1-(-3)} = \frac{-8}{4} = -2 \Rightarrow y = -2(x + 3) + 6 \Rightarrow y = -2x$

17. $y = 2$

18. $m = \frac{5-3}{-2-3} = \frac{2}{-5} = -\frac{2}{5} \Rightarrow y = -\frac{2}{5}(x - 3) + 3 \Rightarrow y = -\frac{2}{5}x + \frac{21}{5}$

19. $y = -3x + 3$

20. Since $2x - y = -2$ is equivalent to $y = 2x + 2$, the slope of the given line (and hence the slope of the desired line) is 2. $y = 2(x - 1) + 1 \Rightarrow y = 2x - 5$

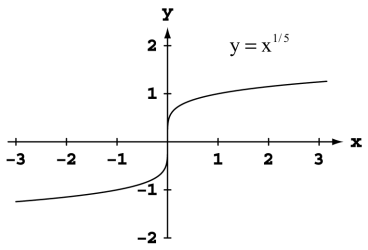
21. Since $4x + 3y = 12$ is equivalent to $y = -\frac{4}{3}x + 4$, the slope of the given line (and hence the slope of the desired line) is $-\frac{4}{3}$. $y = -\frac{4}{3}(x - 4) - 12 \Rightarrow y = -\frac{4}{3}x - \frac{20}{3}$

22. Since $3x - 5y = 1$ is equivalent to $y = \frac{3}{5}x - \frac{1}{5}$, the slope of the given line is $\frac{3}{5}$ and the slope of the perpendicular line is $-\frac{5}{3}$. $y = -\frac{5}{3}(x + 2) - 3 \Rightarrow y = -\frac{5}{3}x - \frac{19}{3}$

23. Since $\frac{1}{2}x + \frac{1}{3}y = 1$ is equivalent to $y = -\frac{3}{2}x + 3$, the slope of the given line is $-\frac{3}{2}$ and the slope of the perpendicular line is $\frac{2}{3}$. $y = \frac{2}{3}(x + 1) + 2 \Rightarrow y = \frac{2}{3}x + \frac{8}{3}$

24. The line passes through $(0, -5)$ and $(3, 0)$. $m = \frac{0-(-5)}{3-0} = \frac{5}{3} \Rightarrow y = \frac{5}{3}x - 5$

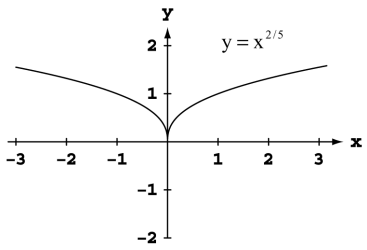
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



25. The area is $A = \pi r^2$ and the circumference is $C = 2\pi r$. Thus, $r = \frac{C}{2\pi} \Rightarrow A = \pi\left(\frac{C}{2\pi}\right)^2 = \frac{C^2}{4\pi}$.

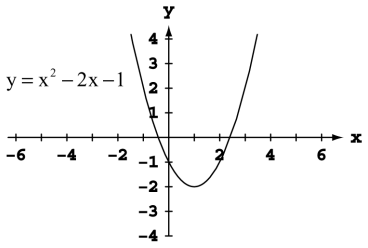
26. The surface area is $S = 4\pi r^2 \Rightarrow r = \left(\frac{S}{4\pi}\right)^{1/2}$. The volume is $V = \frac{4}{3}\pi r^3 \Rightarrow r = \sqrt[3]{\frac{3V}{4\pi}}$. Substitution into the formula for surface area gives $S = 4\pi r^2 = 4\pi\left(\frac{3V}{4\pi}\right)^{2/3}$.

27. The coordinates of a point on the parabola are $(x, x^2)$. The angle of inclination $\theta$ joining this point to the origin satisfies the equation $\tan\theta = \frac{x^2}{x} = x$. Thus the point has coordinates $(x, x^2) = (\tan\theta, \tan^2\theta)$.



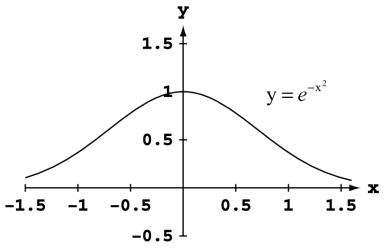
28. $\tan\theta = \frac{\text{rise}}{\text{run}} = \frac{h}{500} \Rightarrow h = 500\tan\theta$ ft.

29.



Symmetric about the origin.

30.



Symmetric about the y-axis.

31.

Neither

32.

Symmetric about the y-axis.

33. $y(-x) = (-x)^2 + 1 = x^2 + 1 = y(x)$. Even.

34. $y(-x) = (-x)^5 - (-x)^3 - (-x) = -x^5 + x^3 + x = -y(x)$. Odd.

35. $y(-x) = 1 - \cos(-x) = 1 - \cos x = y(x)$. Even.

36. $y(-x) = \sec(-x)\tan(-x) = \frac{\sin(-x)}{\cos^2(-x)} = \frac{-\sin x}{\cos^2 x} = -\sec x \tan x = -y(x)$. Odd.

37. $y(-x) = \frac{(-x)^4+1}{(-x)^3-2(-x)} = \frac{x^4+1}{-x^3+2x} = -\frac{x^4+1}{x^3-2x} = -y(x)$. Odd.

38. $y(-x) = 1 - \sin(-x) = 1 + \sin x$. Neither even nor odd.

39. $y(-x) = -x + \cos(-x) = -x + \cos x$. Neither even nor odd.

40. $y(-x) = \sqrt{(-x)^4 - 1} = \sqrt{x^4 - 1} = y(x)$. Even.

The graph of $f_2(x) = f_1(|x|)$ is the same as the graph of $f_1(x)$ to the right of the y-axis. The graph of $f_2(x)$ to the left of the y-axis is the reflection of $y = f_1(x)$, $x \geq 0$ across the y-axis.

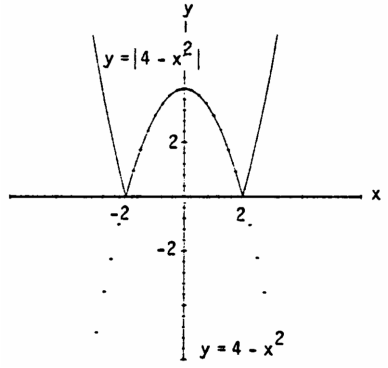
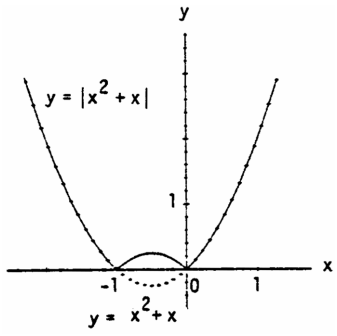
65.



Whenever $g_1(x)$ is positive, the graph of $y = g_2(x) = |g_1(x)|$ is the same as the graph of $y = g_1(x)$. When $g_1(x)$ is negative, the graph of $y = g_2(x)$ is the reflection of the graph of $y = g_1(x)$ across the x-axis.

66.

It does not change the graph.



67.

Whenever $g_1(x)$ is positive, the graph of $y = g_2(x) = |g_1(x)|$ is the same as the graph of $y = g_1(x)$. When $g_1(x)$ is negative, the graph of $y = g_2(x)$ is the reflection of the graph of $y = g_1(x)$ across the x-axis.

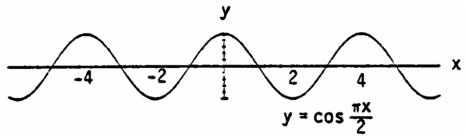
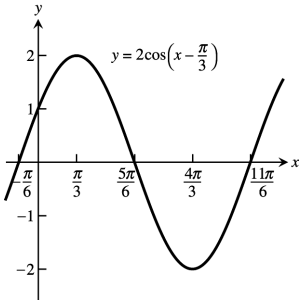
period $= \pi$

70.



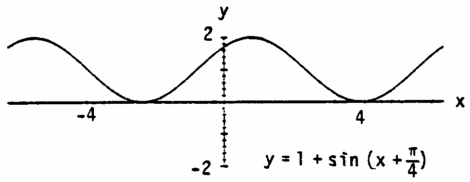
period $= 4\pi$

71.



period $= 2$

72.



period $= 4$

73.

period $= 2\pi$

74.

period $= 2\pi$

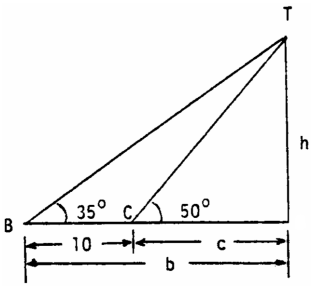
75. (a) $\sin B = \sin \frac{\pi}{3} = \frac{b}{c} = \frac{b}{2} \Rightarrow b = 2 \sin \frac{\pi}{3} = 2\left(\frac{\sqrt{3}}{2}\right) = \sqrt{3}$. By the theorem of Pythagoras,

$a^2 + b^2 = c^2 \Rightarrow a = \sqrt{c^2 - b^2} = \sqrt{4 - 3} = 1$.

(b) $\sin B = \sin \frac{\pi}{3} = \frac{b}{c} = \frac{2}{c} \Rightarrow c = \frac{2}{\sin \frac{\pi}{3}} = \frac{2}{\left(\frac{\sqrt{3}}{2}\right)} = \frac{4}{\sqrt{3}}$. Thus, $a = \sqrt{c^2 - b^2} = \sqrt{\left(\frac{4}{\sqrt{3}}\right)^2 - (2)^2} = \sqrt{\frac{4}{3}} = \frac{2}{\sqrt{3}}$.

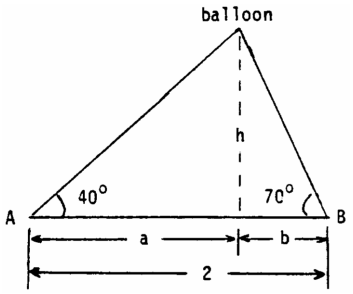
76. (a) $\sin A = \frac{a}{c} \Rightarrow a = c \sin A$

(b) $\tan A = \frac{a}{b} \Rightarrow a = b \tan A$



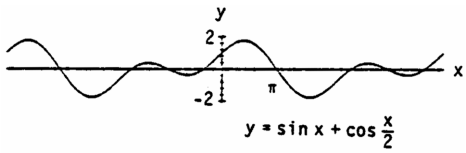
77. (a) $\tan B = \frac{b}{a} \Rightarrow a = \frac{b}{\tan B}$

(b) $\sin A = \frac{a}{c} \Rightarrow c = \frac{a}{\sin A}$



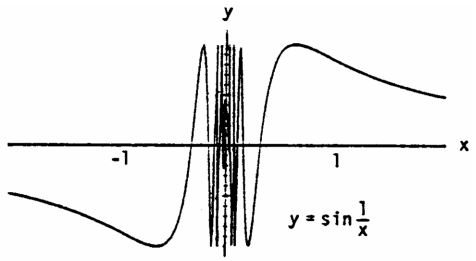
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

78. (a) $\sin A = \frac{a}{c}$ (c) $\sin A = \frac{a}{c} = \frac{\sqrt{c^2-b^2}}{c}$



79. Let h = height of vertical pole, and let b and c denote the distances of points B and C from the base of the pole, measured along the flatground, respectively. Then, $\tan 50° = \frac{h}{c}$, $\tan 35° = \frac{h}{b}$, and $b - c = 10$.
Thus, $h = c \tan 50°$ and $h = b \tan 35° = (c + 10) \tan 35°$
$\Rightarrow c \tan 50° = (c + 10) \tan 35°$
$\Rightarrow c (\tan 50° - \tan 35°) = 10 \tan 35°$
$\Rightarrow c = \frac{10 \tan 35°}{\tan 50° - \tan 35°} \Rightarrow h = c \tan 50°$
$= \frac{10 \tan 35° \tan 50°}{\tan 50° - \tan 35°} \approx 16.98$ m.

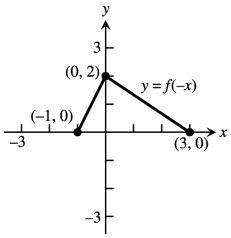
80. Let h = height of balloon above ground. From the figure at the right, $\tan 40° = \frac{h}{a}$, $\tan 70° = \frac{h}{b}$, and $a + b = 2$. Thus, $h = b \tan 70° \Rightarrow h = (2 - a) \tan 70°$ and $h = a \tan 40°$
$\Rightarrow (2 - a) \tan 70° = a \tan 40° \Rightarrow a(\tan 40° + \tan 70°)$
$= 2 \tan 70° \Rightarrow a = \frac{2 \tan 70°}{\tan 40° + \tan 70°} \Rightarrow h = a \tan 40°$
$= \frac{2 \tan 70° \tan 40°}{\tan 40° + \tan 70°} \approx 1.3$ km.



81. (a)

(b) The period appears to be $4\pi$.
(c) $f(x + 4\pi) = \sin(x + 4\pi) + \cos\left(\frac{x+4\pi}{2}\right) = \sin(x + 2\pi) + \cos\left(\frac{x}{2} + 2\pi\right) = \sin x + \cos\frac{x}{2}$ since the period of sine and cosine is $2\pi$. Thus, f(x) has period $4\pi$.

82. (a)



(b) $D = (-\infty, 0) \cup (0, \infty)$; $R = [-1, 1]$
(c) f is not periodic. For suppose f has period p. Then $f\left(\frac{1}{2\pi} + kp\right) = f\left(\frac{1}{2\pi}\right) = \sin 2\pi = 0$ for all integers k. Choose k so large that $\frac{1}{2\pi} + kp > \frac{1}{\pi} \Rightarrow 0 < \frac{1}{(1/2\pi)+kp} < \pi$. But then $f\left(\frac{1}{2\pi} + kp\right) = \sin\left(\frac{1}{(1/2\pi)+kp}\right) > 0$ which is a contradiction. Thus f has no period, as claimed.

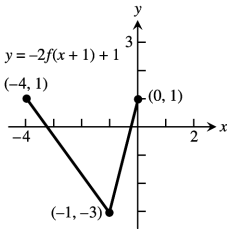
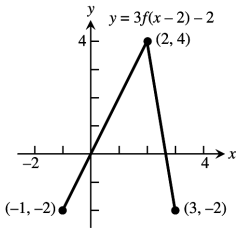
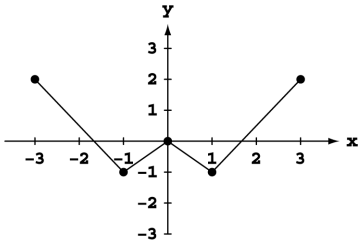
## CHAPTER 1 ADDITIONAL AND ADVANCED EXERCISES



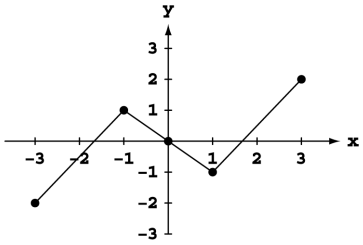
1. (a) The given graph is reflected about the y-axis.



(b) The given graph is reflected about the x-axis.



(c) The given graph is shifted left 1 unit, stretched vertically by a factor of 2, reflected about the x-axis, and then shifted upward 1 unit.

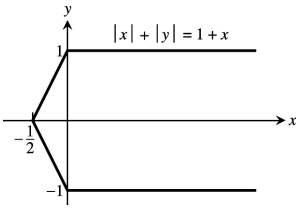


(d) The given graph is shifted right 2 units, stretched vertically by a factor of 3, and then shifted downward 2 units.

2. (a)

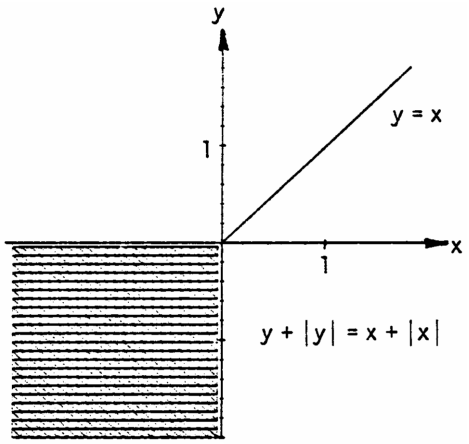
(b)

3. There are (infinitely) many such function pairs. For example, $f(x) = 3x$ and $g(x) = 4x$ satisfy $f(g(x)) = f(4x) = 3(4x) = 12x = 4(3x) = g(3x) = g(f(x))$.



4. Yes, there are many such function pairs. For example, if $g(x) = (2x + 3)^3$ and $f(x) = x^{1/3}$, then $(f \circ g)(x) = f(g(x)) = f\left((2x + 3)^3\right) = \left((2x + 3)^3\right)^{1/3} = 2x + 3$.

5. If f is odd and defined at x, then $f(-x) = -f(x)$. Thus $g(-x) = f(-x) - 2 = -f(x) - 2$ whereas $-g(x) = -(f(x) - 2) = -f(x) + 2$. Then g cannot be odd because $g(-x) = -g(x) \Rightarrow -f(x) - 2 = -f(x) + 2 \Rightarrow 4 = 0$, which is a contradiction. Also, g(x) is not even unless $f(x) = 0$ for all x. On the other hand, if f is even, then $g(x) = f(x) - 2$ is also even: $g(-x) = f(-x) - 2 = f(x) - 2 = g(x)$.



6. If g is odd and g(0) is defined, then $g(0) = g(-0) = -g(0)$. Therefore, $2g(0) = 0 \Rightarrow g(0) = 0$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

7. For $(x, y)$ in the 1st quadrant, $|x| + |y| = 1 + x$ $\Leftrightarrow$ $x + y = 1 + x$ $\Leftrightarrow$ $y = 1$. For $(x, y)$ in the 2nd quadrant, $|x| + |y| = x + 1$ $\Leftrightarrow$ $-x + y = x + 1$ $\Leftrightarrow$ $y = 2x + 1$. In the 3rd quadrant, $|x| + |y| = x + 1$ $\Leftrightarrow$ $-x - y = x + 1$ $\Leftrightarrow$ $y = -2x - 1$. In the 4th quadrant, $|x| + |y| = x + 1$ $\Leftrightarrow$ $x + (-y) = x + 1$ $\Leftrightarrow$ $y = -1$. The graph is given at the right.

8. We use reasoning similar to Exercise 7.
   (1) 1st quadrant: $y + |y| = x + |x|$ $\Leftrightarrow$ $2y = 2x$ $\Leftrightarrow$ $y = x$.
   (2) 2nd quadrant: $y + |y| = x + |x|$ $\Leftrightarrow$ $2y = x + (-x) = 0$ $\Leftrightarrow$ $y = 0$.
   (3) 3rd quadrant: $y + |y| = x + |x|$ $\Leftrightarrow$ $y + (-y) = x + (-x)$ $\Leftrightarrow$ $0 = 0$ $\Rightarrow$ all points in the 3rd quadrant satisfy the equation.
   (4) 4th quadrant: $y + |y| = x + |x|$ $\Leftrightarrow$ $y + (-y) = 2x$ $\Leftrightarrow$ $0 = x$. Combining these results we have the graph given at the right:

9. By the law of sines, $\frac{\sin\frac{\pi}{3}}{\sqrt{3}} = \frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin\frac{\pi}{4}}{b}$ $\Rightarrow$ $b = \frac{\sqrt{3}\sin(\pi/4)}{\sin(\pi/3)} = \frac{\sqrt{3}\left(\frac{\sqrt{2}}{2}\right)}{\frac{\sqrt{3}}{2}} = \sqrt{2}$.

10. By the law of sines, $\frac{\sin\frac{\pi}{4}}{4} = \frac{\sin A}{a} = \frac{\sin B}{b} = \frac{\sin B}{3}$ $\Rightarrow$ $\sin B = \frac{3}{4}\sin\frac{\pi}{4} = \frac{3}{4}\left(\frac{\sqrt{2}}{2}\right) = \frac{3\sqrt{2}}{8}$.

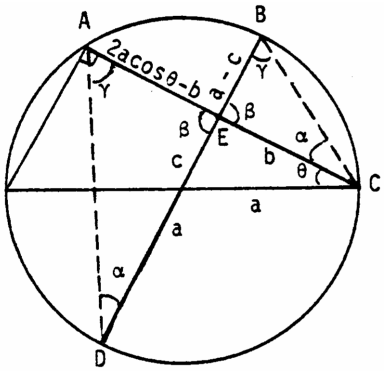
11. By the law of cosines, $a^2 = b^2 + c^2 - 2bc\cos A$ $\Rightarrow$ $\cos A = \frac{b^2+c^2-a^2}{2bc} = \frac{2^2+3^2-2^2}{2(2)(3)} = \frac{3}{4}$.

12. By the law of cosines, $c^2 = a^2 + b^2 - 2ab\cos C = 2^2 + 3^2 - (2)(2)(3)\cos\frac{\pi}{4} = 4 + 9 - 12\left(\frac{\sqrt{2}}{2}\right)$ $= 13 - 6\sqrt{2}$ $\Rightarrow$ $c = \sqrt{13 - 6\sqrt{2}}$, since $c > 0$.

13. By the law of cosines, $b^2 = a^2 + c^2 - 2ac\cos B$ $\Rightarrow$ $\cos B = \frac{a^2+c^2-b^2}{2ac} = \frac{2^2+4^2-3^2}{(2)(2)(4)} = \frac{4+16-9}{16}$ $= \frac{11}{16}$. Since $0 < B < \pi$, $\sin B = \sqrt{1 - \cos^2 B} = \sqrt{1 - \frac{121}{256}} = \frac{\sqrt{135}}{16} = \frac{3\sqrt{15}}{16}$.

14. By the law of cosines, $c^2 = a^2 + b^2 - 2ab\cos C$ $\Rightarrow$ $\cos C = \frac{a^2+b^2-c^2}{2ab} = \frac{2^2+4^2-5^2}{(2)(2)(4)} = \frac{4+16-25}{16}$ $= -\frac{5}{16}$. Since $0 < C < \pi$, $\sin C = \sqrt{1 - \cos^2 C} = \sqrt{1 - \frac{25}{256}} = \frac{\sqrt{231}}{16}$.

15. (a) $\sin^2 x + \cos^2 x = 1$ $\Rightarrow$ $\sin^2 x = 1 - \cos^2 x = (1 - \cos x)(1 + \cos x)$ $\Rightarrow$ $(1 - \cos x) = \frac{\sin^2 x}{1+\cos x}$ $\Rightarrow$ $\frac{1-\cos x}{\sin x} = \frac{\sin x}{1+\cos x}$
    (b) Using the definition of the tangent function and the double angle formulas, we have $\tan^2\left(\frac{x}{2}\right) = \frac{\sin^2\left(\frac{x}{2}\right)}{\cos^2\left(\frac{x}{2}\right)} = \frac{\frac{1-\cos\left(2\left(\frac{x}{2}\right)\right)}{2}}{\frac{1+\cos\left(2\left(\frac{x}{2}\right)\right)}{2}} = \frac{1-\cos x}{1+\cos x}$.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

16. The angles labeled $\gamma$ in the accompanying figure are equal since both angles subtend arc CD. Similarly, the two angles labeled $\alpha$ are equal since they both subtend arc AB. Thus, triangles AED and BEC are similar which implies $\frac{a-c}{b} = \frac{2a\cos\theta - b}{a+c}$

$\Rightarrow (a-c)(a+c) = b(2a\cos\theta - b)$

$\Rightarrow a^2 - c^2 = 2ab\cos\theta - b^2$

$\Rightarrow c^2 = a^2 + b^2 - 2ab\cos\theta.$

17. As in the proof of the law of sines of Section P.5, Exercise 57, $ah = bc\sin A = ab\sin C = ac\sin B$

$\Rightarrow$ the area of ABC $= \frac{1}{2}$ (base)(height) $= \frac{1}{2}ah = \frac{1}{2}bc\sin A = \frac{1}{2}ab\sin C = \frac{1}{2}ac\sin B.$

18. As in Section P.5, Exercise 57, (Area of ABC)$^2 = \frac{1}{4}$ (base)$^2$(height)$^2 = \frac{1}{4}a^2h^2 = \frac{1}{4}a^2b^2\sin^2 C$

$= \frac{1}{4}a^2b^2(1-\cos^2 C)$. By the law of cosines, $c^2 = a^2 + b^2 - 2ab\cos C \Rightarrow \cos C = \frac{a^2+b^2-c^2}{2ab}$.

Thus, (area of ABC)$^2 = \frac{1}{4}a^2b^2(1-\cos^2 C) = \frac{1}{4}a^2b^2\left(1 - \left(\frac{a^2+b^2-c^2}{2ab}\right)^2\right) = \frac{a^2b^2}{4}\left(1 - \frac{(a^2+b^2-c^2)^2}{4a^2b^2}\right)$

$= \frac{1}{16}\left(4a^2b^2 - (a^2+b^2-c^2)^2\right) = \frac{1}{16}\left[(2ab + (a^2+b^2-c^2))(2ab - (a^2+b^2-c^2))\right]$

$= \frac{1}{16}\left[((a+b)^2 - c^2)(c^2 - (a-b)^2)\right] = \frac{1}{16}\left[((a+b)+c)((a+b)-c)(c+(a-b))(c-(a-b))\right]$

$= \left[\left(\frac{a+b+c}{2}\right)\left(\frac{-a+b+c}{2}\right)\left(\frac{a-b+c}{2}\right)\left(\frac{a+b-c}{2}\right)\right] = s(s-a)(s-b)(s-c)$, where $s = \frac{a+b+c}{2}$.

Therefore, the area of ABC equals $\sqrt{s(s-a)(s-b)(s-c)}$.

19. 1. $b + c - (a + c) = b - a$, which is positive since $a < b$. Thus, $a + c < b + c$.
    2. $b - c - (a - c) = b - a$, which is positive since $a < b$. Thus, $a - c < b - c$.
    3. $c > 0$ and $a < b \Rightarrow c - 0 = c$ and $b - a$ are positive $\Rightarrow (b-a)c = bc - ac$ is positive $\Rightarrow ac < bc$.
    4. $a < b$ and $c < 0 \Rightarrow b - a$ and $-c$ are positive $\Rightarrow (b-a)(-c) = ac - bc$ is positive $\Rightarrow bc < ac$.
    5. Since $a > 0$, $a$ and $\frac{1}{a}$ are positive $\Rightarrow \frac{1}{a} > 0$.
    6. Since $0 < a < b$, both $\frac{1}{a}$ and $\frac{1}{b}$ are positive. By (3), $a < b$ and $\frac{1}{a} > 0 \Rightarrow a\left(\frac{1}{a}\right) < b\left(\frac{1}{a}\right)$ or $1 < \frac{b}{a}$ $\Rightarrow 1\left(\frac{1}{b}\right) < \frac{b}{a}\left(\frac{1}{b}\right)$ by (3) since $\frac{1}{b} > 0 \Rightarrow \frac{1}{b} < \frac{1}{a}$.
    7. $a < b < 0 \Rightarrow \frac{1}{a}$ and $\frac{1}{b}$ are both negative, i.e., $\frac{1}{a} < 0$ and $\frac{1}{b} < 0$. By (4), $a < b$ and $\frac{1}{a} < 0 \Rightarrow b\left(\frac{1}{a}\right) < a\left(\frac{1}{a}\right)$ $\Rightarrow \frac{b}{a} < 1 \Rightarrow 1\left(\frac{1}{b}\right) < \frac{b}{a}\left(\frac{1}{b}\right)$ by (4) since $\frac{1}{b} < 0 \Rightarrow \frac{1}{b} < \frac{1}{a}$.

20. (a) If $a = 0$, then $0 = |a| < |b| \Leftrightarrow b \neq 0 \Leftrightarrow 0 = |a|^2 < |b|^2$. Since $|a|^2 = |a|\,|a| = |a^2| = a^2$ and $|b|^2 = b^2$ we obtain $a^2 < b^2$. If $a \neq 0$ then $|a| > 0$ and $|a| < |b| \Rightarrow a^2 < b^2$. On the other hand, if $a^2 < b^2$ then $a^2 = |a|^2 < |b|^2 = b^2 \Rightarrow 0 < |b|^2 - |a|^2 = (|b| - |a|)(|b| + |a|)$. Since $(|b| + |a|) > 0$ and the product $(|b| - |a|)(|b| + |a|)$ is positive, we must have $(|b| - |a|) > 0 \Rightarrow |b| > |a|$. Thus $|a| < |b| \Leftrightarrow a^2 < b^2$.

    (b) $ab \leq |ab| \Rightarrow -ab \geq -2|ab|$ by Exercise 19(4) above $\Rightarrow a^2 - 2ab + b^2 \geq |a|^2 - 2|a|\,|b| + |b|^2$, since $|a|^2 = a^2$ and $|b|^2 = b^2$. Factoring both sides, $(a-b)^2 \geq (|a| - |b|)^2 \Rightarrow |a - b| \geq ||a| - |b||$, by part (a).

21. The fact that $|a_1 + a_2 + \ldots + a_n| \leq |a_1| + |a_2| + \ldots + |a_n|$ holds for $n = 1$ is obvious. It also holds for $n = 2$ by the triangle inequality. We now show it holds for all positive integers n, by induction.

Suppose it holds for $n = k \geq 1$: $|a_1 + a_2 + \ldots + a_k| \leq |a_1| + |a_2| + \ldots + |a_k|$ (this is the induction hypothesis). Then $|a_1 + a_2 + \ldots + a_k + a_{k+1}| = |(a_1 + a_2 + \ldots + a_k) + a_{k+1}| \leq |a_1 + a_2 + \ldots + a_k| + |a_{k+1}|$ (by the triangle inequality) $\leq |a_1| + |a_2| + \ldots + |a_k| + |a_{k+1}|$ (by the induction hypothesis) and the inequality holds for $n = k + 1$. Hence it holds for all n by induction.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

22. The fact that $|a_1 + a_2 + \ldots + a_n| \geq |a_1| - |a_2| - \ldots - |a_n|$ holds for $n = 1$ is obvious. It holds for $n = 2$ by Exercise 21(b), since $|a_1 + a_2| = |a_1 - (-a_2)| \geq ||a_1| - |-a_2|| = ||a_1| - |a_2|| \geq |a_1| - |a_2|$.
We now show it holds for all positive integers n by induction.

Suppose the inequality holds for $n = k \geq 1$. Then $|a_1 + a_2 + \ldots + a_k| \geq |a_1| - |a_2| - \ldots - |a_k|$ (this is the induction hypothesis). Thus $|a_1 + \ldots + a_k + a_{k+1}| = |(a_1 + \ldots + a_k) - (-a_{k+1})|$
$\geq ||(a_1 + \ldots + a_k)| - |-a_{k+1}||$ (by Exercise 21(b)) $= ||a_1 + \ldots + a_k| - |a_{k+1}|| \geq |a_1 + \ldots + a_k| - |a_{k+1}|$
$\geq |a_1| - |a_2| - \ldots - |a_k| - |a_{k+1}|$ (by the induction hypothesis). Hence the inequality holds for all n by induction.

23. If f is even and odd, then $f(-x) = -f(x)$ and $f(-x) = f(x) \Rightarrow f(x) = -f(x)$ for all x in the domain of f. Thus $2f(x) = 0 \Rightarrow f(x) = 0$.

24. (a) As suggested, let $E(x) = \frac{f(x)+f(-x)}{2} \Rightarrow E(-x) = \frac{f(-x)+f(-(-x))}{2} = \frac{f(x)+f(-x)}{2} = E(x) \Rightarrow$ E is an even function. Define $O(x) = f(x) - E(x) = f(x) - \frac{f(x)+f(-x)}{2} = \frac{f(x)-f(-x)}{2}$. Then
$O(-x) = \frac{f(-x)-f(-(-x))}{2} = \frac{f(-x)-f(x)}{2} = -\left(\frac{f(x)-f(-x)}{2}\right) = -O(x) \Rightarrow$ O is an odd function
$\Rightarrow f(x) = E(x) + O(x)$ is the sum of an even and an odd function.

(b) Part (a) shows that $f(x) = E(x) + O(x)$ is the sum of an even and an odd function. If also $f(x) = E_1(x) + O_1(x)$, where $E_1$ is even and $O_1$ is odd, then $f(x) - f(x) = 0 = (E_1(x) + O_1(x)) - (E(x) + O(x))$. Thus, $E(x) - E_1(x) = O_1(x) - O(x)$ for all x in the domain of f (which is the same as the domain of $E - E_1$ and $O - O_1$). Now $(E - E_1)(-x) = E(-x) - E_1(-x) = E(x) - E_1(x)$ (since E and $E_1$ are even) $= (E - E_1)(x) \Rightarrow E - E_1$ is even. Likewise, $(O_1 - O)(-x) = O_1(-x) - O(-x) = -O_1(x) - (-O(x))$ (since O and $O_1$ are odd) $= -(O_1(x) - O(x)) = -(O_1 - O)(x) \Rightarrow O_1 - O$ is odd. Therefore, $E - E_1$ and $O_1 - O$ are both even and odd so they must be zero at each x in the domain of f by Exercise 23. That is, $E_1 = E$ and $O_1 = O$, so the decomposition of f found in part (a) is unique.

25. $y = ax^2 + bx + c = a\left(x^2 + \frac{b}{a}x + \frac{b^2}{4a^2}\right) - \frac{b^2}{4a} + c = a\left(x + \frac{b}{2a}\right)^2 - \frac{b^2}{4a} + c$

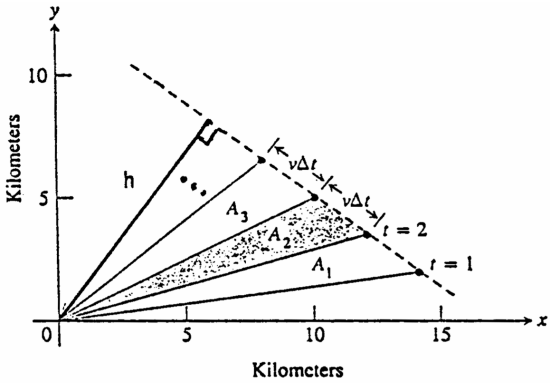
(a) If $a > 0$ the graph is a parabola that opens upward. Increasing a causes a vertical stretching and a shift of the vertex toward the y-axis and upward. If $a < 0$ the graph is a parabola that opens downward. Decreasing a causes a vertical stretching and a shift of the vertex toward the y-axis and downward.

(b) If $a > 0$ the graph is a parabola that opens upward. If also $b > 0$, then increasing b causes a shift of the graph downward to the left; if $b < 0$, then decreasing b causes a shift of the graph downward and to the right.

If $a < 0$ the graph is a parabola that opens downward. If $b > 0$, increasing b shifts the graph upward to the right. If $b < 0$, decreasing b shifts the graph upward to the left.

(c) Changing c (for fixed a and b) by $\Delta c$ shifts the graph upward $\Delta c$ units if $\Delta c > 0$, and downward $-\Delta c$ units if $\Delta c < 0$.

26. (a) If $a > 0$, the graph rises to the right of the vertical line $x = -b$ and falls to the left. If $a < 0$, the graph falls to the right of the line $x = -b$ and rises to the left. If $a = 0$, the graph reduces to the horizontal line $y = c$. As $|a|$ increases, the slope at any given point $x = x_0$ increases in magnitude and the graph becomes steeper. As $|a|$ decreases, the slope at $x_0$ decreases in magnitude and the graph rises or falls more gradually.



(b) Increasing b shifts the graph to the left; decreasing b shifts it to the right.

(c) Increasing c shifts the graph upward; decreasing c shifts it downward.

27. If $m > 0$, the x-intercept of $y = mx + 2$ must be negative. If $m < 0$, then the x-intercept exceeds $\frac{1}{2}$
$\Rightarrow 0 = mx + 2$ and $x > \frac{1}{2} \Rightarrow x = -\frac{2}{m} > \frac{1}{2} \Rightarrow 0 > m > -4$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

28. Each of the triangles pictured has the same base $b = v\Delta t = v(1 \text{ sec})$. Moreover, the height of each triangle is the same value h. Thus $\frac{1}{2}$ (base)(height) $= \frac{1}{2}bh = A_1 = A_2 = A_3 = \ldots$ . In conclusion, the object sweeps out equal areas in each one second interval.

29. (a) By Exercise #95 of Section 1.2, the coordinates of P are $\left(\frac{a+0}{2}, \frac{b+0}{2}\right) = \left(\frac{a}{2}, \frac{b}{2}\right)$. Thus the slope of OP $= \frac{\Delta y}{\Delta x} = \frac{b/2}{a/2} = \frac{b}{a}$.

(b) The slope of AB $= \frac{b-0}{0-a} = -\frac{b}{a}$. The line segments AB and OP are perpendicular when the product of their slopes is $-1 = \left(\frac{b}{a}\right)\left(-\frac{b}{a}\right) = -\frac{b^2}{a^2}$. Thus, $b^2 = a^2 \Rightarrow a = b$ (since both are positive). Therefore, AB is perpendicular to OP when $a = b$.

# CHAPTER 2 LIMITS AND CONTINUITY

## 2.1 RATES OF CHANGE AND LIMITS

1. (a) Does not exist. As x approaches 1 from the right, g(x) approaches 0. As x approaches 1 from the left, g(x) approaches 1. There is no single number L that all the values g(x) get arbitrarily close to as $x \to 1$.
   (b) 1
   (c) 0

2. (a) 0
   (b) $-1$
   (c) Does not exist. As t approaches 0 from the left, f(t) approaches $-1$. As t approaches 0 from the right, f(t) approaches 1. There is no single number L that f(t) gets arbitrarily close to as $t \to 0$.

3. (a) True (b) True (c) False
   (d) False (e) False (f) True

4. (a) False (b) False (c) True
   (d) True (e) True

5. $\lim_{x \to 0} \frac{x}{|x|}$ does not exist because $\frac{x}{|x|} = \frac{x}{x} = 1$ if $x > 0$ and $\frac{x}{|x|} = \frac{x}{-x} = -1$ if $x < 0$. As x approaches 0 from the left, $\frac{x}{|x|}$ approaches $-1$. As x approaches 0 from the right, $\frac{x}{|x|}$ approaches 1. There is no single number L that all the function values get arbitrarily close to as $x \to 0$.

6. As x approaches 1 from the left, the values of $\frac{1}{x-1}$ become increasingly large and negative. As x approaches 1 from the right, the values become increasingly large and positive. There is no one number L that all the function values get arbitrarily close to as $x \to 1$, so $\lim_{x \to 1} \frac{1}{x-1}$ does not exist.

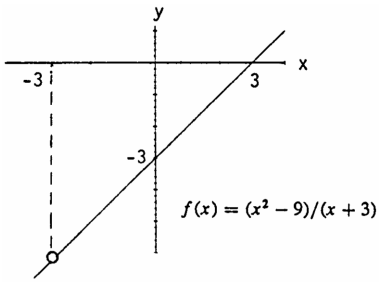
7. Nothing can be said about f(x) because the existence of a limit as $x \to x_0$ does not depend on how the function is defined at $x_0$. In order for a limit to exist, f(x) must be arbitrarily close to a single real number L when x is close enough to $x_0$. That is, the existence of a limit depends on the values of f(x) for x near $x_0$, not on the definition of f(x) at $x_0$ itself.

8. Nothing can be said. In order for $\lim_{x \to 0} f(x)$ to exist, f(x) must close to a single value for x near 0 regardless of the value f(0) itself.

9. No, the definition does not require that f be defined at $x = 1$ in order for a limiting value to exist there. If f(1) is defined, it can be any real number, so we can conclude nothing about f(1) from $\lim_{x \to 1} f(x) = 5$.

10. No, because the existence of a limit depends on the values of f(x) when x is near 1, not on f(1) itself. If $\lim_{x \to 1} f(x)$ exists, its value may be some number other than $f(1) = 5$. We can conclude nothing about $\lim_{x \to 1} f(x)$, whether it exists or what its value is if it does exist, from knowing the value of f(1) alone.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



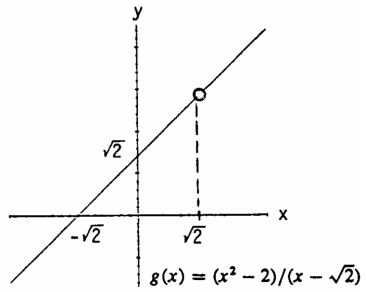
11. (a) $f(x) = (x^2 - 9)/(x + 3)$

| x | −3.1 | −3.01 | −3.001 | −3.0001 | −3.00001 | −3.000001 |
|---|---|---|---|---|---|---|
| f(x) | −6.1 | −6.01 | −6.001 | −6.0001 | −6.00001 | −6.000001 |

| x | −2.9 | −2.99 | −2.999 | −2.9999 | −2.99999 | −2.999999 |
|---|---|---|---|---|---|---|
| f(x) | −5.9 | −5.99 | −5.999 | −5.9999 | −5.99999 | −5.999999 |

The estimate is $\lim_{x \to -3} f(x) = -6$.

(b)



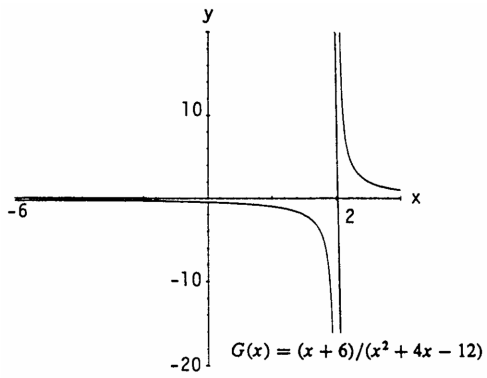
(c) $f(x) = \frac{x^2-9}{x+3} = \frac{(x+3)(x-3)}{x+3} = x - 3$ if $x \neq -3$, and $\lim_{x \to -3} (x - 3) = -3 - 3 = -6$.

12. (a) $g(x) = (x^2 - 2)/\left(x - \sqrt{2}\right)$

| x | 1.4 | 1.41 | 1.414 | 1.4142 | 1.41421 | 1.414213 |
|---|---|---|---|---|---|---|
| g(x) | 2.81421 | 2.82421 | 2.82821 | 2.828413 | 2.828423 | 2.828426 |

(b)

(c) $g(x) = \frac{x^2-2}{x-\sqrt{2}} = \frac{\left(x+\sqrt{2}\right)\left(x-\sqrt{2}\right)}{\left(x-\sqrt{2}\right)} = x + \sqrt{2}$ if $x \neq \sqrt{2}$, and $\lim_{x \to \sqrt{2}} \left(x + \sqrt{2}\right) = \sqrt{2} + \sqrt{2} = 2\sqrt{2}$.



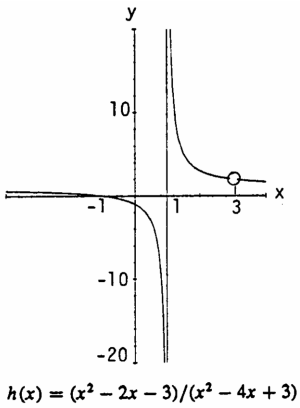
13. (a) $G(x) = (x + 6)/(x^2 + 4x - 12)$

| x | −5.9 | −5.99 | −5.999 | −5.9999 | −5.99999 | −5.999999 |
|---|---|---|---|---|---|---|
| G(x) | −.126582 | −.1251564 | −.1250156 | −.1250015 | −.1250001 | −.1250000 |

| x | −6.1 | −6.01 | −6.001 | −6.0001 | −6.00001 | −6.000001 |
|---|---|---|---|---|---|---|
| G(x) | −.123456 | −.124843 | −.124984 | −.124998 | −.124999 | −.124999 |

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(b)



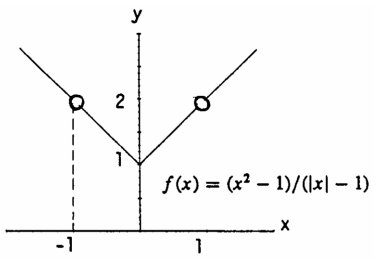
(c) $G(x) = \frac{x+6}{(x^2+4x-12)} = \frac{x+6}{(x+6)(x-2)} = \frac{1}{x-2}$ if $x \neq -6$, and $\lim_{x \to -6} \frac{1}{x-2} = \frac{1}{-6-2} = -\frac{1}{8} = -0.125$.

14. (a) $h(x) = (x^2 - 2x - 3)/(x^2 - 4x + 3)$

| x | 2.9 | 2.99 | 2.999 | 2.9999 | 2.99999 | 2.999999 |
|---|---|---|---|---|---|---|
| h(x) | 2.052631 | 2.005025 | 2.000500 | 2.000050 | 2.000005 | 2.0000005 |

| x | 3.1 | 3.01 | 3.001 | 3.0001 | 3.00001 | 3.000001 |
|---|---|---|---|---|---|---|
| h(x) | 1.952380 | 1.995024 | 1.999500 | 1.999950 | 1.999995 | 1.999999 |

(b)



(c) $h(x) = \frac{x^2-2x-3}{x^2-4x+3} = \frac{(x-3)(x+1)}{(x-3)(x-1)} = \frac{x+1}{x-1}$ if $x \neq 3$, and $\lim_{x \to 3} \frac{x+1}{x-1} = \frac{3+1}{3-1} = \frac{4}{2} = 2$.

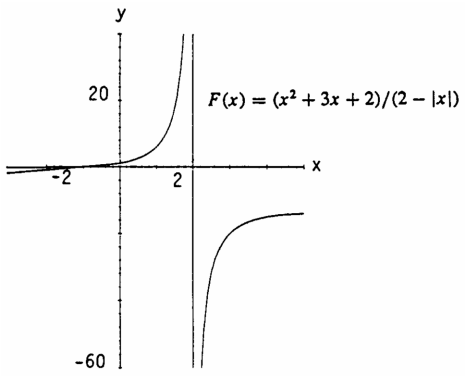
15. (a) $f(x) = (x^2 - 1)/(|x| - 1)$

| x | −1.1 | −1.01 | −1.001 | −1.0001 | −1.00001 | −1.000001 |
|---|---|---|---|---|---|---|
| f(x) | 2.1 | 2.01 | 2.001 | 2.0001 | 2.00001 | 2.000001 |

| x | −.9 | −.99 | −.999 | −.9999 | −.99999 | −.999999 |
|---|---|---|---|---|---|---|
| f(x) | 1.9 | 1.99 | 1.999 | 1.9999 | 1.99999 | 1.999999 |

(b)

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



(c) $f(x) = \frac{x^2-1}{|x|-1} = \begin{cases} \frac{(x+1)(x-1)}{x-1} = x+1, & x \geq 0 \text{ and } x \neq 1 \\ \frac{(x+1)(x-1)}{-(x+1)} = 1-x, & x < 0 \text{ and } x \neq -1 \end{cases}$, and $\lim_{x \to -1} (1-x) = 1-(-1) = 2.$

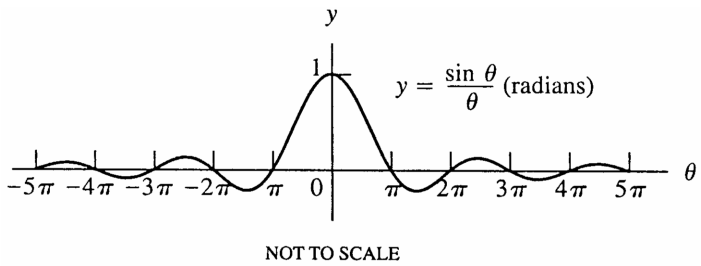
16. (a) $F(x) = (x^2+3x+2)/(2-|x|)$

| x | −2.1 | −2.01 | −2.001 | −2.0001 | −2.00001 | −2.000001 |
|---|---|---|---|---|---|---|
| F(x) | −1.1 | −1.01 | −1.001 | −1.0001 | −1.00001 | −1.000001 |

| x | −1.9 | −1.99 | −1.999 | −1.9999 | −1.99999 | −1.999999 |
|---|---|---|---|---|---|---|
| F(x) | −.9 | −.99 | −.999 | −.9999 | −.99999 | −.999999 |

(b)

(c) $F(x) = \frac{x^2+3x+2}{2-|x|} = \begin{cases} \frac{(x+2)(x+1)}{2-x}, & x \geq 0 \\ \frac{(x+2)(x+1)}{2+x} = x+1, & x < 0 \text{ and } x \neq -2 \end{cases}$, and $\lim_{x \to -2} (x+1) = -2+1 = -1.$



17. (a) $g(\theta) = (\sin\theta)/\theta$

| $\theta$ | .1 | .01 | .001 | .0001 | .00001 | .000001 |
|---|---|---|---|---|---|---|
| g($\theta$) | .998334 | .999983 | .999999 | .999999 | .999999 | .999999 |

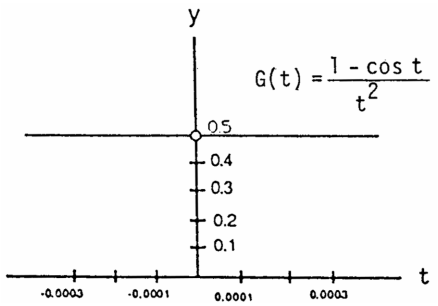
| $\theta$ | −.1 | −.01 | −.001 | −.0001 | −.00001 | −.000001 |
|---|---|---|---|---|---|---|
| g($\theta$) | .998334 | .999983 | .999999 | .999999 | .999999 | .999999 |

$\lim_{\theta \to 0} g(\theta) = 1$

(b)

NOT TO SCALE

18. (a) $G(t) = (1-\cos t)/t^2$



| t | .1 | .01 | .001 | .0001 | .00001 | .000001 |
|---|---|---|---|---|---|---|
| G(t) | .499583 | .499995 | .499999 | .5 | .5 | .5 |

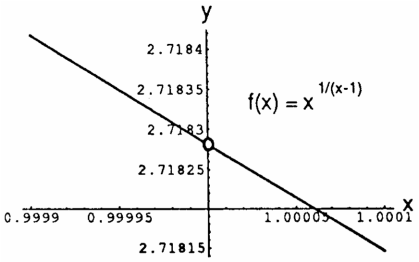
| t | −.1 | −.01 | −.001 | −.0001 | −.00001 | −.000001 |
|---|---|---|---|---|---|---|
| G(t) | .499583 | .499995 | .499999 | .5 | .5 | .5 |

$\lim_{t \to 0} G(t) = 0.5$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(b)

Graph is NOT TO SCALE



19. (a) $f(x) = x^{1/(1-x)}$

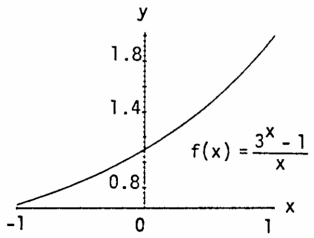
| x | .9 | .99 | .999 | .9999 | .99999 | .999999 |
|---|---|---|---|---|---|---|
| f(x) | .348678 | .366032 | .367695 | .367861 | .367877 | .367879 |

| x | 1.1 | 1.01 | 1.001 | 1.0001 | 1.00001 | 1.000001 |
|---|---|---|---|---|---|---|
| f(x) | .385543 | .369711 | .368063 | .367897 | .367881 | .367878 |

$\lim_{x \to 1} f(x) \approx 0.36788$

(b)

Graph is NOT TO SCALE. Also the intersection of the axes is not the origin: the axes intersect at the point $(1, 2.71820)$.



20. (a) $f(x) = (3^x - 1)/x$

| x | .1 | .01 | .001 | .0001 | .00001 | .000001 |
|---|---|---|---|---|---|---|
| f(x) | 1.161231 | 1.104669 | 1.099215 | 1.098672 | 1.098618 | 1.098612 |

| x | −.1 | −.01 | −.001 | −.0001 | −.00001 | −.000001 |
|---|---|---|---|---|---|---|
| f(x) | 1.040415 | 1.092599 | 1.098009 | 1.098551 | 1.098606 | 1.098611 |

$\lim_{x \to 0} f(x) \approx 1.0986$

(b)

21. $\lim_{x \to 2} 2x = 2(2) = 4$

22. $\lim_{x \to 0} 2x = 2(0) = 0$

23. $\lim_{x \to \frac{1}{3}} (3x - 1) = 3\left(\frac{1}{3}\right) - 1 = 0$

24. $\lim_{x \to 1} \frac{-1}{3x-1} = \frac{-1}{3(1)-1} = -\frac{1}{2}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

25. $\lim\limits_{x \to -1} 3x(2x-1) = 3(-1)(2(-1)-1) = 9$

26. $\lim\limits_{x \to -1} \frac{3x^2}{2x-1} = \frac{3(-1)^2}{2(-1)-1} = \frac{3}{-3} = -1$

27. $\lim\limits_{x \to \frac{\pi}{2}} x \sin x = \frac{\pi}{2} \sin \frac{\pi}{2} = \frac{\pi}{2}$

28. $\lim\limits_{x \to \pi} \frac{\cos x}{1-\pi} = \frac{\cos \pi}{1-\pi} = \frac{-1}{1-\pi} = \frac{1}{\pi-1}$

29. (a) $\frac{\Delta f}{\Delta x} = \frac{f(3)-f(2)}{3-2} = \frac{28-9}{1} = 19$

(b) $\frac{\Delta f}{\Delta x} = \frac{f(1)-f(-1)}{1-(-1)} = \frac{2-0}{2} = 1$

30. (a) $\frac{\Delta g}{\Delta x} = \frac{g(1)-g(-1)}{1-(-1)} = \frac{1-1}{2} = 0$

(b) $\frac{\Delta g}{\Delta x} = \frac{g(0)-g(-2)}{0-(-2)} = \frac{0-4}{2} = -2$

31. (a) $\frac{\Delta h}{\Delta t} = \frac{h\left(\frac{3\pi}{4}\right)-h\left(\frac{\pi}{4}\right)}{\frac{3\pi}{4}-\frac{\pi}{4}} = \frac{-1-1}{\frac{\pi}{2}} = -\frac{4}{\pi}$

(b) $\frac{\Delta h}{\Delta t} = \frac{h\left(\frac{\pi}{2}\right)-h\left(\frac{\pi}{6}\right)}{\frac{\pi}{2}-\frac{\pi}{6}} = \frac{0-\sqrt{3}}{\frac{\pi}{3}} = \frac{-3\sqrt{3}}{\pi}$

32. (a) $\frac{\Delta g}{\Delta t} = \frac{g(\pi)-g(0)}{\pi-0} = \frac{(2-1)-(2+1)}{\pi-0} = -\frac{2}{\pi}$

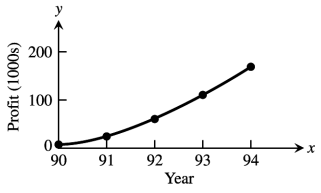
(b) $\frac{\Delta g}{\Delta t} = \frac{g(\pi)-g(-\pi)}{\pi-(-\pi)} = \frac{(2-1)-(2-1)}{2\pi} = 0$

33. $\frac{\Delta R}{\Delta \theta} = \frac{R(2)-R(0)}{2-0} = \frac{\sqrt{8+1}-\sqrt{1}}{2} = \frac{3-1}{2} = 1$

34. $\frac{\Delta P}{\Delta \theta} = \frac{P(2)-P(1)}{2-1} = \frac{(8-16+10)-(1-4+5)}{1} = 2-2 = 0$

35. (a)

| Q | Slope of PQ $= \frac{\Delta p}{\Delta t}$ |
|---|---|
| $Q_1(10, 225)$ | $\frac{650-225}{20-10} = 42.5$ m/sec |
| $Q_2(14, 375)$ | $\frac{650-375}{20-14} = 45.83$ m/sec |
| $Q_3(16.5, 475)$ | $\frac{650-475}{20-16.5} = 50.00$ m/sec |
| $Q_4(18, 550)$ | $\frac{650-550}{20-18} = 50.00$ m/sec |



(b) At t = 20, the Cobra was traveling approximately 50 m/sec or 180 km/h.

36. (a)

| Q | Slope of PQ $= \frac{\Delta p}{\Delta t}$ |
|---|---|
| $Q_1(5, 20)$ | $\frac{80-20}{10-5} = 12$ m/sec |
| $Q_2(7, 39)$ | $\frac{80-39}{10-7} = 13.7$ m/sec |
| $Q_3(8.5, 58)$ | $\frac{80-58}{10-8.5} = 14.7$ m/sec |
| $Q_4(9.5, 72)$ | $\frac{80-72}{10-9.5} = 16$ m/sec |

(b) Approximately 16 m/sec

37. (a)

(b) $\frac{\Delta p}{\Delta t} = \frac{174-62}{1994-1992} = \frac{112}{2} = 56$ thousand dollars per year

(c) The average rate of change from 1991 to 1992 is $\frac{\Delta p}{\Delta t} = \frac{62-27}{1992-1991} = 35$ thousand dollars per year.
The average rate of change from 1992 to 1993 is $\frac{\Delta p}{\Delta t} = \frac{111-62}{1993-1992} = 49$ thousand dollars per year.
So, the rate at which profits were changing in 1992 is approximatley $\frac{1}{2}(35+49) = 42$ thousand dollars per year.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

38. (a) $F(x) = (x+2)/(x-2)$

| x | 1.2 | 1.1 | 1.01 | 1.001 | 1.0001 | 1 |
|---|---|---|---|---|---|---|
| F(x) | $-4.0$ | $-3.\overline{4}$ | $-3.\overline{04}$ | $-3.\overline{004}$ | $-3.\overline{0004}$ | $-3$ |

$\frac{\Delta F}{\Delta x} = \frac{-4.0-(-3)}{1.2-1} = -5.0$; $\frac{\Delta F}{\Delta x} = \frac{-3.\overline{4}-(-3)}{1.1-1} = -4.\overline{4}$;

$\frac{\Delta F}{\Delta x} = \frac{-3.\overline{04}-(-3)}{1.01-1} = -4.\overline{04}$; $\frac{\Delta F}{\Delta x} = \frac{-3.\overline{004}-(-3)}{1.001-1} = -4.\overline{004}$;

$\frac{\Delta F}{\Delta x} = \frac{-3.\overline{0004}-(-3)}{1.0001-1} = -4.\overline{0004}$;

(b) The rate of change of $F(x)$ at $x = 1$ is $-4$.

39. (a) $\frac{\Delta g}{\Delta x} = \frac{g(2)-g(1)}{2-1} = \frac{\sqrt{2}-1}{2-1} \approx 0.414213$ $\frac{\Delta g}{\Delta x} = \frac{g(1.5)-g(1)}{1.5-1} = \frac{\sqrt{1.5}-1}{0.5} \approx 0.449489$

$\frac{\Delta g}{\Delta x} = \frac{g(1+h)-g(1)}{(1+h)-1} = \frac{\sqrt{1+h}-1}{h}$

(b) $g(x) = \sqrt{x}$

| $1+h$ | 1.1 | 1.01 | 1.001 | 1.0001 | 1.00001 | 1.000001 |
|---|---|---|---|---|---|---|
| $\sqrt{1+h}$ | 1.04880 | 1.004987 | 1.0004998 | 1.0000499 | 1.000005 | 1.0000005 |
| $\left(\sqrt{1+h}-1\right)/h$ | 0.4880 | 0.4987 | 0.4998 | 0.499 | 0.5 | 0.5 |

(c) The rate of change of $g(x)$ at $x = 1$ is 0.5.

(d) The calculator gives $\lim_{h \to 0} \frac{\sqrt{1+h}-1}{h} = \frac{1}{2}$.

40. (a) i) $\frac{f(3)-f(2)}{3-2} = \frac{\frac{1}{3}-\frac{1}{2}}{1} = \frac{\frac{-1}{6}}{1} = -\frac{1}{6}$

ii) $\frac{f(T)-f(2)}{T-2} = \frac{\frac{1}{T}-\frac{1}{2}}{T-2} = \frac{\frac{2}{2T}-\frac{T}{2T}}{T-2} = \frac{2-T}{2T(T-2)} = \frac{2-T}{-2T(2-T)} = -\frac{1}{2T}$, $T \neq 2$

(b)

| T | 2.1 | 2.01 | 2.001 | 2.0001 | 2.00001 | 2.000001 |
|---|---|---|---|---|---|---|
| f(T) | 0.476190 | 0.497512 | 0.499750 | 0.4999750 | 0.499997 | 0.499999 |
| $(f(T)-f(2))/(T-2)$ | $-0.2381$ | $-0.2488$ | $-0.2500$ | $-0.2500$ | $-0.2500$ | $-0.2500$ |

(c) The table indicates the rate of change is $-0.25$ at $t = 2$.

(d) $\lim_{T \to 2} \left(\frac{1}{-2T}\right) = -\frac{1}{4}$

41-46. Example CAS commands:

Maple:

```
f := x -> (x^4 − 16)/(x − 2);
x0 := 2;
plot( f(x), x = x0-1..x0+1, color = black,
      title = "Section 2.1, #41(a)" );
limit( f(x), x = x0 );
```

In Exercise 43, note that the standard cube root, x^(1/3), is not defined for x<0 in many CASs. This can be overcome in Maple by entering the function as f := x -> (surd(x+1, 3) − 1)/x.

Mathematica: (assigned function and values for x0 and h may vary)

```
Clear[f, x]
f[x_]:=(x^3 − x^2 − 5x − 3)/(x + 1)^2
x0= −1; h= 0.1;
Plot[f[x],{x, x0 − h, x0 + h}]
Limit[f[x], x → x0]
```

## 2.2 CALCULATING LIMITS USING THE LIMIT LAWS

1. $\lim\limits_{x \to -7} (2x + 5) = 2(-7) + 5 = -14 + 5 = -9$

2. $\lim\limits_{x \to 12} (10 - 3x) = 10 - 3(12) = 10 - 36 = -26$

3. $\lim\limits_{x \to 2} (-x^2 + 5x - 2) = -(2)^2 + 5(2) - 2 = -4 + 10 - 2 = 4$

4. $\lim\limits_{x \to -2} (x^3 - 2x^2 + 4x + 8) = (-2)^3 - 2(-2)^2 + 4(-2) + 8 = -8 - 8 - 8 + 8 = -16$

5. $\lim\limits_{t \to 6} 8(t - 5)(t - 7) = 8(6 - 5)(6 - 7) = -8$

6. $\lim\limits_{s \to \frac{2}{3}} 3s(2s - 1) = 3\left(\frac{2}{3}\right)\left[2\left(\frac{2}{3}\right) - 1\right] = 2\left(\frac{4}{3} - 1\right) = \frac{2}{3}$

7. $\lim\limits_{x \to 2} \frac{x+3}{x+6} = \frac{2+3}{2+6} = \frac{5}{8}$

8. $\lim\limits_{x \to 5} \frac{4}{x-7} = \frac{4}{5-7} = \frac{4}{-2} = -2$

9. $\lim\limits_{y \to -5} \frac{y^2}{5-y} = \frac{(-5)^2}{5-(-5)} = \frac{25}{10} = \frac{5}{2}$

10. $\lim\limits_{y \to 2} \frac{y+2}{y^2+5y+6} = \frac{2+2}{(2)^2+5(2)+6} = \frac{4}{4+10+6} = \frac{4}{20} = \frac{1}{5}$

11. $\lim\limits_{x \to -1} 3(2x - 1)^2 = 3(2(-1) - 1)^2 = 3(-3)^2 = 27$

12. $\lim\limits_{x \to -4} (x + 3)^{1984} = (-4 + 3)^{1984} = (-1)^{1984} = 1$

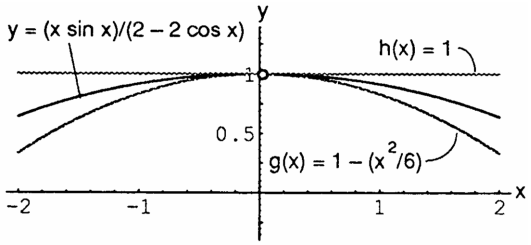
$= \lim_{h\to 0} \frac{h}{h\left(\sqrt{7+h}+\sqrt{7}\right)} = \lim_{h\to 0} \frac{1}{\sqrt{7+h}+\sqrt{7}} = \frac{1}{2\sqrt{7}}$

48. $\lim_{h\to 0} \frac{\sqrt{3(0+h)+1}-\sqrt{3(0)+1}}{h} = \lim_{h\to 0} \frac{\left(\sqrt{3h+1}-1\right)\left(\sqrt{3h+1}+1\right)}{h\left(\sqrt{3h+1}+1\right)} = \lim_{h\to 0} \frac{(3h+1)-1}{h\left(\sqrt{3h+1}+1\right)}$

$= \lim_{h\to 0} \frac{3h}{h\left(\sqrt{3h+1}+1\right)} = \lim_{h\to 0} \frac{3}{\sqrt{3h+1}+1} = \frac{3}{2}$

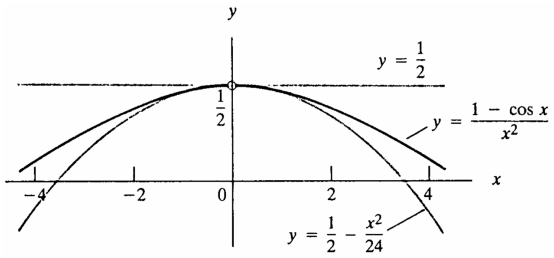


49. $\lim_{x\to 0} \sqrt{5-2x^2} = \sqrt{5-2(0)^2} = \sqrt{5}$ and $\lim_{x\to 0} \sqrt{5-x^2} = \sqrt{5-(0)^2} = \sqrt{5}$; by the sandwich theorem,

$\lim_{x\to 0} f(x) = \sqrt{5}$

50. $\lim_{x\to 0} (2-x^2) = 2-0 = 2$ and $\lim_{x\to 0} 2\cos x = 2(1) = 2$; by the sandwich theorem, $\lim_{x\to 0} g(x) = 2$

51. (a) $\lim_{x\to 0} \left(1-\frac{x^2}{6}\right) = 1-\frac{0}{6} = 1$ and $\lim_{x\to 0} 1 = 1$; by the sandwich theorem, $\lim_{x\to 0} \frac{x\sin x}{2-2\cos x} = 1$



(b) For $x \neq 0$, $y = (x \sin x)/(2 - 2\cos x)$ lies between the other two graphs in the figure, and the graphs converge as $x \to 0$.

52. (a) $\lim_{x\to 0} \left(\frac{1}{2}-\frac{x^2}{24}\right) = \lim_{x\to 0} \frac{1}{2} - \lim_{x\to 0} \frac{x^2}{24} = \frac{1}{2}-0 = \frac{1}{2}$ and $\lim_{x\to 0} \frac{1}{2} = \frac{1}{2}$; by the sandwich theorem,

$\lim_{x\to 0} \frac{1-\cos x}{x^2} = \frac{1}{2}$.

(b) For all $x \neq 0$, the graph of $f(x) = (1 - \cos x)/x^2$ lies between the line $y = \frac{1}{2}$ and the parabola $y = \frac{1}{2} - x^2/24$, and the graphs converge as $x \to 0$.

53. $\lim_{x\to c} f(x)$ exists at those points c where $\lim_{x\to c} x^4 = \lim_{x\to c} x^2$. Thus, $c^4 = c^2 \Rightarrow c^2(1-c^2) = 0$

$\Rightarrow c = 0, 1$, or $-1$. Moreover, $\lim_{x\to 0} f(x) = \lim_{x\to 0} x^2 = 0$ and $\lim_{x\to -1} f(x) = \lim_{x\to 1} f(x) = 1$.

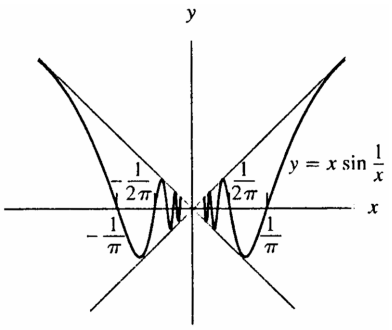
54. Nothing can be concluded about the values of f, g, and h at $x = 2$. Yes, f(2) could be 0. Since the conditions of the sandwich theorem are satisfied, $\lim_{x\to 2} f(x) = -5 \neq 0$.

55. $1 = \lim_{x\to 4} \frac{f(x)-5}{x-2} = \frac{\lim_{x\to 4} f(x) - \lim_{x\to 4} 5}{\lim_{x\to 4} x - \lim_{x\to 4} 2} = \frac{\lim_{x\to 4} f(x) - 5}{4-2} \Rightarrow \lim_{x\to 4} f(x) - 5 = 2(1) \Rightarrow \lim_{x\to 4} f(x) = 2+5 = 7.$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

56. (a) $1 = \lim\limits_{x \to -2} \frac{f(x)}{x^2} = \frac{\lim\limits_{x \to -2} f(x)}{\lim\limits_{x \to -2} x^2} = \frac{\lim\limits_{x \to -2} f(x)}{4} \Rightarrow \lim\limits_{x \to -2} f(x) = 4.$

(b) $1 = \lim\limits_{x \to -2} \frac{f(x)}{x^2} = \left[\lim\limits_{x \to -2} \frac{f(x)}{x}\right]\left[\lim\limits_{x \to -2} \frac{1}{x}\right] = \left[\lim\limits_{x \to -2} \frac{f(x)}{x}\right]\left(\frac{1}{-2}\right) \Rightarrow \lim\limits_{x \to -2} \frac{f(x)}{x} = -2.$



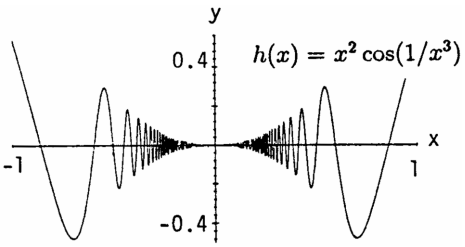
57. (a) $0 = 3 \cdot 0 = \left[\lim\limits_{x \to 2} \frac{f(x)-5}{x-2}\right]\left[\lim\limits_{x \to 2} (x-2)\right] = \lim\limits_{x \to 2} \left[\left(\frac{f(x)-5}{x-2}\right)(x-2)\right] = \lim\limits_{x \to 2} [f(x)-5] = \lim\limits_{x \to 2} f(x) - 5$
$\Rightarrow \lim\limits_{x \to 2} f(x) = 5.$

(b) $0 = 4 \cdot 0 = \left[\lim\limits_{x \to 2} \frac{f(x)-5}{x-2}\right]\left[\lim\limits_{x \to 2} (x-2)\right] \Rightarrow \lim\limits_{x \to 2} f(x) = 5$ as in part (a).

58. (a) $0 = 1 \cdot 0 = \left[\lim\limits_{x \to 0} \frac{f(x)}{x^2}\right]\left[\lim\limits_{x \to 0} x\right]^2 = \left[\lim\limits_{x \to 0} \frac{f(x)}{x^2}\right]\left[\lim\limits_{x \to 0} x^2\right] = \lim\limits_{x \to 0} \left[\frac{f(x)}{x^2} \cdot x^2\right] = \lim\limits_{x \to 0} f(x)$. That is, $\lim\limits_{x \to 0} f(x) = 0$.

(b) $0 = 1 \cdot 0 = \left[\lim\limits_{x \to 0} \frac{f(x)}{x^2}\right]\left[\lim\limits_{x \to 0} x\right] = \lim\limits_{x \to 0} \left[\frac{f(x)}{x^2} \cdot x\right] = \lim\limits_{x \to 0} \frac{f(x)}{x}$. That is, $\lim\limits_{x \to 0} \frac{f(x)}{x} = 0$.

59. (a) $\lim\limits_{x \to 0} x \sin \frac{1}{x} = 0$



(b) $-1 \le \sin \frac{1}{x} \le 1$ for $x \ne 0$:

$x > 0 \Rightarrow -x \le x \sin \frac{1}{x} \le x \Rightarrow \lim\limits_{x \to 0} x \sin \frac{1}{x} = 0$ by the sandwich theorem;

$x < 0 \Rightarrow -x \ge x \sin \frac{1}{x} \ge x \Rightarrow \lim\limits_{x \to 0} x \sin \frac{1}{x} = 0$ by the sandwich theorem.

60. (a) $\lim\limits_{x \to 0} x^2 \cos\left(\frac{1}{x^3}\right) = 0$

(b) $-1 \le \cos\left(\frac{1}{x^3}\right) \le 1$ for $x \ne 0 \Rightarrow -x^2 \le x^2 \cos\left(\frac{1}{x^3}\right) \le x^2 \Rightarrow \lim\limits_{x \to 0} x^2 \cos\left(\frac{1}{x^3}\right) = 0$ by the sandwich theorem since $\lim\limits_{x \to 0} x^2 = 0$.

## 2.3 PRECISE DEFINITION OF A LIMIT

1. 

Step 1: $|x-5| < \delta \Rightarrow -\delta < x-5 < \delta \Rightarrow -\delta + 5 < x < \delta + 5$

Step 2: $\delta + 5 = 7 \Rightarrow \delta = 2$, or $-\delta + 5 = 1 \Rightarrow \delta = 4$.

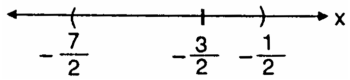
The value of $\delta$ which assures $|x-5| < \delta \Rightarrow 1 < x < 7$ is the smaller value, $\delta = 2$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

2. 

Step 1: $|x-2|<\delta \Rightarrow -\delta<x-2<\delta \Rightarrow -\delta+2<x<\delta+2$

Step 2: $-\delta+2=1 \Rightarrow \delta=1$, or $\delta+2=7 \Rightarrow \delta=5$.



The value of $\delta$ which assures $|x-2|<\delta \Rightarrow 1<x<7$ is the smaller value, $\delta=1$.

3. 

Step 1: $|x-(-3)|<\delta \Rightarrow -\delta<x+3<\delta \Rightarrow -\delta-3<x<\delta-3$

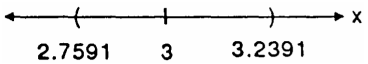
Step 2: $-\delta-3=-\frac{7}{2} \Rightarrow \delta=\frac{1}{2}$, or $\delta-3=-\frac{1}{2} \Rightarrow \delta=\frac{5}{2}$.

The value of $\delta$ which assures $|x-(-3)|<\delta \Rightarrow -\frac{7}{2}<x<-\frac{1}{2}$ is the smaller value, $\delta=\frac{1}{2}$.

4. 

Step 1: $\left|x-\left(-\frac{3}{2}\right)\right|<\delta \Rightarrow -\delta<x+\frac{3}{2}<\delta \Rightarrow -\delta-\frac{3}{2}<x<\delta-\frac{3}{2}$

Step 2: $-\delta-\frac{3}{2}=-\frac{7}{2} \Rightarrow \delta=2$, or $\delta-\frac{3}{2}=-\frac{1}{2} \Rightarrow \delta=1$.



The value of $\delta$ which assures $\left|x-\left(-\frac{3}{2}\right)\right|<\delta \Rightarrow -\frac{7}{2}<x<-\frac{1}{2}$ is the smaller value, $\delta=1$.

5. 

Step 1: $\left|x-\frac{1}{2}\right|<\delta \Rightarrow -\delta<x-\frac{1}{2}<\delta \Rightarrow -\delta+\frac{1}{2}<x<\delta+\frac{1}{2}$

Step 2: $-\delta+\frac{1}{2}=\frac{4}{9} \Rightarrow \delta=\frac{1}{18}$, or $\delta+\frac{1}{2}=\frac{4}{7} \Rightarrow \delta=\frac{1}{14}$.

The value of $\delta$ which assures $\left|x-\frac{1}{2}\right|<\delta \Rightarrow \frac{4}{9}<x<\frac{4}{7}$ is the smaller value, $\delta=\frac{1}{18}$.

6. 

Step 1: $|x-3|<\delta \Rightarrow -\delta<x-3<\delta \Rightarrow -\delta+3<x<\delta+3$

Step 2: $-\delta+3=2.7591 \Rightarrow \delta=0.2409$, or $\delta+3=3.2391 \Rightarrow \delta=0.2391$.

The value of $\delta$ which assures $|x-3|<\delta \Rightarrow 2.7591<x<3.2391$ is the smaller value, $\delta=0.2391$.

7. Step 1: $|x-5|<\delta \Rightarrow -\delta<x-5<\delta \Rightarrow -\delta+5<x<\delta+5$

Step 2: From the graph, $-\delta+5=4.9 \Rightarrow \delta=0.1$, or $\delta+5=5.1 \Rightarrow \delta=0.1$; thus $\delta=0.1$ in either case.

8. Step 1: $|x-(-3)|<\delta \Rightarrow -\delta<x+3<\delta \Rightarrow -\delta-3<x<\delta-3$

Step 2: From the graph, $-\delta-3=-3.1 \Rightarrow \delta=0.1$, or $\delta-3=-2.9 \Rightarrow \delta=0.1$; thus $\delta=0.1$.

9. Step 1: $|x-1|<\delta \Rightarrow -\delta<x-1<\delta \Rightarrow -\delta+1<x<\delta+1$

Step 2: From the graph, $-\delta+1=\frac{9}{16} \Rightarrow \delta=\frac{7}{16}$, or $\delta+1=\frac{25}{16} \Rightarrow \delta=\frac{9}{16}$; thus $\delta=\frac{7}{16}$.

10. Step 1: $|x-3|<\delta \Rightarrow -\delta<x-3<\delta \Rightarrow -\delta+3<x<\delta+3$

Step 2: From the graph, $-\delta+3=2.61 \Rightarrow \delta=0.39$, or $\delta+3=3.41 \Rightarrow \delta=0.41$; thus $\delta=0.39$.

11. Step 1: $|x-2|<\delta \Rightarrow -\delta<x-2<\delta \Rightarrow -\delta+2<x<\delta+2$

Step 2: From the graph, $-\delta+2=\sqrt{3} \Rightarrow \delta=2-\sqrt{3}\approx 0.2679$, or $\delta+2=\sqrt{5} \Rightarrow \delta=\sqrt{5}-2\approx 0.2361$; thus $\delta=\sqrt{5}-2$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

12. Step 1: $|x-(-1)|<\delta \Rightarrow -\delta<x+1<\delta \Rightarrow -\delta-1<x<\delta-1$
Step 2: From the graph, $-\delta-1=-\frac{\sqrt{5}}{2} \Rightarrow \delta=\frac{\sqrt{5}-2}{2}\approx 0.1180$, or $\delta-1=-\frac{\sqrt{3}}{2} \Rightarrow \delta=\frac{2-\sqrt{3}}{2}\approx 0.1340$; thus $\delta=\frac{\sqrt{5}-2}{2}$.

13. Step 1: $|x-(-1)|<\delta \Rightarrow -\delta<x+1<\delta \Rightarrow -\delta-1<x<\delta-1$
Step 2: From the graph, $-\delta-1=-\frac{16}{9} \Rightarrow \delta=\frac{7}{9}\approx 0.77$, or $\delta-1=-\frac{16}{25} \Rightarrow \frac{9}{25}=0.36$; thus $\delta=\frac{9}{25}=0.36$.

14. Step 1: $\left|x-\frac{1}{2}\right|<\delta \Rightarrow -\delta<x-\frac{1}{2}<\delta \Rightarrow -\delta+\frac{1}{2}<x<\delta+\frac{1}{2}$
Step 2: From the graph, $-\delta+\frac{1}{2}=\frac{1}{2.01} \Rightarrow \delta=\frac{1}{2}-\frac{1}{2.01}\approx 0.00248$, or $\delta+\frac{1}{2}=\frac{1}{1.99} \Rightarrow \delta=\frac{1}{1.99}-\frac{1}{2}\approx 0.00251$; thus $\delta=0.00248$.

15. Step 1: $|(x+1)-5|<0.01 \Rightarrow |x-4|<0.01 \Rightarrow -0.01<x-4<0.01 \Rightarrow 3.99<x<4.01$
Step 2: $|x-4|<\delta \Rightarrow -\delta<x-4<\delta \Rightarrow -\delta+4<x<\delta+4 \Rightarrow \delta=0.01$.

16. Step 1: $|(2x-2)-(-6)|<0.02 \Rightarrow |2x+4|<0.02 \Rightarrow -0.02<2x+4<0.02 \Rightarrow -4.02<2x<-3.98$
$\Rightarrow -2.01<x<-1.99$
Step 2: $|x-(-2)|<\delta \Rightarrow -\delta<x+2<\delta \Rightarrow -\delta-2<x<\delta-2 \Rightarrow \delta=0.01$.

17. Step 1: $\left|\sqrt{x+1}-1\right|<0.1 \Rightarrow -0.1<\sqrt{x+1}-1<0.1 \Rightarrow 0.9<\sqrt{x+1}<1.1 \Rightarrow 0.81<x+1<1.21$
$\Rightarrow -0.19<x<0.21$
Step 2: $|x-0|<\delta \Rightarrow -\delta<x<\delta$. Then, $-\delta=-0.19 \Rightarrow \delta=0.19$ or $\delta=0.21$; thus, $\delta=0.19$.

18. Step 1: $\left|\sqrt{x}-\frac{1}{2}\right|<0.1 \Rightarrow -0.1<\sqrt{x}-\frac{1}{2}<0.1 \Rightarrow 0.4<\sqrt{x}<0.6 \Rightarrow 0.16<x<0.36$
Step 2: $\left|x-\frac{1}{4}\right|<\delta \Rightarrow -\delta<x-\frac{1}{4}<\delta \Rightarrow -\delta+\frac{1}{4}<x<\delta+\frac{1}{4}$.
Then, $-\delta+\frac{1}{4}=0.16 \Rightarrow \delta=0.09$ or $\delta+\frac{1}{4}=0.36 \Rightarrow \delta=0.11$; thus $\delta=0.09$.

19. Step 1: $\left|\sqrt{19-x}-3\right|<1 \Rightarrow -1<\sqrt{19-x}-3<1 \Rightarrow 2<\sqrt{19-x}<4 \Rightarrow 4<19-x<16$
$\Rightarrow -4>x-19>-16 \Rightarrow 15>x>3$ or $3<x<15$
Step 2: $|x-10|<\delta \Rightarrow -\delta<x-10<\delta \Rightarrow -\delta+10<x<\delta+10$.
Then $-\delta+10=3 \Rightarrow \delta=7$, or $\delta+10=15 \Rightarrow \delta=5$; thus $\delta=5$.

20. Step 1: $\left|\sqrt{x-7}-4\right|<1 \Rightarrow -1<\sqrt{x-7}-4<1 \Rightarrow 3<\sqrt{x-7}<5 \Rightarrow 9<x-7<25 \Rightarrow 16<x<32$
Step 2: $|x-23|<\delta \Rightarrow -\delta<x-23<\delta \Rightarrow -\delta+23<x<\delta+23$.
Then $-\delta+23=16 \Rightarrow \delta=7$, or $\delta+23=32 \Rightarrow \delta=9$; thus $\delta=7$.

21. Step 1: $\left|\frac{1}{x}-\frac{1}{4}\right|<0.05 \Rightarrow -0.05<\frac{1}{x}-\frac{1}{4}<0.05 \Rightarrow 0.2<\frac{1}{x}<0.3 \Rightarrow \frac{10}{2}>x>\frac{10}{3}$ or $\frac{10}{3}<x<5$.
Step 2: $|x-4|<\delta \Rightarrow -\delta<x-4<\delta \Rightarrow -\delta+4<x<\delta+4$.
Then $-\delta+4=\frac{10}{3}$ or $\delta=\frac{2}{3}$, or $\delta+4=5$ or $\delta=1$; thus $\delta=\frac{2}{3}$.

22. Step 1: $|x^2-3|<0.1 \Rightarrow -0.1<x^2-3<0.1 \Rightarrow 2.9<x^2<3.1 \Rightarrow \sqrt{2.9}<x<\sqrt{3.1}$
Step 2: $\left|x-\sqrt{3}\right|<\delta \Rightarrow -\delta<x-\sqrt{3}<\delta \Rightarrow -\delta+\sqrt{3}<x<\delta+\sqrt{3}$.
Then $-\delta+\sqrt{3}=\sqrt{2.9} \Rightarrow \delta=\sqrt{3}-\sqrt{2.9}\approx 0.0291$, or $\delta+\sqrt{3}=\sqrt{3.1} \Rightarrow \delta=\sqrt{3.1}-\sqrt{3}\approx 0.0286$; thus $\delta=0.0286$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

23. Step 1: $|x^2-4|<0.5 \Rightarrow -0.5<x^2-4<0.5 \Rightarrow 3.5<x^2<4.5 \Rightarrow \sqrt{3.5}<|x|<\sqrt{4.5} \Rightarrow -\sqrt{4.5}<x<-\sqrt{3.5}$, for x near $-2$.
Step 2: $|x-(-2)|<\delta \Rightarrow -\delta<x+2<\delta \Rightarrow -\delta-2<x<\delta-2$.
Then $-\delta-2=-\sqrt{4.5} \Rightarrow \delta=\sqrt{4.5}-2\approx 0.1213$, or $\delta-2=-\sqrt{3.5} \Rightarrow \delta=2-\sqrt{3.5}\approx 0.1292$; thus $\delta=\sqrt{4.5}-2\approx 0.12$.

24. Step 1: $\left|\frac{1}{x}-(-1)\right|<0.1 \Rightarrow -0.1<\frac{1}{x}+1<0.1 \Rightarrow -\frac{11}{10}<\frac{1}{x}<-\frac{9}{10} \Rightarrow -\frac{10}{11}>x>-\frac{10}{9}$ or $-\frac{10}{9}<x<-\frac{10}{11}$.
Step 2: $|x-(-1)|<\delta \Rightarrow -\delta<x+1<\delta \Rightarrow -\delta-1<x<\delta-1$.
Then $-\delta-1=-\frac{10}{9} \Rightarrow \delta=\frac{1}{9}$, or $\delta-1=-\frac{10}{11} \Rightarrow \delta=\frac{1}{11}$; thus $\delta=\frac{1}{11}$.

25. Step 1: $|(x^2-5)-11|<1 \Rightarrow |x^2-16|<1 \Rightarrow -1<x^2-16<1 \Rightarrow 15<x^2<17 \Rightarrow \sqrt{15}<x<\sqrt{17}$.
Step 2: $|x-4|<\delta \Rightarrow -\delta<x-4<\delta \Rightarrow -\delta+4<x<\delta+4$.
Then $-\delta+4=\sqrt{15} \Rightarrow \delta=4-\sqrt{15}\approx 0.1270$, or $\delta+4=\sqrt{17} \Rightarrow \delta=\sqrt{17}-4\approx 0.1231$; thus $\delta=\sqrt{17}-4\approx 0.12$.

26. Step 1: $\left|\frac{120}{x}-5\right|<1 \Rightarrow -1<\frac{120}{x}-5<1 \Rightarrow 4<\frac{120}{x}<6 \Rightarrow \frac{1}{4}>\frac{x}{120}>\frac{1}{6} \Rightarrow 30>x>20$ or $20<x<30$.
Step 2: $|x-24|<\delta \Rightarrow -\delta<x-24<\delta \Rightarrow -\delta+24<x<\delta+24$.
Then $-\delta+24=20 \Rightarrow \delta=4$, or $\delta+24=30 \Rightarrow \delta=6$; thus $\Rightarrow \delta=4$.

27. Step 1: $|mx-2m|<0.03 \Rightarrow -0.03<mx-2m<0.03 \Rightarrow -0.03+2m<mx<0.03+2m \Rightarrow 2-\frac{0.03}{m}<x<2+\frac{0.03}{m}$.
Step 2: $|x-2|<\delta \Rightarrow -\delta<x-2<\delta \Rightarrow -\delta+2<x<\delta+2$.
Then $-\delta+2=2-\frac{0.03}{m} \Rightarrow \delta=\frac{0.03}{m}$, or $\delta+2=2+\frac{0.03}{m} \Rightarrow \delta=\frac{0.03}{m}$. In either case, $\delta=\frac{0.03}{m}$.

28. Step 1: $|mx-3m|<c \Rightarrow -c<mx-3m<c \Rightarrow -c+3m<mx<c+3m \Rightarrow 3-\frac{c}{m}<x<3+\frac{c}{m}$
Step 2: $|x-3|<\delta \Rightarrow -\delta<x-3<\delta \Rightarrow -\delta+3<x<\delta+3$.
Then $-\delta+3=3-\frac{c}{m} \Rightarrow \delta=\frac{c}{m}$, or $\delta+3=3+\frac{c}{m} \Rightarrow \delta=\frac{c}{m}$. In either case, $\delta=\frac{c}{m}$.

29. Step 1: $\left|(mx+b)-\left(\frac{m}{2}+b\right)\right|<c \Rightarrow -c<mx-\frac{m}{2}<c \Rightarrow -c+\frac{m}{2}<mx<c+\frac{m}{2} \Rightarrow \frac{1}{2}-\frac{c}{m}<x<\frac{1}{2}+\frac{c}{m}$.
Step 2: $\left|x-\frac{1}{2}\right|<\delta \Rightarrow -\delta<x-\frac{1}{2}<\delta \Rightarrow -\delta+\frac{1}{2}<x<\delta+\frac{1}{2}$.
Then $-\delta+\frac{1}{2}=\frac{1}{2}-\frac{c}{m} \Rightarrow \delta=\frac{c}{m}$, or $\delta+\frac{1}{2}=\frac{1}{2}+\frac{c}{m} \Rightarrow \delta=\frac{c}{m}$. In either case, $\delta=\frac{c}{m}$.

30. Step 1: $|(mx+b)-(m+b)|<0.05 \Rightarrow -0.05<mx-m<0.05 \Rightarrow -0.05+m<mx<0.05+m \Rightarrow 1-\frac{0.05}{m}<x<1+\frac{0.05}{m}$.
Step 2: $|x-1|<\delta \Rightarrow -\delta<x-1<\delta \Rightarrow -\delta+1<x<\delta+1$.
Then $-\delta+1=1-\frac{0.05}{m} \Rightarrow \delta=\frac{0.05}{m}$, or $\delta+1=1+\frac{0.05}{m} \Rightarrow \delta=\frac{0.05}{m}$. In either case, $\delta=\frac{0.05}{m}$.

31. $\lim_{x\to 3}(3-2x)=3-2(3)=-3$
Step 1: $|(3-2x)-(-3)|<0.02 \Rightarrow -0.02<6-2x<0.02 \Rightarrow -6.02<-2x<-5.98 \Rightarrow 3.01>x>2.99$ or $2.99<x<3.01$.
Step 2: $0<|x-3|<\delta \Rightarrow -\delta<x-3<\delta \Rightarrow -\delta+3<x<\delta+3$.
Then $-\delta+3=2.99 \Rightarrow \delta=0.01$, or $\delta+3=3.01 \Rightarrow \delta=0.01$; thus $\delta=0.01$.

32. $\lim_{x\to -1}(-3x-2)=(-3)(-1)-2=1$
Step 1: $|(-3x-2)-1|<0.03 \Rightarrow -0.03<-3x-3<0.03 \Rightarrow 0.01>x+1>-0.01 \Rightarrow -1.01<x<-0.99$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Step 2: $|x-(-1)|<\delta \Rightarrow -\delta<x+1<\delta \Rightarrow -\delta-1<x<\delta-1$.
Then $-\delta-1=-1.01 \Rightarrow \delta=0.01$, or $\delta-1=-0.99 \Rightarrow \delta=0.01$; thus $\delta=0.01$.

33. $\lim\limits_{x\to 2}\frac{x^2-4}{x-2}=\lim\limits_{x\to 2}\frac{(x+2)(x-2)}{(x-2)}=\lim\limits_{x\to 2}(x+2)=2+2=4,\ x\neq 2$
Step 1: $\left|\left(\frac{x^2-4}{x-2}\right)-4\right|<0.05 \Rightarrow -0.05<\frac{(x+2)(x-2)}{(x-2)}-4<0.05 \Rightarrow 3.95<x+2<4.05,\ x\neq 2$
$\Rightarrow 1.95<x<2.05,\ x\neq 2$.
Step 2: $|x-2|<\delta \Rightarrow -\delta<x-2<\delta \Rightarrow -\delta+2<x<\delta+2$.
Then $-\delta+2=1.95 \Rightarrow \delta=0.05$, or $\delta+2=2.05 \Rightarrow \delta=0.05$; thus $\delta=0.05$.

34. $\lim\limits_{x\to -5}\frac{x^2+6x+5}{x+5}=\lim\limits_{x\to -5}\frac{(x+5)(x+1)}{(x+5)}=\lim\limits_{x\to -5}(x+1)=-4,\ x\neq -5$.
Step 1: $\left|\left(\frac{x^2+6x+5}{x+5}\right)-(-4)\right|<0.05 \Rightarrow -0.05<\frac{(x+5)(x+1)}{(x+5)}+4<0.05 \Rightarrow -4.05<x+1<-3.95,\ x\neq -5$
$\Rightarrow -5.05<x<-4.95,\ x\neq -5$.
Step 2: $|x-(-5)|<\delta \Rightarrow -\delta<x+5<\delta \Rightarrow -\delta-5<x<\delta-5$.
Then $-\delta-5=-5.05 \Rightarrow \delta=0.05$, or $\delta-5=-4.95 \Rightarrow \delta=0.05$; thus $\delta=0.05$.

35. $\lim\limits_{x\to -3}\sqrt{1-5x}=\sqrt{1-5(-3)}=\sqrt{16}=4$
Step 1: $\left|\sqrt{1-5x}-4\right|<0.5 \Rightarrow -0.5<\sqrt{1-5x}-4<0.5 \Rightarrow 3.5<\sqrt{1-5x}<4.5 \Rightarrow 12.25<1-5x<20.25$
$\Rightarrow 11.25<-5x<19.25 \Rightarrow -3.85<x<-2.25$.
Step 2: $|x-(-3)|<\delta \Rightarrow -\delta<x+3<\delta \Rightarrow -\delta-3<x<\delta-3$.
Then $-\delta-3=-3.85 \Rightarrow \delta=0.85$, or $\delta-3=-2.25 \Rightarrow 0.75$; thus $\delta=0.75$.

36. $\lim\limits_{x\to 2}\frac{4}{x}=\frac{4}{2}=2$
Step 1: $\left|\frac{4}{x}-2\right|<0.4 \Rightarrow -0.4<\frac{4}{x}-2<0.4 \Rightarrow 1.6<\frac{4}{x}<2.4 \Rightarrow \frac{10}{16}>\frac{x}{4}>\frac{10}{24} \Rightarrow \frac{10}{4}>x>\frac{10}{6}$ or $\frac{5}{3}<x<\frac{5}{2}$.
Step 2: $|x-2|<\delta \Rightarrow -\delta<x-2<\delta \Rightarrow -\delta+2<x<\delta+2$.
Then $-\delta+2=\frac{5}{3} \Rightarrow \delta=\frac{1}{3}$, or $\delta+2=\frac{5}{2} \Rightarrow \delta=\frac{1}{2}$; thus $\delta=\frac{1}{3}$.

37. Step 1: $|(9-x)-5|<\epsilon \Rightarrow -\epsilon<4-x<\epsilon \Rightarrow -\epsilon-4<-x<\epsilon-4 \Rightarrow \epsilon+4>x>4-\epsilon \Rightarrow 4-\epsilon<x<4+\epsilon$.
Step 2: $|x-4|<\delta \Rightarrow -\delta<x-4<\delta \Rightarrow -\delta+4<x<\delta+4$.
Then $-\delta+4=-\epsilon+4 \Rightarrow \delta=\epsilon$, or $\delta+4=\epsilon+4 \Rightarrow \delta=\epsilon$. Thus choose $\delta=\epsilon$.

38. Step 1: $|(3x-7)-2|<\epsilon \Rightarrow -\epsilon<3x-9<\epsilon \Rightarrow 9-\epsilon<3x<9+\epsilon \Rightarrow 3-\frac{\epsilon}{3}<x<3+\frac{\epsilon}{3}$.
Step 2: $|x-3|<\delta \Rightarrow -\delta<x-3<\delta \Rightarrow -\delta+3<x<\delta+3$.
Then $-\delta+3=3-\frac{\epsilon}{3} \Rightarrow \delta=\frac{\epsilon}{3}$, or $\delta+3=3+\frac{\epsilon}{3} \Rightarrow \delta=\frac{\epsilon}{3}$. Thus choose $\delta=\frac{\epsilon}{3}$.

39. Step 1: $\left|\sqrt{x-5}-2\right|<\epsilon \Rightarrow -\epsilon<\sqrt{x-5}-2<\epsilon \Rightarrow 2-\epsilon<\sqrt{x-5}<2+\epsilon \Rightarrow (2-\epsilon)^2<x-5<(2+\epsilon)^2$
$\Rightarrow (2-\epsilon)^2+5<x<(2+\epsilon)^2+5$.
Step 2: $|x-9|<\delta \Rightarrow -\delta<x-9<\delta \Rightarrow -\delta+9<x<\delta+9$.
Then $-\delta+9=\epsilon^2-4\epsilon+9 \Rightarrow \delta=4\epsilon-\epsilon^2$, or $\delta+9=\epsilon^2+4\epsilon+9 \Rightarrow \delta=4\epsilon+\epsilon^2$. Thus choose the smaller distance, $\delta=4\epsilon-\epsilon^2$.

40. Step 1: $\left|\sqrt{4-x}-2\right|<\epsilon \Rightarrow -\epsilon<\sqrt{4-x}-2<\epsilon \Rightarrow 2-\epsilon<\sqrt{4-x}<2+\epsilon \Rightarrow (2-\epsilon)^2<4-x<(2+\epsilon)^2$
$\Rightarrow -(2+\epsilon)^2<x-4<-(2-\epsilon)^2 \Rightarrow -(2+\epsilon)^2+4<x<-(2-\epsilon)^2+4$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Step 2: $|x-0|<\delta \Rightarrow -\delta<x<\delta$.
Then $-\delta=-(2+\epsilon)^2+4=-\epsilon^2-4\epsilon \Rightarrow \delta=4\epsilon+\epsilon^2$, or $\delta=-(2-\epsilon)^2+4=4\epsilon-\epsilon^2$. Thus choose the smaller distance, $\delta=4\epsilon-\epsilon^2$.

41. Step 1: For $x\neq 1$, $|x^2-1|<\epsilon \Rightarrow -\epsilon<x^2-1<\epsilon \Rightarrow 1-\epsilon<x^2<1+\epsilon \Rightarrow \sqrt{1-\epsilon}<|x|<\sqrt{1+\epsilon}$ $\Rightarrow \sqrt{1-\epsilon}<x<\sqrt{1+\epsilon}$ near $x=1$.
Step 2: $|x-1|<\delta \Rightarrow -\delta<x-1<\delta \Rightarrow -\delta+1<x<\delta+1$.
Then $-\delta+1=\sqrt{1-\epsilon} \Rightarrow \delta=1-\sqrt{1-\epsilon}$, or $\delta+1=\sqrt{1+\epsilon} \Rightarrow \delta=\sqrt{1+\epsilon}-1$. Choose $\delta=\min\left\{1-\sqrt{1-\epsilon},\sqrt{1+\epsilon}-1\right\}$, that is, the smaller of the two distances.

42. Step 1: For $x\neq -2$, $|x^2-4|<\epsilon \Rightarrow -\epsilon<x^2-4<\epsilon \Rightarrow 4-\epsilon<x^2<4+\epsilon \Rightarrow \sqrt{4-\epsilon}<|x|<\sqrt{4+\epsilon}$ $\Rightarrow -\sqrt{4+\epsilon}<x<-\sqrt{4-\epsilon}$ near $x=-2$.
Step 2: $|x-(-2)|<\delta \Rightarrow -\delta<x+2<\delta \Rightarrow -\delta-2<x<\delta-2$.
Then $-\delta-2=-\sqrt{4+\epsilon} \Rightarrow \delta=\sqrt{4+\epsilon}-2$, or $\delta-2=-\sqrt{4-\epsilon} \Rightarrow \delta=2-\sqrt{4-\epsilon}$. Choose $\delta=\min\left\{\sqrt{4+\epsilon}-2,2-\sqrt{4-\epsilon}\right\}$.

43. Step 1: $\left|\frac{1}{x}-1\right|<\epsilon \Rightarrow -\epsilon<\frac{1}{x}-1<\epsilon \Rightarrow 1-\epsilon<\frac{1}{x}<1+\epsilon \Rightarrow \frac{1}{1+\epsilon}<x<\frac{1}{1-\epsilon}$.
Step 2: $|x-1|<\delta \Rightarrow -\delta<x-1<\delta \Rightarrow 1-\delta<x<1+\delta$.
Then $1-\delta=\frac{1}{1+\epsilon} \Rightarrow \delta=1-\frac{1}{1+\epsilon}=\frac{\epsilon}{1+\epsilon}$, or $1+\delta=\frac{1}{1-\epsilon} \Rightarrow \delta=\frac{1}{1-\epsilon}-1=\frac{\epsilon}{1-\epsilon}$.
Choose $\delta=\frac{\epsilon}{1+\epsilon}$, the smaller of the two distances.

44. Step 1: $\left|\frac{1}{x^2}-\frac{1}{3}\right|<\epsilon \Rightarrow -\epsilon<\frac{1}{x^2}-\frac{1}{3}<\epsilon \Rightarrow \frac{1}{3}-\epsilon<\frac{1}{x^2}<\frac{1}{3}+\epsilon \Rightarrow \frac{1-3\epsilon}{3}<\frac{1}{x^2}<\frac{1+3\epsilon}{3} \Rightarrow \frac{3}{1-3\epsilon}>x^2>\frac{3}{1+3\epsilon}$ $\Rightarrow \sqrt{\frac{3}{1+3\epsilon}}<|x|<\sqrt{\frac{3}{1-3\epsilon}}$, or $\sqrt{\frac{3}{1+3\epsilon}}<x<\sqrt{\frac{3}{1-3\epsilon}}$ for x near $\sqrt{3}$.
Step 2: $\left|x-\sqrt{3}\right|<\delta \Rightarrow -\delta<x-\sqrt{3}<\delta \Rightarrow \sqrt{3}-\delta<x<\sqrt{3}+\delta$.
Then $\sqrt{3}-\delta=\sqrt{\frac{3}{1+3\epsilon}} \Rightarrow \delta=\sqrt{3}-\sqrt{\frac{3}{1+3\epsilon}}$, or $\sqrt{3}+\delta=\sqrt{\frac{3}{1-3\epsilon}} \Rightarrow \delta=\sqrt{\frac{3}{1-3\epsilon}}-\sqrt{3}$.
Choose $\delta=\min\left\{\sqrt{3}-\sqrt{\frac{3}{1+3\epsilon}},\sqrt{\frac{3}{1-3\epsilon}}-\sqrt{3}\right\}$.

45. Step 1: $\left|\left(\frac{x^2-9}{x+3}\right)-(-6)\right|<\epsilon \Rightarrow -\epsilon<(x-3)+6<\epsilon, x\neq -3 \Rightarrow -\epsilon<x+3<\epsilon \Rightarrow -\epsilon-3<x<\epsilon-3$.
Step 2: $|x-(-3)|<\delta \Rightarrow -\delta<x+3<\delta \Rightarrow -\delta-3<x<\delta-3$.
Then $-\delta-3=-\epsilon-3 \Rightarrow \delta=\epsilon$, or $\delta-3=\epsilon-3 \Rightarrow \delta=\epsilon$. Choose $\delta=\epsilon$.

46. Step 1: $\left|\left(\frac{x^2-1}{x-1}\right)-2\right|<\epsilon \Rightarrow -\epsilon<(x+1)-2<\epsilon, x\neq 1 \Rightarrow 1-\epsilon<x<1+\epsilon$.
Step 2: $|x-1|<\delta \Rightarrow -\delta<x-1<\delta \Rightarrow 1-\delta<x<1+\delta$.
Then $1-\delta=1-\epsilon \Rightarrow \delta=\epsilon$, or $1+\delta=1+\epsilon \Rightarrow \delta=\epsilon$. Choose $\delta=\epsilon$.

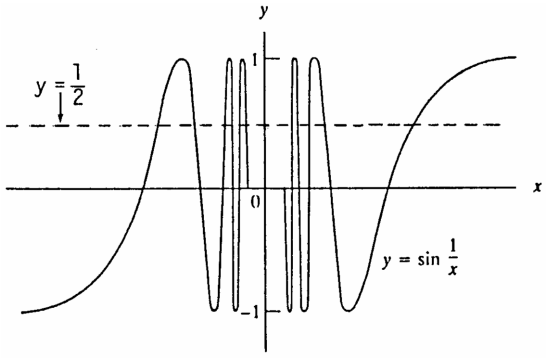
47. Step 1: $x<1$: $|(4-2x)-2|<\epsilon \Rightarrow 0<2-2x<\epsilon$ since $x<1$. Thus, $1-\frac{\epsilon}{2}<x<0$;
$x\geq 1$: $|(6x-4)-2|<\epsilon \Rightarrow 0\leq 6x-6<\epsilon$ since $x\geq 1$. Thus, $1\leq x<1+\frac{\epsilon}{6}$.
Step 2: $|x-1|<\delta \Rightarrow -\delta<x-1<\delta \Rightarrow 1-\delta<x<1+\delta$.
Then $1-\delta=1-\frac{\epsilon}{2} \Rightarrow \delta=\frac{\epsilon}{2}$, or $1+\delta=1+\frac{\epsilon}{6} \Rightarrow \delta=\frac{\epsilon}{6}$. Choose $\delta=\frac{\epsilon}{6}$.

48. Step 1: $x<0$: $|2x-0|<\epsilon \Rightarrow -\epsilon<2x<0 \Rightarrow -\frac{\epsilon}{2}<x<0$;
$x\geq 0$: $\left|\frac{x}{2}-0\right|<\epsilon \Rightarrow 0\leq x<2\epsilon$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Step 2: $|x-0| < \delta \Rightarrow -\delta < x < \delta$.
Then $-\delta = -\frac{\epsilon}{2} \Rightarrow \delta = \frac{\epsilon}{2}$, or $\delta = 2\epsilon \Rightarrow \delta = 2\epsilon$. Choose $\delta = \frac{\epsilon}{2}$.

49. By the figure, $-x \le x \sin\frac{1}{x} \le x$ for all $x > 0$ and $-x \ge x \sin\frac{1}{x} \ge x$ for $x < 0$. Since $\lim_{x\to 0}(-x) = \lim_{x\to 0} x = 0$, then by the sandwich theorem, in either case, $\lim_{x\to 0} x \sin\frac{1}{x} = 0$.



50. By the figure, $-x^2 \le x^2 \sin\frac{1}{x} \le x^2$ for all x except possibly at $x = 0$. Since $\lim_{x\to 0}(-x^2) = \lim_{x\to 0} x^2 = 0$, then by the sandwich theorem, $\lim_{x\to 0} x^2 \sin\frac{1}{x} = 0$.

51. As x approaches the value 0, the values of g(x) approach k. Thus for every number $\epsilon > 0$, there exists a $\delta > 0$ such that $0 < |x-0| < \delta \Rightarrow |g(x) - k| < \epsilon$.

52. Write $x = h + c$. Then $0 < |x-c| < \delta \Leftrightarrow -\delta < x - c < \delta$, $x \ne c \Leftrightarrow -\delta < (h+c) - c < \delta$, $h + c \ne c$
$\Leftrightarrow -\delta < h < \delta$, $h \ne 0 \Leftrightarrow 0 < |h-0| < \delta$.
Thus, $\lim_{x\to c} f(x) = L \Leftrightarrow$ for any $\epsilon > 0$, there exists $\delta > 0$ such that $|f(x) - L| < \epsilon$ whenever $0 < |x-c| < \delta$
$\Leftrightarrow |f(h+c) - L| < \epsilon$ whenever $0 < |h-0| < \delta \Leftrightarrow \lim_{h\to 0} f(h+c) = L$.

53. Let $f(x) = x^2$. The function values do get closer to $-1$ as x approaches 0, but $\lim_{x\to 0} f(x) = 0$, not $-1$. The function $f(x) = x^2$ never gets arbitrarily close to $-1$ for x near 0.

54. Let $f(x) = \sin x$, $L = \frac{1}{2}$, and $x_0 = 0$. There exists a value of x (namely, $x = \frac{\pi}{6}$) for which $\left|\sin x - \frac{1}{2}\right| < \epsilon$ for any given $\epsilon > 0$. However, $\lim_{x\to 0} \sin x = 0$, not $\frac{1}{2}$. The wrong statement does not require x to be arbitrarily close to $x_0$. As another example, let $g(x) = \sin\frac{1}{x}$, $L = \frac{1}{2}$, and $x_0 = 0$. We can choose infinitely many values of x near 0 such that $\sin\frac{1}{x} = \frac{1}{2}$ as you can see from the accompanying figure. However, $\lim_{x\to 0} \sin\frac{1}{x}$ fails to exist. The wrong statement does not require all values of x arbitrarily close to $x_0 = 0$ to lie within $\epsilon > 0$ of $L = \frac{1}{2}$. Again you can see from the figure that there are also infinitely many values of x near 0 such that $\sin\frac{1}{x} = 0$. If we choose $\epsilon < \frac{1}{4}$ we cannot satisfy the inequality $\left|\sin\frac{1}{x} - \frac{1}{2}\right| < \epsilon$ for all values of x sufficiently near $x_0 = 0$.

55. $|A - 9| \le 0.01 \Rightarrow -0.01 \le \pi\left(\frac{x}{2}\right)^2 - 9 \le 0.01 \Rightarrow 8.99 \le \frac{\pi x^2}{4} \le 9.01 \Rightarrow \frac{4}{\pi}(8.99) \le x^2 \le \frac{4}{\pi}(9.01)$
$\Rightarrow 2\sqrt{\frac{8.99}{\pi}} \le x \le 2\sqrt{\frac{9.01}{\pi}}$ or $3.384 \le x \le 3.387$. To be safe, the left endpoint was rounded up and the right endpoint was rounded down.

56. $V = RI \Rightarrow \frac{V}{R} = I \Rightarrow \left|\frac{V}{R} - 5\right| \le 0.1 \Rightarrow -0.1 \le \frac{120}{R} - 5 \le 0.1 \Rightarrow 4.9 \le \frac{120}{R} \le 5.1 \Rightarrow \frac{10}{49} \ge \frac{R}{120} \ge \frac{10}{51} \Rightarrow$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$\frac{(120)(10)}{51} \le R \le \frac{(120)(10)}{49} \Rightarrow 23.53 \le R \le 24.48.$
To be safe, the left endpoint was rounded up and the right endpoint was rounded down.

57. (a) $-\delta < x - 1 < 0 \Rightarrow 1 - \delta < x < 1 \Rightarrow f(x) = x$. Then $|f(x) - 2| = |x - 2| = 2 - x > 2 - 1 = 1$. That is, $|f(x) - 2| \ge 1 \ge \frac{1}{2}$ no matter how small $\delta$ is taken when $1 - \delta < x < 1 \Rightarrow \lim_{x \to 1} f(x) \ne 2$.

(b) $0 < x - 1 < \delta \Rightarrow 1 < x < 1 + \delta \Rightarrow f(x) = x + 1$. Then $|f(x) - 1| = |(x + 1) - 1| = |x| = x > 1$. That is, $|f(x) - 1| \ge 1$ no matter how small $\delta$ is taken when $1 < x < 1 + \delta \Rightarrow \lim_{x \to 1} f(x) \ne 1$.

(c) $-\delta < x - 1 < 0 \Rightarrow 1 - \delta < x < 1 \Rightarrow f(x) = x$. Then $|f(x) - 1.5| = |x - 1.5| = 1.5 - x > 1.5 - 1 = 0.5$. Also, $0 < x - 1 < \delta \Rightarrow 1 < x < 1 + \delta \Rightarrow f(x) = x + 1$. Then $|f(x) - 1.5| = |(x + 1) - 1.5| = |x - 0.5|$ $= x - 0.5 > 1 - 0.5 = 0.5$. Thus, no matter how small $\delta$ is taken, there exists a value of x such that $-\delta < x - 1 < \delta$ but $|f(x) - 1.5| \ge \frac{1}{2} \Rightarrow \lim_{x \to 1} f(x) \ne 1.5$.

58. (a) For $2 < x < 2 + \delta \Rightarrow h(x) = 2 \Rightarrow |h(x) - 4| = 2$. Thus for $\epsilon < 2$, $|h(x) - 4| \ge \epsilon$ whenever $2 < x < 2 + \delta$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x \to 2} h(x) \ne 4$.

(b) For $2 < x < 2 + \delta \Rightarrow h(x) = 2 \Rightarrow |h(x) - 3| = 1$. Thus for $\epsilon < 1$, $|h(x) - 3| \ge \epsilon$ whenever $2 < x < 2 + \delta$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x \to 2} h(x) \ne 3$.

(c) For $2 - \delta < x < 2 \Rightarrow h(x) = x^2$ so $|h(x) - 2| = |x^2 - 2|$. No matter how small $\delta > 0$ is chosen, $x^2$ is close to 4 when x is near 2 and to the left on the real line $\Rightarrow |x^2 - 2|$ will be close to 2. Thus if $\epsilon < 1$, $|h(x) - 2| \ge \epsilon$ whenever $2 - \delta < x < 2$ no mater how small we choose $\delta > 0 \Rightarrow \lim_{x \to 2} h(x) \ne 2$.

59. (a) For $3 - \delta < x < 3 \Rightarrow f(x) > 4.8 \Rightarrow |f(x) - 4| \ge 0.8$. Thus for $\epsilon < 0.8$, $|f(x) - 4| \ge \epsilon$ whenever $3 - \delta < x < 3$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x \to 3} f(x) \ne 4$.

(b) For $3 < x < 3 + \delta \Rightarrow f(x) < 3 \Rightarrow |f(x) - 4.8| \ge 1.8$. Thus for $\epsilon < 1.8$, $|f(x) - 4.8| \ge \epsilon$ whenever $3 < x < 3 + \delta$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x \to 3} f(x) \ne 4.8$.

(c) For $3 - \delta < x < 3 \Rightarrow f(x) > 4.8 \Rightarrow |f(x) - 3| \ge 1.8$. Again, for $\epsilon < 1.8$, $|f(x) - 3| \ge \epsilon$ whenever $3 - \delta < x < 3$ no matter how small we choose $\delta > 0 \Rightarrow \lim_{x \to 3} f(x) \ne 3$.

60. (a) No matter how small we choose $\delta > 0$, for x near $-1$ satisfying $-1 - \delta < x < -1 + \delta$, the values of g(x) are near $1 \Rightarrow |g(x) - 2|$ is near 1. Then, for $\epsilon = \frac{1}{2}$ we have $|g(x) - 2| \ge \frac{1}{2}$ for some x satisfying $-1 - \delta < x < -1 + \delta$, or $0 < |x + 1| < \delta \Rightarrow \lim_{x \to -1} g(x) \ne 2$.

(b) Yes, $\lim_{x \to -1} g(x) = 1$ because from the graph we can find a $\delta > 0$ such that $|g(x) - 1| < \epsilon$ if $0 < |x - (-1)| < \delta$.

61-66. Example CAS commands (values of del may vary for a specified eps):

Maple:

```
f := x -> (x^4-81)/(x-3);x0 := 3;
plot( f(x), x=x0-1..x0+1, color=black,                    # (a)
      title="Section 2.3, #61(a)" );
L := limit( f(x), x=x0 );                                  # (b)
epsilon := 0.2;                                           # (c)
plot( [f(x),L-epsilon,L+epsilon], x=x0-0.01..x0+0.01,
      color=black, linestyle=[1,3,3], title="Section 2.3, #61(c)" );
q := fsolve( abs( f(x)-L ) = epsilon, x=x0-1..x0+1 );    # (d)
delta := abs(x0-q);
plot( [f(x),L-epsilon,L+epsilon], x=x0-delta..x0+delta, color=black, title="Section 2.3, #61(d)" );
for eps in [0.1, 0.005, 0.001 ] do                        # (e)
```

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

```
  q := fsolve( abs( f(x)-L ) = eps, x=x0-1..x0+1 );
  delta := abs(x0-q);
  head := sprintf("Section 2.3, #61(e)\n epsilon = %5f, delta = %5f\n", eps, delta );
  print(plot( [f(x),L-eps,L+eps], x=x0-delta..x0+delta,
              color=black, linestyle=[1,3,3], title=head ));
end do:
```

Mathematica (assigned function and values for x0, eps and del may vary):

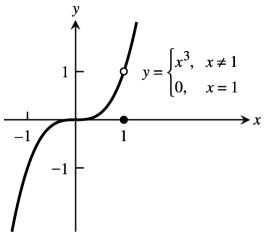
```
Clear[f, x]
y1: = L − eps; y2: = L + eps; x0 = 1;
f[x_]: = (3x^2 − (7x + 1)Sqrt[x] + 5)/(x − 1)
Plot[f[x], {x, x0 − 0.2, x0 + 0.2}]
L: = Limit[f[x], x → x0]
eps = 0.1; del = 0.2;
Plot[{f[x], y1, y2},{x, x0 − del, x0 + del}, PlotRange → {L − 2eps, L + 2eps}]
```

## 2.4 ONE-SIDED LIMITS AND LIMITS AT INFINITY

1. (a) True (b) True (c) False (d) True
   (e) True (f) True (g) False (h) False
   (i) False (j) False (k) True (l) False

2. (a) True (b) False (c) False (d) True
   (e) True (f) True (g) True (h) True
   (i) True (j) False (k) True

3. (a) $\lim\limits_{x \to 2^+} f(x) = \frac{2}{2} + 1 = 2$, $\lim\limits_{x \to 2^-} f(x) = 3 - 2 = 1$
   (b) No, $\lim\limits_{x \to 2} f(x)$ does not exist because $\lim\limits_{x \to 2^+} f(x) \neq \lim\limits_{x \to 2^-} f(x)$
   (c) $\lim\limits_{x \to 4^-} f(x) = \frac{4}{2} + 1 = 3$, $\lim\limits_{x \to 4^+} f(x) = \frac{4}{2} + 1 = 3$
   (d) Yes, $\lim\limits_{x \to 4} f(x) = 3$ because $3 = \lim\limits_{x \to 4^-} f(x) = \lim\limits_{x \to 4^+} f(x)$

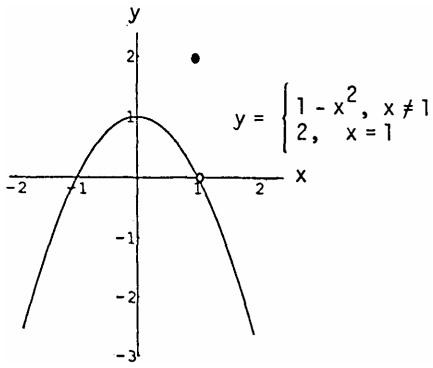


4. (a) $\lim\limits_{x \to 2^+} f(x) = \frac{2}{2} = 1$, $\lim\limits_{x \to 2^-} f(x) = 3 - 2 = 1$, $f(2) = 2$
   (b) Yes, $\lim\limits_{x \to 2} f(x) = 1$ because $1 = \lim\limits_{x \to 2^+} f(x) = \lim\limits_{x \to 2^-} f(x)$
   (c) $\lim\limits_{x \to -1^-} f(x) = 3 - (-1) = 4$, $\lim\limits_{x \to -1^+} f(x) = 3 - (-1) = 4$
   (d) Yes, $\lim\limits_{x \to -1} f(x) = 4$ because $4 = \lim\limits_{x \to -1^-} f(x) = \lim\limits_{x \to -1^+} f(x)$

5. (a) No, $\lim\limits_{x \to 0^+} f(x)$ does not exist since $\sin\left(\frac{1}{x}\right)$ does not approach any single value as x approaches 0
   (b) $\lim\limits_{x \to 0^-} f(x) = \lim\limits_{x \to 0^-} 0 = 0$
   (c) $\lim\limits_{x \to 0} f(x)$ does not exist because $\lim\limits_{x \to 0^+} f(x)$ does not exist

6. (a) **Yes, $\lim\limits_{x \to 0^+} g(x) = 0$** by the sandwich theorem since $-\sqrt{x} \leq g(x) \leq \sqrt{x}$ when $x > 0$
   (b) No, $\lim\limits_{x \to 0^-} g(x)$ does not exist since $\sqrt{x}$ is not defined for $x < 0$
   (c) No, $\lim\limits_{x \to 0} g(x)$ does not exist since $\lim\limits_{x \to 0^-} g(x)$ does not exist

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



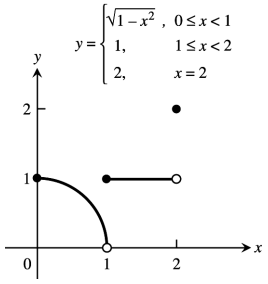
7. (a)

(b) $\lim_{x \to 1^-} f(x) = 1 = \lim_{x \to 1^+} f(x)$

(c) Yes, $\lim_{x \to 1} f(x) = 1$ since the right-hand and left-hand limits exist and equal 1

8. (a)

(b) $\lim_{x \to 1^+} f(x) = 0 = \lim_{x \to 1^-} f(x)$



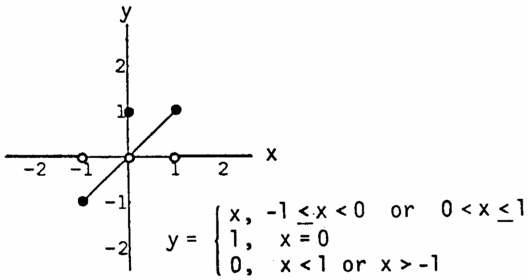
(c) Yes, $\lim_{x \to 1} f(x) = 0$ since the right-hand and left-hand limits exist and equal 0

9. (a) domain: $0 \le x \le 2$
range: $0 < y \le 1$ and $y = 2$

(b) $\lim_{x \to c} f(x)$ exists for c belonging to $(0, 1) \cup (1, 2)$

(c) $x = 2$

(d) $x = 0$



10. (a) domain: $-\infty < x < \infty$
range: $-1 \le y \le 1$

(b) $\lim_{x \to c} f(x)$ exists for c belonging to $(-\infty, -1) \cup (-1, 1) \cup (1, \infty)$

(c) none

(d) none

11. $\lim_{x \to -0.5^-} \sqrt{\frac{x+2}{x-1}} = \sqrt{\frac{-0.5+2}{-0.5+1}} = \sqrt{\frac{3/2}{1/2}} = \sqrt{3}$

12. $\lim_{x \to 1^+} \sqrt{\frac{x-1}{x+2}} = \sqrt{\frac{1-1}{1+2}} = \sqrt{0} = 0$

13. $\lim_{x \to -2^+} \left(\frac{x}{x+1}\right)\left(\frac{2x+5}{x^2+x}\right) = \left(\frac{-2}{-2+1}\right)\left(\frac{2(-2)+5}{(-2)^2+(-2)}\right) = (2)\left(\frac{1}{2}\right) = 1$

14. $\lim_{x \to 1^-} \left(\frac{1}{x+1}\right)\left(\frac{x+6}{x}\right)\left(\frac{3-x}{7}\right) = \left(\frac{1}{1+1}\right)\left(\frac{1+6}{1}\right)\left(\frac{3-1}{7}\right) = \left(\frac{1}{2}\right)\left(\frac{7}{1}\right)\left(\frac{2}{7}\right) = 1$

15. $\lim_{h \to 0^+} \frac{\sqrt{h^2+4h+5}-\sqrt{5}}{h} = \lim_{h \to 0^+} \left(\frac{\sqrt{h^2+4h+5}-\sqrt{5}}{h}\right)\left(\frac{\sqrt{h^2+4h+5}+\sqrt{5}}{\sqrt{h^2+4h+5}+\sqrt{5}}\right)$

$= \lim_{h \to 0^+} \frac{(h^2+4h+5)-5}{h\left(\sqrt{h^2+4h+5}+\sqrt{5}\right)} = \lim_{h \to 0^+} \frac{h(h+4)}{h\left(\sqrt{h^2+4h+5}+\sqrt{5}\right)} = \frac{0+4}{\sqrt{5}+\sqrt{5}} = \frac{2}{\sqrt{5}}$

30. $\lim_{x\to 0} \frac{x^2 - x + \sin x}{2x} = \lim_{x\to 0} \left(\frac{x}{2} - \frac{1}{2} + \frac{1}{2}\left(\frac{\sin x}{x}\right)\right) = 0 - \frac{1}{2} + \frac{1}{2}(1) = 0$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

31. $\lim\limits_{t\to 0} \frac{\sin(1-\cos t)}{1-\cos t} = \lim\limits_{\theta\to 0} \frac{\sin\theta}{\theta} = 1$ since $\theta = 1-\cos t \to 0$ as $t \to 0$

32. $\lim\limits_{h\to 0} \frac{\sin(\sin h)}{\sin h} = \lim\limits_{\theta\to 0} \frac{\sin\theta}{\theta} = 1$ since $\theta = \sin h \to 0$ as $h \to 0$

33. $\lim\limits_{\theta\to 0} \frac{\sin\theta}{\sin 2\theta} = \lim\limits_{\theta\to 0} \left(\frac{\sin\theta}{\sin 2\theta}\cdot\frac{2\theta}{2\theta}\right) = \frac{1}{2}\lim\limits_{\theta\to 0}\left(\frac{\sin\theta}{\theta}\cdot\frac{2\theta}{\sin 2\theta}\right) = \frac{1}{2}\cdot 1\cdot 1 = \frac{1}{2}$

34. $\lim\limits_{x\to 0} \frac{\sin 5x}{\sin 4x} = \lim\limits_{x\to 0}\left(\frac{\sin 5x}{\sin 4x}\cdot\frac{4x}{5x}\cdot\frac{5}{4}\right) = \frac{5}{4}\lim\limits_{x\to 0}\left(\frac{\sin 5x}{5x}\cdot\frac{4x}{\sin 4x}\right) = \frac{5}{4}\cdot 1\cdot 1 = \frac{5}{4}$

35. $\lim\limits_{x\to 0} \frac{\tan 3x}{\sin 8x} = \lim\limits_{x\to 0}\left(\frac{\sin 3x}{\cos 3x}\cdot\frac{1}{\sin 8x}\right) = \lim\limits_{x\to 0}\left(\frac{\sin 3x}{\cos 3x}\cdot\frac{1}{\sin 8x}\cdot\frac{8x}{3x}\cdot\frac{3}{8}\right)$
$= \frac{3}{8}\lim\limits_{x\to 0}\left(\frac{1}{\cos 3x}\right)\left(\frac{\sin 3x}{3x}\right)\left(\frac{8x}{\sin 8x}\right) = \frac{3}{8}\cdot 1\cdot 1\cdot 1 = \frac{3}{8}$

36. $\lim\limits_{y\to 0} \frac{\sin 3y\cot 5y}{y\cot 4y} = \lim\limits_{y\to 0} \frac{\sin 3y\sin 4y\cos 5y}{y\cos 4y\sin 5y} = \lim\limits_{y\to 0}\left(\frac{\sin 3y}{y}\right)\left(\frac{\sin 4y}{\cos 4y}\right)\left(\frac{\cos 5y}{\sin 5y}\right)\left(\frac{3\cdot 4\cdot 5y}{3\cdot 4\cdot 5y}\right)$
$= \lim\limits_{y\to 0}\left(\frac{\sin 3y}{3y}\right)\left(\frac{\sin 4y}{4y}\right)\left(\frac{5y}{\sin 5y}\right)\left(\frac{\cos 5y}{\cos 4y}\right)\left(\frac{3\cdot 4}{5}\right) = 1\cdot 1\cdot 1\cdot 1\cdot\frac{12}{5} = \frac{12}{5}$

Note: In these exercises we use the result $\lim\limits_{x\to\pm\infty}\frac{1}{x^{m/n}} = 0$ whenever $\frac{m}{n} > 0$. This result follows immediately from Example 6 and the power rule in Theorem 8: $\lim\limits_{x\to\pm\infty}\left(\frac{1}{x^{m/n}}\right) = \lim\limits_{x\to\pm\infty}\left(\frac{1}{x}\right)^{m/n} = \left(\lim\limits_{x\to\pm\infty}\frac{1}{x}\right)^{m/n} = 0^{m/n} = 0.$

57. $\lim_{x\to\infty} \frac{2\sqrt{x}+x^{-1}}{3x-7} = \lim_{x\to\infty} \frac{\left(\frac{2}{x^{1/2}}\right)+\left(\frac{1}{x^2}\right)}{3-\frac{7}{x}} = 0$

58. $\lim_{x\to\infty} \frac{2+\sqrt{x}}{2-\sqrt{x}} = \lim_{x\to\infty} \frac{\left(\frac{2}{x^{1/2}}\right)+1}{\left(\frac{2}{x^{1/2}}\right)-1} = -1$

59. $\lim_{x\to-\infty} \frac{\sqrt[3]{x}-\sqrt[5]{x}}{\sqrt[3]{x}+\sqrt[5]{x}} = \lim_{x\to-\infty} \frac{1-x^{(1/5)-(1/3)}}{1+x^{(1/5)-(1/3)}} = \lim_{x\to-\infty} \frac{1-\left(\frac{1}{x^{2/15}}\right)}{1+\left(\frac{1}{x^{2/15}}\right)} = 1$

60. $\lim_{x\to\infty} \frac{x^{-1}+x^{-4}}{x^{-2}-x^{-3}} = \lim_{x\to\infty} \frac{x+\frac{1}{x^2}}{1-\frac{1}{x}} = \infty$

61. $\lim_{x\to\infty} \frac{2x^{5/3}-x^{1/3}+7}{x^{8/5}+3x+\sqrt{x}} = \lim_{x\to\infty} \frac{2x^{1/15}-\frac{1}{x^{19/15}}+\frac{7}{x^{8/5}}}{1+\frac{3}{x^{3/5}}+\frac{1}{x^{11/10}}} = \infty$

62. $\lim_{x\to-\infty} \frac{\sqrt[3]{x}-5x+3}{2x+x^{2/3}-4} = \lim_{x\to-\infty} \frac{\frac{1}{x^{2/3}}-5+\frac{3}{x}}{2+\frac{1}{x^{1/3}}-\frac{4}{x}} = -\frac{5}{2}$

63. Yes. If $\lim_{x\to a^+} f(x) = L = \lim_{x\to a^-} f(x)$, then $\lim_{x\to a} f(x) = L$. If $\lim_{x\to a^+} f(x) \neq \lim_{x\to a^-} f(x)$, then $\lim_{x\to a} f(x)$ does not exist.

64. Since $\lim_{x\to c} f(x) = L$ if and only if $\lim_{x\to c^+} f(x) = L$ and $\lim_{x\to c^-} f(x) = L$, then $\lim_{x\to c} f(x)$ can be found by calculating $\lim_{x\to c^+} f(x)$.

65. If f is an odd function of x, then $f(-x) = -f(x)$. Given $\lim_{x\to 0^+} f(x) = 3$, then $\lim_{x\to 0^-} f(x) = -3$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

66. If f is an even function of x, then $f(-x) = f(x)$. Given $\lim_{x \to 2^-} f(x) = 7$ then $\lim_{x \to -2^+} f(x) = 7$. However, nothing can be said about $\lim_{x \to -2^-} f(x)$ because we don't know $\lim_{x \to 2^+} f(x)$.

67. Yes. If $\lim_{x \to \infty} \frac{f(x)}{g(x)} = 2$ then the ratio of the polynomials' leading coefficients is 2, so $\lim_{x \to -\infty} \frac{f(x)}{g(x)} = 2$ as well.

68. Yes, it can have a horizontal or oblique asymptote.

69. At most 1 horizontal asymptote: If $\lim_{x \to \infty} \frac{f(x)}{g(x)} = L$, then the ratio of the polynomials' leading coefficients is L, so $\lim_{x \to -\infty} \frac{f(x)}{g(x)} = L$ as well.

70. $\lim_{x \to \infty} \sqrt{x^2+x} - \sqrt{x^2-x} = \lim_{x \to \infty} \left[\sqrt{x^2+x} - \sqrt{x^2-x}\right] \cdot \left[\frac{\sqrt{x^2+x}+\sqrt{x^2-x}}{\sqrt{x^2+x}+\sqrt{x^2-x}}\right] = \lim_{x \to \infty} \frac{(x^2+x)-(x^2-x)}{\sqrt{x^2+x}+\sqrt{x^2-x}}$
$= \lim_{x \to \infty} \frac{2x}{\sqrt{x^2+x}+\sqrt{x^2-x}} = \lim_{x \to \infty} \frac{2}{\sqrt{1+\frac{1}{x}}+\sqrt{1-\frac{1}{x}}} = \frac{2}{1+1} = 1$

71. For any $\epsilon > 0$, take $N = 1$. Then for all $x > N$ we have that $|f(x) - k| = |k - k| = 0 < \epsilon$.

72. For any $\epsilon > 0$, take $N = 1$. Then for all $y < -N$ we have that $|f(x) - k| = |k - k| = 0 < \epsilon$.

73. $I = (5, 5+\delta) \Rightarrow 5 < x < 5+\delta$. Also, $\sqrt{x-5} < \epsilon \Rightarrow x - 5 < \epsilon^2 \Rightarrow x < 5 + \epsilon^2$. Choose $\delta = \epsilon^2$
$\Rightarrow \lim_{x \to 5^+} \sqrt{x-5} = 0$.

74. $I = (4-\delta, 4) \Rightarrow 4 - \delta < x < 4$. Also, $\sqrt{4-x} < \epsilon \Rightarrow 4 - x < \epsilon^2 \Rightarrow x > 4 - \epsilon^2$. Choose $\delta = \epsilon^2$
$\Rightarrow \lim_{x \to 4^-} \sqrt{4-x} = 0$.

75. As $x \to 0^-$ the number x is always negative. Thus, $\left|\frac{x}{|x|} - (-1)\right| < \epsilon \Rightarrow \left|\frac{x}{-x} + 1\right| < \epsilon \Rightarrow 0 < \epsilon$ which is always true independent of the value of x. Hence we can choose any $\delta > 0$ with $-\delta < x < 0 \Rightarrow \lim_{x \to 0^-} \frac{x}{|x|} = -1$.

76. Since $x \to 2^+$ we have $x > 2$ and $|x-2| = x - 2$. Then, $\left|\frac{x-2}{|x-2|} - 1\right| = \left|\frac{x-2}{x-2} - 1\right| < \epsilon \Rightarrow 0 < \epsilon$
which is always true so long as $x > 2$. Hence we can choose any $\delta > 0$, and thus $2 < x < 2 + \delta$
$\Rightarrow \left|\frac{x-2}{|x-2|} - 1\right| < \epsilon$. Thus, $\lim_{x \to -2^+} \frac{x-2}{|x-2|} = 1$.

77. (a) $\lim_{x \to 400^+} \lfloor x \rfloor = 400$. Just observe that if $400 < x < 401$, then $\lfloor x \rfloor = 400$. Thus if we choose $\delta = 1$, we have for any number $\epsilon > 0$ that $400 < x < 400 + \delta \Rightarrow |\lfloor x \rfloor - 400| = |400 - 400| = 0 < \epsilon$.
(b) $\lim_{x \to 400^-} \lfloor x \rfloor = 399$. Just observe that if $399 < x < 400$ then $\lfloor x \rfloor = 399$. Thus if we choose $\delta = 1$, we have for any number $\epsilon > 0$ that $400 - \delta < x < 400 \Rightarrow |\lfloor x \rfloor - 399| = |399 - 399| = 0 < \epsilon$.
(c) Since $\lim_{x \to 400^+} \lfloor x \rfloor \neq \lim_{x \to 400^-} \lfloor x \rfloor$ we conclude that $\lim_{x \to 400} \lfloor x \rfloor$ does not exist.

78. (a) $\lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} \sqrt{x} = \sqrt{0} = 0$; $\left|\sqrt{x} - 0\right| < \epsilon \Rightarrow -\epsilon < \sqrt{x} < \epsilon \Rightarrow 0 < x < \epsilon^2$ for x positive. Choose $\delta = \epsilon^2$
$\Rightarrow \lim_{x \to 0^+} f(x) = 0$.
(b) $\lim_{x \to 0^-} f(x) = \lim_{x \to 0^-} x^2 \sin\left(\frac{1}{x}\right) = 0$ by the sandwich theorem since $-x^2 \leq x^2 \sin\left(\frac{1}{x}\right) \leq x^2$ for all $x \neq 0$.
Since $|x^2 - 0| = |-x^2 - 0| = x^2 < \epsilon$ whenever $|x| < \sqrt{\epsilon}$, we choose $\delta = \sqrt{\epsilon}$ and obtain $\left|x^2 \sin\left(\frac{1}{x}\right) - 0\right| < \epsilon$ if $-\delta < x < 0$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(c) The function f has limit 0 at $x_0 = 0$ since both the right-hand and left-hand limits exist and equal 0.

(d) $\lim\limits_{x \to 2} \frac{x^2-3x+2}{x^3-2x^2} = \lim\limits_{x \to 2} \frac{(x-2)(x-1)}{x^2(x-2)} = \lim\limits_{x \to 2} \frac{x-1}{x^2} = \frac{1}{4}, x \neq 2$

(e) $\lim\limits_{x \to 0} \frac{x^2-3x+2}{x^3-2x^2} = \lim\limits_{x \to 0} \frac{(x-2)(x-1)}{x^2(x-2)} = -\infty$ $\left(\frac{\text{negative}\cdot\text{negative}}{\text{positive}\cdot\text{negative}}\right)$

22. (a) $\lim\limits_{x \to 2^+} \frac{x^2-3x+2}{x^3-4x} = \lim\limits_{x \to 2^+} \frac{(x-2)(x-1)}{x(x-2)(x+2)} = \lim\limits_{x \to 2^+} \frac{(x-1)}{x(x+2)} = \frac{1}{2(4)} = \frac{1}{8}$

(b) $\lim\limits_{x \to -2^+} \frac{x^2-3x+2}{x^3-4x} = \lim\limits_{x \to -2^+} \frac{(x-2)(x-1)}{x(x-2)(x+2)} = \lim\limits_{x \to -2^+} \frac{(x-1)}{x(x+2)} = \infty$ $\left(\frac{\text{negative}}{\text{negative}\cdot\text{positive}}\right)$

(c) $\lim\limits_{x \to 0^-} \frac{x^2-3x+2}{x^3-4x} = \lim\limits_{x \to 0^-} \frac{(x-2)(x-1)}{x(x-2)(x+2)} = \lim\limits_{x \to 0^-} \frac{(x-1)}{x(x+2)} = \infty$ $\left(\frac{\text{negative}}{\text{negative}\cdot\text{positive}}\right)$

(d) $\lim\limits_{x \to 1^+} \frac{x^2-3x+2}{x^3-4x} = \lim\limits_{x \to 1^+} \frac{(x-2)(x-1)}{x(x-2)(x+2)} = \lim\limits_{x \to 1^+} \frac{(x-1)}{x(x+2)} = \frac{0}{(1)(3)} = 0$

(e) $\lim\limits_{x \to 0^+} \frac{x-1}{x(x+2)} = -\infty$ $\left(\frac{\text{negative}}{\text{positive}\cdot\text{positive}}\right)$

and $\lim\limits_{x \to 0^-} \frac{x-1}{x(x+2)} = \infty$ $\left(\frac{\text{negative}}{\text{negative}\cdot\text{positive}}\right)$

so the function has no limit as $x \to 0$.

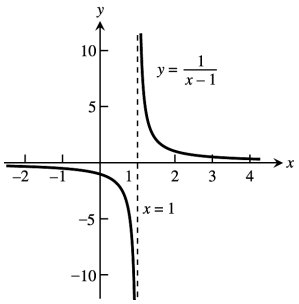
23. (a) $\lim\limits_{t \to 0^+} \left[2 - \frac{3}{t^{1/3}}\right] = -\infty$ (b) $\lim\limits_{t \to 0^-} \left[2 - \frac{3}{t^{1/3}}\right] = \infty$

24. (a) $\lim\limits_{t \to 0^+} \left[\frac{1}{t^{3/5}} + 7\right] = \infty$ (b) $\lim\limits_{t \to 0^-} \left[\frac{1}{t^{3/5}} + 7\right] = -\infty$

25. (a) $\lim\limits_{x \to 0^+} \left[\frac{1}{x^{2/3}} + \frac{2}{(x-1)^{2/3}}\right] = \infty$ (b) $\lim\limits_{x \to 0^-} \left[\frac{1}{x^{2/3}} + \frac{2}{(x-1)^{2/3}}\right] = \infty$

(c) $\lim\limits_{x \to 1^+} \left[\frac{1}{x^{2/3}} + \frac{2}{(x-1)^{2/3}}\right] = \infty$ (d) $\lim\limits_{x \to 1^-} \left[\frac{1}{x^{2/3}} + \frac{2}{(x-1)^{2/3}}\right] = \infty$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



26. (a) $\lim_{x \to 0^+} \left[\frac{1}{x^{1/3}} - \frac{1}{(x-1)^{4/3}}\right] = \infty$

47. For every real number $-B < 0$, we must find a $\delta > 0$ such that for all x, $0 < |x - 0| < \delta \Rightarrow \frac{-1}{x^2} < -B$. Now, $-\frac{1}{x^2} < -B < 0 \Leftrightarrow \frac{1}{x^2} > B > 0 \Leftrightarrow x^2 < \frac{1}{B} \Leftrightarrow |x| < \frac{1}{\sqrt{B}}$. Choose $\delta = \frac{1}{\sqrt{B}}$, then $0 < |x| < \delta \Rightarrow |x| < \frac{1}{\sqrt{B}} \Rightarrow \frac{-1}{x^2} < -B$ so that $\lim_{x \to 0} -\frac{1}{x^2} = -\infty$.

48. For every real number $B > 0$, we must find a $\delta > 0$ such that for all x, $0 < |x - 0| < \delta \Rightarrow \frac{1}{|x|} > B$. Now, $\frac{1}{|x|} > B > 0 \Leftrightarrow |x| < \frac{1}{B}$. Choose $\delta = \frac{1}{B}$. Then $0 < |x - 0| < \delta \Rightarrow |x| < \frac{1}{B} \Rightarrow \frac{1}{|x|} > B$ so that $\lim_{x \to 0} \frac{1}{|x|} = \infty$.

49. For every real number $-B < 0$, we must find a $\delta > 0$ such that for all x, $0 < |x - 3| < \delta \Rightarrow \frac{-2}{(x-3)^2} < -B$. Now, $\frac{-2}{(x-3)^2} < -B < 0 \Leftrightarrow \frac{2}{(x-3)^2} > B > 0 \Leftrightarrow \frac{(x-3)^2}{2} < \frac{1}{B} \Leftrightarrow (x-3)^2 < \frac{2}{B} \Leftrightarrow 0 < |x - 3| < \sqrt{\frac{2}{B}}$. Choose $\delta = \sqrt{\frac{2}{B}}$, then $0 < |x - 3| < \delta \Rightarrow \frac{-2}{(x-3)^2} < -B < 0$ so that $\lim_{x \to 3} \frac{-2}{(x-3)^2} = -\infty$.

50. For every real number $B > 0$, we must find a $\delta > 0$ such that for all x, $0 < |x - (-5)| < \delta \Rightarrow \frac{1}{(x+5)^2} > B$. Now, $\frac{1}{(x+5)^2} > B > 0 \Leftrightarrow (x+5)^2 < \frac{1}{B} \Leftrightarrow |x+5| < \frac{1}{\sqrt{B}}$. Choose $\delta = \frac{1}{\sqrt{B}}$. Then $0 < |x - (-5)| < \delta \Rightarrow |x+5| < \frac{1}{\sqrt{B}} \Rightarrow \frac{1}{(x+5)^2} > B$ so that $\lim_{x \to -5} \frac{1}{(x+5)^2} = \infty$.

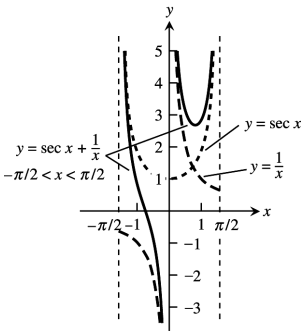
51. (a) We say that f(x) approaches infinity as x approaches $x_0$ from the left, and write $\lim_{x \to x_0^-} f(x) = \infty$, if for every positive number B, there exists a corresponding number $\delta > 0$ such that for all x, $x_0 - \delta < x < x_0 \Rightarrow f(x) > B$.

(b) We say that f(x) approaches minus infinity as x approaches $x_0$ from the right, and write $\lim_{x \to x_0^+} f(x) = -\infty$, if for every positive number B (or negative number $-B$) there exists a corresponding number $\delta > 0$ such that for all x, $x_0 < x < x_0 + \delta \Rightarrow f(x) < -B$.

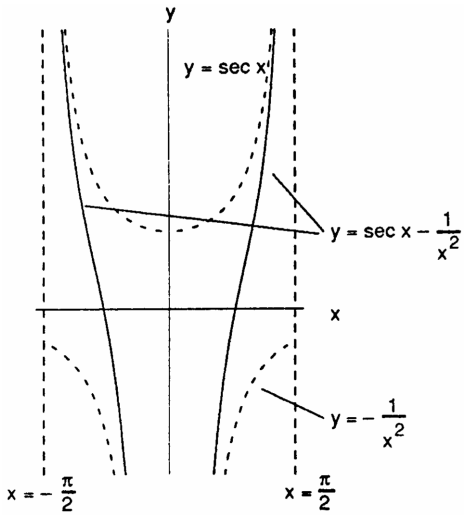
(c) We say that f(x) approaches minus infinity as x approaches $x_0$ from the left, and write $\lim_{x \to x_0^-} f(x) = -\infty$, if for every positive number B (or negative number $-B$) there exists a corresponding number $\delta > 0$ such that for all x, $x_0 - \delta < x < x_0 \Rightarrow f(x) < -B$.

52. For $B > 0$, $\frac{1}{x} > B > 0 \Leftrightarrow x < \frac{1}{B}$. Choose $\delta = \frac{1}{B}$. Then $0 < x < \delta \Rightarrow 0 < x < \frac{1}{B} \Rightarrow \frac{1}{x} > B$ so that $\lim_{x \to 0^+} \frac{1}{x} = \infty$.



53. For $B > 0$, $\frac{1}{x} < -B < 0 \Leftrightarrow -\frac{1}{x} > B > 0 \Leftrightarrow -x < \frac{1}{B} \Leftrightarrow -\frac{1}{B} < x$. Choose $\delta = \frac{1}{B}$. Then $-\delta < x < 0 \Rightarrow -\frac{1}{B} < x \Rightarrow \frac{1}{x} < -B$ so that $\lim_{x \to 0^-} \frac{1}{x} = -\infty$.

54. For $B > 0$, $\frac{1}{x-2} < -B \Leftrightarrow -\frac{1}{x-2} > B \Leftrightarrow -(x-2) < \frac{1}{B} \Leftrightarrow x - 2 > -\frac{1}{B} \Leftrightarrow x > 2 - \frac{1}{B}$. Choose $\delta = \frac{1}{B}$. Then $2 - \delta < x < 2 \Rightarrow -\delta < x - 2 < 0 \Rightarrow -\frac{1}{B} < x - 2 < 0 \Rightarrow \frac{1}{x-2} < -B < 0$ so that $\lim_{x \to 2^-} \frac{1}{x-2} = -\infty$.



55. For $B > 0$, $\frac{1}{x-2} > B \Leftrightarrow 0 < x - 2 < \frac{1}{B}$. Choose $\delta = \frac{1}{B}$. Then $2 < x < 2 + \delta \Rightarrow 0 < x - 2 < \delta \Rightarrow 0 < x - 2 < \frac{1}{B} \Rightarrow \frac{1}{x-2} > B > 0$ so that $\lim_{x \to 2^+} \frac{1}{x-2} = \infty$.

56. For $B > 0$ and $0 < x < 1$, $\frac{1}{1-x^2} > B \Leftrightarrow 1 - x^2 < \frac{1}{B} \Leftrightarrow (1-x)(1+x) < \frac{1}{B}$. Now $\frac{1+x}{2} < 1$ since $x < 1$. Choose $\delta < \frac{1}{2B}$. Then $1 - \delta < x < 1 \Rightarrow -\delta < x - 1 < 0 \Rightarrow 1 - x < \delta < \frac{1}{2B} \Rightarrow (1-x)(1+x) < \frac{1}{B}\left(\frac{1+x}{2}\right) < \frac{1}{B} \Rightarrow \frac{1}{1-x^2} > B$ for $0 < x < 1$ and x near 1 $\Rightarrow \lim_{x \to 1^-} \frac{1}{1-x^2} = \infty$.

## 2.6 CONTINUITY

1. No, discontinuous at $x = 2$, not defined at $x = 2$

2. No, discontinuous at $x = 3$, $1 = \lim_{x \to 3^-} g(x) \neq g(3) = 1.5$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

3. Continuous on $[-1, 3]$

4. No, discontinuous at $x = 1$, $1.5 = \lim_{x \to 1^-} k(x) \neq \lim_{x \to 1^+} k(x) = 0$

5. (a) Yes
   (b) Yes, $\lim_{x \to -1^+} f(x) = 0$
   (c) Yes
   (d) Yes

6. (a) Yes, $f(1) = 1$
   (b) Yes, $\lim_{x \to 1} f(x) = 2$
   (c) No
   (d) No

7. (a) No
   (b) No

8. $[-1, 0) \cup (0, 1) \cup (1, 2) \cup (2, 3)$

9. $f(2) = 0$, since $\lim_{x \to 2^-} f(x) = -2(2) + 4 = 0 = \lim_{x \to 2^+} f(x)$

10. $f(1)$ should be changed to $2 = \lim_{x \to 1} f(x)$

11. Nonremovable discontinuity at $x = 1$ because $\lim_{x \to 1} f(x)$ fails to exist ( $\lim_{x \to 1^-} f(x) = 1$ and $\lim_{x \to 1^+} f(x) = 0$). Removable discontinuity at $x = 0$ by assigning the number $\lim_{x \to 0} f(x) = 0$ to be the value of $f(0)$ rather than $f(0) = 1$.

12. Nonremovable discontinuity at $x = 1$ because $\lim_{x \to 1} f(x)$ fails to exist ( $\lim_{x \to 1^-} f(x) = 2$ and $\lim_{x \to 1^+} f(x) = 1$). Removable discontinuity at $x = 2$ by assigning the number $\lim_{x \to 2} f(x) = 1$ to be the value of $f(2)$ rather than $f(2) = 2$.

13. Discontinuous only when $x - 2 = 0 \Rightarrow x = 2$

14. Discontinuous only when $(x + 2)^2 = 0 \Rightarrow x = -2$

15. Discontinuous only when $x^2 - 4x + 3 = 0 \Rightarrow (x - 3)(x - 1) = 0 \Rightarrow x = 3$ or $x = 1$

16. Discontinuous only when $x^2 - 3x - 10 = 0 \Rightarrow (x - 5)(x + 2) = 0 \Rightarrow x = 5$ or $x = -2$

17. Continuous everywhere. ( $|x - 1| + \sin x$ defined for all x; limits exist and are equal to function values.)

18. Continuous everywhere. ( $|x| + 1 \neq 0$ for all x; limits exist and are equal to function values.)

19. Discontinuous only at $x = 0$

20. Discontinuous at odd integer multiples of $\frac{\pi}{2}$, i.e., $x = (2n - 1)\frac{\pi}{2}$, n an integer, but continuous at all other x.

21. Discontinuous when $2x$ is an integer multiple of $\pi$, i.e., $2x = n\pi$, n an integer $\Rightarrow x = \frac{n\pi}{2}$, n an integer, but continuous at all other x.

22. Discontinuous when $\frac{\pi x}{2}$ is an odd integer multiple of $\frac{\pi}{2}$, i.e., $\frac{\pi x}{2} = (2n - 1)\frac{\pi}{2}$, n an integer $\Rightarrow x = 2n - 1$, n an integer (i.e., x is an odd integer). Continuous everywhere else.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

23. Discontinuous at odd integer multiples of $\frac{\pi}{2}$, i.e., $x = (2n-1)\frac{\pi}{2}$, n an integer, but continuous at all other x.

24. Continuous everywhere since $x^4 + 1 \geq 1$ and $-1 \leq \sin x \leq 1 \Rightarrow 0 \leq \sin^2 x \leq 1 \Rightarrow 1 + \sin^2 x \geq 1$; limits exist and are equal to the function values.

25. Discontinuous when $2x + 3 < 0$ or $x < -\frac{3}{2} \Rightarrow$ continuous on the interval $\left[-\frac{3}{2}, \infty\right)$.

26. Discontinuous when $3x - 1 < 0$ or $x < \frac{1}{3} \Rightarrow$ continuous on the interval $\left[\frac{1}{3}, \infty\right)$.

27. Continuous everywhere: $(2x-1)^{1/3}$ is defined for all x; limits exist and are equal to function values.

28. Continuous everywhere: $(2-x)^{1/5}$ is defined for all x; limits exist and are equal to function values.

29. $\lim_{x \to \pi} \sin(x - \sin x) = \sin(\pi - \sin \pi) = \sin(\pi - 0) = \sin \pi = 0$, and function continuous at $x = \pi$.

30. $\lim_{t \to 0} \sin\left(\frac{\pi}{2}\cos(\tan t)\right) = \sin\left(\frac{\pi}{2}\cos(\tan(0))\right) = \sin\left(\frac{\pi}{2}\cos(0)\right) = \sin\left(\frac{\pi}{2}\right) = 1$, and function continuous at $t = 0$.

31. $\lim_{y \to 1} \sec(y\sec^2 y - \tan^2 y - 1) = \lim_{y \to 1} \sec(y\sec^2 y - \sec^2 y) = \lim_{y \to 1} \sec((y-1)\sec^2 y) = \sec((1-1)\sec^2 1)$ $= \sec 0 = 1$, , and function continuous at $y = 1$.

32. $\lim_{x \to 0} \tan\left[\frac{\pi}{4}\cos\left(\sin x^{1/3}\right)\right] = \tan\left[\frac{\pi}{4}\cos(\sin(0))\right] = \tan\left(\frac{\pi}{4}\cos(0)\right) = \tan\left(\frac{\pi}{4}\right) = 1$, and function continuous at $x = 0$.

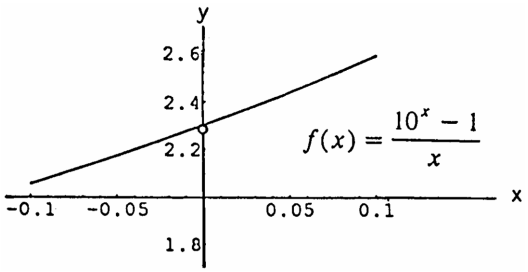
33. $\lim_{t \to 0} \cos\left[\frac{\pi}{\sqrt{19 - 3\sec 2t}}\right] = \cos\left[\frac{\pi}{\sqrt{19 - 3\sec 0}}\right] = \cos\frac{\pi}{\sqrt{16}} = \cos\frac{\pi}{4} = \frac{\sqrt{2}}{2}$, and function continuous at $t = 0$.

34. $\lim_{x \to \frac{\pi}{6}} \sqrt{\csc^2 x + 5\sqrt{3}\tan x} = \sqrt{\csc^2\left(\frac{\pi}{6}\right) + 5\sqrt{3}\tan\left(\frac{\pi}{6}\right)} = \sqrt{4 + 5\sqrt{3}\left(\frac{1}{\sqrt{3}}\right)} = \sqrt{9} = 3$, and function continuous at $x = \frac{\pi}{6}$.

35. $g(x) = \frac{x^2-9}{x-3} = \frac{(x+3)(x-3)}{(x-3)} = x + 3, x \neq 3 \Rightarrow g(3) = \lim_{x \to 3}(x+3) = 6$

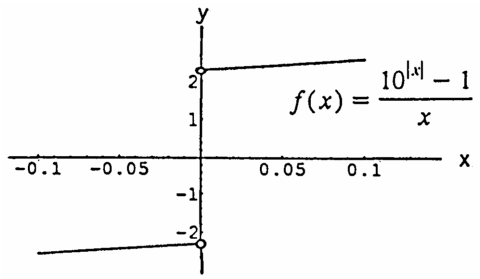
36. $h(t) = \frac{t^2+3t-10}{t-2} = \frac{(t+5)(t-2)}{t-2} = t + 5, t \neq 2 \Rightarrow h(2) = \lim_{t \to 2}(t+5) = 7$

37. $f(s) = \frac{s^3-1}{s^2-1} = \frac{(s^2+s+1)(s-1)}{(s+1)(s-1)} = \frac{s^2+s+1}{s+1}, s \neq 1 \Rightarrow f(1) = \lim_{s \to 1}\left(\frac{s^2+s+1}{s+1}\right) = \frac{3}{2}$



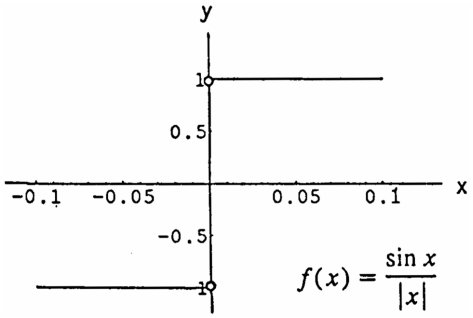
38. $g(x) = \frac{x^2-16}{x^2-3x-4} = \frac{(x+4)(x-4)}{(x-4)(x+1)} = \frac{x+4}{x+1}, x \neq 4 \Rightarrow g(4) = \lim_{x \to 4}\left(\frac{x+4}{x+1}\right) = \frac{8}{5}$

39. As defined, $\lim_{x \to 3^-} f(x) = (3)^2 - 1 = 8$ and $\lim_{x \to 3^+} (2a)(3) = 6a$. For f(x) to be continuous we must have $6a = 8 \Rightarrow a = \frac{4}{3}$.

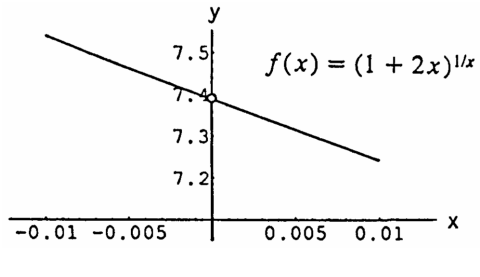


40. As defined, $\lim_{x \to -2^-} g(x) = -2$ and $\lim_{x \to -2^+} g(x) = b(-2)^2 = 4b$. For g(x) to be continuous we must have $4b = -2 \Rightarrow b = -\frac{1}{2}$.

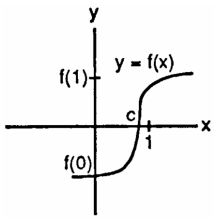
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



41. The function can be extended: f(0) ≈ 2.3.



42. The function cannot be extended to be continuous at x = 0. If f(0) ≈ 2.3, it will be continuous from the right. Or if f(0) ≈ −2.3, it will be continuous from the left.



43. The function cannot be extended to be continuous at x = 0. If f(0) = 1, it will be continuous from the right. Or if f(0) = −1, it will be continuous from the left.

44. The function can be extended: f(0) ≈ 7.39.

45. f(x) is continuous on [0, 1] and f(0) < 0, f(1) > 0 ⇒ by the Intermediate Value Theorem f(x) takes on every value between f(0) and f(1) ⇒ the equation f(x) = 0 has at least one solution between x = 0 and x = 1.

46. cos x = x ⇒ (cos x) − x = 0. If $x = -\frac{\pi}{2}$, $\cos\left(-\frac{\pi}{2}\right) - \left(-\frac{\pi}{2}\right) > 0$. If $x = \frac{\pi}{2}$, $\cos\left(\frac{\pi}{2}\right) - \frac{\pi}{2} < 0$. Thus cos x − x = 0 for some x between $-\frac{\pi}{2}$ and $\frac{\pi}{2}$ according to the Intermediate Value Theorem.

47. Let $f(x) = x^3 - 15x + 1$ which is continuous on $[-4, 4]$. Then $f(-4) = -3$, $f(-1) = 15$, $f(1) = -13$, and $f(4) = 5$. By the Intermediate Value Theorem, f(x) = 0 for some x in each of the intervals $-4 < x < -1$, $-1 < x < 1$, and $1 < x < 4$. That is, $x^3 - 15x + 1 = 0$ has three solutions in $[-4, 4]$. Since a polynomial of degree 3 can have at most 3 solutions, these are the only solutions.

48. Without loss of generality, assume that a < b. Then $F(x) = (x - a)^2 (x - b)^2 + x$ is continuous for all values of x, so it is continuous on the interval [a, b]. Moreover F(a) = a and F(b) = b. By the Intermediate Value Theorem, since $a < \frac{a+b}{2} < b$, there is a number c between a and b such that $F(x) = \frac{a+b}{2}$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

49. Answers may vary. Note that f is continuous for every value of x.
    (a) $f(0) = 10$, $f(1) = 1^3 - 8(1) + 10 = 3$. Since $3 < \pi < 10$, by the Intermediate Value Theorem, there exists a c so that $0 < c < 1$ and $f(c) = \pi$.
    (b) $f(0) = 10$, $f(-4) = (-4)^3 - 8(-4) + 10 = -22$. Since $-22 < -\sqrt{3} < 10$, by the Intermediate Value Theorem, there exists a c so that $-4 < c < 0$ and $f(c) = -\sqrt{3}$.
    (c) $f(0) = 10$, $f(1000) = (1000)^3 - 8(1000) + 10 = 999{,}992{,}010$. Since $10 < 5{,}000{,}000 < 999{,}992{,}010$, by the Intermediate Value Theorem, there exists a c so that $0 < c < 1000$ and $f(c) = 5{,}000{,}000$.

50. All five statements ask for the same information because of the intermediate value property of continuous functions.
    (a) A root of $f(x) = x^3 - 3x - 1$ is a point c where $f(c) = 0$.
    (b) The points where $y = x^3$ crosses $y = 3x + 1$ have the same y-coordinate, or $y = x^3 = 3x + 1$ $\Rightarrow$ $f(x) = x^3 - 3x - 1 = 0$.
    (c) $x^3 - 3x = 1$ $\Rightarrow$ $x^3 - 3x - 1 = 0$. The solutions to the equation are the roots of $f(x) = x^3 - 3x - 1$.
    (d) The points where $y = x^3 - 3x$ crosses $y = 1$ have common y-coordinates, or $y = x^3 - 3x = 1$ $\Rightarrow$ $f(x) = x^3 - 3x - 1 = 0$.
    (e) The solutions of $x^3 - 3x - 1 = 0$ are those points where $f(x) = x^3 - 3x - 1$ has value 0.

51. Answers may vary. For example, $f(x) = \frac{\sin(x-2)}{x-2}$ is discontinuous at $x = 2$ because it is not defined there. However, the discontinuity can be removed because f has a limit (namely 1) as $x \to 2$.

52. Answers may vary. For example, $g(x) = \frac{1}{x+1}$ has a discontinuity at $x = -1$ because $\lim_{x \to -1} g(x)$ does not exist. $\left(\lim_{x \to -1^-} g(x) = -\infty \text{ and } \lim_{x \to -1^+} g(x) = +\infty.\right)$

53. (a) Suppose $x_0$ is rational $\Rightarrow$ $f(x_0) = 1$. Choose $\epsilon = \frac{1}{2}$. For any $\delta > 0$ there is an irrational number x (actually infinitely many) in the interval $(x_0 - \delta, x_0 + \delta)$ $\Rightarrow$ $f(x) = 0$. Then $0 < |x - x_0| < \delta$ but $|f(x) - f(x_0)| = 1 > \frac{1}{2} = \epsilon$, so $\lim_{x \to x_0} f(x)$ fails to exist $\Rightarrow$ f is discontinuous at $x_0$ rational.

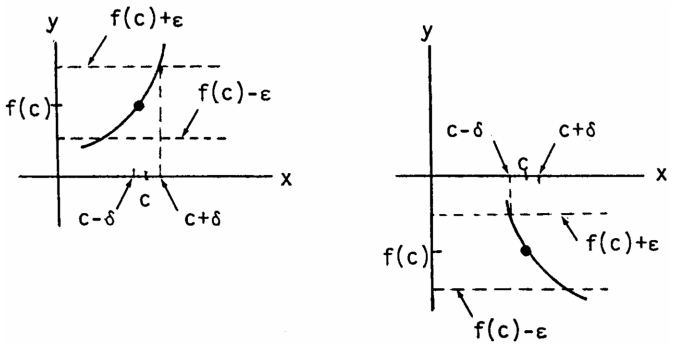
        On the other hand, $x_0$ irrational $\Rightarrow$ $f(x_0) = 0$ and there is a rational number x in $(x_0 - \delta, x_0 + \delta)$ $\Rightarrow$ $f(x) = 1$. Again $\lim_{x \to x_0} f(x)$ fails to exist $\Rightarrow$ f is discontinuous at $x_0$ irrational. That is, f is discontinuous at every point.

    (b) f is neither right-continuous nor left-continuous at any point $x_0$ because in every interval $(x_0 - \delta, x_0)$ or $(x_0, x_0 + \delta)$ there exist both rational and irrational real numbers. Thus neither limits $\lim_{x \to x_0^-} f(x)$ and $\lim_{x \to x_0^+} f(x)$ exist by the same arguments used in part (a).

54. Yes. Both $f(x) = x$ and $g(x) = x - \frac{1}{2}$ are continuous on $[0, 1]$. However $\frac{f(x)}{g(x)}$ is undefined at $x = \frac{1}{2}$ since $g\left(\frac{1}{2}\right) = 0$ $\Rightarrow$ $\frac{f(x)}{g(x)}$ is discontinuous at $x = \frac{1}{2}$.

55. No. For instance, if $f(x) = 0$, $g(x) = \lceil x \rceil$, then $h(x) = 0\,(\lceil x \rceil) = 0$ is continuous at $x = 0$ and g(x) is not.

56. Let $f(x) = \frac{1}{x-1}$ and $g(x) = x + 1$. Both functions are continuous at $x = 0$. The composition $f \circ g = f(g(x)) = \frac{1}{(x+1)-1} = \frac{1}{x}$ is discontinuous at $x = 0$, since it is not defined there. Theorem 10 requires that f(x) be continuous at g(0), which is not the case here since $g(0) = 1$ and f is undefined at 1.



57. Yes, because of the Intermediate Value Theorem. If f(a) and f(b) did have different signs then f would have to equal zero at some point between a and b since f is continuous on $[a, b]$.

58. Let $f(x)$ be the new position of point x and let $d(x) = f(x) - x$. The displacement function d is negative if x is the left-hand point of the rubber band and positive if x is the right-hand point of the rubber band. By the Intermediate Value Theorem, $d(x) = 0$ for some point in between. That is, $f(x) = x$ for some point x, which is then in its original position.

59. If $f(0) = 0$ or $f(1) = 1$, we are done (i.e., $c = 0$ or $c = 1$ in those cases). Then let $f(0) = a > 0$ and $f(1) = b < 1$ because $0 \le f(x) \le 1$. Define $g(x) = f(x) - x \Rightarrow$ g is continuous on $[0, 1]$. Moreover, $g(0) = f(0) - 0 = a > 0$ and $g(1) = f(1) - 1 = b - 1 < 0 \Rightarrow$ by the Intermediate Value Theorem there is a number c in $(0, 1)$ such that $g(c) = 0 \Rightarrow f(c) - c = 0$ or $f(c) = c$.

60. Let $\epsilon = \frac{|f(c)|}{2} > 0$. Since f is continuous at $x = c$ there is a $\delta > 0$ such that $|x - c| < \delta \Rightarrow |f(x) - f(c)| < \epsilon$ $\Rightarrow f(c) - \epsilon < f(x) < f(c) + \epsilon$.
If $f(c) > 0$, then $\epsilon = \frac{1}{2} f(c) \Rightarrow \frac{1}{2} f(c) < f(x) < \frac{3}{2} f(c) \Rightarrow f(x) > 0$ on the interval $(c - \delta, c + \delta)$.
If $f(c) < 0$, then $\epsilon = -\frac{1}{2} f(c) \Rightarrow \frac{3}{2} f(c) < f(x) < \frac{1}{2} f(c) \Rightarrow f(x) < 0$ on the interval $(c - \delta, c + \delta)$.

61. By Exercises 52 in Section 2.3, we have $\lim_{x \to c} f(x) = L \Leftrightarrow \lim_{h \to 0} f(c + h) = L$.
Thus, $f(x)$ is continuous at $x = c \Leftrightarrow \lim_{x \to c} f(x) = f(c) \Leftrightarrow \lim_{h \to 0} f(c + h) = f(c)$.

62. By Exercise 61, it suffices to show that $\lim_{h \to 0} \sin(c + h) = \sin c$ and $\lim_{h \to 0} \cos(c + h) = \cos c$.
Now $\lim_{h \to 0} \sin(c + h) = \lim_{h \to 0} \big[(\sin c)(\cos h) + (\cos c)(\sin h)\big] = (\sin c)\Big(\lim_{h \to 0} \cos h\Big) + (\cos c)\Big(\lim_{h \to 0} \sin h\Big)$
By Example 6 Section 2.2, $\lim_{h \to 0} \cos h = 1$ and $\lim_{h \to 0} \sin h = 0$. So $\lim_{h \to 0} \sin(c + h) = \sin c$ and thus $f(x) = \sin x$ is continuous at $x = c$. Similarly,
$\lim_{h \to 0} \cos(c + h) = \lim_{h \to 0} \big[(\cos c)(\cos h) - (\sin c)(\sin h)\big] = (\cos c)\Big(\lim_{h \to 0} \cos h\Big) - (\sin c)\Big(\lim_{h \to 0} \sin h\Big) = \cos c$.
Thus, $g(x) = \cos x$ is continuous at $x = c$.

63. $x \approx 1.8794, -1.5321, -0.3473$

64. $x \approx 1.4516, -0.8547, 0.4030$

65. $x \approx 1.7549$

66. $x \approx 1.5596$

67. $x \approx 3.5156$

68. $x \approx -3.9058, 3.8392, 0.0667$

at $(1,4)$: $y-4 = 6(t-1)$, tangent line

17. $m = \lim_{h\to 0} \frac{\sqrt{4+h}-2}{h} = \lim_{h\to 0} \frac{\sqrt{4+h}-2}{h} \cdot \frac{\sqrt{4+h}+2}{\sqrt{4+h}+2} = \lim_{h\to 0} \frac{(4+h)-4}{h\left(\sqrt{4+h}+2\right)} = \lim_{h\to 0} \frac{h}{h\left(\sqrt{4+h}+2\right)} = \frac{1}{\sqrt{4}+2}$
$= \frac{1}{4}$; at $(4,2)$: $y-2 = \frac{1}{4}(x-4)$, tangent line

18. $m = \lim_{h\to 0} \frac{\sqrt{(8+h)+1}-3}{h} = \lim_{h\to 0} \frac{\sqrt{9+h}-3}{h} \cdot \frac{\sqrt{9+h}+3}{\sqrt{9+h}+3} = \lim_{h\to 0} \frac{(9+h)-9}{h\left(\sqrt{9+h}+3\right)} = \lim_{h\to 0} \frac{h}{h\left(\sqrt{9+h}+3\right)}$
$= \frac{1}{\sqrt{9}+3} = \frac{1}{6}$; at $(8,3)$: $y-3 = \frac{1}{6}(x-8)$, tangent line

19. At $x = -1$, $y = 5 \Rightarrow m = \lim_{h\to 0} \frac{5(-1+h)^2-5}{h} = \lim_{h\to 0} \frac{5(1-2h+h^2)-5}{h} = \lim_{h\to 0} \frac{5h(-2+h)}{h} = -10$, slope

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

20. At $x = 2, y = -3 \Rightarrow m = \lim_{h \to 0} \frac{[1-(2+h)^2]-(-3)}{h} = \lim_{h \to 0} \frac{(1-4-4h-h^2)+3}{h} = \lim_{h \to 0} \frac{-h(4+h)}{h} = -4$, slope

21. At $x = 3, y = \frac{1}{2} \Rightarrow m = \lim_{h \to 0} \frac{\frac{1}{(3+h)-1} - \frac{1}{2}}{h} = \lim_{h \to 0} \frac{2-(2+h)}{2h(2+h)} = \lim_{h \to 0} \frac{-h}{2h(2+h)} = -\frac{1}{4}$, slope

22. At $x = 0, y = -1 \Rightarrow m = \lim_{h \to 0} \frac{\frac{h-1}{h+1} - (-1)}{h} = \lim_{h \to 0} \frac{(h-1)+(h+1)}{h(h+1)} = \lim_{h \to 0} \frac{2h}{h(h+1)} = 2$, slope

23. At a horizontal tangent the slope $m = 0 \Rightarrow 0 = m = \lim_{h \to 0} \frac{[(x+h)^2+4(x+h)-1]-(x^2+4x-1)}{h}$
$= \lim_{h \to 0} \frac{(x^2+2xh+h^2+4x+4h-1)-(x^2+4x-1)}{h} = \lim_{h \to 0} \frac{(2xh+h^2+4h)}{h} = \lim_{h \to 0} (2x+h+4) = 2x+4;$
$2x + 4 = 0 \Rightarrow x = -2$. Then $f(-2) = 4 - 8 - 1 = -5 \Rightarrow (-2, -5)$ is the point on the graph where there is a horizontal tangent.

24. $0 = m = \lim_{h \to 0} \frac{[(x+h)^3-3(x+h)]-(x^3-3x)}{h} = \lim_{h \to 0} \frac{(x^3+3x^2h+3xh^2+h^3-3x-3h)-(x^3-3x)}{h}$
$= \lim_{h \to 0} \frac{3x^2h+3xh^2+h^3-3h}{h} = \lim_{h \to 0} (3x^2+3xh+h^2-3) = 3x^2-3; 3x^2-3 = 0 \Rightarrow x = -1$ or $x = 1$. Then $f(-1) = 2$ and $f(1) = -2 \Rightarrow (-1, 2)$ and $(1, -2)$ are the points on the graph where a horizontal tangent exists.

25. $-1 = m = \lim_{h \to 0} \frac{\frac{1}{(x+h)-1} - \frac{1}{x-1}}{h} = \lim_{h \to 0} \frac{(x-1)-(x+h-1)}{h(x-1)(x+h-1)} = \lim_{h \to 0} \frac{-h}{h(x-1)(x+h-1)} = -\frac{1}{(x-1)^2}$
$\Rightarrow (x-1)^2 = 1 \Rightarrow x^2 - 2x = 0 \Rightarrow x(x-2) = 0 \Rightarrow x = 0$ or $x = 2$. If $x = 0$, then $y = -1$ and $m = -1$
$\Rightarrow y = -1 - (x - 0) = -(x+1)$. If $x = 2$, then $y = 1$ and $m = -1 \Rightarrow y = 1 - (x-2) = -(x-3)$.

26. $\frac{1}{4} = m = \lim_{h \to 0} \frac{\sqrt{x+h}-\sqrt{x}}{h} = \lim_{h \to 0} \frac{\sqrt{x+h}-\sqrt{x}}{h} \cdot \frac{\sqrt{x+h}+\sqrt{x}}{\sqrt{x+h}+\sqrt{x}} = \lim_{h \to 0} \frac{(x+h)-x}{h\left(\sqrt{x+h}+\sqrt{x}\right)}$
$= \lim_{h \to 0} \frac{h}{h\left(\sqrt{x+h}+\sqrt{x}\right)} = \frac{1}{2\sqrt{x}}$. Thus, $\frac{1}{4} = \frac{1}{2\sqrt{x}} \Rightarrow \sqrt{x} = 2 \Rightarrow x = 4 \Rightarrow y = 2$. The tangent line is $y = 2 + \frac{1}{4}(x-4) = \frac{x}{4} + 1$.

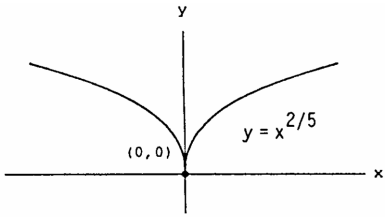
27. $\lim_{h \to 0} \frac{f(2+h)-f(2)}{h} = \lim_{h \to 0} \frac{(100-4.9(2+h)^2)-(100-4.9(2)^2)}{h} = \lim_{h \to 0} \frac{-4.9(4+4h+h^2)+4.9(4)}{h}$
$= \lim_{h \to 0} (-19.6 - 4.9h) = -19.6$. The minus sign indicates the object is falling <u>downward</u> at a speed of 19.6 m/sec.

28. $\lim_{h \to 0} \frac{f(10+h)-f(10)}{h} = \lim_{h \to 0} \frac{3(10+h)^2-3(10)^2}{h} = \lim_{h \to 0} \frac{3(20h+h^2)}{h} = 60$ ft/sec.

29. $\lim_{h \to 0} \frac{f(3+h)-f(3)}{h} = \lim_{h \to 0} \frac{\pi(3+h)^2-\pi(3)^2}{h} = \lim_{h \to 0} \frac{\pi[9+6h+h^2-9]}{h} = \lim_{h \to 0} \pi(6+h) = 6\pi$

30. $\lim_{h \to 0} \frac{f(2+h)-f(2)}{h} = \lim_{h \to 0} \frac{\frac{4\pi}{3}(2+h)^3-\frac{4\pi}{3}(2)^3}{h} = \lim_{h \to 0} \frac{\frac{4\pi}{3}[12h+6h^2+h^3]}{h} = \lim_{h \to 0} \frac{4\pi}{3}[12+6h+h^2] = 16\pi$

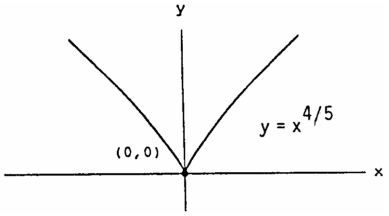
31. Slope at origin $= \lim_{h \to 0} \frac{f(0+h)-f(0)}{h} = \lim_{h \to 0} \frac{h^2 \sin\left(\frac{1}{h}\right)}{h} = \lim_{h \to 0} h \sin\left(\frac{1}{h}\right) = 0 \Rightarrow$ yes, $f(x)$ does have a tangent at the origin with slope 0.



32. $\lim_{h \to 0} \frac{g(0+h)-g(0)}{h} = \lim_{h \to 0} \frac{h \sin\left(\frac{1}{h}\right)}{h} = \lim_{h \to 0} \sin\frac{1}{h}$. Since $\lim_{h \to 0} \sin\frac{1}{h}$ does not exist, $f(x)$ has no tangent at the origin.

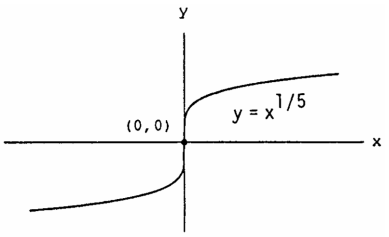
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

33. $\lim\limits_{h\to 0^-} \frac{f(0+h)-f(0)}{h} = \lim\limits_{h\to 0^-} \frac{-1-0}{h} = \infty$, and $\lim\limits_{h\to 0^+} \frac{f(0+h)-f(0)}{h} = \lim\limits_{h\to 0^+} \frac{1-0}{h} = \infty$. Therefore, $\lim\limits_{h\to 0} \frac{f(0+h)-f(0)}{h} = \infty \Rightarrow$ yes, the graph of f has a vertical tangent at the origin.



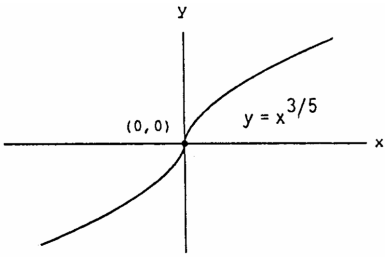
34. $\lim\limits_{h\to 0^-} \frac{U(0+h)-U(0)}{h} = \lim\limits_{h\to 0^-} \frac{0-1}{h} = \infty$, and $\lim\limits_{h\to 0^+} \frac{U(0+h)-U(0)}{h} = \lim\limits_{h\to 0^+} \frac{1-1}{h} = 0 \Rightarrow$ no, the graph of f does not have a vertical tangent at $(0, 1)$ because the limit does not exist.

35. (a) The graph appears to have a cusp at $x = 0$.



(b) $\lim\limits_{h\to 0^-} \frac{f(0+h)-f(0)}{h} = \lim\limits_{h\to 0^-} \frac{h^{2/5}-0}{h} = \lim\limits_{h\to 0^-} \frac{1}{h^{3/5}} = -\infty$ and $\lim\limits_{h\to 0^+} \frac{1}{h^{3/5}} = \infty \Rightarrow$ limit does not exist $\Rightarrow$ the graph of $y = x^{2/5}$ does not have a vertical tangent at $x = 0$.

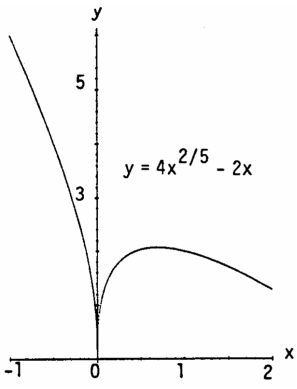
36. (a) The graph appears to have a cusp at $x = 0$.



(b) $\lim\limits_{h\to 0^-} \frac{f(0+h)-f(0)}{h} = \lim\limits_{h\to 0^-} \frac{h^{4/5}-0}{h} = \lim\limits_{h\to 0^-} \frac{1}{h^{1/5}} = -\infty$ and $\lim\limits_{h\to 0^+} \frac{1}{h^{1/5}} = \infty \Rightarrow$ limit does not exist $\Rightarrow$ $y = x^{4/5}$ does not have a vertical tangent at $x = 0$.

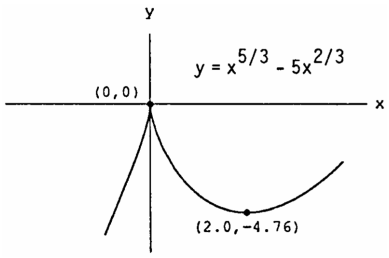
37. (a) The graph appears to have a vertical tangent at $x = 0$.

(b) $\lim\limits_{h\to 0} \frac{f(0+h)-f(0)}{h} = \lim\limits_{h\to 0} \frac{h^{1/5}-0}{h} = \lim\limits_{h\to 0} \frac{1}{h^{4/5}} = \infty \Rightarrow y = x^{1/5}$ has a vertical tangent at $x = 0$.



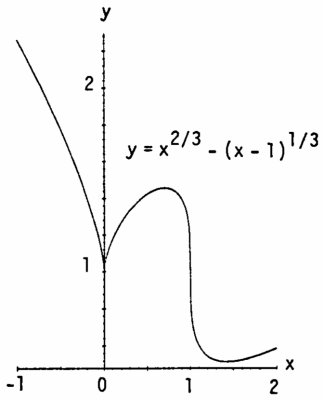
38. (a) The graph appears to have a vertical tangent at $x = 0$.

(b) $\lim\limits_{h\to 0} \frac{f(0+h)-f(0)}{h} = \lim\limits_{h\to 0} \frac{h^{3/5}-0}{h} = \lim\limits_{h\to 0} \frac{1}{h^{2/5}} = \infty \Rightarrow$ the graph of $y = x^{3/5}$ has a vertical tangent at $x = 0$.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

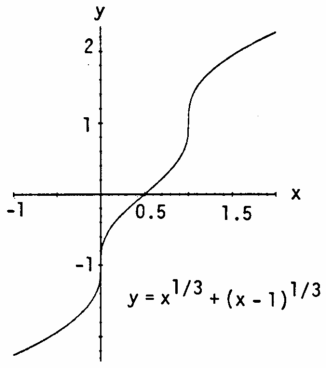
39. (a) The graph appears to have a cusp at $x = 0$.



(b) $\lim\limits_{h \to 0^-} \frac{f(0+h)-f(0)}{h} = \lim\limits_{h \to 0^-} \frac{4h^{2/5}-2h}{h} = \lim\limits_{h \to 0^-} \frac{4}{h^{3/5}} - 2 = -\infty$ and $\lim\limits_{h \to 0^+} \frac{4}{h^{3/5}} - 2 = \infty$
$\Rightarrow$ limit does not exist $\Rightarrow$ the graph of $y = 4x^{2/5} - 2x$ does not have a vertical tangent at $x = 0$.

40. (a) The graph appears to have a cusp at $x = 0$.

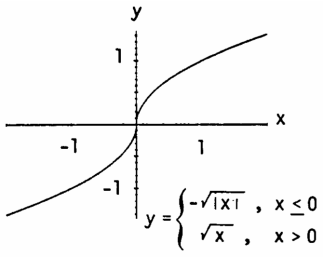
(b) $\lim\limits_{h \to 0} \frac{f(0+h)-f(0)}{h} = \lim\limits_{h \to 0} \frac{h^{5/3}-5h^{2/3}}{h} = \lim\limits_{h \to 0} h^{2/3} - \frac{5}{h^{1/3}} = 0 - \lim\limits_{h \to 0} \frac{5}{h^{1/3}}$ does not exist $\Rightarrow$ the graph of $y = x^{5/3} - 5x^{2/3}$ does not have a vertical tangent at $x = 0$.



41. (a) The graph appears to have a vertical tangent at $x = 1$ and a cusp at $x = 0$.

(b) $x = 1$: $\lim\limits_{h \to 0} \frac{(1+h)^{2/3}-(1+h-1)^{1/3}-1}{h} = \lim\limits_{h \to 0} \frac{(1+h)^{2/3}-h^{1/3}-1}{h} = -\infty$
$\Rightarrow$ $y = x^{2/3} - (x-1)^{1/3}$ has a vertical tangent at $x = 1$;
$x = 0$: $\lim\limits_{h \to 0} \frac{f(0+h)-f(0)}{h} = \lim\limits_{h \to 0} \frac{h^{2/3}-(h-1)^{1/3}-(-1)^{1/3}}{h} = \lim\limits_{h \to 0} \left[\frac{1}{h^{1/3}} - \frac{(h-1)^{1/3}}{h} + \frac{1}{h}\right]$
does not exist $\Rightarrow$ $y = x^{2/3} - (x-1)^{1/3}$ does not have a vertical tangent at $x = 0$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

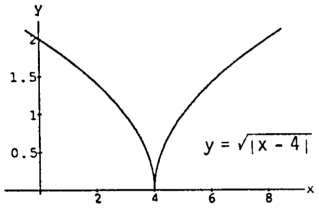


42. (a) The graph appears to have vertical tangents at $x = 0$ and $x = 1$.

(b) $x = 0$: $\lim\limits_{h \to 0} \frac{f(0+h)-f(0)}{h} = \lim\limits_{h \to 0} \frac{h^{1/3}+(h-1)^{1/3}-(-1)^{1/3}}{h} = \infty \Rightarrow y = x^{1/3} + (x-1)^{1/3}$ has a vertical tangent at $x = 0$;

$x = 1$: $\lim\limits_{h \to 0} \frac{f(1+h)-f(1)}{h} = \lim\limits_{h \to 0} \frac{(1+h)^{1/3}+(1+h-1)^{1/3}-1}{h} = \infty \Rightarrow y = x^{1/3} + (x-1)^{1/3}$ has a vertical tangent at $x = 1$.

43. (a) The graph appears to have a vertical tangent at $x = 0$.



(b) $\lim\limits_{h \to 0^+} \frac{f(0+h)-f(0)}{h} = \lim\limits_{x \to 0^+} \frac{\sqrt{h}-0}{h} = \lim\limits_{h \to 0} \frac{1}{\sqrt{h}} = \infty$;

$\lim\limits_{h \to 0^-} \frac{f(0+h)-f(0)}{h} = \lim\limits_{h \to 0^-} \frac{-\sqrt{|h|}-0}{h} = \lim\limits_{h \to 0^-} \frac{-\sqrt{|h|}}{-|h|} = \lim\limits_{h \to 0^-} \frac{1}{\sqrt{|h|}} = \infty$

$\Rightarrow$ y has a vertical tangent at $x = 0$.

44. (a) The graph appears to have a cusp at $x = 4$.

(b) $\lim\limits_{h \to 0^+} \frac{f(4+h)-f(4)}{h} = \lim\limits_{h \to 0^+} \frac{\sqrt{|4-(4+h)|}-0}{h} = \lim\limits_{h \to 0^+} \frac{\sqrt{|h|}}{h} = \lim\limits_{h \to 0^+} \frac{1}{\sqrt{h}} = \infty$;

$\lim\limits_{h \to 0^-} \frac{f(4+h)-f(4)}{h} = \lim\limits_{h \to 0^-} \frac{\sqrt{|4-(4+h)|}}{h} = \lim\limits_{h \to 0^-} \frac{\sqrt{|h|}}{-|h|} = \lim\limits_{h \to 0^-} \frac{-1}{\sqrt{|h|}} = -\infty$

$\Rightarrow y = \sqrt{4-x}$ does not have a vertical tangent at $x = 4$.

45-48. Example CAS commands:

Maple:

```
f := x -> x^3 + 2*x;x0 := 0;
plot( f(x), x=x0-1/2..x0+3, color=black,                # part (a)
      title="Section 2.7, #45(a)" );
q := unapply( (f(x0+h)-f(x0))/h, h );                   # part (b)

## CHAPTER 2 PRACTICE EXERCISES

1. At $x = -1$: $\lim_{x \to -1^-} f(x) = \lim_{x \to -1^+} f(x) = 1$

   $\Rightarrow \lim_{x \to -1} f(x) = 1 = f(-1)$

   $\Rightarrow$ f is continuous at $x = -1$.

   At $x = 0$: $\lim_{x \to 0^-} f(x) = \lim_{x \to 0^+} f(x) = 0 \Rightarrow \lim_{x \to 0} f(x) = 0$.

   But $f(0) = 1 \neq \lim_{x \to 0} f(x)$

   $\Rightarrow$ f is discontinuous at $x = 0$.

   If we define $f(0) = 0$, then the discontinuity at $x = 0$ is removable.

   At $x = 1$: $\lim_{x \to 1^-} f(x) = -1$ and $\lim_{x \to 1^+} f(x) = 1$

   $\Rightarrow \lim_{x \to 1} f(x)$ does not exist

   $\Rightarrow$ f is discontinuous at $x = 1$.

2. At $x = -1$: $\lim_{x \to -1^-} f(x) = 0$ and $\lim_{x \to -1^+} f(x) = -1$

   $\Rightarrow \lim_{x \to -1} f(x)$ does not exist

   $\Rightarrow$ f is discontinuous at $x = -1$.

   At $x = 0$: $\lim_{x \to 0^-} f(x) = -\infty$ and $\lim_{x \to 0^+} f(x) = \infty$

   $\Rightarrow \lim_{x \to 0} f(x)$ does not exist

   $\Rightarrow$ f is discontinuous at $x = 0$.

   At $x = 1$: $\lim_{x \to 1^-} f(x) = \lim_{x \to 1^+} f(x) = 1 \Rightarrow \lim_{x \to 1} f(x) = 1$.

   But $f(1) = 0 \neq \lim_{x \to 1} f(x)$

   $\Rightarrow$ f is discontinuous at $x = 1$.

   If we define $f(1) = 1$, then the discontinuity at $x = 1$ is removable.

3. (a) $\lim_{t \to t_0} (3f(t)) = 3 \lim_{t \to t_0} f(t) = 3(-7) = -21$

   (b) $\lim_{t \to t_0} (f(t))^2 = \left(\lim_{t \to t_0} f(t)\right)^2 = (-7)^2 = 49$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(c) $\lim_{t \to t_0} (f(t) \cdot g(t)) = \lim_{t \to t_0} f(t) \cdot \lim_{t \to t_0} g(t) = (-7)(0) = 0$

(d) $\lim_{t \to t_0} \frac{f(t)}{g(t)-7} = \frac{\lim_{t \to t_0} f(t)}{\lim_{t \to t_0} (g(t) - 7)} = \frac{\lim_{t \to t_0} f(t)}{\lim_{t \to t_0} g(t) - \lim_{t \to t_0} 7} = \frac{-7}{0-7} = 1$

(e) $\lim_{t \to t_0} \cos(g(t)) = \cos\left(\lim_{t \to t_0} g(t)\right) = \cos 0 = 1$

(f) $\lim_{t \to t_0} |f(t)| = \left|\lim_{t \to t_0} f(t)\right| = |-7| = 7$

(g) $\lim_{t \to t_0} (f(t) + g(t)) = \lim_{t \to t_0} f(t) + \lim_{t \to t_0} g(t) = -7 + 0 = -7$

(h) $\lim_{t \to t_0} \left(\frac{1}{f(t)}\right) = \frac{1}{\lim_{t \to t_0} f(t)} = \frac{1}{-7} = -\frac{1}{7}$

4. (a) $\lim_{x \to 0} -g(x) = -\lim_{x \to 0} g(x) = -\sqrt{2}$

(b) $\lim_{x \to 0} (g(x) \cdot f(x)) = \lim_{x \to 0} g(x) \cdot \lim_{x \to 0} f(x) = \left(\sqrt{2}\right)\left(\frac{1}{2}\right) = \frac{\sqrt{2}}{2}$

(c) $\lim_{x \to 0} (f(x) + g(x)) = \lim_{x \to 0} f(x) + \lim_{x \to 0} g(x) = \frac{1}{2} + \sqrt{2}$

(d) $\lim_{x \to 0} \frac{1}{f(x)} = \frac{1}{\lim_{x \to 0} f(x)} = \frac{1}{\frac{1}{2}} = 2$

(e) $\lim_{x \to 0} (x + f(x)) = \lim_{x \to 0} x + \lim_{x \to 0} f(x) = 0 + \frac{1}{2} = \frac{1}{2}$

(f) $\lim_{x \to 0} \frac{f(x) \cdot \cos x}{x-1} = \frac{\lim_{x \to 0} f(x) \cdot \lim_{x \to 0} \cos x}{\lim_{x \to 0} x - \lim_{x \to 0} 1} = \frac{\left(\frac{1}{2}\right)(1)}{0-1} = -\frac{1}{2}$

5. Since $\lim_{x \to 0} x = 0$ we must have that $\lim_{x \to 0} (4 - g(x)) = 0$. Otherwise, if $\lim_{x \to 0} (4 - g(x))$ is a finite positive number, we would have $\lim_{x \to 0^-} \left[\frac{4-g(x)}{x}\right] = -\infty$ and $\lim_{x \to 0^+} \left[\frac{4-g(x)}{x}\right] = \infty$ so the limit could not equal 1 as $x \to 0$. Similar reasoning holds if $\lim_{x \to 0} (4 - g(x))$ is a finite negative number. We conclude that $\lim_{x \to 0} g(x) = 4$.

6. $2 = \lim_{x \to -4} \left[x \lim_{x \to 0} g(x)\right] = \lim_{x \to -4} x \cdot \lim_{x \to -4} \left[\lim_{x \to 0} g(x)\right] = -4 \lim_{x \to -4} \left[\lim_{x \to 0} g(x)\right] = -4 \lim_{x \to 0} g(x)$
(since $\lim_{x \to 0} g(x)$ is a constant) $\Rightarrow \lim_{x \to 0} g(x) = \frac{2}{-4} = -\frac{1}{2}$.

7. (a) $\lim_{x \to c} f(x) = \lim_{x \to c} x^{1/3} = c^{1/3} = f(c)$ for every real number $c \Rightarrow f$ is continuous on $(-\infty, \infty)$.

(b) $\lim_{x \to c} g(x) = \lim_{x \to c} x^{3/4} = c^{3/4} = g(c)$ for every nonnegative real number $c \Rightarrow g$ is continuous on $[0, \infty)$.

(c) $\lim_{x \to c} h(x) = \lim_{x \to c} x^{-2/3} = \frac{1}{c^{2/3}} = h(c)$ for every nonzero real number $c \Rightarrow h$ is continuous on $(-\infty, 0)$ and $(-\infty, \infty)$.

(d) $\lim_{x \to c} k(x) = \lim_{x \to c} x^{-1/6} = \frac{1}{c^{1/6}} = k(c)$ for every positive real number $c \Rightarrow k$ is continuous on $(0, \infty)$

8. (a) $\bigcup_{n \in I} \left(\left(n - \frac{1}{2}\right)\pi, \left(n + \frac{1}{2}\right)\pi\right)$, where I = the set of all integers.

(b) $\bigcup_{n \in I} (n\pi, (n+1)\pi)$, where I = the set of all integers.

(c) $(-\infty, \pi) \cup (\pi, \infty)$

(d) $(-\infty, 0) \cup (0, \infty)$

9. (a) $\lim_{x \to 0} \frac{x^2 - 4x + 4}{x^3 + 5x^2 - 14x} = \lim_{x \to 0} \frac{(x-2)(x-2)}{x(x+7)(x-2)} = \lim_{x \to 0} \frac{x-2}{x(x+7)}$, $x \neq 2$; the limit does not exist because $\lim_{x \to 0^-} \frac{x-2}{x(x+7)} = \infty$ and $\lim_{x \to 0^+} \frac{x-2}{x(x+7)} = -\infty$

(b) $\lim_{x \to 2} \frac{x^2 - 4x + 4}{x^3 + 5x^2 - 14x} = \lim_{x \to 2} \frac{(x-2)(x-2)}{x(x+7)(x-2)} = \lim_{x \to 2} \frac{x-2}{x(x+7)}$, $x \neq 2$, and $\lim_{x \to 2} \frac{x-2}{x(x+7)} = \frac{0}{2(9)} = 0$

10. (a) $\lim_{x \to 0} \frac{x^2 + x}{x^5 + 2x^4 + x^3} = \lim_{x \to 0} \frac{x(x+1)}{x^3(x^2 + 2x + 1)} = \lim_{x \to 0} \frac{x+1}{x^2(x+1)(x+1)} = \lim_{x \to 0} \frac{1}{x^2(x+1)}$, $x \neq 0$ and $x \neq -1$.
Now $\lim_{x \to 0^-} \frac{1}{x^2(x+1)} = \infty$ and $\lim_{x \to 0^+} \frac{1}{x^2(x+1)} = \infty \Rightarrow \lim_{x \to 0} \frac{x^2 + x}{x^5 + 2x^4 + x^3} = \infty$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(b) $\lim_{x \to -1} \frac{x^2+x}{x^5+2x^4+x^3} = \lim_{x \to -1} \frac{x(x+1)}{x^3(x^2+2x+1)} = \lim_{x \to -1} \frac{1}{x^2(x+1)}$, $x \neq 0$ and $x \neq -1$. The limit does not exist because $\lim_{x \to -1^-} \frac{1}{x^2(x+1)} = -\infty$ and $\lim_{x \to -1^+} \frac{1}{x^2(x+1)} = \infty$.

11. $\lim_{x \to 1} \frac{1-\sqrt{x}}{1-x} = \lim_{x \to 1} \frac{1-\sqrt{x}}{(1-\sqrt{x})(1+\sqrt{x})} = \lim_{x \to 1} \frac{1}{1+\sqrt{x}} = \frac{1}{2}$

12. $\lim_{x \to a} \frac{x^2-a^2}{x^4-a^4} = \lim_{x \to a} \frac{(x^2-a^2)}{(x^2+a^2)(x^2-a^2)} = \lim_{x \to a} \frac{1}{x^2+a^2} = \frac{1}{2a^2}$

13. $\lim_{h \to 0} \frac{(x+h)^2-x^2}{h} = \lim_{h \to 0} \frac{(x^2+2hx+h^2)-x^2}{h} = \lim_{h \to 0} (2x+h) = 2x$

14. $\lim_{x \to 0} \frac{(x+h)^2-x^2}{h} = \lim_{x \to 0} \frac{(x^2+2hx+h^2)-x^2}{h} = \lim_{x \to 0} (2x+h) = h$

15. $\lim_{x \to 0} \frac{\frac{1}{2+x}-\frac{1}{2}}{x} = \lim_{x \to 0} \frac{2-(2+x)}{2x(2+x)} = \lim_{x \to 0} \frac{-1}{4+2x} = -\frac{1}{4}$

16. $\lim_{x \to 0} \frac{(2+x)^3-8}{x} = \lim_{x \to 0} \frac{(x^3+6x^2+12x+8)-8}{x} = \lim_{x \to 0} (x^2+6x+12) = 12$

17. $\lim_{x \to 0^+} [4\,g(x)]^{1/3} = 2 \Rightarrow \left[\lim_{x \to 0^+} 4\,g(x)\right]^{1/3} = 2 \Rightarrow \lim_{x \to 0^+} 4\,g(x) = 8$, since $2^3 = 8$. Then $\lim_{x \to 0^+} g(x) = 2$.

18. $\lim_{x \to \sqrt{5}} \frac{1}{x+g(x)} = 2 \Rightarrow \lim_{x \to \sqrt{5}} (x+g(x)) = \frac{1}{2} \Rightarrow \sqrt{5} + \lim_{x \to \sqrt{5}} g(x) = \frac{1}{2} \Rightarrow \lim_{x \to \sqrt{5}} g(x) = \frac{1}{2} - \sqrt{5}$

19. $\lim_{x \to 1} \frac{3x^2+1}{g(x)} = \infty \Rightarrow \lim_{x \to 1} g(x) = 0$ since $\lim_{x \to 1} (3x^2+1) = 4$

20. $\lim_{x \to -2} \frac{5-x^2}{\sqrt{g(x)}} = 0 \Rightarrow \lim_{x \to -2} g(x) = \infty$ since $\lim_{x \to -2} (5-x^2) = 1$

21. $\lim_{x \to -\infty} \frac{2x+3}{5x+7} = \lim_{x \to -\infty} \frac{2+\frac{3}{x}}{5+\frac{7}{x}} = \frac{2+0}{5+0} = \frac{2}{5}$

22. $\lim_{x \to -\infty} \frac{2x^2+3}{5x^2+7} = \lim_{x \to -\infty} \frac{2+\frac{3}{x^2}}{5+\frac{7}{x^2}} = \frac{2+0}{5+0} = \frac{2}{5}$

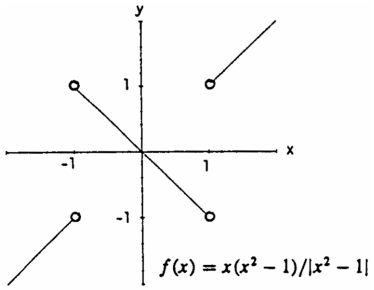
23. $\lim_{x \to -\infty} \frac{x^2-4x+8}{3x^3} = \lim_{x \to -\infty} \left(\frac{1}{3x} - \frac{4}{3x^2} + \frac{8}{3x^3}\right) = 0-0+0 = 0$

24. $\lim_{x \to \infty} \frac{1}{x^2-7x+1} = \lim_{x \to \infty} \frac{\frac{1}{x^2}}{1-\frac{7}{x}+\frac{1}{x^2}} = \frac{0}{1-0+0} = 0$

25. $\lim_{x \to -\infty} \frac{x^2-7x}{x+1} = \lim_{x \to -\infty} \frac{x-7}{1+\frac{1}{x}} = -\infty$

26. $\lim_{x \to \infty} \frac{x^4+x^3}{12x^3+128} = \lim_{x \to -\infty} \frac{x+1}{12+\frac{128}{x^3}} = \infty$

27. $\lim_{x \to \infty} \frac{|\sin x|}{[x]} \leq \lim_{x \to \infty} \frac{1}{[x]} = 0$ since int $x \to \infty$ as $x \to \infty \Rightarrow \lim_{x \to \infty} \frac{|\sin x|}{[x]} = 0$.

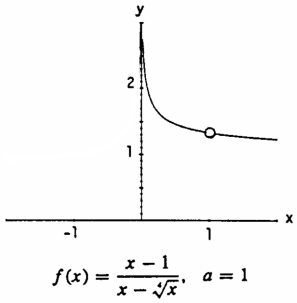


28. $\lim_{\theta \to \infty} \frac{|\cos\theta - 1|}{\theta} \leq \lim_{\theta \to \infty} \frac{|-2|}{\theta} = 0 \Rightarrow \lim_{\theta \to \infty} \frac{|\cos\theta - 1|}{\theta} = 0$.

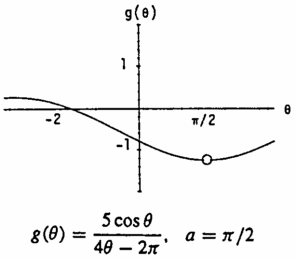
29. $\lim_{x \to \infty} \frac{x+\sin x+2\sqrt{x}}{x+\sin x} = \lim_{x \to \infty} \frac{1+\frac{\sin x}{x}+\frac{2}{\sqrt{x}}}{1+\frac{\sin x}{x}} = \frac{1+0+0}{1+0} = 1$

30. $\lim_{x \to \infty} \frac{x^{2/3}+x^{-1}}{x^{2/3}+\cos^2 x} = \lim_{x \to \infty} \left(\frac{1+x^{-5/3}}{1+\frac{\cos^2 x}{x^{2/3}}}\right) = \frac{1+0}{1+0} = 1$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

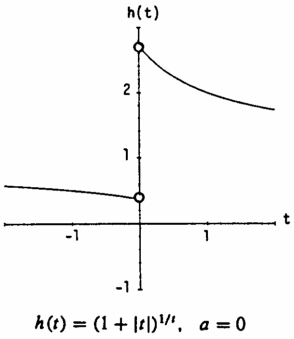


31. At $x = -1$: $\lim_{x \to -1^-} f(x) = \lim_{x \to -1^-} \frac{x(x^2-1)}{|x^2-1|}$
$= \lim_{x \to -1^-} \frac{x(x^2-1)}{x^2-1} = \lim_{x \to -1^-} x = -1$, and
$\lim_{x \to -1^+} f(x) = \lim_{x \to -1^+} \frac{x(x^2-1)}{|x^2-1|} = \lim_{x \to -1^+} \frac{x(x^2-1)}{-(x^2-1)}$
$= \lim_{x \to -1} (-x) = -(-1) = 1$. Since
$\lim_{x \to -1^-} f(x) \neq \lim_{x \to -1^+} f(x)$
$\Rightarrow \lim_{x \to -1} f(x)$ does not exist, the function f cannot be extended to a continuous function at $x = -1$.



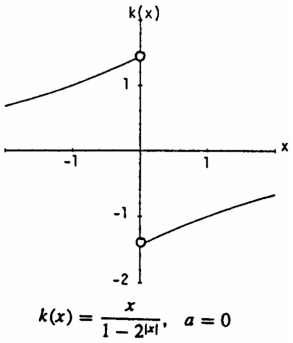
At $x = 1$: $\lim_{x \to 1^-} f(x) = \lim_{x \to 1^-} \frac{x(x^2-1)}{|x^2-1|} = \lim_{x \to 1^-} \frac{x(x^2-1)}{-(x^2-1)} = \lim_{x \to 1^-} (-x) = -1$, and
$\lim_{x \to 1^+} f(x) = \lim_{x \to 1^+} \frac{x(x^2-1)}{|x^2-1|} = \lim_{x \to 1^+} \frac{x(x^2-1)}{x^2-1} = \lim_{x \to 1^+} x = 1$. Again $\lim_{x \to 1} f(x)$ does not exist so f cannot be extended to a continuous function at $x = 1$ either.

32. The discontinuity at $x = 0$ of $f(x) = \sin\left(\frac{1}{x}\right)$ is nonremovable because $\lim_{x \to 0} \sin \frac{1}{x}$ does not exist.



33. Yes, f does have a continuous extension to $a = 1$:
define $f(1) = \lim_{x \to 1} \frac{x-1}{x - \sqrt[4]{x}} = \frac{4}{3}$.

34. Yes, g does have a continuous extension to $a = \frac{\pi}{2}$:
$g\left(\frac{\pi}{2}\right) = \lim_{\theta \to \frac{\pi}{2}} \frac{5\cos\theta}{4\theta - 2\pi} = -\frac{5}{4}$.



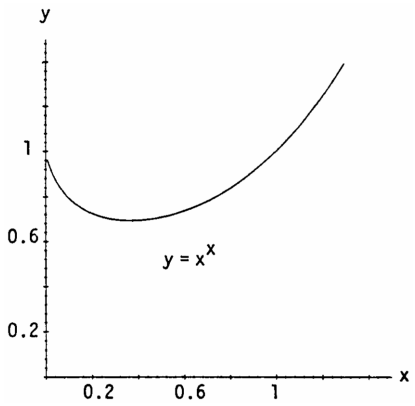
35. From the graph we see that $\lim_{t \to 0^-} h(t) \neq \lim_{t \to 0^+} h(t)$
so h cannot be extended to a continuous function at $a = 0$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

36. From the graph we see that $\lim_{x \to 0^-} k(x) \neq \lim_{x \to 0^+} k(x)$ so k cannot be extended to a continuous function at $a = 0$.

37. (a) $f(-1) = -1$ and $f(2) = 5 \Rightarrow$ f has a root between $-1$ and 2 by the Intermediate Value Theorem.
(b), (c) root is 1.32471795724

38. (a) $f(-2) = -2$ and $f(0) = 2 \Rightarrow$ f has a root between $-2$ and 0 by the Intermediate Value Theorem.
(b), (c) root is $-1.76929235424$



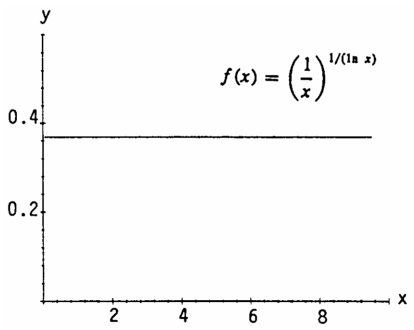
**CHAPTER 2 ADDITIONAL AND ADVANCED EXERCISES**

1. (a)

| x | 0.1 | 0.01 | 0.001 | 0.0001 | 0.00001 |
|---|---|---|---|---|---|
| $x^x$ | 0.7943 | 0.9550 | 0.9931 | 0.9991 | 0.9999 |

Apparently, $\lim_{x \to 0^+} x^x = 1$

(b)



2. (a)

| x | 10 | 100 | 1000 |
|---|---|---|---|
| $\left(\frac{1}{x}\right)^{1/(\ln x)}$ | 0.3679 | 0.3679 | 0.3679 |

Apparently, $\lim_{x \to \infty} \left(\frac{1}{x}\right)^{1/(\ln x)} = 0.3678 = \frac{1}{e}$

(b)

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

3. $\lim_{v \to c^-} L = \lim_{v \to c^-} L_0 \sqrt{1 - \frac{v^2}{c^2}} = L_0 \sqrt{1 - \frac{\lim_{v \to c^-} v^2}{c^2}} = L_0 \sqrt{1 - \frac{c^2}{c^2}} = 0$
The left-hand limit was needed because the function L is undefined if $v > c$ (the rocket cannot move faster than the speed of light).

4. $\left|\frac{\sqrt{x}}{2} - 1\right| < 0.2 \Rightarrow -0.2 < \frac{\sqrt{x}}{2} - 1 < 0.2 \Rightarrow 0.8 < \frac{\sqrt{x}}{2} < 1.2 \Rightarrow 1.6 < \sqrt{x} < 2.4 \Rightarrow 2.56 < x < 5.76.$
$\left|\frac{\sqrt{x}}{2} - 1\right| < 0.1 \Rightarrow -0.1 < \frac{\sqrt{x}}{2} - 1 < 0.1 \Rightarrow 0.9 < \frac{\sqrt{x}}{2} < 1.1 \Rightarrow 1.8 < \sqrt{x} < 2.2 \Rightarrow 3.24 < x < 4.84.$

5. $|10 + (t - 70) \times 10^{-4} - 10| < 0.0005 \Rightarrow |(t - 70) \times 10^{-4}| < 0.0005 \Rightarrow -0.0005 < (t - 70) \times 10^{-4} < 0.0005$
$\Rightarrow -5 < t - 70 < 5 \Rightarrow 65° < t < 75° \Rightarrow$ Within 5° F.

6. We want to know in what interval to hold values of h to make V satisfy the inequality
$|V - 1000| = |36\pi h - 1000| \leq 10$. To find out, we solve the inequality:
$|36\pi h - 1000| \leq 10 \Rightarrow -10 \leq 36\pi h - 1000 \leq 10 \Rightarrow 990 \leq 36\pi h \leq 1010 \Rightarrow \frac{990}{36\pi} \leq h \leq \frac{1010}{36\pi}$
$\Rightarrow 8.8 \leq h \leq 8.9$. where 8.8 was rounded up, to be safe, and 8.9 was rounded down, to be safe.
The interval in which we should hold h is about $8.9 - 8.8 = 0.1$ cm wide (1 mm). With stripes 1 mm wide, we can expect to measure a liter of water with an accuracy of 1%, which is more than enough accuracy for cooking.

7. Show $\lim_{x \to 1} f(x) = \lim_{x \to 1} (x^2 - 7) = -6 = f(1)$.
Step 1: $|(x^2 - 7) + 6| < \epsilon \Rightarrow -\epsilon < x^2 - 1 < \epsilon \Rightarrow 1 - \epsilon < x^2 < 1 + \epsilon \Rightarrow \sqrt{1 - \epsilon} < x < \sqrt{1 + \epsilon}$.
Step 2: $|x - 1| < \delta \Rightarrow -\delta < x - 1 < \delta \Rightarrow -\delta + 1 < x < \delta + 1$.
Then $-\delta + 1 = \sqrt{1 - \epsilon}$ or $\delta + 1 = \sqrt{1 + \epsilon}$. Choose $\delta = \min\left\{1 - \sqrt{1 - \epsilon}, \sqrt{1 + \epsilon} - 1\right\}$, then
$0 < |x - 1| < \delta \Rightarrow |(x^2 - 7) - 6| < \epsilon$ and $\lim_{x \to 1} f(x) = -6$. By the continuity test, f(x) is continuous at $x = 1$.

8. Show $\lim_{x \to \frac{1}{4}} g(x) = \lim_{x \to \frac{1}{4}} \frac{1}{2x} = 2 = g\left(\frac{1}{4}\right)$.
Step 1: $\left|\frac{1}{2x} - 2\right| < \epsilon \Rightarrow -\epsilon < \frac{1}{2x} - 2 < \epsilon \Rightarrow 2 - \epsilon < \frac{1}{2x} < 2 + \epsilon \Rightarrow \frac{1}{4-2\epsilon} > x > \frac{1}{4+2\epsilon}$.
Step 2: $\left|x - \frac{1}{4}\right| < \delta \Rightarrow -\delta < x - \frac{1}{4} < \delta \Rightarrow -\delta + \frac{1}{4} < x < \delta + \frac{1}{4}$.
Then $-\delta + \frac{1}{4} = \frac{1}{4+2\epsilon} \Rightarrow \delta = \frac{1}{4} - \frac{1}{4+2\epsilon} = \frac{\epsilon}{4(2+\epsilon)}$, or $\delta + \frac{1}{4} = \frac{1}{4-2\epsilon} \Rightarrow \delta = \frac{1}{4-2\epsilon} - \frac{1}{4} = \frac{\epsilon}{4(2-\epsilon)}$.
Choose $\delta = \frac{\epsilon}{4(2+\epsilon)}$, the smaller of the two values. Then $0 < \left|x - \frac{1}{4}\right| < \delta \Rightarrow \left|\frac{1}{2x} - 2\right| < \epsilon$ and $\lim_{x \to \frac{1}{4}} \frac{1}{2x} = 2$.
By the continuity test, g(x) is continuous at $x = \frac{1}{4}$.

9. Show $\lim_{x \to 2} h(x) = \lim_{x \to 2} \sqrt{2x - 3} = 1 = h(2)$.
Step 1: $\left|\sqrt{2x - 3} - 1\right| < \epsilon \Rightarrow -\epsilon < \sqrt{2x - 3} - 1 < \epsilon \Rightarrow 1 - \epsilon < \sqrt{2x - 3} < 1 + \epsilon \Rightarrow \frac{(1-\epsilon)^2+3}{2} < x < \frac{(1+\epsilon)^2+3}{2}$.
Step 2: $|x - 2| < \delta \Rightarrow -\delta < x - 2 < \delta$ or $-\delta + 2 < x < \delta + 2$.
Then $-\delta + 2 = \frac{(1-\epsilon)^2+3}{2} \Rightarrow \delta = 2 - \frac{(1-\epsilon)^2+3}{2} = \frac{1-(1-\epsilon)^2}{2} = \epsilon - \frac{\epsilon^2}{2}$, or $\delta + 2 = \frac{(1+\epsilon)^2+3}{2}$
$\Rightarrow \delta = \frac{(1+\epsilon)^2+3}{2} - 2 = \frac{(1+\epsilon)^2-1}{2} = \epsilon + \frac{\epsilon^2}{2}$. Choose $\delta = \epsilon - \frac{\epsilon^2}{2}$, the smaller of the two values. Then,
$0 < |x - 2| < \delta \Rightarrow \left|\sqrt{2x - 3} - 1\right| < \epsilon$, so $\lim_{x \to 2} \sqrt{2x - 3} = 1$. By the continuity test, h(x) is continuous at $x = 2$.

10. Show $\lim_{x \to 5} F(x) = \lim_{x \to 5} \sqrt{9 - x} = 2 = F(5)$.
Step 1: $\left|\sqrt{9 - x} - 2\right| < \epsilon \Rightarrow -\epsilon < \sqrt{9 - x} - 2 < \epsilon \Rightarrow 9 - (2 - \epsilon)^2 > x > 9 - (2 + \epsilon)^2$.
Step 2: $0 < |x - 5| < \delta \Rightarrow -\delta < x - 5 < \delta \Rightarrow -\delta + 5 < x < \delta + 5$.
Then $-\delta + 5 = 9 - (2 + \epsilon)^2 \Rightarrow \delta = (2 + \epsilon)^2 - 4 = \epsilon^2 + 2\epsilon$, or $\delta + 5 = 9 - (2 - \epsilon)^2 \Rightarrow \delta = 4 - (2 - \epsilon)^2 = \epsilon^2 - 2\epsilon$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Choose $\delta = \epsilon^2 - 2\epsilon$, the smaller of the two values. Then, $0 < |x - 5| < \delta \Rightarrow \left|\sqrt{9-x} - 2\right| < \epsilon$, so $\lim_{x \to 5} \sqrt{9-x} = 2$. By the continuity test, F(x) is continuous at $x = 5$.

11. Suppose $L_1$ and $L_2$ are two different limits. Without loss of generality assume $L_2 > L_1$. Let $\epsilon = \frac{1}{3}(L_2 - L_1)$. Since $\lim_{x \to x_0} f(x) = L_1$ there is a $\delta_1 > 0$ such that $0 < |x - x_0| < \delta_1 \Rightarrow |f(x) - L_1| < \epsilon \Rightarrow -\epsilon < f(x) - L_1 < \epsilon$ $\Rightarrow -\frac{1}{3}(L_2 - L_1) + L_1 < f(x) < \frac{1}{3}(L_2 - L_1) + L_1 \Rightarrow 4L_1 - L_2 < 3f(x) < 2L_1 + L_2$. Likewise, $\lim_{x \to x_0} f(x) = L_2$ so there is a $\delta_2$ such that $0 < |x - x_0| < \delta_2 \Rightarrow |f(x) - L_2| < \epsilon \Rightarrow -\epsilon < f(x) - L_2 < \epsilon$ $\Rightarrow -\frac{1}{3}(L_2 - L_1) + L_2 < f(x) < \frac{1}{3}(L_2 - L_1) + L_2 \Rightarrow 2L_2 + L_1 < 3f(x) < 4L_2 - L_1$ $\Rightarrow L_1 - 4L_2 < -3f(x) < -2L_2 - L_1$. If $\delta = \min\{\delta_1, \delta_2\}$ both inequalities must hold for $0 < |x - x_0| < \delta$:
$\left.\begin{array}{l} 4L_1 - L_2 < 3f(x) < 2L_1 + L_2 \\ L_1 - 4L_2 < -3f(x) < -2L_2 - L_1 \end{array}\right\} \Rightarrow 5(L_1 - L_2) < 0 < L_1 - L_2$. That is, $L_1 - L_2 < 0$ and $L_1 - L_2 > 0$, a contradiction.

12. Suppose $\lim_{x \to c} f(x) = L$. If $k = 0$, then $\lim_{x \to c} kf(x) = \lim_{x \to c} 0 = 0 = 0 \cdot \lim_{x \to c} f(x)$ and we are done. If $k \neq 0$, then given any $\epsilon > 0$, there is a $\delta > 0$ so that $0 < |x - c| < \delta \Rightarrow |f(x) - L| < \frac{\epsilon}{|k|} \Rightarrow |k||f(x) - L| < \epsilon$ $\Rightarrow |k(f(x) - L)| < \epsilon \Rightarrow |(kf(x)) - (kL)| < \epsilon$. Thus, $\lim_{x \to c} kf(x) = kL = k\left(\lim_{x \to c} f(x)\right)$.

13. (a) Since $x \to 0^+, 0 < x^3 < x < 1 \Rightarrow (x^3 - x) \to 0^- \Rightarrow \lim_{x \to 0^+} f(x^3 - x) = \lim_{y \to 0^-} f(y) = B$ where $y = x^3 - x$.
(b) Since $x \to 0^-, -1 < x < x^3 < 0 \Rightarrow (x^3 - x) \to 0^+ \Rightarrow \lim_{x \to 0^-} f(x^3 - x) = \lim_{y \to 0^+} f(y) = A$ where $y = x^3 - x$.
(c) Since $x \to 0^+, 0 < x^4 < x^2 < 1 \Rightarrow (x^2 - x^4) \to 0^+ \Rightarrow \lim_{x \to 0^+} f(x^2 - x^4) = \lim_{y \to 0^+} f(y) = A$ where $y = x^2 - x^4$.
(d) Since $x \to 0^-, -1 < x < 0 \Rightarrow 0 < x^4 < x^2 < 1 \Rightarrow (x^2 - x^4) \to 0^+ \Rightarrow \lim_{x \to 0^+} f(x^2 - x^4) = A$ as in part (c).

14. (a) True, because if $\lim_{x \to a} (f(x) + g(x))$ exists then $\lim_{x \to a} (f(x) + g(x)) - \lim_{x \to a} f(x) = \lim_{x \to a} [(f(x) + g(x)) - f(x)]$ $= \lim_{x \to a} g(x)$ exists, contrary to assumption.
(b) False; for example take $f(x) = \frac{1}{x}$ and $g(x) = -\frac{1}{x}$. Then neither $\lim_{x \to 0} f(x)$ nor $\lim_{x \to 0} g(x)$ exists, but $\lim_{x \to 0} (f(x) + g(x)) = \lim_{x \to 0} \left(\frac{1}{x} - \frac{1}{x}\right) = \lim_{x \to 0} 0 = 0$ exists.
(c) True, because $g(x) = |x|$ is continuous $\Rightarrow g(f(x)) = |f(x)|$ is continuous (it is the composite of continuous functions).
(d) False; for example let $f(x) = \begin{cases} -1, & x \leq 0 \\ 1, & x > 0 \end{cases} \Rightarrow f(x)$ is discontinuous at $x = 0$. However $|f(x)| = 1$ is continuous at $x = 0$.

15. Show $\lim_{x \to -1} f(x) = \lim_{x \to -1} \frac{x^2 - 1}{x + 1} = \lim_{x \to -1} \frac{(x+1)(x-1)}{(x+1)} = -2, x \neq -1$.
Define the continuous extension of f(x) as $F(x) = \begin{cases} \frac{x^2-1}{x+1}, & x \neq -1 \\ -2, & x = -1 \end{cases}$. We now prove the limit of f(x) as $x \to -1$ exists and has the correct value.
Step 1: $\left|\frac{x^2-1}{x+1} - (-2)\right| < \epsilon \Rightarrow -\epsilon < \frac{(x+1)(x-1)}{(x+1)} + 2 < \epsilon \Rightarrow -\epsilon < (x - 1) + 2 < \epsilon, x \neq -1 \Rightarrow -\epsilon - 1 < x < \epsilon - 1$.
Step 2: $|x - (-1)| < \delta \Rightarrow -\delta < x + 1 < \delta \Rightarrow -\delta - 1 < x < \delta - 1$.
Then $-\delta - 1 = -\epsilon - 1 \Rightarrow \delta = \epsilon$, or $\delta - 1 = \epsilon - 1 \Rightarrow \delta = \epsilon$. Choose $\delta = \epsilon$. Then $0 < |x - (-1)| < \delta$ $\Rightarrow \left|\frac{x^2-1}{x+1} - (-2)\right| < \epsilon \Rightarrow \lim_{x \to -1} F(x) = -2$. Since the conditions of the continuity test are met by F(x), then f(x) has a continuous extension to F(x) at $x = -1$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

16. Show $\lim_{x\to 3} g(x) = \lim_{x\to 3} \frac{x^2-2x-3}{2x-6} = \lim_{x\to 3} \frac{(x-3)(x+1)}{2(x-3)} = 2, x \neq 3.$

Define the continuous extension of g(x) as $G(x) = \begin{cases} \frac{x^2-2x-3}{2x-6}, & x \neq 3 \\ 2, & x = 3 \end{cases}$. We now prove the limit of g(x) as $x \to 3$ exists and has the correct value.

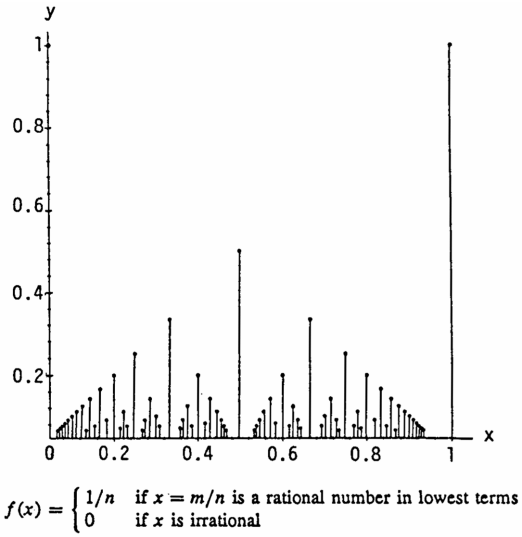
Step 1: $\left|\frac{x^2-2x-3}{2x-6} - 2\right| < \epsilon \Rightarrow -\epsilon < \frac{(x-3)(x+1)}{2(x-3)} - 2 < \epsilon \Rightarrow -\epsilon < \frac{x+1}{2} - 2 < \epsilon, x \neq 3 \Rightarrow 3 - 2\epsilon < x < 3 + 2\epsilon.$

Step 2: $|x-3| < \delta \Rightarrow -\delta < x - 3 < \delta \Rightarrow 3 - \delta < x < \delta + 3.$

Then, $3 - \delta = 3 - 2\epsilon \Rightarrow \delta = 2\epsilon$, or $\delta + 3 = 3 + 2\epsilon \Rightarrow \delta = 2\epsilon$. Choose $\delta = 2\epsilon$. Then $0 < |x-3| < \delta$ $\Rightarrow \left|\frac{x^2-2x-3}{2x-6} - 2\right| < \epsilon \Rightarrow \lim_{x\to 3} \frac{(x-3)(x+1)}{2(x-3)} = 2$. Since the conditions of the continuity test hold for G(x), g(x) can be continuously extended to G(x) at $x = 3$.

17. (a) Let $\epsilon > 0$ be given. If x is rational, then $f(x) = x \Rightarrow |f(x) - 0| = |x - 0| < \epsilon \Leftrightarrow |x - 0| < \epsilon$; i.e., choose $\delta = \epsilon$. Then $|x - 0| < \delta \Rightarrow |f(x) - 0| < \epsilon$ for x rational. If x is irrational, then $f(x) = 0 \Rightarrow |f(x) - 0| < \epsilon$ $\Leftrightarrow 0 < \epsilon$ which is true no matter how close irrational x is to 0, so again we can choose $\delta = \epsilon$. In either case, given $\epsilon > 0$ there is a $\delta = \epsilon > 0$ such that $0 < |x - 0| < \delta \Rightarrow |f(x) - 0| < \epsilon$. Therefore, f is continuous at $x = 0$.

(b) Choose $x = c > 0$. Then within any interval $(c - \delta, c + \delta)$ there are both rational and irrational numbers. If c is rational, pick $\epsilon = \frac{c}{2}$. No matter how small we choose $\delta > 0$ there is an irrational number x in $(c - \delta, c + \delta) \Rightarrow |f(x) - f(c)| = |0 - c| = c > \frac{c}{2} = \epsilon$. That is, f is not continuous at any rational $c > 0$. On the other hand, suppose c is irrational $\Rightarrow f(c) = 0$. Again pick $\epsilon = \frac{c}{2}$. No matter how small we choose $\delta > 0$ there is a rational number x in $(c - \delta, c + \delta)$ with $|x - c| < \frac{c}{2} = \epsilon \Leftrightarrow \frac{c}{2} < x < \frac{3c}{2}$. Then $|f(x) - f(c)| = |x - 0|$ $= |x| > \frac{c}{2} = \epsilon \Rightarrow$ f is not continuous at any irrational $c > 0$.



If $x = c < 0$, repeat the argument picking $\epsilon = \frac{|c|}{2} = \frac{-c}{2}$. Therefore f fails to be continuous at any nonzero value $x = c$.

18. (a) Let $c = \frac{m}{n}$ be a rational number in $[0, 1]$ reduced to lowest terms $\Rightarrow f(c) = \frac{1}{n}$. Pick $\epsilon = \frac{1}{2n}$. No matter how small $\delta > 0$ is taken, there is an irrational number x in the interval $(c - \delta, c + \delta) \Rightarrow |f(x) - f(c)| = \left|0 - \frac{1}{n}\right|$ $= \frac{1}{n} > \frac{1}{2n} = \epsilon$. Therefore f is discontinuous at $x = c$, a rational number.

(b) Now suppose c is an irrational number $\Rightarrow f(c) = 0$. Let $\epsilon > 0$ be given. Notice that $\frac{1}{2}$ is the only rational number reduced to lowest terms with denominator 2 and belonging to $[0, 1]$; $\frac{1}{3}$ and $\frac{2}{3}$ the only rationals with denominator 3 belonging to $[0, 1]$; $\frac{1}{4}$ and $\frac{3}{4}$ with denominator 4 in $[0, 1]$; $\frac{1}{5}$, $\frac{2}{5}$, $\frac{3}{5}$ and $\frac{4}{5}$ with denominator 5 in $[0, 1]$; etc. In general, choose N so that $\frac{1}{N} < \epsilon \Rightarrow$ there exist only finitely many rationals in $[0, 1]$ having denominator $\leq N$, say $r_1, r_2, \ldots, r_p$. Let $\delta = \min\{|c - r_i| : i = 1, \ldots, p\}$. Then the interval $(c - \delta, c + \delta)$ contains no rational numbers with denominator $\leq N$. Thus, $0 < |x - c| < \delta \Rightarrow |f(x) - f(c)| = |f(x) - 0|$ $= |f(x)| \leq \frac{1}{N} < \epsilon \Rightarrow$ f is continuous at $x = c$ irrational.

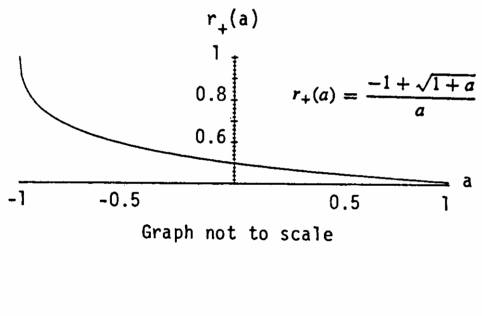
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(c) The graph looks like the markings on a typical ruler when the points (x, f(x)) on the graph of f(x) are connected to the x-axis with vertical lines.

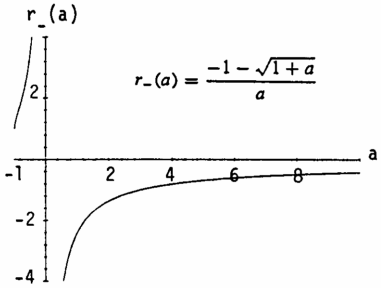
19. Yes. Let R be the radius of the equator (earth) and suppose at a fixed instant of time we label noon as the zero point, 0, on the equator $\Rightarrow$ $0 + \pi R$ represents the midnight point (at the same exact time). Suppose $x_1$ is a point on the equator "just after" noon $\Rightarrow$ $x_1 + \pi R$ is simultaneously "just after" midnight. It seems reasonable that the temperature T at a point just after noon is hotter than it would be at the diametrically opposite point just after midnight: That is, $T(x_1) - T(x_1 + \pi R) > 0$. At exactly the same moment in time pick $x_2$ to be a point just before midnight $\Rightarrow$ $x_2 + \pi R$ is just before noon. Then $T(x_2) - T(x_2 + \pi R) < 0$. Assuming the temperature function T is continuous along the equator (which is reasonable), the Intermediate Value Theorem says there is a point c between 0 (noon) and $\pi R$ (simultaneously midnight) such that $T(c) - T(c + \pi R) = 0$; i.e., there is always a pair of antipodal points on the earth's equator where the temperatures are the same.

20. $\lim\limits_{x \to c} f(x)g(x) = \lim\limits_{x \to c} \frac{1}{4}\left[(f(x) + g(x))^2 - (f(x) - g(x))^2\right] = \frac{1}{4}\left[\left(\lim\limits_{x \to c}(f(x) + g(x))\right)^2 - \left(\lim\limits_{x \to c}(f(x) - g(x))\right)^2\right]$
$= \frac{1}{4}\left(3^2 - (-1)^2\right) = 2.$

21. (a) At $x = 0$: $\lim\limits_{a \to 0} r_+(a) = \lim\limits_{a \to 0} \frac{-1 + \sqrt{1+a}}{a} = \lim\limits_{a \to 0} \left(\frac{-1 + \sqrt{1+a}}{a}\right)\left(\frac{-1 - \sqrt{1+a}}{-1 - \sqrt{1+a}}\right)$
$= \lim\limits_{a \to 0} \frac{1 - (1+a)}{a\left(-1 - \sqrt{1+a}\right)} = \frac{-1}{-1 - \sqrt{1+0}} = \frac{1}{2}$



At $x = -1$: $\lim\limits_{a \to -1^+} r_+(a) = \lim\limits_{a \to -1^+} \frac{1 - (1+a)}{a\left(-1 - \sqrt{1+a}\right)} = \lim\limits_{a \to -1} \frac{-a}{a\left(-1 - \sqrt{1+a}\right)} = \frac{-1}{-1 - \sqrt{0}} = 1$



(b) At $x = 0$: $\lim\limits_{a \to 0^-} r_-(a) = \lim\limits_{a \to 0^-} \frac{-1 - \sqrt{1+a}}{a} = \lim\limits_{a \to 0^-} \left(\frac{-1 - \sqrt{1+a}}{a}\right)\left(\frac{-1 + \sqrt{1+a}}{-1 + \sqrt{1+a}}\right)$
$= \lim\limits_{a \to 0^-} \frac{1 - (1+a)}{a\left(-1 + \sqrt{1+a}\right)} = \lim\limits_{a \to 0^-} \frac{-a}{a\left(-1 + \sqrt{1+a}\right)} = \lim\limits_{a \to 0^-} \frac{-1}{-1 + \sqrt{1+a}} = \infty$ (because the denominator is always negative); $\lim\limits_{a \to 0^+} r_-(a) = \lim\limits_{a \to 0^+} \frac{-1}{-1 + \sqrt{1+a}} = -\infty$ (because the denominator is always positive). Therefore, $\lim\limits_{a \to 0} r_-(a)$ does not exist.

At $x = -1$: $\lim\limits_{a \to -1^+} r_-(a) = \lim\limits_{a \to -1^+} \frac{-1 - \sqrt{1+a}}{a} = \lim\limits_{a \to -1^+} \frac{-1}{-1 + \sqrt{1+a}} = 1$

(c)

(d)

22. $f(x) = x + 2\cos x \Rightarrow f(0) = 0 + 2\cos 0 = 2 > 0$ and $f(-\pi) = -\pi + 2\cos(-\pi) = -\pi - 2 < 0$. Since f(x) is continuous on $[-\pi, 0]$, by the Intermediate Value Theorem, f(x) must take on every value between $[-\pi - 2, 2]$. Thus there is some number c in $[-\pi, 0]$ such that $f(c) = 0$; i.e., c is a solution to $x + 2\cos x = 0$.

23. (a) The function f is bounded on D if $f(x) \geq M$ and $f(x) \leq N$ for all x in D. This means $M \leq f(x) \leq N$ for all x in D. Choose B to be $\max\{|M|, |N|\}$. Then $|f(x)| \leq B$. On the other hand, if $|f(x)| \leq B$, then $-B \leq f(x) \leq B \Rightarrow f(x) \geq -B$ and $f(x) \leq B \Rightarrow f(x)$ is bounded on D with $N = B$ an upper bound and $M = -B$ a lower bound.

(b) Assume $f(x) \leq N$ for all x and that $L > N$. Let $\epsilon = \frac{L-N}{2}$. Since $\lim_{x \to x_0} f(x) = L$ there is a $\delta > 0$ such that $0 < |x - x_0| < \delta \Rightarrow |f(x) - L| < \epsilon \Leftrightarrow L - \epsilon < f(x) < L + \epsilon \Leftrightarrow L - \frac{L-N}{2} < f(x) < L + \frac{L-N}{2}$ $\Leftrightarrow \frac{L+N}{2} < f(x) < \frac{3L-N}{2}$. But $L > N \Rightarrow \frac{L+N}{2} > N \Rightarrow N < f(x)$ contrary to the boundedness assumption $f(x) \leq N$. This contradiction proves $L \leq N$.

(c) Assume $M \leq f(x)$ for all x and that $L < M$. Let $\epsilon = \frac{M-L}{2}$. As in part (b), $0 < |x - x_0| < \delta$ $\Rightarrow L - \frac{M-L}{2} < f(x) < L + \frac{M-L}{2} \Leftrightarrow \frac{3L-M}{2} < f(x) < \frac{M+L}{2} < M$, a contradiction.

24. (a) If $a \geq b$, then $a - b \geq 0 \Rightarrow |a - b| = a - b \Rightarrow \max(a, b) = \frac{a+b}{2} + \frac{|a-b|}{2} = \frac{a+b}{2} + \frac{a-b}{2} = \frac{2a}{2} = a$.
If $a \leq b$, then $a - b \leq 0 \Rightarrow |a - b| = -(a - b) = b - a \Rightarrow \max(a, b) = \frac{a+b}{2} + \frac{|a-b|}{2} = \frac{a+b}{2} + \frac{b-a}{2}$ $= \frac{2b}{2} = b$.

(b) Let $\min(a, b) = \frac{a+b}{2} - \frac{|a-b|}{2}$.

# CHAPTER 3 DIFFERENTIATION

## 3.1 THE DERIVATIVE OF A FUNCTION

1. Step 1: $f(x) = 4 - x^2$ and $f(x+h) = 4 - (x+h)^2$

   Step 2: $\frac{f(x+h)-f(x)}{h} = \frac{[4-(x+h)^2]-(4-x^2)}{h} = \frac{(4-x^2-2xh-h^2)-4+x^2}{h} = \frac{-2xh-h^2}{h} = \frac{h(-2x-h)}{h}$
   $= -2x - h$

   Step 3: $f'(x) = \lim_{h\to 0}(-2x-h) = -2x$; $f'(-3) = 6$, $f'(0) = 0$, $f'(1) = -2$

2. $F(x) = (x-1)^2 + 1$ and $F(x+h) = (x+h-1)^2 + 1 \Rightarrow F'(x) = \lim_{h\to 0} \frac{[(x+h-1)^2+1]-[(x-1)^2+1]}{h}$
   $= \lim_{h\to 0} \frac{(x^2+2xh+h^2-2x-2h+1+1)-(x^2-2x+1+1)}{h} = \lim_{h\to 0} \frac{2xh+h^2-2h}{h} = \lim_{h\to 0}(2x+h-2)$
   $= 2(x-1)$; $F'(-1) = -4$, $F'(0) = -2$, $F'(2) = 2$

3. Step 1: $g(t) = \frac{1}{t^2}$ and $g(t+h) = \frac{1}{(t+h)^2}$

   Step 2: $\frac{g(t+h)-g(t)}{h} = \frac{\frac{1}{(t+h)^2} - \frac{1}{t^2}}{h} = \frac{\left(\frac{t^2-(t+h)^2}{(t+h)^2\cdot t^2}\right)}{h} = \frac{t^2-(t^2+2th+h^2)}{(t+h)^2\cdot t^2\cdot h} = \frac{-2th-h^2}{(t+h)^2\,t^2 h}$
   $= \frac{h(-2t-h)}{(t+h)^2\,t^2 h} = \frac{-2t-h}{(t+h)^2\,t^2}$

   Step 3: $g'(t) = \lim_{h\to 0} \frac{-2t-h}{(t+h)^2\,t^2} = \frac{-2t}{t^2\cdot t^2} = \frac{-2}{t^3}$; $g'(-1) = 2$, $g'(2) = -\frac{1}{4}$, $g'\left(\sqrt{3}\right) = -\frac{2}{3\sqrt{3}}$

4. $k(z) = \frac{1-z}{2z}$ and $k(z+h) = \frac{1-(z+h)}{2(z+h)} \Rightarrow k'(z) = \lim_{h\to 0} \frac{\left(\frac{1-(z+h)}{2(z+h)} - \frac{1-z}{2z}\right)}{h}$
   $= \lim_{h\to 0} \frac{(1-z-h)z-(1-z)(z+h)}{2(z+h)zh} = \lim_{h\to 0} \frac{z-z^2-zh-z-h+z^2+zh}{2(z+h)zh} = \lim_{h\to 0} \frac{-h}{2(z+h)zh} = \lim_{h\to 0} \frac{-1}{2(z+h)z}$
   $= \frac{-1}{2z^2}$; $k'(-1) = -\frac{1}{2}$, $k'(1) = -\frac{1}{2}$, $k'\left(\sqrt{2}\right) = -\frac{1}{4}$

5. Step 1: $p(\theta) = \sqrt{3\theta}$ and $p(\theta+h) = \sqrt{3(\theta+h)}$

   Step 2: $\frac{p(\theta+h)-p(\theta)}{h} = \frac{\sqrt{3(\theta+h)}-\sqrt{3\theta}}{h} = \frac{\left(\sqrt{3\theta+3h}-\sqrt{3\theta}\right)}{h}\cdot\frac{\left(\sqrt{3\theta+3h}+\sqrt{3\theta}\right)}{\left(\sqrt{3\theta+3h}+\sqrt{3\theta}\right)} = \frac{(3\theta+3h)-3\theta}{h\left(\sqrt{3\theta+3h}+\sqrt{3\theta}\right)}$
   $= \frac{3h}{h\left(\sqrt{3\theta+3h}+\sqrt{3\theta}\right)} = \frac{3}{\sqrt{3\theta+3h}+\sqrt{3\theta}}$

   Step 3: $p'(\theta) = \lim_{h\to 0} \frac{3}{\sqrt{3\theta+3h}+\sqrt{3\theta}} = \frac{3}{\sqrt{3\theta}+\sqrt{3\theta}} = \frac{3}{2\sqrt{3\theta}}$; $p'(1) = \frac{3}{2\sqrt{3}}$, $p'(3) = \frac{1}{2}$, $p'\left(\frac{2}{3}\right) = \frac{3}{2\sqrt{2}}$

6. $r(s) = \sqrt{2s+1}$ and $r(s+h) = \sqrt{2(s+h)+1} \Rightarrow r'(s) = \lim_{h\to 0} \frac{\sqrt{2s+2h+1}-\sqrt{2s+1}}{h}$
   $= \lim_{h\to 0} \frac{\left(\sqrt{2s+h+1}-\sqrt{2s+1}\right)}{h}\cdot\frac{\left(\sqrt{2s+2h+1}+\sqrt{2s+1}\right)}{\left(\sqrt{2s+2h+1}+\sqrt{2s+1}\right)} = \lim_{h\to 0} \frac{(2s+2h+1)-(2s+1)}{h\left(\sqrt{2s+2h+1}+\sqrt{2s+1}\right)}$
   $= \lim_{h\to 0} \frac{2h}{h\left(\sqrt{2s+2h+1}+\sqrt{2s+1}\right)} = \lim_{h\to 0} \frac{2}{\sqrt{2s+2h+1}+\sqrt{2s+1}} = \frac{2}{\sqrt{2s+1}+\sqrt{2s+1}} = \frac{2}{2\sqrt{2s+1}}$
   $= \frac{1}{\sqrt{2s+1}}$; $r'(0) = 1$, $r'(1) = \frac{1}{\sqrt{3}}$, $r'\left(\frac{1}{2}\right) = \frac{1}{\sqrt{2}}$

7. $y = f(x) = 2x^3$ and $f(x+h) = 2(x+h)^3 \Rightarrow \frac{dy}{dx} = \lim_{h\to 0} \frac{2(x+h)^3-2x^3}{h} = \lim_{h\to 0} \frac{2(x^3+3x^2h+3xh^2+h^3)-2x^3}{h}$
   $= \lim_{h\to 0} \frac{6x^2h+6xh^2+2h^3}{h} = \lim_{h\to 0} \frac{h(6x^2+6xh+2h^2)}{h} = \lim_{h\to 0}(6x^2+6xh+2h^2) = 6x^2$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

8. $r = \frac{s^3}{2} + 1 \Rightarrow \frac{dr}{ds} = \lim_{h \to 0} \frac{\left[\frac{(s+h)^3}{2} + 1\right] - \left[\frac{s^3}{2} + 1\right]}{h} = \frac{1}{2} \lim_{h \to 0} \frac{[(s+h)^3 + 2] - [s^3 + 2]}{h}$
$= \frac{1}{2} \lim_{h \to 0} \frac{s^3 + 3s^2h + 3sh^2 + h^3 + 2 - s^3 - 2}{h} = \frac{1}{2} \lim_{h \to 0} \frac{h[3s^2 + 3sh + h^2]}{h} = \frac{1}{2} \lim_{h \to 0} (3s^2 + 3sh + h^2) = \frac{3}{2} s^2$

9. $s = r(t) = \frac{t}{2t+1}$ and $r(t+h) = \frac{t+h}{2(t+h)+1} \Rightarrow \frac{ds}{dt} = \lim_{h \to 0} \frac{\left(\frac{t+h}{2(t+h)+1}\right) - \left(\frac{t}{2t+1}\right)}{h}$
$= \lim_{h \to 0} \frac{\left(\frac{(t+h)(2t+1) - t(2t+2h+1)}{(2t+2h+1)(2t+1)}\right)}{h} = \lim_{h \to 0} \frac{(t+h)(2t+1) - t(2t+2h+1)}{(2t+2h+1)(2t+1)h}$
$= \lim_{h \to 0} \frac{2t^2 + t + 2ht + h - 2t^2 - 2ht - t}{(2t+2h+1)(2t+1)h} = \lim_{h \to 0} \frac{h}{(2t+2h+1)(2t+1)h} = \lim_{h \to 0} \frac{1}{(2t+2h+1)(2t+1)}$
$= \frac{1}{(2t+1)(2t+1)} = \frac{1}{(2t+1)^2}$

10. $\frac{dv}{dt} = \lim_{h \to 0} \frac{\left[(t+h) - \frac{1}{t+h}\right] - \left(t - \frac{1}{t}\right)}{h} = \lim_{h \to 0} \frac{h - \frac{1}{t+h} + \frac{1}{t}}{h} = \lim_{h \to 0} \frac{\left(\frac{h(t+h)t - t + (t+h)}{(t+h)t}\right)}{h}$
$= \lim_{h \to 0} \frac{ht^2 + h^2t + h}{h(t+h)t} = \lim_{h \to 0} \frac{t^2 + ht + 1}{(t+h)t} = \frac{t^2+1}{t^2} = 1 + \frac{1}{t^2}$

11. $p = f(q) = \frac{1}{\sqrt{q+1}}$ and $f(q+h) = \frac{1}{\sqrt{(q+h)+1}} \Rightarrow \frac{dp}{dq} = \lim_{h \to 0} \frac{\left(\frac{1}{\sqrt{(q+h)+1}}\right) - \left(\frac{1}{\sqrt{q+1}}\right)}{h}$
$= \lim_{h \to 0} \frac{\left(\frac{\sqrt{q+1} - \sqrt{q+h+1}}{\sqrt{q+h+1}\sqrt{q+1}}\right)}{h} = \lim_{h \to 0} \frac{\sqrt{q+1} - \sqrt{q+h+1}}{h\sqrt{q+h+1}\sqrt{q+1}}$
$= \lim_{h \to 0} \frac{(\sqrt{q+1} - \sqrt{q+h+1})}{h\sqrt{q+h+1}\sqrt{q+1}} \cdot \frac{(\sqrt{q+1} + \sqrt{q+h+1})}{(\sqrt{q+1} + \sqrt{q+h+1})} = \lim_{h \to 0} \frac{(q+1) - (q+h+1)}{h\sqrt{q+h+1}\sqrt{q+1}(\sqrt{q+1} + \sqrt{q+h+1})}$
$= \lim_{h \to 0} \frac{-h}{h\sqrt{q+h+1}\sqrt{q+1}(\sqrt{q+1} + \sqrt{q+h+1})} = \lim_{h \to 0} \frac{-1}{\sqrt{q+h+1}\sqrt{q+1}(\sqrt{q+1} + \sqrt{q+h+1})}$
$= \frac{-1}{\sqrt{q+1}\sqrt{q+1}(\sqrt{q+1} + \sqrt{q+1})} = \frac{-1}{2(q+1)\sqrt{q+1}}$

12. $\frac{dz}{dw} = \lim_{h \to 0} \frac{\left(\frac{1}{\sqrt{3(w+h)-2}} - \frac{1}{\sqrt{3w-2}}\right)}{h} = \lim_{h \to 0} \frac{\sqrt{3w-2} - \sqrt{3w+3h-2}}{h\sqrt{3w+3h-2}\sqrt{3w-2}}$
$= \lim_{h \to 0} \frac{\left(\sqrt{3w-2} - \sqrt{3w+3h-2}\right)}{h\sqrt{3w+3h-2}\sqrt{3w-2}} \cdot \frac{\left(\sqrt{3w-2} + \sqrt{3w+3h-2}\right)}{\left(\sqrt{3w-2} + \sqrt{3w+3h-2}\right)}$
$= \lim_{h \to 0} \frac{(3w-2) - (3w+3h-2)}{h\sqrt{3w+3h-2}\sqrt{3w-2}\left(\sqrt{3w-2} + \sqrt{3w+3h-2}\right)}$
$= \lim_{h \to 0} \frac{-3}{\sqrt{3w+3h-2}\sqrt{3w-2}\left(\sqrt{3w-2} + \sqrt{3w+3h-2}\right)} = \frac{-3}{\sqrt{3w-2}\sqrt{3w-2}\left(\sqrt{3w-2} + \sqrt{3w-2}\right)}$
$= \frac{-3}{2(3w-2)\sqrt{3w-2}}$

13. $f(x) = x + \frac{9}{x}$ and $f(x+h) = (x+h) + \frac{9}{(x+h)} \Rightarrow \frac{f(x+h) - f(x)}{h} = \frac{\left[(x+h) + \frac{9}{(x+h)}\right] - \left[x + \frac{9}{x}\right]}{h}$
$= \frac{x(x+h)^2 + 9x - x^2(x+h) - 9(x+h)}{x(x+h)h} = \frac{x^3 + 2x^2h + xh^2 + 9x - x^3 - x^2h - 9x - 9h}{x(x+h)h} = \frac{x^2h + xh^2 - 9h}{x(x+h)h}$
$= \frac{h(x^2 + xh - 9)}{x(x+h)h} = \frac{x^2 + xh - 9}{x(x+h)}$; $f'(x) = \lim_{h \to 0} \frac{x^2 + xh - 9}{x(x+h)} = \frac{x^2 - 9}{x^2} = 1 - \frac{9}{x^2}$; $m = f'(-3) = 0$

14. $k(x) = \frac{1}{2+x}$ and $k(x+h) = \frac{1}{2+(x+h)} \Rightarrow k'(x) = \lim_{h \to 0} \frac{k(x+h) - k(x)}{h} = \lim_{h \to 0} \frac{\left(\frac{1}{2+x+h} - \frac{1}{2+x}\right)}{h}$
$= \lim_{h \to 0} \frac{(2+x) - (2+x+h)}{h(2+x)(2+x+h)} = \lim_{h \to 0} \frac{-h}{h(2+x)(2+x+h)} = \lim_{h \to 0} \frac{-1}{(2+x)(2+x+h)} = \frac{-1}{(2+x)^2}$;
$k'(2) = -\frac{1}{16}$

15. $\frac{ds}{dt} = \lim_{h \to 0} \frac{[(t+h)^3 - (t+h)^2] - (t^3 - t^2)}{h} = \lim_{h \to 0} \frac{(t^3 + 3t^2h + 3th^2 + h^3) - (t^2 + 2th + h^2) - t^3 + t^2}{h}$
$= \lim_{h \to 0} \frac{3t^2h + 3th^2 + h^3 - 2th - h^2}{h} = \lim_{h \to 0} \frac{h(3t^2 + 3th + h^2 - 2t - h)}{h} = \lim_{h \to 0} (3t^2 + 3th + h^2 - 2t - h)$

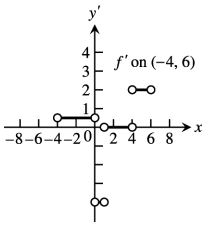
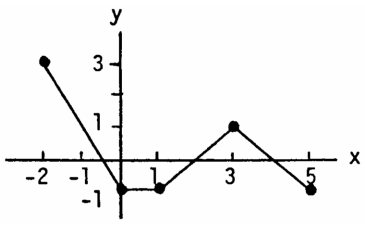
$= \lim_{z \to x} \frac{1}{\sqrt{z} + \sqrt{x}} = \frac{1}{2\sqrt{x}}$

27. Note that as x increases, the slope of the tangent line to the curve is first negative, then zero (when $x = 0$), then positive $\Rightarrow$ the slope is always increasing which matches (b).



28. Note that the slope of the tangent line is never negative. For x negative, $f_2'(x)$ is positive but decreasing as x increases. When $x = 0$, the slope of the tangent line to x is 0. For $x > 0$, $f_2'(x)$ is positive and increasing. This graph matches (a).

29. $f_3(x)$ is an oscillating function like the cosine. Everywhere that the graph of $f_3$ has a horizontal tangent we expect $f_3'$ to be zero, and (d) matches this condition.



30. The graph matches with (c).

31. (a) $f'$ is not defined at $x = 0, 1, 4$. At these points, the left-hand and right-hand derivatives do not agree. For example, $\lim_{x \to 0^-} \frac{f(x) - f(0)}{x - 0}$ = slope of line joining $(-4, 0)$ and $(0, 2) = \frac{1}{2}$ but $\lim_{x \to 0^+} \frac{f(x) - f(0)}{x - 0}$ = slope of line joining $(0, 2)$ and $(1, -2) = -4$. Since these values are not equal, $f'(0) = \lim_{x \to 0} \frac{f(x) - f(0)}{x - 0}$ does not exist.

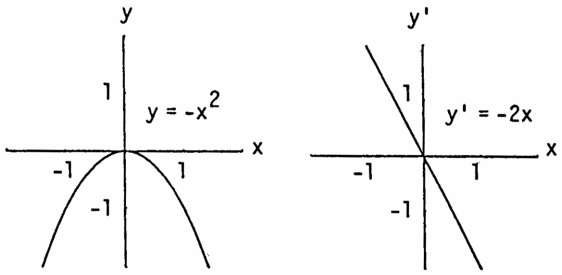
39. (a) The function is differentiable on its domain $-3 \le x \le 2$ (it is smooth)
    (b) none
    (c) none

40. (a) The function is differentiable on its domain $-2 \le x \le 3$ (it is smooth)
    (b) none
    (c) none



41. (a) The function is differentiable on $-3 \le x < 0$ and $0 < x \le 3$
    (b) none
    (c) The function is neither continuous nor differentiable at $x = 0$ since $\lim_{x \to 0^-} f(x) \ne \lim_{x \to 0^+} f(x)$

42. (a) f is differentiable on $-2 \le x < -1$, $-1 < x < 0$, $0 < x < 2$, and $2 < x \le 3$
    (b) f is continuous but not differentiable at $x = -1$: $\lim_{x \to -1} f(x) = 0$ exists but there is a corner at $x = -1$ since $\lim_{h \to 0^-} \frac{f(-1+h)-f(-1)}{h} = -3$ and $\lim_{h \to 0^+} \frac{f(-1+h)-f(-1)}{h} = 3 \Rightarrow f'(-1)$ does not exist
    (c) f is neither continuous nor differentiable at $x = 0$ and $x = 2$:
    at $x = 0$, $\lim_{x \to 0^-} f(x) = 3$ but $\lim_{x \to 0^+} f(x) = 0 \Rightarrow \lim_{x \to 0} f(x)$ does not exist;
    at $x = 2$, $\lim_{x \to 2} f(x)$ exists but $\lim_{x \to 2} f(x) \ne f(2)$

43. (a) f is differentiable on $-1 \le x < 0$ and $0 < x \le 2$
    (b) f is continuous but not differentiable at $x = 0$: $\lim_{x \to 0} f(x) = 0$ exists but there is a cusp at $x = 0$, so $f'(0) = \lim_{h \to 0} \frac{f(0+h)-f(0)}{h}$ does not exist
    (c) none

44. (a) f is differentiable on $-3 \le x < -2$, $-2 < x < 2$, and $2 < x \le 3$
    (b) f is continuous but not differentiable at $x = -2$ and $x = 2$: there are corners at those points
    (c) none

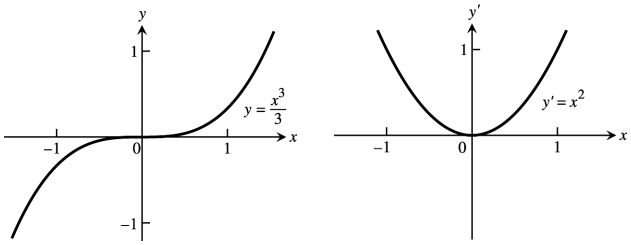
45. (a) $f'(x) = \lim_{h \to 0} \frac{f(x+h)-f(x)}{h} = \lim_{h \to 0} \frac{-(x+h)^2-(-x^2)}{h} = \lim_{h \to 0} \frac{-x^2-2xh-h^2+x^2}{h} = \lim_{h \to 0} (-2x - h) = -2x$
    (b)

    (c) $y' = -2x$ is positive for $x < 0$, $y'$ is zero when $x = 0$, $y'$ is negative when $x > 0$
    (d) $y = -x^2$ is increasing for $-\infty < x < 0$ and decreasing for $0 < x < \infty$; the function is increasing on intervals where $y' > 0$ and decreasing on intervals where $y' < 0$

46. (a) $f'(x) = \lim_{h \to 0} \frac{f(x+h)-f(x)}{h} = \lim_{h \to 0} \frac{\left(\frac{-1}{x+h} - \frac{-1}{x}\right)}{h} = \lim_{h \to 0} \frac{-x+(x+h)}{x(x+h)h} = \lim_{h \to 0} \frac{1}{x(x+h)} = \frac{1}{x^2}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(b)



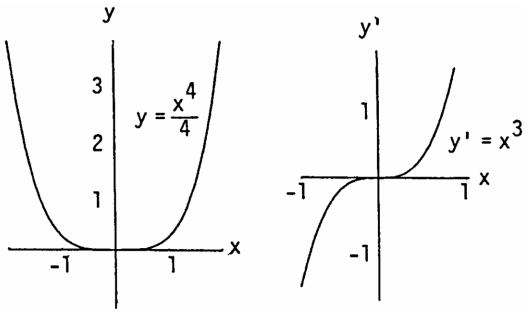
(c) $y'$ is positive for all $x \neq 0$, $y'$ is never 0, $y'$ is never negative

(d) $y = -\frac{1}{x}$ is increasing for $-\infty < x < 0$ and $0 < x < \infty$

47. (a) Using the alternate formula for calculating derivatives: $f'(x) = \lim_{z \to x} \frac{f(z) - f(x)}{z - x} = \lim_{z \to x} \frac{\left(\frac{z^3}{3} - \frac{x^3}{3}\right)}{z - x}$

$= \lim_{z \to x} \frac{z^3 - x^3}{3(z - x)} = \lim_{z \to x} \frac{(z - x)(z^2 + zx + x^2)}{3(z - x)} = \lim_{z \to x} \frac{z^2 + zx + x^2}{3} = x^2 \Rightarrow f'(x) = x^2$

(b)



(c) $y'$ is positive for all $x \neq 0$, and $y' = 0$ when $x = 0$; $y'$ is never negative

(d) $y = \frac{x^3}{3}$ is increasing for all $x \neq 0$ (the graph is horizontal at $x = 0$) because y is increasing where $y' > 0$; y is never decreasing

48. (a) Using the alternate form for calculating derivatives: $f'(x) = \lim_{z \to x} \frac{f(z) - f(x)}{z - x} = \lim_{z \to x} \frac{\left(\frac{z^4}{4} - \frac{x^4}{4}\right)}{z - x}$

$= \lim_{z \to x} \frac{z^4 - x^4}{4(z - x)} = \lim_{z \to x} \frac{(z - x)(z^3 + xz^2 + x^2z + x^3)}{4(z - x)} = \lim_{z \to x} \frac{z^3 + xz^2 + x^2z + x^3}{4} = x^3 \Rightarrow f'(x) = x^3$

(b)

(c) $y'$ is positive for $x > 0$, $y'$ is zero for $x = 0$, $y'$ is negative for $x < 0$

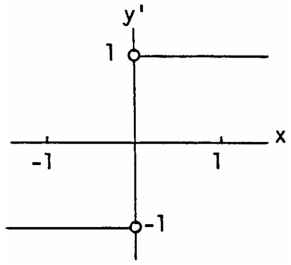
(d) $y = \frac{x^4}{4}$ is increasing on $0 < x < \infty$ and decreasing on $-\infty < x < 0$

49. $y' = \lim_{x \to c} \frac{f(x) - f(c)}{x - c} = \lim_{x \to c} \frac{x^3 - c^3}{x - c} = \lim_{x \to c} \frac{(x - c)(x^2 + xc + c^2)}{x - c} = \lim_{x \to c} (x^2 + xc + c^2) = 3c^2$.
The slope of the curve $y = x^3$ at $x = c$ is $y' = 3c^2$. Notice that $3c^2 \geq 0$ for all $c \Rightarrow y = x^3$ never has a negative slope.

50. Horizontal tangents occur where $y' = 0$. Thus, $y' = \lim_{h \to 0} \frac{2\sqrt{x + h} - 2\sqrt{x}}{h}$

$= \lim_{h \to 0} \frac{2\left(\sqrt{x + h} - \sqrt{x}\right)}{h} \cdot \frac{\left(\sqrt{x + h} + \sqrt{x}\right)}{\left(\sqrt{x + h} + \sqrt{x}\right)} = \lim_{h \to 0} \frac{2((x + h) - x))}{h\left(\sqrt{x + h} + \sqrt{x}\right)} = \lim_{h \to 0} \frac{2}{\sqrt{x + h} + \sqrt{x}} = \frac{1}{\sqrt{x}}$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



Then $y' = 0$ when $\frac{1}{\sqrt{x}} = 0$ which is never true $\Rightarrow$ the curve has no horizontal tangents.

51. $y' = \lim_{h \to 0} \frac{(2(x+h)^2 - 13(x+h) + 5) - (2x^2 - 13x + 5)}{h} = \lim_{h \to 0} \frac{2x^2 + 4xh + 2h^2 - 13x - 13h + 5 - 2x^2 + 13x - 5}{h}$
$= \lim_{h \to 0} \frac{4xh + 2h^2 - 13h}{h} = \lim_{h \to 0} (4x + 2h - 13) = 4x - 13$, slope at x. The slope is $-1$ when $4x - 13 = -1$ $\Rightarrow$ $4x = 12$ $\Rightarrow$ $x = 3$ $\Rightarrow$ $y = 2 \cdot 3^2 - 13 \cdot 3 + 5 = -16$. Thus the tangent line is $y + 16 = (-1)(x - 3)$ $\Rightarrow y = -x - 13$ and the point of tangency is $(3, -16)$.

52. For the curve $y = \sqrt{x}$, we have $y' = \lim_{h \to 0} \frac{\left(\sqrt{x+h} - \sqrt{x}\right)}{h} \cdot \frac{\left(\sqrt{x+h} + \sqrt{x}\right)}{\left(\sqrt{x+h} + \sqrt{x}\right)} = \lim_{h \to 0} \frac{(x+h) - x}{\left(\sqrt{x+h} + \sqrt{x}\right) h}$
$= \lim_{h \to 0} \frac{1}{\sqrt{x+h} + \sqrt{x}} = \frac{1}{2\sqrt{x}}$. Suppose $\left(a, \sqrt{a}\right)$ is the point of tangency of such a line and $(-1, 0)$ is the point on the line where it crosses the x-axis. Then the slope of the line is $\frac{\sqrt{a} - 0}{a - (-1)} = \frac{\sqrt{a}}{a+1}$ which must also equal $\frac{1}{2\sqrt{a}}$; using the derivative formula at $x = a$ $\Rightarrow$ $\frac{\sqrt{a}}{a+1} = \frac{1}{2\sqrt{a}}$ $\Rightarrow$ $2a = a + 1$ $\Rightarrow$ $a = 1$. Thus such a line does exist: its point of tangency is $(1, 1)$, its slope is $\frac{1}{2\sqrt{a}} = \frac{1}{2}$; and an equation of the line is $y - 1 = \frac{1}{2}(x - 1)$ $\Rightarrow y = \frac{1}{2}x + \frac{1}{2}$.

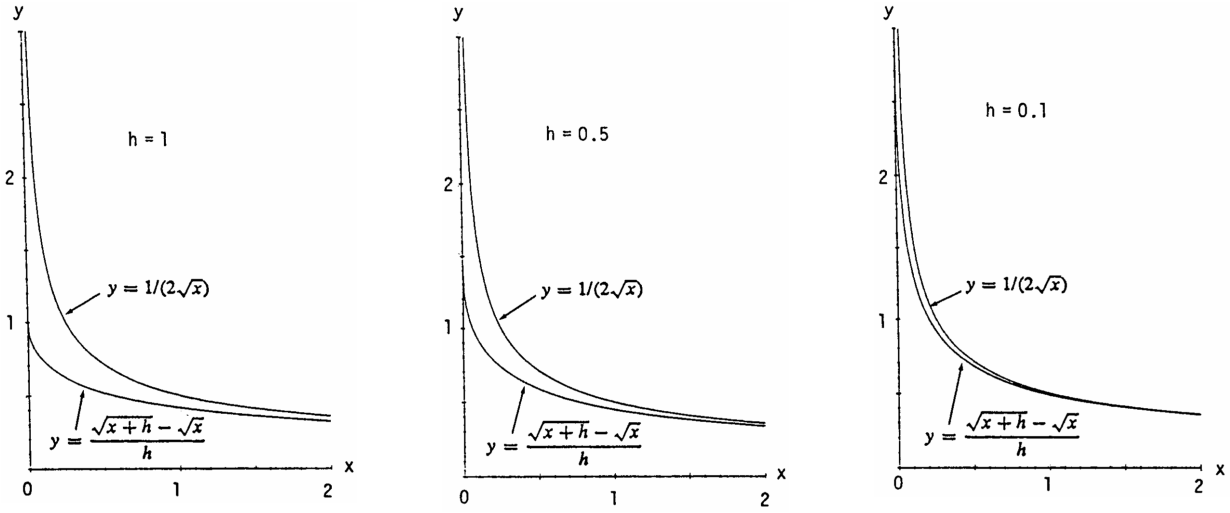
53. No. Derivatives of functions have the intermediate value property. The function $f(x) = \lfloor x \rfloor$ satisfies $f(0) = 0$ and $f(1) = 1$ but does not take on the value $\frac{1}{2}$ anywhere in $[0, 1]$ $\Rightarrow$ f does not have the intermediate value property. Thus f cannot be the derivative of any function on $[0, 1]$ $\Rightarrow$ f cannot be the derivative of any function on $(-\infty, \infty)$.

54. The graphs are the same. So we know that for $f(x) = |x|$, we have $f'(x) = \frac{|x|}{x}$.

55. Yes; the derivative of $-f$ is $-f'$ so that $f'(x_0)$ exists $\Rightarrow$ $-f'(x_0)$ exists as well.

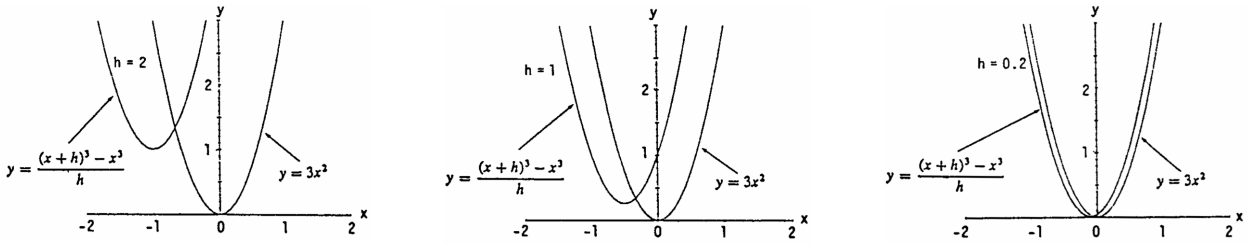
56. Yes; the derivative of $3g$ is $3g'$ so that $g'(7)$ exists $\Rightarrow$ $3g'(7)$ exists as well.

57. Yes, $\lim_{t \to 0} \frac{g(t)}{h(t)}$ can exist but it need not equal zero. For example, let $g(t) = mt$ and $h(t) = t$. Then $g(0) = h(0) = 0$, but $\lim_{t \to 0} \frac{g(t)}{h(t)} = \lim_{t \to 0} \frac{mt}{t} = \lim_{t \to 0} m = m$, which need not be zero.



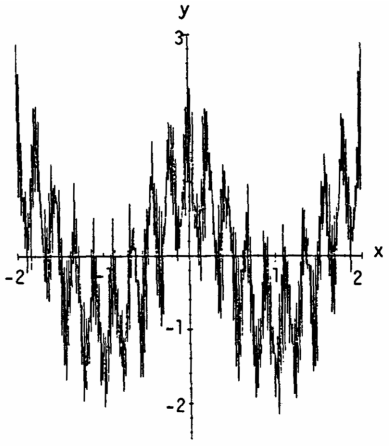
58. (a) Suppose $|f(x)| \le x^2$ for $-1 \le x \le 1$. Then $|f(0)| \le 0^2$ $\Rightarrow$ $f(0) = 0$. Then $f'(0) = \lim_{h \to 0} \frac{f(0+h) - f(0)}{h}$
$= \lim_{h \to 0} \frac{f(h) - 0}{h} = \lim_{h \to 0} \frac{f(h)}{h}$. For $|h| \le 1$, $-h^2 \le f(h) \le h^2$ $\Rightarrow$ $-h \le \frac{f(h)}{h} \le h$ $\Rightarrow$ $f'(0) = \lim_{h \to 0} \frac{f(h)}{h} = 0$ by the Sandwich Theorem for limits.

(b) Note that for $x \ne 0$, $|f(x)| = \left|x^2 \sin \frac{1}{x}\right| = |x^2| \, |\sin x| \le |x^2| \cdot 1 = x^2$ (since $-1 \le \sin x \le 1$). By part (a), f is differentiable at $x = 0$ and $f'(0) = 0$.



59. The graphs are shown below for $h = 1, 0.5, 0.1$. The function $y = \frac{1}{2\sqrt{x}}$ is the derivative of the function $y = \sqrt{x}$ so that $\frac{1}{2\sqrt{x}} = \lim_{h \to 0} \frac{\sqrt{x+h} - \sqrt{x}}{h}$. The graphs reveal that $y = \frac{\sqrt{x+h} - \sqrt{x}}{h}$ gets closer to $y = \frac{1}{2\sqrt{x}}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



as h gets smaller and smaller.

60. The graphs are shown below for h = 2, 1, 0.5. The function $y = 3x^2$ is the derivative of the function $y = x^3$ so that $3x^2 = \lim_{h \to 0} \frac{(x+h)^3 - x^3}{h}$. The graphs reveal that $y = \frac{(x+h)^3 - x^3}{h}$ gets closer to $y = 3x^2$ as h gets smaller and smaller.

61. Weierstrass's nowhere differentiable continuous function.

$$g(x) = \cos(\pi x) + \left(\frac{2}{3}\right)^1 \cos(9\pi x) + \left(\frac{2}{3}\right)^2 \cos(9^2 \pi x) + \left(\frac{2}{3}\right)^3 \cos(9^3 \pi x) + \cdots + \left(\frac{2}{3}\right)^7 \cos(9^7 \pi x)$$

### 3.2 DIFFERENTIATION RULES

1. $y = -x^2 + 3 \Rightarrow \frac{dy}{dx} = \frac{d}{dx}(-x^2) + \frac{d}{dx}(3) = -2x + 0 = -2x \Rightarrow \frac{d^2y}{dx^2} = -2$

2. $y = x^2 + x + 8 \Rightarrow \frac{dy}{dx} = 2x + 1 + 0 = 2x + 1 \Rightarrow \frac{d^2y}{dx^2} = 2$

3. $s = 5t^3 - 3t^5 \Rightarrow \frac{ds}{dt} = \frac{d}{dt}(5t^3) - \frac{d}{dt}(3t^5) = 15t^2 - 15t^4 \Rightarrow \frac{d^2s}{dt^2} = \frac{d}{dt}(15t^2) - \frac{d}{dt}(15t^4) = 30t - 60t^3$

4. $w = 3z^7 - 7z^3 + 21z^2 \Rightarrow \frac{dw}{dz} = 21z^6 - 21z^2 + 42z \Rightarrow \frac{d^2w}{dz^2} = 126z^5 - 42z + 42$

5. $y = \frac{4}{3}x^3 - x \Rightarrow \frac{dy}{dx} = 4x^2 - 1 \Rightarrow \frac{d^2y}{dx^2} = 8x$

6. $y = \frac{x^3}{3} + \frac{x^2}{2} + \frac{x}{4} \Rightarrow \frac{dy}{dx} = x^2 + x + \frac{1}{4} \Rightarrow \frac{d^2y}{dx^2} = 2x + 1 + 0 = 2x + 1$

7. $w = 3z^{-2} - z^{-1} \Rightarrow \frac{dw}{dz} = -6z^{-3} + z^{-2} = \frac{-6}{z^3} + \frac{1}{z^2} \Rightarrow \frac{d^2w}{dz^2} = 18z^{-4} - 2z^{-3} = \frac{18}{z^4} - \frac{2}{z^3}$

8. $s = -2t^{-1} + 4t^{-2} \Rightarrow \frac{ds}{dt} = 2t^{-2} - 8t^{-3} = \frac{2}{t^2} - \frac{8}{t^3} \Rightarrow \frac{d^2s}{dt^2} = -4t^{-3} + 24t^{-4} = \frac{-4}{t^3} + \frac{24}{t^4}$

9. $y = 6x^2 - 10x - 5x^{-2} \Rightarrow \frac{dy}{dx} = 12x - 10 + 10x^{-3} = 12x - 10 + \frac{10}{x^3} \Rightarrow \frac{d^2y}{dx^2} = 12 - 0 - 30x^{-4} = 12 - \frac{30}{x^4}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

10. $y = 4 - 2x - x^{-3} \Rightarrow \frac{dy}{dx} = -2 + 3x^{-4} = -2 + \frac{3}{x^4} \Rightarrow \frac{d^2y}{dx^2} = 0 - 12x^{-5} = \frac{-12}{x^5}$

11. $r = \frac{1}{3}s^{-2} - \frac{5}{2}s^{-1} \Rightarrow \frac{dr}{ds} = -\frac{2}{3}s^{-3} + \frac{5}{2}s^{-2} = \frac{-2}{3s^3} + \frac{5}{2s^2} \Rightarrow \frac{d^2r}{ds^2} = 2s^{-4} - 5s^{-3} = \frac{2}{s^4} - \frac{5}{s^3}$

12. $r = 12\theta^{-1} - 4\theta^{-3} + \theta^{-4} \Rightarrow \frac{dr}{d\theta} = -12\theta^{-2} + 12\theta^{-4} - 4\theta^{-5} = \frac{-12}{\theta^2} + \frac{12}{\theta^4} - \frac{4}{\theta^5} \Rightarrow \frac{d^2r}{d\theta^2} = 24\theta^{-3} - 48\theta^{-5} + 20\theta^{-6}$
$= \frac{24}{\theta^3} - \frac{48}{\theta^5} + \frac{20}{\theta^6}$

13. (a) $y = (3 - x^2)(x^3 - x + 1) \Rightarrow y' = (3 - x^2) \cdot \frac{d}{dx}(x^3 - x + 1) + (x^3 - x + 1) \cdot \frac{d}{dx}(3 - x^2)$
$= (3 - x^2)(3x^2 - 1) + (x^3 - x + 1)(-2x) = -5x^4 + 12x^2 - 2x - 3$
(b) $y = -x^5 + 4x^3 - x^2 - 3x + 3 \Rightarrow y' = -5x^4 + 12x^2 - 2x - 3$

14. (a) $y = (x - 1)(x^2 + x + 1) \Rightarrow y' = (x - 1)(2x + 1) + (x^2 + x + 1)(1) = 3x^2$
(b) $y = (x - 1)(x^2 + x + 1) = x^3 - 1 \Rightarrow y' = 3x^2$

15. (a) $y = (x^2 + 1)\left(x + 5 + \frac{1}{x}\right) \Rightarrow y' = (x^2 + 1) \cdot \frac{d}{dx}\left(x + 5 + \frac{1}{x}\right) + \left(x + 5 + \frac{1}{x}\right) \cdot \frac{d}{dx}(x^2 + 1)$
$= (x^2 + 1)(1 - x^{-2}) + (x + 5 + x^{-1})(2x) = (x^2 - 1 + 1 - x^{-2}) + (2x^2 + 10x + 2) = 3x^2 + 10x + 2 - \frac{1}{x^2}$
(b) $y = x^3 + 5x^2 + 2x + 5 + \frac{1}{x} \Rightarrow y' = 3x^2 + 10x + 2 - \frac{1}{x^2}$

16. $y = \left(x + \frac{1}{x}\right)\left(x - \frac{1}{x} + 1\right)$
(a) $y' = (x + x^{-1}) \cdot (1 + x^{-2}) + (x - x^{-1} + 1)(1 - x^{-2}) = 2x + 1 - \frac{1}{x^2} + \frac{2}{x^3}$
(b) $y = x^2 + x + \frac{1}{x} - \frac{1}{x^2} \Rightarrow y' = 2x + 1 - \frac{1}{x^2} + \frac{2}{x^3}$

17. $y = \frac{2x+5}{3x-2}$; use the quotient rule: $u = 2x + 5$ and $v = 3x - 2 \Rightarrow u' = 2$ and $v' = 3 \Rightarrow y' = \frac{vu' - uv'}{v^2}$
$= \frac{(3x-2)(2) - (2x+5)(3)}{(3x-2)^2} = \frac{6x - 4 - 6x - 15}{(3x-2)^2} = \frac{-19}{(3x-2)^2}$

18. $z = \frac{2x+1}{x^2-1} \Rightarrow \frac{dz}{dx} = \frac{(x^2-1)(2) - (2x+1)(2x)}{(x^2-1)^2} = \frac{2x^2 - 2 - 4x^2 - 2x}{(x^2-1)^2} = \frac{-2x^2 - 2x - 2}{(x^2-1)^2} = \frac{-2(x^2 + x + 1)}{(x^2-1)^2}$

19. $g(x) = \frac{x^2-4}{x+0.5}$; use the quotient rule: $u = x^2 - 4$ and $v = x + 0.5 \Rightarrow u' = 2x$ and $v' = 1 \Rightarrow g'(x) = \frac{vu' - uv'}{v^2}$
$= \frac{(x+0.5)(2x) - (x^2-4)(1)}{(x+0.5)^2} = \frac{2x^2 + x - x^2 + 4}{(x+0.5)^2} = \frac{x^2 + x + 4}{(x+0.5)^2}$

20. $f(t) = \frac{t^2-1}{t^2+t-2} = \frac{(t-1)(t+1)}{(t+2)(t-1)} = \frac{t+1}{t+2}, t \neq 1 \Rightarrow f'(t) = \frac{(t+2)(1) - (t+1)(1)}{(t+2)^2} = \frac{t+2-t-1}{(t+2)^2} = \frac{1}{(t+2)^2}$

21. $v = (1 - t)(1 + t^2)^{-1} = \frac{1-t}{1+t^2} \Rightarrow \frac{dv}{dt} = \frac{(1+t^2)(-1) - (1-t)(2t)}{(1+t^2)^2} = \frac{-1 - t^2 - 2t + 2t^2}{(1+t^2)^2} = \frac{t^2 - 2t - 1}{(1+t^2)^2}$

22. $w = \frac{x+5}{2x-7} \Rightarrow w' = \frac{(2x-7)(1) - (x+5)(2)}{(2x-7)^2} = \frac{2x - 7 - 2x - 10}{(2x-7)^2} = \frac{-17}{(2x-7)^2}$

23. $f(s) = \frac{\sqrt{s}-1}{\sqrt{s}+1} \Rightarrow f'(s) = \frac{(\sqrt{s}+1)\left(\frac{1}{2\sqrt{s}}\right) - (\sqrt{s}-1)\left(\frac{1}{2\sqrt{s}}\right)}{(\sqrt{s}+1)^2} = \frac{(\sqrt{s}+1) - (\sqrt{s}-1)}{2\sqrt{s}(\sqrt{s}+1)^2} = \frac{1}{\sqrt{s}(\sqrt{s}+1)^2}$
NOTE: $\frac{d}{ds}\left(\sqrt{s}\right) = \frac{1}{2\sqrt{s}}$ from Example 2 in Section 2.1

24. $u = \frac{5x+1}{2\sqrt{x}} \Rightarrow \frac{du}{dx} = \frac{(2\sqrt{x})(5) - (5x+1)\left(\frac{1}{\sqrt{x}}\right)}{4x} = \frac{5x-1}{4x^{3/2}}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

25. $v = \frac{1+x-4\sqrt{x}}{x} \Rightarrow v' = \frac{x\left(1-\frac{2}{\sqrt{x}}\right)-\left(1+x-4\sqrt{x}\right)}{x^2} = \frac{2\sqrt{x}-1}{x^2}$

26. $r = 2\left(\frac{1}{\sqrt{\theta}}+\sqrt{\theta}\right) \Rightarrow r' = 2\left(\frac{\sqrt{\theta}(0)-1\left(\frac{1}{2\sqrt{\theta}}\right)}{\theta}+\frac{1}{2\sqrt{\theta}}\right) = -\frac{1}{\theta^{3/2}}+\frac{1}{\theta^{1/2}}$

27. $y = \frac{1}{(x^2-1)(x^2+x+1)}$; use the quotient rule: $u = 1$ and $v = (x^2-1)(x^2+x+1) \Rightarrow u' = 0$ and
$v' = (x^2-1)(2x+1)+(x^2+x+1)(2x) = 2x^3+x^2-2x-1+2x^3+2x^2+2x = 4x^3+3x^2-1$
$\Rightarrow \frac{dy}{dx} = \frac{vu'-uv'}{v^2} = \frac{0-1(4x^3+3x^2-1)}{(x^2-1)^2(x^2+x+1)^2} = \frac{-4x^3-3x^2+1}{(x^2-1)^2(x^2+x+1)^2}$

28. $y = \frac{(x+1)(x+2)}{(x-1)(x-2)} = \frac{x^2+3x+2}{x^2-3x+2} \Rightarrow y' = \frac{(x^2-3x+2)(2x+3)-(x^2+3x+2)(2x-3)}{(x-1)^2(x-2)^2} = \frac{-6x^2+12}{(x-1)^2(x-2)^2}$
$= \frac{-6(x^2-2)}{(x-1)^2(x-2)^2}$

29. $y = \frac{1}{2}x^4-\frac{3}{2}x^2-x \Rightarrow y' = 2x^3-3x-1 \Rightarrow y'' = 6x^2-3 \Rightarrow y''' = 12x \Rightarrow y^{(4)} = 12 \Rightarrow y^{(n)} = 0$ for all $n \geq 5$

30. $y = \frac{1}{120}x^5 \Rightarrow y' = \frac{1}{24}x^4 \Rightarrow y'' = \frac{1}{6}x^3 \Rightarrow y''' = \frac{1}{2}x^2 \Rightarrow y^{(4)} = x \Rightarrow y^{(5)} = 1 \Rightarrow y^{(n)} = 0$ for all $n \geq 6$

31. $y = \frac{x^3+7}{x} = x^2+7x^{-1} \Rightarrow \frac{dy}{dx} = 2x-7x^{-2} = 2x-\frac{7}{x^2} \Rightarrow \frac{d^2y}{dx^2} = 2+14x^{-3} = 2+\frac{14}{x^3}$

32. $s = \frac{t^2+5t-1}{t^2} = 1+\frac{5}{t}-\frac{1}{t^2} = 1+5t^{-1}-t^{-2} \Rightarrow \frac{ds}{dt} = 0-5t^{-2}+2t^{-3} = -5t^{-2}+2t^{-3} = \frac{-5}{t^2}+\frac{2}{t^3}$
$\Rightarrow \frac{d^2s}{dt^2} = 10t^{-3}-6t^{-4} = \frac{10}{t^3}-\frac{6}{t^4}$

33. $r = \frac{(\theta-1)(\theta^2+\theta+1)}{\theta^3} = \frac{\theta^3-1}{\theta^3} = 1-\frac{1}{\theta^3} = 1-\theta^{-3} \Rightarrow \frac{dr}{d\theta} = 0+3\theta^{-4} = 3\theta^{-4} = \frac{3}{\theta^4} \Rightarrow \frac{d^2r}{d\theta^2} = -12\theta^{-5} = \frac{-12}{\theta^5}$

34. $u = \frac{(x^2+x)(x^2-x+1)}{x^4} = \frac{x(x+1)(x^2-x+1)}{x^4} = \frac{x(x^3+1)}{x^4} = \frac{x^4+x}{x^4} = 1+\frac{x}{x^4} = 1+x^{-3}$
$\Rightarrow \frac{du}{dx} = 0-3x^{-4} = -3x^{-4} = \frac{-3}{x^4} \Rightarrow \frac{d^2u}{dx^2} = 12x^{-5} = \frac{12}{x^5}$

35. $w = \left(\frac{1+3z}{3z}\right)(3-z) = \left(\frac{1}{3}z^{-1}+1\right)(3-z) = z^{-1}-\frac{1}{3}+3-z = z^{-1}+\frac{8}{3}-z \Rightarrow \frac{dw}{dz} = -z^{-2}+0-1 = -z^{-2}-1$
$= \frac{-1}{z^2}-1 \Rightarrow \frac{d^2w}{dz^2} = 2z^{-3}-0 = 2z^{-3} = \frac{2}{z^3}$

36. $w = (z+1)(z-1)(z^2+1) = (z^2-1)(z^2+1) = z^4-1 \Rightarrow \frac{dw}{dz} = 4z^3-0 = 4z^3 \Rightarrow \frac{d^2w}{dz^2} = 12z^2$

37. $p = \left(\frac{q^2+3}{12q}\right)\left(\frac{q^4-1}{q^3}\right) = \frac{q^6-q^2+3q^4-3}{12q^4} = \frac{1}{12}q^2-\frac{1}{12}q^{-2}+\frac{1}{4}-\frac{1}{4}q^{-4} \Rightarrow \frac{dp}{dq} = \frac{1}{6}q+\frac{1}{6}q^{-3}+q^{-5} = \frac{1}{6}q+\frac{1}{6q^3}+\frac{1}{q^5}$
$\Rightarrow \frac{d^2p}{dq^2} = \frac{1}{6}-\frac{1}{2}q^{-4}-5q^{-6} = \frac{1}{6}-\frac{1}{2q^4}-\frac{5}{q^6}$

38. $p = \frac{q^2+3}{(q-1)^3+(q+1)^3} = \frac{q^2+3}{(q^3-3q^2+3q-1)+(q^3+3q^2+3q+1)} = \frac{q^2+3}{2q^3+6q} = \frac{q^2+3}{2q(q^2+3)} = \frac{1}{2q} = \frac{1}{2}q^{-1}$
$\Rightarrow \frac{dp}{dq} = -\frac{1}{2}q^{-2} = -\frac{1}{2q^2} \Rightarrow \frac{d^2p}{dq^2} = q^{-3} = \frac{1}{q^3}$

39. $u(0) = 5$, $u'(0) = -3$, $v(0) = -1$, $v'(0) = 2$
(a) $\frac{d}{dx}(uv) = uv'+vu' \Rightarrow \frac{d}{dx}(uv)\Big|_{x=0} = u(0)v'(0)+v(0)u'(0) = 5\cdot 2+(-1)(-3) = 13$
(b) $\frac{d}{dx}\left(\frac{u}{v}\right) = \frac{vu'-uv'}{v^2} \Rightarrow \frac{d}{dx}\left(\frac{u}{v}\right)\Big|_{x=0} = \frac{v(0)u'(0)-u(0)v'(0)}{(v(0))^2} = \frac{(-1)(-3)-(5)(2)}{(-1)^2} = -7$
(c) $\frac{d}{dx}\left(\frac{v}{u}\right) = \frac{uv'-vu'}{u^2} \Rightarrow \frac{d}{dx}\left(\frac{v}{u}\right)\Big|_{x=0} = \frac{u(0)v'(0)-v(0)u'(0)}{(u(0))^2} = \frac{(5)(2)-(-1)(-3)}{(5)^2} = \frac{7}{25}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(d) $\frac{d}{dx}(7v-2u) = 7v' - 2u' \Rightarrow \frac{d}{dx}(7v-2u)\Big|_{x=0} = 7v'(0) - 2u'(0) = 7\cdot 2 - 2(-3) = 20$

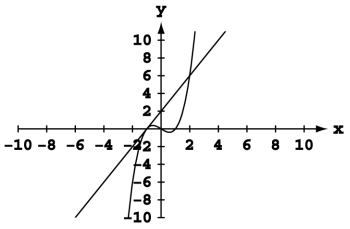
40. $u(1)=2,\ u'(1)=0,\ v(1)=5,\ v'(1)=-1$
(a) $\frac{d}{dx}(uv)\Big|_{x=1} = u(1)v'(1) + v(1)u'(1) = 2\cdot(-1) + 5\cdot 0 = -2$
(b) $\frac{d}{dx}\left(\frac{u}{v}\right)\Big|_{x=1} = \frac{v(1)u'(1) - u(1)v'(1)}{(v(1))^2} = \frac{5\cdot 0 - 2\cdot(-1)}{(5)^2} = \frac{2}{25}$
(c) $\frac{d}{dx}\left(\frac{v}{u}\right)\Big|_{x=1} = \frac{u(1)v'(1) - v(1)u'(1)}{(u(1))^2} = \frac{2\cdot(-1) - 5\cdot 0}{(2)^2} = -\frac{1}{2}$
(d) $\frac{d}{dx}(7v-2u)\Big|_{x=1} = 7v'(1) - 2u'(1) = 7\cdot(-1) - 2\cdot 0 = -7$

41. $y = x^3 - 4x + 1$. Note that $(2,1)$ is on the curve: $1 = 2^3 - 4(2) + 1$
(a) Slope of the tangent at $(x,y)$ is $y' = 3x^2 - 4 \Rightarrow$ slope of the tangent at $(2,1)$ is $y'(2) = 3(2)^2 - 4 = 8$. Thus the slope of the line perpendicular to the tangent at $(2,1)$ is $-\frac{1}{8} \Rightarrow$ the equation of the line perpendicular to to the tangent line at $(2,1)$ is $y - 1 = -\frac{1}{8}(x-2)$ or $y = -\frac{x}{8} + \frac{5}{4}$.
(b) The slope of the curve at x is $m = 3x^2 - 4$ and the smallest value for m is $-4$ when $x = 0$ and $y = 1$.
(c) We want the slope of the curve to be $8 \Rightarrow y' = 8 \Rightarrow 3x^2 - 4 = 8 \Rightarrow 3x^2 = 12 \Rightarrow x^2 = 4 \Rightarrow x = \pm 2$. When $x = 2$, $y = 1$ and the tangent line has equation $y - 1 = 8(x-2)$ or $y = 8x - 15$; when $x = -2$, $y = (-2)^3 - 4(-2) + 1 = 1$, and the tangent line has equation $y - 1 = 8(x+2)$ or $y = 8x + 17$.

42. (a) $y = x^3 - 3x - 2 \Rightarrow y' = 3x^2 - 3$. For the tangent to be horizontal, we need $m = y' = 0 \Rightarrow 0 = 3x^2 - 3 \Rightarrow 3x^2 = 3 \Rightarrow x = \pm 1$. When $x = -1$, $y = 0 \Rightarrow$ the tangent line has equation $y = 0$. The line perpendicular to this line at $(-1,0)$ is $x = -1$. When $x = 1$, $y = -4 \Rightarrow$ the tangent line has equation $y = -4$. The line perpendicular to this line at $(1,-4)$ is $x = 1$.
(b) The smallest value of $y'$ is $-3$, and this occurs when $x = 0$ and $y = -2$. The tangent to the curve at $(0,-2)$ has slope $-3 \Rightarrow$ the line perpendicular to the tangent at $(0,-2)$ has slope $\frac{1}{3} \Rightarrow y + 2 = \frac{1}{3}(x-0)$ or $y = \frac{1}{3}x - 2$ is an equation of the perpendicular line.

43. $y = \frac{4x}{x^2+1} \Rightarrow \frac{dy}{dx} = \frac{(x^2+1)(4) - (4x)(2x)}{(x^2+1)^2} = \frac{4x^2+4-8x^2}{(x^2+1)^2} = \frac{4(-x^2+1)}{(x^2+1)^2}$. When $x = 0$, $y = 0$ and $y' = \frac{4(0+1)}{1} = 4$, so the tangent to the curve at $(0,0)$ is the line $y = 4x$. When $x = 1$, $y = 2 \Rightarrow y' = 0$, so the tangent to the curve at $(1,2)$ is the line $y = 2$.

44. $y = \frac{8}{x^2+4} \Rightarrow y' = \frac{(x^2+4)(0) - 8(2x)}{(x^2+4)^2} = \frac{-16x}{(x^2+4)^2}$. When $x = 2$, $y = 1$ and $y' = \frac{-16(2)}{(2^2+4)^2} = -\frac{1}{2}$, so the tangent line to the curve at $(2,1)$ has the equation $y - 1 = -\frac{1}{2}(x-2)$, or $y = -\frac{x}{2} + 2$.

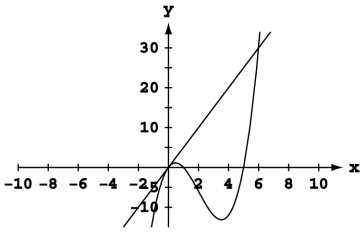


45. $y = ax^2 + bx + c$ passes through $(0,0) \Rightarrow 0 = a(0) + b(0) + c \Rightarrow c = 0$; $y = ax^2 + bx$ passes through $(1,2) \Rightarrow 2 = a + b$; $y' = 2ax + b$ and since the curve is tangent to $y = x$ at the origin, its slope is 1 at $x = 0 \Rightarrow y' = 1$ when $x = 0 \Rightarrow 1 = 2a(0) + b \Rightarrow b = 1$. Then $a + b = 2 \Rightarrow a = 1$. In summary $a = b = 1$ and $c = 0$ so the curve is $y = x^2 + x$.

46. $y = cx - x^2$ passes through $(1,0) \Rightarrow 0 = c(1) - 1 \Rightarrow c = 1 \Rightarrow$ the curve is $y = x - x^2$. For this curve, $y' = 1 - 2x$ and $x = 1 \Rightarrow y' = -1$. Since $y = x - x^2$ and $y = x^2 + ax + b$ have common tangents at $x = 0$, $y = x^2 + ax + b$ must also have slope $-1$ at $x = 1$. Thus $y' = 2x + a \Rightarrow -1 = 2\cdot 1 + a \Rightarrow a = -3 \Rightarrow y = x^2 - 3x + b$. Since this last curve passes through $(1,0)$, we have $0 = 1 - 3 + b \Rightarrow b = 2$. In summary, $a = -3$, $b = 2$ and $c = 1$ so the curves are $y = x^2 - 3x + 2$ and $y = x - x^2$.

47. (a) $y = x^3 - x \Rightarrow y' = 3x^2 - 1$. When $x = -1$, $y = 0$ and $y' = 2 \Rightarrow$ the tangent line to the curve at $(-1,0)$ is $y = 2(x+1)$ or $y = 2x + 2$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



(b)

(c) $\left.\begin{array}{l} y = x^3 - x \\ y = 2x + 2 \end{array}\right\} \Rightarrow x^3 - x = 2x + 2 \Rightarrow x^3 - 3x - 2 = (x-2)(x+1)^2 = 0 \Rightarrow x = 2$ or $x = -1$. Since $y = 2(2) + 2 = 6$; the other intersection point is $(2, 6)$

48. (a) $y = x^3 - 6x^2 + 5x \Rightarrow y' = 3x^2 - 12x + 5$. When $x = 0$, $y = 0$ and $y' = 5 \Rightarrow$ the tangent line to the curve at $(0, 0)$ is $y = 5x$.

(b)

(c) $\left.\begin{array}{l} y = x^3 - 6x^2 + 5x \\ y = 5x \end{array}\right\} \Rightarrow x^3 - 6x^2 + 5x = 5x \Rightarrow x^3 - 6x^2 = 0 \Rightarrow x^2(x-6) = 0 \Rightarrow x = 0$ or $x = 6$. Since $y = 5(6) = 30$, the other intersection point is $(6, 30)$.

49. $P(x) = a_n x^n + a_{n-1}x^{n-1} + \cdots + a_2x^2 + a_1x + a_0 \Rightarrow P'(x) = na_nx^{n-1} + (n-1)a_{n-1}x^{n-2} + \cdots + 2a_2x + a_1$

50. $R = M^2\left(\frac{C}{2} - \frac{M}{3}\right) = \frac{C}{2}M^2 - \frac{1}{3}M^3$, where C is a constant $\Rightarrow \frac{dR}{dM} = CM - M^2$

51. Let c be a constant $\Rightarrow \frac{dc}{dx} = 0 \Rightarrow \frac{d}{dx}(u \cdot c) = u \cdot \frac{dc}{dx} + c \cdot \frac{du}{dx} = u \cdot 0 + c\,\frac{du}{dx} = c\,\frac{du}{dx}$. Thus when one of the functions is a constant, the Product Rule is just the Constant Multiple Rule $\Rightarrow$ the Constant Multiple Rule is a special case of the Product Rule.

52. (a) We use the Quotient rule to derive the Reciprocal Rule (with $u = 1$): $\frac{d}{dx}\left(\frac{1}{v}\right) = \frac{v\cdot 0 - 1\cdot\frac{dv}{dx}}{v^2} = \frac{-1\cdot\frac{dv}{dx}}{v^2}$ $= -\frac{1}{v^2}\cdot\frac{dv}{dx}$.

(b) Now, using the Reciprocal Rule and the Product Rule, we'll derive the Quotient Rule: $\frac{d}{dx}\left(\frac{u}{v}\right) = \frac{d}{dx}\left(u \cdot \frac{1}{v}\right)$ $= u \cdot \frac{d}{dx}\left(\frac{1}{v}\right) + \frac{1}{v}\cdot\frac{du}{dx}$ (Product Rule) $= u \cdot \left(\frac{-1}{v^2}\right)\frac{dv}{dx} + \frac{1}{v}\,\frac{du}{dx}$ (Reciprocal Rule) $\Rightarrow \frac{d}{dx}\left(\frac{u}{v}\right) = \frac{-u\,\frac{dv}{dx} + v\,\frac{du}{dx}}{v^2}$ $= \frac{v\,\frac{du}{dx} - u\,\frac{dv}{dx}}{v^2}$, the Quotient Rule.

53. (a) $\frac{d}{dx}(uvw) = \frac{d}{dx}((uv)\cdot w) = (uv)\frac{dw}{dx} + w\cdot\frac{d}{dx}(uv) = uv\,\frac{dw}{dx} + w\left(u\,\frac{dv}{dx} + v\,\frac{du}{dx}\right) = uv\,\frac{dw}{dx} + wu\,\frac{dv}{dx} + wv\,\frac{du}{dx}$ $= uvw' + uv'w + u'vw$

(b) $\frac{d}{dx}(u_1u_2u_3u_4) = \frac{d}{dx}((u_1u_2u_3)\,u_4) = (u_1u_2u_3)\,\frac{du_4}{dx} + u_4\,\frac{d}{dx}(u_1u_2u_3) \Rightarrow \frac{d}{dx}(u_1u_2u_3u_4)$ $= u_1u_2u_3\,\frac{du_4}{dx} + u_4\left(u_1u_2\,\frac{du_3}{dx} + u_3u_1\,\frac{du_2}{dx} + u_3u_2\,\frac{du_1}{dx}\right)$ (using (a) above) $\Rightarrow \frac{d}{dx}(u_1u_2u_3u_4) = u_1u_2u_3\,\frac{du_4}{dx} + u_1u_2u_4\,\frac{du_3}{dx} + u_1u_3u_4\,\frac{du_2}{dx} + u_2u_3u_4\,\frac{du_1}{dx}$ $= u_1u_2u_3u_4' + u_1u_2u_3'u_4 + u_1u_2'u_3u_4 + u_1'u_2u_3u_4$

(c) Generalizing (a) and (b) above, $\frac{d}{dx}(u_1\cdots u_n) = u_1u_2\cdots u_{n-1}u_n' + u_1u_2\cdots u_{n-2}u_{n-1}'u_n + \ldots + u_1'u_2\cdots u_n$

54. In this problem we don't know the Power Rule works with fractional powers so we can't use it. Remember $\frac{d}{dx}\left(\sqrt{x}\right) = \frac{1}{2\sqrt{x}}$ (from Example 2 in Section 2.1)

(a) $\frac{d}{dx}\left(x^{3/2}\right) = \frac{d}{dx}\left(x \cdot x^{1/2}\right) = x \cdot \frac{d}{dx}\left(\sqrt{x}\right) + \sqrt{x}\,\frac{d}{dx}(x) = x \cdot \frac{1}{2\sqrt{x}} + \sqrt{x} \cdot 1 = \frac{\sqrt{x}}{2} + \sqrt{x} = \frac{3\sqrt{x}}{2} = \frac{3}{2}x^{1/2}$

(b) $\frac{d}{dx}\left(x^{5/2}\right) = \frac{d}{dx}\left(x^2 \cdot x^{1/2}\right) = x^2\,\frac{d}{dx}\left(\sqrt{x}\right) + \sqrt{x}\,\frac{d}{dx}\left(x^2\right) = x^2 \cdot \left(\frac{1}{2\sqrt{x}}\right) + \sqrt{x} \cdot 2x = \frac{1}{2}x^{3/2} + 2x^{3/2} = \frac{5}{2}x^{3/2}$

(c) $\frac{d}{dx}\left(x^{7/2}\right) = \frac{d}{dx}\left(x^3 \cdot x^{1/2}\right) = x^3\,\frac{d}{dx}\left(\sqrt{x}\right) + \sqrt{x}\,\frac{d}{dx}\left(x^3\right) = x^3 \cdot \left(\frac{1}{2\sqrt{x}}\right) + \sqrt{x} \cdot 3x^2 = \frac{1}{2}x^{5/2} + 3x^{5/2} = \frac{7}{2}x^{5/2}$

(d) We have $\frac{d}{dx}\left(x^{3/2}\right) = \frac{3}{2}x^{1/2}$, $\frac{d}{dx}\left(x^{5/2}\right) = \frac{5}{2}x^{3/2}$, $\frac{d}{dx}\left(x^{7/2}\right) = \frac{7}{2}x^{5/2}$ so it appears that $\frac{d}{dx}\left(x^{n/2}\right) = \frac{n}{2}x^{(n/2)-1}$ whenever n is an odd positive integer $\geq 3$.

55. $p = \frac{nRT}{V-nb} - \frac{an^2}{V^2}$. We are holding T constant, and a, b, n, R are also constant so their derivatives are zero

$\Rightarrow \frac{dP}{dV} = \frac{(V-nb)\cdot 0 - (nRT)(1)}{(V-nb)^2} - \frac{V^2(0) - (an^2)(2V)}{(V^2)^2} = \frac{-nRT}{(V-nb)^2} + \frac{2an^2}{V^3}$

56. $A(q) = \frac{km}{q} + cm + \frac{hq}{2} = (km)q^{-1} + cm + \left(\frac{h}{2}\right)q \Rightarrow \frac{dA}{dq} = -(km)q^{-2} + \left(\frac{h}{2}\right) = -\frac{km}{q^2} + \frac{h}{2} \Rightarrow \frac{d^2A}{dt^2} = 2(km)q^{-3} = \frac{2km}{q^3}$

## 3.3 THE DERIVATIVE AS A RATE OF CHANGE

1. $s = t^2 - 3t + 2,\ 0 \leq t \leq 2$

(a) displacement $= \Delta s = s(2) - s(0) = 0m - 2m = -2$ m, $v_{av} = \frac{\Delta s}{\Delta t} = \frac{-2}{2} = -1$ m/sec

(b) $v = \frac{ds}{dt} = 2t - 3 \Rightarrow |v(0)| = |-3| = 3$ m/sec and $|v(2)| = 1$ m/sec;
$a = \frac{d^2s}{dt^2} = 2 \Rightarrow a(0) = 2$ m/sec$^2$ and $a(2) = 2$ m/sec$^2$

(c) $v = 0 \Rightarrow 2t - 3 = 0 \Rightarrow t = \frac{3}{2}$. v is negative in the interval $0 < t < \frac{3}{2}$ and v is positive when $\frac{3}{2} < t < 2 \Rightarrow$ the body changes direction at $t = \frac{3}{2}$.

2. $s = 6t - t^2,\ 0 \leq t \leq 6$

(a) displacement $= \Delta s = s(6) - s(0) = 0$ m, $v_{av} = \frac{\Delta s}{\Delta t} = \frac{0}{6} = 0$ m/sec

(b) $v = \frac{ds}{dt} = 6 - 2t \Rightarrow |v(0)| = |6| = 6$ m/sec and $|v(6)| = |-6| = 6$ m/sec;
$a = \frac{d^2s}{dt^2} = -2 \Rightarrow a(0) = -2$ m/sec$^2$ and $a(6) = -2$ m/sec$^2$

(c) $v = 0 \Rightarrow 6 - 2t = 0 \Rightarrow t = 3$. v is positive in the interval $0 < t < 3$ and v is negative when $3 < t < 6 \Rightarrow$ the body changes direction at $t = 3$.

3. $s = -t^3 + 3t^2 - 3t,\ 0 \leq t \leq 3$

(a) displacement $= \Delta s = s(3) - s(0) = -9$ m, $v_{av} = \frac{\Delta s}{\Delta t} = \frac{-9}{3} = -3$ m/sec

(b) $v = \frac{ds}{dt} = -3t^2 + 6t - 3 \Rightarrow |v(0)| = |-3| = 3$ m/sec and $|v(3)| = |-12| = 12$ m/sec; $a = \frac{d^2s}{dt^2} = -6t + 6$
$\Rightarrow a(0) = 6$ m/sec$^2$ and $a(3) = -12$ m/sec$^2$

(c) $v = 0 \Rightarrow -3t^2 + 6t - 3 = 0 \Rightarrow t^2 - 2t + 1 = 0 \Rightarrow (t-1)^2 = 0 \Rightarrow t = 1$. For all other values of t in the interval the velocity v is negative (the graph of $v = -3t^2 + 6t - 3$ is a parabola with vertex at $t = 1$ which opens downward $\Rightarrow$ the body never changes direction).

4. $s = \frac{t^4}{4} - t^3 + t^2,\ 0 \leq t \leq 3$

(a) $\Delta s = s(3) - s(0) = \frac{9}{4}$ m, $v_{av} = \frac{\Delta s}{\Delta t} = \frac{\frac{9}{4}}{3} = \frac{3}{4}$ m/sec

(b) $v = t^3 - 3t^2 + 2t \Rightarrow |v(0)| = 0$ m/sec and $|v(3)| = 6$ m/sec; $a = 3t^2 - 6t + 2 \Rightarrow a(0) = 2$ m/sec$^2$ and $a(3) = 11$ m/sec$^2$

(c) $v = 0 \Rightarrow t^3 - 3t^2 + 2t = 0 \Rightarrow t(t-2)(t-1) = 0 \Rightarrow t = 0, 1, 2 \Rightarrow v = t(t-2)(t-1)$ is positive in the interval for $0 < t < 1$ and v is negative for $1 < t < 2$ and v is positive for $2 < t < 3 \Rightarrow$ the body changes direction at

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$t = 1$ and at $t = 2$.

5. $s = \frac{25}{t^2} - \frac{5}{t}$, $1 \le t \le 5$
   (a) $\Delta s = s(5) - s(1) = -20$ m, $v_{av} = \frac{-20}{4} = -5$ m/sec
   (b) $v = \frac{-50}{t^3} + \frac{5}{t^2} \Rightarrow |v(1)| = 45$ m/sec and $|v(5)| = \frac{1}{5}$ m/sec; $a = \frac{150}{t^4} - \frac{10}{t^3} \Rightarrow a(1) = 140$ m/sec$^2$ and $a(5) = \frac{4}{25}$ m/sec$^2$
   (c) $v = 0 \Rightarrow \frac{-50+5t}{t^3} = 0 \Rightarrow -50 + 5t = 0 \Rightarrow t = 10 \Rightarrow$ the body does not change direction in the interval

6. $s = \frac{25}{t+5}$, $-4 \le t \le 0$
   (a) $\Delta s = s(0) - s(-4) = -20$ m, $v_{av} = -\frac{20}{4} = -5$ m/sec
   (b) $v = \frac{-25}{(t+5)^2} \Rightarrow |v(-4)| = 25$ m/sec and $|v(0)| = 1$ m/sec; $a = \frac{50}{(t+5)^3} \Rightarrow a(-4) = 50$ m/sec$^2$ and $a(0) = \frac{2}{5}$ m/sec$^2$
   (c) $v = 0 \Rightarrow \frac{-25}{(t+5)^2} = 0 \Rightarrow$ v is never 0 $\Rightarrow$ the body never changes direction

7. $s = t^3 - 6t^2 + 9t$ and let the positive direction be to the right on the s-axis.
   (a) $v = 3t^2 - 12t + 9$ so that $v = 0 \Rightarrow t^2 - 4t + 3 = (t-3)(t-1) = 0 \Rightarrow t = 1$ or 3; $a = 6t - 12 \Rightarrow a(1) = -6$ m/sec$^2$ and $a(3) = 6$ m/sec$^2$. Thus the body is motionless but being accelerated left when $t = 1$, and motionless but being accelerated right when $t = 3$.
   (b) $a = 0 \Rightarrow 6t - 12 = 0 \Rightarrow t = 2$ with speed $|v(2)| = |12 - 24 + 9| = 3$ m/sec
   (c) The body moves to the right or forward on $0 \le t < 1$, and to the left or backward on $1 < t < 2$. The positions are $s(0) = 0$, $s(1) = 4$ and $s(2) = 2 \Rightarrow$ total distance $= |s(1) - s(0)| + |s(2) - s(1)| = |4| + |-2| = 6$ m.

8. $v = t^2 - 4t + 3 \Rightarrow a = 2t - 4$
   (a) $v = 0 \Rightarrow t^2 - 4t + 3 = 0 \Rightarrow t = 1$ or $3 \Rightarrow a(1) = -2$ m/sec$^2$ and $a(3) = 2$ m/sec$^2$
   (b) $v > 0 \Rightarrow (t-3)(t-1) > 0 \Rightarrow 0 \le t < 1$ or $t > 3$ and the body is moving forward; $v < 0 \Rightarrow (t-3)(t-1) < 0 \Rightarrow 1 < t < 3$ and the body is moving backward
   (c) velocity increasing $\Rightarrow a > 0 \Rightarrow 2t - 4 > 0 \Rightarrow t > 2$; velocity decreasing $\Rightarrow a < 0 \Rightarrow 2t - 4 < 0 \Rightarrow 0 \le t < 2$

9. $s_m = 1.86t^2 \Rightarrow v_m = 3.72t$ and solving $3.72t = 27.8 \Rightarrow t \approx 7.5$ sec on Mars; $s_j = 11.44t^2 \Rightarrow v_j = 22.88t$ and solving $22.88t = 27.8 \Rightarrow t \approx 1.2$ sec on Jupiter.

10. (a) $v(t) = s'(t) = 24 - 1.6t$ m/sec, and $a(t) = v'(t) = s''(t) = -1.6$ m/sec$^2$
    (b) Solve $v(t) = 0 \Rightarrow 24 - 1.6t = 0 \Rightarrow t = 15$ sec
    (c) $s(15) = 24(15) - .8(15)^2 = 180$ m
    (d) Solve $s(t) = 90 \Rightarrow 24t - .8t^2 = 90 \Rightarrow t = \frac{30 \pm 15\sqrt{2}}{2} \approx 4.39$ sec going up and 25.6 sec going down
    (e) Twice the time it took to reach its highest point or 30 sec

11. $s = 15t - \frac{1}{2} g_s t^2 \Rightarrow v = 15 - g_s t$ so that $v = 0 \Rightarrow 15 - g_s t = 0 \Rightarrow g_s = \frac{15}{t}$. Therefore $g_s = \frac{15}{20} = \frac{3}{4} = 0.75$ m/sec$^2$

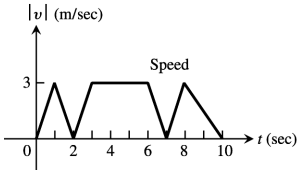
12. Solving $s_m = 832t - 2.6t^2 = 0 \Rightarrow t(832 - 2.6t) = 0 \Rightarrow t = 0$ or $320 \Rightarrow 320$ sec on the moon; solving $s_e = 832t - 16t^2 = 0 \Rightarrow t(832 - 16t) = 0 \Rightarrow t = 0$ or $52 \Rightarrow 52$ sec on the earth. Also, $v_m = 832 - 5.2t = 0 \Rightarrow t = 160$ and $s_m(160) = 66{,}560$ ft, the height it reaches above the moon's surface; $v_e = 832 - 32t = 0 \Rightarrow t = 26$ and $s_e(26) = 10{,}816$ ft, the height it reaches above the earth's surface.

13. (a) $s = 179 - 16t^2 \Rightarrow v = -32t \Rightarrow$ speed $= |v| = 32t$ ft/sec and $a = -32$ ft/sec$^2$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

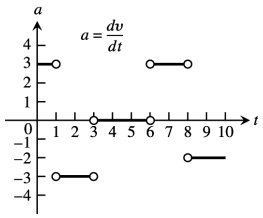
(b) $s = 0 \Rightarrow 179 - 16t^2 = 0 \Rightarrow t = \sqrt{\frac{179}{16}} \approx 3.3$ sec

(c) When $t = \sqrt{\frac{179}{16}}$, $v = -32\sqrt{\frac{179}{16}} = -8\sqrt{179} \approx -107.0$ ft/sec



14. (a) $\lim_{\theta \to \frac{\pi}{2}} v = \lim_{\theta \to \frac{\pi}{2}} 9.8(\sin\theta)t = 9.8t$ so we expect $v = 9.8t$ m/sec in free fall

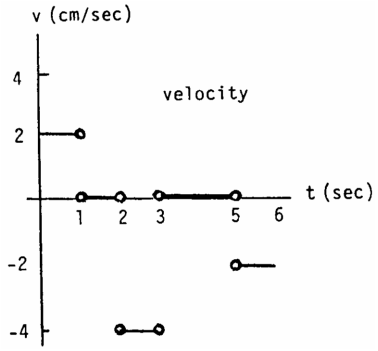
(b) $a = \frac{dv}{dt} = 9.8$ m/sec$^2$

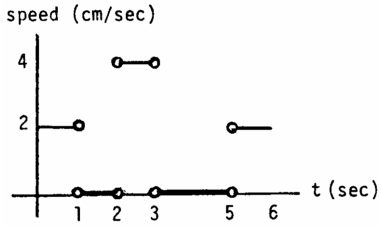


15. (a) at 2 and 7 seconds

(b) between 3 and 6 seconds: $3 \le t \le 6$

(c)





(d)

16. (a) P is moving to the left when $2 < t < 3$ or $5 < t < 6$; P is moving to the right when $0 < t < 1$; P is standing still when $1 < t < 2$ or $3 < t < 5$

(b)

17. (a) 190 ft/sec

(b) 2 sec

(c) at 8 sec, 0 ft/sec

(d) 10.8 sec, 90 ft/sec

(e) From $t = 8$ until $t = 10.8$ sec, a total of 2.8 sec

(f) Greatest acceleration happens 2 sec after launch

(g) From $t = 2$ to $t = 10.8$ sec; during this period, $a = \frac{v(10.8) - v(2)}{10.8 - 2} \approx -32$ ft/sec$^2$

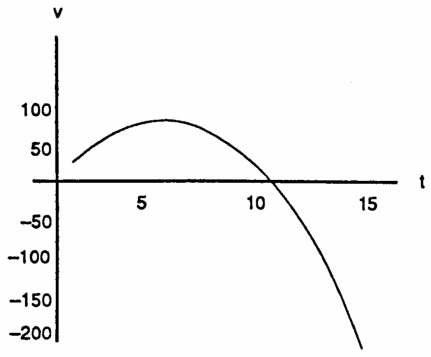
18. (a) Forward: $0 \le t < 1$ and $5 < t < 7$; Backward: $1 < t < 5$; Speeds up: $1 < t < 2$ and $5 < t < 6$; Slows down: $0 \le t < 1$, $3 < t < 5$, and $6 < t < 7$

(b) Positive: $3 < t < 6$; negative: $0 \le t < 2$ and $6 < t < 7$; zero: $2 < t < 3$ and $7 < t < 9$

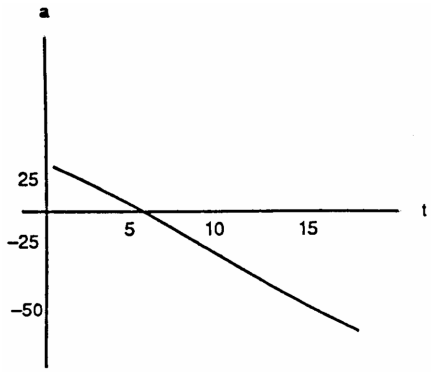
(c) $t = 0$ and $2 \le t \le 3$

(d) $7 \le t \le 9$

19. $s = 490t^2 \Rightarrow v = 980t \Rightarrow a = 980$

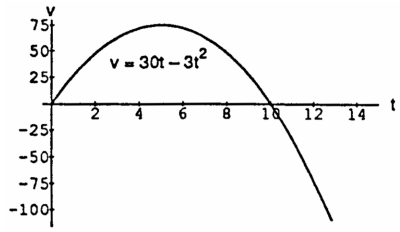


(a) Solving $160 = 490t^2 \Rightarrow t = \frac{4}{7}$ sec. The average velocity was $\frac{s(4/7) - s(0)}{4/7} = 280$ cm/sec.

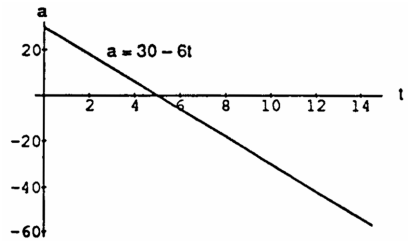


(b) At the 160 cm mark the balls are falling at $v(4/7) = 560$ cm/sec. The acceleration at the 160 cm mark was 980 cm/sec$^2$.

(c) The light was flashing at a rate of $\frac{17}{4/7} = 29.75$ flashes per second.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



20. (a)

(b)

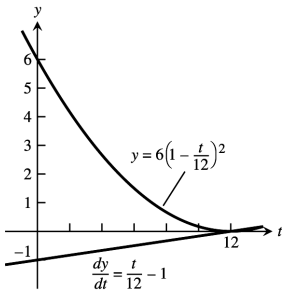
21. C = position, A = velocity, and B = acceleration. Neither A nor C can be the derivative of B because B's derivative is constant. Graph C cannot be the derivative of A either, because A has some negative slopes while C has only positive values. So, C (being the derivative of neither A nor B) must be the graph of position. Curve C has both positive and negative slopes, so its derivative, the velocity, must be A and not B. That leaves B for acceleration.

22. C = position, B = velocity, and A = acceleration. Curve C cannot be the derivative of either A or B because C has only negative values while both A and B have some positive slopes. So, C represents position. Curve C has no positive slopes, so its derivative, the velocity, must be B. That leaves A for acceleration. Indeed, A is negative where B has negative slopes and positive where B has positive slopes.

23. (a) $c(100) = 11{,}000 \Rightarrow c_{av} = \frac{11{,}000}{100} = \$110$
    (b) $c(x) = 2000 + 100x - .1x^2 \Rightarrow c'(x) = 100 - .2x$. Marginal cost $= c'(x) \Rightarrow$ the marginal cost of producing 100 machines is $c'(100) = \$80$
    (c) The cost of producing the $101^{st}$ machine is $c(101) - c(100) = 100 - \frac{201}{10} = \$79.90$

24. (a) $r(x) = 20000\left(1 - \frac{1}{x}\right) \Rightarrow r'(x) = \frac{20000}{x^2}$, which is marginal revenue.
    (b) $r'(100) = \frac{20000}{100^2} = \$2$.
    (c) $\lim_{x \to \infty} r'(x) = \lim_{x \to \infty} \frac{20000}{x^2} = 0$. The increase in revenue as the number of items increases without bound will approach zero.

25. $b(t) = 10^6 + 10^4 t - 10^3 t^2 \Rightarrow b'(t) = 10^4 - (2)(10^3 t) = 10^3(10 - 2t)$
    (a) $b'(0) = 10^4$ bacteria/hr
    (b) $b'(5) = 0$ bacteria/hr
    (c) $b'(10) = -10^4$ bacteria/hr



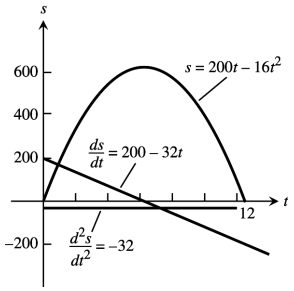
26. $Q(t) = 200(30 - t)^2 = 200\,(900 - 60t + t^2) \Rightarrow Q'(t) = 200(-60 + 2t) \Rightarrow Q'(10) = -8{,}000$ gallons/min is the rate the water is running at the end of 10 min. Then $\frac{Q(10) - Q(0)}{10} = -10{,}000$ gallons/min is the average rate the water flows during the first 10 min. The negative signs indicate water is leaving the tank.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

27. (a) $y = 6\left(1 - \frac{t}{12}\right)^2 = 6\left(1 - \frac{t}{6} + \frac{t^2}{144}\right) \Rightarrow \frac{dy}{dt} = \frac{t}{12} - 1$

(b) The largest value of $\frac{dy}{dt}$ is 0 m/h when $t = 12$ and the fluid level is falling the slowest at that time. The smallest value of $\frac{dy}{dt}$ is $-1$ m/h, when $t = 0$, and the fluid level is falling the fastest at that time.

(c) In this situation, $\frac{dy}{dt} \le 0 \Rightarrow$ the graph of y is always decreasing. As $\frac{dy}{dt}$ increases in value, the slope of the graph of y increases from $-1$ to 0 over the interval $0 \le t \le 12$.



28. (a) $V = \frac{4}{3}\pi r^3 \Rightarrow \frac{dV}{dr} = 4\pi r^2 \Rightarrow \left.\frac{dV}{dr}\right|_{r=2} = 4\pi(2)^2 = 16\pi$ ft$^3$/ft

(b) When $r = 2$, $\frac{dV}{dr} = 16\pi$ so that when r changes by 1 unit, we expect V to change by approximately $16\pi$. Therefore when r changes by 0.2 units V changes by approximately $(16\pi)(0.2) = 3.2\pi \approx 10.05$ ft$^3$. Note that $V(2.2) - V(2) \approx 11.09$ ft$^3$.

29. 200 km/hr $= 55\frac{5}{9}$ m/sec $= \frac{500}{9}$ m/sec, and $D = \frac{10}{9}t^2 \Rightarrow V = \frac{20}{9}t$. Thus $V = \frac{500}{9} \Rightarrow \frac{20}{9}t = \frac{500}{9} \Rightarrow t = 25$ sec. When $t = 25$, $D = \frac{10}{9}(25)^2 = \frac{6250}{9}$ m

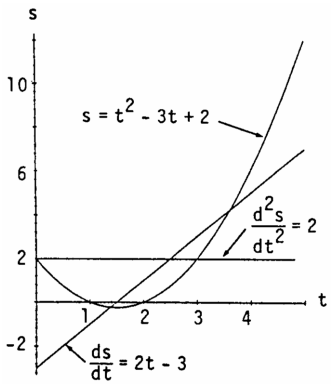
30. $s = v_0 t - 16t^2 \Rightarrow v = v_0 - 32t$; $v = 0 \Rightarrow t = \frac{v_0}{32}$; $1900 = v_0 t - 16t^2$ so that $t = \frac{v_0}{32} \Rightarrow 1900 = \frac{v_0^2}{32} - \frac{v_0^2}{64}$ $\Rightarrow v_0 = \sqrt{(64)(1900)} = 80\sqrt{19}$ ft/sec and, finally, $\frac{80\sqrt{19}\text{ ft}}{\text{sec}} \cdot \frac{60\text{ sec}}{1\text{ min}} \cdot \frac{60\text{ min}}{1\text{ hr}} \cdot \frac{1\text{ mi}}{5280\text{ ft}} \approx 238$ mph.

31.

(a) $v = 0$ when $t = 6.25$ sec

(b) $v > 0$ when $0 \le t < 6.25 \Rightarrow$ body moves up; $v < 0$ when $6.25 < t \le 12.5 \Rightarrow$ body moves down

(c) body changes direction at $t = 6.25$ sec



(d) body speeds up on $(6.25, 12.5]$ and slows down on $[0, 6.25)$

(e) The body is moving fastest at the endpoints $t = 0$ and $t = 12.5$ when it is traveling 200 ft/sec. It's moving slowest at $t = 6.25$ when the speed is 0.

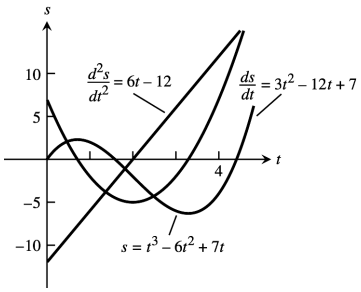
(f) When $t = 6.25$ the body is $s = 625$ m from the origin and farthest away.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

32.

(a) $v = 0$ when $t = \frac{3}{2}$ sec

(b) $v < 0$ when $0 \le t < 1.5 \Rightarrow$ body moves down; $v > 0$ when $1.5 < t \le 5 \Rightarrow$ body moves up



(c) body changes direction at $t = \frac{3}{2}$ sec

(d) body speeds up on $\left(\frac{3}{2}, 5\right]$ and slows down on $\left[0, \frac{3}{2}\right)$

(e) body is moving fastest at $t = 5$ when the speed $= |v(5)| = 7$ units/sec; it is moving slowest at $t = \frac{3}{2}$ when the speed is 0

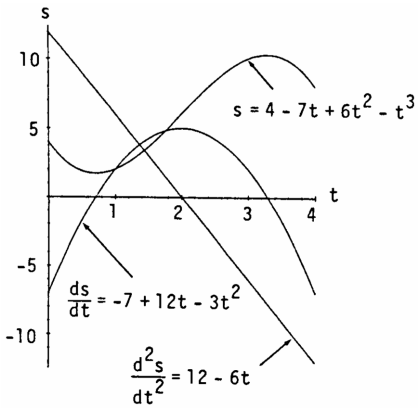
(f) When $t = 5$ the body is $s = 12$ units from the origin and farthest away.

33.

(a) $v = 0$ when $t = \frac{6 \pm \sqrt{15}}{3}$ sec

(b) $v < 0$ when $\frac{6-\sqrt{15}}{3} < t < \frac{6+\sqrt{15}}{3} \Rightarrow$ body moves left; $v > 0$ when $0 \le t < \frac{6-\sqrt{15}}{3}$ or $\frac{6+\sqrt{15}}{3} < t \le 4$ $\Rightarrow$ body moves right

(c) body changes direction at $t = \frac{6 \pm \sqrt{15}}{3}$ sec



(d) body speeds up on $\left(\frac{6-\sqrt{15}}{3}, 2\right) \cup \left(\frac{6+\sqrt{15}}{3}, 4\right]$ and slows down on $\left[0, \frac{6-\sqrt{15}}{3}\right) \cup \left(2, \frac{6+\sqrt{15}}{3}\right)$.

(e) The body is moving fastest at $t = 0$ and $t = 4$ when it is moving 7 units/sec and slowest at $t = \frac{6 \pm \sqrt{15}}{3}$ sec

(f) When $t = \frac{6+\sqrt{15}}{3}$ the body is at position $s \approx -6.303$ units and farthest from the origin.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

34.

(a) $v = 0$ when $t = \frac{6 \pm \sqrt{15}}{3}$

(b) $v < 0$ when $0 \le t < \frac{6-\sqrt{15}}{3}$ or $\frac{6+\sqrt{15}}{3} < t \le 4 \Rightarrow$ body is moving left; $v > 0$ when $\frac{6-\sqrt{15}}{3} < t < \frac{6+\sqrt{15}}{3} \Rightarrow$ body is moving right

(c) body changes direction at $t = \frac{6 \pm \sqrt{15}}{3}$ sec

(d) body speeds up on $\left(\frac{6-\sqrt{15}}{3}, 2\right) \cup \left(\frac{6+\sqrt{15}}{3}, 4\right]$ and slows down on $\left[0, \frac{6-\sqrt{15}}{3}\right) \cup \left(2, \frac{6+\sqrt{15}}{3}\right)$

(e) The body is moving fastest at 7 units/sec when $t = 0$ and $t = 4$; it is moving slowest and stationary at $t = \frac{6 \pm \sqrt{15}}{3}$

(f) When $t = \frac{6+\sqrt{15}}{3}$ the position is $s \approx 10.303$ units and the body is farthest from the origin.

35. (a) It takes 135 seconds.

(b) Average speed $= \frac{\Delta F}{\Delta t} = \frac{5-0}{73-0} = \frac{5}{73} \approx 0.068$ furlongs/sec.

(c) Using a symmetric difference quotient, the horse's speed is approximately $\frac{\Delta F}{\Delta t} = \frac{4-2}{59-33} = \frac{2}{26} \approx 0.077$ furlongs/sec.

(d) The horse is running the fastest during the last furlong (between the 9th and 10th furlong markers). This furlong takes only 11 seconds to run, which is the least amount of time for a furlong.

(e) The horse accelerates the fastest during the first furlong (between markers 0 and 1).

## 3.4 DERIVATIVES OF TRIGONOMETRIC FUNCTIONS

1. $y = -10x + 3\cos x \Rightarrow \frac{dy}{dx} = -10 + 3\frac{d}{dx}(\cos x) = -10 - 3\sin x$

2. $y = \frac{3}{x} + 5\sin x \Rightarrow \frac{dy}{dx} = \frac{-3}{x^2} + 5\frac{d}{dx}(\sin x) = \frac{-3}{x^2} + 5\cos x$

3. $y = \csc x - 4\sqrt{x} + 7 \Rightarrow \frac{dy}{dx} = -\csc x \cot x - \frac{4}{2\sqrt{x}} + 0 = -\csc x \cot x - \frac{2}{\sqrt{x}}$

4. $y = x^2 \cot x - \frac{1}{x^2} \Rightarrow \frac{dy}{dx} = x^2\frac{d}{dx}(\cot x) + \cot x \cdot \frac{d}{dx}(x^2) + \frac{2}{x^3} = -x^2\csc^2 x + (\cot x)(2x) + \frac{2}{x^3}$
$= -x^2\csc^2 x + 2x\cot x + \frac{2}{x^3}$

5. $y = (\sec x + \tan x)(\sec x - \tan x) \Rightarrow \frac{dy}{dx} = (\sec x + \tan x)\frac{d}{dx}(\sec x - \tan x) + (\sec x - \tan x)\frac{d}{dx}(\sec x + \tan x)$
$= (\sec x + \tan x)(\sec x \tan x - \sec^2 x) + (\sec x - \tan x)(\sec x \tan x + \sec^2 x)$
$= (\sec^2 x \tan x + \sec x \tan^2 x - \sec^3 x - \sec^2 x \tan x) + (\sec^2 x \tan x - \sec x \tan^2 x + \sec^3 x - \tan x \sec^2 x) = 0.$
$\left(\text{Note also that } y = \sec^2 x - \tan^2 x = (\tan^2 x + 1) - \tan^2 x = 1 \Rightarrow \frac{dy}{dx} = 0.\right)$

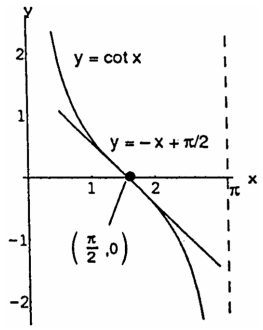
31. Yes, $y = x + \sin x \Rightarrow y' = 1 + \cos x$; horizontal tangent occurs where $1 + \cos x = 0 \Rightarrow \cos x = -1 \Rightarrow x = \pi$

32. No, $y = 2x + \sin x \Rightarrow y' = 2 + \cos x$; horizontal tangent occurs where $2 + \cos x = 0 \Rightarrow \cos x = -2$. But there are no x-values for which $\cos x = -2$.



33. No, $y = x - \cot x \Rightarrow y' = 1 + \csc^2 x$; horizontal tangent occurs where $1 + \csc^2 x = 0 \Rightarrow \csc^2 x = -1$. But there are no x-values for which $\csc^2 x = -1$.

34. Yes, $y = x + 2\cos x \Rightarrow y' = 1 - 2\sin x$; horizontal tangent occurs where $1 - 2\sin x = 0 \Rightarrow 1 = 2\sin x \Rightarrow \frac{1}{2} = \sin x \Rightarrow x = \frac{\pi}{6}$ or $x = \frac{5\pi}{6}$

35. We want all points on the curve where the tangent line has slope 2. Thus, $y = \tan x \Rightarrow y' = \sec^2 x$ so that $y' = 2 \Rightarrow \sec^2 x = 2 \Rightarrow \sec x = \pm\sqrt{2} \Rightarrow x = \pm\frac{\pi}{4}$. Then the tangent line at $\left(\frac{\pi}{4}, 1\right)$ has equation $y - 1 = 2\left(x - \frac{\pi}{4}\right)$; the tangent line at $\left(-\frac{\pi}{4}, -1\right)$ has equation $y + 1 = 2\left(x + \frac{\pi}{4}\right)$.

36. We want all points on the curve $y = \cot x$ where the tangent line has slope $-1$. Thus $y = \cot x \Rightarrow y' = -\csc^2 x$ so that $y' = -1 \Rightarrow -\csc^2 x = -1 \Rightarrow \csc^2 x = 1 \Rightarrow \csc x = \pm 1 \Rightarrow x = \frac{\pi}{2}$. The tangent line at $\left(\frac{\pi}{2}, 0\right)$ is $y = -x + \frac{\pi}{2}$.

37. $y = 4 + \cot x - 2\csc x \Rightarrow y' = -\csc^2 x + 2\csc x \cot x = -\left(\frac{1}{\sin x}\right)\left(\frac{1 - 2\cos x}{\sin x}\right)$
    (a) When $x = \frac{\pi}{2}$, then $y' = -1$; the tangent line is $y = -x + \frac{\pi}{2} + 2$.
    (b) To find the location of the horizontal tangent set $y' = 0 \Rightarrow 1 - 2\cos x = 0 \Rightarrow x = \frac{\pi}{3}$ radians. When $x = \frac{\pi}{3}$, then $y = 4 - \sqrt{3}$ is the horizontal tangent.

38. $y = 1 + \sqrt{2}\csc x + \cot x \Rightarrow y' = -\sqrt{2}\csc x \cot x - \csc^2 x = -\left(\frac{1}{\sin x}\right)\left(\frac{\sqrt{2}\cos x + 1}{\sin x}\right)$
    (a) If $x = \frac{\pi}{4}$, then $y' = -4$; the tangent line is $y = -4x + \pi + 4$.
    (b) To find the location of the horizontal tangent set $y' = 0 \Rightarrow \sqrt{2}\cos x + 1 = 0 \Rightarrow x = \frac{3\pi}{4}$ radians. When $x = \frac{3\pi}{4}$, then $y = 2$ is the horizontal tangent.

39. $\lim_{x \to 2} \sin\left(\frac{1}{x} - \frac{1}{2}\right) = \sin\left(\frac{1}{2} - \frac{1}{2}\right) = \sin 0 = 0$

40. $\lim_{x \to -\frac{\pi}{6}} \sqrt{1 + \cos(\pi \csc x)} = \sqrt{1 + \cos\left(\pi \csc\left(-\frac{\pi}{6}\right)\right)} = \sqrt{1 + \cos(\pi \cdot (-2))} = \sqrt{2}$

41. $\lim_{x \to 0} \sec\left[\cos x + \pi \tan\left(\frac{\pi}{4 \sec x}\right) - 1\right] = \sec\left[\cos 0 + \pi \tan\left(\frac{\pi}{4 \sec 0}\right) - 1\right] = \sec\left[1 + \pi \tan\left(\frac{\pi}{4}\right) - 1\right] = \sec \pi = -1$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

42. $\lim_{x \to 0} \sin\left(\frac{\pi+\tan x}{\tan x - 2\sec x}\right) = \sin\left(\frac{\pi+\tan 0}{\tan 0 - 2\sec 0}\right) = \sin\left(-\frac{\pi}{2}\right) = -1$

43. $\lim_{t \to 0} \tan\left(1 - \frac{\sin t}{t}\right) = \tan\left(1 - \lim_{t \to 0} \frac{\sin t}{t}\right) = \tan(1-1) = 0$

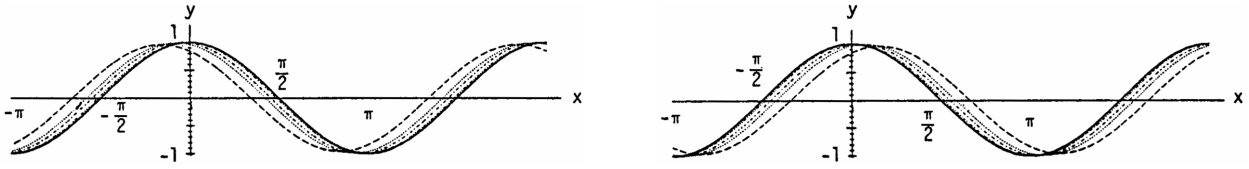
44. $\lim_{\theta \to 0} \cos\left(\frac{\pi\theta}{\sin\theta}\right) = \cos\left(\pi \lim_{\theta \to 0} \frac{\theta}{\sin\theta}\right) = \cos\left(\pi \cdot \frac{1}{\lim_{\theta \to 0} \frac{\sin\theta}{\theta}}\right) = \cos\left(\pi \cdot \frac{1}{1}\right) = -1$

45. $s = 2 - 2\sin t \Rightarrow v = \frac{ds}{dt} = -2\cos t \Rightarrow a = \frac{dv}{dt} = 2\sin t \Rightarrow j = \frac{da}{dt} = 2\cos t$. Therefore, velocity $= v\left(\frac{\pi}{4}\right)$ $= -\sqrt{2}$ m/sec; speed $= \left|v\left(\frac{\pi}{4}\right)\right| = \sqrt{2}$ m/sec; acceleration $= a\left(\frac{\pi}{4}\right) = \sqrt{2}$ m/sec$^2$; jerk $= j\left(\frac{\pi}{4}\right) = \sqrt{2}$ m/sec$^3$.

46. $s = \sin t + \cos t \Rightarrow v = \frac{ds}{dt} = \cos t - \sin t \Rightarrow a = \frac{dv}{dt} = -\sin t - \cos t \Rightarrow j = \frac{da}{dt} = -\cos t + \sin t$. Therefore velocity $= v\left(\frac{\pi}{4}\right) = 0$ m/sec; speed $= \left|v\left(\frac{\pi}{4}\right)\right| = 0$ m/sec; acceleration $= a\left(\frac{\pi}{4}\right) = -\sqrt{2}$ m/sec$^2$; jerk $= j\left(\frac{\pi}{4}\right) = 0$ m/sec$^3$.

47. $\lim_{x \to 0} f(x) = \lim_{x \to 0} \frac{\sin^2 3x}{x^2} = \lim_{x \to 0} 9\left(\frac{\sin 3x}{3x}\right)\left(\frac{\sin 3x}{3x}\right) = 9$ so that f is continuous at $x = 0 \Rightarrow \lim_{x \to 0} f(x) = f(0)$ $\Rightarrow 9 = c$.

48. $\lim_{x \to 0^-} g(x) = \lim_{x \to 0^-} (x + b) = b$ and $\lim_{x \to 0^+} g(x) = \lim_{x \to 0^+} \cos x = 1$ so that g is continuous at $x = 0 \Rightarrow \lim_{x \to 0^-} g(x)$ $= \lim_{x \to 0^+} g(x) \Rightarrow b = 1$. Now g is not differentiable at $x = 0$: At $x = 0$, the left-hand derivative is $\frac{d}{dx}(x + b)\Big|_{x=0} = 1$, but the right-hand derivative is $\frac{d}{dx}(\cos x)\Big|_{x=0} = -\sin 0 = 0$. The left- and right-hand derivatives can never agree at $x = 0$, so g is not differentiable at $x = 0$ for any value of b (including $b = 1$).

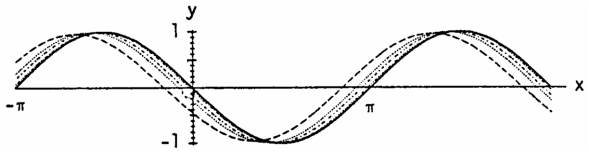


49. $\frac{d^{999}}{dx^{999}}(\cos x) = \sin x$ because $\frac{d^4}{dx^4}(\cos x) = \cos x \Rightarrow$ the derivative of cos x any number of times that is a multiple of 4 is cos x. Thus, dividing 999 by 4 gives $999 = 249 \cdot 4 + 3 \Rightarrow \frac{d^{999}}{dx^{999}}(\cos x)$ $= \frac{d^3}{dx^3}\left[\frac{d^{249 \cdot 4}}{dx^{249 \cdot 4}}(\cos x)\right] = \frac{d^3}{dx^3}(\cos x) = \sin x$.

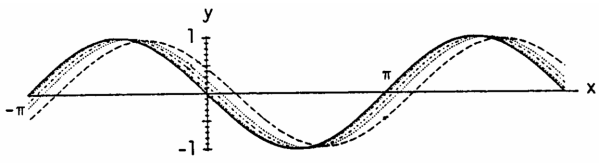
50. (a) $y = \sec x = \frac{1}{\cos x} \Rightarrow \frac{dy}{dx} = \frac{(\cos x)(0) - (1)(-\sin x)}{(\cos x)^2} = \frac{\sin x}{\cos^2 x} = \left(\frac{1}{\cos x}\right)\left(\frac{\sin x}{\cos x}\right) = \sec x \tan x$
$\Rightarrow \frac{d}{dx}(\sec x) = \sec x \tan x$

(b) $y = \csc x = \frac{1}{\sin x} \Rightarrow \frac{dy}{dx} = \frac{(\sin x)(0) - (1)(\cos x)}{(\sin x)^2} = \frac{-\cos x}{\sin^2 x} = \left(\frac{-1}{\sin x}\right)\left(\frac{\cos x}{\sin x}\right) = -\csc x \cot x$
$\Rightarrow \frac{d}{dx}(\csc x) = -\csc x \cot x$

(c) $y = \cot x = \frac{\cos x}{\sin x} \Rightarrow \frac{dy}{dx} = \frac{(\sin x)(-\sin x) - (\cos x)(\cos x)}{(\sin x)^2} = \frac{-\sin^2 x - \cos^2 x}{\sin^2 x} = \frac{-1}{\sin^2 x} = -\csc^2 x$
$\Rightarrow \frac{d}{dx}(\cot x) = -\csc^2 x$

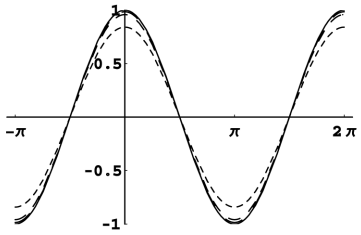


51.

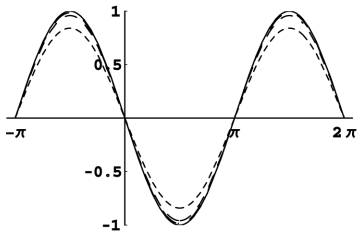


As h takes on the values of 1, 0.5, 0.3 and 0.1 the corresponding dashed curves of $y = \frac{\sin(x+h) - \sin x}{h}$ get closer and closer to the black curve $y = \cos x$ because $\frac{d}{dx}(\sin x) = \lim_{h \to 0} \frac{\sin(x+h) - \sin x}{h} = \cos x$. The same is true as h takes on the values of $-1$, $-0.5$, $-0.3$ and $-0.1$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



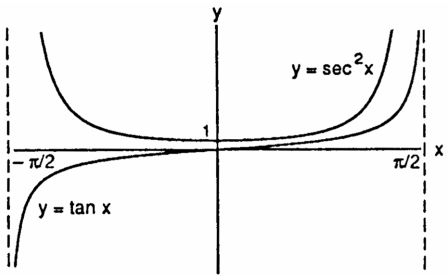
52.



As h takes on the values of 1, 0.5, 0.3, and 0.1 the corresponding dashed curves of $y = \frac{\cos(x+h) - \cos x}{h}$ get closer and closer to the black curve $y = -\sin x$ because $\frac{d}{dx}(\cos x) = \lim_{h \to 0} \frac{\cos(x+h) - \cos x}{h} = -\sin x$. The same is true as h takes on the values of $-1$, $-0.5$, $-0.3$, and $-0.1$.

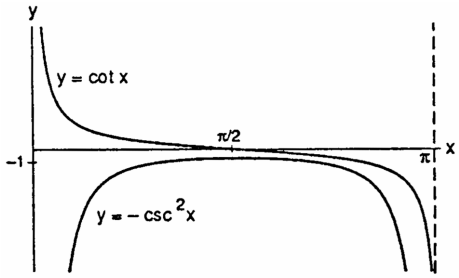
53. (a)

The dashed curves of $y = \frac{\sin(x+h) - \sin(x-h)}{2h}$ are closer to the black curve $y = \cos x$ than the corresponding dashed curves in Exercise 51 illustrating that the centered difference quotient is a better approximation of the derivative of this function.



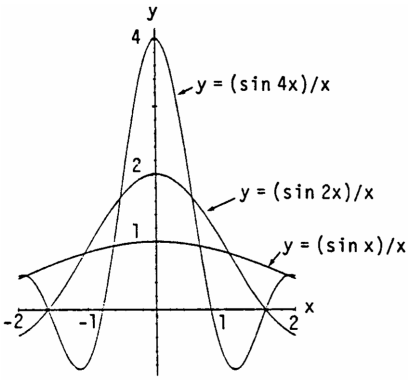
(b)

The dashed curves of $y = \frac{\cos(x+h) - \cos(x-h)}{2h}$ are closer to the black curve $y = -\sin x$ than the corresponding dashed curves in Exercise 52 illustrating that the centered difference quotient is a better approximation of the derivative of this function.



54. $\lim_{h \to 0} \frac{|0+h| - |0-h|}{2h} = \lim_{x \to 0} \frac{|h| - |h|}{2h} = \lim_{h \to 0} 0 = 0 \Rightarrow$ the limits of the centered difference quotient exists even though the derivative of $f(x) = |x|$ does not exist at $x = 0$.

55. $y = \tan x \Rightarrow y' = \sec^2 x$, so the smallest value $y' = \sec^2 x$ takes on is $y' = 1$ when $x = 0$; $y'$ has no maximum value since $\sec^2 x$ has no largest value on $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right)$; $y'$ is never negative since $\sec^2 x \geq 1$.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

56. $y = \cot x \Rightarrow y' = -\csc^2 x$ so $y'$ has no smallest value since $-\csc^2 x$ has no minimum value on $(0, \pi)$; the largest value of $y'$ is $-1$, when $x = \frac{\pi}{2}$; the slope is never positive since the largest value $y' = -\csc^2 x$ takes on is $-1$.

57. $y = \frac{\sin x}{x}$ appears to cross the y-axis at $y = 1$, since $\lim_{x \to 0} \frac{\sin x}{x} = 1$; $y = \frac{\sin 2x}{x}$ appears to cross the y-axis at $y = 2$, since $\lim_{x \to 0} \frac{\sin 2x}{x} = 2$; $y = \frac{\sin 4x}{x}$ appears to cross the y-axis at $y = 4$, since $\lim_{x \to 0} \frac{\sin 4x}{x} = 4$.
However, none of these graphs actually cross the y-axis since $x = 0$ is not in the domain of the functions. Also, $\lim_{x \to 0} \frac{\sin 5x}{x} = 5$, $\lim_{x \to 0} \frac{\sin(-3x)}{x} = -3$, and $\lim_{x \to 0} \frac{\sin kx}{x} = k \Rightarrow$ the graphs of $y = \frac{\sin 5x}{x}$, $y = \frac{\sin(-3x)}{x}$, and $y = \frac{\sin kx}{x}$ approach 5, $-3$, and k, respectively, as $x \to 0$. However, the graphs do not actually cross the y-axis.

## 3.5 THE CHAIN RULE AND PARAMETRIC EQUATIONS

1. $f(u) = 6u - 9 \Rightarrow f'(u) = 6 \Rightarrow f'(g(x)) = 6$; $g(x) = \frac{1}{2}x^4 \Rightarrow g'(x) = 2x^3$; therefore $\frac{dy}{dx} = f'(g(x))g'(x)$ $= 6 \cdot 2x^3 = 12x^3$

2. $f(u) = 2u^3 \Rightarrow f'(u) = 6u^2 \Rightarrow f'(g(x)) = 6(8x-1)^2$; $g(x) = 8x - 1 \Rightarrow g'(x) = 8$; therefore $\frac{dy}{dx} = f'(g(x))g'(x)$ $= 6(8x-1)^2 \cdot 8 = 48(8x-1)^2$

3. $f(u) = \sin u \Rightarrow f'(u) = \cos u \Rightarrow f'(g(x)) = \cos(3x+1)$; $g(x) = 3x + 1 \Rightarrow g'(x) = 3$; therefore $\frac{dy}{dx} = f'(g(x))g'(x)$ $= (\cos(3x+1))(3) = 3\cos(3x+1)$

4. $f(u) = \cos u \Rightarrow f'(u) = -\sin u \Rightarrow f'(g(x)) = -\sin\left(\frac{-x}{3}\right)$; $g(x) = \frac{-x}{3} \Rightarrow g'(x) = -\frac{1}{3}$; therefore $\frac{dy}{dx} = f'(g(x))g'(x)$ $= -\sin\left(\frac{-x}{3}\right) \cdot \left(\frac{-1}{3}\right) = \frac{1}{3}\sin\left(\frac{-x}{3}\right)$

5. $f(u) = \cos u \Rightarrow f'(u) = -\sin u \Rightarrow f'(g(x)) = -\sin(\sin x)$; $g(x) = \sin x \Rightarrow g'(x) = \cos x$; therefore $\frac{dy}{dx} = f'(g(x))g'(x) = -(\sin(\sin x))\cos x$

6. $f(u) = \sin u \Rightarrow f'(u) = \cos u \Rightarrow f'(g(x)) = \cos(x - \cos x)$; $g(x) = x - \cos x \Rightarrow g'(x) = 1 + \sin x$; therefore $\frac{dy}{dx} = f'(g(x))g'(x) = (\cos(x - \cos x))(1 + \sin x)$

7. $f(u) = \tan u \Rightarrow f'(u) = \sec^2 u \Rightarrow f'(g(x)) = \sec^2(10x-5)$; $g(x) = 10x - 5 \Rightarrow g'(x) = 10$; therefore $\frac{dy}{dx} = f'(g(x))g'(x) = (\sec^2(10x-5))(10) = 10\sec^2(10x-5)$

8. $f(u) = -\sec u \Rightarrow f'(u) = -\sec u \tan u \Rightarrow f'(g(x)) = -\sec(x^2+7x)\tan(x^2+7x)$; $g(x) = x^2 + 7x$ $\Rightarrow g'(x) = 2x + 7$; therefore $\frac{dy}{dx} = f'(g(x))g'(x) = -(2x+7)\sec(x^2+7x)\tan(x^2+7x)$

9. With $u = (2x+1)$, $y = u^5$: $\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = 5u^4 \cdot 2 = 10(2x+1)^4$

10. With $u = (4-3x)$, $y = u^9$: $\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = 9u^8 \cdot (-3) = -27(4-3x)^8$

11. With $u = \left(1 - \frac{x}{7}\right)$, $y = u^{-7}$: $\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = -7u^{-8} \cdot \left(-\frac{1}{7}\right) = \left(1 - \frac{x}{7}\right)^{-8}$

12. With $u = \left(\frac{x}{2} - 1\right)$, $y = u^{-10}$: $\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = -10u^{-11} \cdot \left(\frac{1}{2}\right) = -5\left(\frac{x}{2} - 1\right)^{-11}$

13. With $u = \left(\frac{x^2}{8} + x - \frac{1}{x}\right)$, $y = u^4$: $\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = 4u^3 \cdot \left(\frac{x}{4} + 1 + \frac{1}{x^2}\right) = 4\left(\frac{x^2}{8} + x - \frac{1}{x}\right)^3\left(\frac{x}{4} + 1 + \frac{1}{x^2}\right)$

14. With $u = \left(\frac{x}{5} + \frac{1}{5x}\right)$, $y = u^5$: $\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = 5u^4 \cdot \left(\frac{1}{5} - \frac{1}{5x^2}\right) = \left(\frac{x}{5} + \frac{1}{5x}\right)^4\left(1 - \frac{1}{x^2}\right)$

15. With $u = \tan x$, $y = \sec u$: $\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = (\sec u \tan u)(\sec^2 x) = (\sec(\tan x)\tan(\tan x))\sec^2 x$

16. With $u = \pi - \frac{1}{x}$, $y = \cot u$: $\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = (-\csc^2 u)\left(\frac{1}{x^2}\right) = -\frac{1}{x^2}\csc^2\left(\pi - \frac{1}{x}\right)$

17. With $u = \sin x$, $y = u^3$: $\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = 3u^2\cos x = 3(\sin^2 x)(\cos x)$

18. With $u = \cos x$, $y = 5u^{-4}$: $\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx} = (-20u^{-5})(-\sin x) = 20(\cos^{-5} x)(\sin x)$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

19. $p = \sqrt{3-t} = (3-t)^{1/2} \Rightarrow \frac{dp}{dt} = \frac{1}{2}(3-t)^{-1/2} \cdot \frac{d}{dt}(3-t) = -\frac{1}{2}(3-t)^{-1/2} = \frac{-1}{2\sqrt{3-t}}$

20. $q = \sqrt{2r-r^2} = (2r-r^2)^{1/2} \Rightarrow \frac{dq}{dr} = \frac{1}{2}(2r-r^2)^{-1/2} \cdot \frac{d}{dr}(2r-r^2) = \frac{1}{2}(2r-r^2)^{-1/2}(2-2r) = \frac{1-r}{\sqrt{2r-r^2}}$

21. $s = \frac{4}{3\pi}\sin 3t + \frac{4}{5\pi}\cos 5t \Rightarrow \frac{ds}{dt} = \frac{4}{3\pi}\cos 3t \cdot \frac{d}{dt}(3t) + \frac{4}{5\pi}(-\sin 5t) \cdot \frac{d}{dt}(5t) = \frac{4}{\pi}\cos 3t - \frac{4}{\pi}\sin 5t$
$= \frac{4}{\pi}(\cos 3t - \sin 5t)$

22. $s = \sin\left(\frac{3\pi t}{2}\right) + \cos\left(\frac{3\pi t}{2}\right) \Rightarrow \frac{ds}{dt} = \cos\left(\frac{3\pi t}{2}\right) \cdot \frac{d}{dt}\left(\frac{3\pi t}{2}\right) - \sin\left(\frac{3\pi t}{2}\right) \cdot \frac{d}{dt}\left(\frac{3\pi t}{2}\right) = \frac{3\pi}{2}\cos\left(\frac{3\pi t}{2}\right) - \frac{3\pi}{2}\sin\left(\frac{3\pi t}{2}\right)$
$= \frac{3\pi}{2}\left(\cos\frac{3\pi t}{2} - \sin\frac{3\pi t}{2}\right)$

23. $r = (\csc\theta + \cot\theta)^{-1} \Rightarrow \frac{dr}{d\theta} = -(\csc\theta + \cot\theta)^{-2}\frac{d}{d\theta}(\csc\theta + \cot\theta) = \frac{\csc\theta\cot\theta + \csc^2\theta}{(\csc\theta + \cot\theta)^2} = \frac{\csc\theta(\cot\theta + \csc\theta)}{(\csc\theta + \cot\theta)^2}$
$= \frac{\csc\theta}{\csc\theta + \cot\theta}$

24. $r = -(\sec\theta + \tan\theta)^{-1} \Rightarrow \frac{dr}{d\theta} = (\sec\theta + \tan\theta)^{-2}\frac{d}{d\theta}(\sec\theta + \tan\theta) = \frac{\sec\theta\tan\theta + \sec^2\theta}{(\sec\theta + \tan\theta)^2} = \frac{\sec\theta(\tan\theta + \sec\theta)}{(\sec\theta + \tan\theta)^2}$
$= \frac{\sec\theta}{\sec\theta + \tan\theta}$

25. $y = x^2\sin^4 x + x\cos^{-2} x \Rightarrow \frac{dy}{dx} = x^2\frac{d}{dx}(\sin^4 x) + \sin^4 x \cdot \frac{d}{dx}(x^2) + x\frac{d}{dx}(\cos^{-2} x) + \cos^{-2} x \cdot \frac{d}{dx}(x)$
$= x^2\left(4\sin^3 x\frac{d}{dx}(\sin x)\right) + 2x\sin^4 x + x\left(-2\cos^{-3} x \cdot \frac{d}{dx}(\cos x)\right) + \cos^{-2} x$
$= x^2(4\sin^3 x\cos x) + 2x\sin^4 x + x(\,(-2\cos^{-3} x)\,(-\sin x)) + \cos^{-2} x$
$= 4x^2\sin^3 x\cos x + 2x\sin^4 x + 2x\sin x\cos^{-3} x + \cos^{-2} x$

26. $y = \frac{1}{x}\sin^{-5} x - \frac{x}{3}\cos^3 x \Rightarrow y' = \frac{1}{x}\frac{d}{dx}(\sin^{-5} x) + \sin^{-5} x \cdot \frac{d}{dx}\left(\frac{1}{x}\right) - \frac{x}{3}\frac{d}{dx}(\cos^3 x) - \cos^3 x \cdot \frac{d}{dx}\left(\frac{x}{3}\right)$
$= \frac{1}{x}(-5\sin^{-6} x\cos x) + (\sin^{-5} x)\left(-\frac{1}{x^2}\right) - \frac{x}{3}(\,(3\cos^2 x)\,(-\sin x)) - (\cos^3 x)\left(\frac{1}{3}\right)$
$= -\frac{5}{x}\sin^{-6} x\cos x - \frac{1}{x^2}\sin^{-5} x + x\cos^2 x\sin x - \frac{1}{3}\cos^3 x$

27. $y = \frac{1}{21}(3x-2)^7 + \left(4 - \frac{1}{2x^2}\right)^{-1} \Rightarrow \frac{dy}{dx} = \frac{7}{21}(3x-2)^6 \cdot \frac{d}{dx}(3x-2) + (-1)\left(4 - \frac{1}{2x^2}\right)^{-2} \cdot \frac{d}{dx}\left(4 - \frac{1}{2x^2}\right)$
$= \frac{7}{21}(3x-2)^6 \cdot 3 + (-1)\left(4 - \frac{1}{2x^2}\right)^{-2}\left(\frac{1}{x^3}\right) = (3x-2)^6 - \frac{1}{x^3\left(4 - \frac{1}{2x^2}\right)^2}$

28. $y = (5-2x)^{-3} + \frac{1}{8}\left(\frac{2}{x} + 1\right)^4 \Rightarrow \frac{dy}{dx} = -3(5-2x)^{-4}(-2) + \frac{4}{8}\left(\frac{2}{x} + 1\right)^3\left(-\frac{2}{x^2}\right) = 6(5-2x)^{-4} - \left(\frac{1}{x^2}\right)\left(\frac{2}{x} + 1\right)^3$
$= \frac{6}{(5-2x)^4} - \frac{\left(\frac{2}{x} + 1\right)^3}{x^2}$

29. $y = (4x+3)^4(x+1)^{-3} \Rightarrow \frac{dy}{dx} = (4x+3)^4(-3)(x+1)^{-4} \cdot \frac{d}{dx}(x+1) + (x+1)^{-3}(4)(4x+3)^3 \cdot \frac{d}{dx}(4x+3)$
$= (4x+3)^4(-3)(x+1)^{-4}(1) + (x+1)^{-3}(4)(4x+3)^3(4) = -3(4x+3)^4(x+1)^{-4} + 16(4x+3)^3(x+1)^{-3}$
$= \frac{(4x+3)^3}{(x+1)^4}[-3(4x+3) + 16(x+1)] = \frac{(4x+3)^3(4x+7)}{(x+1)^4}$

30. $y = (2x-5)^{-1}(x^2-5x)^6 \Rightarrow \frac{dy}{dx} = (2x-5)^{-1}(6)(x^2-5x)^5(2x-5) + (x^2-5x)^6(-1)(2x-5)^{-2}(2)$
$= 6(x^2-5x)^5 - \frac{2(x^2-5x)^6}{(2x-5)^2}$

31. $h(x) = x\tan\left(2\sqrt{x}\right) + 7 \Rightarrow h'(x) = x\frac{d}{dx}\left(\tan\left(2x^{1/2}\right)\right) + \tan\left(2x^{1/2}\right) \cdot \frac{d}{dx}(x) + 0$
$= x\sec^2\left(2x^{1/2}\right) \cdot \frac{d}{dx}\left(2x^{1/2}\right) + \tan\left(2x^{1/2}\right) = x\sec^2\left(2\sqrt{x}\right) \cdot \frac{1}{\sqrt{x}} + \tan\left(2\sqrt{x}\right) = \sqrt{x}\sec^2\left(2\sqrt{x}\right) + \tan\left(2\sqrt{x}\right)$

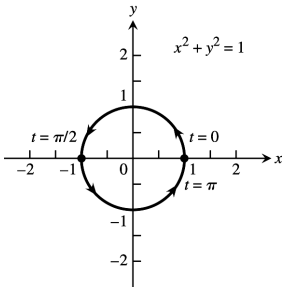
65. $y = 2\tan\left(\frac{\pi x}{4}\right) \Rightarrow \frac{dy}{dx} = \left(2\sec^2\frac{\pi x}{4}\right)\left(\frac{\pi}{4}\right) = \frac{\pi}{2}\sec^2\frac{\pi x}{4}$

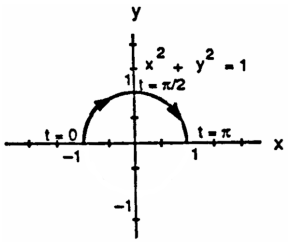
(a) $\left.\frac{dy}{dx}\right|_{x=1} = \frac{\pi}{2}\sec^2\left(\frac{\pi}{4}\right) = \pi \Rightarrow$ slope of tangent is 2; thus, $y(1) = 2\tan\left(\frac{\pi}{4}\right) = 2$ and $y'(1) = \pi \Rightarrow$ tangent line is given by $y - 2 = \pi(x - 1) \Rightarrow y = \pi x + 2 - \pi$

(b) $y' = \frac{\pi}{2}\sec^2\left(\frac{\pi x}{4}\right)$ and the smallest value the secant function can have in $-2 < x < 2$ is 1 $\Rightarrow$ the minimum value of $y'$ is $\frac{\pi}{2}$ and that occurs when $\frac{\pi}{2} = \frac{\pi}{2}\sec^2\left(\frac{\pi x}{4}\right) \Rightarrow 1 = \sec^2\left(\frac{\pi x}{4}\right) \Rightarrow \pm 1 = \sec\left(\frac{\pi x}{4}\right) \Rightarrow x = 0$.



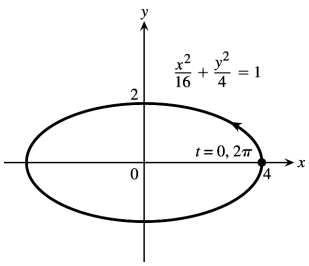
66. (a) $y = \sin 2x \Rightarrow y' = 2\cos 2x \Rightarrow y'(0) = 2\cos(0) = 2 \Rightarrow$ tangent to $y = \sin 2x$ at the origin is $y = 2x$; $y = -\sin\left(\frac{x}{2}\right) \Rightarrow y' = -\frac{1}{2}\cos\left(\frac{x}{2}\right) \Rightarrow y'(0) = -\frac{1}{2}\cos 0 = -\frac{1}{2} \Rightarrow$ tangent to $y = -\sin\left(\frac{x}{2}\right)$ at the origin is $y = -\frac{1}{2}x$. The tangents are perpendicular to each other at the origin since the product of their slopes is $-1$.

(b) $y = \sin(mx) \Rightarrow y' = m\cos(mx) \Rightarrow y'(0) = m\cos 0 = m$; $y = -\sin\left(\frac{x}{m}\right) \Rightarrow y' = -\frac{1}{m}\cos\left(\frac{x}{m}\right)$ $\Rightarrow y'(0) = -\frac{1}{m}\cos(0) = -\frac{1}{m}$. Since $m \cdot \left(-\frac{1}{m}\right) = -1$, the tangent lines are perpendicular at the origin.

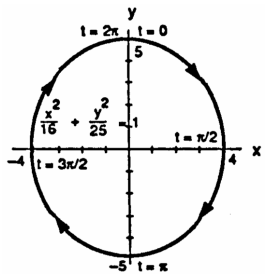


(c) $y = \sin(mx) \Rightarrow y' = m\cos(mx)$. The largest value $\cos(mx)$ can attain is 1 at $x = 0 \Rightarrow$ the largest value $y'$ can attain is $|m|$ because $|y'| = |m\cos(mx)| = |m|\,|\cos mx| \le |m| \cdot 1 = |m|$. Also, $y = -\sin\left(\frac{x}{m}\right)$ $\Rightarrow y' = -\frac{1}{m}\cos\left(\frac{x}{m}\right) \Rightarrow |y'| = \left|\frac{-1}{m}\cos\left(\frac{x}{m}\right)\right| \le \left|\frac{1}{m}\right|\left|\cos\left(\frac{x}{m}\right)\right| \le \frac{1}{|m|} \Rightarrow$ the largest value $y'$ can attain is $\left|\frac{1}{m}\right|$.

(d) $y = \sin(mx) \Rightarrow y' = m\cos(mx) \Rightarrow y'(0) = m \Rightarrow$ slope of curve at the origin is m. Also, $\sin(mx)$ completes m periods on $[0, 2\pi]$. Therefore the slope of the curve $y = \sin(mx)$ at the origin is the same as the number of periods it completes on $[0, 2\pi]$. In particular, for large m, we can think of "compressing" the graph of $y = \sin x$ horizontally which gives more periods completed on $[0, 2\pi]$, but also increases the slope of the graph at the origin.

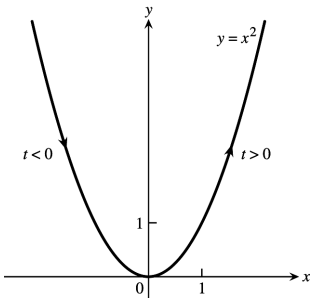


67. $x = \cos 2t$, $y = \sin 2t$, $0 \le t \le \pi$
$\Rightarrow \cos^2 2t + \sin^2 2t = 1 \Rightarrow x^2 + y^2 = 1$

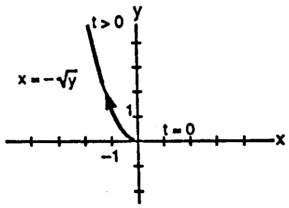


68. $x = \cos(\pi - t)$, $y = \sin(\pi - t)$, $0 \le t \le \pi$
$\Rightarrow \cos^2(\pi - t) + \sin^2(\pi - t) = 1$
$\Rightarrow x^2 + y^2 = 1$, $y \ge 0$

69. $x = 4\cos t$, $y = 2\sin t$, $0 \le t \le 2\pi$
$\Rightarrow \frac{16\cos^2 t}{16} + \frac{4\sin^2 t}{4} = 1 \Rightarrow \frac{x^2}{16} + \frac{y^2}{4} = 1$



70. $x = 4\sin t$, $y = 5\cos t$, $0 \le t \le 2\pi$
$\Rightarrow \frac{16\sin^2 t}{16} + \frac{25\cos^2 t}{25} = 1 \Rightarrow \frac{x^2}{16} + \frac{y^2}{25} = 1$



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(b) $x = a\cos t,\ y = b\sin t,\ 0 \le t \le 2\pi$
(c) $x = a\sin t,\ y = b\cos t,\ \frac{\pi}{2} \le t \le \frac{9\pi}{2}$
(d) $x = a\cos t,\ y = b\sin t,\ 0 \le t \le 4\pi$

81. Using $(-1, -3)$ we create the parametric equations $x = -1 + at$ and $y = -3 + bt$, representing a line which goes through $(-1, -3)$ at $t = 0$. We determine a and b so that the line goes through $(4, 1)$ when $t = 1$.
Since $4 = -1 + a \Rightarrow a = 5$. Since $1 = -3 + b \Rightarrow b = 4$. Therefore, one possible parameterization is $x = -1 + 5t$, $y = -3 - 4t$, $0 \le t \le 1$.

82. Using $(-1, 3)$ we create the parametric equations $x = -1 + at$ and $y = 3 + bt$, representing a line which goes through $(-1, 3)$ at $t = 0$. We determine a and b so that the line goes through $(3, -2)$ when $t = 1$. Since $3 = -1 + a \Rightarrow a = 4$.
Since $-2 = 3 + b \Rightarrow b = -5$. Therefore, one possible parameterization is $x = -1 + 4t$, $y = -3 - 5t$, $0 \le t \le 1$.

83. The lower half of the parabola is given by $x = y^2 + 1$ for $y \le 0$. Substituting t for y, we obtain one possible parameterization $x = t^2 + 1$, $y = t$, $t \le 0$.

84. The vertex of the parabola is at $(-1, -1)$, so the left half of the parabola is given by $y = x^2 + 2x$ for $x \le -1$. Substituting t for x, we obtain one possible parametrization: $x = t$, $y = t^2 + 2t$, $t \le -1$.

85. For simplicity, we assume that x and y are linear functions of t and that the point$(x, y)$ starts at $(2, 3)$ for $t = 0$ and passes through $(-1, -1)$ at $t = 1$. Then $x = f(t)$, where $f(0) = 2$ and $f(1) = -1$.
Since slope $= \frac{\Delta x}{\Delta t} = \frac{-1-2}{1-0} = -3$, $x = f(t) = -3t + 2 = 2 - 3t$. Also, $y = g(t)$, where $g(0) = 3$ and $g(1) = -1$.
Since slope $= \frac{\Delta y}{\Delta t} = \frac{-1-3}{1-0} = -4$. $y = g(t) = -4t + 3 = 3 - 4t$.
One possible parameterization is: $x = 2 - 3t$, $y = 3 - 4t$, $t \ge 0$.

86. For simplicity, we assume that x and y are linear functions of t and that the point$(x, y)$ starts at $(-1, 2)$ for $t = 0$ and passes through $(0, 0)$ at $t = 1$. Then $x = f(t)$, where $f(0) = -1$ and $f(1) = 0$.
Since slope $= \frac{\Delta x}{\Delta t} = \frac{0-(-1)}{1-0} = 1$, $x = f(t) = 1t + (-1) = -1 + t$. Also, $y = g(t)$, where $g(0) = 2$ and $g(1) = 0$.
Since slope $= \frac{\Delta y}{\Delta t} = \frac{0-2}{1-0} = -2$. $y = g(t) = -2t + 2 = 2 - 2t$.
One possible parameterization is: $x = -1 + t$, $y = 2 - 2t$, $t \ge 0$.

87. $t = \frac{\pi}{4} \Rightarrow x = 2\cos\frac{\pi}{4} = \sqrt{2}$, $y = 2\sin\frac{\pi}{4} = \sqrt{2}$; $\frac{dx}{dt} = -2\sin t$, $\frac{dy}{dt} = 2\cos t \Rightarrow \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{2\cos t}{-2\sin t} = -\cot t$
$\Rightarrow \left.\frac{dy}{dx}\right|_{t=\frac{\pi}{4}} = -\cot\frac{\pi}{4} = -1$; tangent line is $y - \sqrt{2} = -1\left(x - \sqrt{2}\right)$ or $y = -x + 2\sqrt{2}$; $\frac{dy'}{dt} = \csc^2 t$
$\Rightarrow \frac{d^2y}{dx^2} = \frac{dy'/dt}{dx/dt} = \frac{\csc^2 t}{-2\sin t} = -\frac{1}{2\sin^3 t} \Rightarrow \left.\frac{d^2y}{dx^2}\right|_{t=\frac{\pi}{4}} = -\sqrt{2}$

88. $t = \frac{2\pi}{3} \Rightarrow x = \cos\frac{2\pi}{3} = -\frac{1}{2}$, $y = \sqrt{3}\cos\frac{2\pi}{3} = -\frac{\sqrt{3}}{2}$; $\frac{dx}{dt} = -\sin t$, $\frac{dy}{dt} = -\sqrt{3}\sin t \Rightarrow \frac{dy}{dx} = \frac{-\sqrt{3}\sin t}{-\sin t} = \sqrt{3}$
$\Rightarrow \left.\frac{dy}{dx}\right|_{t=\frac{2\pi}{3}} = \sqrt{3}$; tangent line is $y - \left(-\frac{\sqrt{3}}{2}\right) = \sqrt{3}\left[x - \left(-\frac{1}{2}\right)\right]$ or $y = \sqrt{3}x$; $\frac{dy'}{dt} = 0 \Rightarrow \frac{d^2y}{dx^2} = \frac{0}{-\sin t} = 0$
$\Rightarrow \left.\frac{d^2y}{dx^2}\right|_{t=\frac{2\pi}{3}} = 0$

89. $t = \frac{1}{4} \Rightarrow x = \frac{1}{4}$, $y = \frac{1}{2}$; $\frac{dx}{dt} = 1$, $\frac{dy}{dt} = \frac{1}{2\sqrt{t}} \Rightarrow \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{1}{2\sqrt{t}} \Rightarrow \left.\frac{dy}{dx}\right|_{t=\frac{1}{4}} = \frac{1}{2\sqrt{\frac{1}{4}}} = 1$; tangent line is
$y - \frac{1}{2} = 1\cdot\left(x - \frac{1}{4}\right)$ or $y = x + \frac{1}{4}$; $\frac{dy'}{dt} = -\frac{1}{4}t^{-3/2} \Rightarrow \frac{d^2y}{dx^2} = \frac{dy'/dt}{dx/dt} = -\frac{1}{4}t^{-3/2} \Rightarrow \left.\frac{d^2y}{dx^2}\right|_{t=\frac{1}{4}} = -2$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

90. $t = 3 \Rightarrow x = -\sqrt{3+1} = -2$, $y = \sqrt{3(3)} = 3$; $\frac{dx}{dt} = -\frac{1}{2}(t+1)^{-1/2}$, $\frac{dy}{dt} = \frac{3}{2}(3t)^{-1/2} \Rightarrow \frac{dy}{dx} = \frac{\left(\frac{3}{2}\right)(3t)^{-1/2}}{\left(-\frac{1}{2}\right)(t+1)^{-1/2}}$
$= -\frac{3\sqrt{t+1}}{\sqrt{3t}} = \left.\frac{dy}{dx}\right|_{t=3} = \frac{-3\sqrt{3+1}}{\sqrt{3(3)}} = -2$; tangent line is $y - 3 = -2[x-(-2)]$ or $y = -2x - 1$;
$\frac{dy'}{dt} = \frac{\sqrt{3t}\left[-\frac{3}{2}(t+1)^{-1/2}\right] + 3\sqrt{t+1}\left[\frac{3}{2}(3t)^{-1/2}\right]}{3t} = \frac{3}{2t\sqrt{3t}\sqrt{t+1}} \Rightarrow \frac{d^2y}{dx^2} = \frac{\left(\frac{3}{2t\sqrt{3t}\sqrt{t+1}}\right)}{\left(\frac{-1}{2\sqrt{t+1}}\right)} = -\frac{3}{t\sqrt{3t}}$
$\Rightarrow \left.\frac{d^2y}{dx^2}\right|_{t=3} = -\frac{1}{3}$

91. $t = -1 \Rightarrow x = 5$, $y = 1$; $\frac{dx}{dt} = 4t$, $\frac{dy}{dt} = 4t^3 \Rightarrow \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{4t^3}{4t} = t^2 \Rightarrow \left.\frac{dy}{dx}\right|_{t=-1} = (-1)^2 = 1$; tangent line is
$y - 1 = 1 \cdot (x-5)$ or $y = x - 4$; $\frac{dy'}{dt} = 2t \Rightarrow \frac{d^2y}{dx^2} = \frac{dy'/dt}{dx/dt} = \frac{2t}{4t} = \frac{1}{2} \Rightarrow \left.\frac{d^2y}{dx^2}\right|_{t=-1} = \frac{1}{2}$

92. $t = \frac{\pi}{3} \Rightarrow x = \frac{\pi}{3} - \sin\frac{\pi}{3} = \frac{\pi}{3} - \frac{\sqrt{3}}{2}$, $y = 1 - \cos\frac{\pi}{3} = 1 - \frac{1}{2} = \frac{1}{2}$; $\frac{dx}{dt} = 1 - \cos t$, $\frac{dy}{dt} = \sin t \Rightarrow \frac{dy}{dx} = \frac{dy/dt}{dx/dt}$
$= \frac{\sin t}{1-\cos t} \Rightarrow \left.\frac{dy}{dx}\right|_{t=\frac{\pi}{3}} = \frac{\sin\left(\frac{\pi}{3}\right)}{1-\cos\left(\frac{\pi}{3}\right)} = \frac{\left(\frac{\sqrt{3}}{2}\right)}{\left(\frac{1}{2}\right)} = \sqrt{3}$; tangent line is $y - \frac{1}{2} = \sqrt{3}\left(x - \frac{\pi}{3} + \frac{\sqrt{3}}{2}\right)$
$\Rightarrow y = \sqrt{3}x - \frac{\pi\sqrt{3}}{3} + 2$; $\frac{dy'}{dt} = \frac{(1-\cos t)(\cos t) - (\sin t)(\sin t)}{(1-\cos t)^2} = \frac{-1}{1-\cos t} \Rightarrow \frac{d^2y}{dx^2} = \frac{dy'/dt}{dx/dt} = \frac{\left(\frac{-1}{1-\cos t}\right)}{1-\cos t}$
$= \frac{-1}{(1-\cos t)^2} \Rightarrow \left.\frac{d^2y}{dx^2}\right|_{t=\frac{\pi}{3}} = -4$

93. $t = \frac{\pi}{2} \Rightarrow x = \cos\frac{\pi}{2} = 0$, $y = 1 + \sin\frac{\pi}{2} = 2$; $\frac{dx}{dt} = -\sin t$, $\frac{dy}{dt} = \cos t \Rightarrow \frac{dy}{dx} = \frac{\cos t}{-\sin t} = -\cot t$
$\Rightarrow \left.\frac{dy}{dx}\right|_{t=\frac{\pi}{2}} = -\cot\frac{\pi}{2} = 0$; tangent line is $y = 2$; $\frac{dy'}{dt} = \csc^2 t \Rightarrow \frac{d^2y}{dx^2} = \frac{\csc^2 t}{-\sin t} = -\csc^3 t \Rightarrow \left.\frac{d^2y}{dx^2}\right|_{t=\frac{\pi}{2}} = -1$

94. $t = -\frac{\pi}{4} \Rightarrow x = \sec^2\left(-\frac{\pi}{4}\right) - 1 = 1$, $y = \tan\left(-\frac{\pi}{4}\right) = -1$; $\frac{dx}{dt} = 2\sec^2 t \tan t$, $\frac{dy}{dt} = \sec^2 t$
$\Rightarrow \frac{dy}{dx} = \frac{\sec^2 t}{2\sec^2 t \tan t} = \frac{1}{2\tan t} = \frac{1}{2}\cot t \Rightarrow \left.\frac{dy}{dx}\right|_{t=-\frac{\pi}{4}} = \frac{1}{2}\cot\left(-\frac{\pi}{4}\right) = -\frac{1}{2}$; tangent line is
$y - (-1) = -\frac{1}{2}(x-1)$ or $y = -\frac{1}{2}x - \frac{1}{2}$; $\frac{dy'}{dt} = -\frac{1}{2}\csc^2 t \Rightarrow \frac{d^2y}{dx^2} = \frac{-\frac{1}{2}\csc^2 t}{2\sec^2 t \tan t} = -\frac{1}{4}\cot^3 t$
$\Rightarrow \left.\frac{d^2y}{dx^2}\right|_{t=-\frac{\pi}{4}} = \frac{1}{4}$

95. $s = A\cos(2\pi bt) \Rightarrow v = \frac{ds}{dt} = -A\sin(2\pi bt)(2\pi b) = -2\pi bA\sin(2\pi bt)$. If we replace b with 2b to double the frequency, the velocity formula gives $v = -4\pi bA\sin(4\pi bt) \Rightarrow$ doubling the frequency causes the velocity to double. Also $v = -2\pi bA\sin(2\pi bt) \Rightarrow a = \frac{dv}{dt} = -4\pi^2 b^2 A\cos(2\pi bt)$. If we replace b with 2b in the acceleration formula, we get $a = -16\pi^2 b^2 A\cos(4\pi bt) \Rightarrow$ doubling the frequency causes the acceleration to quadruple. Finally, $a = -4\pi^2 b^2 A\cos(2\pi bt) \Rightarrow j = \frac{da}{dt} = 8\pi^3 b^3 A\sin(2\pi bt)$. If we replace b with 2b in the jerk formula, we get $j = 64\pi^3 b^3 A\sin(4\pi bt) \Rightarrow$ doubling the frequency multiplies the jerk by a factor of 8.

96. (a) $y = 37\sin\left[\frac{2\pi}{365}(x-101)\right] + 25 \Rightarrow y' = 37\cos\left[\frac{2\pi}{365}(x-101)\right]\left(\frac{2\pi}{365}\right) = \frac{74\pi}{365}\cos\left[\frac{2\pi}{365}(x-101)\right]$.
The temperature is increasing the fastest when $y'$ is as large as possible. The largest value of $\cos\left[\frac{2\pi}{365}(x-101)\right]$ is 1 and occurs when $\frac{2\pi}{365}(x-101) = 0 \Rightarrow x = 101 \Rightarrow$ on day 101 of the year ($\sim$ April 11), the temperature is increasing the fastest.
(b) $y'(101) = \frac{74\pi}{365}\cos\left[\frac{2\pi}{365}(101-101)\right] = \frac{74\pi}{365}\cos(0) = \frac{74\pi}{365} \approx 0.64$ °F/day

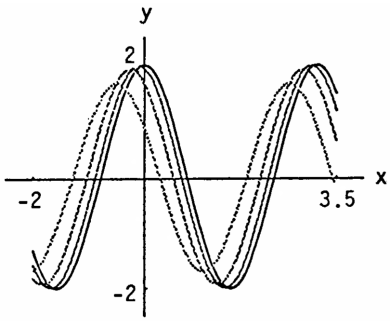
97. $s = (1+4t)^{1/2} \Rightarrow v = \frac{ds}{dt} = \frac{1}{2}(1+4t)^{-1/2}(4) = 2(1+4t)^{-1/2} \Rightarrow v(6) = 2(1+4\cdot 6)^{-1/2} = \frac{2}{5}$ m/sec;
$v = 2(1+4t)^{-1/2} \Rightarrow a = \frac{dv}{dt} = -\frac{1}{2}\cdot 2(1+4t)^{-3/2}(4) = -4(1+4t)^{-3/2} \Rightarrow a(6) = -4(1+4\cdot 6)^{-3/2} = -\frac{4}{125}$ m/sec$^2$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

98. We need to show $a = \frac{dv}{dt}$ is constant: $a = \frac{dv}{dt} = \frac{dv}{ds} \cdot \frac{ds}{dt}$ and $\frac{dv}{ds} = \frac{d}{ds}\left(k\sqrt{s}\right) = \frac{k}{2\sqrt{s}} \Rightarrow a = \frac{dv}{ds} \cdot \frac{ds}{dt} = \frac{dv}{ds} \cdot v$ $= \frac{k}{2\sqrt{s}} \cdot k\sqrt{s} = \frac{k^2}{2}$ which is a constant.

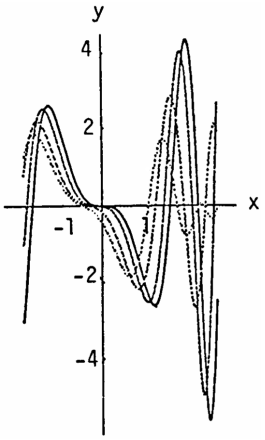
99. v proportional to $\frac{1}{\sqrt{s}} \Rightarrow v = \frac{k}{\sqrt{s}}$ for some constant k $\Rightarrow \frac{dv}{ds} = -\frac{k}{2s^{3/2}}$. Thus, $a = \frac{dv}{dt} = \frac{dv}{ds} \cdot \frac{ds}{dt} = \frac{dv}{ds} \cdot v$ $= -\frac{k}{2s^{3/2}} \cdot \frac{k}{\sqrt{s}} = -\frac{k^2}{2}\left(\frac{1}{s^2}\right) \Rightarrow$ acceleration is a constant times $\frac{1}{s^2}$ so a is inversely proportional to $s^2$.

100. Let $\frac{dx}{dt} = f(x)$. Then, $a = \frac{dv}{dt} = \frac{dv}{dx} \cdot \frac{dx}{dt} = \frac{dv}{dx} \cdot f(x) = \frac{d}{dx}\left(\frac{dx}{dt}\right) \cdot f(x) = \frac{d}{dx}(f(x)) \cdot f(x) = f'(x)f(x)$, as required.



101. $T = 2\pi\sqrt{\frac{L}{g}} \Rightarrow \frac{dT}{dL} = 2\pi \cdot \frac{1}{2\sqrt{\frac{L}{g}}} \cdot \frac{1}{g} = \frac{\pi}{g\sqrt{\frac{L}{g}}} = \frac{\pi}{\sqrt{gL}}$. Therefore, $\frac{dT}{du} = \frac{dT}{dL} \cdot \frac{dL}{du} = \frac{\pi}{\sqrt{gL}} \cdot kL = \frac{\pi k\sqrt{L}}{\sqrt{g}} = \frac{1}{2} \cdot 2\pi k\sqrt{\frac{L}{g}}$ $= \frac{kT}{2}$, as required.

102. No. The chain rule says that when g is differentiable at 0 and f is differentiable at g(0), then $f \circ g$ is differentiable at 0. But the chain rule says nothing about what happens when g is not differentiable at 0 so there is no contradiction.



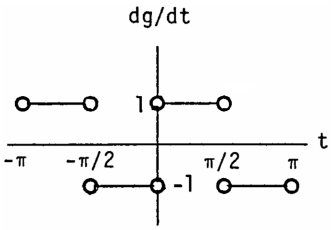
103. The graph of $y = (f \circ g)(x)$ has a horizontal tangent at $x = 1$ provided that $(f \circ g)'(1) = 0 \Rightarrow f'(g(1))g'(1) = 0$ $\Rightarrow$ either $f'(g(1)) = 0$ or $g'(1) = 0$ (or both) $\Rightarrow$ either the graph of f has a horizontal tangent at $u = g(1)$, or the graph of g has a horizontal tangent at $x = 1$ (or both).

104. $(f \circ g)'(-5) < 0 \Rightarrow f'(g(-5)) \cdot g'(-5) < 0 \Rightarrow f'(g(-5))$ and $g'(-5)$ are both nonzero and have opposite signs. That is, either $[f'(g(-5)) > 0$ and $g'(-5) < 0]$ or $[f'(g(-5)) < 0$ and $g'(-5) > 0]$.

105. As $h \to 0$, the graph of $y = \frac{\sin 2(x+h) - \sin 2x}{h}$ approaches the graph of $y = 2\cos 2x$ because $\lim_{h \to 0} \frac{\sin 2(x+h) - \sin 2x}{h} = \frac{d}{dx}(\sin 2x) = 2\cos 2x$.

106. As $h \to 0$, the graph of $y = \frac{\cos[(x+h)^2] - \cos(x^2)}{h}$ approaches the graph of $y = -2x\sin(x^2)$ because $\lim_{h \to 0} \frac{\cos[(x+h)^2] - \cos(x^2)}{h} = \frac{d}{dx}[\cos(x^2)] = -2x\sin(x^2)$.

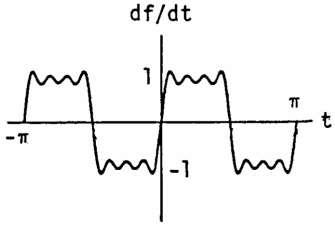
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



107. $\frac{dx}{dt} = \cos t$ and $\frac{dy}{dt} = 2\cos 2t \Rightarrow \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{2\cos 2t}{\cos t} = \frac{2(2\cos^2 t - 1)}{\cos t}$; then $\frac{dy}{dx} = 0 \Rightarrow \frac{2(2\cos^2 t - 1)}{\cos t} = 0$ $\Rightarrow 2\cos^2 t - 1 = 0 \Rightarrow \cos t = \pm\frac{1}{\sqrt{2}} \Rightarrow t = \frac{\pi}{4}, \frac{3\pi}{4}, \frac{5\pi}{4}, \frac{7\pi}{4}$. In the 1st quadrant: $t = \frac{\pi}{4} \Rightarrow x = \sin\frac{\pi}{4} = \frac{\sqrt{2}}{2}$ and $y = \sin 2\left(\frac{\pi}{4}\right) = 1 \Rightarrow \left(\frac{\sqrt{2}}{2}, 1\right)$ is the point where the tangent line is horizontal. At the origin: $x = 0$ and $y = 0$ $\Rightarrow \sin t = 0 \Rightarrow t = 0$ or $t = \pi$ and $\sin 2t = 0 \Rightarrow t = 0, \frac{\pi}{2}, \pi, \frac{3\pi}{2}$; thus $t = 0$ and $t = \pi$ give the tangent lines at the origin. Tangents at origin: $\left.\frac{dy}{dx}\right|_{t=0} = 2 \Rightarrow y = 2x$ and $\left.\frac{dy}{dx}\right|_{t=\pi} = -2 \Rightarrow y = -2x$

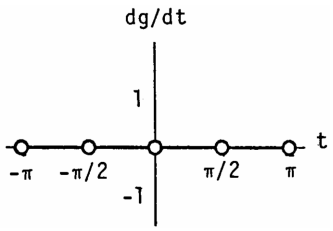
108. $\frac{dx}{dt} = 2\cos 2t$ and $\frac{dy}{dt} = 3\cos 3t \Rightarrow \frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{3\cos 3t}{2\cos 2t} = \frac{3(\cos 2t\cos t - \sin 2t\sin t)}{2(2\cos^2 t - 1)}$ $= \frac{3[(2\cos^2 t - 1)(\cos t) - 2\sin t\cos t\sin t]}{2(2\cos^2 t - 1)} = \frac{(3\cos t)(2\cos^2 t - 1 - 2\sin^2 t)}{2(2\cos^2 t - 1)} = \frac{(3\cos t)(4\cos^2 t - 3)}{2(2\cos^2 t - 1)}$; then $\frac{dy}{dx} = 0 \Rightarrow \frac{(3\cos t)(4\cos^2 t - 3)}{2(2\cos^2 t - 1)} = 0 \Rightarrow 3\cos t = 0$ or $4\cos^2 t - 3 = 0$: $3\cos t = 0 \Rightarrow t = \frac{\pi}{2}, \frac{3\pi}{2}$ and $4\cos^2 t - 3 = 0 \Rightarrow \cos t = \pm\frac{\sqrt{3}}{2} \Rightarrow t = \frac{\pi}{6}, \frac{5\pi}{6}, \frac{7\pi}{6}, \frac{11\pi}{6}$. In the 1st quadrant: $t = \frac{\pi}{6} \Rightarrow x = \sin 2\left(\frac{\pi}{6}\right) = \frac{\sqrt{3}}{2}$ and $y = \sin 3\left(\frac{\pi}{6}\right) = 1 \Rightarrow \left(\frac{\sqrt{3}}{2}, 1\right)$ is the point where the graph has a horizontal tangent. At the origin: $x = 0$ and $y = 0 \Rightarrow \sin 2t = 0$ and $\sin 3t = 0 \Rightarrow t = 0, \frac{\pi}{2}, \pi, \frac{3\pi}{2}$ and $t = 0, \frac{\pi}{3}, \frac{2\pi}{3}, \pi, \frac{4\pi}{3}, \frac{5\pi}{3} \Rightarrow t = 0$ and $t = \pi$ give the tangent lines at the origin. Tangents at the origin: $\left.\frac{dy}{dx}\right|_{t=0} = \frac{3\cos 0}{2\cos 0} = \frac{3}{2} \Rightarrow y = \frac{3}{2}x$, and $\left.\frac{dy}{dx}\right|_{t=\pi}$ $= \frac{3\cos(3\pi)}{2\cos(2\pi)} = -\frac{3}{2} \Rightarrow y = -\frac{3}{2}x$

109. From the power rule, with $y = x^{1/4}$, we get $\frac{dy}{dx} = \frac{1}{4}x^{-3/4}$. From the chain rule, $y = \sqrt{\sqrt{x}}$ $\Rightarrow \frac{dy}{dx} = \frac{1}{2\sqrt{\sqrt{x}}} \cdot \frac{d}{dx}\left(\sqrt{x}\right) = \frac{1}{2\sqrt{\sqrt{x}}} \cdot \frac{1}{2\sqrt{x}} = \frac{1}{4}x^{-3/4}$, in agreement.



110. From the power rule, with $y = x^{3/4}$, we get $\frac{dy}{dx} = \frac{3}{4}x^{-1/4}$. From the chain rule, $y = \sqrt{x\sqrt{x}}$ $\Rightarrow \frac{dy}{dx} = \frac{1}{2\sqrt{x\sqrt{x}}} \cdot \frac{d}{dx}\left(x\sqrt{x}\right) \Rightarrow \frac{dy}{dx} = \frac{1}{2\sqrt{x\sqrt{x}}} \cdot \left(x \cdot \frac{1}{2\sqrt{x}} + \sqrt{x}\right) = \frac{1}{2\sqrt{x\sqrt{x}}} \cdot \left(\frac{3}{2}\sqrt{x}\right) = \frac{3\sqrt{x}}{4\sqrt{x\sqrt{x}}}$ $= \frac{3\sqrt{x}}{4\sqrt{x}\sqrt{\sqrt{x}}} = \frac{3}{4}x^{-1/4}$, in agreement.

111. (a)



(b) $\frac{df}{dt} = 1.27324\sin 2t + 0.42444\sin 6t + 0.2546\sin 10t + 0.18186\sin 14t$

(c) The curve of $y = \frac{df}{dt}$ approximates $y = \frac{dg}{dt}$ the best when t is not $-\pi, -\frac{\pi}{2}, 0, \frac{\pi}{2}$, nor $\pi$.

111-116. Example CAS commands:

Maple:

```
f := t -> 0.78540 - 0.63662*cos(2*t) - 0.07074*cos(6*t)
      - 0.02546*cos(10*t) - 0.01299*cos(14*t);
g := t -> piecewise( t<-Pi/2, t+Pi, t<0, -t, t<Pi/2, t, Pi-t );
plot( [f(t),g(t)], t=-Pi..Pi );
Df := D(f);
Dg := D(g);
plot( [Df(t),Dg(t)], t=-Pi..Pi );
```

Mathematica: (functions, domains, and value for t0 may change):

To see the relationship between f[t] and f'[t] in 111 and h[t] in 112

```
Clear[t, f]
f[t_] = 0.78540 − 0.63662 Cos[2t] − 0.07074 Cos[6t] − 0.02546 Cos[10t] − 0.01299 Cos[14t]
f'[t]
Plot[{f[t], f'[t]},{t, −π, π}]
```

For the parametric equations in 113 - 116, do the following. Do NOT use the colon when defining tanline.

```
Clear[x, y, t]
t0 = p/4;
x[t_]:=1−Cos[t]
y[t_]:=1 + Sin[t]
p1=ParametricPlot[{x[t], y[t]},{t, −π, π}]
yp[t_]:=y'[t]/x'[t]
ypp[t_]:=yp'[t]/x'[t]
yp[t0]//N
ypp[t0]//N
tanline[x_]=y[t0] + yp[t0] (x − x[t0])
p2=Plot[tanline[x], {x, 0, 1}]
Show[p1, p2]
```

(a) the slope of the tangent line $m = y'|_{(1,0)} = \left.\frac{2\pi \cos(\pi x - y)}{1 + 2 \cos(\pi x - y)}\right|_{(1,0)} = 2\pi \Rightarrow$ the tangent line is
$y - 0 = 2\pi(x - 1) \Rightarrow y = 2\pi x - 2\pi$

(b) the normal line is $y - 0 = -\frac{1}{2\pi}(x - 1) \Rightarrow y = -\frac{x}{2\pi} + \frac{1}{2\pi}$

56. $x^2 \cos^2 y - \sin y = 0 \Rightarrow x^2(2 \cos y)(-\sin y)y' + 2x \cos^2 y - y' \cos y = 0 \Rightarrow y'[-2x^2 \cos y \sin y - \cos y]$
$= -2x \cos^2 y \Rightarrow y' = \frac{2x \cos^2 y}{2x^2 \cos y \sin y + \cos y}$;

(a) the slope of the tangent line $m = y'|_{(0,\pi)} = \left.\frac{2x \cos^2 y}{2x^2 \cos y \sin y + \cos y}\right|_{(0,\pi)} = 0 \Rightarrow$ the tangent line is $y = \pi$

(b) the normal line is $x = 0$

57. Solving $x^2 + xy + y^2 = 7$ and $y = 0 \Rightarrow x^2 = 7 \Rightarrow x = \pm\sqrt{7} \Rightarrow \left(-\sqrt{7}, 0\right)$ and $\left(\sqrt{7}, 0\right)$ are the points where the curve crosses the x-axis. Now $x^2 + xy + y^2 = 7 \Rightarrow 2x + y + xy' + 2yy' = 0 \Rightarrow (x + 2y)y' = -2x - y$
$\Rightarrow y' = -\frac{2x + y}{x + 2y} \Rightarrow m = -\frac{2x + y}{x + 2y} \Rightarrow$ the slope at $\left(-\sqrt{7}, 0\right)$ is $m = -\frac{-2\sqrt{7}}{-\sqrt{7}} = -2$ and the slope at $\left(\sqrt{7}, 0\right)$ is $m = -\frac{2\sqrt{7}}{\sqrt{7}} = -2$. Since the slope is $-2$ in each case, the corresponding tangents must be parallel.

58. $x^2 + xy + y^2 = 7 \Rightarrow 2x + y + x\frac{dy}{dx} + 2y\frac{dy}{dx} = 0 \Rightarrow (x + 2y)\frac{dy}{dx} = -2x - y \Rightarrow \frac{dy}{dx} = \frac{-2x - y}{x + 2y}$ and $\frac{dx}{dy} = \frac{x + 2y}{-2x - y}$;

(a) Solving $\frac{dy}{dx} = 0 \Rightarrow -2x - y = 0 \Rightarrow y = -2x$ and substitution into the original equation gives
$x^2 + x(-2x) + (-2x)^2 = 7 \Rightarrow 3x^2 = 7 \Rightarrow x = \pm\sqrt{\frac{7}{3}}$ and $y = \mp 2\sqrt{\frac{7}{3}}$ when the tangents are parallel to the x-axis.

(b) Solving $\frac{dx}{dy} = 0 \Rightarrow x + 2y = 0 \Rightarrow y = -\frac{x}{2}$ and substitution gives $x^2 + x\left(-\frac{x}{2}\right) + \left(-\frac{x}{2}\right)^2 = 7 \Rightarrow \frac{3x^2}{4} = 7$
$\Rightarrow x = \pm 2\sqrt{\frac{7}{3}}$ and $y = \mp\sqrt{\frac{7}{3}}$ when the tangents are parallel to the y-axis.

59. $y^4 = y^2 - x^2 \Rightarrow 4y^3y' = 2yy' - 2x \Rightarrow 2(2y^3 - y)y' = -2x \Rightarrow y' = \frac{x}{y - 2y^3}$; the slope of the tangent line at $\left(\frac{\sqrt{3}}{4}, \frac{\sqrt{3}}{2}\right)$ is $\left.\frac{x}{y - 2y^3}\right|_{\left(\frac{\sqrt{3}}{4}, \frac{\sqrt{3}}{2}\right)} = \frac{\frac{\sqrt{3}}{4}}{\frac{\sqrt{3}}{2} - \frac{6\sqrt{3}}{8}} = \frac{\frac{1}{4}}{\frac{1}{2} - \frac{3}{4}} = \frac{1}{2 - 3} = -1$; the slope of the tangent line at $\left(\frac{\sqrt{3}}{4}, \frac{1}{2}\right)$ is $\left.\frac{x}{y - 2y^3}\right|_{\left(\frac{\sqrt{3}}{4}, \frac{1}{2}\right)} = \frac{\frac{\sqrt{3}}{4}}{\frac{1}{2} - \frac{2}{8}} = \frac{2\sqrt{3}}{4 - 2} = \sqrt{3}$

60. $y^2(2 - x) = x^3 \Rightarrow 2yy'(2 - x) + y^2(-1) = 3x^2 \Rightarrow y' = \frac{y^2 + 3x^2}{2y(2 - x)}$; the slope of the tangent line is $m = \left.\frac{y^2 + 3x^2}{2y(2 - x)}\right|_{(1,1)} = \frac{4}{2} = 2 \Rightarrow$ the tangent line is $y - 1 = 2(x - 1) \Rightarrow y = 2x - 1$; the normal line is $y - 1 = -\frac{1}{2}(x - 1) \Rightarrow y = -\frac{1}{2}x + \frac{3}{2}$

61. $y^4 - 4y^2 = x^4 - 9x^2 \Rightarrow 4y^3y' - 8yy' = 4x^3 - 18x \Rightarrow y'(4y^3 - 8y) = 4x^3 - 18x \Rightarrow y' = \frac{4x^3 - 18x}{4y^3 - 8y} = \frac{2x^3 - 9x}{2y^3 - 4y}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$= \frac{x(2x^2-9)}{y(2y^2-4)} = m$; $(-3,2)$: $m = \frac{(-3)(18-9)}{2(8-4)} = -\frac{27}{8}$; $(-3,-2)$: $m = \frac{27}{8}$; $(3,2)$: $m = \frac{27}{8}$; $(3,-2)$: $m = -\frac{27}{8}$

62. $x^3+y^3-9xy=0 \Rightarrow 3x^2+3y^2y'-9xy'-9y=0 \Rightarrow y'(3y^2-9x)=9y-3x^2 \Rightarrow y' = \frac{9y-3x^2}{3y^2-9x} = \frac{3y-x^2}{y^2-3x}$

(a) $y'|_{(4,2)} = \frac{5}{4}$ and $y'|_{(2,4)} = \frac{4}{5}$;

(b) $y' = 0 \Rightarrow \frac{3y-x^2}{y^2-3x} = 0 \Rightarrow 3y-x^2=0 \Rightarrow y = \frac{x^2}{3} \Rightarrow x^3 + \left(\frac{x^2}{3}\right)^3 - 9x\left(\frac{x^2}{3}\right) = 0 \Rightarrow x^6 - 54x^3 = 0$
$\Rightarrow x^3(x^3-54)=0 \Rightarrow x = 0$ or $x = \sqrt[3]{54} = 3\sqrt[3]{2} \Rightarrow$ there is a horizontal tangent at $x = 3\sqrt[3]{2}$. To find the corresponding y-value, we will use part (c).

(c) $\frac{dx}{dy} = 0 \Rightarrow \frac{y^2-3x}{3y-x^2} = 0 \Rightarrow y^2-3x=0 \Rightarrow y = \pm\sqrt{3x}$; $y = \sqrt{3x} \Rightarrow x^3 + \left(\sqrt{3x}\right)^3 - 9x\sqrt{3x} = 0$
$\Rightarrow x^3 - 6\sqrt{3}\,x^{3/2} = 0 \Rightarrow x^{3/2}\left(x^{3/2} - 6\sqrt{3}\right) = 0 \Rightarrow x^{3/2} = 0$ or $x^{3/2} = 6\sqrt{3} \Rightarrow x = 0$ or $x = \sqrt[3]{108} = 3\sqrt[3]{4}$.
Since the equation $x^3+y^3-9xy=0$ is symmetric in x and y, the graph is symmetric about the line $y=x$. That is, if $(a,b)$ is a point on the folium, then so is $(b,a)$. Moreover, if $y'|_{(a,b)} = m$, then $y'|_{(b,a)} = \frac{1}{m}$. Thus, if the folium has a horizontal tangent at $(a,b)$, it has a vertical tangent at $(b,a)$ so one might expect that with a horizontal tangent at $x = \sqrt[3]{54}$ and a vertical tangent at $x = 3\sqrt[3]{4}$, the points of tangency are $\left(\sqrt[3]{54}, 3\sqrt[3]{4}\right)$ and $\left(3\sqrt[3]{4}, \sqrt[3]{54}\right)$, respectively. One can check that these points do satisfy the equation $x^3+y^3-9xy=0$.

63. $x^2-2tx+2t^2=4 \Rightarrow 2x\frac{dx}{dt} - 2x - 2t\frac{dx}{dt} + 4t = 0 \Rightarrow (2x-2t)\frac{dx}{dt} = 2x-4t \Rightarrow \frac{dx}{dt} = \frac{2x-4t}{2x-2t} = \frac{x-2t}{x-t}$;
$2y^3-3t^2=4 \Rightarrow 6y^2\frac{dy}{dt} - 6t = 0 \Rightarrow \frac{dy}{dt} = \frac{6t}{6y^2} = \frac{t}{y^2}$; thus $\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{\left(\frac{t}{y^2}\right)}{\left(\frac{x-2t}{x-t}\right)} = \frac{t(x-t)}{y^2(x-2t)}$; $t=2$
$\Rightarrow x^2 - 2(2)x + 2(2)^2 = 4 \Rightarrow x^2-4x+4=0 \Rightarrow (x-2)^2=0 \Rightarrow x=2; t=2 \Rightarrow 2y^3 - 3(2)^2 = 4$
$\Rightarrow 2y^3 = 16 \Rightarrow y^3 = 8 \Rightarrow y = 2$; therefore $\left.\frac{dy}{dx}\right|_{t=2} = \frac{2(2-2)}{(2)^2(2-2(2))} = 0$

64. $x = \sqrt{5-\sqrt{t}} \Rightarrow \frac{dx}{dt} = \frac{1}{2}\left(5-\sqrt{t}\right)^{-1/2}\left(-\frac{1}{2}t^{-1/2}\right) = -\frac{1}{4\sqrt{t}\sqrt{5-\sqrt{t}}}$; $y(t-1) = \sqrt{t} \Rightarrow y + (t-1)\frac{dy}{dt} = \frac{1}{2}t^{-1/2}$
$\Rightarrow (t-1)\frac{dy}{dt} = \frac{1}{2\sqrt{t}} - y \Rightarrow \frac{dy}{dt} = \frac{\frac{1}{2\sqrt{t}} - y}{(t-1)} = \frac{1-2y\sqrt{t}}{2t\sqrt{t}-2\sqrt{t}}$; thus $\frac{dy}{dx} = \frac{\frac{dy}{dt}}{\frac{dx}{dt}} = \frac{\frac{1-2y\sqrt{t}}{2t\sqrt{t}-2\sqrt{t}}}{\frac{-1}{4\sqrt{t}\sqrt{5-\sqrt{t}}}} = \frac{1-2y\sqrt{t}}{2\sqrt{t}(t-1)} \cdot \frac{4\sqrt{t}\sqrt{5-\sqrt{t}}}{-1}$
$= \frac{2\left(1-2y\sqrt{t}\right)\sqrt{5-\sqrt{t}}}{1-t}$; $t=4 \Rightarrow x = \sqrt{5-\sqrt{4}} = \sqrt{3}$; $t=4 \Rightarrow y(3) = \sqrt{4} = 2$
therefore, $\left.\frac{dy}{dx}\right|_{t=4} = \frac{2\left(1-2(2)\sqrt{4}\right)\sqrt{5-\sqrt{4}}}{1-4} = \frac{14}{3}$

65. $x + 2x^{3/2} = t^2 + t \Rightarrow \frac{dx}{dt} + 3x^{1/2}\frac{dx}{dt} = 2t+1 \Rightarrow \left(1+3x^{1/2}\right)\frac{dx}{dt} = 2t+1 \Rightarrow \frac{dx}{dt} = \frac{2t+1}{1+3x^{1/2}}$; $y\sqrt{t+1} + 2t\sqrt{y} = 4$
$\Rightarrow \frac{dy}{dt}\sqrt{t+1} + y\left(\frac{1}{2}\right)(t+1)^{-1/2} + 2\sqrt{y} + 2t\left(\frac{1}{2}y^{-1/2}\right)\frac{dy}{dt} = 0 \Rightarrow \frac{dy}{dt}\sqrt{t+1} + \frac{y}{2\sqrt{t+1}} + 2\sqrt{y} + \left(\frac{t}{\sqrt{y}}\right)\frac{dy}{dt} = 0$
$\Rightarrow \left(\sqrt{t+1} + \frac{t}{\sqrt{y}}\right)\frac{dy}{dt} = \frac{-y}{2\sqrt{t+1}} - 2\sqrt{y} \Rightarrow \frac{dy}{dt} = \frac{\left(\frac{-y}{2\sqrt{t+1}} - 2\sqrt{y}\right)}{\left(\sqrt{t+1} + \frac{t}{\sqrt{y}}\right)} = \frac{-y\sqrt{y} - 4y\sqrt{t+1}}{2\sqrt{y}(t+1) + 2t\sqrt{t+1}}$; thus
$\frac{dy}{dx} = \frac{dy/dt}{dx/dt} = \frac{\left(\frac{-y\sqrt{y}-4y\sqrt{t+1}}{2\sqrt{y}(t+1)+2t\sqrt{t+1}}\right)}{\left(\frac{2t+1}{1+3x^{1/2}}\right)}$; $t=0 \Rightarrow x + 2x^{3/2} = 0 \Rightarrow x\left(1+2x^{1/2}\right) = 0 \Rightarrow x = 0; t = 0$
$\Rightarrow y\sqrt{0+1} + 2(0)\sqrt{y} = 4 \Rightarrow y = 4$; therefore $\left.\frac{dy}{dx}\right|_{t=0} = \frac{\left(\frac{-4\sqrt{4}-4(4)\sqrt{0+1}}{2\sqrt{4}(0+1)+2(0)\sqrt{0+1}}\right)}{\left(\frac{2(0)+1}{1+3(0)^{1/2}}\right)} = -6$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

66. $x \sin t + 2x = t \Rightarrow \frac{dx}{dt} \sin t + x \cos t + 2\frac{dx}{dt} = 1 \Rightarrow (\sin t + 2)\frac{dx}{dt} = 1 - x\cos t \Rightarrow \frac{dx}{dt} = \frac{1 - x\cos t}{\sin t + 2}$;
$t \sin t - 2t = y \Rightarrow \sin t + t\cos t - 2 = \frac{dy}{dt}$; thus $\frac{dy}{dx} = \frac{\sin t + t\cos t - 2}{\left(\frac{1 - x\cos t}{\sin t + 2}\right)}$; $t = \pi \Rightarrow x \sin \pi + 2x = \pi$
$\Rightarrow x = \frac{\pi}{2}$; therefore $\left.\frac{dy}{dx}\right|_{t=\pi} = \frac{\sin \pi + \pi \cos \pi - 2}{\left[\frac{1 - \left(\frac{\pi}{2}\right)\cos \pi}{\sin \pi + 2}\right]} = \frac{-4\pi - 8}{2 + \pi} = -4$

67. (a) if $f(x) = \frac{3}{2}x^{2/3} - 3$, then $f'(x) = x^{-1/3}$ and $f''(x) = -\frac{1}{3}x^{-4/3}$ so the claim $f''(x) = x^{-1/3}$ is false
(b) if $f(x) = \frac{9}{10}x^{5/3} - 7$, then $f'(x) = \frac{3}{2}x^{2/3}$ and $f''(x) = x^{-1/3}$ is true
(c) $f''(x) = x^{-1/3} \Rightarrow f'''(x) = -\frac{1}{3}x^{-4/3}$ is true
(d) if $f'(x) = \frac{3}{2}x^{2/3} + 6$, then $f''(x) = x^{-1/3}$ is true

68. $2x^2 + 3y^2 = 5 \Rightarrow 4x + 6yy' = 0 \Rightarrow y' = -\frac{2x}{3y} \Rightarrow y'|_{(1,1)} = -\left.\frac{2x}{3y}\right|_{(1,1)} = -\frac{2}{3}$ and $y'|_{(1,-1)} = -\left.\frac{2x}{3y}\right|_{(1,-1)} = \frac{2}{3}$;
also, $y^2 = x^3 \Rightarrow 2yy' = 3x^2 \Rightarrow y' = \frac{3x^2}{2y} \Rightarrow y'|_{(1,1)} = \left.\frac{3x^2}{2y}\right|_{(1,1)} = \frac{3}{2}$ and $y'|_{(1,-1)} = \left.\frac{3x^2}{2y}\right|_{(1,-1)} = -\frac{3}{2}$. Therefore the tangents to the curves are perpendicular at $(1, 1)$ and $(1, -1)$ (i.e., the curves are orthogonal at these two points of intersection).

69. $x^2 + 2xy - 3y^2 = 0 \Rightarrow 2x + 2xy' + 2y - 6yy' = 0 \Rightarrow y'(2x - 6y) = -2x - 2y \Rightarrow y' = \frac{x + y}{3y - x} \Rightarrow$ the slope of the tangent line $m = y'|_{(1,1)} = \left.\frac{x + y}{3y - x}\right|_{(1,1)} = 1 \Rightarrow$ the equation of the normal line at $(1, 1)$ is $y - 1 = -1(x - 1)$
$\Rightarrow y = -x + 2$. To find where the normal line intersects the curve we substitute into its equation:
$x^2 + 2x(2 - x) - 3(2 - x)^2 = 0 \Rightarrow x^2 + 4x - 2x^2 - 3(4 - 4x + x^2) = 0 \Rightarrow -4x^2 + 16x - 12 = 0$
$\Rightarrow x^2 - 4x + 3 = 0 \Rightarrow (x - 3)(x - 1) = 0 \Rightarrow x = 3$ and $y = -x + 2 = -1$. Therefore, the normal to the curve at $(1, 1)$ intersects the curve at the point $(3, -1)$. Note that it also intersects the curve at $(1, 1)$.

70. $xy + 2x - y = 0 \Rightarrow x\frac{dy}{dx} + y + 2 - \frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = \frac{y + 2}{1 - x}$; the slope of the line $2x + y = 0$ is $-2$. In order to be parallel, the normal lines must also have slope of $-2$. Since a normal is perpendicular to a tangent, the slope of the tangent is $\frac{1}{2}$. Therefore, $\frac{y + 2}{1 - x} = \frac{1}{2} \Rightarrow 2y + 4 = 1 - x \Rightarrow x = -3 - 2y$. Substituting in the original equation, $y(-3 - 2y) + 2(-3 - 2y) - y = 0 \Rightarrow y^2 + 4y + 3 = 0 \Rightarrow y = -3$ or $y = -1$. If $y = -3$, then $x = 3$ and $y + 3 = -2(x - 3) \Rightarrow y = -2x + 3$. If $y = -1$, then $x = -1$ and $y + 1 = -2(x + 1) \Rightarrow y = -2x - 3$.

71. $y^2 = x \Rightarrow \frac{dy}{dx} = \frac{1}{2y}$. If a normal is drawn from $(a, 0)$ to $(x_1, y_1)$ on the curve its slope satisfies $\frac{y_1 - 0}{x_1 - a} = -2y_1$
$\Rightarrow y_1 = -2y_1(x_1 - a)$ or $a = x_1 + \frac{1}{2}$. Since $x_1 \geq 0$ on the curve, we must have that $a \geq \frac{1}{2}$. By symmetry, the two points on the parabola are $\left(x_1, \sqrt{x_1}\right)$ and $\left(x_1, -\sqrt{x_1}\right)$. For the normal to be perpendicular,
$\left(\frac{\sqrt{x_1}}{x_1 - a}\right)\left(\frac{\sqrt{x_1}}{a - x_1}\right) = -1 \Rightarrow \frac{x_1}{(a - x_1)^2} = 1 \Rightarrow x_1 = (a - x_1)^2 \Rightarrow x_1 = \left(x_1 + \frac{1}{2} - x_1\right)^2 \Rightarrow x_1 = \frac{1}{4}$ and $y_1 = \pm\frac{1}{2}$.
Therefore, $\left(\frac{1}{4}, \pm\frac{1}{2}\right)$ and $a = \frac{3}{4}$.

72. Ex. 6b.) $y = x^{1/2}$ has no derivative at $x = 0$ because the slope of the graph becomes vertical at $x = 0$.
Ex. 7a.) $y = (1 - x^2)^{1/4}$ has a derivative only on $(-1, 1)$ because the function is defined only on $[-1, 1]$ and the slope of the tangent becomes vertical at both $x = -1$ and $x = 1$.

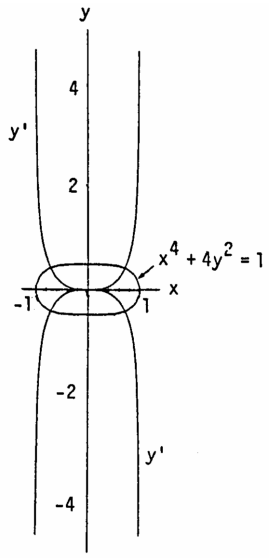
73. $xy^3 + x^2y = 6 \Rightarrow x\left(3y^2\frac{dy}{dx}\right) + y^3 + x^2\frac{dy}{dx} + 2xy = 0 \Rightarrow \frac{dy}{dx}(3xy^2 + x^2) = -y^3 - 2xy \Rightarrow \frac{dy}{dx} = \frac{-y^3 - 2xy}{3xy^2 + x^2}$
$= -\frac{y^3 + 2xy}{3xy^2 + x^2}$; also, $xy^3 + x^2y = 6 \Rightarrow x(3y^2) + y^3\frac{dx}{dy} + x^2 + y\left(2x\frac{dx}{dy}\right) = 0 \Rightarrow \frac{dx}{dy}(y^3 + 2xy) = -3xy^2 - x^2$
$\Rightarrow \frac{dx}{dy} = -\frac{3xy^2 + x^2}{y^3 + 2xy}$; thus $\frac{dx}{dy}$ appears to equal $\frac{1}{\frac{dy}{dx}}$. The two different treatments view the graphs as functions

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

symmetric across the line $y = x$, so their slopes are reciprocals of one another at the corresponding points $(a, b)$ and $(b, a)$.

74. $x^3 + y^2 = \sin^2 y \Rightarrow 3x^2 + 2y\frac{dy}{dx} = (2\sin y)(\cos y)\frac{dy}{dx} \Rightarrow \frac{dy}{dx}(2y - 2\sin y\cos y) = -3x^2 \Rightarrow \frac{dy}{dx} = \frac{-3x^2}{2y - 2\sin y\cos y}$ $= \frac{3x^2}{2\sin y\cos y - 2y}$; also, $x^3 + y^2 = \sin^2 y \Rightarrow 3x^2\frac{dx}{dy} + 2y = 2\sin y\cos y \Rightarrow \frac{dx}{dy} = \frac{2\sin y\cos y - 2y}{3x^2}$; thus $\frac{dx}{dy}$ appears to equal $\frac{1}{\frac{dy}{dx}}$. The two different treatments view the graphs as functions symmetric across the line $y = x$ so their slopes are reciprocals of one another at the corresponding points $(a, b)$ and $(b, a)$.

75. $x^4 + 4y^2 = 1$:



(a) $y^2 = \frac{1-x^4}{4} \Rightarrow y = \pm\frac{1}{2}\sqrt{1 - x^4}$

$\Rightarrow \frac{dy}{dx} = \pm\frac{1}{4}(1 - x^4)^{-1/2}(-4x^3) = \frac{\pm x^3}{(1-x^4)^{1/2}}$;

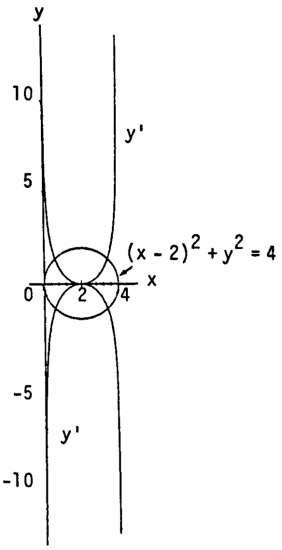
differentiating implicitly, we find, $4x^3 + 8y\frac{dy}{dx} = 0$

$\Rightarrow \frac{dy}{dx} = \frac{-4x^3}{8y} = \frac{-4x^3}{8\left(\pm\frac{1}{2}\sqrt{1-x^4}\right)} = \frac{\pm x^3}{(1-x^4)^{1/2}}$.

(b)

76. $(x - 2)^2 + y^2 = 4$:

(a) $y = \pm\sqrt{4 - (x-2)^2}$



$\Rightarrow \frac{dy}{dx} = \pm\frac{1}{2}(4 - (x-2)^2)^{-1/2}(-2(x-2))$

$= \frac{\pm(x-2)}{[4-(x-2)^2]^{1/2}}$; differentiating implicitly,

$2(x-2) + 2y\frac{dy}{dx} = 0 \Rightarrow \frac{dy}{dx} = \frac{-2(x-2)}{2y}$

$= \frac{-(x-2)}{y} = \frac{-(x-2)}{\pm[4-(x-2)^2]^{1/2}} = \frac{\pm(x-2)}{[4-(x-2)^2]^{1/2}}$.

$\Rightarrow \frac{ds}{dt} = \frac{x}{\sqrt{x^2+y^2+z^2}}\frac{dx}{dt} + \frac{y}{\sqrt{x^2+y^2+z^2}}\frac{dy}{dt} + \frac{z}{\sqrt{x^2+y^2+z^2}}\frac{dz}{dt}$

(b) From part (a) with $\frac{dx}{dt} = 0 \Rightarrow \frac{ds}{dt} = \frac{y}{\sqrt{x^2+y^2+z^2}}\frac{dy}{dt} + \frac{z}{\sqrt{x^2+y^2+z^2}}\frac{dz}{dt}$

(c) From part (a) with $\frac{ds}{dt} = 0 \Rightarrow 0 = 2x\frac{dx}{dt} + 2y\frac{dy}{dt} + 2z\frac{dz}{dt} \Rightarrow \frac{dx}{dt} + \frac{y}{x}\frac{dy}{dt} + \frac{z}{x}\frac{dz}{dt} = 0$

9. (a) $A = \frac{1}{2}ab\sin\theta \Rightarrow \frac{dA}{dt} = \frac{1}{2}ab\cos\theta\frac{d\theta}{dt}$ (b) $A = \frac{1}{2}ab\sin\theta \Rightarrow \frac{dA}{dt} = \frac{1}{2}ab\cos\theta\frac{d\theta}{dt} + \frac{1}{2}b\sin\theta\frac{da}{dt}$

(c) $A = \frac{1}{2}ab\sin\theta \Rightarrow \frac{dA}{dt} = \frac{1}{2}ab\cos\theta\frac{d\theta}{dt} + \frac{1}{2}b\sin\theta\frac{da}{dt} + \frac{1}{2}a\sin\theta\frac{db}{dt}$

10. Given $A = \pi r^2$, $\frac{dr}{dt} = 0.01$ cm/sec, and $r = 50$ cm. Since $\frac{dA}{dt} = 2\pi r\frac{dr}{dt}$, then $\frac{dA}{dt}\Big|_{r=50} = 2\pi(50)\left(\frac{1}{100}\right)$ $= \pi$ cm$^2$/min.

11. Given $\frac{d\ell}{dt} = -2$ cm/sec, $\frac{dw}{dt} = 2$ cm/sec, $\ell = 12$ cm and $w = 5$ cm.

(a) $A = \ell w \Rightarrow \frac{dA}{dt} = \ell\frac{dw}{dt} + w\frac{d\ell}{dt} \Rightarrow \frac{dA}{dt} = 12(2) + 5(-2) = 14$ cm$^2$/sec, increasing

(b) $P = 2\ell + 2w \Rightarrow \frac{dP}{dt} = 2\frac{d\ell}{dt} + 2\frac{dw}{dt} = 2(-2) + 2(2) = 0$ cm/sec, constant

(c) $D = \sqrt{w^2+\ell^2} = (w^2+\ell^2)^{1/2} \Rightarrow \frac{dD}{dt} = \frac{1}{2}(w^2+\ell^2)^{-1/2}\left(2w\frac{dw}{dt} + 2\ell\frac{d\ell}{dt}\right) \Rightarrow \frac{dD}{dt} = \frac{w\frac{dw}{dt} + \ell\frac{d\ell}{dt}}{\sqrt{w^2+\ell^2}}$ $= \frac{(5)(2)+(12)(-2)}{\sqrt{25+144}} = -\frac{14}{13}$ cm/sec, decreasing

12. (a) $V = xyz \Rightarrow \frac{dV}{dt} = yz\frac{dx}{dt} + xz\frac{dy}{dt} + xy\frac{dz}{dt} \Rightarrow \frac{dV}{dt}\Big|_{(4,3,2)} = (3)(2)(1) + (4)(2)(-2) + (4)(3)(1) = 2$ m$^3$/sec

(b) $S = 2xy + 2xz + 2yz \Rightarrow \frac{dS}{dt} = (2y+2z)\frac{dx}{dt} + (2x+2z)\frac{dy}{dt} + (2x+2y)\frac{dz}{dt}$

$\Rightarrow \frac{dS}{dt}\Big|_{(4,3,2)} = (10)(1) + (12)(-2) + (14)(1) = 0$ m$^2$/sec

(c) $\ell = \sqrt{x^2+y^2+z^2} = (x^2+y^2+z^2)^{1/2} \Rightarrow \frac{d\ell}{dt} = \frac{x}{\sqrt{x^2+y^2+z^2}}\frac{dx}{dt} + \frac{y}{\sqrt{x^2+y^2+z^2}}\frac{dy}{dt} + \frac{z}{\sqrt{x^2+y^2+z^2}}\frac{dz}{dt}$

$\Rightarrow \frac{d\ell}{dt}\Big|_{(4,3,2)} = \left(\frac{4}{\sqrt{29}}\right)(1) + \left(\frac{3}{\sqrt{29}}\right)(-2) + \left(\frac{2}{\sqrt{29}}\right)(1) = 0$ m/sec

13. Given: $\frac{dx}{dt} = 5$ ft/sec, the ladder is 13 ft long, and $x = 12$, $y = 5$ at the instant of time

(a) Since $x^2 + y^2 = 169 \Rightarrow \frac{dy}{dt} = -\frac{x}{y}\frac{dx}{dt} = -\left(\frac{12}{5}\right)(5) = -12$ ft/sec, the ladder is sliding down the wall

(b) The area of the triangle formed by the ladder and walls is $A = \frac{1}{2}xy \Rightarrow \frac{dA}{dt} = \left(\frac{1}{2}\right)\left(x\frac{dy}{dt} + y\frac{dx}{dt}\right)$. The area is changing at $\frac{1}{2}[12(-12) + 5(5)] = -\frac{119}{2} = -59.5$ ft$^2$/sec.

(c) $\cos\theta = \frac{x}{13} \Rightarrow -\sin\theta\frac{d\theta}{dt} = \frac{1}{13}\cdot\frac{dx}{dt} \Rightarrow \frac{d\theta}{dt} = -\frac{1}{13\sin\theta}\cdot\frac{dx}{dt} = -\left(\frac{1}{5}\right)(5) = -1$ rad/sec

14. $s^2 = y^2 + x^2 \Rightarrow 2s\frac{ds}{dt} = 2x\frac{dx}{dt} + 2y\frac{dy}{dt} \Rightarrow \frac{ds}{dt} = \frac{1}{s}\left(x\frac{dx}{dt} + y\frac{dy}{dt}\right) \Rightarrow \frac{ds}{dt} = \frac{1}{\sqrt{169}}[5(-442) + 12(-481)]$ $= -614$ knots

15. Let s represent the distance between the girl and the kite and x represents the horizontal distance between the girl and kite $\Rightarrow s^2 = (300)^2 + x^2 \Rightarrow \frac{ds}{dt} = \frac{x}{s}\frac{dx}{dt} = \frac{400(25)}{500} = 20$ ft/sec.

16. When the diameter is 3.8 in., the radius is 1.9 in. and $\frac{dr}{dt} = \frac{1}{3000}$ in/min. Also $V = 6\pi r^2 \Rightarrow \frac{dV}{dt} = 12\pi r\frac{dr}{dt}$ $\Rightarrow \frac{dV}{dt} = 12\pi(1.9)\left(\frac{1}{3000}\right) = 0.0076\pi$. The volume is changing at about 0.0239 in$^3$/min.

17. $V = \frac{1}{3}\pi r^2 h$, $h = \frac{3}{8}(2r) = \frac{3r}{4} \Rightarrow r = \frac{4h}{3} \Rightarrow V = \frac{1}{3}\pi\left(\frac{4h}{3}\right)^2 h = \frac{16\pi h^3}{27} \Rightarrow \frac{dV}{dt} = \frac{16\pi h^2}{9}\frac{dh}{dt}$

(a) $\frac{dh}{dt}\Big|_{h=4} = \left(\frac{9}{16\pi 4^2}\right)(10) = \frac{90}{256\pi} \approx 0.1119$ m/sec $= 11.19$ cm/sec

(b) $r = \frac{4h}{3} \Rightarrow \frac{dr}{dt} = \frac{4}{3}\frac{dh}{dt} = \frac{4}{3}\left(\frac{90}{256\pi}\right) = \frac{15}{32\pi} \approx 0.1492$ m/sec $= 14.92$ cm/sec

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

18. (a) $V = \frac{1}{3}\pi r^2 h$ and $r = \frac{15h}{2} \Rightarrow V = \frac{1}{3}\pi\left(\frac{15h}{2}\right)^2 h = \frac{75\pi h^3}{4} \Rightarrow \frac{dV}{dt} = \frac{225\pi h^2}{4}\frac{dh}{dt} \Rightarrow \frac{dh}{dt}\Big|_{h=5} = \frac{4(-50)}{225\pi(5)^2} = \frac{-8}{225\pi}$
$\approx -0.0113$ m/min $= -1.13$ cm/min

(b) $r = \frac{15h}{2} \Rightarrow \frac{dr}{dt} = \frac{15}{2}\frac{dh}{dt} \Rightarrow \frac{dr}{dt}\Big|_{h=5} = \left(\frac{15}{2}\right)\left(\frac{-8}{225\pi}\right) = \frac{-4}{15\pi} \approx -0.0849$ m/sec $= -8.49$ cm/sec

19. (a) $V = \frac{\pi}{3}y^2(3R - y) \Rightarrow \frac{dV}{dt} = \frac{\pi}{3}\left[2y(3R - y) + y^2(-1)\right]\frac{dy}{dt} \Rightarrow \frac{dy}{dt} = \left[\frac{\pi}{3}(6Ry - 3y^2)\right]^{-1}\frac{dV}{dt} \Rightarrow$ at $R = 13$ and $y = 8$ we have $\frac{dy}{dt} = \frac{1}{144\pi}(-6) = \frac{-1}{24\pi}$ m/min

(b) The hemisphere is on the circle $r^2 + (13 - y)^2 = 169 \Rightarrow r = \sqrt{26y - y^2}$ m

(c) $r = (26y - y^2)^{1/2} \Rightarrow \frac{dr}{dt} = \frac{1}{2}(26y - y^2)^{-1/2}(26 - 2y)\frac{dy}{dt} \Rightarrow \frac{dr}{dt} = \frac{13 - y}{\sqrt{26y - y^2}}\frac{dy}{dt} \Rightarrow \frac{dr}{dt}\Big|_{y=8} = \frac{13 - 8}{\sqrt{26\cdot 8 - 64}}\left(\frac{-1}{24\pi}\right)$
$= \frac{-5}{288\pi}$ m/min

20. If $V = \frac{4}{3}\pi r^3$, $S = 4\pi r^2$, and $\frac{dV}{dt} = kS = 4k\pi r^2$, then $\frac{dV}{dt} = 4\pi r^2\frac{dr}{dt} \Rightarrow 4k\pi r^2 = 4\pi r^2\frac{dr}{dt} \Rightarrow \frac{dr}{dt} = k$, a constant. Therefore, the radius is increasing at a constant rate.

21. If $V = \frac{4}{3}\pi r^3$, $r = 5$, and $\frac{dV}{dt} = 100\pi$ ft$^3$/min, then $\frac{dV}{dt} = 4\pi r^2\frac{dr}{dt} \Rightarrow \frac{dr}{dt} = 1$ ft/min. Then $S = 4\pi r^2 \Rightarrow \frac{dS}{dt}$
$= 8\pi r\frac{dr}{dt} = 8\pi(5)(1) = 40\pi$ ft$^2$/min, the rate at which the surface area is increasing.

22. Let s represent the length of the rope and x the horizontal distance of the boat from the dock.

(a) We have $s^2 = x^2 + 36 \Rightarrow \frac{dx}{dt} = \frac{s}{x}\frac{ds}{dt} = \frac{s}{\sqrt{s^2 - 36}}\frac{ds}{dt}$. Therefore, the boat is approaching the dock at $\frac{dx}{dt}\Big|_{s=10} = \frac{10}{\sqrt{10^2 - 36}}(-2) = -2.5$ ft/sec.

(b) $\cos\theta = \frac{6}{r} \Rightarrow -\sin\theta\frac{d\theta}{dt} = -\frac{6}{r^2}\frac{dr}{dt} \Rightarrow \frac{d\theta}{dt} = \frac{6}{r^2\sin\theta}\frac{dr}{dt}$. Thus, $r = 10$, $x = 8$, and $\sin\theta = \frac{8}{10}$
$\Rightarrow \frac{d\theta}{dt} = \frac{6}{10^2\left(\frac{8}{10}\right)}\cdot(-2) = -\frac{3}{20}$ rad/sec

23. Let s represent the distance between the bicycle and balloon, h the height of the balloon and x the horizontal distance between the balloon and the bicycle. The relationship between the variables is $s^2 = h^2 + x^2$
$\Rightarrow \frac{ds}{dt} = \frac{1}{s}\left(h\frac{dh}{dt} + x\frac{dx}{dt}\right) \Rightarrow \frac{ds}{dt} = \frac{1}{85}[68(1) + 51(17)] = 11$ ft/sec.

24. (a) Let h be the height of the coffee in the pot. Since the radius of the pot is 3, the volume of the coffee is $V = 9\pi h \Rightarrow \frac{dV}{dt} = 9\pi\frac{dh}{dt} \Rightarrow$ the rate the coffee is rising is $\frac{dh}{dt} = \frac{1}{9\pi}\frac{dV}{dt} = \frac{10}{9\pi}$ in/min.

(b) Let h be the height of the coffee in the pot. From the figure, the radius of the filter $r = \frac{h}{2} \Rightarrow V = \frac{1}{3}\pi r^2 h$
$= \frac{\pi h^3}{12}$, the volume of the filter. The rate the coffee is falling is $\frac{dh}{dt} = \frac{4}{\pi h^2}\frac{dV}{dt} = \frac{4}{25\pi}(-10) = -\frac{8}{5\pi}$ in/min.

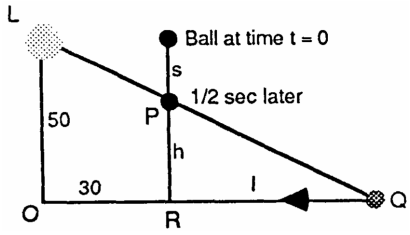
25. $y = QD^{-1} \Rightarrow \frac{dy}{dt} = D^{-1}\frac{dQ}{dt} - QD^{-2}\frac{dD}{dt} = \frac{1}{41}(0) - \frac{233}{(41)^2}(-2) = \frac{466}{1681}$ L/min $\Rightarrow$ increasing about 0.2772 L/min

26. (a) $\frac{dc}{dt} = (3x^2 - 12x + 15)\frac{dx}{dt} = (3(2)^2 - 12(2) + 15)(0.1) = 0.3$, $\frac{dr}{dt} = 9\frac{dx}{dt} = 9(0.1) = 0.9$, $\frac{dp}{dt} = 0.9 - 0.3 = 0.6$

(b) $\frac{dc}{dt} = (3x^2 - 12x - 45x^{-2})\frac{dx}{dt} = (3(1.5)^2 - 12(1.5) - 45(1.5)^{-2})(0.05) = -1.5625$, $\frac{dr}{dt} = 70\frac{dx}{dt} = 70(0.05) = 3.5$,
$\frac{dp}{dt} = 3.5 - (-1.5625) = 5.0625$

27. Let $P(x, y)$ represent a point on the curve $y = x^2$ and $\theta$ the angle of inclination of a line containing P and the origin. Consequently, $\tan\theta = \frac{y}{x} \Rightarrow \tan\theta = \frac{x^2}{x} = x \Rightarrow \sec^2\theta\frac{d\theta}{dt} = \frac{dx}{dt} \Rightarrow \frac{d\theta}{dt} = \cos^2\theta\frac{dx}{dt}$. Since $\frac{dx}{dt} = 10$ m/sec and $\cos^2\theta|_{x=3} = \frac{x^2}{y^2 + x^2} = \frac{3^2}{9^2 + 3^2} = \frac{1}{10}$, we have $\frac{d\theta}{dt}\Big|_{x=3} = 1$ rad/sec.

28. $y = (-x)^{1/2}$ and $\tan\theta = \frac{y}{x} \Rightarrow \tan\theta = \frac{(-x)^{1/2}}{x} \Rightarrow \sec^2\theta\frac{d\theta}{dt} = \frac{\left(\frac{1}{2}\right)(-x)^{-1/2}(-1)x - (-x)^{1/2}(1)}{x^2}\frac{dx}{dt}$



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$\Rightarrow \frac{d\theta}{dt} = \left(\frac{\frac{-x}{2\sqrt{-x}} - \sqrt{-x}}{x^2}\right)(\cos^2\theta)\left(\frac{dx}{dt}\right)$. Now, $\tan\theta = \frac{2}{-4} = -\frac{1}{2} \Rightarrow \cos\theta = -\frac{2}{\sqrt{5}} \Rightarrow \cos^2\theta = \frac{4}{5}$. Then $\frac{d\theta}{dt} = \left(\frac{\frac{4}{4}-2}{16}\right)\left(\frac{4}{5}\right)(-8) = \frac{2}{5}$ rad/sec.

29. The distance from the origin is $s = \sqrt{x^2+y^2}$ and we wish to find $\frac{ds}{dt}\Big|_{(5,12)}$
$= \frac{1}{2}(x^2+y^2)^{-1/2}\left(2x\frac{dx}{dt} + 2y\frac{dy}{dt}\right)\Big|_{(5,12)} = \frac{(5)(-1)+(12)(-5)}{\sqrt{25+144}} = -5$ m/sec

30. When s represents the length of the shadow and x the distance of the man from the streetlight, then $s = \frac{3}{5}x$.
(a) If I represents the distance of the tip of the shadow from the streetlight, then $I = s + x \Rightarrow \frac{dI}{dt} = \frac{ds}{dt} + \frac{dx}{dt}$ (which is velocity not speed) $\Rightarrow \left|\frac{dI}{dt}\right| = \left|\frac{3}{5}\frac{dx}{dt} + \frac{dx}{dt}\right| = \left|\frac{8}{5}\right|\left|\frac{dx}{dt}\right| = \frac{8}{5}|-5| = 8$ ft/sec, the speed the tip of the shadow is moving along the ground.
(b) $\frac{ds}{dt} = \frac{3}{5}\frac{dx}{dt} = \frac{3}{5}(-5) = -3$ ft/sec, so the length of the shadow is decreasing at a rate of 3 ft/sec.

31. Let $s = 16t^2$ represent the distance the ball has fallen, h the distance between the ball and the ground, and I the distance between the shadow and the point directly beneath the ball. Accordingly, $s + h = 50$ and since the triangle LOQ and triangle PRQ are similar we have $I = \frac{30h}{50-h} \Rightarrow h = 50 - 16t^2$ and $I = \frac{30(50-16t^2)}{50-(50-16t^2)}$
$= \frac{1500}{16t^2} - 30 \Rightarrow \frac{dI}{dt} = -\frac{1500}{8t^3} \Rightarrow \frac{dI}{dt}\Big|_{t=\frac{1}{2}} = -1500$ ft/sec.

32. Let s = distance of car from foot of perpendicular in the textbook diagram $\Rightarrow \tan\theta = \frac{s}{132} \Rightarrow \sec^2\theta\frac{d\theta}{dt} = \frac{1}{132}\frac{ds}{dt}$
$\Rightarrow \frac{d\theta}{dt} = \frac{\cos^2\theta}{132}\frac{ds}{dt}$; $\frac{ds}{dt} = -264$ and $\theta = 0 \Rightarrow \frac{d\theta}{dt} = -2$ rad/sec. A half second later the car has traveled 132 ft right of the perpendicular $\Rightarrow |\theta| = \frac{\pi}{4}$, $\cos^2\theta = \frac{1}{2}$, and $\frac{ds}{dt} = 264$ (since s increases) $\Rightarrow \frac{d\theta}{dt} = \frac{\left(\frac{1}{2}\right)}{132}(264) = 1$ rad/sec.

33. The volume of the ice is $V = \frac{4}{3}\pi r^3 - \frac{4}{3}\pi 4^3 \Rightarrow \frac{dV}{dt} = 4\pi r^2\frac{dr}{dt} \Rightarrow \frac{dr}{dt}\Big|_{r=6} = \frac{-5}{72\pi}$ in./min when $\frac{dV}{dt} = -10$ in$^3$/min, the thickness of the ice is decreasing at $\frac{5}{72\pi}$ in/min. The surface area is $S = 4\pi r^2 \Rightarrow \frac{dS}{dt} = 8\pi r\frac{dr}{dt} \Rightarrow \frac{dS}{dt}\Big|_{r=6} = 48\pi\left(\frac{-5}{72\pi}\right)$
$= -\frac{10}{3}$ in$^2$/min, the outer surface area of the ice is decreasing at $\frac{10}{3}$ in$^2$/min.

34. Let s represent the horizontal distance between the car and plane while r is the line-of-sight distance between the car and plane $\Rightarrow 9 + s^2 = r^2 \Rightarrow \frac{ds}{dt} = \frac{r}{\sqrt{r^2-9}}\frac{dr}{dt} \Rightarrow \frac{ds}{dt}\Big|_{r=5} = \frac{5}{\sqrt{16}}(-160) = -200$ mph
$\Rightarrow$ speed of plane + speed of car = 200 mph $\Rightarrow$ the speed of the car is 80 mph.

35. When x represents the length of the shadow, then $\tan\theta = \frac{80}{x} \Rightarrow \sec^2\theta\frac{d\theta}{dt} = -\frac{80}{x^2}\frac{dx}{dt} \Rightarrow \frac{dx}{dt} = \frac{-x^2\sec^2\theta}{80}\frac{d\theta}{dt}$.
We are given that $\frac{d\theta}{dt} = 0.27° = \frac{3\pi}{2000}$ rad/min. At $x = 60$, $\cos\theta = \frac{3}{5} \Rightarrow$
$\left|\frac{dx}{dt}\right| = \left|\frac{-x^2\sec^2\theta}{80}\frac{d\theta}{dt}\right|_{\left(\frac{d\theta}{dt}=\frac{3\pi}{2000}\text{ and }\sec\theta=\frac{5}{3}\right)} = \frac{3\pi}{16}$ ft/min $\approx 0.589$ ft/min $\approx 7.1$ in./min.

36. Let A represent the side opposite $\theta$ and B represent the side adjacent $\theta$. $\tan\theta = \frac{A}{B} \Rightarrow \sec^2\theta\frac{d\theta}{dt} = \frac{1}{B}\frac{dA}{dt} - \frac{A}{B^2}\frac{dB}{dt}$
$t \Rightarrow$ at A = 10 m and B = 20 m we have $\cos\theta = \frac{20}{10\sqrt{5}} = \frac{2}{\sqrt{5}}$ and $\frac{d\theta}{dt} = \left[\left(\frac{1}{20}\right)(-2) - \left(\frac{10}{400}(1)\right)\right]\left(\frac{4}{5}\right)$
$= \left(\frac{-1}{10} - \frac{1}{40}\right)\left(\frac{4}{5}\right) = -\frac{1}{10}$ rad/sec $= -\frac{18°}{\pi}$/sec $\approx -6°$/sec

37. Let x represent distance of the player from second base and s the distance to third base. Then $\frac{dx}{dt} = -16$ ft/sec
(a) $s^2 = x^2 + 8100 \Rightarrow 2s\frac{ds}{dt} = 2x\frac{dx}{dt} \Rightarrow \frac{ds}{dt} = \frac{x}{s}\frac{dx}{dt}$. When the player is 30 ft from first base, x = 60

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$\Rightarrow s = 30\sqrt{13}$ and $\frac{ds}{dt} = \frac{60}{30\sqrt{13}}(-16) = \frac{-32}{\sqrt{13}} \approx -8.875$ ft/sec

(b) $\cos\theta_1 = \frac{90}{s} \Rightarrow -\sin\theta_1 \frac{d\theta_1}{dt} = -\frac{90}{s^2} \cdot \frac{ds}{dt} \Rightarrow \frac{d\theta_1}{dt} = \frac{90}{s^2 \sin\theta_1} \cdot \frac{ds}{dt} = \frac{90}{sx} \cdot \frac{ds}{dt}$. Therefore, $x = 60$ and $s = 30\sqrt{13}$
$\Rightarrow \frac{d\theta_1}{dt} = \frac{90}{\left(30\sqrt{13}\right)(60)} \cdot \left(\frac{-32}{\sqrt{13}}\right) = \frac{-8}{65}$ rad/sec; $\sin\theta_2 = \frac{90}{s} \Rightarrow \cos\theta_2 \frac{d\theta_2}{dt} = -\frac{90}{s^2} \cdot \frac{ds}{dt} \Rightarrow \frac{d\theta_2}{dt} = \frac{-90}{s^2\cos\theta_2} \cdot \frac{ds}{dt}$
$= \frac{-90}{sx} \cdot \frac{ds}{dt}$. Therefore, $x = 60$ and $s = 30\sqrt{13} \Rightarrow \frac{d\theta_2}{dt} = \frac{8}{65}$ rad/sec.

(c) $\frac{d\theta_1}{dt} = \frac{90}{s^2\sin\theta_1} \cdot \frac{ds}{dt} = \frac{90}{\left(s^2 \cdot \frac{x}{s}\right)} \cdot \left(\frac{x}{s}\right) \cdot \left(\frac{dx}{dt}\right) = \left(\frac{90}{s^2}\right)\left(\frac{dx}{dt}\right) = \left(\frac{90}{x^2+8100}\right)\frac{dx}{dt} \Rightarrow \lim_{x\to 0} \frac{d\theta_1}{dt}$
$= \lim_{x\to 0}\left(\frac{90}{x^2+8100}\right)(-15) = -\frac{1}{6}$ rad/sec; $\frac{d\theta_2}{dt} = \frac{-90}{s^2\cos\theta_2} \cdot \frac{ds}{dt} = \left(\frac{-90}{s^2 \cdot \frac{x}{s}}\right)\left(\frac{x}{s}\right)\left(\frac{dx}{dt}\right) = \left(\frac{-90}{s^2}\right)\left(\frac{dx}{dt}\right)$
$= \left(\frac{-90}{x^2+8100}\right)\frac{dx}{dt} \Rightarrow \lim_{x\to 0} \frac{d\theta_2}{dt} = \frac{1}{6}$ rad/sec

38. Let a represent the distance between point O and ship A, b the distance between point O and ship B, and D the distance between the ships. By the Law of Cosines, $D^2 = a^2 + b^2 - 2ab\cos 120°$
$\Rightarrow \frac{dD}{dt} = \frac{1}{2D}\left[2a\frac{da}{dt} + 2b\frac{db}{dt} + a\frac{db}{dt} + b\frac{da}{dt}\right]$. When $a = 5$, $\frac{da}{dt} = 14$, $b = 3$, and $\frac{db}{dt} = 21$, then $\frac{dD}{dt} = \frac{413}{2D}$ where $D = 7$. The ships are moving $\frac{dD}{dt} = 29.5$ knots apart.

## 3.8 LINEARIZATION AND DIFFERENTIALS

1. $f(x) = x^3 - 2x + 3 \Rightarrow f'(x) = 3x^2 - 2 \Rightarrow L(x) = f'(2)(x-2) + f(2) = 10(x-2) + 7 \Rightarrow L(x) = 10x - 13$ at $x = 2$

2. $f(x) = \sqrt{x^2+9} = (x^2+9)^{1/2} \Rightarrow f'(x) = \left(\frac{1}{2}\right)(x^2+9)^{-1/2}(2x) = \frac{x}{\sqrt{x^2+9}} \Rightarrow L(x) = f'(-4)(x+4) + f(-4)$
$= -\frac{4}{5}(x+4) + 5 \Rightarrow L(x) = -\frac{4}{5}x + \frac{9}{5}$ at $x = -4$

3. $f(x) = x + \frac{1}{x} \Rightarrow f'(x) = 1 - x^{-2} \Rightarrow L(x) = f(1) + f'(1)(x-1) = 2 + 0(x-1) = 2$

4. $f(x) = x^{1/3} \Rightarrow f'(x) = \frac{1}{3x^{2/3}} \Rightarrow L(x) = f'(-8)(x-(-8)) + f(-8) = \frac{1}{12}(x+8) - 2 \Rightarrow L(x) = \frac{1}{12}x - \frac{4}{3}$

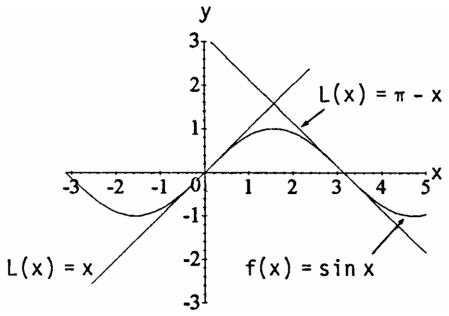
5. $f(x) = x^2 + 2x \Rightarrow f'(x) = 2x + 2 \Rightarrow L(x) = f'(0)(x-0) + f(0) = 2(x-0) + 0 \Rightarrow L(x) = 2x$ at $x = 0$

6. $f(x) = x^{-1} \Rightarrow f'(x) = -x^{-2} \Rightarrow L(x) = f'(1)(x-1) + f(1) = (-1)(x-1) + 1 \Rightarrow L(x) = -x + 2$ at $x = 1$

7. $f(x) = 2x^2 + 4x - 3 \Rightarrow f'(x) = 4x + 4 \Rightarrow L(x) = f'(-1)(x+1) + f(-1) = 0(x+1) + (-5) \Rightarrow L(x) = -5$ at $x = -1$

8. $f(x) = 1 + x \Rightarrow f'(x) = 1 \Rightarrow L(x) = f'(8)(x-8) + f(8) = 1(x-8) + 9 \Rightarrow L(x) = x + 1$ at $x = 8$

9. $f(x) = \sqrt[3]{x} = x^{1/3} \Rightarrow f'(x) = \left(\frac{1}{3}\right)x^{-2/3} \Rightarrow L(x) = f'(8)(x-8) + f(8) = \frac{1}{12}(x-8) + 2 \Rightarrow L(x) = \frac{1}{12}x + \frac{4}{3}$ at $x = 8$

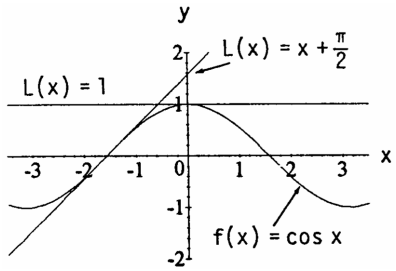


10. $f(x) = \frac{x}{x+1} \Rightarrow f'(x) = \frac{(1)(x+1)-(1)(x)}{(x+1)^2} = \frac{1}{(x+1)^2} \Rightarrow L(x) = f'(1)(x-1) + f(1) = \frac{1}{4}(x-1) + \frac{1}{2}$
$\Rightarrow L(x) = \frac{1}{4}x + \frac{1}{4}$ at $x = 1$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

11. $f(x) = \sin x \Rightarrow f'(x) = \cos x$

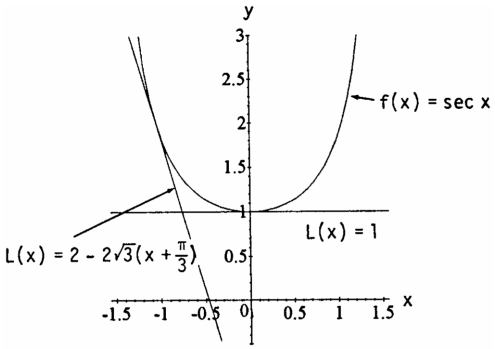
(a) $L(x) = f'(0)(x - 0) + f(0) = 1(x - 0) + 0$
$\Rightarrow L(x) = x$ at $x = 0$



(b) $L(x) = f'(\pi)(x - \pi) + f(\pi) = (-1)(x - \pi) + 0$
$\Rightarrow L(x) = \pi - x$ at $x = \pi$

12. $f(x) = \cos x \Rightarrow f'(x) = -\sin x$

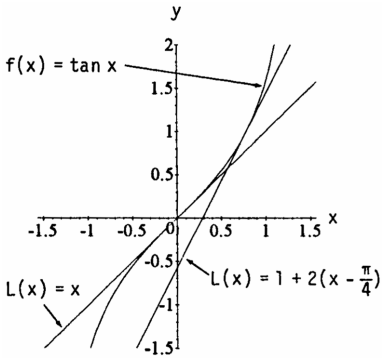
(a) $L(x) = f'(0)(x - 0) + f(0) = 0(x - 0) + 1$
$\Rightarrow L(x) = 1$ at $x = 0$



(b) $L(x) = f'\left(-\frac{\pi}{2}\right)\left(x + \frac{\pi}{2}\right) + f\left(-\frac{\pi}{2}\right)$
$= -(-1)\left(x + \frac{\pi}{2}\right) + 0 \Rightarrow L(x) = x + \frac{\pi}{2}$
at $x = -\frac{\pi}{2}$

13. $f(x) = \sec x \Rightarrow f'(x) = \sec x \tan x$

(a) $L(x) = f'(0)(x - 0) + f(0) = 0(x - 0) + 1$
$\Rightarrow L(x) = 1$ at $x = 0$



(b) $L(x) = f'\left(-\frac{\pi}{3}\right)\left(x + \frac{\pi}{3}\right) + f\left(-\frac{\pi}{3}\right)$
$= -2\sqrt{3}\left(x + \frac{\pi}{3}\right) + 2 \Rightarrow L(x) = 2 - 2\sqrt{3}\left(x + \frac{\pi}{3}\right)$
at $x = -\frac{\pi}{3}$

14. $f(x) = \tan x \Rightarrow f'(x) = \sec^2 x$

(a) $L(x) = f'(0)(x - 0) + f(0) = 1(x - 0) + 0 = x$
$\Rightarrow L(x) = x$ at $x = 0$

(b) $L(x) = f'\left(\frac{\pi}{4}\right)\left(x - \frac{\pi}{4}\right) + f\left(\frac{\pi}{4}\right) = 2\left(x - \frac{\pi}{4}\right) + 1$
$\Rightarrow L(x) = 1 + 2\left(x - \frac{\pi}{4}\right)$ at $x = \frac{\pi}{4}$

15. $f'(x) = k(1 + x)^{k-1}$. We have $f(0) = 1$ and $f'(0) = k$. $L(x) = f(0) + f'(0)(x - 0) = 1 + k(x - 0) = 1 + kx$

16. (a) $f(x) = (1 - x)^6 = [1 + (-x)]^6 \approx 1 + 6(-x) = 1 - 6x$

(b) $f(x) = \frac{2}{1 - x} = 2[1 + (-x)]^{-1} \approx 2[1 + (-1)(-x)] = 2 + 2x$

(c) $f(x) = (1 + x)^{-1/2} \approx 1 + \left(-\frac{1}{2}\right)x = 1 - \frac{x}{2}$

(d) $f(x) = \sqrt{1 + x^2} = \sqrt{2}\left(1 + \frac{x^2}{2}\right)^{1/2} \approx \sqrt{2}\left(1 + \frac{1}{2}\frac{x^2}{2}\right) = \sqrt{2}\left(1 + \frac{x^2}{4}\right)$

(e) $f(x) = (4 + 3x)^{1/3} = 4^{1/3}\left(1 + \frac{3x}{4}\right)^{1/3} \approx 4^{1/3}\left(1 + \frac{1}{3}\frac{3x}{4}\right) = 4^{1/3}\left(1 + \frac{x}{4}\right)$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(f) $f(x) = \left(1 - \frac{1}{2+x}\right)^{2/3} = \left[1 + \left(-\frac{1}{2+x}\right)\right]^{2/3} \approx 1 + \frac{2}{3}\left(-\frac{1}{2+x}\right) = 1 - \frac{2}{6+3x}$

17. (a) $(1.0002)^{50} = (1 + 0.0002)^{50} \approx 1 + 50(0.0002) = 1 + .01 = 1.01$
(b) $\sqrt[3]{1.009} = (1 + 0.009)^{1/3} \approx 1 + \left(\frac{1}{3}\right)(0.009) = 1 + 0.003 = 1.003$

18. $f(x) = \sqrt{x+1} + \sin x = (x+1)^{1/2} + \sin x \Rightarrow f'(x) = \left(\frac{1}{2}\right)(x+1)^{-1/2} + \cos x \Rightarrow L_f(x) = f'(0)(x-0) + f(0)$
$= \frac{3}{2}(x-0) + 1 \Rightarrow L_f(x) = \frac{3}{2}x + 1$, the linearization of $f(x)$; $g(x) = \sqrt{x+1} = (x+1)^{1/2} \Rightarrow g'(x)$
$= \left(\frac{1}{2}\right)(x+1)^{-1/2} \Rightarrow L_g(x) = g'(0)(x-0) + g(0) = \frac{1}{2}(x-0) + 1 \Rightarrow L_g(x) = \frac{1}{2}x + 1$, the linearization of $g(x)$;
$h(x) = \sin x \Rightarrow h'(x) = \cos x \Rightarrow L_h(x) = h'(0)(x-0) + h(0) = (1)(x-0) + 0 \Rightarrow L_h(x) = x$, the linearization of $h(x)$. $L_f(x) = L_g(x) + L_h(x)$ implies that the linearization of a sum is equal to the sum of the linearizations.

19. $y = x^3 - 3\sqrt{x} = x^3 - 3x^{1/2} \Rightarrow dy = \left(3x^2 - \frac{3}{2}x^{-1/2}\right)dx \Rightarrow dy = \left(3x^2 - \frac{3}{2\sqrt{x}}\right)dx$

20. $y = x\sqrt{1-x^2} = x(1-x^2)^{1/2} \Rightarrow dy = \left[(1)(1-x^2)^{1/2} + (x)\left(\frac{1}{2}\right)(1-x^2)^{-1/2}(-2x)\right]dx$
$= (1-x^2)^{-1/2}\left[(1-x^2) - x^2\right]dx = \frac{(1-2x^2)}{\sqrt{1-x^2}}\,dx$

21. $y = \frac{2x}{1+x^2} \Rightarrow dy = \left(\frac{(2)(1+x^2) - (2x)(2x)}{(1+x^2)^2}\right)dx = \frac{2-2x^2}{(1+x^2)^2}\,dx$

22. $y = \frac{2\sqrt{x}}{3(1+\sqrt{x})} = \frac{2x^{1/2}}{3(1+x^{1/2})} \Rightarrow dy = \left(\frac{x^{-1/2}\left(3\left(1+x^{1/2}\right)\right) - 2x^{1/2}\left(\frac{3}{2}x^{-1/2}\right)}{9(1+x^{1/2})^2}\right)dx = \frac{3x^{-1/2}+3-3}{9(1+x^{1/2})^2}\,dx$
$\Rightarrow dy = \frac{1}{3\sqrt{x}(1+\sqrt{x})^2}\,dx$

23. $2y^{3/2} + xy - x = 0 \Rightarrow 3y^{1/2}\,dy + y\,dx + x\,dy - dx = 0 \Rightarrow \left(3y^{1/2} + x\right)dy = (1-y)\,dx \Rightarrow dy = \frac{1-y}{3\sqrt{y}+x}\,dx$

24. $xy^2 - 4x^{3/2} - y = 0 \Rightarrow y^2\,dx + 2xy\,dy - 6x^{1/2}\,dx - dy = 0 \Rightarrow (2xy-1)\,dy = \left(6x^{1/2} - y^2\right)dx$
$\Rightarrow dy = \frac{6\sqrt{x}-y^2}{2xy-1}\,dx$

25. $y = \sin\left(5\sqrt{x}\right) = \sin\left(5x^{1/2}\right) \Rightarrow dy = \left(\cos\left(5x^{1/2}\right)\right)\left(\frac{5}{2}x^{-1/2}\right)dx \Rightarrow dy = \frac{5\cos\left(5\sqrt{x}\right)}{2\sqrt{x}}\,dx$

26. $y = \cos(x^2) \Rightarrow dy = \left[-\sin(x^2)\right](2x)\,dx = -2x\sin(x^2)\,dx$

27. $y = 4\tan\left(\frac{x^3}{3}\right) \Rightarrow dy = 4\left(\sec^2\left(\frac{x^3}{3}\right)\right)(x^2)\,dx \Rightarrow dy = 4x^2\sec^2\left(\frac{x^3}{3}\right)dx$

28. $y = \sec(x^2-1) \Rightarrow dy = \left[\sec(x^2-1)\tan(x^2-1)\right](2x)\,dx = 2x\left[\sec(x^2-1)\tan(x^2-1)\right]dx$

29. $y = 3\csc\left(1-2\sqrt{x}\right) = 3\csc\left(1-2x^{1/2}\right) \Rightarrow dy = 3\left(-\csc\left(1-2x^{1/2}\right)\right)\cot\left(1-2x^{1/2}\right)\left(-x^{-1/2}\right)dx$
$\Rightarrow dy = \frac{3}{\sqrt{x}}\csc\left(1-2\sqrt{x}\right)\cot\left(1-2\sqrt{x}\right)dx$

30. $y = 2\cot\left(\frac{1}{\sqrt{x}}\right) = 2\cot\left(x^{-1/2}\right) \Rightarrow dy = -2\csc^2\left(x^{-1/2}\right)\left(-\frac{1}{2}\right)\left(x^{-3/2}\right)dx \Rightarrow dy = \frac{1}{\sqrt{x^3}}\csc^2\left(\frac{1}{\sqrt{x}}\right)dx$

31. $f(x) = x^2 + 2x$, $x_0 = 1$, $dx = 0.1 \Rightarrow f'(x) = 2x + 2$
(a) $\Delta f = f(x_0 + dx) - f(x_0) = f(1.1) - f(1) = 3.41 - 3 = 0.41$
(b) $df = f'(x_0)\,dx = [2(1) + 2](0.1) = 0.4$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(c) $|\Delta f - df| = |0.41 - 0.4| = 0.01$

32. $f(x) = 2x^2 + 4x - 3$, $x_0 = -1$, $dx = 0.1 \Rightarrow f'(x) = 4x + 4$
(a) $\Delta f = f(x_0 + dx) - f(x_0) = f(-.9) - f(-1) = .02$
(b) $df = f'(x_0)\,dx = [4(-1) + 4](.1) = 0$
(c) $|\Delta f - df| = |.02 - 0| = .02$

33. $f(x) = x^3 - x$, $x_0 = 1$, $dx = 0.1 \Rightarrow f'(x) = 3x^2 - 1$
(a) $\Delta f = f(x_0 + dx) - f(x_0) = f(1.1) - f(1) = .231$
(b) $df = f'(x_0)\,dx = [3(1)^2 - 1](.1) = .2$
(c) $|\Delta f - df| = |.231 - .2| = .031$

(a) $\Delta f = f(x_0 + dx) - f(x_0) = f(2.1) - f(2) = 1.061$
(b) $df = f'(x_0)\,dx = (10)(0.10) = 1$
(c) $|\Delta f - df| = |1.061 - 1| = .061$

37. $V = \frac{4}{3}\pi r^3 \Rightarrow dV = 4\pi r_0^2\,dr$

38. $V = x^3 \Rightarrow dV = 3x_0^2\,dx$

39. $S = 6x^2 \Rightarrow dS = 12x_0\,dx$

40. $S = \pi r\sqrt{r^2 + h^2} = \pi r\,(r^2 + h^2)^{1/2}$, h constant $\Rightarrow \frac{dS}{dr} = \pi\,(r^2 + h^2)^{1/2} + \pi r \cdot r\,(r^2 + h^2)^{-1/2}$
$\Rightarrow \frac{dS}{dr} = \frac{\pi\,(r^2 + h^2) + \pi r^2}{\sqrt{r^2 + h^2}} \Rightarrow dS = \frac{\pi\,(2r_0^2 + h^2)}{\sqrt{r_0^2 + h^2}}\,dr$, h constant

41. $V = \pi r^2 h$, height constant $\Rightarrow dV = 2\pi r_0 h\,dr$

42. $S = 2\pi rh \Rightarrow dS = 2\pi r\,dh$

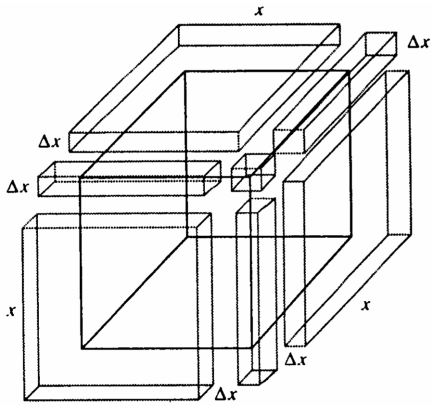
43. Given $r = 2$ m, $dr = .02$ m
(a) $A = \pi r^2 \Rightarrow dA = 2\pi r\,dr = 2\pi(2)(.02) = .08\pi$ m$^2$
(b) $\left(\frac{.08\pi}{4\pi}\right)(100\%) = 2\%$

44. $C = 2\pi r$ and $dC = 2$ in. $\Rightarrow dC = 2\pi\,dr \Rightarrow dr = \frac{1}{\pi} \Rightarrow$ the diameter grew about $\frac{2}{\pi}$ in.; $A = \pi r^2 \Rightarrow dA = 2\pi r\,dr$
$= 2\pi(5)\left(\frac{1}{\pi}\right) = 10$ in.$^2$

45. The volume of a cylinder is $V = \pi r^2 h$. When h is held fixed, we have $\frac{dV}{dr} = 2\pi rh$, and so $dV = 2\pi rh\,dr$. For $h = 30$ in., $r = 6$ in., and $dr = 0.5$ in., the volume of the material in the shell is approximately $dV = 2\pi rh\,dr = 2\pi(6)(30)(0.5)$
$= 180\pi \approx 565.5$ in$^3$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

46. Let $\theta$ = angle of elevation and h = height of building. Then $h = 30\tan\theta$, so $dh = 30\sec^2\theta\, d\theta$. We want $|dh| < 0.04h$, which gives: $|30\sec^2\theta\, d\theta| < 0.04|30\tan\theta| \Rightarrow \frac{1}{\cos^2\theta}|d\theta| < \frac{0.04\sin\theta}{\cos\theta} \Rightarrow |d\theta| < 0.04\sin\theta\cos\theta \Rightarrow |d\theta| < 0.04\sin\frac{5\pi}{12}\cos\frac{5\pi}{12} = 0.01$ radian. The angle should be measured with an error of less than $0.01$ radian (or approximatley $0.57$ degrees), which is a percentage error of approximately $0.76\%$.



47. $V = \pi h^3 \Rightarrow dV = 3\pi h^2\, dh$; recall that $\Delta V \approx dV$. Then $|\Delta V| \le (1\%)(V) = \frac{(1)(\pi h^3)}{100} \Rightarrow |dV| \le \frac{(1)(\pi h^3)}{100} \Rightarrow |3\pi h^2\, dh| \le \frac{(1)(\pi h^3)}{100} \Rightarrow |dh| \le \frac{1}{300}h = \left(\frac{1}{3}\%\right)h$. Therefore the greatest tolerated error in the measurement of h is $\frac{1}{3}\%$.

48. (a) Let $D_i$ represent the inside diameter. Then $V = \pi r^2 h = \pi\left(\frac{D_i}{2}\right)^2 h = \frac{\pi D_i^2 h}{4}$ and $h = 10 \Rightarrow V = \frac{5\pi D_i^2}{2} \Rightarrow dV = 5\pi D_i\, dD_i$. Recall that $\Delta V \approx dV$. We want $|\Delta V| \le (1\%)(V) \Rightarrow |dV| \le \left(\frac{1}{100}\right)\left(\frac{5\pi D_i^2}{2}\right) = \frac{\pi D_i^2}{40} \Rightarrow 5\pi D_i\, dD_i \le \frac{\pi D_i^2}{40} \Rightarrow \frac{dD_i}{D_i} \le 200$. The inside diameter must be measured to within $0.5\%$.

(b) Let $D_e$ represent the exterior diameter, h the height and S the area of the painted surface. $S = \pi D_e h \Rightarrow dS = \pi h dD_e \Rightarrow \frac{dS}{S} = \frac{dD_e}{D_e}$. Thus for small changes in exterior diameter, the approximate percentage change in the exterior diameter is equal to the approximate percentage change in the area painted, and to estimate the amount of paint required to within $5\%$, the tanks's exterior diameter must be measured to within $5\%$.

49. $V = \pi r^2 h$, h is constant $\Rightarrow dV = 2\pi rh\, dr$; recall that $\Delta V \approx dV$. We want $|\Delta V| \le \frac{1}{1000}V \Rightarrow |dV| \le \frac{\pi r^2 h}{1000} \Rightarrow |2\pi rh\, dr| \le \frac{\pi r^2 h}{1000} \Rightarrow |dr| \le \frac{r}{2000} = (.05\%)r \Rightarrow$ a $.05\%$ variation in the radius can be tolerated.

50. Volume $= (x+\Delta x)^3 = x^3 + 3x^2(\Delta x) + 3x(\Delta x)^2 + (\Delta x)^3$

51. $W = a + \frac{b}{g} = a + bg^{-1} \Rightarrow dW = -bg^{-2}\, dg = -\frac{b\, dg}{g^2} \Rightarrow \frac{dW_{moon}}{dW_{earth}} = \frac{\left(-\frac{b\, dg}{(5.2)^2}\right)}{\left(-\frac{b\, dg}{(32)^2}\right)} = \left(\frac{32}{5.2}\right)^2 = 37.87$, so a change of gravity on the moon has about 38 times the effect that a change of the same magnitude has on Earth.

52. (a) $T = 2\pi\left(\frac{L}{g}\right)^{1/2} \Rightarrow dT = 2\pi\sqrt{L}\left(-\frac{1}{2}g^{-3/2}\right)dg = -\pi\sqrt{L}\,g^{-3/2}\, dg$

(b) If g increases, then $dg > 0 \Rightarrow dT < 0$. The period T decreases and the clock ticks more frequently. Both the pendulum speed and clock speed increase.

(c) $0.001 = -\pi\sqrt{100}\left(980^{-3/2}\right)dg \Rightarrow dg \approx -0.977$ cm/sec$^2$ $\Rightarrow$ the new g $\approx 979$ cm/sec$^2$

53. The error in measurement $dx = (1\%)(10) = 0.1$ cm; $V = x^3 \Rightarrow dV = 3x^2\, dx = 3(10)^2(0.1) = 30$ cm$^3$ $\Rightarrow$ the percentage error in the volume calculation is $\left(\frac{30}{1000}\right)(100\%) = 3\%$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

54. $A = s^2 \Rightarrow dA = 2s\,ds$; recall that $\Delta A \approx dA$. Then $|\Delta A| \le (2\%)A = \frac{2s^2}{100} = \frac{s^2}{50} \Rightarrow |dA| \le \frac{s^2}{50} \Rightarrow |2s\,ds| \le \frac{s^2}{50}$ $\Rightarrow |ds| \le \frac{s^2}{(2s)(50)} = \frac{s}{100} = (1\%)\,s \Rightarrow$ the error must be no more than 1% of the true value.

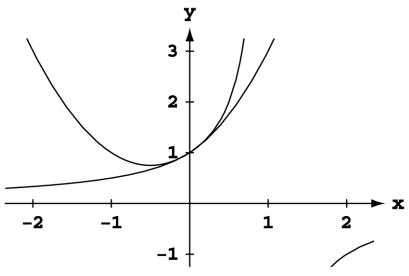
55. Given $D = 100$ cm, $dD = 1$ cm, $V = \frac{4}{3}\pi\left(\frac{D}{2}\right)^3 = \frac{\pi D^3}{6} \Rightarrow dV = \frac{\pi}{2}D^2\,dD = \frac{\pi}{2}(100)^2(1) = \frac{10^4\pi}{2}$. Then $\frac{dV}{V}(100\%)$ $= \left[\frac{\frac{10^4\pi}{2}}{\frac{10^6\pi}{6}}\right](10^2\%) = \left[\frac{\frac{10^6\pi}{2}}{\frac{10^6\pi}{6}}\right]\% = 3\%$

56. $V = \frac{4}{3}\pi r^3 = \frac{4}{3}\pi\left(\frac{D}{2}\right)^3 = \frac{\pi D^3}{6} \Rightarrow dV = \frac{\pi D^2}{2}\,dD$; recall that $\Delta V \approx dV$. Then $|\Delta V| \le (3\%)V = \left(\frac{3}{100}\right)\left(\frac{\pi D^3}{6}\right)$ $= \frac{\pi D^3}{200} \Rightarrow |dV| \le \frac{\pi D^3}{200} \Rightarrow \left|\frac{\pi D^2}{2}\,dD\right| \le \frac{\pi D^3}{200} \Rightarrow |dD| \le \frac{D}{100} = (1\%)\,D \Rightarrow$ the allowable percentage error in measuring the diameter is 1%.

57. A 5% error in measuring $t \Rightarrow dt = (5\%)t = \frac{t}{20}$. Then $s = 16t^2 \Rightarrow ds = 32t\,dt = 32t\left(\frac{t}{20}\right) = \frac{32t^2}{20} = \frac{16t^2}{10} = \left(\frac{1}{10}\right)s$ $= (10\%)s \Rightarrow$ a 10% error in the calculation of s.

58. From Example 8 we have $\frac{dV}{V} = 4\,\frac{dr}{r}$. An increase of 12.5% in r will give a 50% increase in V.

59. $\lim_{x\to 0} \frac{\sqrt{1+x}}{1+\frac{x}{2}} = \frac{\sqrt{1+0}}{1+\frac{0}{2}} = 1$



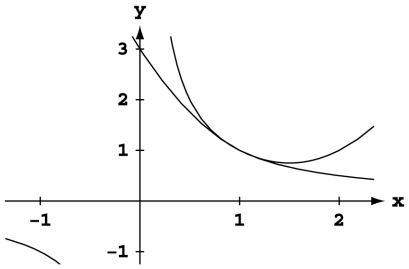
60. $\lim_{x\to 0} \frac{\tan x}{x} = \lim_{x\to 0}\left(\frac{\sin x}{x}\right)\left(\frac{1}{\cos x}\right) = (1)(1) = 1$

61. $E(x) = f(x) - g(x) \Rightarrow E(x) = f(x) - m(x-a) - c$. Then $E(a) = 0 \Rightarrow f(a) - m(a-a) - c = 0 \Rightarrow c = f(a)$. Next we calculate m: $\lim_{x\to a}\frac{E(x)}{x-a} = 0 \Rightarrow \lim_{x\to a}\frac{f(x)-m(x-a)-c}{x-a} = 0 \Rightarrow \lim_{x\to a}\left[\frac{f(x)-f(a)}{x-a} - m\right] = 0$ (since $c = f(a)$) $\Rightarrow f'(a) - m = 0 \Rightarrow m = f'(a)$. Therefore, $g(x) = m(x-a) + c = f'(a)(x-a) + f(a)$ is the linear approximation, as claimed.

62. (a) i. $Q(a) = f(a)$ implies that $b_0 = f(a)$.
ii. Since $Q'(x) = b_1 + 2b_2(x-a)$, $Q'(a) = f'(a)$ implies that $b_1 = f'(a)$.
iii. Since $Q''(x) = 2b_2$, $Q''(a) = f''(a)$ implies that $b_2 = \frac{f''(a)}{2}$.
In summary, $b_0 = f(a)$, $b_1 = f'(a)$, and $b_2 = \frac{f''(a)}{2}$.

(b) $f(x) = (1-x)^{-1}$
$f'(x) = -1(1-x)^{-2}(-1) = (1-x)^{-2}$
$f''(x) = -2(1-x)^{-3}(-1) = 2(1-x)^{-3}$
Since $f(0) = 1$, $f'(0) = 1$, and $f''(0) = 2$, the coefficients are $b_0 = 1$, $b_1 = 1$, $b_2 = \frac{2}{2} = 1$. The quadratic approximation is $Q(x) = 1 + x + x^2$.

(c) As one zooms in, the two graphs quickly become indistinguishable. They appear to be identical.



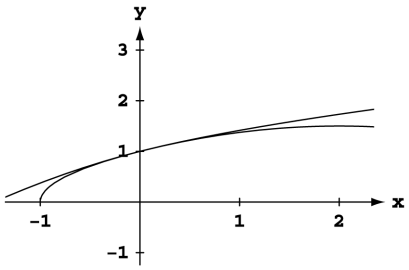
$[-2.35, 2.35]$ by $[-1.25, 3.25]$

(d) $g(x) = x^{-1}$
$g'(x) = -1x^{-2}$
$g''(x) = 2x^{-3}$
Since $g(1) = 1$, $g'(1) = -1$, and $g''(1) = 2$, the coefficients are $b_0 = 1$, $b_1 = -1$, $b_2 = \frac{2}{2} = 1$. The quadratic

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

approximation is $Q(x) = 1 - (x-1) + (x-1)^2$.

$[-1.35, 3.35]$ by $[-1.25, 3.25]$



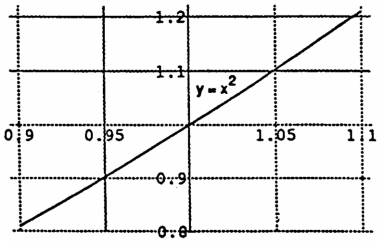
As one zooms in, the two graphs quickly become indistinguishable. They appear to be identical.

(e) $h(x) = (1+x)^{1/2}$

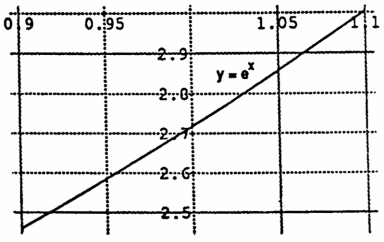
$h'(x) = \frac{1}{2}(1+x)^{-1/2}$

$h''(x) = -\frac{1}{4}(1+x)^{-3/2}$

Since $h(0) = 1$, $h'(0) = \frac{1}{2}$, and $h''(0) = -\frac{1}{4}$ , the coefficients are $b_0 = 1$, $b_1 = \frac{1}{2}$, $b_2 = \frac{-\frac{1}{4}}{2} = -\frac{1}{8}$. The quadratic approximation is $Q(x) = 1 + \frac{x}{2} - \frac{x^2}{8}$.

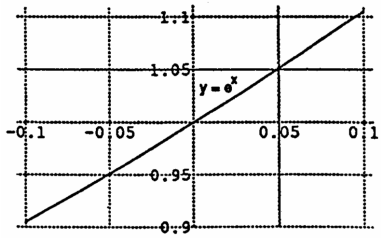


$[-1.35, 3.35]$ by $[-1.25, 3.25]$

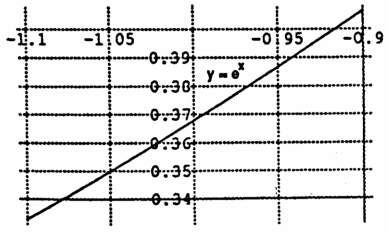


As one zooms in, the two graphs quickly become indistinguishable. They appear to be identical.

(f) The linearization of any differentiable function $u(x)$ at $x = a$ is $L(x) = u(a) + u'(a)(x-a) = b_0 + b_1(x-a)$, where $b_0$ and $b_1$ are the coefficients of the constant and linear terms of the quadratic approximation. Thus, the linearization for $f(x)$ at $x = 0$ is $1 + x$; the linearization for $g(x)$ at $x = 1$ is $1 - (x-1)$ or $2 - x$; and the linearization for $h(x)$ at $x = 0$ is $1 + \frac{x}{2}$.



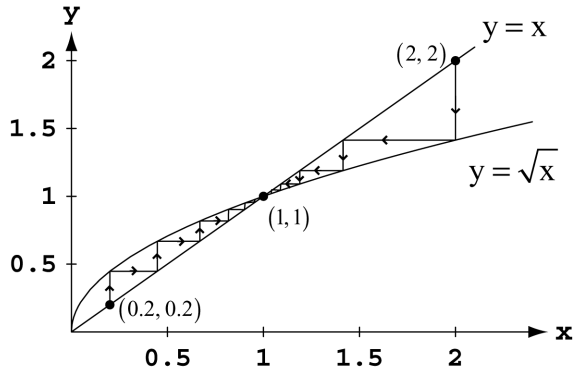
63. (a) $x = 1$



(b) $x = 1$; $m = 2.5$, $e^1 \approx 2.7$

$x = 0$; $m = 1$, $e^0 = 1$

$x = -1$; $m = 0.3$, $e^{-1} \approx 0.4$



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

64. If f has a horizontal tangent at $x = a$, then $f'(a) = 0$ and the linearization of f at $x = a$ is $L(x) = f(a) + f'(a)(x - a) = f(a) + 0 \cdot (x - a) = f(a)$. The linearization is a constant.

65. Find $|v|$ when $m = 1.01m_0$. $m = \frac{m_0}{\sqrt{1-\frac{v^2}{c^2}}} \Rightarrow m\sqrt{1-\frac{v^2}{c^2}} = m_0 \Rightarrow \sqrt{1-\frac{v^2}{c^2}} = \frac{m_0}{m} \Rightarrow 1-\frac{v^2}{c^2} = \frac{m_0^2}{m^2} \Rightarrow v^2 = c^2\left(1-\frac{m_0^2}{m^2}\right)$
$\Rightarrow |v| = c\sqrt{1-\frac{m_0^2}{m^2}} \Rightarrow dv = c \cdot \frac{1}{2}\left(1-\frac{m_0^2}{m^2}\right)^{-1/2}\left(\frac{2m_0^2}{m^3}\right)dm$, $dm = 0.01m_0 \Rightarrow dv = \frac{c\,m_0^2}{m^3\sqrt{1-\frac{m_0^2}{m^2}}}\left(\frac{m_0}{100}\right)$. $m = \frac{101}{100}m_0$,
$dv = \frac{c\cdot m_0^2}{\frac{101^3}{100^3}m_0^3\sqrt{1-\frac{m_0^2}{\frac{101^2}{100^2}m_0^2}}}\left(\frac{m_0}{100}\right) = \frac{1000}{101^3\sqrt{1-\frac{100^2}{101^2}}} \approx 0.69c$. Body at rest $\Rightarrow v_0 = 0$ and $v = v_0 + dv$
$\Rightarrow v = 0.69c$.

66. (a) The successive square roots of 2 appear to converge to the number 1. For tenth roots the convergence is more rapid.
(b) Successive square roots of 0.5 also converge to 1. In fact, successive square roots of any positive number converge to 1.
A graph indicates what is going on:

Starting on the line $y = x$, the successive square roots are found by moving to the graph of $y = \sqrt{x}$ and then across to the line $y = x$ again. From any positive starting value x, the iterates converge to 1.

67-70. Example CAS commands:

Maple:

```
with(plots):
a:= 1: f:=x -> x ^ 3 + x ^ 2 − 2*x;
plot(f(x), x=−1..2);
diff(f(x),x);
fp := unapply (″,x);
L:=x -> f(a) + fp(a)*(x − a);
plot({f(x), L(x)}, x=−1..2);
err:=x -> abs(f(x) − L(x));
plot(err(x), x=−1..2, title = #absolute error function#);
err(−1);
```

Mathematica: (function, x1, x2, and a may vary):

```
Clear[f, x]
{x1, x2} = {−1, 2}; a = 1;
f[x_]:=x^3 + x^2 − 2x
Plot[f[x], {x, x1, x2}]
lin[x_]=f[a] + f'[a](x − a)
Plot[{f[x], lin[x]}, {x, x1, x2}]
err[x_]=Abs[f[x] − lin[x]]
```

Plot[err[x], {x, x1,x 2}]

err//N

After reviewing the error function, plot the error function and epsilon for differing values of epsilon (eps) and delta (del)

eps = 0.5; del = 0.4

Plot[{err[x], eps},{x, a − del, a + del}]

**CHAPTER 3 PRACTICE EXERCISES**

1. $y = x^5 - 0.125x^2 + 0.25x \Rightarrow \frac{dy}{dx} = 5x^4 - 0.25x + 0.25$

2. $y = 3 - 0.7x^3 + 0.3x^7 \Rightarrow \frac{dy}{dx} = -2.1x^2 + 2.1x^6$

3. $y = x^3 - 3(x^2 + \pi^2) \Rightarrow \frac{dy}{dx} = 3x^2 - 3(2x + 0) = 3x^2 - 6x = 3x(x - 2)$

4. $y = x^7 + \sqrt{7}x - \frac{1}{\pi+1} \Rightarrow \frac{dy}{dx} = 7x^6 + \sqrt{7}$

5. $y = (x + 1)^2(x^2 + 2x) \Rightarrow \frac{dy}{dx} = (x + 1)^2(2x + 2) + (x^2 + 2x)(2(x + 1)) = 2(x + 1)[(x + 1)^2 + x(x + 2)]$
$= 2(x + 1)(2x^2 + 4x + 1)$

6. $y = (2x - 5)(4 - x)^{-1} \Rightarrow \frac{dy}{dx} = (2x - 5)(-1)(4 - x)^{-2}(-1) + (4 - x)^{-1}(2) = (4 - x)^{-2}[(2x - 5) + 2(4 - x)]$
$= 3(4 - x)^{-2}$

7. $y = (\theta^2 + \sec\theta + 1)^3 \Rightarrow \frac{dy}{d\theta} = 3(\theta^2 + \sec\theta + 1)^2(2\theta + \sec\theta\tan\theta)$

8. $y = \left(-1 - \frac{\csc\theta}{2} - \frac{\theta^2}{4}\right)^2 \Rightarrow \frac{dy}{d\theta} = 2\left(-1 - \frac{\csc\theta}{2} - \frac{\theta^2}{4}\right)\left(\frac{\csc\theta\cot\theta}{2} - \frac{\theta}{2}\right) = \left(-1 - \frac{\csc\theta}{2} - \frac{\theta^2}{4}\right)(\csc\theta\cot\theta - \theta)$

9. $s = \frac{\sqrt{t}}{1+\sqrt{t}} \Rightarrow \frac{ds}{dt} = \frac{(1+\sqrt{t})\cdot\frac{1}{2\sqrt{t}} - \sqrt{t}\left(\frac{1}{2\sqrt{t}}\right)}{(1+\sqrt{t})^2} = \frac{(1+\sqrt{t}) - \sqrt{t}}{2\sqrt{t}(1+\sqrt{t})^2} = \frac{1}{2\sqrt{t}(1+\sqrt{t})^2}$

10. $s = \frac{1}{\sqrt{t}-1} \Rightarrow \frac{ds}{dt} = \frac{(\sqrt{t}-1)(0) - 1\left(\frac{1}{2\sqrt{t}}\right)}{(\sqrt{t}-1)^2} = \frac{-1}{2\sqrt{t}(\sqrt{t}-1)^2}$

11. $y = 2\tan^2 x - \sec^2 x \Rightarrow \frac{dy}{dx} = (4\tan x)(\sec^2 x) - (2\sec x)(\sec x\tan x) = 2\sec^2 x\tan x$

12. $y = \frac{1}{\sin^2 x} - \frac{2}{\sin x} = \csc^2 x - 2\csc x \Rightarrow \frac{dy}{dx} = (2\csc x)(-\csc x\cot x) - 2(-\csc x\cot x) = (2\csc x\cot x)(1 - \csc x)$

13. $s = \cos^4(1 - 2t) \Rightarrow \frac{ds}{dt} = 4\cos^3(1 - 2t)(-\sin(1 - 2t))(-2) = 8\cos^3(1 - 2t)\sin(1 - 2t)$

14. $s = \cot^3\left(\frac{2}{t}\right) \Rightarrow \frac{ds}{dt} = 3\cot^2\left(\frac{2}{t}\right)\left(-\csc^2\left(\frac{2}{t}\right)\right)\left(\frac{-2}{t^2}\right) = \frac{6}{t^2}\cot^2\left(\frac{2}{t}\right)\csc^2\left(\frac{2}{t}\right)$

15. $s = (\sec t + \tan t)^5 \Rightarrow \frac{ds}{dt} = 5(\sec t + \tan t)^4(\sec t\tan t + \sec^2 t) = 5(\sec t)(\sec t + \tan t)^5$

16. $s = \csc^5(1 - t + 3t^2) \Rightarrow \frac{ds}{dt} = 5\csc^4(1 - t + 3t^2)(-\csc(1 - t + 3t^2)\cot(1 - t + 3t^2))(-1 + 6t)$
$= -5(6t - 1)\csc^5(1 - t + 3t^2)\cot(1 - t + 3t^2)$

17. $r = \sqrt{2\theta\sin\theta} = (2\theta\sin\theta)^{1/2} \Rightarrow \frac{dr}{d\theta} = \frac{1}{2}(2\theta\sin\theta)^{-1/2}(2\theta\cos\theta + 2\sin\theta) = \frac{\theta\cos\theta + \sin\theta}{\sqrt{2\theta\sin\theta}}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

18. $r = 2\theta\sqrt{\cos\theta} = 2\theta(\cos\theta)^{1/2} \Rightarrow \frac{dr}{d\theta} = 2\theta\left(\frac{1}{2}\right)(\cos\theta)^{-1/2}(-\sin\theta) + 2(\cos\theta)^{1/2} = \frac{-\theta\sin\theta}{\sqrt{\cos\theta}} + 2\sqrt{\cos\theta}$
$= \frac{2\cos\theta - \theta\sin\theta}{\sqrt{\cos\theta}}$

19. $r = \sin\sqrt{2\theta} = \sin(2\theta)^{1/2} \Rightarrow \frac{dr}{d\theta} = \cos(2\theta)^{1/2}\left(\frac{1}{2}(2\theta)^{-1/2}(2)\right) = \frac{\cos\sqrt{2\theta}}{\sqrt{2\theta}}$

20. $r = \sin\left(\theta + \sqrt{\theta+1}\right) \Rightarrow \frac{dr}{d\theta} = \cos\left(\theta + \sqrt{\theta+1}\right)\left(1 + \frac{1}{2\sqrt{\theta+1}}\right) = \frac{2\sqrt{\theta+1}+1}{2\sqrt{\theta+1}}\cos\left(\theta + \sqrt{\theta+1}\right)$

21. $y = \frac{1}{2}x^2\csc\frac{2}{x} \Rightarrow \frac{dy}{dx} = \frac{1}{2}x^2\left(-\csc\frac{2}{x}\cot\frac{2}{x}\right)\left(\frac{-2}{x^2}\right) + \left(\csc\frac{2}{x}\right)\left(\frac{1}{2}\cdot 2x\right) = \csc\frac{2}{x}\cot\frac{2}{x} + x\csc\frac{2}{x}$

22. $y = 2\sqrt{x}\sin\sqrt{x} \Rightarrow \frac{dy}{dx} = 2\sqrt{x}\left(\cos\sqrt{x}\right)\left(\frac{1}{2\sqrt{x}}\right) + \left(\sin\sqrt{x}\right)\left(\frac{2}{2\sqrt{x}}\right) = \cos\sqrt{x} + \frac{\sin\sqrt{x}}{\sqrt{x}}$

23. $y = x^{-1/2}\sec(2x)^2 \Rightarrow \frac{dy}{dx} = x^{-1/2}\sec(2x)^2\tan(2x)^2(2(2x)\cdot 2) + \sec(2x)^2\left(-\frac{1}{2}x^{-3/2}\right)$
$= 8x^{1/2}\sec(2x)^2\tan(2x)^2 - \frac{1}{2}x^{-3/2}\sec(2x)^2 = \frac{1}{2}x^{1/2}\sec(2x)^2\left[16\tan(2x)^2 - x^{-2}\right]$ or $\frac{1}{2x^{3/2}}\sec(2x)^2\left[16x^2\tan(2x)^2 - 1\right]$

24. $y = \sqrt{x}\csc(x+1)^3 = x^{1/2}\csc(x+1)^3$
$\Rightarrow \frac{dy}{dx} = x^{1/2}\left(-\csc(x+1)^3\cot(x+1)^3\right)\left(3(x+1)^2\right) + \csc(x+1)^3\left(\frac{1}{2}x^{-1/2}\right)$
$= -3\sqrt{x}(x+1)^2\csc(x+1)^3\cot(x+1)^3 + \frac{\csc(x+1)^3}{2\sqrt{x}} = \frac{1}{2}\sqrt{x}\csc(x+1)^3\left[\frac{1}{x} - 6(x+1)^2\cot(x+1)^3\right]$
or $\frac{1}{2\sqrt{x}}\csc(x+1)^3[1 - 6x(x+1)^2\cot(x+1)^3]$

25. $y = 5\cot x^2 \Rightarrow \frac{dy}{dx} = 5\left(-\csc^2 x^2\right)(2x) = -10x\csc^2(x^2)$

26. $y = x^2\cot 5x \Rightarrow \frac{dy}{dx} = x^2\left(-\csc^2 5x\right)(5) + (\cot 5x)(2x) = -5x^2\csc^2 5x + 2x\cot 5x$

27. $y = x^2\sin^2(2x^2) \Rightarrow \frac{dy}{dx} = x^2(2\sin(2x^2))(\cos(2x^2))(4x) + \sin^2(2x^2)(2x) = 8x^3\sin(2x^2)\cos(2x^2) + 2x\sin^2(2x^2)$

28. $y = x^{-2}\sin^2(x^3) \Rightarrow \frac{dy}{dx} = x^{-2}(2\sin(x^3))(\cos(x^3))(3x^2) + \sin^2(x^3)(-2x^{-3}) = 6\sin(x^3)\cos(x^3) - 2x^{-3}\sin^2(x^3)$

29. $s = \left(\frac{4t}{t+1}\right)^{-2} \Rightarrow \frac{ds}{dt} = -2\left(\frac{4t}{t+1}\right)^{-3}\left(\frac{(t+1)(4) - (4t)(1)}{(t+1)^2}\right) = -2\left(\frac{4t}{t+1}\right)^{-3}\frac{4}{(t+1)^2} = -\frac{(t+1)}{8t^3}$

30. $s = \frac{-1}{15(15t-1)^3} = -\frac{1}{15}(15t-1)^{-3} \Rightarrow \frac{ds}{dt} = -\frac{1}{15}(-3)(15t-1)^{-4}(15) = \frac{3}{(15t-1)^4}$

31. $y = \left(\frac{\sqrt{x}}{x+1}\right)^2 \Rightarrow \frac{dy}{dx} = 2\left(\frac{\sqrt{x}}{x+1}\right)\cdot\frac{(x+1)\left(\frac{1}{2\sqrt{x}}\right) - \left(\sqrt{x}\right)(1)}{(x+1)^2} = \frac{(x+1) - 2x}{(x+1)^3} = \frac{1-x}{(x+1)^3}$

32. $y = \left(\frac{2\sqrt{x}}{2\sqrt{x}+1}\right)^2 \Rightarrow \frac{dy}{dx} = 2\left(\frac{2\sqrt{x}}{2\sqrt{x}+1}\right)\left(\frac{(2\sqrt{x}+1)\left(\frac{1}{\sqrt{x}}\right) - (2\sqrt{x})\left(\frac{1}{\sqrt{x}}\right)}{(2\sqrt{x}+1)^2}\right) = \frac{4\sqrt{x}\left(\frac{1}{\sqrt{x}}\right)}{(2\sqrt{x}+1)^3} = \frac{4}{(2\sqrt{x}+1)^3}$

33. $y = \sqrt{\frac{x^2+x}{x^2}} = \left(1 + \frac{1}{x}\right)^{1/2} \Rightarrow \frac{dy}{dx} = \frac{1}{2}\left(1+\frac{1}{x}\right)^{-1/2}\left(-\frac{1}{x^2}\right) = -\frac{1}{2x^2\sqrt{1+\frac{1}{x}}}$

34. $y = 4x\sqrt{x+\sqrt{x}} = 4x\left(x + x^{1/2}\right)^{1/2} \Rightarrow \frac{dy}{dx} = 4x\left(\frac{1}{2}\right)\left(x+x^{1/2}\right)^{-1/2}\left(1 + \frac{1}{2}x^{-1/2}\right) + \left(x+x^{1/2}\right)^{1/2}(4)$
$= \left(x+\sqrt{x}\right)^{-1/2}\left[2x\left(1 + \frac{1}{2\sqrt{x}}\right) + 4\left(x+\sqrt{x}\right)\right] = \left(x+\sqrt{x}\right)^{-1/2}\left(2x + \sqrt{x} + 4x + 4\sqrt{x}\right) = \frac{6x+5\sqrt{x}}{\sqrt{x+\sqrt{x}}}$

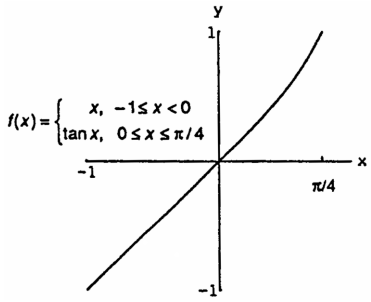
$= \frac{(2x^2+4xh+2h^2+1)-(2x^2+1)}{h} = \frac{4xh+2h^2}{h} = 4x+2h \Rightarrow g'(x) = \lim_{h\to 0}\frac{g(x+h)-g(x)}{h} = \lim_{h\to 0}(4x+2h)$
$= 4x$

65. (a)

$f(x) = \begin{cases} x^2, & -1 \le x < 0 \\ -x^2, & 0 \le x < 1 \end{cases}$

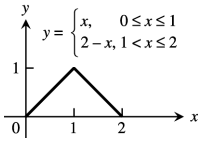


(b) $\lim_{x\to 0^-} f(x) = \lim_{x\to 0^-} x^2 = 0$ and $\lim_{x\to 0^+} f(x) = \lim_{x\to 0^+} -x^2 = 0 \Rightarrow \lim_{x\to 0} f(x) = 0$. Since $\lim_{x\to 0} f(x) = 0 = f(0)$ it follows that f is continuous at $x = 0$.

(c) $\lim_{x\to 0^-} f'(x) = \lim_{x\to 0^-}(2x) = 0$ and $\lim_{x\to 0^+} f'(x) = \lim_{x\to 0^+}(-2x) = 0 \Rightarrow \lim_{x\to 0} f'(x) = 0$. Since this limit exists, it

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

follows that f is differentiable at $x = 0$.



66. (a)

(b) $\lim_{x \to 0^-} f(x) = \lim_{x \to 0^-} x = 0$ and $\lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} \tan x = 0 \Rightarrow \lim_{x \to 0} f(x) = 0$. Since $\lim_{x \to 0} f(x) = 0 = f(0)$, it follows that f is continuous at $x = 0$.

(c) $\lim_{x \to 0^-} f'(x) = \lim_{x \to 0^-} 1 = 1$ and $\lim_{x \to 0^+} f'(x) = \lim_{x \to 0^+} \sec^2 x = 1 \Rightarrow \lim_{x \to 0} f'(x) = 1$. Since this limit exists it follows that f is differentiable at $x = 0$.

67. (a)

(b) $\lim_{x \to 1^-} f(x) = \lim_{x \to 1^-} x = 1$ and $\lim_{x \to 1^+} f(x) = \lim_{x \to 1^+} (2 - x) = 1 \Rightarrow \lim_{x \to 1} f(x) = 1$. Since $\lim_{x \to 1} f(x) = 1 = f(1)$, it follows that f is continuous at $x = 1$.

(c) $\lim_{x \to 1^-} f'(x) = \lim_{x \to 1^-} 1 = 1$ and $\lim_{x \to 1^+} f'(x) = \lim_{x \to 1^+} -1 = -1 \Rightarrow \lim_{x \to 1^-} f'(x) \ne \lim_{x \to 1^+} f'(x)$, so $\lim_{x \to 1} f'(x)$ does not exist $\Rightarrow$ f is not differentiable at $x = 1$.

68. (a) $\lim_{x \to 0^-} f(x) = \lim_{x \to 0^-} \sin 2x = 0$ and $\lim_{x \to 0^+} f(x) = \lim_{x \to 0^+} mx = 0 \Rightarrow \lim_{x \to 0} f(x) = 0$, independent of m; since $f(0) = 0 = \lim_{x \to 0} f(x)$ it follows that f is continuous at $x = 0$ for all values of m.

(b) $\lim_{x \to 0^-} f'(x) = \lim_{x \to 0^-} (\sin 2x)' = \lim_{x \to 0^-} 2 \cos 2x = 2$ and $\lim_{x \to 0^+} f'(x) = \lim_{x \to 0^+} (mx)' = \lim_{x \to 0^+} m = m \Rightarrow$ f is differentiable at $x = 0$ provided that $\lim_{x \to 0^-} f'(x) = \lim_{x \to 0^+} f'(x) \Rightarrow m = 2$.

69. $y = \frac{x}{2} + \frac{1}{2x-4} = \frac{1}{2}x + (2x-4)^{-1} \Rightarrow \frac{dy}{dx} = \frac{1}{2} - 2(2x-4)^{-2}$; the slope of the tangent is $-\frac{3}{2} \Rightarrow -\frac{3}{2} = \frac{1}{2} - 2(2x-4)^{-2} \Rightarrow -2 = -2(2x-4)^{-2} \Rightarrow 1 = \frac{1}{(2x-4)^2} \Rightarrow (2x-4)^2 = 1 \Rightarrow 4x^2 - 16x + 16 = 1$ $\Rightarrow 4x^2 - 16x + 15 = 0 \Rightarrow (2x-5)(2x-3) = 0 \Rightarrow x = \frac{5}{2}$ or $x = \frac{3}{2} \Rightarrow \left(\frac{5}{2}, \frac{9}{4}\right)$ and $\left(\frac{3}{2}, -\frac{1}{4}\right)$ are points on the curve where the slope is $-\frac{3}{2}$.

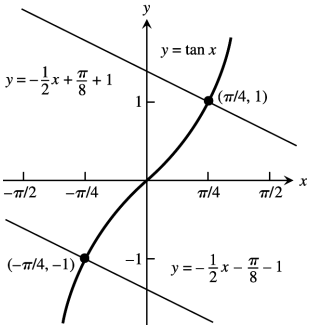
70. $y = x - \frac{1}{2x} \Rightarrow \frac{dy}{dx} = 1 + \frac{2}{(2x)^2} = 1 + \frac{1}{2x^2}$; the slope of the tangent is $3 \Rightarrow 3 = 1 + \frac{1}{2x^2} \Rightarrow 2 = \frac{1}{2x^2} \Rightarrow x^2 = \frac{1}{4}$ $\Rightarrow x = \pm\frac{1}{2} \Rightarrow \left(\frac{1}{2}, -\frac{1}{2}\right)$ and $\left(-\frac{1}{2}, \frac{1}{2}\right)$ are points on the curve where the slope is 3.

71. $y = 2x^3 - 3x^2 - 12x + 20 \Rightarrow \frac{dy}{dx} = 6x^2 - 6x - 12$; the tangent is parallel to the x-axis when $\frac{dy}{dx} = 0$ $\Rightarrow 6x^2 - 6x - 12 = 0 \Rightarrow x^2 - x - 2 = 0 \Rightarrow (x-2)(x+1) = 0 \Rightarrow x = 2$ or $x = -1 \Rightarrow (2, 0)$ and $(-1, 27)$ are points on the curve where the tangent is parallel to the x-axis.

72. $y = x^3 \Rightarrow \frac{dy}{dx} = 3x^2 \Rightarrow \left.\frac{dy}{dx}\right|_{(-2,-8)} = 12$; an equation of the tangent line at $(-2, -8)$ is $y + 8 = 12(x + 2)$

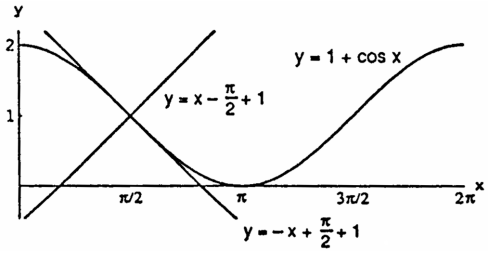
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$\Rightarrow$ $y = 12x + 16$; x-intercept: $0 = 12x + 16 \Rightarrow x = -\frac{4}{3} \Rightarrow \left(-\frac{4}{3}, 0\right)$; y-intercept: $y = 12(0) + 16 = 16 \Rightarrow (0, 16)$



73. $y = 2x^3 - 3x^2 - 12x + 20 \Rightarrow \frac{dy}{dx} = 6x^2 - 6x - 12$

(a) The tangent is perpendicular to the line $y = 1 - \frac{x}{24}$ when $\frac{dy}{dx} = -\left(\frac{1}{-\left(\frac{1}{24}\right)}\right) = 24$; $6x^2 - 6x - 12 = 24$ $\Rightarrow x^2 - x - 2 = 4 \Rightarrow x^2 - x - 6 = 0 \Rightarrow (x - 3)(x + 2) = 0 \Rightarrow x = -2$ or $x = 3 \Rightarrow (-2, 16)$ and $(3, 11)$ are points where the tangent is perpendicular to $y = 1 - \frac{x}{24}$.



(b) The tangent is parallel to the line $y = \sqrt{2} - 12x$ when $\frac{dy}{dx} = -12 \Rightarrow 6x^2 - 6x - 12 = -12 \Rightarrow x^2 - x = 0$ $\Rightarrow x(x - 1) = 0 \Rightarrow x = 0$ or $x = 1 \Rightarrow (0, 20)$ and $(1, 7)$ are points where the tangent is parallel to $y = \sqrt{2} - 12x$.

74. $y = \frac{\pi \sin x}{x} \Rightarrow \frac{dy}{dx} = \frac{x(\pi \cos x) - (\pi \sin x)(1)}{x^2} \Rightarrow m_1 = \left.\frac{dy}{dx}\right|_{x=\pi} = \frac{-\pi^2}{\pi^2} = -1$ and $m_2 = \left.\frac{dy}{dx}\right|_{x=-\pi} \frac{\pi^2}{\pi^2} = 1$.
Since $m_1 = -\frac{1}{m_2}$ the tangents intersect at right angles.

75. $y = \tan x$, $-\frac{\pi}{2} < x < \frac{\pi}{2} \Rightarrow \frac{dy}{dx} = \sec^2 x$; now the slope of $y = -\frac{x}{2}$ is $-\frac{1}{2} \Rightarrow$ the normal line is parallel to $y = -\frac{x}{2}$ when $\frac{dy}{dx} = 2$. Thus, $\sec^2 x = 2 \Rightarrow \frac{1}{\cos^2 x} = 2$ $\Rightarrow \cos^2 x = \frac{1}{2} \Rightarrow \cos x = \frac{\pm 1}{\sqrt{2}} \Rightarrow x = -\frac{\pi}{4}$ and $x = \frac{\pi}{4}$ for $-\frac{\pi}{2} < x < \frac{\pi}{2} \Rightarrow \left(-\frac{\pi}{4}, -1\right)$ and $\left(\frac{\pi}{4}, 1\right)$ are points where the normal is parallel to $y = -\frac{x}{2}$.

76. $y = 1 + \cos x \Rightarrow \frac{dy}{dx} = -\sin x \Rightarrow \left.\frac{dy}{dx}\right|_{\left(\frac{\pi}{2}, 1\right)} = -1$
$\Rightarrow$ the tangent at $\left(\frac{\pi}{2}, 1\right)$ is the line $y - 1 = -\left(x - \frac{\pi}{2}\right)$
$\Rightarrow y = -x + \frac{\pi}{2} + 1$; the normal at $\left(\frac{\pi}{2}, 1\right)$ is
$y - 1 = (1)\left(x - \frac{\pi}{2}\right) \Rightarrow y = x - \frac{\pi}{2} + 1$

77. $y = x^2 + C \Rightarrow \frac{dy}{dx} = 2x$ and $y = x \Rightarrow \frac{dy}{dx} = 1$; the parabola is tangent to $y = x$ when $2x = 1 \Rightarrow x = \frac{1}{2} \Rightarrow y = \frac{1}{2}$; thus, $\frac{1}{2} = \left(\frac{1}{2}\right)^2 + C \Rightarrow C = \frac{1}{4}$

78. $y = x^3 \Rightarrow \frac{dy}{dx} = 3x^2 \Rightarrow \left.\frac{dy}{dx}\right|_{x=a} = 3a^2 \Rightarrow$ the tangent line at $(a, a^3)$ is $y - a^3 = 3a^2(x - a)$. The tangent line intersects $y = x^3$ when $x^3 - a^3 = 3a^2(x - a) \Rightarrow (x - a)(x^2 + xa + a^2) = 3a^2(x - a) \Rightarrow (x - a)(x^2 + xa - 2a^2) = 0$ $\Rightarrow (x - a)^2(x + 2a) = 0 \Rightarrow x = a$ or $x = -2a$. Now $\left.\frac{dy}{dx}\right|_{x=-2a} = 3(-2a)^2 = 12a^2 = 4(3a^2)$, so the slope at $x = -2a$ is 4 times as large as the slope at $(a, a^3)$ where $x = a$.

79. The line through $(0, 3)$ and $(5, -2)$ has slope $m = \frac{3 - (-2)}{0 - 5} = -1 \Rightarrow$ the line through $(0, 3)$ and $(5, -2)$ is $y = -x + 3$; $y = \frac{c}{x + 1} \Rightarrow \frac{dy}{dx} = \frac{-c}{(x + 1)^2}$, so the curve is tangent to $y = -x + 3 \Rightarrow \frac{dy}{dx} = -1 = \frac{-c}{(x + 1)^2}$
$\Rightarrow (x + 1)^2 = c$, $x \neq -1$. Moreover, $y = \frac{c}{x + 1}$ intersects $y = -x + 3 \Rightarrow \frac{c}{x + 1} = -x + 3$, $x \neq -1$
$\Rightarrow c = (x + 1)(-x + 3)$, $x \neq -1$. Thus $c = c \Rightarrow (x + 1)^2 = (x + 1)(-x + 3) \Rightarrow (x + 1)[x + 1 - (-x + 3)]$
$= 0$, $x \neq -1 \Rightarrow (x + 1)(2x - 2) = 0 \Rightarrow x = 1$ (since $x \neq -1$) $\Rightarrow c = 4$.

80. Let $\left(b, \pm\sqrt{a^2-b^2}\right)$ be a point on the circle $x^2+y^2=a^2$. Then $x^2+y^2=a^2 \Rightarrow 2x+2y\frac{dy}{dx}=0 \Rightarrow \frac{dy}{dx}=-\frac{x}{y}$ $\Rightarrow \left.\frac{dy}{dx}\right|_{x=b}=\frac{-b}{\pm\sqrt{a^2-b^2}} \Rightarrow$ normal line through $\left(b, \pm\sqrt{a^2-b^2}\right)$ has slope $\frac{\pm\sqrt{a^2-b^2}}{b} \Rightarrow$ normal line is $y-\left(\pm\sqrt{a^2-b^2}\right)=\frac{\pm\sqrt{a^2-b^2}}{b}(x-b) \Rightarrow y\mp\sqrt{a^2-b^2}=\frac{\pm\sqrt{a^2-b^2}}{b}x\mp\sqrt{a^2-b^2} \Rightarrow y=\pm\frac{\sqrt{a^2-b^2}}{b}x$ which passes through the origin.

81. $x^2+2y^2=9 \Rightarrow 2x+4y\frac{dy}{dx}=0 \Rightarrow \frac{dy}{dx}=-\frac{x}{2y} \Rightarrow \left.\frac{dy}{dx}\right|_{(1,2)}=-\frac{1}{4} \Rightarrow$ the tangent line is $y=2-\frac{1}{4}(x-1)$ $=-\frac{1}{4}x+\frac{9}{4}$ and the normal line is $y=2+4(x-1)=4x-2$.

82. $x^3+y^2=2 \Rightarrow 3x^2+2y\frac{dy}{dx}=0 \Rightarrow \frac{dy}{dx}=\frac{-3x^2}{2y} \Rightarrow \left.\frac{dy}{dx}\right|_{(1,1)}=-\frac{3}{2} \Rightarrow$ the tangent line is $y=1+\frac{-3}{2}(x-1)$ $=-\frac{3}{2}x+\frac{5}{2}$ and the normal line is $y=1+\frac{2}{3}(x-1)=\frac{2}{3}x+\frac{1}{3}$.

83. $xy+2x-5y=2 \Rightarrow \left(x\frac{dy}{dx}+y\right)+2-5\frac{dy}{dx}=0 \Rightarrow \frac{dy}{dx}(x-5)=-y-2 \Rightarrow \frac{dy}{dx}=\frac{-y-2}{x-5} \Rightarrow \left.\frac{dy}{dx}\right|_{(3,2)}=2$ $\Rightarrow$ the tangent line is $y=2+2(x-3)=2x-4$ and the normal line is $y=2+\frac{-1}{2}(x-3)=-\frac{1}{2}x+\frac{7}{2}$.

84. $(y-x)^2=2x+4 \Rightarrow 2(y-x)\left(\frac{dy}{dx}-1\right)=2 \Rightarrow (y-x)\frac{dy}{dx}=1+(y-x) \Rightarrow \frac{dy}{dx}=\frac{1+y-x}{y-x} \Rightarrow \left.\frac{dy}{dx}\right|_{(6,2)}=\frac{3}{4}$ $\Rightarrow$ the tangent line is $y=2+\frac{3}{4}(x-6)=\frac{3}{4}x-\frac{5}{2}$ and the normal line is $y=2-\frac{4}{3}(x-6)=-\frac{4}{3}x+10$.

85. $x+\sqrt{xy}=6 \Rightarrow 1+\frac{1}{2\sqrt{xy}}\left(x\frac{dy}{dx}+y\right)=0 \Rightarrow x\frac{dy}{dx}+y=-2\sqrt{xy} \Rightarrow \frac{dy}{dx}=\frac{-2\sqrt{xy}-y}{x} \Rightarrow \left.\frac{dy}{dx}\right|_{(4,1)}=\frac{-5}{4}$ $\Rightarrow$ the tangent line is $y=1-\frac{5}{4}(x-4)=-\frac{5}{4}x+6$ and the normal line is $y=1+\frac{4}{5}(x-4)=\frac{4}{5}x-\frac{11}{5}$.

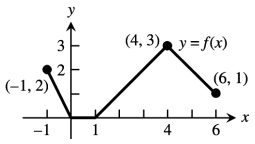
86. $x^{3/2}+2y^{3/2}=17 \Rightarrow \frac{3}{2}x^{1/2}+3y^{1/2}\frac{dy}{dx}=0 \Rightarrow \frac{dy}{dx}=\frac{-x^{1/2}}{2y^{1/2}} \Rightarrow \left.\frac{dy}{dx}\right|_{(1,4)}=-\frac{1}{4} \Rightarrow$ the tangent line is $y=4-\frac{1}{4}(x-1)=-\frac{1}{4}x+\frac{17}{4}$ and the normal line is $y=4+4(x-1)=4x$.

87. $x^3y^3+y^2=x+y \Rightarrow \left[x^3\left(3y^2\frac{dy}{dx}\right)+y^3(3x^2)\right]+2y\frac{dy}{dx}=1+\frac{dy}{dx} \Rightarrow 3x^3y^2\frac{dy}{dx}+2y\frac{dy}{dx}-\frac{dy}{dx}=1-3x^2y^3$ $\Rightarrow \frac{dy}{dx}(3x^3y^2+2y-1)=1-3x^2y^3 \Rightarrow \frac{dy}{dx}=\frac{1-3x^2y^3}{3x^3y^2+2y-1} \Rightarrow \left.\frac{dy}{dx}\right|_{(1,1)}=-\frac{2}{4}$, but $\left.\frac{dy}{dx}\right|_{(1,-1)}$ is undefined. Therefore, the curve has slope $-\frac{1}{2}$ at $(1,1)$ but the slope is undefined at $(1,-1)$.

88. $y=\sin(x-\sin x) \Rightarrow \frac{dy}{dx}=[\cos(x-\sin x)](1-\cos x)$; $y=0 \Rightarrow \sin(x-\sin x)=0 \Rightarrow x-\sin x=k\pi$, $k=-2,-1,0,1,2$ (for our interval) $\Rightarrow \cos(x-\sin x)=\cos(k\pi)=\pm 1$. Therefore, $\frac{dy}{dx}=0$ and $y=0$ when $1-\cos x=0$ and $x=k\pi$. For $-2\pi\le x\le 2\pi$, these equations hold when $k=-2$, 0, and 2 (since $\cos(-\pi)=\cos\pi=-1$). Thus the curve has horizontal tangents at the x-axis for the x-values $-2\pi$, 0, and $2\pi$ (which are even integer multiples of $\pi$) $\Rightarrow$ the curve has an infinite number of horizontal tangents.

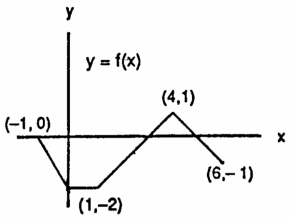
89. $x=\frac{1}{2}\tan t$, $y=\frac{1}{2}\sec t \Rightarrow \frac{dy}{dx}=\frac{dy/dt}{dx/dt}=\frac{\frac{1}{2}\sec t\tan t}{\frac{1}{2}\sec^2 t}=\frac{\tan t}{\sec t}=\sin t \Rightarrow \left.\frac{dy}{dx}\right|_{t=\pi/3}=\sin\frac{\pi}{3}=\frac{\sqrt{3}}{2}$; $t=\frac{\pi}{3}$ $\Rightarrow x=\frac{1}{2}\tan\frac{\pi}{3}=\frac{\sqrt{3}}{2}$ and $y=\frac{1}{2}\sec\frac{\pi}{3}=1 \Rightarrow y=\frac{\sqrt{3}}{2}x+\frac{1}{4}$; $\frac{d^2y}{dx^2}=\frac{dy'/dt}{dx/dt}=\frac{\cos t}{\frac{1}{2}\sec^2 t}=2\cos^3 t \Rightarrow \left.\frac{d^2y}{dx^2}\right|_{t=\pi/3}$ $=2\cos^3\left(\frac{\pi}{3}\right)=\frac{1}{4}$

90. $x=1+\frac{1}{t^2}$, $y=1-\frac{3}{t} \Rightarrow \frac{dy}{dx}=\frac{dy/dt}{dx/dt}=\frac{\left(\frac{3}{t^2}\right)}{\left(-\frac{2}{t^3}\right)}=-\frac{3}{2}t \Rightarrow \left.\frac{dy}{dx}\right|_{t=2}=-\frac{3}{2}(2)=-3$; $t=2 \Rightarrow x=1+\frac{1}{2^2}=\frac{5}{4}$ and



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$y = 1 - \frac{3}{2} = -\frac{1}{2} \Rightarrow y = -3x + \frac{13}{4}$; $\frac{d^2y}{dx^2} = \frac{dy'/dt}{dx/dt} = \frac{\left(-\frac{3}{2}\right)}{\left(-\frac{2}{t^3}\right)} = \frac{3}{4}t^3 \Rightarrow \left.\frac{d^2y}{dx^2}\right|_{t=2} = \frac{3}{4}(2)^3 = 6$



91. B = graph of f, A = graph of f′. Curve B cannot be the derivative of A because A has only negative slopes while some of B's values are positive.

92. A = graph of f, B = graph of f′. Curve A cannot be the derivative of B because B has only negative slopes while A has positive values for $x > 0$.

$= \lim_{x\to 0} \left[\frac{\left(\frac{x}{2}\right)}{\sin\left(\frac{x}{2}\right)} \cdot \frac{\left(\frac{x}{2}\right)}{\sin\left(\frac{x}{2}\right)} \cdot \frac{\sin x}{x}\right] = (1)(1)(1) = 1$

104. $\lim_{\theta\to 0} \frac{1-\cos\theta}{\theta^2} = \lim_{\theta\to 0} \frac{2\sin^2\left(\frac{\theta}{2}\right)}{\theta^2} = \lim_{\theta\to 0} \left[\frac{\sin\left(\frac{\theta}{2}\right)}{\left(\frac{\theta}{2}\right)} \cdot \frac{\sin\left(\frac{\theta}{2}\right)}{\left(\frac{\theta}{2}\right)} \cdot \frac{1}{2}\right] = (1)(1)\left(\frac{1}{2}\right) = \frac{1}{2}$

105. $\lim_{x\to 0} \frac{\tan x}{x} = \lim_{x\to 0} \left(\frac{1}{\cos x} \cdot \frac{\sin x}{x}\right) = 1$; let $\theta = \tan x \Rightarrow \theta \to 0$ as $x \to 0 \Rightarrow \lim_{x\to 0} g(x) = \lim_{x\to 0} \frac{\tan(\tan x)}{\tan x}$
$= \lim_{\theta\to 0} \frac{\tan\theta}{\theta} = 1$. Therefore, to make g continuous at the origin, define $g(0) = 1$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

106. $\lim_{x\to 0} f(x) = \lim_{x\to 0} \frac{\tan(\tan x)}{\sin(\sin x)} = \lim_{x\to 0} \left[\frac{\tan(\tan x)}{\tan x} \cdot \frac{\sin x}{\sin(\sin x)} \cdot \frac{1}{\cos x}\right] = 1 \cdot \lim_{x\to 0} \frac{\sin x}{\sin(\sin x)}$ (using the result of #105); let $\theta = \sin x \Rightarrow \theta \to 0$ as $x \to 0 \Rightarrow \lim_{x\to 0} \frac{\sin x}{\sin(\sin x)} = \lim_{\theta\to 0} \frac{\theta}{\sin\theta} = 1$. Therefore, to make f continuous at the origin, define $f(0) = 1$.

107. (a) $S = 2\pi r^2 + 2\pi rh$ and h constant $\Rightarrow \frac{dS}{dt} = 4\pi r\frac{dr}{dt} + 2\pi h\frac{dr}{dt} = (4\pi r + 2\pi h)\frac{dr}{dt}$

(b) $S = 2\pi r^2 + 2\pi rh$ and r constant $\Rightarrow \frac{dS}{dt} = 2\pi r\frac{dh}{dt}$

(c) $S = 2\pi r^2 + 2\pi rh \Rightarrow \frac{dS}{dt} = 4\pi r\frac{dr}{dt} + 2\pi\left(r\frac{dh}{dt} + h\frac{dr}{dt}\right) = (4\pi r + 2\pi h)\frac{dr}{dt} + 2\pi r\frac{dh}{dt}$

(d) S constant $\Rightarrow \frac{dS}{dt} = 0 \Rightarrow 0 = (4\pi r + 2\pi h)\frac{dr}{dt} + 2\pi r\frac{dh}{dt} \Rightarrow (2r + h)\frac{dr}{dt} = -r\frac{dh}{dt} \Rightarrow \frac{dr}{dt} = \frac{-r}{2r+h}\frac{dh}{dt}$

108. $S = \pi r\sqrt{r^2 + h^2} \Rightarrow \frac{dS}{dt} = \pi r \cdot \frac{\left(r\frac{dr}{dt} + h\frac{dh}{dt}\right)}{\sqrt{r^2+h^2}} + \pi\sqrt{r^2 + h^2}\frac{dr}{dt}$;

(a) h constant $\Rightarrow \frac{dh}{dt} = 0 \Rightarrow \frac{dS}{dt} = \frac{\pi r^2\frac{dr}{dt}}{\sqrt{r^2+h^2}} + \pi\sqrt{r^2 + h^2}\frac{dr}{dt} = \left[\pi\sqrt{r^2 + h^2} + \frac{\pi r^2}{\sqrt{r^2+h^2}}\right]\frac{dr}{dt}$

(b) r constant $\Rightarrow \frac{dr}{dt} = 0 \Rightarrow \frac{dS}{dt} = \frac{\pi rh}{\sqrt{r^2+h^2}}\frac{dh}{dt}$

(c) In general, $\frac{dS}{dt} = \left[\pi\sqrt{r^2 + h^2} + \frac{\pi r^2}{\sqrt{r^2+h^2}}\right]\frac{dr}{dt} + \frac{\pi rh}{\sqrt{r^2+h^2}}\frac{dh}{dt}$

109. $A = \pi r^2 \Rightarrow \frac{dA}{dt} = 2\pi r\frac{dr}{dt}$; so $r = 10$ and $\frac{dr}{dt} = -\frac{2}{\pi}$ m/sec $\Rightarrow \frac{dA}{dt} = (2\pi)(10)\left(-\frac{2}{\pi}\right) = -40$ m$^2$/sec

110. $V = s^3 \Rightarrow \frac{dV}{dt} = 3s^2 \cdot \frac{ds}{dt} \Rightarrow \frac{ds}{dt} = \frac{1}{3s^2}\frac{dV}{dt}$; so $s = 20$ and $\frac{dV}{dt} = 1200$ cm$^3$/min $\Rightarrow \frac{ds}{dt} = \frac{1}{3(20)^2}(1200) = 1$ cm/min

111. $\frac{dR_1}{dt} = -1$ ohm/sec, $\frac{dR_2}{dt} = 0.5$ ohm/sec; and $\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2} \Rightarrow \frac{-1}{R^2}\frac{dR}{dt} = \frac{-1}{R_1^2}\frac{dR_1}{dt} - \frac{1}{R_2^2}\frac{dR_2}{dt}$. Also, $R_1 = 75$ ohms and $R_2 = 50$ ohms $\Rightarrow \frac{1}{R} = \frac{1}{75} + \frac{1}{50} \Rightarrow R = 30$ ohms. Therefore, from the derivative equation, $\frac{-1}{(30)^2}\frac{dR}{dt} = \frac{-1}{(75)^2}(-1) - \frac{1}{(50)^2}(0.5) = \left(\frac{1}{5625} - \frac{1}{5000}\right) \Rightarrow \frac{dR}{dt} = (-900)\left(\frac{5000-5625}{5625\cdot 5000}\right) = \frac{9(625)}{50(5625)} = \frac{1}{50}$ $= 0.02$ ohm/sec.

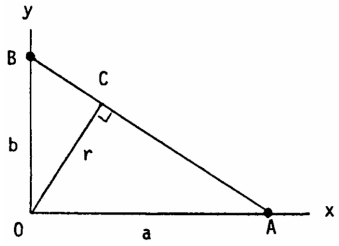
112. $\frac{dR}{dt} = 3$ ohms/sec and $\frac{dX}{dt} = -2$ ohms/sec; $Z = \sqrt{R^2 + X^2} \Rightarrow \frac{dZ}{dt} = \frac{R\frac{dR}{dt} + X\frac{dX}{dt}}{\sqrt{R^2+X^2}}$ so that $R = 10$ ohms and $X = 20$ ohms $\Rightarrow \frac{dZ}{dt} = \frac{(10)(3)+(20)(-2)}{\sqrt{10^2+20^2}} = \frac{-1}{\sqrt{5}} \approx -0.45$ ohm/sec.

113. Given $\frac{dx}{dt} = 10$ m/sec and $\frac{dy}{dt} = 5$ m/sec, let D be the distance from the origin $\Rightarrow D^2 = x^2 + y^2 \Rightarrow 2D\frac{dD}{dt}$ $= 2x\frac{dx}{dt} + 2y\frac{dy}{dt} \Rightarrow D\frac{dD}{dt} = x\frac{dx}{dt} + y\frac{dy}{dt}$. When $(x, y) = (3, -4)$, $D = \sqrt{3^2 + (-4)^2} = 5$ and $5\frac{dD}{dt} = (5)(10) + (12)(5) \Rightarrow \frac{dD}{dt} = \frac{110}{5} = 22$. Therefore, the particle is moving away from the origin at 22 m/sec (because the distance D is increasing).

114. Let D be the distance from the origin. We are given that $\frac{dD}{dt} = 11$ units/sec. Then $D^2 = x^2 + y^2$ $= x^2 + \left(x^{3/2}\right)^2 = x^2 + x^3 \Rightarrow 2D\frac{dD}{dt} = 2x\frac{dx}{dt} + 3x^2\frac{dx}{dt} = x(2 + 3x)\frac{dx}{dt}$; $x = 3 \Rightarrow D = \sqrt{3^2 + 3^3} = 6$ and substitution in the derivative equation gives $(2)(6)(11) = (3)(2 + 9)\frac{dx}{dt} \Rightarrow \frac{dx}{dt} = 4$ units/sec.

115. (a) From the diagram we have $\frac{10}{h} = \frac{4}{r} \Rightarrow r = \frac{2}{5}h$.

(b) $V = \frac{1}{3}\pi r^2 h = \frac{1}{3}\pi\left(\frac{2}{5}h\right)^2 h = \frac{4\pi h^3}{75} \Rightarrow \frac{dV}{dt} = \frac{4\pi h^2}{25}\frac{dh}{dt}$, so $\frac{dV}{dt} = -5$ and $h = 6 \Rightarrow \frac{dh}{dt} = -\frac{125}{144\pi}$ ft/min.



116. From the sketch in the text, $s = r\theta \Rightarrow \frac{ds}{dt} = r\frac{d\theta}{dt} + \theta\frac{dr}{dt}$. Also $r = 1.2$ is constant $\Rightarrow \frac{dr}{dt} = 0$ $\Rightarrow \frac{ds}{dt} = r\frac{d\theta}{dt} = (1.2)\frac{d\theta}{dt}$. Therefore, $\frac{ds}{dt} = 6$ ft/sec and $r = 1.2$ ft $\Rightarrow \frac{d\theta}{dt} = 5$ rad/sec

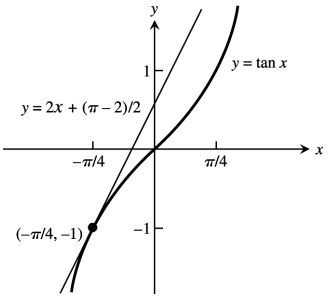
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

117. (a) From the sketch in the text, $\frac{d\theta}{dt} = -0.6$ rad/sec and $x = \tan\theta$. Also $x = \tan\theta \Rightarrow \frac{dx}{dt} = \sec^2\theta\,\frac{d\theta}{dt}$; at point A, $x = 0 \Rightarrow \theta = 0 \Rightarrow \frac{dx}{dt} = (\sec^2 0)(-0.6) = -0.6$. Therefore the speed of the light is $0.6 = \frac{3}{5}$ km/sec when it reaches point A.

(b) $\frac{(3/5)\text{ rad}}{\text{sec}} \cdot \frac{1\text{ rev}}{2\pi\text{ rad}} \cdot \frac{60\text{ sec}}{\text{min}} = \frac{18}{\pi}$ revs/min

118. From the figure, $\frac{a}{r} = \frac{b}{BC} \Rightarrow \frac{a}{r} = \frac{b}{\sqrt{b^2 - r^2}}$. We are given that r is constant. Differentiation gives,

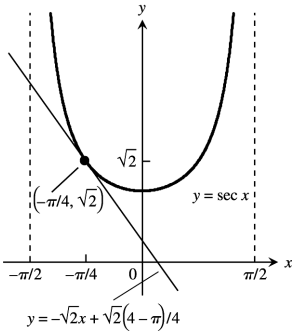
$\frac{1}{r}\cdot\frac{da}{dt} = \frac{\left(\sqrt{b^2-r^2}\right)\left(\frac{db}{dt}\right) - (b)\left(\frac{b}{\sqrt{b^2-r^2}}\right)\left(\frac{db}{dt}\right)}{b^2 - r^2}$. Then,



$b = 2r$ and $\frac{db}{dt} = -0.3r$

$$\Rightarrow \frac{da}{dt} = r\left[\frac{\sqrt{(2r)^2 - r^2}\,(-0.3r) - (2r)\left(\frac{2r(-0.3r)}{\sqrt{(2r)^2 - r^2}}\right)}{(2r)^2 - r^2}\right]$$

$$= \frac{\sqrt{3r^2}\,(-0.3r) + \frac{4r^2(0.3r)}{\sqrt{3r^2}}}{3r} = \frac{(3r^2)(-0.3r) + (4r^2)(0.3r)}{3\sqrt{3}\,r^2} = \frac{0.3r}{3\sqrt{3}} = \frac{r}{10\sqrt{3}}\text{ m/sec.}$$



Since $\frac{da}{dt}$ is positive, the distance OA is increasing when $OB = 2r$, and B is moving toward O at the rate of $0.3r$ m/sec.

119.(a) If $f(x) = \tan x$ and $x = -\frac{\pi}{4}$, then $f'(x) = \sec^2 x$, $f\left(-\frac{\pi}{4}\right) = -1$ and $f'\left(-\frac{\pi}{4}\right) = 2$. The linearization of $f(x)$ is $L(x) = 2\left(x + \frac{\pi}{4}\right) + (-1) = 2x + \frac{\pi - 2}{2}$.

(b) If $f(x) = \sec x$ and $x = -\frac{\pi}{4}$, then $f'(x) = \sec x \tan x$, $f\left(-\frac{\pi}{4}\right) = \sqrt{2}$ and $f'\left(-\frac{\pi}{4}\right) = -\sqrt{2}$. The linearization of $f(x)$ is $L(x) = -\sqrt{2}\left(x + \frac{\pi}{4}\right) + \sqrt{2}$

$= -\sqrt{2}x + \frac{\sqrt{2}(4-\pi)}{4}$.

120. $f(x) = \frac{1}{1+\tan x} \Rightarrow f'(x) = \frac{-\sec^2 x}{(1+\tan x)^2}$. The linearization at $x = 0$ is $L(x) = f'(0)(x - 0) + f(0) = 1 - x$.

121. $f(x) = \sqrt{x+1} + \sin x - 0.5 = (x+1)^{1/2} + \sin x - 0.5 \Rightarrow f'(x) = \left(\frac{1}{2}\right)(x+1)^{-1/2} + \cos x$

$\Rightarrow L(x) = f'(0)(x - 0) + f(0) = 1.5(x - 0) + 0.5 \Rightarrow L(x) = 1.5x + 0.5$, the linearization of $f(x)$.

122. $f(x) = \frac{2}{1-x} + \sqrt{1+x} - 3.1 = 2(1-x)^{-1} + (1+x)^{1/2} - 3.1 \Rightarrow f'(x) = -2(1-x)^{-2}(-1) + \frac{1}{2}(1+x)^{-1/2}$

$= \frac{2}{(1-x)^2} + \frac{1}{2\sqrt{1+x}} \Rightarrow L(x) = f'(0)(x - 0) + f(0) = 2.5x - 0.1$, the linearization of $f(x)$.

123. $S = \pi r\sqrt{r^2 + h^2}$, r constant $\Rightarrow dS = \pi r \cdot \frac{1}{2}(r^2 + h^2)^{-1/2} 2h\,dh = \frac{\pi r h}{\sqrt{r^2 + h^2}} dh$. Height changes from $h_0$ to $h_0 + dh$

$\Rightarrow dS = \frac{\pi r h_0 (dh)}{\sqrt{r^2 + h_0^2}}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

124.(a) $S = 6r^2 \Rightarrow dS = 12r\,dr$. We want $|dS| \le (2\%)\,S \Rightarrow |12r\,dr| \le \frac{12r^2}{100} \Rightarrow |dr| \le \frac{r}{100}$. The measurement of the edge r must have an error less than 1%.

(b) When $V = r^3$, then $dV = 3r^2\,dr$. The accuracy of the volume is $\left(\frac{dV}{V}\right)(100\%) = \left(\frac{3r^2\,dr}{r^3}\right)(100\%)$ $= \left(\frac{3}{r}\right)(dr)(100\%) = \left(\frac{3}{r}\right)\left(\frac{r}{100}\right)(100\%) = 3\%$

125.$C = 2\pi r \Rightarrow r = \frac{C}{2\pi}$, $S = 4\pi r^2 = \frac{C^2}{\pi}$, and $V = \frac{4}{3}\pi r^3 = \frac{C^3}{6\pi^2}$. It also follows that $dr = \frac{1}{2\pi}\,dC$, $dS = \frac{2C}{\pi}\,dC$ and $dV = \frac{C^2}{2\pi^2}\,dC$. Recall that $C = 10$ cm and $dC = 0.4$ cm.

(a) $dr = \frac{0.4}{2\pi} = \frac{0.2}{\pi}$ cm $\Rightarrow \left(\frac{dr}{r}\right)(100\%) = \left(\frac{0.2}{\pi}\right)\left(\frac{2\pi}{10}\right)(100\%) = (.04)(100\%) = 4\%$

(b) $dS = \frac{20}{\pi}(0.4) = \frac{8}{\pi}$ cm $\Rightarrow \left(\frac{dS}{S}\right)(100\%) = \left(\frac{8}{\pi}\right)\left(\frac{\pi}{100}\right)(100\%) = 8\%$

(c) $dV = \frac{10^2}{2\pi^2}(0.4) = \frac{20}{\pi^2}$ cm $\Rightarrow \left(\frac{dV}{V}\right)(100\%) = \left(\frac{20}{\pi^2}\right)\left(\frac{6\pi^2}{1000}\right)(100\%) = 12\%$

126.Similar triangles yield $\frac{35}{h} = \frac{15}{6} \Rightarrow h = 14$ ft. The same triangles imply that $\frac{20+a}{h} = \frac{a}{6} \Rightarrow h = 120a^{-1} + 6$ $\Rightarrow dh = -120a^{-2}\,da = -\frac{120}{a^2}\,da = \left(-\frac{120}{a^2}\right)\left(\pm\frac{1}{12}\right) = \left(-\frac{120}{15^2}\right)\left(\pm\frac{1}{12}\right) = \pm\frac{2}{45} \approx \pm .0444$ ft $= \pm 0.53$ inches.

## CHAPTER 3 ADDITIONAL AND ADVANCED EXERCISES

1. (a) $\sin 2\theta = 2\sin\theta\cos\theta \Rightarrow \frac{d}{d\theta}(\sin 2\theta) = \frac{d}{d\theta}(2\sin\theta\cos\theta) \Rightarrow 2\cos 2\theta = 2[(\sin\theta)(-\sin\theta) + (\cos\theta)(\cos\theta)]$ $\Rightarrow \cos 2\theta = \cos^2\theta - \sin^2\theta$

(b) $\cos 2\theta = \cos^2\theta - \sin^2\theta \Rightarrow \frac{d}{d\theta}(\cos 2\theta) = \frac{d}{d\theta}(\cos^2\theta - \sin^2\theta) \Rightarrow -2\sin 2\theta = (2\cos\theta)(-\sin\theta) - (2\sin\theta)(\cos\theta)$ $\Rightarrow \sin 2\theta = \cos\theta\sin\theta + \sin\theta\cos\theta \Rightarrow \sin 2\theta = 2\sin\theta\cos\theta$

2. The derivative of $\sin(x + a) = \sin x\cos a + \cos x\sin a$ with respect to x is $\cos(x + a) = \cos x\cos a - \sin x\sin a$, which is also an identity. This principle does not apply to the equation $x^2 - 2x - 8 = 0$, since $x^2 - 2x - 8 = 0$ is not an identity: it holds for 2 values of x ($-2$ and 4), but not for all x.

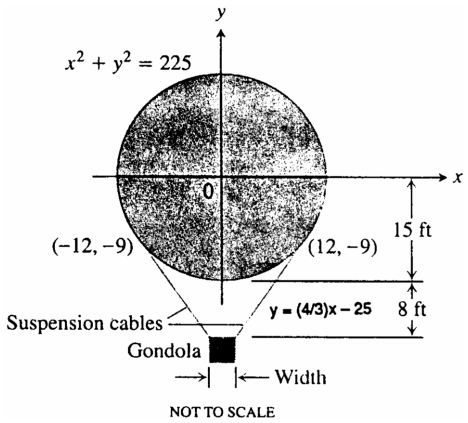
3. (a) $f(x) = \cos x \Rightarrow f'(x) = -\sin x \Rightarrow f''(x) = -\cos x$, and $g(x) = a + bx + cx^2 \Rightarrow g'(x) = b + 2cx \Rightarrow g''(x) = 2c$; also, $f(0) = g(0) \Rightarrow \cos(0) = a \Rightarrow a = 1$; $f'(0) = g'(0) \Rightarrow -\sin(0) = b \Rightarrow b = 0$; $f''(0) = g''(0)$ $\Rightarrow -\cos(0) = 2c \Rightarrow c = -\frac{1}{2}$. Therefore, $g(x) = 1 - \frac{1}{2}x^2$.

(b) $f(x) = \sin(x + a) \Rightarrow f'(x) = \cos(x + a)$, and $g(x) = b\sin x + c\cos x \Rightarrow g'(x) = b\cos x - c\sin x$; also, $f(0) = g(0) \Rightarrow \sin(a) = b\sin(0) + c\cos(0) \Rightarrow c = \sin a$; $f'(0) = g'(0) \Rightarrow \cos(a) = b\cos(0) - c\sin(0)$ $\Rightarrow b = \cos a$. Therefore, $g(x) = \sin x\cos a + \cos x\sin a$.

(c) When $f(x) = \cos x$, $f'''(x) = \sin x$ and $f^{(4)}(x) = \cos x$; when $g(x) = 1 - \frac{1}{2}x^2$, $g'''(x) = 0$ and $g^{(4)}(x) = 0$. Thus $f'''(0) = 0 = g'''(0)$ so the third derivatives agree at $x = 0$. However, the fourth derivatives do not agree since $f^{(4)}(0) = 1$ but $g^{(4)}(0) = 0$. In case (b), when $f(x) = \sin(x + a)$ and $g(x)$ $= \sin x\cos a + \cos x\sin a$, notice that $f(x) = g(x)$ for all x, not just $x = 0$. Since this is an identity, we have $f^{(n)}(x) = g^{(n)}(x)$ for any x and any positive integer n.

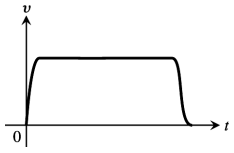
4. (a) $y = \sin x \Rightarrow y' = \cos x \Rightarrow y'' = -\sin x \Rightarrow y'' + y = -\sin x + \sin x = 0$; $y = \cos x \Rightarrow y' = -\sin x$ $\Rightarrow y'' = -\cos x \Rightarrow y'' + y = -\cos x + \cos x = 0$; $y = a\cos x + b\sin x \Rightarrow y' = -a\sin x + b\cos x$ $\Rightarrow y'' = -a\cos x - b\sin x \Rightarrow y'' + y = (-a\cos x - b\sin x) + (a\cos x + b\sin x) = 0$

(b) $y = \sin(2x) \Rightarrow y' = 2\cos(2x) \Rightarrow y'' = -4\sin(2x) \Rightarrow y'' + 4y = -4\sin(2x) + 4\sin(2x) = 0$. Similarly, $y = \cos(2x)$ and $y = a\cos(2x) + b\sin(2x)$ satisfy the differential equation $y'' + 4y = 0$. In general, $y = \cos(mx)$, $y = \sin(mx)$ and $y = a\cos(mx) + b\sin(mx)$ satisfy the differential equation $y'' + m^2y = 0$.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

5. If the circle $(x-h)^2+(y-k)^2=a^2$ and $y=x^2+1$ are tangent at $(1,2)$, then the slope of this tangent is $m=2x|_{(1,2)}=2$ and the tangent line is $y=2x$. The line containing $(h,k)$ and $(1,2)$ is perpendicular to $y=2x \Rightarrow \frac{k-2}{h-1}=-\frac{1}{2} \Rightarrow h=5-2k \Rightarrow$ the location of the center is $(5-2k,k)$. Also, $(x-h)^2+(y-k)^2=a^2$ $\Rightarrow x-h+(y-k)y'=0 \Rightarrow 1+(y')^2+(y-k)y''=0 \Rightarrow y''=\frac{1+(y')^2}{k-y}$. At the point $(1,2)$ we know $y'=2$ from the tangent line and that $y''=2$ from the parabola. Since the second derivatives are equal at $(1,2)$ we obtain $2=\frac{1+(2)^2}{k-2} \Rightarrow k=\frac{9}{2}$. Then $h=5-2k=-4 \Rightarrow$ the circle is $(x+4)^2+\left(y-\frac{9}{2}\right)^2=a^2$. Since $(1,2)$ lies on the circle we have that $a=\frac{5\sqrt{5}}{2}$.



6. The total revenue is the number of people times the price of the fare: $r(x)=xp=x\left(3-\frac{x}{40}\right)^2$, where $0\le x\le 60$. The marginal revenue is $\frac{dr}{dx}=\left(3-\frac{x}{40}\right)^2+2x\left(3-\frac{x}{40}\right)\left(-\frac{1}{40}\right) \Rightarrow \frac{dr}{dx}=\left(3-\frac{x}{40}\right)\left[\left(3-\frac{x}{40}\right)-\frac{2x}{40}\right]$ $=3\left(3-\frac{x}{40}\right)\left(1-\frac{x}{40}\right)$. Then $\frac{dr}{dx}=0 \Rightarrow x=40$ (since $x=120$ does not belong to the domain). When 40 people are on the bus the marginal revenue is zero and the fare is $p(40)=\left(3-\frac{x}{40}\right)^2\Big|_{x=40}=\$4.00$.

7. (a) $y=uv \Rightarrow \frac{dy}{dt}=\frac{du}{dt}v+u\frac{dv}{dt}=(0.04u)v+u(0.05v)=0.09uv=0.09y \Rightarrow$ the rate of growth of the total production is 9% per year.
   (b) If $\frac{du}{dt}=-0.02u$ and $\frac{dv}{dt}=0.03v$, then $\frac{dy}{dt}=(-0.02u)v+(0.03v)u=0.01uv=0.01y$, increasing at 1% per year.

8. When $x^2+y^2=225$, then $y'=-\frac{x}{y}$. The tangent line to the balloon at $(12,-9)$ is $y+9=\frac{4}{3}(x-12)$ $\Rightarrow y=\frac{4}{3}x-25$. The top of the gondola is $15+8$ $=23$ ft below the center of the balloon. The intersection of $y=-23$ and $y=\frac{4}{3}x-25$ is at the far right edge of the gondola $\Rightarrow -23=\frac{4}{3}x-25$ $\Rightarrow x=\frac{3}{2}$. Thus the gondola is $2x=3$ ft wide.

9. Answers will vary. Here is one possibility.

10. $s(t)=10\cos\left(t+\frac{\pi}{4}\right) \Rightarrow v(t)=\frac{ds}{dt}=-10\sin\left(t+\frac{\pi}{4}\right) \Rightarrow a(t)=\frac{dv}{dt}=\frac{d^2s}{dt^2}=-10\cos\left(t+\frac{\pi}{4}\right)$
    (a) $s(0)=10\cos\left(\frac{\pi}{4}\right)=\frac{10}{\sqrt{2}}$
    (b) Left: $-10$, Right: 10
    (c) Solving $10\cos\left(t+\frac{\pi}{4}\right)=-10 \Rightarrow \cos\left(t+\frac{\pi}{4}\right)=-1 \Rightarrow t=\frac{3\pi}{4}$ when the particle is farthest to the left. Solving $10\cos\left(t+\frac{\pi}{4}\right)=10 \Rightarrow \cos\left(t+\frac{\pi}{4}\right)=1 \Rightarrow t=-\frac{\pi}{4}$, but $t\ge 0 \Rightarrow t=2\pi+\frac{-\pi}{4}=\frac{7\pi}{4}$ when the particle is farthest to the right. Thus, $v\left(\frac{3\pi}{4}\right)=0$, $v\left(\frac{7\pi}{4}\right)=0$, $a\left(\frac{3\pi}{4}\right)=10$, and $a\left(\frac{7\pi}{4}\right)=-10$.
    (d) Solving $10\cos\left(t+\frac{\pi}{4}\right)=0 \Rightarrow t=\frac{\pi}{4} \Rightarrow v\left(\frac{\pi}{4}\right)=-10$, $\left|v\left(\frac{\pi}{4}\right)\right|=10$ and $a\left(\frac{\pi}{4}\right)=0$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

11. (a) $s(t) = 64t - 16t^2 \Rightarrow v(t) = \frac{ds}{dt} = 64 - 32t = 32(2 - t)$. The maximum height is reached when $v(t) = 0$ $\Rightarrow t = 2$ sec. The velocity when it leaves the hand is $v(0) = 64$ ft/sec.

    (b) $s(t) = 64t - 2.6t^2 \Rightarrow v(t) = \frac{ds}{dt} = 64 - 5.2t$. The maximum height is reached when $v(t) = 0 \Rightarrow t \approx 12.31$ sec. The maximum height is about $s(12.31) = 393.85$ ft.

12. $s_1 = 3t^3 - 12t^2 + 18t + 5$ and $s_2 = -t^3 + 9t^2 - 12t \Rightarrow v_1 = 9t^2 - 24t + 18$ and $v_2 = -3t^2 + 18t - 12$; $v_1 = v_2$ $\Rightarrow 9t^2 - 24t + 18 = -3t^2 + 18t - 12 \Rightarrow 2t^2 - 7t + 5 = 0 \Rightarrow (t - 1)(2t - 5) = 0 \Rightarrow t = 1$ sec and $t = 2.5$ sec.

13. $m(v^2 - v_0^2) = k(x_0^2 - x^2) \Rightarrow m\left(2v\frac{dv}{dt}\right) = k\left(-2x\frac{dx}{dt}\right) \Rightarrow m\frac{dv}{dt} = k\left(-\frac{2x}{2v}\right)\frac{dx}{dt} \Rightarrow m\frac{dv}{dt} = -kx\left(\frac{1}{v}\right)\frac{dx}{dt}$. Then substituting $\frac{dx}{dt} = v \Rightarrow m\frac{dv}{dt} = -kx$, as claimed.

14. (a) $x = At^2 + Bt + C$ on $[t_1, t_2] \Rightarrow v = \frac{dx}{dt} = 2At + B \Rightarrow v\left(\frac{t_1 + t_2}{2}\right) = 2A\left(\frac{t_1 + t_2}{2}\right) + B = A(t_1 + t_2) + B$ is the instantaneous velocity at the midpoint. The average velocity over the time interval is $v_{av} = \frac{\Delta x}{\Delta t}$ $= \frac{(At_2^2 + Bt_2 + C) - (At_1^2 + Bt_1 + C)}{t_2 - t_1} = \frac{(t_2 - t_1)[A(t_2 + t_1) + B]}{t_2 - t_1} = A(t_2 + t_1) + B$.

    (b) On the graph of the parabola $x = At^2 + Bt + C$, the slope of the curve at the midpoint of the interval $[t_1, t_2]$ is the same as the average slope of the curve over the interval.

15. (a) To be continuous at $x = \pi$ requires that $\lim_{x \to \pi^-} \sin x = \lim_{x \to \pi^+} (mx + b) \Rightarrow 0 = m\pi + b \Rightarrow m = -\frac{b}{\pi}$;

    (b) If $y' = \begin{cases} \cos x, & x < \pi \\ m, & x \geq \pi \end{cases}$ is differentiable at $x = \pi$, then $\lim_{x \to \pi^-} \cos x = m \Rightarrow m = -1$ and $b = \pi$.

16. $f(x)$ is continuous at 0 because $\lim_{x \to 0} \frac{1 - \cos x}{x} = 0 = f(0)$. $f'(0) = \lim_{x \to 0} \frac{f(x) - f(0)}{x - 0} = \lim_{x \to 0} \frac{\frac{1 - \cos x}{x} - 0}{x}$ $= \lim_{x \to 0} \left(\frac{1 - \cos x}{x^2}\right)\left(\frac{1 + \cos x}{1 + \cos x}\right) = \lim_{x \to 0} \left(\frac{\sin x}{x}\right)^2 \left(\frac{1}{1 + \cos x}\right) = \frac{1}{2}$. Therefore $f'(0)$ exists with value $\frac{1}{2}$.

17. (a) For all a, b and for all $x \neq 2$, f is differentiable at x. Next, f differentiable at $x = 2 \Rightarrow$ f continuous at $x = 2$ $\Rightarrow \lim_{x \to 2^-} f(x) = f(2) \Rightarrow 2a = 4a - 2b + 3 \Rightarrow 2a - 2b + 3 = 0$. Also, f differentiable at $x \neq 2$ $\Rightarrow f'(x) = \begin{cases} a, & x < 2 \\ 2ax - b, & x > 2 \end{cases}$. In order that $f'(2)$ exist we must have $a = 2a(2) - b \Rightarrow a = 4a - b \Rightarrow 3a = b$. Then $2a - 2b + 3 = 0$ and $3a = b \Rightarrow a = \frac{3}{4}$ and $b = \frac{9}{4}$.

    (b) For $x < 2$, the graph of f is a straight line having a slope of $\frac{3}{4}$ and passing through the origin; for $x \geq 2$, the graph of f is a parabola. At $x = 2$, the value of the y-coordinate on the parabola is $\frac{3}{2}$ which matches the y-coordinate of the point on the straight line at $x = 2$. In addition, the slope of the parabola at the match up point is $\frac{3}{4}$ which is equal to the slope of the straight line. Therefore, since the graph is differentiable at the match up point, the graph is smooth there.

18. (a) For any a, b and for any $x \neq -1$, g is differentiable at x. Next, g differentiable at $x = -1 \Rightarrow$ g continuous at $x = -1 \Rightarrow \lim_{x \to -1^+} g(x) = g(-1) \Rightarrow -a - 1 + 2b = -a + b \Rightarrow b = 1$. Also, g differentiable at $x \neq -1$ $\Rightarrow g'(x) = \begin{cases} a, & x < -1 \\ 3ax^2 + 1, & x > -1 \end{cases}$. In order that $g'(-1)$ exist we must have $a = 3a(-1)^2 + 1 \Rightarrow a = 3a + 1$ $\Rightarrow a = -\frac{1}{2}$.

    (b) For $x \leq -1$, the graph of f is a straight line having a slope of $-\frac{1}{2}$ and a y-intercept of 1. For $x > -1$, the graph of f is a parabola. At $x = -1$, the value of the y-coordinate on the parabola is $\frac{3}{2}$ which matches the y-coordinate of the point on the straight line at $x = -1$. In addition, the slope of the parabola at the match up point is $-\frac{1}{2}$ which is equal to the slope of the straight line. Therefore, since the graph is differentiable at the match up point, the graph is smooth there.

19. f odd $\Rightarrow f(-x) = -f(x) \Rightarrow \frac{d}{dx}(f(-x)) = \frac{d}{dx}(-f(x)) \Rightarrow f'(-x)(-1) = -f'(x) \Rightarrow f'(-x) = f'(x) \Rightarrow f'$ is even.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

20. $f$ even $\Rightarrow f(-x) = f(x) \Rightarrow \frac{d}{dx}(f(-x)) = \frac{d}{dx}(f(x)) \Rightarrow f'(-x)(-1) = f'(x) \Rightarrow f'(-x) = -f'(x) \Rightarrow f'$ is odd.

21. Let $h(x) = (fg)(x) = f(x)\,g(x) \Rightarrow h'(x) = \lim_{x \to x_0} \frac{h(x) - h(x_0)}{x - x_0} = \lim_{x \to x_0} \frac{f(x)\,g(x) - f(x_0)\,g(x_0)}{x - x_0}$
$= \lim_{x \to x_0} \frac{f(x)\,g(x) - f(x)\,g(x_0) + f(x)\,g(x_0) - f(x_0)\,g(x_0)}{x - x_0} = \lim_{x \to x_0} \left[f(x)\left[\frac{g(x) - g(x_0)}{x - x_0}\right]\right] + \lim_{x \to x_0} \left[g(x_0)\left[\frac{f(x) - f(x_0)}{x - x_0}\right]\right]$
$= f(x_0) \lim_{x \to x_0} \left[\frac{g(x) - g(x_0)}{x - x_0}\right] + g(x_0)\,f'(x_0) = 0 \cdot \lim_{x \to x_0} \left[\frac{g(x) - g(x_0)}{x - x_0}\right] + g(x_0)\,f'(x_0) = g(x_0)\,f'(x_0)$, if $g$ is continuous at $x_0$. Therefore $(fg)(x)$ is differentiable at $x_0$ if $f(x_0) = 0$, and $(fg)'(x_0) = g(x_0)\,f'(x_0)$.

22. From Exercise 21 we have that $fg$ is differentiable at 0 if $f$ is differentiable at 0, $f(0) = 0$ and $g$ is continuous at 0.
    (a) If $f(x) = \sin x$ and $g(x) = |x|$, then $|x| \sin x$ is differentiable because $f'(0) = \cos(0) = 1$, $f(0) = \sin(0) = 0$ and $g(x) = |x|$ is continuous at $x = 0$.
    (b) If $f(x) = \sin x$ and $g(x) = x^{2/3}$, then $x^{2/3} \sin x$ is differentiable because $f'(0) = \cos(0) = 1$, $f(0) = \sin(0) = 0$ and $g(x) = x^{2/3}$ is continuous at $x = 0$.
    (c) If $f(x) = 1 - \cos x$ and $g(x) = \sqrt[3]{x}$, then $\sqrt[3]{x}\,(1 - \cos x)$ is differentiable because $f'(0) = \sin(0) = 0$, $f(0) = 1 - \cos(0) = 0$ and $g(x) = x^{1/3}$ is continuous at $x = 0$.
    (d) If $f(x) = x$ and $g(x) = x \sin\left(\frac{1}{x}\right)$, then $x^2 \sin\left(\frac{1}{x}\right)$ is differentiable because $f'(0) = 1$, $f(0) = 0$ and $\lim_{x \to 0} x \sin\left(\frac{1}{x}\right) = \lim_{x \to 0} \frac{\sin\left(\frac{1}{x}\right)}{\frac{1}{x}} = \lim_{t \to \infty} \frac{\sin t}{t} = 0$ (so $g$ is continuous at $x = 0$).

23. If $f(x) = x$ and $g(x) = x \sin\left(\frac{1}{x}\right)$, then $x^2 \sin\left(\frac{1}{x}\right)$ is differentiable at $x = 0$ because $f'(0) = 1$, $f(0) = 0$ and $\lim_{x \to 0} x \sin\left(\frac{1}{x}\right) = \lim_{x \to 0} \frac{\sin\left(\frac{1}{x}\right)}{\frac{1}{x}} = \lim_{t \to \infty} \frac{\sin t}{t} = 0$ (so $g$ is continuous at $x = 0$). In fact, from Exercise 21, $h'(0) = g(0)\,f'(0) = 0$. However, for $x \neq 0$, $h'(x) = \left[x^2 \cos\left(\frac{1}{x}\right)\right]\left(-\frac{1}{x^2}\right) + 2x \sin\left(\frac{1}{x}\right)$. But $\lim_{x \to 0} h'(x) = \lim_{x \to 0} \left[-\cos\left(\frac{1}{x}\right) + 2x \sin\left(\frac{1}{x}\right)\right]$ does not exist because $\cos\left(\frac{1}{x}\right)$ has no limit as $x \to 0$. Therefore, the derivative is not continuous at $x = 0$ because it has no limit there.

24. From the given conditions we have $f(x + h) = f(x)\,f(h)$, $f(h) - 1 = hg(h)$ and $\lim_{h \to 0} g(h) = 1$. Therefore,
$f'(x) = \lim_{h \to 0} \frac{f(x+h) - f(x)}{h} = \lim_{h \to 0} \frac{f(x)\,f(h) - f(x)}{h} = \lim_{h \to 0} f(x)\left[\frac{f(h) - 1}{h}\right] = f(x)\left[\lim_{h \to 0} g(h)\right] = f(x) \cdot 1 = f(x)$
$\Rightarrow f'(x) = f(x)$ and $f'(x)$ exists at every value of $x$.

25. Step 1: The formula holds for $n = 2$ (a single product) since $y = u_1 u_2 \Rightarrow \frac{dy}{dx} = \frac{du_1}{dx}\,u_2 + u_1\,\frac{du_2}{dx}$.
Step 2: Assume the formula holds for $n = k$:
$y = u_1 u_2 \cdots u_k \Rightarrow \frac{dy}{dx} = \frac{du_1}{dx}\,u_2 u_3 \cdots u_k + u_1\,\frac{du_2}{dx}\,u_3 \cdots u_k + \ldots + u_1 u_2 \cdots u_{k-1}\,\frac{du_k}{dx}$.
If $y = u_1 u_2 \cdots u_k u_{k+1} = (u_1 u_2 \cdots u_k)\,u_{k+1}$, then $\frac{dy}{dx} = \frac{d(u_1 u_2 \cdots u_k)}{dx}\,u_{k+1} + u_1 u_2 \cdots u_k\,\frac{du_{k+1}}{dx}$
$= \left(\frac{du_1}{dx}\,u_2 u_3 \cdots u_k + u_1\,\frac{du_2}{dx}\,u_3 \cdots u_k + \cdots + u_1 u_2 \cdots u_{k-1}\,\frac{du_k}{dx}\right)u_{k+1} + u_1 u_2 \cdots u_k\,\frac{du_{k+1}}{dx}$
$= \frac{du_1}{dx}\,u_2 u_3 \cdots u_{k+1} + u_1\,\frac{du_2}{dx}\,u_3 \cdots u_{k+1} + \cdots + u_1 u_2 \cdots u_{k-1}\,\frac{du_k}{dx}\,u_{k+1} + u_1 u_2 \cdots u_k\,\frac{du_{k+1}}{dx}$.
Thus the original formula holds for $n = (k+1)$ whenever it holds for $n = k$.

26. Recall $\binom{m}{k} = \frac{m!}{k!\,(m-k)!}$. Then $\binom{m}{1} = \frac{m!}{1!\,(m-1)!} = m$ and $\binom{m}{k} + \binom{m}{k+1} = \frac{m!}{k!\,(m-k)!} + \frac{m!}{(k+1)!\,(m-k-1)!}$
$= \frac{m!\,(k+1) + m!\,(m-k)}{(k+1)!\,(m-k)!} = \frac{m!\,(m+1)}{(k+1)!\,(m-k)!} = \frac{(m+1)!}{(k+1)!\,((m+1)-(k+1))!} = \binom{m+1}{k+1}$. Now, we prove Leibniz's rule by mathematical induction.
Step 1: If $n = 1$, then $\frac{d(uv)}{dx} = u\,\frac{dv}{dx} + v\,\frac{du}{dx}$. Assume that the statement is true for $n = k$, that is:
$\frac{d^k(uv)}{dx^k} = \frac{d^k u}{dx^k}\,v + k\,\frac{d^{k-1}u}{dx^{k-1}}\,\frac{dv}{dx} + \binom{k}{2}\,\frac{d^{k-2}u}{dx^{k-2}}\,\frac{d^2 v}{dx^2} + \ldots + \binom{k}{k-1}\,\frac{du}{dv}\,\frac{d^{k-1}v}{dx^{k-1}} + u\,\frac{d^k v}{dx^k}$.
Step 2: If $n = k + 1$, then $\frac{d^{k+1}(uv)}{dx^{k+1}} = \frac{d}{dx}\left(\frac{d^k(uv)}{dx^k}\right) = \left[\frac{d^{k+1}u}{dx^{k+1}}\,v + \frac{d^k u}{dx^k}\,\frac{dv}{dx}\right] + \left[k\,\frac{d^k u}{dx^k}\,\frac{dv}{dx} + k\,\frac{d^{k-1}u}{dx^{k-1}}\,\frac{d^2 v}{dx^2}\right]$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$$+\left[\binom{k}{2}\frac{d^{k-1}u}{dx^{k-1}}\frac{d^2v}{dx^2}+\binom{k}{2}\frac{d^{k-2}u}{dx^{k-2}}\frac{d^3v}{dx^3}\right]+\cdots+\left[\binom{k}{k-1}\frac{d^2u}{dx^2}\frac{d^{k-1}v}{dx^{k-1}}+\binom{k}{k-1}\frac{du}{dx}\frac{d^ku}{dx^k}v\right]$$
$$+\left[\frac{du}{dx}\frac{d^kv}{dx^k}+u\frac{d^{k+1}u}{dx^{k+1}}\right]=\frac{d^{k+1}u}{dx^{k+1}}v+(k+1)\frac{d^ku}{dx^k}\frac{dv}{dx}+\left[\binom{k}{1}+\binom{k}{2}\right]\frac{d^{k-1}u}{dx^{k-1}}\frac{d^2v}{dx^2}+\cdots$$
$$+\left[\binom{k}{k-1}+\binom{k}{k}\right]\frac{du}{dx}\frac{d^kv}{dx^k}+u\frac{d^{k+1}v}{dx^{k+1}}=\frac{d^{k+1}u}{dx^{k+1}}v+(k+1)\frac{d^ku}{dx^k}\frac{dv}{dx}+\binom{k+1}{2}\frac{d^{k-1}u}{dx^{k-1}}\frac{d^2v}{dx^2}+\cdots$$
$$+\binom{k+1}{k}\frac{du}{dx}\frac{d^kv}{dx^k}+u\frac{d^{k+1}v}{dx^{k+1}}.$$

Therefore the formula (c) holds for $n=(k+1)$ whenever it holds for $n=k$.

27. (a) $T^2=\frac{4\pi^2L}{g}\Rightarrow L=\frac{T^2g}{4\pi^2}\Rightarrow L=\frac{(1\text{ sec}^2)(32.2\text{ ft/sec}^2)}{4\pi^2}\Rightarrow L\approx 0.8156\text{ ft}$

(b) $T^2=\frac{4\pi^2L}{g}\Rightarrow T=\frac{2\pi}{\sqrt{g}}\sqrt{L}$; $dT=\frac{2\pi}{\sqrt{g}}\cdot\frac{1}{2\sqrt{L}}dL=\frac{\pi}{\sqrt{Lg}}dL$; $dT=\frac{\pi}{\sqrt{(0.8156\text{ ft})(32.2\text{ ft/sec}^2)}}(0.01\text{ ft})\approx 0.00613\text{ sec}$.

(c) Since there are 86,400 sec in a day, we have $(0.00613\text{ sec})(86{,}400\text{ sec/day})\approx 529.6\text{ sec/day}$, or 8.83 min/day; the clock will lose about 8.83 min/day.

28. $v=s^3\Rightarrow\frac{dv}{dt}=3s^2\frac{ds}{dt}=-k(6s^2)\Rightarrow\frac{ds}{dt}=-2k$. If $s_0=$ the initial length of the cube's side, then $s_1=s_0-2k$ $\Rightarrow 2k=s_0-s_1$. Let $t=$ the time it will take the ice cube to melt. Now, $t=\frac{s_0}{2k}=\frac{s_0}{s_0-s_1}=\frac{(v_0)^{1/3}}{(v_0)^{1/3}-\left(\frac{3}{4}v_0\right)^{1/3}}$ $=\frac{1}{1-\left(\frac{3}{4}\right)^{1/3}}\approx 11\text{ hr}$.

# CHAPTER 4 APPLICATIONS OF DERIVATIVES

## 4.1 EXTREME VALUES OF FUNCTIONS

1. An absolute minimum at $x = c_2$, an absolute maximum at $x = b$. Theorem 1 guarantees the existence of such extreme values because h is continuous on $[a, b]$.

2. An absolute minimum at $x = b$, an absolute maximum at $x = c$. Theorem 1 guarantees the existence of such extreme values because f is continuous on $[a, b]$.

3. No absolute minimum. An absolute maximum at $x = c$. Since the function's domain is an open interval, the function does not satisfy the hypotheses of Theorem 1 and need not have absolute extreme values.

4. No absolute extrema. The function is neither continuous nor defined on a closed interval, so it need not fulfill the conclusions of Theorem 1.

5. An absolute minimum at $x = a$ and an absolute maximum at $x = c$. Note that $y = g(x)$ is not continuous but still has extrema. When the hypothesis of Theorem 1 is satisfied then extrema are guaranteed, but when the hypothesis is not satisfied, absolute extrema may or may not occur.

6. Absolute minimum at $x = c$ and an absolute maximum at $x = a$. Note that $y = g(x)$ is not continuous but still has absolute extrema. When the hypothesis of Theorem 1 is satisfied then extrema are guaranteed, but when the hypothesis is not satisfied, absolute extrema may or may not occur.

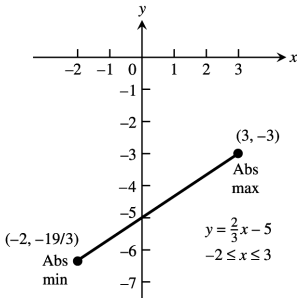
7. Local minimum at $(-1, 0)$, local maximum at $(1, 0)$

8. Minima at $(-2, 0)$ and $(2, 0)$, maximum at $(0, 2)$

9. Maximum at $(0, 5)$. Note that there is no minimum since the endpoint $(2, 0)$ is excluded from the graph.

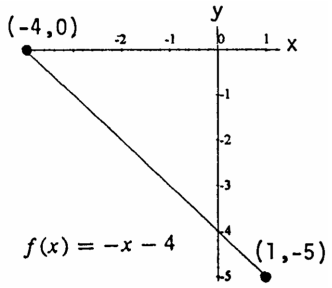
10. Local maximum at $(-3, 0)$, local minimum at $(2, 0)$, maximum at $(1, 2)$, minimum at $(0, -1)$

11. Graph (c), since this the only graph that has positive slope at c.



12. Graph (b), since this is the only graph that represents a differentiable function at a and b and has negative slope at c.

13. Graph (d), since this is the only graph representing a funtion that is differentiable at b but not at a.



14. Graph (a), since this is the only graph that represents a function that is not differentiable at a or b.

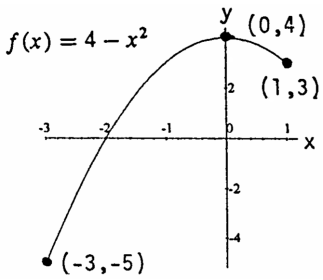
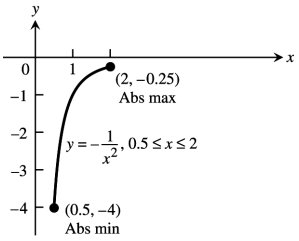
15. $f(x) = \frac{2}{3}x - 5 \Rightarrow f'(x) = \frac{2}{3} \Rightarrow$ no critical points; $f(-2) = -\frac{19}{3}$, $f(3) = -3 \Rightarrow$ the absolute maximum is $-3$ at $x = 3$ and the absolute minimum is $-\frac{19}{3}$ at $x = -2$

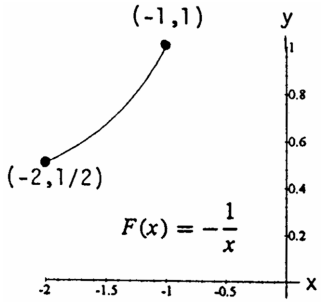


16. $f(x) = -x - 4 \Rightarrow f'(x) = -1 \Rightarrow$ no critical points; $f(-4) = 0$, $f(1) = -5 \Rightarrow$ the absolute maximum is 0 at $x = -4$ and the absolute minimum is $-5$ at $x = 1$

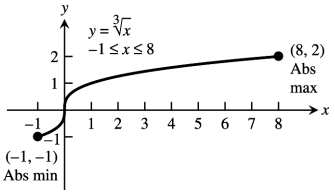


17. $f(x) = x^2 - 1 \Rightarrow f'(x) = 2x \Rightarrow$ a critical point at $x = 0$; $f(-1) = 0$, $f(0) = -1$, $f(2) = 3 \Rightarrow$ the absolute maximum is 3 at $x = 2$ and the absolute minimum is $-1$ at $x = 0$

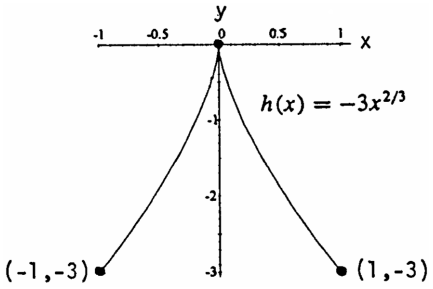
18. $f(x) = 4 - x^2 \Rightarrow f'(x) = -2x \Rightarrow$ a critical point at $x = 0$; $f(-3) = -5$, $f(0) = 4$, $f(1) = 3 \Rightarrow$ the absolute maximum is 4 at $x = 0$ and the absolute minimum is $-5$ at $x = -3$



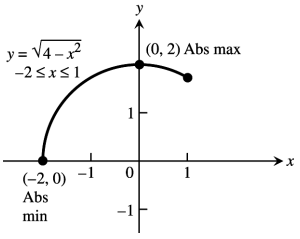
19. $F(x) = -\frac{1}{x^2} = -x^{-2} \Rightarrow F'(x) = 2x^{-3} = \frac{2}{x^3}$, however $x = 0$ is not a critical point since 0 is not in the domain; $F(0.5) = -4$, $F(2) = -0.25 \Rightarrow$ the absolute maximum is $-0.25$ at $x = 2$ and the absolute minimum is $-4$ at $x = 0.5$



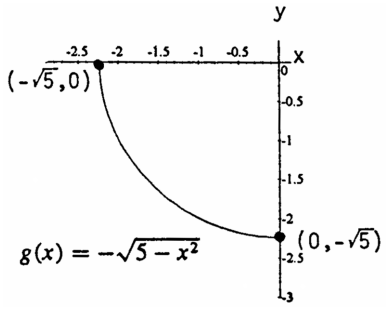
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



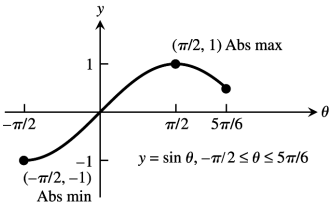
20. $F(x) = -\frac{1}{x} = -x^{-1} \Rightarrow F'(x) = x^{-2} = \frac{1}{x^2}$, however $x = 0$ is not a critical point since 0 is not in the domain; $F(-2) = \frac{1}{2}$, $F(-1) = 1 \Rightarrow$ the absolute maximum is 1 at $x = -1$ and the absolute minimum is $\frac{1}{2}$ at $x = -2$



21. $h(x) = \sqrt[3]{x} = x^{1/3} \Rightarrow h'(x) = \frac{1}{3}x^{-2/3} \Rightarrow$ a critical point at $x = 0$; $h(-1) = -1$, $h(0) = 0$, $h(8) = 2 \Rightarrow$ the absolute maximum is 2 at $x = 8$ and the absolute minimum is $-1$ at $x = -1$

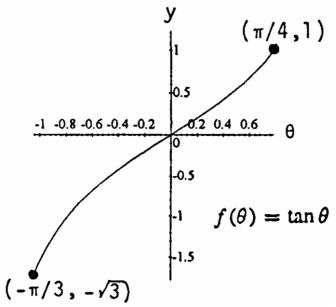


22. $h(x) = -3x^{2/3} \Rightarrow h'(x) = -2x^{-1/3} \Rightarrow$ a critical point at $x = 0$; $h(-1) = -3$, $h(0) = 0$, $h(1) = -3 \Rightarrow$ the absolute maximum is 0 at $x = 0$ and the absolute minimum is $-3$ at $x = 1$ and at $x = -1$

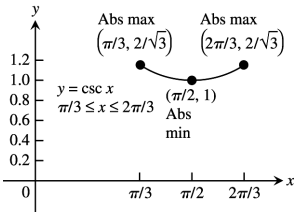


23. $g(x) = \sqrt{4 - x^2} = (4 - x^2)^{1/2}$
$\Rightarrow g'(x) = \frac{1}{2}(4 - x^2)^{-1/2}(-2x) = \frac{-x}{\sqrt{4 - x^2}}$
$\Rightarrow$ critical points at $x = -2$ and $x = 0$, but not at $x = 2$ because 2 is not in the domain; $g(-2) = 0$, $g(0) = 2$, $g(1) = \sqrt{3} \Rightarrow$ the absolute maximum is 2 at $x = 0$ and the absolute minimum is 0 at $x = -2$

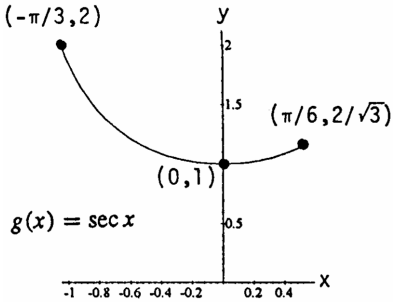
24. $g(x) = -\sqrt{5 - x^2} = -(5 - x^2)^{1/2}$ $(5 - x^2)^{-1/2}(-2x)$
$\Rightarrow g'(x) = -\left(\frac{1}{2}\right) = \frac{x}{\sqrt{5 - x^2}} \Rightarrow$ critical points at $x = -\sqrt{5}$ and $x = 0$, but not at $x = \sqrt{5}$ because $\sqrt{5}$ is not in the domain; $f\left(-\sqrt{5}\right) = 0$, $f(0) = -\sqrt{5}$
$\Rightarrow$ the absolute maximum is 0 at $x = -\sqrt{5}$ and the absolute minimum is $-\sqrt{5}$ at $x = 0$



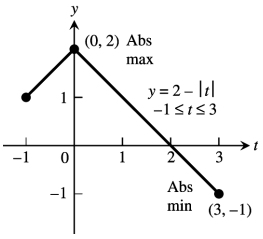
25. $f(\theta) = \sin\theta \Rightarrow f'(\theta) = \cos\theta \Rightarrow \theta = \frac{\pi}{2}$ is a critical point, but $\theta = \frac{-\pi}{2}$ is not a critical point because $\frac{-\pi}{2}$ is not interior to the domain; $f\left(\frac{-\pi}{2}\right) = -1$, $f\left(\frac{\pi}{2}\right) = 1$, $f\left(\frac{5\pi}{6}\right) = \frac{1}{2}$
$\Rightarrow$ the absolute maximum is 1 at $\theta = \frac{\pi}{2}$ and the absolute minimum is $-1$ at $\theta = \frac{-\pi}{2}$



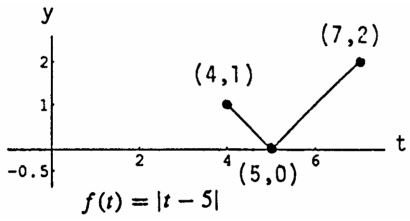
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



26. $f(\theta) = \tan\theta \Rightarrow f'(\theta) = \sec^2\theta \Rightarrow$ f has no critical points in $\left(\frac{-\pi}{3}, \frac{\pi}{4}\right)$. The extreme values therefore occur at the endpoints: $f\left(\frac{-\pi}{3}\right) = -\sqrt{3}$ and $f\left(\frac{\pi}{4}\right) = 1 \Rightarrow$ the absolute maximum is 1 at $\theta = \frac{\pi}{4}$ and the absolute minimum is $-\sqrt{3}$ at $\theta = \frac{-\pi}{3}$



27. $g(x) = \csc x \Rightarrow g'(x) = -(\csc x)(\cot x) \Rightarrow$ a critical point at $x = \frac{\pi}{2}$; $g\left(\frac{\pi}{3}\right) = \frac{2}{\sqrt{3}}$, $g\left(\frac{\pi}{2}\right) = 1$, $g\left(\frac{2\pi}{3}\right) = \frac{2}{\sqrt{3}} \Rightarrow$ the absolute maximum is $\frac{2}{\sqrt{3}}$ at $x = \frac{\pi}{3}$ and $x = \frac{2\pi}{3}$, and the absolute minimum is 1 at $x = \frac{\pi}{2}$

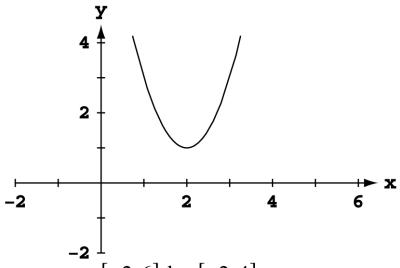


28. $g(x) = \sec x \Rightarrow g'(x) = (\sec x)(\tan x) \Rightarrow$ a critical point at $x = 0$; $g\left(-\frac{\pi}{3}\right) = 2$, $g(0) = 1$, $g\left(\frac{\pi}{6}\right) = \frac{2}{\sqrt{3}} \Rightarrow$ the absolute maximum is 2 at $x = -\frac{\pi}{3}$ and the absolute minimum is 1 at $x = 0$

29. $f(t) = 2 - |t| = 2 - \sqrt{t^2} = 2 - (t^2)^{1/2}$
$\Rightarrow f'(t) = -\frac{1}{2}(t^2)^{-1/2}(2t) = -\frac{t}{\sqrt{t^2}} = -\frac{t}{|t|}$
$\Rightarrow$ a critical point at $t = 0$; $f(-1) = 1$, $f(0) = 2$, $f(3) = -1 \Rightarrow$ the absolute maximum is 2 at $t = 0$ and the absolute minimum is $-1$ at $t = 3$

30. $f(t) = |t-5| = \sqrt{(t-5)^2} = ((t-5)^2)^{1/2} \Rightarrow f'(t)$
$= \frac{1}{2}((t-5)^2)^{-1/2}(2(t-5)) = \frac{t-5}{\sqrt{(t-5)^2}} = \frac{t-5}{|t-5|}$
$\Rightarrow$ a critical point at $t = 5$; $f(4) = 1$, $f(5) = 0$, $f(7) = 2$
$\Rightarrow$ the absolute maximum is 2 at $t = 7$ and the absolute minimum is 0 at $t = 5$

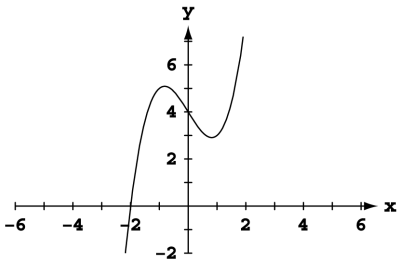
31. $f(x) = x^{4/3} \Rightarrow f'(x) = \frac{4}{3}x^{1/3} \Rightarrow$ a critical point at $x = 0$; $f(-1) = 1$, $f(0) = 0$, $f(8) = 16 \Rightarrow$ the absolute maximum is 16 at $x = 8$ and the absolute minimum is 0 at $x = 0$



32. $f(x) = x^{5/3} \Rightarrow f'(x) = \frac{5}{3}x^{2/3} \Rightarrow$ a critical point at $x = 0$; $f(-1) = -1$, $f(0) = 0$, $f(8) = 32 \Rightarrow$ the absolute maximum is 32 at $x = 8$ and the absolute minimum is $-1$ at $x = -1$

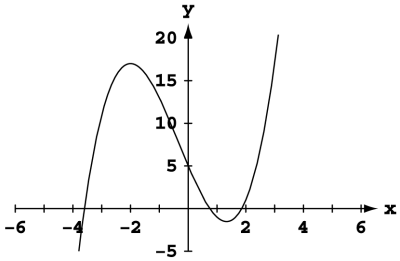
33. $g(\theta) = \theta^{3/5} \Rightarrow g'(\theta) = \frac{3}{5}\theta^{-2/5} \Rightarrow$ a critical point at $\theta = 0$; $g(-32) = -8$, $g(0) = 0$, $g(1) = 1 \Rightarrow$ the absolute maximum is 1 at $\theta = 1$ and the absolute minimum is $-8$ at $\theta = -32$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



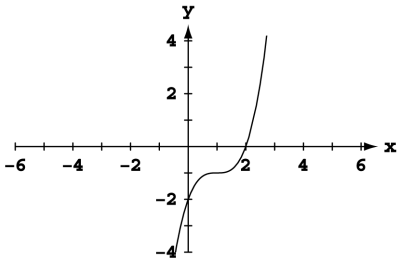
34. $h(\theta) = 3\theta^{2/3} \Rightarrow h'(\theta) = 2\theta^{-1/3} \Rightarrow$ a critical point at $\theta = 0$; $h(-27) = 27$, $h(0) = 0$, $h(8) = 12 \Rightarrow$ the absolute maximum is 27 at $\theta = -27$ and the absolute minimum is 0 at $\theta = 0$

35. Minimum value is 1 at $x = 2$.



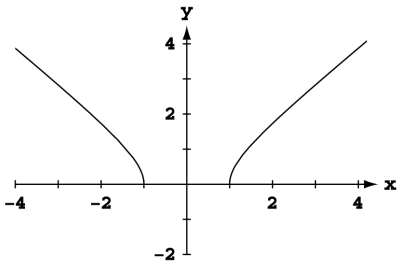
$[-2,6]$ by $[-2,4]$

36. To find the exact values, note that $y' = 3x^2 - 2$, which is zero when $x = \pm\sqrt{\frac{2}{3}}$. Local maximum at $\left(-\sqrt{\frac{2}{3}},\ 4 + \frac{4\sqrt{6}}{9}\right) \approx (-0.816,\ 5.089)$; local minimum at $\left(\sqrt{\frac{2}{3}},\ 4 - \frac{4\sqrt{6}}{9}\right) \approx (0.816,\ 2.911)$



$[-6,6]$ by $[-2,7]$

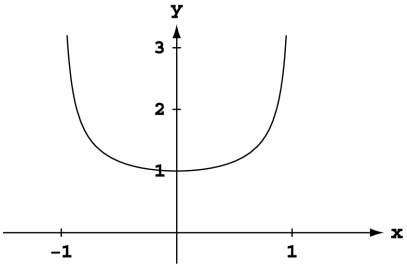
37. To find the exact values, note that that $y' = 3x^2 + 2x - 8 = (3x - 4)(x + 2)$, which is zero when $x = -2$ or $x = \frac{4}{3}$. Local maximum at $(-2,\ 17)$; local minimum at $\left(\frac{4}{3},\ -\frac{41}{27}\right)$



$[-6,6]$ by $[-5,20]$

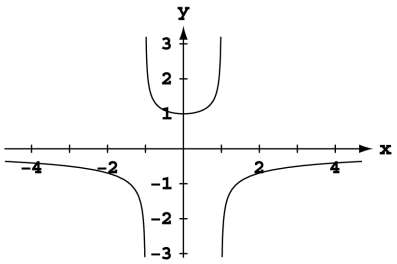
38. Note that $y' = 3x^2 - 6x + 3 = 3(x - 1)^2$, which is zero at $x = 1$. The graph shows that the function assumes lower values to the left and higher values to the right of this point, so the function has no local or global extreme values.

$[-6,6]$ by $[-4,4]$



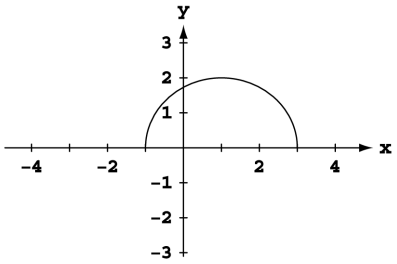
39. Minimum value is 0 when $x = -1$ or $x = 1$.

$[-6,6]$ by $[-2,4]$



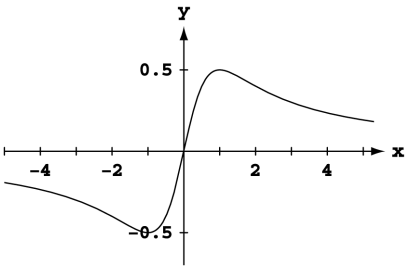
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

40. The minimum value is 1 at $x = 0$.



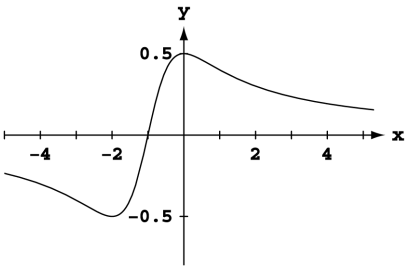
$[-1.5,1.5]$ by $[-0.5,3]$

41. The actual graph of the function has asymptotes at $x = \pm 1$, so there are no extrema near these values. (This is an example of grapher failure.) There is a local minimum at $(0, 1)$.



$[-4.7,4.7]$ by $[-3.1,3.1]$

42. Maximum value is 2 at $x = 1$;
minimum value is 0 at $x = -1$ and $x = 3$.

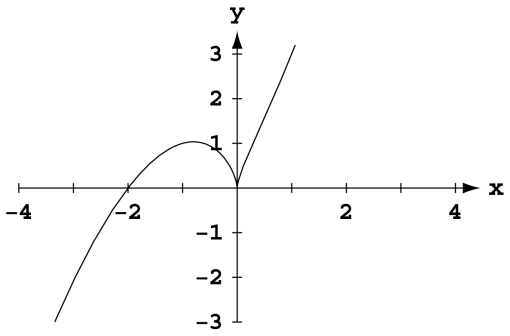


$[-4.7,4.7]$ by $[-3.1,3.1]$

43. Maximum value is $\frac{1}{2}$ at $x = 1$;
minimum value is $-\frac{1}{2}$ as $x = -1$.

$[-5,5]$ by $[-0.7,0.7]$

44. Maximum value is $\frac{1}{2}$ at $x = 0$;
minimum value is $-\frac{1}{2}$ as $x = -2$.



$[-5,5]$ by $[-0.8,0.6]$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

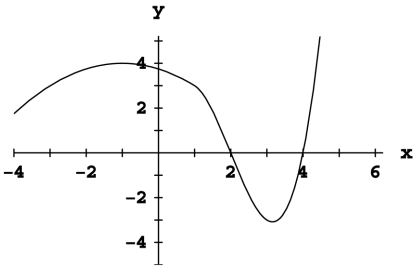
| $x = -1$ | 0 | maximum | 5 |
| $x = 1$ | undefined | local min | 1 |
| $x = 3$ | 0 | maximum | 5 |

$[-4, 6]$ by $[-2, 6]$

52. We begin by determining whether $f'(x)$ is defined at $x = 1$, where $f(x) = \begin{cases} -\frac{1}{4}x^2 - \frac{1}{2}x + \frac{15}{4}, & x \le 1 \\ x^3 - 6x^2 + 8x, & x > 1 \end{cases}$



Clearly, $f'(x) = -\frac{1}{2}x - \frac{1}{2}$ if $x < 1$, and $\lim\limits_{h \to 0^-} f'(1 + h) = -1$. Also, $f'(x) = 3x^2 - 12x + 8$ if $x > 1$, and $\lim\limits_{h \to 0^+} f'(1 + h) = -1$. Since f is continuous at $x = 1$, we have that $f'(1) = -1$. Thus,

$f'(x) = \begin{cases} -\frac{1}{2}x - \frac{1}{2}, & x \le 1 \\ 3x^2 - 12x + 8\,, & x > 1 \end{cases}$

Note that $-\frac{1}{2}x - \frac{1}{2} = 0$ when $x = -1$, and $3x^2 - 12x + 8 = 0$ when $x = \frac{12 \pm \sqrt{12^2 - 4(3)(8)}}{2(3)} = \frac{12 \pm \sqrt{48}}{6} = 2 \pm \frac{2\sqrt{3}}{3}$.

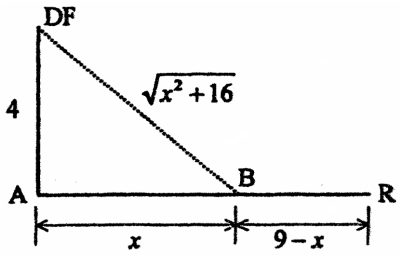
But $2 - \frac{2\sqrt{3}}{3} \approx 0.845 < 1$, so the critical points occur at $x = -1$ and $x = 2 + \frac{2\sqrt{3}}{3} \approx 3.155$.

| crit. pt. | derivative | extremum | value |
|---|---|---|---|
| $x = -1$ | 0 | local max | 4 |
| $x \approx 3.155$ | 0 | local min | $\approx -3.079$ |

$[-4, 6]$ by $[-5, 5]$

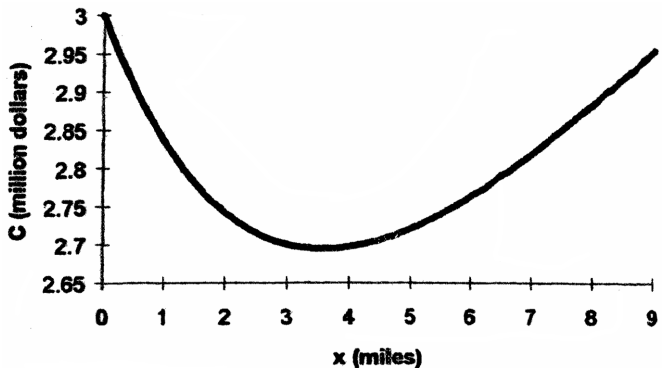
53. (a) No, since $f'(x) = \frac{2}{3}(x - 2)^{-1/3}$, which is undefined at $x = 2$.
(b) The derivative is defined and nonzero for all $x \ne 2$. Also, $f(2) = 0$ and $f(x) > 0$ for all $x \ne 2$.
(c) No, $f(x)$ need not have a global maximum because its domain is all real numbers. Any restriction of f to a closed interval of the form $[a, b]$ would have both a maximum value and minimum value on the interval.
(d) The answers are the same as (a) and (b) with 2 replaced by a.

54. Note that $f(x) = \begin{cases} -x^3 + 9x, & x \le -3 \text{ or } 0 \le x < 3 \\ x^3 - 9x, & -3 < x < 0 \text{ or } x \ge 3 \end{cases}$. Therefore, $f'(x) = \begin{cases} -3x^3 + 9, & x < -3 \text{ or } 0 < x < 3 \\ 3x^3 - 9, & -3 < x < 0 \text{ or } x > 3 \end{cases}$.



(a) No, since the left- and right-hand derivatives at $x = 0$, are $-9$ and 9, respectively.
(b) No, since the left- and right-hand derivatives at $x = 3$, are $-18$ and 18, respectively.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

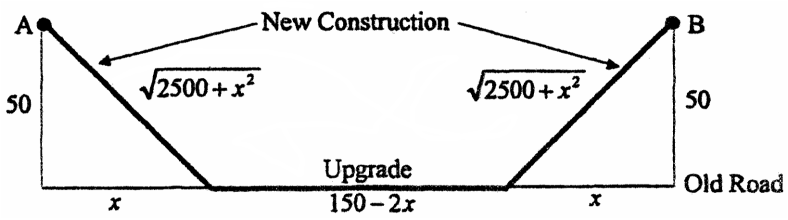


(c) No, since the left- and right-hand derivatives at $x = -3$, are 18 and $-18$, respectively.

(d) The critical points occur when $f'(x) = 0$ (at $x = \pm\sqrt{3}$) and when $f'(x)$ is undefined (at $x = 0$ and $x = \pm 3$). The minimum value is 0 at $x = -3$, at $x = 0$, and at $x = 3$; local maxima occur at $\left(-\sqrt{3},\ 6\sqrt{3}\right)$ and $\left(\sqrt{3},\ 6\sqrt{3}\right)$.

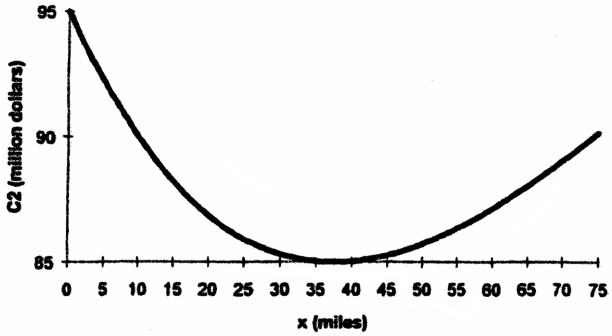
55.

(a) The construction cost is $C(x) = 0.3\sqrt{16 + x^2} + 0.2(9 - x)$ million dollars, where $0 \le x \le 9$ miles. The following is a graph of $C(x)$.



Solving $C'(x) = \frac{0.3x}{\sqrt{16+x^2}} - 0.2 = 0$ gives $x = \pm\frac{8\sqrt{5}}{5} \approx \pm 3.58$ miles, but only $x = 3.58$ miles is a critical point is the specified domain. Evaluating the costs at the critical and endpoints gives $C(0) = \$3$ million, $C\left(\frac{8\sqrt{5}}{5}\right) \approx \$2.694$ million, and $C(9) \approx \$2.955$ million. Therefore, to minimize the cost of construction, the pipeline should be placed from the docking facility to point B, 3.58 miles along the shore from point A, and then along the shore from B to the refinery.

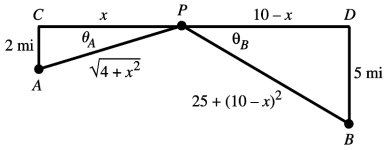
(b) If the per mile cost of underwater construction is p, then $C(x) = p\sqrt{16 + x^2} + 0.2(9 - x)$ and $C'(x) = \frac{0.3x}{\sqrt{16+x^2}} - 0.2 = 0$ gives $x_c = \frac{0.8}{\sqrt{p^2 - 0.04}}$, which minimizes the construction cost provided $x_c \le 9$. The value of p that gives $x_c = 9$ miles is 0.218864. Consequently, if the underwater construction costs \$218,864 per mile or less, then running the pipeline along a straight line directly from the docking facility to the refinery will minimize the cost of construction.



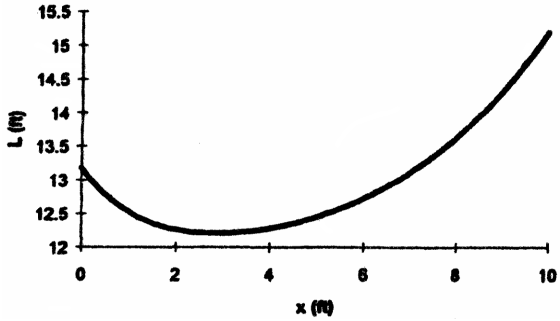
In theory, p would have to be infinite to justify running the pipe directly from the docking facility to point A (i.e., for $x_c$ to be zero). For all values of $p > 0.218864$ there is always an $x_c \in (0,\ 9)$ that will give a minimum value for C. This is proved by looking at $C''(x_c) = \frac{16p}{(16+x_c^2)^{3/2}}$ which is always positive for $p > 0$.

56. There are two options to consider. The first is to build a new road straight from Village A to Village B. The second is to build a new highway segment from Village A to the Old Road, reconstruct a segment of Old Road, and build a new highway segment from Old Road to Village B, as shown in the figure. The cost of the first option is $C_1 = 0.5(150)$ million dollars $= 75$ million dollars.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

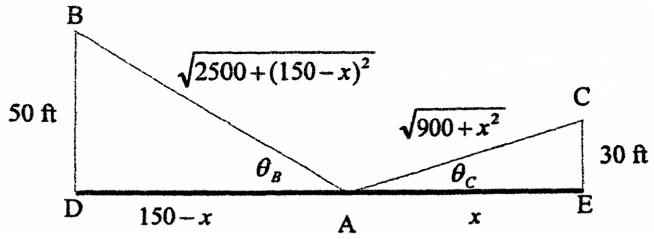


The construction cost for the second option is $C_2(x) = 0.5\left(2\sqrt{2500 + x^2}\right) + 0.3(150 - 2x)$ million dollars for $0 \le x \le 75$ miles. The following is a graph of $C_2(x)$.

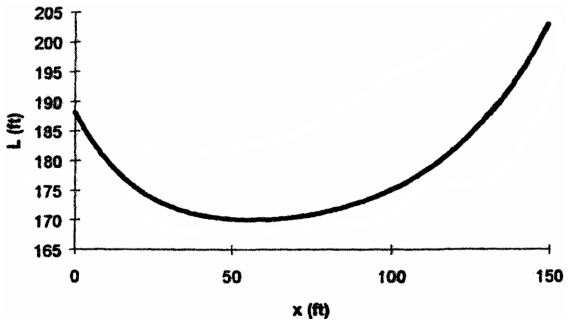


Solving $C_2'(x) = \frac{x}{\sqrt{2500 + x^2}} - 0.6 = 0$ give $x = \pm 37.5$ miles, but only $x = 37.5$ miles is in the specified domain. In summary, $C_1 = \$75$ million, $C_2(0) = \$95$ million, $C_2(37.5) = \$85$ million, and $C_2(75) = \$90.139$ million. Consequently, a new road straight from village A to village B is the least expensive option.

57.



The length of pipeline is $L(x) = \sqrt{4 + x^2} + \sqrt{25 + (10 - x)^2}$ for $0 \le x \le 10$. The following is a graph of $L(x)$.



Setting the derivative of $L(x)$ equal to zero gives $L'(x) = \frac{x}{\sqrt{4+x^2}} - \frac{(10-x)}{\sqrt{25+(10-x)^2}} = 0$. Note that $\frac{x}{\sqrt{4+x^2}} = \cos\theta_A$ and $\frac{10-x}{\sqrt{25+(10-x)^2}} = \cos\theta_B$, therefore, $L'(x) = 0$ when $\cos\theta_A = \cos\theta_B$, or $\theta_A = \theta_B$ and $\triangle ACP$ is similar to $\triangle BDP$. Use simple proportions to determine x as follows: $\frac{x}{2} = \frac{10-x}{5} \Rightarrow x = \frac{20}{7} \approx 2.857$ miles along the coast from town A to town B. If the two towns were on opposite sides of the river, the obvious solution would be to place the pump station on a straight line (the shortest distance) between two towns, again forcing $\theta_A = \theta_B$. The shortest length of pipe is the same regardless of whether the towns are on thee same or opposite sides of the river.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

58.

(a) The length of guy wire is $L(x) = \sqrt{900 + x^2} + \sqrt{2500 + (150 - x)^2}$ for $0 \le x \le 150$. The following is a graph of $L(x)$.

Setting $L'(x)$ equal to zero gives $L'(x) = \frac{x}{\sqrt{900+x^2}} - \frac{(150-x)}{\sqrt{2500+(150-x)^2}} = 0$. Note that $\frac{x}{\sqrt{900+x^2}} = \cos\theta_A$ and $\frac{(150-x)}{\sqrt{2500+(150-x)^2}} = \cos\theta_B$. Therefore, $L'(x) = 0$ when $\cos\theta_A = \cos\theta_B$, or $\theta_A = \theta_B$ and $\triangle ACE$ is similar to $\triangle ABD$.

Use simple proportions to determine x: $\frac{x}{30} = \frac{150-x}{50} \Rightarrow x = \frac{225}{4} = 56.25$ feet.

(b) If the heights of the towers are $h_B$ and $h_C$, and the horizontal distance between them is s, then $L(x) = \sqrt{h_C^2 + x^2} + \sqrt{h_B^2 + (s-x)^2}$ and $L'(x) = \frac{x}{\sqrt{h_C^2+x^2}} - \frac{(s-x)}{\sqrt{h_B+(s-x)^2}}$. However, $\frac{x}{\sqrt{h_C^2+x^2}} = \cos\theta_C$ and $\frac{(s-x)}{\sqrt{h_B+(s-x)^2}} = \cos\theta_B$. Therefore, $L'(x) = 0$ when $\cos\theta_C = \cos\theta_B$, or $\theta_C = \theta_B$ and $\triangle ACE$ is similar to $\triangle ABD$.

Simple proportions can again be used to determine the optimum x: $\frac{x}{h_c} = \frac{s-x}{h_B} \Rightarrow x = \left(\frac{h_c}{h_B+h_c}\right)s$.

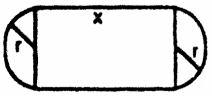
59. (a) $V(x) = 160x - 52x^2 + 4x^3$

$V'(x) = 160 - 104x + 12x^2 = 4(x-2)(3x-20)$

The only critical point in the interval $(0, 5)$ is at $x = 2$. The maximum value of $V(x)$ is 144 at $x = 2$.

(b) The largest possible volume of the box is 144 cubic units, and it occurs when $x = 2$ units.

60. (a) $P'(x) = 2 - 200x^{-2}$



The only critical point in the interval $(0, \infty)$ is at $x = 10$. The minimum value of $P(x)$ is 40 at $x = 10$.

(b) The smallest possible perimeter of the rectangel is 40 units and it occurs at $x = 10$ units which makes the rectangle a 10 by 10 square.

61. Let x represent the length of the base and $\sqrt{25 - x^2}$ the height of the triangle. The area of the triangle is represented by $A(x) = \frac{x}{2}\sqrt{25 - x^2}$ where $0 \le x \le 5$. Consequently, solving $A'(x) = 0 \Rightarrow \frac{25-2x^2}{2\sqrt{25-x^2}} = 0 \Rightarrow x = \frac{5}{\sqrt{2}}$. Since $A(0) = A(5) = 0$, $A(x)$ is maximized at $x = \frac{5}{\sqrt{2}}$. The largest possible area is $A\left(\frac{5}{\sqrt{2}}\right) = \frac{25}{4}$ cm$^2$.

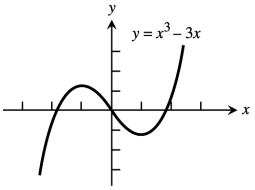
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

62. (a) From the diagram the perimeter $P = 2x + 2\pi r = 400$ $\Rightarrow x = 200 - \pi r$. The area A is $2rx$ $\Rightarrow A(r) = 400r - 2\pi r^2$ where $0 \le r \le \frac{200}{\pi}$.

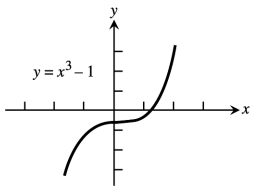
(b) $A'(r) = 400 - 4\pi r$ so the only critical point is $r = \frac{100}{\pi}$. Since $A(r) = 0$ if $r = 0$ and $x = 200 - \pi r = 0$, the values $r = \frac{100}{\pi} \approx 31.83$ m and $x = 100$ m maximize the area over the interval $0 \le r \le \frac{200}{\pi}$.

63. $s = -\frac{1}{2}gt^2 + v_0 t + s_0 \Rightarrow \frac{ds}{dt} = -gt + v_0 = 0 \Rightarrow t = \frac{v_0}{g}$. Now $s(t) = s_0 \Leftrightarrow t\left(-\frac{gt}{2} + v_0\right) = 0 \Leftrightarrow t = 0$ or $t = \frac{2v_0}{g}$. Thus $s\left(\frac{v_0}{g}\right) = -\frac{1}{2}g\left(\frac{v_0}{g}\right)^2 + v_0\left(\frac{v_0}{g}\right) + s_0 = \frac{v_0^2}{2g} + s_0 > s_0$ is the maximum height over the interval $0 \le t \le \frac{2v_0}{g}$.

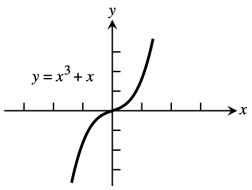
64. $\frac{dI}{dt} = -2\sin t + 2\cos t$, solving $\frac{dI}{dt} = 0 \Rightarrow \tan t = 1 \Rightarrow t = \frac{\pi}{4} + n\pi$ where n is a nonnegative integer (in this exercise t is never negative) $\Rightarrow$ the peak current is $2\sqrt{2}$ amps.



65. Yes, since $f(x) = |x| = \sqrt{x^2} = (x^2)^{1/2} \Rightarrow f'(x) = \frac{1}{2}(x^2)^{-1/2}(2x) = \frac{x}{(x^2)^{1/2}} = \frac{x}{|x|}$ is not defined at $x = 0$. Thus it is not required that $f'$ be zero at a local extreme point since $f'$ may be undefined there.



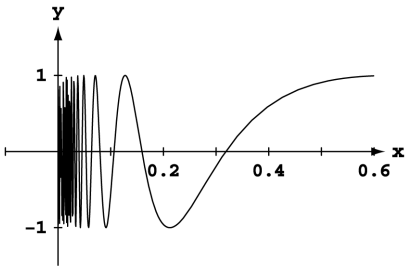
66. If $f(c)$ is a local maximum value of f, then $f(x) \le f(c)$ for all x in some open interval $(a, b)$ containing c. Since f is even, $f(-x) = f(x) \le f(c) = f(-c)$ for all $-x$ in the open interval $(-b, -a)$ containing $-c$. That is, f assumes a local maximum at the point $-c$. This is also clear from the graph of f because the graph of an even function is symmetric about the y-axis.



67. If $g(c)$ is a local minimum value of g, then $g(x) \ge g(c)$ for all x in some open interval $(a, b)$ containing c. Since g is odd, $g(-x) = -g(x) \le -g(c) = g(-c)$ for all $-x$ in the open interval $(-b, -a)$ containing $-c$. That is, g assumes a local maximum at the point $-c$. This is also clear from the graph of g because the graph of an odd function is symmetric about the origin.

68. If there are no boundary points or critical points the function will have no extreme values in its domain. Such functions do indeed exist, for example $f(x) = x$ for $-\infty < x < \infty$. (Any other linear function $f(x) = mx + b$ with $m \ne 0$ will do as well.)

69. (a) $f'(x) = 3ax^2 + 2bx + c$ is a quadratic, so it can have 0, 1, or 2 zeros, which would be the critical points of f. The function $f(x) = x^3 - 3x$ has two critical points at $x = -1$ and $x = 1$. The function $f(x) = x^3 - 1$ has one critical point at $x = 0$. The function $f(x) = x^3 + x$ has no critical points.

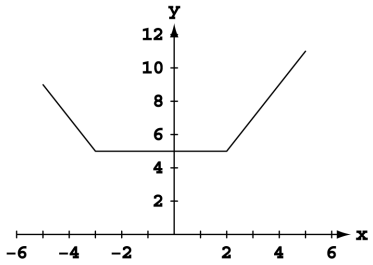


(b) The function can have either two local extreme values or no extreme values. (If there is only one critical point, the cubic function has no extreme values.)

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

70. (a)

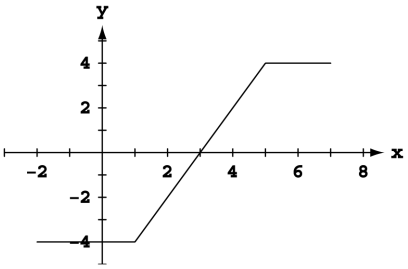
$[-0.1, 0.6]$ by $[-1.5, 1.5]$



$f(0) = 0$ is not a local extreme value because in any open interval containing $x = 0$, there are infinitely many points where $f(x) = 1$ and where $f(x) = -1$.

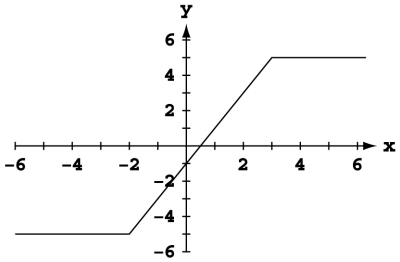
(b) One possible answer, on the interval $[0, 1]$:

$$f(x) = \begin{cases} (1-x)\cos\frac{1}{1-x}, & 0 \le x < 1 \\ 0, & x = 1 \end{cases}$$



This function has no local extreme value at $x = 1$. Note that it is continuous on $[0, 1]$.

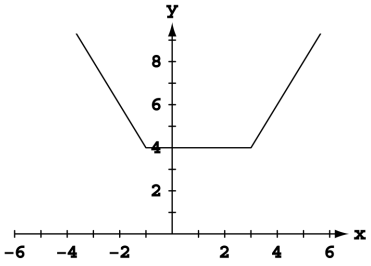
71. Maximum value is 11 at $x = 5$;
minimum value is 5 on the interval $[-3, 2]$;
local maximum at $(-5, 9)$



$[-6, 6]$ by $[0, 12]$

72. Maximum value is 4 on the interval $[5, 7]$;
minimum value is $-4$ on the interval $[-2, 1]$.

$[-3, 8]$ by $[-5, 5]$



73. Maximum value is 5 on the interval $[3, \infty)$;
minimum value is $-5$ on the interval $(-\infty, -2]$.

$[-6, 6]$ by $[-6, 6]$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

74. Minimum value is 4 on the interval $[-1, 3]$

$[-6,6]$ by $[0,9]$

75-80. Example CAS commands:

Maple:

```
with(student):
f := x -> x^4 - 8*x^2 + 4*x + 2;
domain := x=-20/25..64/25;
plot( f(x), domain, color=black, title="Section 4.1 #75(a)" );
Df := D(f);
plot( Df(x), domain, color=black, title="Section 4.1 # 75(b)" )
StatPt := fsolve( Df(x)=0, domain )
SingPt := NULL;
EndPt := op(rhs(domain));
Pts :=evalf([EndPt,StatPt,SingPt]);
Values := [seq( f(x), x=Pts )];
```

Maximum value is 2.7608 and occurs at x=2.56 (right endpoint).

Minimum value $^{34}$is -6.2680 and occurs at x=1.86081 (singular point).

Mathematica: (functions may vary) (see section 2.5 re. RealsOnly ):

```
<<Miscellaneous `RealOnly`
Clear[f,x]
a = −1; b = 10/3;
f[x_] =2 + 2x − 3 x^(2/3)
f'[x]
Plot[{f[x], f'[x]}, {x, a, b}]
NSolve[f'[x]==0, x]
{f[a], f[0], f[x]/.%, f[b]//N
```

In more complicated expressions, NSolve may not yield results. In this case, an approximate solution (say 1.1 here) is observed from the graph and the following command is used:

```
FindRoot[f'[x]==0,{x, 1.1}]
```

## 4.2 THE MEAN VALUE THEOREM

1. When $f(x) = x^2 + 2x - 1$ for $0 \le x \le 1$, then $\frac{f(1)-f(0)}{1-0} = f'(c) \Rightarrow 3 = 2c + 2 \Rightarrow c = \frac{1}{2}$.

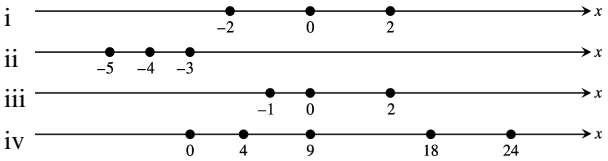
2. When $f(x) = x^{2/3}$ for $0 \le x \le 1$, then $\frac{f(1)-f(0)}{1-0} = f'(c) \Rightarrow 1 = \left(\frac{2}{3}\right) c^{-1/3} \Rightarrow c = \frac{8}{27}$.

3. When $f(x) = x + \frac{1}{x}$ for $\frac{1}{2} \le x \le 2$, then $\frac{f(2)-f(1/2)}{2-1/2} = f'(c) \Rightarrow 0 = 1 - \frac{1}{c^2} \Rightarrow c = 1$.

4. When $f(x) = \sqrt{x-1}$ for $1 \le x \le 3$, then $\frac{f(3)-f(1)}{3-1} = f'(c) \Rightarrow \frac{\sqrt{2}}{2} = \frac{1}{2\sqrt{c-1}} \Rightarrow c = \frac{3}{2}$.

5. Does not; $f(x)$ is not differentiable at $x = 0$ in $(-1, 8)$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



6. Does; f(x) is continuous for every point of [0, 1] and differentiable for every point in (0, 1).

7. Does; f(x) is continuous for every point of [0, 1] and differentiable for every point in (0, 1).

8. Does not; f(x) is not continuous at $x = 0$ because $\lim_{x \to 0^-} f(x) = 1 \neq 0 = f(0)$.

9. Since f(x) is not continuous on $0 \leq x \leq 1$, Rolle's Theorem does not apply: $\lim_{x \to 1^-} f(x) = \lim_{x \to 1^-} x = 1 \neq 0 = f(1)$.

10. Since f(x) must be continuous at $x = 0$ and $x = 1$ we have $\lim_{x \to 0^+} f(x) = a = f(0) \Rightarrow a = 3$ and $\lim_{x \to 1^-} f(x) = \lim_{x \to 1^+} f(x) \Rightarrow -1 + 3 + a = m + b \Rightarrow 5 = m + b$. Since f(x) must also be differentiable at $x = 1$ we have $\lim_{x \to 1^-} f'(x) = \lim_{x \to 1^+} f'(x) \Rightarrow -2x + 3\big|_{x=1} = m\big|_{x=1} \Rightarrow 1 = m$. Therefore, $a = 3$, $m = 1$ and $b = 4$.

11. (a)

(b) Let $r_1$ and $r_2$ be zeros of the polynomial $P(x) = x^n + a_{n-1}x^{n-1} + \ldots + a_1x + a_0$, then $P(r_1) = P(r_2) = 0$. Since polynomials are everywhere continuous and differentiable, by Rolle's Theorem $P'(r) = 0$ for some r between $r_1$ and $r_2$, where $P'(x) = nx^{n-1} + (n-1)\,a_{n-1}x^{n-2} + \ldots + a_1$.

12. With f both differentiable and continuous on [a, b] and $f(r_1) = f(r_2) = f(r_3) = 0$ where $r_1$, $r_2$ and $r_3$ are in [a, b], then by Rolle's Theorem there exists a $c_1$ between $r_1$ and $r_2$ such that $f'(c_1) = 0$ and a $c_2$ between $r_2$ and $r_3$ such that $f'(c_2) = 0$. Since $f'$ is both differentiable and continuous on [a, b], Rolle's Theorem again applies and we have a $c_3$ between $c_1$ and $c_2$ such that $f''(c_3) = 0$. To generalize, if f has n+1 zeros in [a, b] and $f^{(n)}$ is continuous on [a, b], then $f^{(n)}$ has at least one zero between a and b.

13. Since $f''$ exists throughout [a, b] the derivative function $f'$ is continuous there. If $f'$ has more than one zero in [a, b], say $f'(r_1) = f'(r_2) = 0$ for $r_1 \neq r_2$, then by Rolle's Theorem there is a c between $r_1$ and $r_2$ such that $f''(c) = 0$, contrary to $f'' > 0$ throughout [a, b]. Therefore $f'$ has at most one zero in [a, b]. The same argument holds if $f'' < 0$ throughout [a, b].

14. If f(x) is a cubic polynomial with four or more zeros, then by Rolle's Theorem $f'(x)$ has three or more zeros, $f''(x)$ has 2 or more zeros and $f'''(x)$ has at least one zero. This is a contradiction since $f'''(x)$ is a non-zero constant when f(x) is a cubic polynomial.

15. With $f(-2) = 11 > 0$ and $f(-1) = -1 < 0$ we conclude from the Intermediate Value Theorem that $f(x) = x^4 + 3x + 1$ has at least one zero between $-2$ and $-1$. Then $-2 < x < -1 \Rightarrow -8 < x^3 < -1 \Rightarrow -32 < 4x^3 < -4 \Rightarrow -29 < 4x^3 + 3 < -1 \Rightarrow f'(x) < 0$ for $-2 < x < -1 \Rightarrow f(x)$ is decreasing on $[-2, -1] \Rightarrow f(x) = 0$ has exactly one solution in the interval $(-2, -1)$.

16. $f(x) = x^3 + \frac{4}{x^2} + 7 \Rightarrow f'(x) = 3x^2 - \frac{8}{x^3} > 0$ on $(-\infty, 0) \Rightarrow f(x)$ is increasing on $(-\infty, 0)$. Also, $f(x) < 0$ if $x < -2$ and $f(x) > 0$ if $-2 < x < 0 \Rightarrow f(x)$ has exactly one zero in $(-\infty, 0)$.

17. $g(t) = \sqrt{t} + \sqrt{t+1} - 4 \Rightarrow g'(t) = \frac{1}{2\sqrt{t}} + \frac{1}{2\sqrt{t+1}} > 0 \Rightarrow g(t)$ is increasing for t in $(0, \infty)$; $g(3) = \sqrt{3} - 2 < 0$ and $g(15) = \sqrt{15} > 0 \Rightarrow g(t)$ has exactly one zero in $(0, \infty)$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

18. $g(t) = \frac{1}{1-t} + \sqrt{1+t} - 3.1 \Rightarrow g'(t) = \frac{1}{(1-t)^2} + \frac{1}{2\sqrt{1+t}} > 0 \Rightarrow$ g(t) is increasing for t in $(-1, 1)$; $g(-0.99) = -2.5$ and $g(0.99) = 98.3 \Rightarrow$ g(t) has exactly one zero in $(-1, 1)$.

19. $r(\theta) = \theta + \sin^2\left(\frac{\theta}{3}\right) - 8 \Rightarrow r'(\theta) = 1 + \frac{2}{3}\sin\left(\frac{\theta}{3}\right)\cos\left(\frac{\theta}{3}\right) = 1 + \frac{1}{3}\sin\left(\frac{2\theta}{3}\right) > 0$ on $(-\infty, \infty) \Rightarrow r(\theta)$ is increasing on $(-\infty, \infty)$; $r(0) = -8$ and $r(8) = \sin^2\left(\frac{8}{3}\right) > 0 \Rightarrow r(\theta)$ has exactly one zero in $(-\infty, \infty)$.

20. $r(\theta) = 2\theta - \cos^2\theta + \sqrt{2} \Rightarrow r'(\theta) = 2 + 2\sin\theta\cos\theta = 2 + \sin 2\theta > 0$ on $(-\infty, \infty) \Rightarrow r(\theta)$ is increasing on $(-\infty, \infty)$; $r(-2\pi) = -4\pi - \cos(-2\pi) + \sqrt{2} = -4\pi - 1 + \sqrt{2} < 0$ and $r(2\pi) = 4\pi - 1 + \sqrt{2} > 0 \Rightarrow r(\theta)$ has exactly one zero in $(-\infty, \infty)$.

21. $r(\theta) = \sec\theta - \frac{1}{\theta^3} + 5 \Rightarrow r'(\theta) = (\sec\theta)(\tan\theta) + \frac{3}{\theta^4} > 0$ on $\left(0, \frac{\pi}{2}\right) \Rightarrow r(\theta)$ is increasing on $\left(0, \frac{\pi}{2}\right)$; $r(0.1) \approx -994$ and $r(1.57) \approx 1260.5 \Rightarrow r(\theta)$ has exactly one zero in $\left(0, \frac{\pi}{2}\right)$.

22. $r(\theta) = \tan\theta - \cot\theta - \theta \Rightarrow r'(\theta) = \sec^2\theta + \csc^2\theta - 1 = \sec^2\theta + \cot^2\theta > 0$ on $\left(0, \frac{\pi}{2}\right) \Rightarrow r(\theta)$ is increasing on $\left(0, \frac{\pi}{2}\right)$; $r\left(\frac{\pi}{4}\right) = -\frac{\pi}{4} < 0$ and $r(1.57) \approx 1254.2 \Rightarrow r(\theta)$ has exactly one zero in $\left(0, \frac{\pi}{2}\right)$.

23. By Corollary 1, $f'(x) = 0$ for all $x \Rightarrow f(x) = C$, where C is a constant. Since $f(-1) = 3$ we have $C = 3 \Rightarrow f(x) = 3$ for all x.

24. $g(x) = 2x + 5 \Rightarrow g'(x) = 2 = f'(x)$ for all x. By Corollary 2, $f(x) = g(x) + C$ for some constant C. Then $f(0) = g(0) + C \Rightarrow 5 = 5 + C \Rightarrow C = 0 \Rightarrow f(x) = g(x) = 2x + 5$ for all x.

25. $g(x) = x^2 \Rightarrow g'(x) = 2x = f'(x)$ for all x. By Corollary 2, $f(x) = g(x) + C$.
(a) $f(0) = 0 \Rightarrow 0 = g(0) + C = 0 + C \Rightarrow C = 0 \Rightarrow f(x) = x^2 \Rightarrow f(2) = 4$
(b) $f(1) = 0 \Rightarrow 0 = g(1) + C = 1 + C \Rightarrow C = -1 \Rightarrow f(x) = x^2 - 1 \Rightarrow f(2) = 3$
(c) $f(-2) = 3 \Rightarrow 3 = g(-2) + C \Rightarrow 3 = 4 + C \Rightarrow C = -1 \Rightarrow f(x) = x^2 - 1 \Rightarrow f(2) = 3$

26. $g(x) = mx \Rightarrow g'(x) = m$, a constant. If $f'(x) = m$, then by Corollary 2, $f(x) = g(x) + b = mx + b$ where b is a constant. Therefore all functions whose derivatives are constant can be graphed as straight lines $y = mx + b$.

27. (a) $y = \frac{x^2}{2} + C$ (b) $y = \frac{x^3}{3} + C$ (c) $y = \frac{x^4}{4} + C$

28. (a) $y = x^2 + C$ (b) $y = x^2 - x + C$ (c) $y = x^3 + x^2 - x + C$

29. (a) $y' = -x^{-2} \Rightarrow y = \frac{1}{x} + C$ (b) $y = x + \frac{1}{x} + C$ (c) $y = 5x - \frac{1}{x} + C$

30. (a) $y' = \frac{1}{2}x^{-1/2} \Rightarrow y = x^{1/2} + C \Rightarrow y = \sqrt{x} + C$ (b) $y = 2\sqrt{x} + C$
(c) $y = 2x^2 - 2\sqrt{x} + C$

31. (a) $y = -\frac{1}{2}\cos 2t + C$ (b) $y = 2\sin\frac{t}{2} + C$
(c) $y = -\frac{1}{2}\cos 2t + 2\sin\frac{t}{2} + C$

32. (a) $y = \tan\theta + C$ (b) $y' = \theta^{1/2} \Rightarrow y = \frac{2}{3}\theta^{3/2} + C$ (c) $y = \frac{2}{3}\theta^{3/2} - \tan\theta + C$

33. $f(x) = x^2 - x + C$; $0 = f(0) = 0^2 - 0 + C \Rightarrow C = 0 \Rightarrow f(x) = x^2 - x$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

34. $g(x) = -\frac{1}{x} + x^2 + C$; $1 = g(-1) = -\frac{1}{-1} + (-1)^2 + C \Rightarrow C = -1 \Rightarrow g(x) = -\frac{1}{x} + x^2 - 1$

35. $r(\theta) = 8\theta + \cot\theta + C$; $0 = r\left(\frac{\pi}{4}\right) = 8\left(\frac{\pi}{4}\right) + \cot\left(\frac{\pi}{4}\right) + C \Rightarrow 0 = 2\pi + 1 + C \Rightarrow C = -2\pi - 1$
$\Rightarrow r(\theta) = 8\theta + \cot\theta - 2\pi - 1$

36. $r(t) = \sec t - t + C$; $0 = r(0) = \sec(0) - 0 + C \Rightarrow C = -1 \Rightarrow r(t) = \sec t - t - 1$

37. $v = \frac{ds}{dt} = 9.8t + 5 \Rightarrow s = 4.9t^2 + 5t + C$; at $s = 10$ and $t = 0$ we have $C = 10 \Rightarrow s = 4.9t^2 + 5t + 10$

38. $v = \frac{ds}{dt} = 32t - 2 \Rightarrow s = 16t^2 - 2t + C$; at $s = 4$ and $t = \frac{1}{2}$ we have $C = 1 \Rightarrow s = 6t^2 - 2t + 1$

39. $v = \frac{ds}{dt} = \sin(\pi t) \Rightarrow s = -\frac{1}{\pi}\cos(\pi t) + C$; at $s = 0$ and $t = 0$ we have $C = \frac{1}{\pi} \Rightarrow s = \frac{1 - \cos(\pi t)}{\pi}$

40. $v = \frac{ds}{dt} = \frac{2}{\pi}\cos\left(\frac{2t}{\pi}\right) \Rightarrow s = \sin\left(\frac{2t}{\pi}\right) + C$; at $s = 1$ and $t = \pi^2$ we have $C = 1 \Rightarrow s = \sin\left(\frac{2t}{\pi}\right) + 1$

41. $a = 32 \Rightarrow v = 32t + C_1$; at $v = 20$ and $t = 0$ we have $C_1 = 20 \Rightarrow v = 32t + 20 \Rightarrow s = 16t^2 + 20t + C_2$; at $s = 5$ and $t = 0$ we have $C_2 = 5 \Rightarrow s = 16t^2 + 20t + 5$

42. $a = 9.8 \Rightarrow v = 9.8t + C_1$; at $v = -3$ and $t = 0$ we have $C_1 = -3 \Rightarrow v = 9.8t - 3 \Rightarrow s = 4.9t^2 - 3t + C_2$; at $s = 0$ and $t = 0$ we have $C_2 = 0 \Rightarrow s = 4.9t^2 - 3t$

43. $a = -4\sin(2t) \Rightarrow v = 2\cos(2t) + C_1$; at $v = 2$ and $t = 0$ we have $C_1 = 0 \Rightarrow v = 2\cos(2t) \Rightarrow s = \sin(2t) + C_2$; at $s = -3$ and $t = 0$ we have $C_2 = -3 \Rightarrow s = \sin(2t) - 3$

44. $a = \frac{9}{\pi^2}\cos\left(\frac{3t}{\pi}\right) \Rightarrow v = \frac{3}{\pi}\sin\left(\frac{3t}{\pi}\right) + C_1$; at $v = 0$ and $t = 0$ we have $C_1 = 0 \Rightarrow v = \frac{3}{\pi}\sin\left(\frac{3t}{\pi}\right) \Rightarrow s = -\cos\left(\frac{3t}{\pi}\right) + C_2$; at $s = -1$ and $t = 0$ we have $C_2 = 0 \Rightarrow s = -\cos\left(\frac{3t}{\pi}\right)$

45. If $T(t)$ is the temperature of the thermometer at time $t$, then $T(0) = -19°$ C and $T(14) = 100°$ C. From the Mean Value Theorem there exists a $0 < t_0 < 14$ such that $\frac{T(14) - T(0)}{14 - 0} = 8.5°$ C/sec $= T'(t_0)$, the rate at which the temperature was changing at $t = t_0$ as measured by the rising mercury on the thermometer.

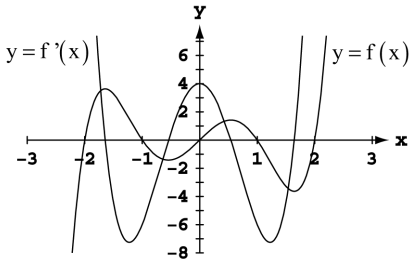
46. Because the trucker's average speed was 79.5 mph, by the Mean Value Theorem, the trucker must have been going that speed at least once during the trip.

47. Because its average speed was approximately 7.667 knots, and by the Mean Value Theorem, it must have been going that speed at least once during the trip.

48. The runner's average speed for the marathon was approximately 11.909 mph. Therefore, by the Mean Value Theorem, the runner must have been going that speed at least once during the marathon. Since the initial speed and final speed are both 0 mph and the runner's speed is continuous, by the Intermediate Value Theorem, the runner's speed must have been 11 mph at least twice.

49. Let $d(t)$ represent the distance the automobile traveled in time $t$. The average speed over $0 \le t \le 2$ is $\frac{d(2) - d(0)}{2 - 0}$. The Mean Value Theorem says that for some $0 < t_0 < 2$, $d'(t_0) = \frac{d(2) - d(0)}{2 - 0}$. The value $d'(t_0)$ is the speed of the automobile at time $t_0$ (which is read on the speedometer).

50. $a(t) = v'(t) = 1.6 \Rightarrow v(t) = 1.6t + C$; at $(0,\ 0)$ we have $C = 0 \Rightarrow v(t) = 1.6t$. When $t = 30$, then $v(30) = 48$ m/sec.

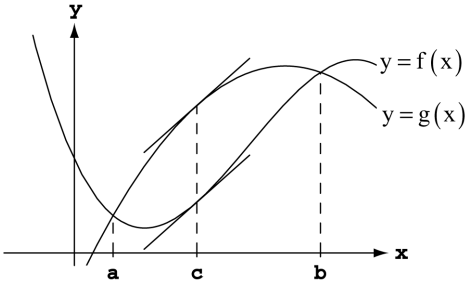


Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

51. The conclusion of the Mean Value Theorem yields $\frac{\frac{1}{b}-\frac{1}{a}}{b-a} = -\frac{1}{c^2} \Rightarrow c^2\left(\frac{a-b}{ab}\right) = a-b \Rightarrow c = \sqrt{ab}$.

52. The conclusion of the Mean Value Theorem yields $\frac{b^2-a^2}{b-a} = 2c \Rightarrow c = \frac{a+b}{2}$.

53. $f'(x) = [\cos x \sin(x+2) + \sin x \cos(x+2)] - 2\sin(x+1)\cos(x+1) = \sin(x+x+2) - \sin 2(x+1)$
$= \sin(2x+2) - \sin(2x+2) = 0$. Therefore, the function has the constant value $f(0) = -\sin^2 1 \approx -0.7081$ which explains why the graph is a horizontal line.



54. (a) $f(x) = (x+2)(x+1)x(x-1)(x-2) = x^5 - 5x^3 + 4x$ is one possibility.
(b) Graphing $f(x) = x^5 - 5x^3 + 4x$ and $f'(x) = 5x^4 - 15x^2 + 4$ on $[-3, 3]$ by $[-7, 7]$ we see that each x-intercept of $f'(x)$ lies between a pair of x-intercepts of $f(x)$, as expected by Rolle's Theorem.

(c) Yes, since sin is continuous and differentiable on $(-\infty, \infty)$.

55. $f(x)$ must be zero at least once between a and b by the Intermediate Value Theorem. Now suppose that $f(x)$ is zero twice between a and b. Then by the Mean Value Theorem, $f'(x)$ would have to be zero at least once between the two zeros of $f(x)$, but this can't be true since we are given that $f'(x) \neq 0$ on this interval. Therefore, $f(x)$ is zero once and only once between a and b.

56. Consider the function $k(x) = f(x) - g(x)$. $k(x)$ is continuous and differentiable on $[a, b]$, and since $k(a) = f(a) - g(a)$ and $k(b) = f(b) - g(b)$, by the Mean Value Theorem, there must be a point c in $(a, b)$ where $k'(c) = 0$. But since $k'(c) = f'(c) - g'(c)$, this means that $f'(c) = g'(c)$, and c is a point where the graphs of f and g have tangent lines with the same slope, so these lines are either parallel or are the same line.

57. Yes. By Corollary 2 we have $f(x) = g(x) + c$ since $f'(x) = g'(x)$. If the graphs start at the same point $x = a$, then $f(a) = g(a) \Rightarrow c = 0 \Rightarrow f(x) = g(x)$.

58. Let $f(x) = \sin x$ for $a \le x \le b$. From the Mean Value Theorem there exists a c between a and b such that $\frac{\sin b - \sin a}{b-a} = \cos c \Rightarrow -1 \le \frac{\sin b - \sin a}{b-a} \le 1 \Rightarrow \left|\frac{\sin b - \sin a}{b-a}\right| \le 1 \Rightarrow |\sin b - \sin a| \le |b-a|$.

59. By the Mean Value Theorem we have $\frac{f(b)-f(a)}{b-a} = f'(c)$ for some point c between a and b. Since $b - a > 0$ and $f(b) < f(a)$, we have $f(b) - f(a) < 0 \Rightarrow f'(c) < 0$.

60. The condition is that $f'$ should be continuous over $[a, b]$. The Mean Value Theorem then guarantees the existence of a point c in $(a, b)$ such that $\frac{f(b)-f(a)}{b-a} = f'(c)$. If $f'$ is continuous, then it has a minimum and maximum value on $[a, b]$, and $\min f' \le f'(c) \le \max f'$, as required.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

61. $f'(x) = (1 + x^4 \cos x)^{-1} \Rightarrow f''(x) = -(1 + x^4 \cos x)^{-2}(4x^3 \cos x - x^4 \sin x)$
$= -x^3(1 + x^4 \cos x)^{-2}(4 \cos x - x \sin x) < 0$ for $0 \le x \le 0.1 \Rightarrow f'(x)$ is decreasing when $0 \le x \le 0.1$
$\Rightarrow$ min $f' \approx 0.9999$ and max $f' = 1$. Now we have $0.9999 \le \frac{f(0.1)-1}{0.1} \le 1 \Rightarrow 0.09999 \le f(0.1) - 1 \le 0.1$
$\Rightarrow 1.09999 \le f(0.1) \le 1.1$.

62. $f'(x) = (1 - x^4)^{-1} \Rightarrow f''(x) = -(1 - x^4)^{-2}(-4x^3) = \frac{4x^3}{(1-x^4)^3} > 0$ for $0 < x \le 0.1 \Rightarrow f'(x)$ is increasing when
$0 \le x \le 0.1 \Rightarrow$ min $f' = 1$ and max $f' = 1.0001$. Now we have $1 \le \frac{f(0.1)-2}{0.1} \le 1.0001$
$\Rightarrow 0.1 \le f(0.1) - 2 \le 0.10001 \Rightarrow 2.1 \le f(0.1) \le 2.10001$.

63. (a) Suppose $x < 1$, then by the Mean Value Theorem $\frac{f(x)-f(1)}{x-1} < 0 \Rightarrow f(x) > f(1)$. Suppose $x > 1$, then by the Mean Value Theorem $\frac{f(x)-f(1)}{x-1} > 0 \Rightarrow f(x) > f(1)$. Therefore $f(x) \ge 1$ for all x since $f(1) = 1$.
(b) Yes. From part (a), $\lim_{x \to 1^-} \frac{f(x)-f(1)}{x-1} \le 0$ and $\lim_{x \to 1^+} \frac{f(x)-f(1)}{x-1} \ge 0$. Since $f'(1)$ exists, these two one-sided limits are equal and have the value $f'(1) \Rightarrow f'(1) \le 0$ and $f'(1) \ge 0 \Rightarrow f'(1) = 0$.

64. From the Mean Value Theorem we have $\frac{f(b)-f(a)}{b-a} = f'(c)$ where c is between a and b. But $f'(c) = 2pc + q = 0$ has only one solution $c = -\frac{q}{2p}$. (Note: $p \ne 0$ since f is a quadratic function.)

## 4.3 MONOTONIC FUNCTIONS AND THE FIRST DERIVATIVE TEST

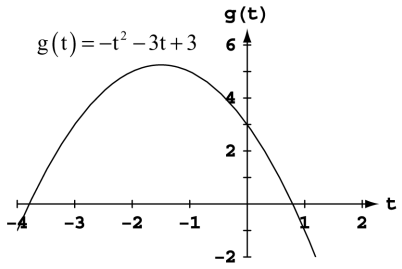
1. (a) $f'(x) = x(x-1) \Rightarrow$ critical points at 0 and 1
(b) $f' = +++ \,|_0\, --- \,|_1\, +++ \Rightarrow$ increasing on $(-\infty, 0)$ and $(1, \infty)$, decreasing on $(0, 1)$
(c) Local maximum at $x = 0$ and a local minimum at $x = 1$

2. (a) $f'(x) = (x-1)(x+2) \Rightarrow$ critical points at $-2$ and 1
(b) $f' = +++ \,|_{-2}\, --- \,|_1\, +++ \Rightarrow$ increasing on $(-\infty, -2)$ and $(1, \infty)$, decreasing on $(-2, 1)$
(c) Local maximum at $x = -2$ and a local minimum at $x = 1$

3. (a) $f'(x) = (x-1)^2(x+2) \Rightarrow$ critical points at $-2$ and 1
(b) $f' = --- \,|_{-2}\, +++ \,|_1\, +++ \Rightarrow$ increasing on $(-2, 1)$ and $(1, \infty)$, decreasing on $(-\infty, -2)$
(c) No local maximum and a local minimum at $x = -2$

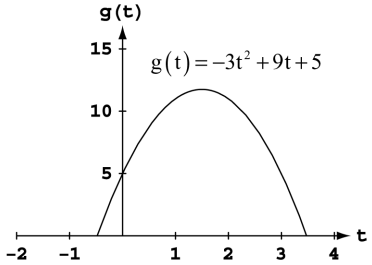
4. (a) $f'(x) = (x-1)^2(x+2)^2 \Rightarrow$ critical points at $-2$ and 1
(b) $f' = +++ \,|_{-2}\, +++ \,|_1\, +++ \Rightarrow$ increasing on $(-\infty, -2) \cup (-2, 1) \cup (1, \infty)$, never decreasing
(c) No local extrema

5. (a) $f'(x) = (x-1)(x+2)(x-3) \Rightarrow$ critical points at $-2$, 1 and 3
(b) $f' = --- \,|_{-2}\, +++ \,|_1\, --- \,|_3\, +++ \Rightarrow$ increasing on $(-2, 1)$ and $(3, \infty)$, decreasing on $(-\infty, -2)$ and $(1, 3)$
(c) Local maximum at $x = 1$, local minima at $x = -2$ and $x = 3$



6. (a) $f'(x) = (x-7)(x+1)(x+5) \Rightarrow$ critical points at $-5$, $-1$ and 7
(b) $f' = --- \,|_{-5}\, +++ \,|_{-1}\, --- \,|_7\, +++ \Rightarrow$ increasing on $(-5, -1)$ and $(7, \infty)$, decreasing on $(-\infty, -5)$ and $(-1, 7)$
(c) Local maximum at $x = -1$, local minima at $x = -5$ and $x = 7$

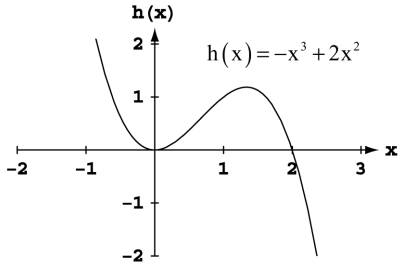
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



7. (a) $f'(x) = x^{-1/3}(x+2) \Rightarrow$ critical points at $-2$ and $0$
   (b) $f' = +++ \underset{-2}{|} --- \underset{0}{)}( +++ \Rightarrow$ increasing on $(-\infty, -2)$ and $(0, \infty)$, decreasing on $(-2, 0)$
   (c) Local maximum at $x = -2$, local minimum at $x = 0$

8. (a) $f'(x) = x^{-1/2}(x-3) \Rightarrow$ critical points at $0$ and $3$
   (b) $f' = (\underset{0}{---} \underset{3}{|} +++ \Rightarrow$ increasing on $(3, \infty)$, decreasing on $(0, 3)$
   (c) No local maximum and a local minimum at $x = 3$

9. (a) $g(t) = -t^2 - 3t + 3 \Rightarrow g'(t) = -2t - 3 \Rightarrow$ a critical point at $t = -\frac{3}{2}$; $g' = +++ \underset{-3/2}{|} ---$, increasing on $\left(-\infty, -\frac{3}{2}\right)$, decreasing on $\left(-\frac{3}{2}, \infty\right)$
   (b) local maximum value of $g\left(-\frac{3}{2}\right) = \frac{21}{4}$ at $t = -\frac{3}{2}$
   (c) absolute maximum is $\frac{21}{4}$ at $t = -\frac{3}{2}$
   (d)

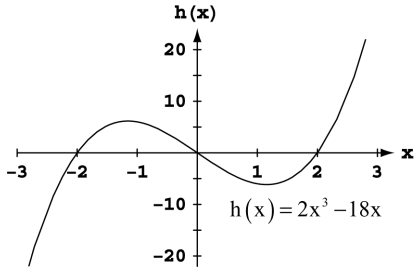


10. (a) $g(t) = -3t^2 + 9t + 5 \Rightarrow g'(t) = -6t + 9 \Rightarrow$ a critical point at $t = \frac{3}{2}$; $g' = +++ \underset{3/2}{|} ---$, increasing on $\left(-\infty, \frac{3}{2}\right)$, decreasing on $\left(\frac{3}{2}, \infty\right)$
    (b) local maximum value of $g\left(\frac{3}{2}\right) = \frac{47}{4}$ at $t = \frac{3}{2}$
    (c) absolute maximum is $\frac{47}{4}$ at $t = \frac{3}{2}$
    (d)

11. (a) $h(x) = -x^3 + 2x^2 \Rightarrow h'(x) = -3x^2 + 4x = x(4 - 3x) \Rightarrow$ critical points at $x = 0, \frac{4}{3}$
    $\Rightarrow h' = --- \underset{0}{|} +++ \underset{4/3}{|} ---$, increasing on $\left(0, \frac{4}{3}\right)$, decreasing on $(-\infty, 0)$ and $\left(\frac{4}{3}, \infty\right)$
    (b) local maximum value of $h\left(\frac{4}{3}\right) = \frac{32}{27}$ at $x = \frac{4}{3}$; local minimum value of $h(0) = 0$ at $x = 0$
    (c) no absolute extrema

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(d)



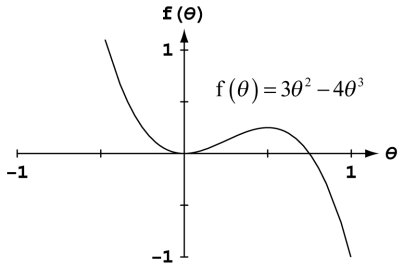
12. (a) $h(x) = 2x^3 - 18x \Rightarrow h'(x) = 6x^2 - 18 = 6\left(x + \sqrt{3}\right)\left(x - \sqrt{3}\right) \Rightarrow$ critical points at $x = \pm\sqrt{3}$

$\Rightarrow h' = +++ \underset{-\sqrt{3}}{|} --- \underset{\sqrt{3}}{|} +++$, increasing on $\left(-\infty, -\sqrt{3}\right)$ and $\left(\sqrt{3}, \infty\right)$, decreasing on $\left(-\sqrt{3}, \sqrt{3}\right)$

(b) a local maximum is $h\left(-\sqrt{3}\right) = 12\sqrt{3}$ at $x = -\sqrt{3}$; local minimum is $h\left(\sqrt{3}\right) = -12\sqrt{3}$ at $x = \sqrt{3}$

(c) no absolute extrema

(d)



13. (a) $f(\theta) = 3\theta^2 - 4\theta^3 \Rightarrow f'(\theta) = 6\theta - 12\theta^2 = 6\theta(1 - 2\theta) \Rightarrow$ critical points at $\theta = 0, \frac{1}{2} \Rightarrow f' = --- \underset{0}{|} +++ \underset{1/2}{|} ---$,

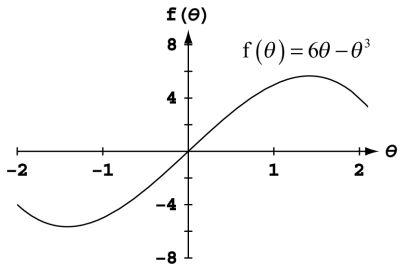
increasing on $\left(0, \frac{1}{2}\right)$, decreasing on $(-\infty, 0)$ and $\left(\frac{1}{2}, \infty\right)$

(b) a local maximum is $f\left(\frac{1}{2}\right) = \frac{1}{4}$ at $\theta = \frac{1}{2}$, a local minimum is $f(0) = 0$ at $\theta = 0$

(c) no absolute extrema

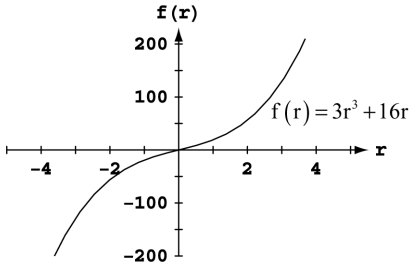
(d)

14. (a) $f(\theta) = 6\theta - \theta^3 \Rightarrow f'(\theta) = 6 - 3\theta^2 = 3\left(\sqrt{2} - \theta\right)\left(\sqrt{2} + \theta\right) \Rightarrow$ critical points at $\theta = \pm\sqrt{2} \Rightarrow$



$f' = --- \underset{-\sqrt{2}}{|} +++ \underset{\sqrt{2}}{|} ---$, increasing on $\left(-\sqrt{2}, \sqrt{2}\right)$, decreasing on $\left(-\infty, -\sqrt{2}\right)$ and $\left(\sqrt{2}, \infty\right)$

(b) a local maximum is $f\left(\sqrt{2}\right) = 4\sqrt{2}$ at $\theta = \sqrt{2}$, a local minimum is $f\left(-\sqrt{2}\right) = -4\sqrt{2}$ at $\theta = -\sqrt{2}$



(c) no absolute extrema

47. $f(x) = x^3 - 3x + 2 \Rightarrow f'(x) = 3x^2 - 3 = 3(x-1)(x+1) \Rightarrow f' = +++ \,|_{-1}\, --- \,|_{1}\, +++ \Rightarrow$ rising for $x = c = 2$ since $f'(x) > 0$ for $x = c = 2$.

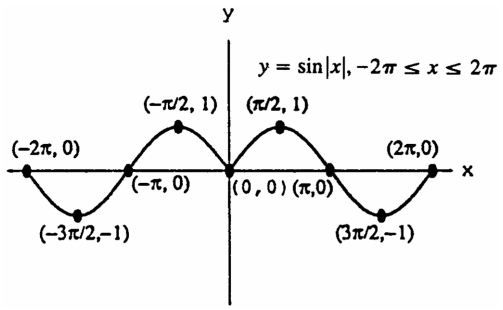
48. $f(x) = ax^2 + bx + c = a\left(x^2 + \frac{b}{a}x\right) + c = a\left(x^2 + \frac{b}{a}x + \frac{b^2}{4a^2}\right) - \frac{b^2}{4a} + c = a\left(x + \frac{b}{2a}\right)^2 - \frac{b^2 - 4ac}{4a}$, a parabola whose vertex is at $x = -\frac{b}{2a}$. Thus when $a > 0$, f is increasing on $\left(\frac{-b}{2a}, \infty\right)$ and decreasing on $\left(-\infty, \frac{-b}{2a}\right)$; when $a < 0$, f is increasing on $\left(-\infty, \frac{-b}{2a}\right)$ and decreasing on $\left(\frac{-b}{2a}, \infty\right)$. Also note that $f'(x) = 2ax + b = 2a\left(x + \frac{b}{2a}\right) \Rightarrow$ for $a > 0$, $f' = --- \,|_{-b/2a}\, +++$; for $a < 0$, $f' = +++ \,|_{-b/2a}\, ---$.

## 4.4 CONCAVITY AND CURVE SKETCHING

1. $y = \frac{x^3}{3} - \frac{x^2}{2} - 2x + \frac{1}{3} \Rightarrow y' = x^2 - x - 2 = (x-2)(x+1) \Rightarrow y'' = 2x - 1 = 2\left(x - \frac{1}{2}\right)$. The graph is rising on $(-\infty, -1)$ and $(2, \infty)$, falling on $(-1, 2)$, concave up on $\left(\frac{1}{2}, \infty\right)$ and concave down on $\left(-\infty, \frac{1}{2}\right)$. Consequently, a local maximum is $\frac{3}{2}$ at $x = -1$, a local minimum is $-3$ at $x = 2$, and $\left(\frac{1}{2}, -\frac{3}{4}\right)$ is a point of inflection.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

2. $y = \frac{x^4}{4} - 2x^2 + 4 \Rightarrow y' = x^3 - 4x = x(x^2-4) = x(x+2)(x-2) \Rightarrow y'' = 3x^2 - 4 = \left(\sqrt{3}x + 2\right)\left(\sqrt{3}x - 2\right)$. The graph is rising on $(-2, 0)$ and $(2, \infty)$, falling on $(-\infty, -2)$ and $(0, 2)$, concave up on $\left(-\infty, \frac{2}{\sqrt{3}}\right)$ and $\left(\frac{2}{\sqrt{3}}, \infty\right)$ and concave down on $\left(-\frac{2}{\sqrt{3}}, \frac{2}{\sqrt{3}}\right)$. Consequently, a local maximum is 4 at $x = 0$, local minima are 0 at $x = \pm 2$, and $\left(-\frac{2}{\sqrt{3}}, \frac{16}{9}\right)$ and $\left(\frac{2}{\sqrt{3}}, \frac{16}{9}\right)$ are points of inflection.

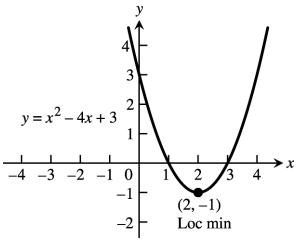


3. $y = \frac{3}{4}(x^2-1)^{2/3} \Rightarrow y' = \left(\frac{3}{4}\right)\left(\frac{2}{3}\right)(x^2-1)^{-1/3}(2x) = x(x^2-1)^{-1/3}$, $y'$ = $---)\,(+++\,|\,---)(+++$ ($-1$, $0$, $1$) $\Rightarrow$ the graph is rising on $(-1, 0)$ and $(1, \infty)$, falling on $(-\infty, -1)$ and $(0, 1) \Rightarrow$ a local maximum is $\frac{3}{4}$ at $x = 0$, local minima are 0 at $x = \pm 1$; $y'' = (x^2-1)^{-1/3} + (x)\left(-\frac{1}{3}\right)(x^2-1)^{-4/3}(2x) = \frac{x^2-3}{3\sqrt[3]{(x^2-1)^4}}$,
$y''$ = $+++\,|\,---)\,(---)(---\,|\,+++ \Rightarrow$ the graph is concave up on $\left(-\infty, -\sqrt{3}\right)$ and $\left(\sqrt{3}, \infty\right)$, concave down on $\left(-\sqrt{3}, \sqrt{3}\right) \Rightarrow$ points of inflection at $\left(\pm\sqrt{3}, \frac{3\sqrt[3]{4}}{4}\right)$ ($-\sqrt{3}$, $-1$, $1$, $\sqrt{3}$)

4. $y = \frac{9}{14}x^{1/3}(x^2-7) \Rightarrow y' = \frac{3}{14}x^{-2/3}(x^2-7) + \frac{9}{14}x^{1/3}(2x) = \frac{3}{2}x^{-2/3}(x^2-1)$, $y'$ = $+++\,|\,---)(---\,|\,+++$ ($-1$, $0$, $1$) $\Rightarrow$ the graph is rising on $(-\infty, -1)$ and $(1, \infty)$, falling on $(-1, 1) \Rightarrow$ a local maximum is $\frac{27}{7}$ at $x = -1$, a local minimum is $-\frac{27}{7}$ at $x = 1$; $y'' = -x^{-5/3}(x^2-1) + 3x^{1/3} = 2x^{1/3} + x^{-5/3} = x^{-5/3}(2x^2+1)$,
$y''$ = $---)(+++ \Rightarrow$ the graph is concave up on $(0, \infty)$, concave down on $(-\infty, 0) \Rightarrow$ a point of inflection at $(0, 0)$ ($0$)

5. $y = x + \sin 2x \Rightarrow y' = 1 + 2\cos 2x$, $y'$ = $[\,---\,|\,+++\,|\,---\,]$ ($-2\pi/3$, $-\pi/3$, $\pi/3$, $2\pi/3$) $\Rightarrow$ the graph is rising on $\left(-\frac{\pi}{3}, \frac{\pi}{3}\right)$, falling on $\left(-\frac{2\pi}{3}, -\frac{\pi}{3}\right)$ and $\left(\frac{\pi}{3}, \frac{2\pi}{3}\right) \Rightarrow$ local maxima are $-\frac{2\pi}{3} + \frac{\sqrt{3}}{2}$ at $x = -\frac{2\pi}{3}$ and $\frac{\pi}{3} + \frac{\sqrt{3}}{2}$ at $x = \frac{\pi}{3}$, local minima are $-\frac{\pi}{3} - \frac{\sqrt{3}}{2}$ at $x = -\frac{\pi}{3}$ and $\frac{2\pi}{3} - \frac{\sqrt{3}}{2}$ at $x = \frac{2\pi}{3}$; $y'' = -4\sin 2x$, $y''$ = $[\,---\,|\,+++\,|\,---\,|\,+++\,]$ ($-2\pi/3$, $-\pi/2$, $0$, $\pi/2$, $2\pi/3$) $\Rightarrow$ the graph is concave up on $\left(-\frac{\pi}{2}, 0\right)$ and $\left(\frac{\pi}{2}, \frac{2\pi}{3}\right)$, concave down on $\left(-\frac{2\pi}{3}, -\frac{\pi}{2}\right)$ and $\left(0, \frac{\pi}{2}\right) \Rightarrow$ points of inflection at $\left(-\frac{\pi}{2}, -\frac{\pi}{2}\right)$, $(0, 0)$, and $\left(\frac{\pi}{2}, \frac{\pi}{2}\right)$

6. $y = \tan x - 4x \Rightarrow y' = \sec^2 x - 4$, $y'$ = $(\,+++\,|\,---\,|\,+++\,)$ ($-\pi/2$, $-\pi/3$, $\pi/3$, $\pi/2$) $\Rightarrow$ the graph is rising on $\left(-\frac{\pi}{2}, -\frac{\pi}{3}\right)$ and $\left(\frac{\pi}{3}, \frac{\pi}{2}\right)$, falling on $\left(-\frac{\pi}{3}, \frac{\pi}{3}\right) \Rightarrow$ a local maximum is $-\sqrt{3} + \frac{4\pi}{3}$ at $x = -\frac{\pi}{3}$, a local minimum is $\sqrt{3} - \frac{4\pi}{3}$ at $x = \frac{\pi}{3}$; $y'' = 2(\sec x)(\sec x)(\tan x) = 2(\sec^2 x)(\tan x)$, $y''$ = $(\,---\,|\,+++\,)$ ($-\pi/2$, $0$, $\pi/2$) $\Rightarrow$ the graph is concave up on $\left(0, \frac{\pi}{2}\right)$, concave down on $\left(-\frac{\pi}{2}, 0\right) \Rightarrow$ a point of inflection at $(0, 0)$



7. If $x \geq 0$, $\sin|x| = \sin x$ and if $x < 0$, $\sin|x| = \sin(-x) = -\sin x$. From the sketch the graph is rising on $\left(-\frac{3\pi}{2}, -\frac{\pi}{2}\right)$, $\left(0, \frac{\pi}{2}\right)$ and $\left(\frac{3\pi}{2}, 2\pi\right)$, falling on $\left(-2\pi, -\frac{3\pi}{2}\right)$, $\left(-\frac{\pi}{2}, 0\right)$ and $\left(\frac{\pi}{2}, \frac{3\pi}{2}\right)$; local minima are $-1$ at $x = \pm\frac{3\pi}{2}$ and 0 at $x = 0$; local maxima are 1 at $x = \pm\frac{\pi}{2}$ and 0 at $x = \pm 2\pi$; concave up on $(-2\pi, -\pi)$ and $(\pi, 2\pi)$, and concavedown on $(-\pi, 0)$ and $(0, \pi) \Rightarrow$ points of inflection are $(-\pi, 0)$ and $(\pi, 0)$

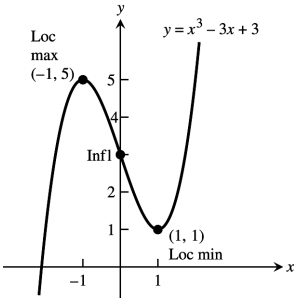
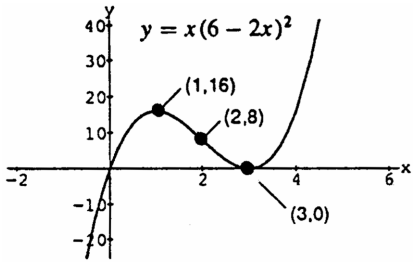
8. $y = 2\cos x - \sqrt{2}x \Rightarrow y' = -2\sin x - \sqrt{2}$, $y' = \underset{-\pi}{[} \text{---} \underset{-3\pi/4}{|} \text{+++} \underset{-\pi/4}{|} \text{---} \underset{5\pi/4}{|} \text{+++} \underset{3\pi/2}{]} \Rightarrow$ rising on $\left(-\frac{3\pi}{4}, -\frac{\pi}{4}\right)$and $\left(\frac{5\pi}{4}, \frac{3\pi}{2}\right)$, falling on $\left(-\pi, -\frac{3\pi}{4}\right)$ and $\left(-\frac{\pi}{4}, \frac{5\pi}{4}\right) \Rightarrow$ local maxima are $-2 + \pi\sqrt{2}$ at $x = -\pi$, $\sqrt{2} + \frac{\pi\sqrt{2}}{4}$ at $x = -\frac{\pi}{4}$ and $-\frac{3\pi\sqrt{2}}{2}$ at $x = \frac{3\pi}{2}$, and local minima are $-\sqrt{2} + \frac{3\pi\sqrt{2}}{4}$ at $x = -\frac{3\pi}{4}$ and $-\sqrt{2} - \frac{5\pi\sqrt{2}}{4}$ at $x = \frac{5\pi}{4}$; $y'' = -2\cos x$, $y'' = \underset{-\pi}{[} \text{+++} \underset{-\pi/2}{|} \text{---} \underset{\pi/2}{|} \text{+++} \underset{3\pi/2}{]} \Rightarrow$ concave up on $\left(-\pi, -\frac{\pi}{2}\right)$ and $\left(\frac{\pi}{2}, \frac{3\pi}{2}\right)$, concave down on $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right) \Rightarrow$ points of inflection at $\left(-\frac{\pi}{2}, \frac{\sqrt{2}\pi}{2}\right)$ and $\left(\frac{\pi}{2}, -\frac{\sqrt{2}\pi}{2}\right)$

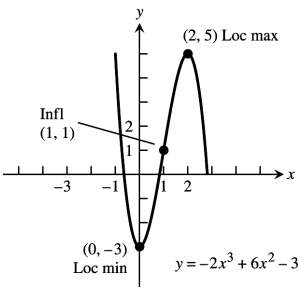


9. When $y = x^2 - 4x + 3$, then $y' = 2x - 4 = 2(x - 2)$ and $y'' = 2$. The curve rises on $(2, \infty)$ and falls on $(-\infty, 2)$. At $x = 2$ there is a minimum. Since $y'' > 0$, the curve is concave up for all x.

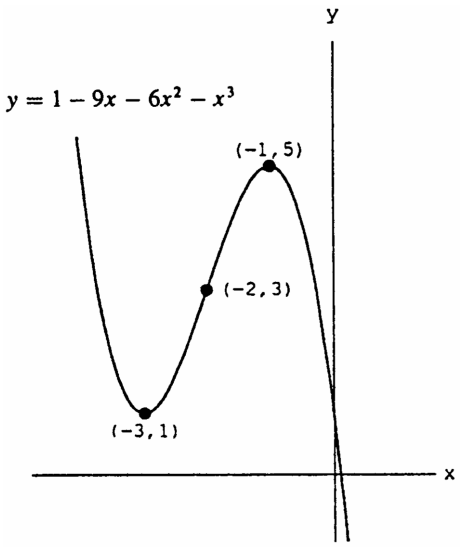


10. When $y = 6 - 2x - x^2$, then $y' = -2 - 2x = -2(1 + x)$ and $y'' = -2$. The curve rises on $(-\infty, -1)$ and falls on $(-1, \infty)$. At $x = -1$ there is a maximum. Since $y'' < 0$, the curve is concave down for all x.

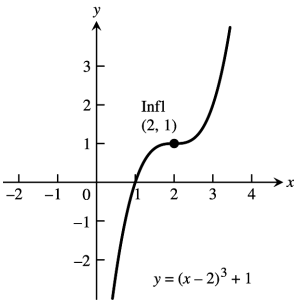
11. When $y = x^3 - 3x + 3$, then $y' = 3x^2 - 3 = 3(x - 1)(x + 1)$ and $y'' = 6x$. The curve rises on $(-\infty, -1) \cup (1, \infty)$ and falls on $(-1, 1)$. At $x = -1$ there is a local maximum and at $x = 1$ a local minimum. The curve is concave down on $(-\infty, 0)$ and concave up on $(0, \infty)$. There is a point of inflection at $x = 0$.



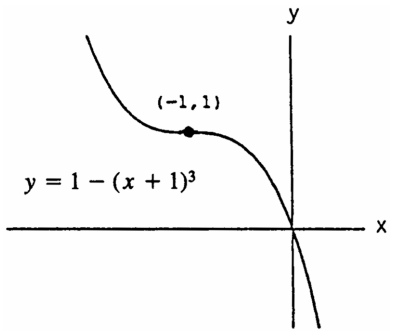
12. When $y = x(6 - 2x)^2$, then $y' = -4x(6 - 2x) + (6 - 2x)^2$ $= 12(3 - x)(1 - x)$ and $y'' = -12(3 - x) - 12(1 - x)$ $= 24(x - 2)$. The curve rises on $(-\infty, 1) \cup (3, \infty)$ and falls on $(1, 3)$. The curve is concave down on $(-\infty, 2)$ and concave up on $(2, \infty)$. At $x = 2$ there is a point of inflection.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

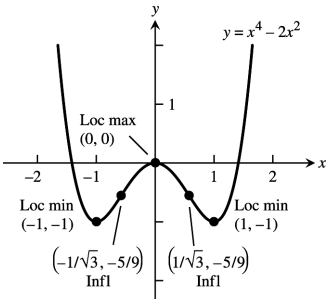


13. When $y = -2x^3 + 6x^2 - 3$, then $y' = -6x^2 + 12x = -6x(x - 2)$ and $y'' = -12x + 12 = -12(x - 1)$. The curve rises on $(0, 2)$ and falls on $(-\infty, 0)$ and $(2, \infty)$. At $x = 0$ there is a local minimum and at $x = 2$ a local maximum. The curve is concave up on $(-\infty, 1)$ and concave down on $(1, \infty)$. At $x = 1$ there is a point of inflection.

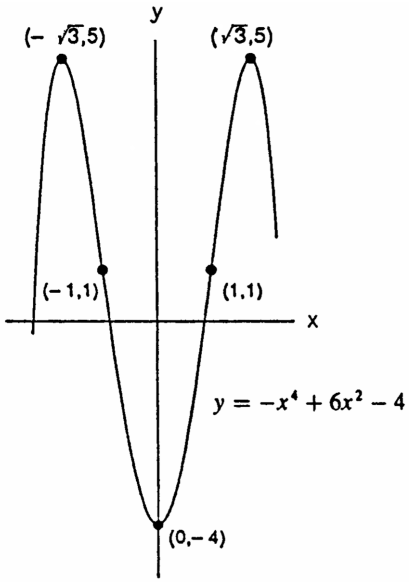


14. When $y = 1 - 9x - 6x^2 - x^3$, then $y' = -9 - 12x - 3x^2 = -3(x + 3)(x + 1)$ and $y'' = -12 - 6x = -6(x + 2)$. The curve rises on $(-3, -1)$ and falls on $(-\infty, -3)$ and $(-1, \infty)$. At $x = -1$ there is a local maximum and at $x = -3$ a local minimum. The curve is concave up on $(-\infty, -2)$ and concave down on $(-2, \infty)$. At $x = -2$ there is a point of inflection.

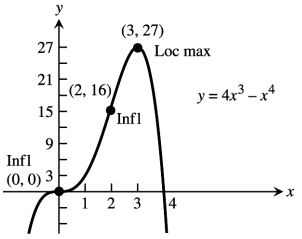
15. When $y = (x - 2)^3 + 1$, then $y' = 3(x - 2)^2$ and $y'' = 6(x - 2)$. The curve never falls and there are no local extrema. The curve is concave down on $(-\infty, 2)$ and concave up on $(2, \infty)$. At $x = 2$ there is a point of inflection.



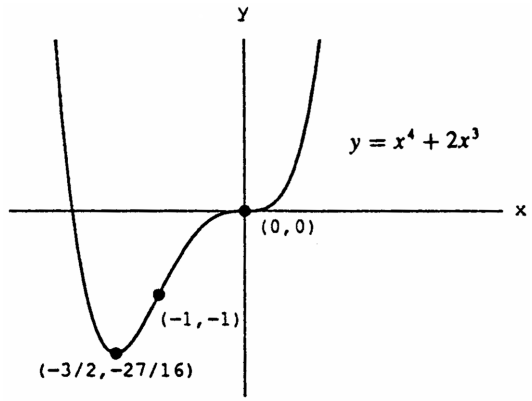
16. When $y = 1 - (x + 1)^3$, then $y' = -3(x + 1)^2$ and $y'' = -6(x + 1)$. The curve never rises and there are no local extrema. The curve is concave up on $(-\infty, -1)$ and concave down on $(-1, \infty)$. At $x = -1$ there is a point of inflection.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

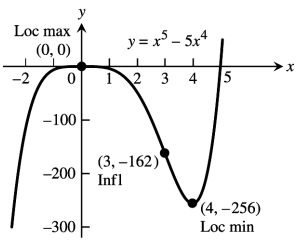


17. When $y = x^4 - 2x^2$, then $y' = 4x^3 - 4x = 4x(x+1)(x-1)$ and $y'' = 12x^2 - 4 = 12\left(x + \frac{1}{\sqrt{3}}\right)\left(x - \frac{1}{\sqrt{3}}\right)$. The curve rises on $(-1, 0)$ and $(1, \infty)$ and falls on $(-\infty, -1)$ and $(0, 1)$. At $x = \pm 1$ there are local minima and at $x = 0$ a local maximum. The curve is concave up on $\left(-\infty, -\frac{1}{\sqrt{3}}\right)$ and $\left(\frac{1}{\sqrt{3}}, \infty\right)$ and concave down on $\left(-\frac{1}{\sqrt{3}}, \frac{1}{\sqrt{3}}\right)$. At $x = \frac{\pm 1}{\sqrt{3}}$ there are points of inflection.

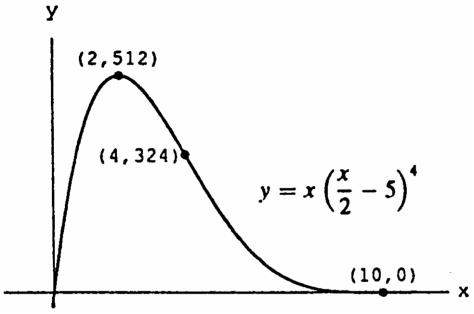


18. When $y = -x^4 + 6x^2 - 4$, then $y' = -4x^3 + 12x$ $= -4x\left(x + \sqrt{3}\right)\left(x - \sqrt{3}\right)$ and $y'' = -12x^2 + 12$ $= -12(x+1)(x-1)$. The curve rises on $\left(-\infty, -\sqrt{3}\right)$ and $\left(0, \sqrt{3}\right)$, and falls on $\left(-\sqrt{3}, 0\right)$ and $\left(\sqrt{3}, \infty\right)$. At $x = \pm\sqrt{3}$there are local maxima and at $x = 0$ a local minimum. The curve is concave up on $(-1, 1)$ and concave down on $(-\infty, -1)$ and $(1, \infty)$. At $x = \pm 1$ there are points of inflection.

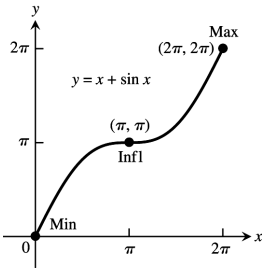
19. When $y = 4x^3 - x^4$, then $y' = 12x^2 - 4x^3 = 4x^2(3 - x)$ and $y'' = 24x - 12x^2 = 12x(2 - x)$. The curve rises on $(-\infty, 3)$ and falls on $(3, \infty)$. At $x = 3$ there is a local maximum, but there is no local minimum. The graph is concave up on $(0,\ 2)$ and concave down on $(-\infty,\ 0)$ and $(2,\ \infty)$. There are inflection points at $x = 0$ and $x = 2$.



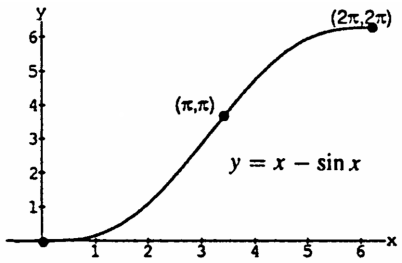
20. When $y = x^4 + 2x^3$, then $y' = 4x^3 + 6x^2 = 2x^2(2x + 3)$ and $y'' = 12x^2 + 12x = 12x(x+1)$. The curve rises on $\left(-\frac{3}{2}, \infty\right)$ and falls on $\left(-\infty, -\frac{3}{2}\right)$. There is a local minimum at $x = -\frac{3}{2}$, but no local maximum. The curve is concave up on $(-\infty, -1)$ and $(0, \infty)$, and concave down on $(-1, 0)$. At $x = -1$ and $x = 0$ there are points of inflection.



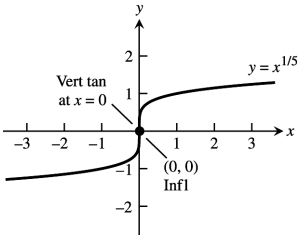
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



21. When $y = x^5 - 5x^4$, then $y' = 5x^4 - 20x^3 = 5x^3(x-4)$ and $y'' = 20x^3 - 60x^2 = 20x^2(x-3)$. The curve rises on $(-\infty, 0)$ and $(4, \infty)$, and falls on $(0, 4)$. There is a local maximum at $x = 0$, and a local minimum at $x = 4$. The curve is concave down on $(-\infty, 3)$ and concave up on $(3, \infty)$. At $x = 3$ there is a point of inflection.

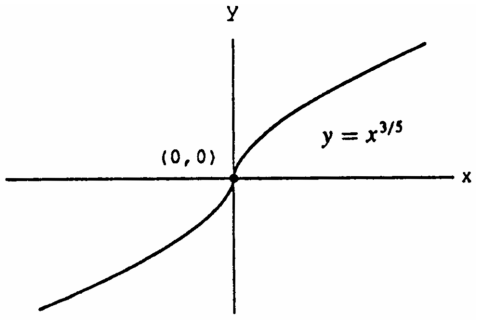


22. When $y = x\left(\frac{x}{2} - 5\right)^4$, then $y' = \left(\frac{x}{2} - 5\right)^4 + x(4)\left(\frac{x}{2} - 5\right)^3\left(\frac{1}{2}\right)$ $= \left(\frac{x}{2} - 5\right)^3\left(\frac{5x}{2} - 5\right)$, and $y'' = 3\left(\frac{x}{2} - 5\right)^2\left(\frac{1}{2}\right)\left(\frac{5x}{2} - 5\right)$ $+ \left(\frac{x}{2} - 5\right)^3\left(\frac{5}{2}\right) = 5\left(\frac{x}{2} - 5\right)^2(x - 4)$. The curve is rising on $(-\infty, 2)$ and $(10, \infty)$, and falling on $(2, 10)$. There is a local maximum at $x = 2$ and a local minimum at $x = 10$. The curve is concave down on $(-\infty, 4)$ and concave up on $(4, \infty)$. At $x = 4$ there is a point of inflection.

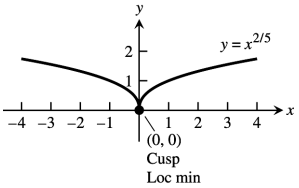


23. When $y = x + \sin x$, then $y' = 1 + \cos x$ and $y'' = -\sin x$. The curve rises on $(0, 2\pi)$. At $x = 0$ there is a local and absolute minimum and at $x = 2\pi$ there is a local and absolute maximum. The curve is concave down on $(0, \pi)$ and concave up on $(\pi, 2\pi)$. At $x = \pi$ there is a point of inflection.

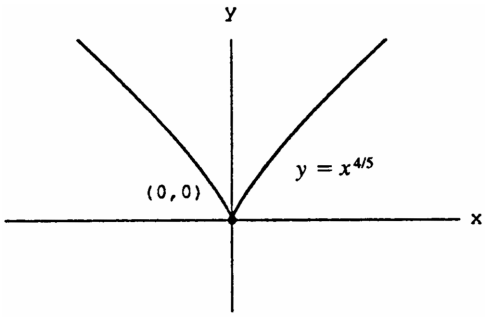
24. When $y = x - \sin x$, then $y' = 1 - \cos x$ and $y'' = \sin x$. The curve rises on $(0, 2\pi)$. At $x = 0$ there is a local and absolute minimum and at $x = 2\pi$ there is a local and absolute maximum. The curve is concave up on $(0, \pi)$ and concave down on $(\pi, 2\pi)$. At $x = \pi$ there is a point of inflection.



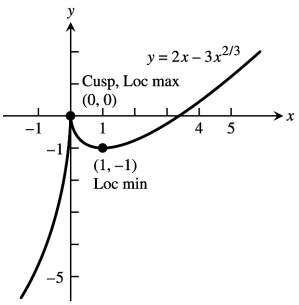
25. When $y = x^{1/5}$, then $y' = \frac{1}{5}x^{-4/5}$ and $y'' = -\frac{4}{25}x^{-9/5}$. The curve rises on $(-\infty, \infty)$ and there are no extrema. The curve is concave up on $(-\infty, 0)$ and concave down on $(0, \infty)$. At $x = 0$ there is a point of inflection.



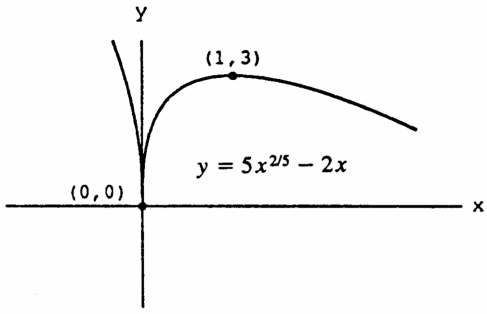
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



26. When $y = x^{3/5}$, then $y' = \frac{3}{5}x^{-2/5}$ and $y'' = -\frac{6}{25}x^{-7/5}$. The curve rises on $(-\infty, \infty)$ and there are no extrema. The curve is concave up on $(-\infty, 0)$ and concave down on $(0, \infty)$. At $x = 0$ there is a point of inflection.

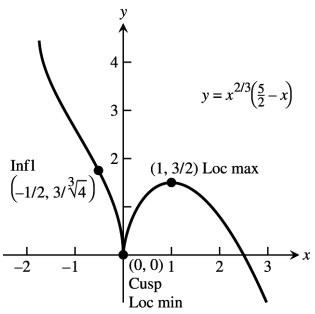


27. When $y = x^{2/5}$, then $y' = \frac{2}{5}x^{-3/5}$ and $y'' = -\frac{6}{25}x^{-8/5}$. The curve is rising on $(0, \infty)$ and falling on $(-\infty, 0)$. At $x = 0$ there is a local and absolute minimum. There is no local or absolute maximum. The curve is concave down on $(-\infty, 0)$ and $(0, \infty)$. There are no points of inflection, but a cusp exists at $x = 0$.

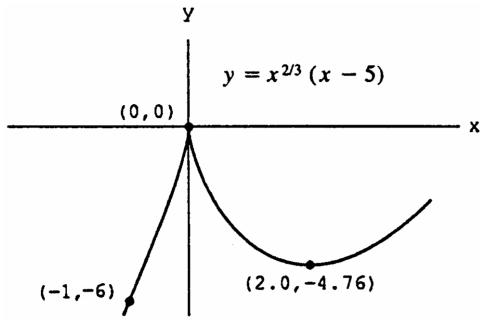


28. When $y = x^{4/5}$, then $y' = \frac{4}{5}x^{-1/5}$ and $y'' = -\frac{4}{25}x^{-6/5}$. The curve is rising on $(0, \infty)$ and falling on $(-\infty, 0)$. At $x = 0$ there is a local and absolute minimum. There is no local or absolute maximum. The curve is concave down on $(-\infty, 0)$ and $(0, \infty)$. There are no points of inflection, but a cusp exists at $x = 0$.

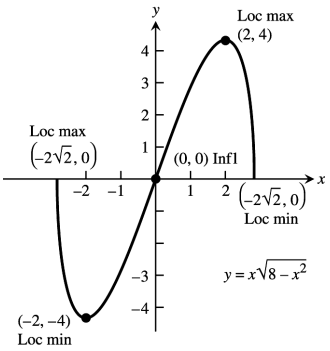
29. When $y = 2x - 3x^{2/3}$, then $y' = 2 - 2x^{-1/3}$ and $y'' = \frac{2}{3}x^{-4/3}$. The curve is rising on $(-\infty, 0)$ and $(1, \infty)$, and falling on $(0, 1)$. There is a local maximum at $x = 0$ and a local minimum at $x = 1$. The curve is concave up on $(-\infty, 0)$ and $(0, \infty)$. There are no points of inflection, but a cusp exists at $x = 0$.



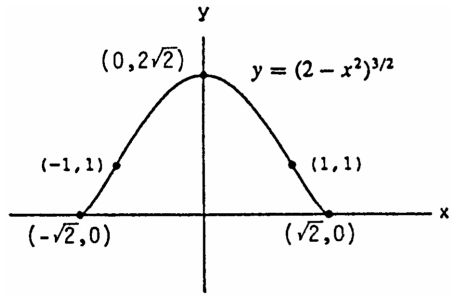
30. When $y = 5x^{2/5} - 2x$, then $y' = 2x^{-3/5} - 2 = 2\left(x^{-3/5} - 1\right)$ and $y'' = -\frac{6}{5}x^{-8/5}$. The curve is rising on $(0, 1)$ and falling on $(-\infty, 0)$ and $(1, \infty)$. There is a local minimum at $x = 0$ and a local maximum at $x = 1$. The curve is concave down on $(-\infty, 0)$ and $(0, \infty)$. There are no points of inflection, but a cusp exists at $x = 0$.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

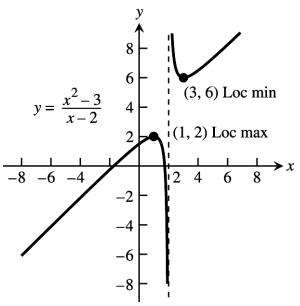


31. When $y = x^{2/3}\left(\frac{5}{2} - x\right) = \frac{5}{2}x^{2/3} - x^{5/3}$, then
$y' = \frac{5}{3}x^{-1/3} - \frac{5}{3}x^{2/3} = \frac{5}{3}x^{-1/3}(1 - x)$ and
$y'' = -\frac{5}{9}x^{-4/3} - \frac{10}{9}x^{-1/3} = -\frac{5}{9}x^{-4/3}(1 + 2x)$.
The curve is rising on $(0, 1)$ and falling on $(-\infty, 0)$ and $(1, \infty)$. There is a local minimum at $x = 0$ and a local maximum at $x = 1$. The curve is concave up on $\left(-\infty, -\frac{1}{2}\right)$ and concave down on $\left(-\frac{1}{2}, 0\right)$ and $(0, \infty)$. There is a point of inflection at $x = -\frac{1}{2}$ and a cusp at $x = 0$.

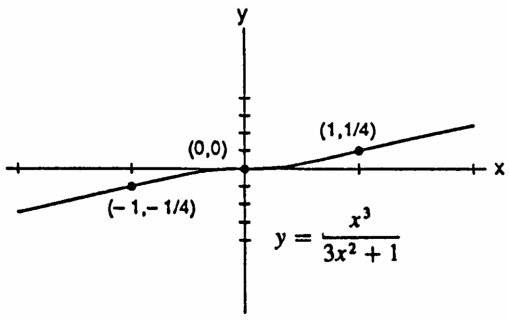


32. When $y = x^{2/3}(x - 5) = x^{5/3} - 5x^{2/3}$, then
$y' = \frac{5}{3}x^{2/3} - \frac{10}{3}x^{-1/3} = \frac{5}{3}x^{-1/3}(x - 2)$ and
$y'' = \frac{10}{9}x^{-1/3} + \frac{10}{9}x^{-4/3} = \frac{10}{9}x^{-4/3}(x + 1)$. The curve is rising on $(-\infty, 0)$ and $(2, \infty)$, and falling on $(0, 2)$. There is a local minimum at $x = 2$ and a local maximum at $x = 0$. The curve is concave up on $(-1, 0)$ and $(0, \infty)$, and concave down on $(-\infty, -1)$. There is a point of inflection at $x = -1$ and a cusp at $x = 0$.

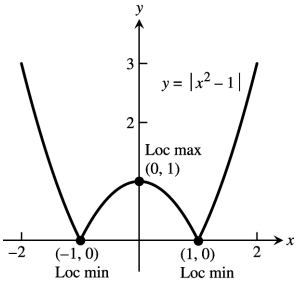
33. When $y = x\sqrt{8 - x^2} = x(8 - x^2)^{1/2}$, then
$y' = (8 - x^2)^{1/2} + (x)\left(\frac{1}{2}\right)(8 - x^2)^{-1/2}(-2x)$
$= (8 - x^2)^{-1/2}(8 - 2x^2) = \frac{2(2 - x)(2 + x)}{\sqrt{\left(2\sqrt{2} + x\right)\left(2\sqrt{2} - x\right)}}$ and
$y'' = \left(-\frac{1}{2}\right)(8 - x^2)^{-\frac{3}{2}}(-2x)(8 - 2x^2) + (8 - x^2)^{-\frac{1}{2}}(-4x)$
$= \frac{2x(x^2 - 12)}{\sqrt{(8 - x^2)^3}}$. The curve is rising on $(-2, 2)$, and falling on $\left(-2\sqrt{2}, -2\right)$ and $\left(2, 2\sqrt{2}\right)$. There are local minima $x = -2$ and $x = 2\sqrt{2}$, and local maxima at $x = -2\sqrt{2}$ and $x = 2$. The curve is concave up on $\left(-2\sqrt{2}, 0\right)$ and concave down on $\left(0, 2\sqrt{2}\right)$. There is a point of inflection at $x = 0$.



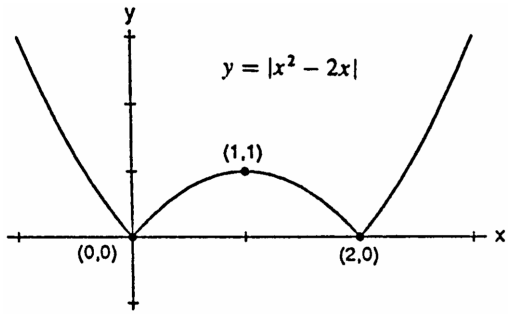
34. When $y = (2 - x^2)^{3/2}$, then $y' = \left(\frac{3}{2}\right)(2 - x^2)^{1/2}(-2x)$
$= -3x\sqrt{2 - x^2} = -3x\sqrt{\left(\sqrt{2} - x\right)\left(\sqrt{2} + x\right)}$ and
$y'' = (-3)(2 - x^2)^{1/2} + (-3x)\left(\frac{1}{2}\right)(2 - x^2)^{-1/2}(-2x)$
$= \frac{-6(1 - x)(1 + x)}{\sqrt{\left(\sqrt{2} - x\right)\left(\sqrt{2} + x\right)}}$. The curve is rising on $\left(-\sqrt{2}, 0\right)$ and falling on $\left(0, \sqrt{2}\right)$. There is a local maximum at $x = 0$, and local minima at $x = \pm\sqrt{2}$. The curve is concave down on $(-1, 1)$ and concave up on $\left(-\sqrt{2}, -1\right)$ and $\left(1, \sqrt{2}\right)$. There are points of inflection at $x = \pm 1$.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



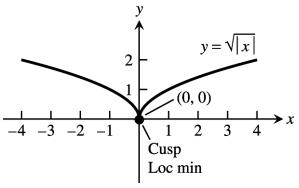
35. When $y = \frac{x^2-3}{x-2}$, then $y' = \frac{2x(x-2)-(x^2-3)(1)}{(x-2)^2}$
$= \frac{(x-3)(x-1)}{(x-2)^2}$ and
$y'' = \frac{(2x-4)(x-2)^2-(x^2-4x+3)2(x-2)}{(x-2)^4} = \frac{2}{(x-2)^3}$.
The curve is rising on $(-\infty, 1)$ and $(3, \infty)$, and falling on $(1, 2)$ and $(2, 3)$. There is a local maximum at $x = 1$ and a local minimum at $x = 3$. The curve is concave down on $(-\infty, 2)$ and concave up on $(2, \infty)$. There are no points of inflection because $x = 2$ is not in the domain.



36. When $y = \frac{x^3}{3x^2+1}$, then $y' = \frac{3x^2(3x^2+1)-x^3(6x)}{(3x^2+1)^2}$
$= \frac{3x^2(x^2+1)}{(3x^2+1)^2}$ and
$y'' = \frac{(12x^3+6x)(3x^2+1)^2-2(3x^2+1)(6x)(3x^4+3x^2)}{(3x^2+1)^4}$
$= \frac{6x(1-x)(1+x)}{(3x^2+1)^3}$. The curve is rising on $(-\infty, \infty)$ so there are no local extrema. The curve is concave up on $(-\infty, -1)$ and $(0, 1)$, and concave down on $(-1, 0)$ and $(1, \infty)$. There are points of inflection at $x = -1$, $x = 0$, and $x = 1$.

37. When $y = |x^2 - 1| = \begin{cases} x^2 - 1, & |x| \geq 1 \\ 1 - x^2, & |x| < 1 \end{cases}$, then
$y' = \begin{cases} 2x, & |x| > 1 \\ -2x, & |x| < 1 \end{cases}$ and $y'' = \begin{cases} 2, & |x| > 1 \\ -2, & |x| < 1 \end{cases}$. The curve rises on $(-1, 0)$ and $(1, \infty)$ and falls on $(-\infty, -1)$ and $(0, 1)$. There is a local maximum at $x = 0$ and local minima at $x = \pm 1$. The curve is concave up on $(-\infty, -1)$ and $(1, \infty)$, and concave down on $(-1, 1)$. There are no points of inflection because y is not differentiable at $x = \pm 1$ (so there is no tangent line at those points).

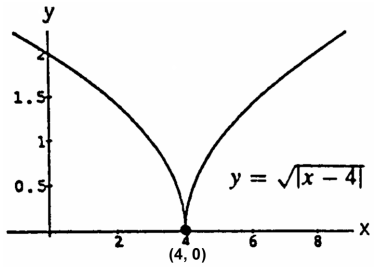
38. When $y = |x^2 - 2x| = \begin{cases} x^2 - 2x, & x < 0 \\ 2x - x^2, & 0 \leq x \leq 2 \\ x^2 - 2x, & x > 2 \end{cases}$, then
$y' = \begin{cases} 2x - 2, & x < 0 \\ 2 - 2x, & 0 < x < 2 \\ 2x - 2, & x > 2 \end{cases}$, and $y'' = \begin{cases} 2, & x < 0 \\ -2, & 0 < x < 2 \\ 2, & x > 2 \end{cases}$.
The curve is rising on $(0, 1)$ and $(2, \infty)$, and falling on $(-\infty, 0)$ and $(1, 2)$. There is a local maximum at $x = 1$ and local minima at $x = 0$ and $x = 2$. The curve is concave up on $(-\infty, 0)$ and $(2, \infty)$, and concave down on $(0, 2)$. There are no points of inflection because y is not differentiable at $x = 0$ and $x = 2$ (so there is no tangent at those points).



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

39. When $y = \sqrt{|x|} = \begin{cases} \sqrt{x}, & x \geq 0 \\ \sqrt{-x}, & x < 0 \end{cases}$, then

$y' = \begin{cases} \frac{1}{2\sqrt{x}}, & x > 0 \\ \frac{-1}{2\sqrt{-x}}, & x < 0 \end{cases}$ and $y'' = \begin{cases} \frac{-x^{-3/2}}{4}, & x > 0 \\ \frac{-(-x)^{-3/2}}{4}, & x < 0 \end{cases}$.

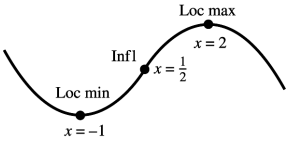


Since $\lim_{x \to 0^-} y' = -\infty$ and $\lim_{x \to 0^+} y' = \infty$ there is a cusp at $x = 0$. There is a local minimum at $x = 0$, but no local maximum. The curve is concave down on $(-\infty, 0)$ and $(0, \infty)$. There are no points of inflection.

40. When $y = \sqrt{|x-4|} = \begin{cases} \sqrt{x-4}, & x \geq 4 \\ \sqrt{4-x}, & x < 4 \end{cases}$, then

$y' = \begin{cases} \frac{1}{2\sqrt{x-4}}, & x > 4 \\ \frac{-1}{2\sqrt{4-x}}, & x < 4 \end{cases}$ and $y'' = \begin{cases} \frac{-(x-4)^{-3/2}}{4}, & x > 4 \\ \frac{-(4-x)^{-3/2}}{4}, & x < 4 \end{cases}$.

Since $\lim_{x \to 4^-} y' = -\infty$ and $\lim_{x \to 4^+} y' = \infty$ there is a cusp at $x = 4$. There is a local minimum at $x = 4$, but no local maximum. The curve is concave down on $(-\infty, 4)$ and $(4, \infty)$. There are no points of inflection.



41. $y' = 2 + x - x^2 = (1 + x)(2 - x)$, $y' = \underset{-1}{---} | \underset{2}{+++} | ---$

$\Rightarrow$ rising on $(-1, 2)$, falling on $(-\infty, -1)$ and $(2, \infty)$

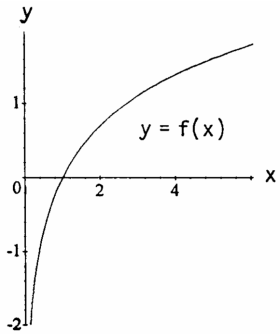
70.

71. Graphs printed in color can shift during a press run, so your values may differ somewhat from those given here.
   (a) The body is moving away from the origin when |displacement| is increasing as t increases, $0 < t < 2$ and $6 < t < 9.5$; the body is moving toward the origin when |displacement| is decreasing as t increases, $2 < t < 6$ and $9.5 < t < 15$
   (b) The velocity will be zero when the slope of the tangent line for $y = s(t)$ is horizontal. The velocity is zero when t is approximately 2, 6, or 9.5 sec.
   (c) The acceleration will be zero at those values of t where the curve $y = s(t)$ has points of inflection. The acceleration is zero when t is approximately 4, 7.5, or 12.5 sec.
   (d) The acceleration is positive when the concavity is up, $4 < t < 7.5$ and $12.5 < t < 15$; the acceleration is negative when the concavity is down, $0 < t < 4$ and $7.5 < t < 12.5$

72. (a) The body is moving away from the origin when |displacement| is increasing as t increases, $1.5 < t < 4$, $10 < t < 12$ and $13.5 < t < 16$; the body is moving toward the origin when |displacement| is decreasing as t increases, $0 < t < 1.5$, $4 < t < 10$ and $12 < t < 13.5$
   (b) The velocity will be zero when the slope of the tangent line for $y = s(t)$ is horizontal. The velocity is zero when t is approximately 0, 4, 12 or 16 sec.
   (c) The acceleration will be zero at those values of t where the curve $y = s(t)$ has points of inflection. The acceleration is zero when t is approximately 1.5, 6, 8, 10.5, or 13.5 sec.
   (d) The acceleration is positive when the concavity is up, $0 < t < 1.5$, $6 < t < 8$ and $10 < t < 13.5$, the acceleration is negative when the concavity is down, $1.5 < t < 6$, $8 < t < 10$ and $13.5 < t < 16$.

73. The marginal cost is $\frac{dc}{dx}$ which changes from decreasing to increasing when its derivative $\frac{d^2c}{dx^2}$ is zero. This is a point of inflection of the cost curve and occurs when the production level x is approximately 60 thousand units.

74. The marginal revenue is $\frac{dy}{dx}$ and it is increasing when its derivative $\frac{d^2y}{dx^2}$ is positive $\Rightarrow$ the curve is concave up $\Rightarrow$ $0 < t < 2$ and $5 < t < 9$; marginal revenue is decreasing when $\frac{d^2y}{dx^2} < 0$ $\Rightarrow$ the curve is concave down $\Rightarrow$ $2 < t < 5$ and $9 < t < 12$.



75. When $y' = (x-1)^2(x-2)$, then $y'' = 2(x-1)(x-2) + (x-1)^2$. The curve falls on $(-\infty, 2)$ and rises on $(2, \infty)$. At $x = 2$ there is a local minimum. There is no local maximum. The curve is concave upward on $(-\infty, 1)$ and

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$\left(\frac{5}{3}, \infty\right)$, and concave downward on $\left(1, \frac{5}{3}\right)$. At $x = 1$ or $x = \frac{5}{3}$ there are inflection points.

76. When $y' = (x-1)^2(x-2)(x-4)$, then $y'' = 2(x-1)(x-2)(x-4) + (x-1)^2(x-4) + (x-1)^2(x-2)$ $= (x-1)\left[2\left(x^2-6x+8\right) + \left(x^2-5x+4\right) + \left(x^2-3x+2\right)\right] = 2(x-1)\left(2x^2-10x+11\right)$. The curve rises on $(-\infty, 2)$ and $(4, \infty)$ and falls on $(2, 4)$. At $x = 2$ there is a local maximum and at $x = 4$ a local minimum. The curve is concave downward on $(-\infty, 1)$ and $\left(\frac{5-\sqrt{3}}{2}, \frac{5+\sqrt{3}}{2}\right)$ and concave upward on $\left(1, \frac{5-\sqrt{3}}{2}\right)$ and $\left(\frac{5+\sqrt{3}}{2}, \infty\right)$. At $x = 1$, $\frac{5-\sqrt{3}}{2}$ and $\frac{5+\sqrt{3}}{2}$ there are inflection points.

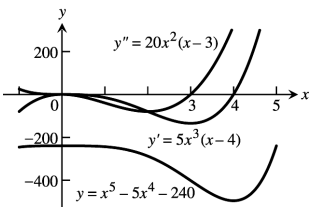
77. The graph must be concave down for $x > 0$ because $f''(x) = -\frac{1}{x^2} < 0$.

78. The second derivative, being continuous and never zero, cannot change sign. Therefore the graph will always be concave up or concave down so it will have no inflection points and no cusps or corners.

79. The curve will have a point of inflection at $x = 1$ if 1 is a solution of $y'' = 0$; $y = x^3 + bx^2 + cx + d$ $\Rightarrow$ $y' = 3x^2 + 2bx + c$ $\Rightarrow$ $y'' = 6x + 2b$ and $6(1) + 2b = 0$ $\Rightarrow$ $b = -3$.

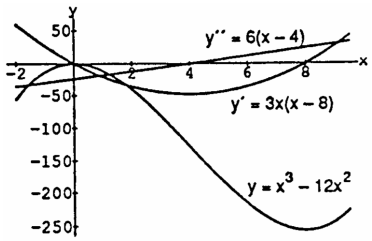
80. (a) True. If $f(x)$ is a polynomial of even degree then $f'$ is of odd degree. Every polynomial of odd degree has at least one real root $\Rightarrow$ $f'(x) = 0$ for some $x = r$ $\Rightarrow$ f has a horizontal tangent at $x = r$.
(b) False. For example, $f(x) = x - 1$ is a polynomial of odd degree but $f'(x) = 1$ is never 0. As another example, $y = \frac{1}{3}x^3 + x^2 + x$ is a polynomial of odd degree, but $y' = x^2 + 2x + 1 = (x+1)^2 > 0$ for all x.

81. (a) $f(x) = ax^2 + bx + c = a\left(x^2 + \frac{b}{a}x\right) + c = a\left(x^2 + \frac{b}{a}x + \frac{b^2}{4a^2}\right) - \frac{b^2}{4a} + c = a\left(x + \frac{b}{2a}\right)^2 - \frac{b^2-4ac}{4a}$ a parabola whose vertex is at $x = -\frac{b}{2a}$ $\Rightarrow$ the coordinates of the vertex are $\left(-\frac{b}{2a}, -\frac{b^2-4ac}{4a}\right)$
(b) The second derivative, $f''(x) = 2a$, describes concavity $\Rightarrow$ when $a > 0$ the parabola is concave up and when $a < 0$ the parabola is concave down.



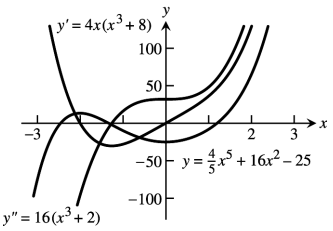
82. No, $f''(x)$ could be decreasing to zero at $x = c$ and then increase again so it would be concave up on every interval even though $f''(x) = 0$. For example $f(x) = x^4$ is always concave up even though $f''(0) = 0$.

83. A quadratic curve never has an inflection point. If $y = ax^2 + bx + c$ where $a \neq 0$, then $y' = 2ax + b$ and $y'' = 2a$. Since $2a$ is a constant, it is not possible for $y''$ to change signs.

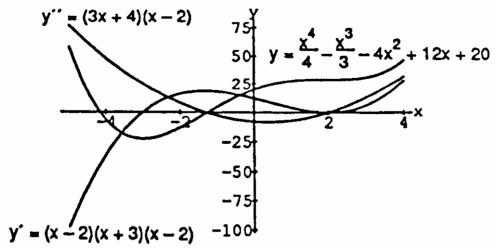


84. A cubic curve always has exactly one inflection point. If $y = ax^3 + bx^2 + cx + d$ where $a \neq 0$, then $y' = 3ax^2 + 2bx + c$ and $y'' = 6ax + 2b$. Since $\frac{-b}{3a}$ is a solution of $y'' = 0$, we have that $y''$ changes its sign at $x = -\frac{b}{3a}$ and $y'$ exists everywhere (so there is a tangent at $x = -\frac{b}{3a}$). Thus the curve has an inflection point at $x = -\frac{b}{3a}$. There are no other inflection points because $y''$ changes sign only at this zero.

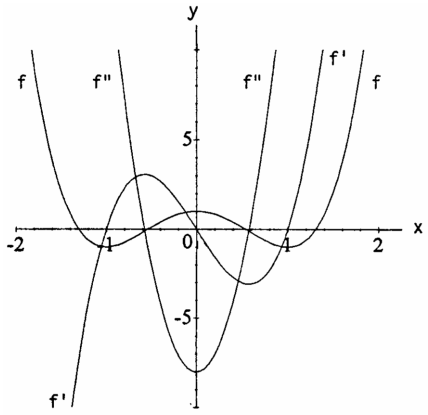
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



85. If $y = x^5 - 5x^4 - 240$, then $y' = 5x^3(x-4)$ and $y'' = 20x^2(x-3)$. The zeros of $y'$ are extrema, and there is a point of inflection at $x = 3$.

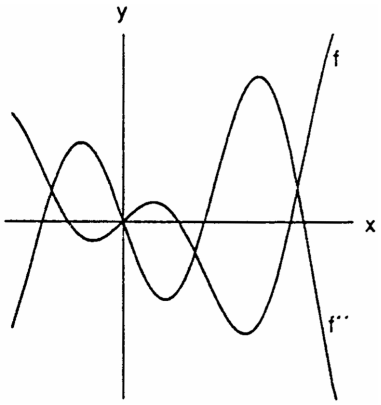


86. If $y = x^3 - 12x^2$, then $y' = 3x(x-8)$ and $y'' = 6(x-4)$. The zeros of $y'$ and $y''$ are extrema and points of inflection, respectively.

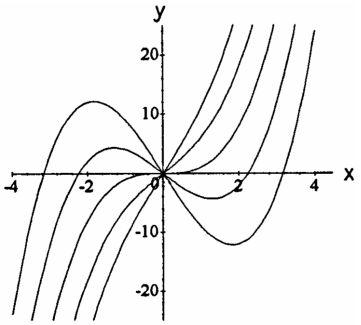


87. If $y = \frac{4}{5}x^5 + 16x^2 - 25$, then $y' = 4x(x^3+8)$ and $y'' = 16(x^3+2)$. The zeros of $y'$ and $y''$ are extrema and points of inflection, respectively.

88. If $y = \frac{x^4}{4} - \frac{x^3}{3} - 4x^2 + 12x + 20$, then $y' = x^3 - x^2 - 8x + 12 = (x+3)(x-2)^2$. So y has a local minimum at $x = -3$ as its only extreme value. Also $y'' = 3x^2 - 2x - 8 = (3x+4)(x-2)$ and there are inflection points at both zeros, $-\frac{4}{3}$ and 2, of $y''$.

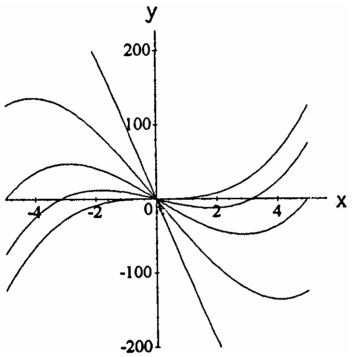


89. The graph of f falls where $f' < 0$, rises where $f' > 0$, and has horizontal tangents where $f' = 0$. It has local minima at points where $f'$ changes from negative to positive and local maxima where $f'$ changes from positive to negative. The graph of f is concave down where $f'' < 0$ and concave up where $f'' > 0$. It has an inflection point each time $f''$changes sign, provided a tangent line exists there.

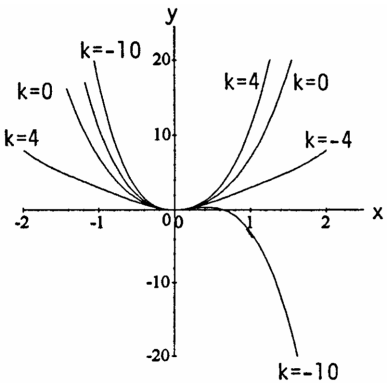


Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

90. The graph f is concave down where $f'' < 0$, and concave up where $f'' > 0$. It has an inflection point each time $f''$ changes sign, provided a tangent line exists there.

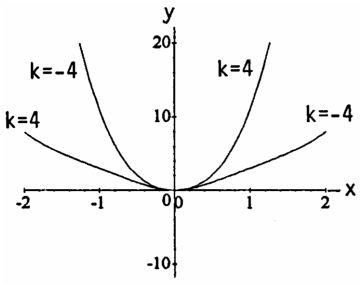


91. (a) It appears to control the number and magnitude of the local extrema. If $k < 0$, there is a local maximum to the left of the origin and a local minimum to the right. The larger the magnitude of k ($k < 0$), the greater the magnitude of the extrema. If $k > 0$, the graph has only positive slopes and lies entirely in the first and third quadrants with no local extrema. The graph becomes increasingly steep and straight as $k \to \infty$.

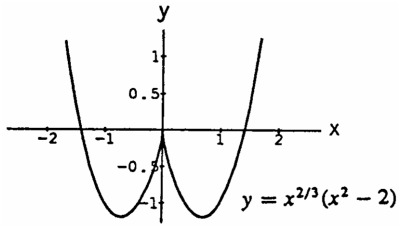


(b) $f'(x) = 3x^2 + k \Rightarrow$ the discriminant $0^2 - 4(3)(k) = -12k$ is positive for $k < 0$, zero for $k = 0$, and negative for $k > 0$; $f'$ has two zeros $x = \pm\sqrt{-\frac{k}{3}}$ when $k < 0$, one zero $x = 0$ when $k = 0$ and no real zeros when $k > 0$; the sign of k controls the number of local extrema.

(c) As $k \to \infty$, $f'(x) \to \infty$ and the graph becomes increasingly steep and straight. As $k \to -\infty$, the crest of the graph (local maximum) in the second quadrant becomes increasingly high and the trough (local minimum) in the fourth quadrant becomes increasingly deep.

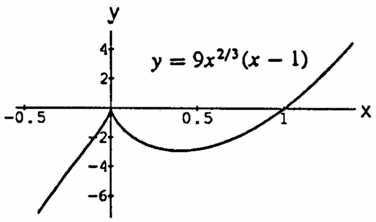


92. (a) It appears to control the concavity and the number of local extrema.



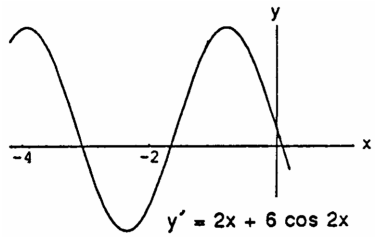
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(b) $f(x) = x^4 + kx^3 + 6x^2 \Rightarrow f'(x) = 4x^3 + 3kx^2 + 12x \Rightarrow f''(x) = 12x^2 + 6kx + 12 \Rightarrow$ the discriminant is $36k^2 - 4(12)(12) = 36(k+4)(k-4)$, so the sign line of the discriminant is $+++ \,|_{-4}\, --- \,|_{4}\, +++ \Rightarrow$ the discriminant is positive when $|k| > 4$, zero when $k = \pm 4$, and negative when $|k| < 4$; $f''(x) = 0$ has two zeros when $|k| > 4$, one zero when $k = \pm 4$, and no real zeros for $|k| < 4$; the value of k controls the number of possible points of inflection.



93. (a) If $y = x^{2/3}(x^2 - 2)$, then $y' = \frac{4}{3}x^{-1/3}(2x^2 - 1)$ and $y'' = \frac{4}{9}x^{-4/3}(10x^2 + 1)$. The curve rises on $\left(-\frac{1}{\sqrt{2}}, 0\right)$ and $\left(\frac{1}{\sqrt{2}}, \infty\right)$ and falls on $\left(-\infty, -\frac{1}{\sqrt{2}}\right)$ and $\left(0, \frac{1}{\sqrt{2}}\right)$. The curve is concave up on $(-\infty, 0)$ and $(0, \infty)$.

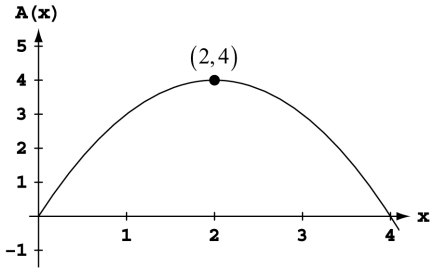
(b) A cusp since $\lim_{x \to 0^-} y' = \infty$ and $\lim_{x \to 0^+} y' = -\infty$.



94. (a) If $y = 9x^{2/3}(x - 1)$, then $y' = \frac{15\left(x - \frac{2}{5}\right)}{x^{1/3}}$ and $y'' = \frac{10\left(x + \frac{1}{5}\right)}{x^{4/3}}$. The curve rises on $(-\infty, 0)$ and $\left(\frac{2}{5}, \infty\right)$ and falls on $\left(0, \frac{2}{5}\right)$. The curve is concave down on $\left(-\infty, -\frac{1}{5}\right)$ and concave up on $\left(-\frac{1}{5}, 0\right)$ and $(0, \infty)$.

(b) A cusp since $\lim_{x \to 0^-} y' = \infty$ and $\lim_{x \to 0^+} y' = -\infty$.

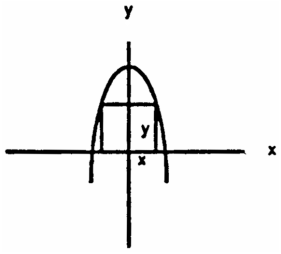
95. Yes: $y = x^2 + 3\sin 2x \Rightarrow y' = 2x + 6\cos 2x$. The graph of $y'$ is zero near $-3$ and this indicates a horizontal tangent near $x = -3$.



## 4.5 APPLIED OPTIMIZATION PROBLEMS

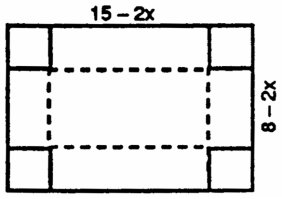
1. Let $\ell$ and w represent the length and width of the rectangle, respectively. With an area of 16 in.$^2$, we have that $(\ell)(w) = 16 \Rightarrow w = 16\ell^{-1} \Rightarrow$ the perimeter is $P = 2\ell + 2w = 2\ell + 32\ell^{-1}$ and $P'(\ell) = 2 - \frac{32}{\ell^2} = \frac{2(\ell^2 - 16)}{\ell^2}$. Solving $P'(\ell) = 0 \Rightarrow \frac{2(\ell+4)(\ell-4)}{\ell^2} = 0 \Rightarrow \ell = -4, 4$. Since $\ell > 0$ for the length of a rectangle, $\ell$ must be 4 and $w = 4 \Rightarrow$ the perimeter is 16 in., a minimum since $P''(\ell) = \frac{16}{\ell^3} > 0$.

2. Let x represent the length of the rectangle in meters $(0 < x < 4)$ Then the width is $4 - x$ and the area is $A(x) = x(4 - x) = 4x - x^2$. Since $A'(x) = 4 - 2x$, the critical point occurs at $x = 2$. Since, $A'(x) > 0$ for $0 < x < 2$ and $A'(x) < 0$ for $2 < x < 4$, this critical point corresponds to the maximum area. The rectangle with the largest area measures 2 m by $4 - 2 = 2$ m, so it is a square.

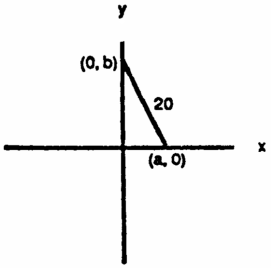


Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

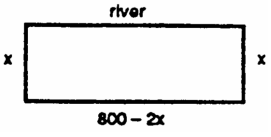
Graphical Support:



3. (a) The line containing point P also contains the points $(0, 1)$ and $(1, 0)$ $\Rightarrow$ the line containing P is $y = 1 - x$ $\Rightarrow$ a general point on that line is $(x, 1 - x)$.
   (b) The area $A(x) = 2x(1 - x)$, where $0 \le x \le 1$.
   (c) When $A(x) = 2x - 2x^2$, then $A'(x) = 0 \Rightarrow 2 - 4x = 0 \Rightarrow x = \frac{1}{2}$. Since $A(0) = 0$ and $A(1) = 0$, we conclude that $A\left(\frac{1}{2}\right) = \frac{1}{2}$ sq units is the largest area. The dimensions are 1 unit by $\frac{1}{2}$ unit.

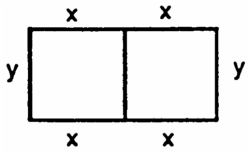


4. The area of the rectangle is $A = 2xy = 2x\left(12 - x^2\right)$, where $0 \le x \le \sqrt{12}$. Solving $A'(x) = 0 \Rightarrow 24 - 6x^2 = 0 \Rightarrow x = -2$ or 2. Now $-2$ is not in the domain, and since $A(0) = 0$ and $A\left(\sqrt{12}\right) = 0$, we conclude that $A(2) = 32$ square units is the maximum area. The dimensions are 4 units by 8 units.



5. The volume of the box is $V(x) = x(15 - 2x)(8 - 2x)$ $= 120x - 46x^2 + 4x^3$, where $0 \le x \le 4$. Solving $V'(x) = 0$ $\Rightarrow 120 - 92x + 12x^2 = 4(6 - x)(5 - 3x) = 0 \Rightarrow x = \frac{5}{3}$ or 6, but 6 is not in the domain. Since $V(0) = V(4) = 0$, $V\left(\frac{5}{3}\right) = \frac{2450}{27} \approx 91$ in$^3$ must be the maximum volume of the box with dimensions $\frac{14}{3} \times \frac{35}{3} \times \frac{5}{3}$ inches.

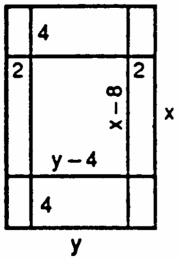
6. The area of the triangle is $A = \frac{1}{2}ba = \frac{b}{2}\sqrt{400 - b^2}$, where $0 \le b \le 20$. Then $\frac{dA}{db} = \frac{1}{2}\sqrt{400 - b^2} - \frac{b^2}{2\sqrt{400 - b^2}}$ $= \frac{200 - b^2}{\sqrt{400 - b^2}} = 0 \Rightarrow$ the interior critical point is $b = 10\sqrt{2}$. When $b = 0$ or 20, the area is zero $\Rightarrow$ $A\left(10\sqrt{2}\right)$ is the maximum area. When $a^2 + b^2 = 400$ and $b = 10\sqrt{2}$, the value of a is also $10\sqrt{2} \Rightarrow$ the maximum area occurs when $a = b$.



7. The area is $A(x) = x(800 - 2x)$, where $0 \le x \le 400$. Solving $A'(x) = 800 - 4x = 0 \Rightarrow x = 200$. With $A(0) = A(400) = 0$, the maximum area is $A(200) = 80{,}000$ m$^2$. The dimensions are 200 m by 400 m.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

8. The area is $2xy = 216 \Rightarrow y = \frac{108}{x}$. The amount of fence needed is $P = 4x + 3y = 4x + 324x^{-1}$, where $0 < x$; $\frac{dP}{dx} = 4 - \frac{324}{x^2} = 0 \Rightarrow x^2 - 81 = 0 \Rightarrow$ the critical points are 0 and $\pm 9$, but 0 and $-9$ are not in the domain. Then $P''(9) > 0 \Rightarrow$ at $x = 9$ there is a minimum $\Rightarrow$ the dimensions of the outer rectangle are 18 m by 12 m $\Rightarrow$ 72 meters of fence will be needed.

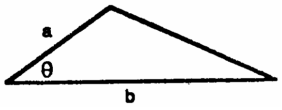


9. (a) We minimize the weight $= tS$ where S is the surface area, and t is the thickness of the steel walls of the tank. The surace area is $S = x^2 + 4xy$ where x is the length of a side of the square base of the tank, and y is its depth. The volume of the tank must be $500 ft^3 \Rightarrow y = \frac{500}{x^2}$. Therefore, the weight of the tank is $w(x) = t\left(x^2 + \frac{2000}{x}\right)$. Treating the thickness as a constant gives $w'(x) = t\left(2x - \frac{2000}{x^2}\right)$ for x.0. The critical value is at $x = 10$. Since $w''(10) = t\left(2 + \frac{4000}{10^3}\right) > 0$, there is a minimum at $x = 10$. Therefore, the optimum dimensions of the tank are 10 ft on the base edges and 5 ft deep.

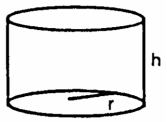
   (b) Minimizing the surface area of the tank minimizes its weight for a given wall thickness. The thickness of the steel walls would likely be determined by other considerations such as structural requirements.

10. (a) The volume of the tank being $1125 ft^3$, we have that $yx^2 = 1125 \Rightarrow y = \frac{1125}{x^2}$. The cost of building the tank is $c(x) = 5x^2 + 30x\left(\frac{1125}{x^2}\right)$, where $0 < x$. Then $c'(x) = 10x - \frac{33750}{x^2} = 0 \Rightarrow$ the critical points are 0 and 15, but 0 is not in the domain. Thus, $c''(15) > 0 \Rightarrow$ at $x = 15$ we have a minimum. The values of $x = 15$ ft and $y = 5$ ft will minimize the cost.

    (b) The cost function $c = 5(x^2 + 4xy) + 10xy$, can be separated into two items: (1) the cost of the materials and labor to fabricate the tank, and (2) the cost for the excavation. Since the area of the sides and bottom of the tanks is $(x^2 + 4xy)$, it can be deduced that the unit cost to fabricate the tanks is $\$5/ft^2$. Normally, excavation costs are per unit volume of excavated material. Consequently, the total excavation cost can be taken as $10xy = \left(\frac{10}{x}\right)(x^2y)$. This suggests that the unit cost of excavation is $\frac{\$10/ft^2}{x}$ where x is the length of a side of the square base of the tank in feet. For the least expensive tank, the unit cost for the excavation is $\frac{\$10/ft^2}{15\ ft} = \frac{\$0.67}{ft^3} = \frac{\$18}{yd^3}$. The total cost of the least expensive tank is \$3375, which is the sum of \$2625 for fabrication and \$750 for the excavation.



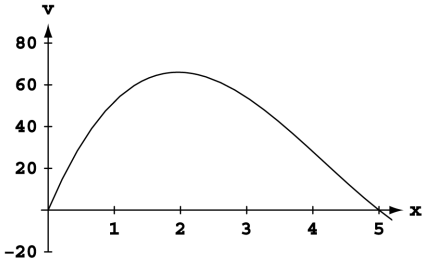
11. The area of the printing is $(y - 4)(x - 8) = 50$. Consequently, $y = \left(\frac{50}{x - 8}\right) + 4$. The area of the paper is $A(x) = x\left(\frac{50}{x - 8} + 4\right)$, where $8 < x$. Then $A'(x) = \left(\frac{50}{x - 8} + 4\right) - x\left(\frac{50}{(x - 8)^2}\right) = \frac{4(x - 8)^2 - 400}{(x - 8)^2} = 0$ $\Rightarrow$ the critical points are $-2$ and 18, but $-2$ is not in the domain. Thus $A''(18) > 0 \Rightarrow$ at $x = 18$ we have a minimum. Therefore the dimensions 18 by 9 inches minimize the amount of paper.



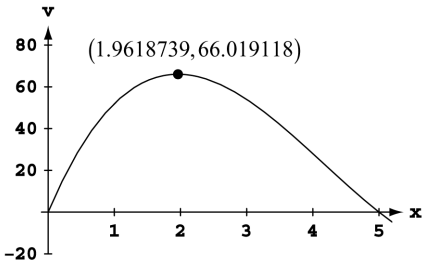
12. The volume of the cone is $V = \frac{1}{3}\pi r^2 h$, where $r = x = \sqrt{9 - y^2}$ and $h = y + 3$ (from the figure in the text). Thus, $V(y) = \frac{\pi}{3}(9 - y^2)(y + 3) = \frac{\pi}{3}(27 + 9y - 3y^2 - y^3) \Rightarrow V'(y) = \frac{\pi}{3}(9 - 6y - 3y^2) = \pi(1 - y)(3 + y)$. The critical points are $-3$ and 1, but $-3$ is not in the domain. Thus $V''(1) = \frac{\pi}{3}(-6 - 6(1)) < 0 \Rightarrow$ at $y = 1$ we have a maximum volume of $V(1) = \frac{\pi}{3}(8)(4) = \frac{32\pi}{3}$ cubic units.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

13. The area of the triangle is $A(\theta) = \frac{ab \sin\theta}{2}$, where $0 < \theta < \pi$. Solving $A'(\theta) = 0 \Rightarrow \frac{ab\cos\theta}{2} = 0 \Rightarrow \theta = \frac{\pi}{2}$. Since $A''(\theta) = -\frac{ab\sin\theta}{2} \Rightarrow A''\left(\frac{\pi}{2}\right) < 0$, there is a maximum at $\theta = \frac{\pi}{2}$.



14. A volume $V = \pi r^2 h = 1000 \Rightarrow h = \frac{1000}{\pi r^2}$. The amount of material is the surface area given by the sides and bottom of the can $\Rightarrow S = 2\pi rh + \pi r^2 = \frac{2000}{r} + \pi r^2, 0 < r$. Then $\frac{dS}{dr} = -\frac{2000}{r^2} + 2\pi r = 0 \Rightarrow \frac{\pi r^3 - 1000}{r^2} = 0$. The critical points are 0 and $\frac{10}{\sqrt[3]{\pi}}$, but 0 is not in the domain. Since $\frac{d^2S}{dr^2} = \frac{4000}{r^3} + 2\pi > 0$, we have a minimum surface area when $r = \frac{10}{\sqrt[3]{\pi}}$ cm and $h = \frac{1000}{\pi r^2} = \frac{10}{\sqrt[3]{\pi}}$ cm. Comparing this result to the result found in Example 2, if we include both ends of the can, then we have a minimum surface area when the can is shorter-specifically, when the height of the can is the same as its diameter.

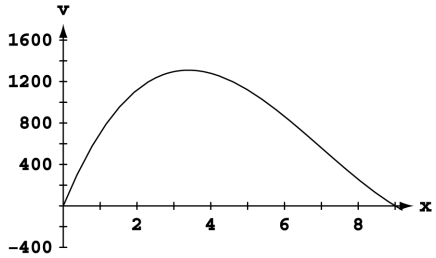


15. With a volume of 1000 cm and $V = \pi r^2 h$, then $h = \frac{1000}{\pi r^2}$. The amount of aluminum used per can is $A = 8r^2 + 2\pi rh = 8r^2 + \frac{2000}{r}$. Then $A'(r) = 16r - \frac{2000}{r^2} = 0 \Rightarrow \frac{8r^3 - 1000}{r^2} = 0 \Rightarrow$ the critical points are 0 and 5, but $r = 0$ results in no can. Since $A''(r) = 16 + \frac{1000}{r^3} > 0$ we have a minimum at $r = 5 \Rightarrow h = \frac{40}{\pi}$ and h:r = 8:$\pi$.

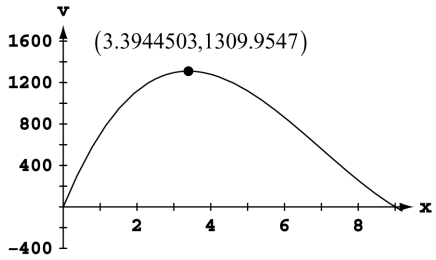
16. (a) The base measures $10 - 2x$ in. by $\frac{15-2x}{2}$ in., so the volume formula is $V(x) = \frac{x(10-2x)(15-2x)}{2} = 2x^3 - 25x^2 + 75x$.

(b) We require $x > 0$, $2x < 10$, and $2x < 15$. Combining these requirements, the domain is the interval $(0, 5)$.

(c) The maximum volume is approximately 66.02 in.$^3$ when $x \approx 1.96$ in.



(d) $V'(x) = 6x^2 - 50x + 75$. The critical point occurs when $V'(x) = 0$, at $x = \frac{50 \pm \sqrt{(-50)^2 - 4(6)(75)}}{2(6)} = \frac{50 \pm \sqrt{700}}{12} = \frac{25 \pm 5\sqrt{7}}{6}$, that is, $x \approx 1.96$ or $x \approx 6.37$. We discard the larger value because it is not in the domain. Since $V''(x) = 12x - 50$, which is negative when $x \approx 1.96$, the critical point corresponds to the maximum volume. The maximum volume occurs when $x = \frac{25 - 5\sqrt{7}}{6} \approx 1.96$, which comfimrs the result in (c).



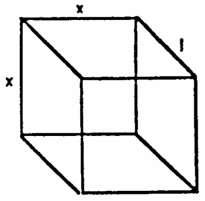
17. (a) The" sides" of the suitcase will measure $24 - 2x$ in. by $18 - 2x$ in. and will be $2x$ in. apart, so the volume formula is $V(x) = 2x(24 - 2x)(18 - 2x) = 8x^3 - 168x^2 + 862x$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(b) We require $x > 0$, $2x < 18$, and $2x < 24$. Combining these requirements, the domain is the interval $(0, 9)$.

(c) The maximum volume is approximately 1309.95 in.$^3$ when $x \approx 3.39$ in.

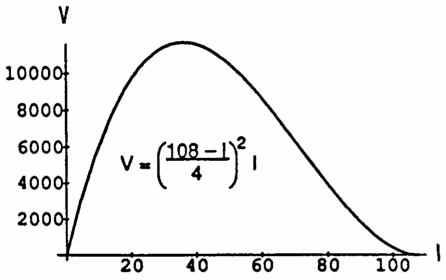
(d) $V'(x) = 24x^2 - 336x + 864 = 24(x^2 - 14x + 36)$. The critical point is at $x = \frac{14 \pm \sqrt{(-14)^2 - 4(1)(36)}}{2(1)} = \frac{14 \pm \sqrt{52}}{2}$ $= 7 \pm \sqrt{13}$, that is, $x \approx 3.39$ or $x \approx 10.61$. We discard the larger value because it is not in the domain. Since $V''(x) = 24(2x - 14)$ which is negative when $x \approx 3.39$, the critical point corresponds to the maximum volume. The maximum value occurs at $x = 7 - \sqrt{13} \approx 3.39$, which confirms the results in (c).



(e) $8x^3 - 168x^2 + 862x = 1120 \Rightarrow 8(x^3 - 21x^2 + 108x - 140) = 0 \Rightarrow 8(x - 2)(x - 5)(x - 14) = 0$. Since 14 is not in the fomain, the possible values of x are $x = 2$ in. or $x = 5$ in.

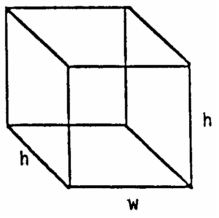
(f) The dimensions of the resulting box are $2x$ in., $(24 - 2x)$ in., and $(18 - 2x)$. Each of these measurements must be positive, so that gives the domain of $(0, 9)$.

18. If the upper right vertex of the rectangle is located at $(x, 4 \cos 0.5\, x)$ for $0 < x < \pi$, then the rectangle has width $2x$ and height $4 \cos 0.5x$, so the area is $A(x) = 8x \cos 0.5x$. Solving $A'(x) = 0$ graphically for $0 < x < \pi$, we find that $x \approx 2.214$. Evaluating $2x$ and $4 \cos 0.5x$ for $x \approx 2.214$, the dimensions of the rectangle are approximately 4.43 (width) by 1.79 (height), and the maximum area is approximately 7.923.

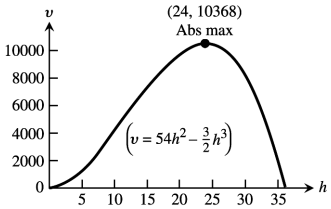


19. Let the radius of the cylinder be r cm, $0 < r < 10$. Then the height is $2\sqrt{100 - r^2}$ and the volume is $V(r) = 2\pi r^2 \sqrt{100 - r^2}$ cm$^3$. Then, $V'(r) = 2\pi r^2 \left(\frac{1}{\sqrt{100 - r^2}}\right)(-2r) + \left(2\pi\sqrt{100 - r^2}\right)(2r)$ $= \frac{-2\pi r^3 + 4\pi r(100 - r^2)}{\sqrt{100 - r^2}} = \frac{2\pi r(200 - 3r^2)}{\sqrt{100 - r^2}}$. The critical point for $0 < r < 10$ occurs at $r = \sqrt{\frac{200}{3}} = 10\sqrt{\frac{2}{3}}$. Since $V'(r) > 0$ for $0 < r < 10\sqrt{\frac{2}{3}}$ and $V'(r) < 0$ for $10\sqrt{\frac{2}{3}} < r < 10$, the critical point corresponds to the maximum volume. The dimensions are $r = 10\sqrt{\frac{2}{3}} \approx 8.16$ cm and $h = \frac{20}{\sqrt{3}} \approx 11.55$ cm, and the volume is $\frac{4000\pi}{3\sqrt{3}} \approx 2418.40$ cm$^3$.

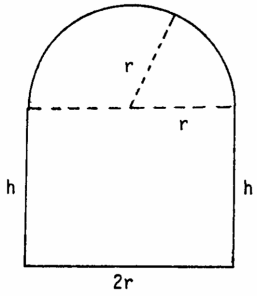
20. (a) From the diagram we have $4x + \ell = 108$ and $V = x^2\ell$. The volume of the box is $V(x) = x^2(108 - 4x)$, where $0 \le x < 27$. Then
$V'(x) = 216x - 12x^2 = 12x(18 - x) = 0$
$\Rightarrow$ the critical points are 0 and 18, but $x = 0$ results in no box. Since $V''(x) = 216 - 24x < 0$ at $x = 18$ we have a maximum. The dimensions of the box are $18 \times 18 \times 36$ in.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



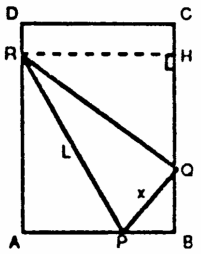
(b) In terms of length, $V(\ell) = x^2\ell = \left(\frac{108-\ell}{4}\right)^2 \ell$. The graph indicates that the maximum volume occurs near $\ell = 36$, which is consistent with the result of part (a).



21. (a) From the diagram we have $3h + 2w = 108$ and $V = h^2w \Rightarrow V(h) = h^2\left(54 - \frac{3}{2}h\right) = 54h^2 - \frac{3}{2}h^3$. Then $V'(h) = 108h - \frac{9}{2}h^2 = \frac{9}{2}h(24 - h) = 0$ $\Rightarrow h = 0$ or $h = 24$, but $h = 0$ results in no box. Since $V''(h) = 108 - 9h < 0$ at $h = 24$, we have a maximum volume at $h = 24$ and $w = 54 - \frac{3}{2}h = 18$.

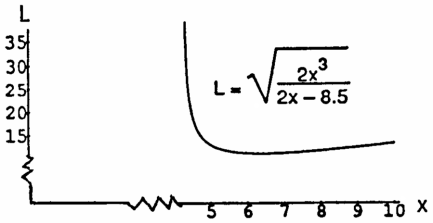
(b)

22. From the diagram the perimeter is $P = 2r + 2h + \pi r$, where r is the radius of the semicircle and h is the height of the rectangle. The amount of light transmitted proportional to $A = 2rh + \frac{1}{4}\pi r^2 = r(P - 2r - \pi r) + \frac{1}{4}\pi r^2$ $= rP - 2r^2 - \frac{3}{4}\pi r^2$. Then $\frac{dA}{dr} = P - 4r - \frac{3}{2}\pi r = 0$ $\Rightarrow r = \frac{2P}{8+3\pi} \Rightarrow 2h = P - \frac{4P}{8+3\pi} - \frac{2\pi P}{8+3\pi} = \frac{(4+\pi)P}{8+3\pi}$. Therefore, $\frac{2r}{h} = \frac{8}{4+\pi}$ gives the proportions that admit the most light since $\frac{d^2A}{dr^2} = -4 - \frac{3}{2}\pi < 0$.



23. The fixed volume is $V = \pi r^2 h + \frac{2}{3}\pi r^3 \Rightarrow h = \frac{V}{\pi r^2} - \frac{2r}{3}$, where h is the height of the cylinder and r is the radius of the hemisphere. To minimize the cost we must minimize surface area of the cylinder added to twice the surface area of the hemisphere. Thus, we minimize $C = 2\pi rh + 4\pi r^2 = 2\pi r\left(\frac{V}{\pi r^2} - \frac{2r}{3}\right) + 4\pi r^2 = \frac{2V}{r} + \frac{8}{3}\pi r^2$. Then $\frac{dC}{dr} = -\frac{2V}{r^2} + \frac{16}{3}\pi r = 0 \Rightarrow V = \frac{8}{3}\pi r^3 \Rightarrow r = \left(\frac{3V}{8\pi}\right)^{1/3}$. From the volume equation, $h = \frac{V}{\pi r^2} - \frac{2r}{3}$ $= \frac{4V^{1/3}}{\pi^{1/3}\cdot 3^{2/3}} - \frac{2\cdot 3^{1/3}\cdot V^{1/3}}{3\cdot 2\cdot \pi^{1/3}} = \frac{3^{1/3}\cdot 2\cdot 4\cdot V^{1/3} - 2\cdot 3^{1/3}\cdot V^{1/3}}{3\cdot 2\cdot \pi^{1/3}} = \left(\frac{3V}{\pi}\right)^{1/3}$. Since $\frac{d^2C}{dr^2} = \frac{4V}{r^3} + \frac{16}{3}\pi > 0$, these dimensions do minimize the cost.

24. The volume of the trough is maximized when the area of the cross section is maximized. From the diagram the area of the cross section is $A(\theta) = \cos\theta + \sin\theta\cos\theta$, $0 < \theta < \frac{\pi}{2}$. Then $A'(\theta) = -\sin\theta + \cos^2\theta - \sin^2\theta$ $= -(2\sin^2\theta + \sin\theta - 1) = -(2\sin\theta - 1)(\sin\theta + 1)$ so $A'(\theta) = 0 \Rightarrow \sin\theta = \frac{1}{2}$ or $\sin\theta = -1 \Rightarrow \theta = \frac{\pi}{6}$ because $\sin\theta \neq -1$ when $0 < \theta < \frac{\pi}{2}$. Also, $A'(\theta) > 0$ for $0 < \theta < \frac{\pi}{6}$ and $A'(\theta) < 0$ for $\frac{\pi}{6} < \theta < \frac{\pi}{2}$. Therefore, at $\theta = \frac{\pi}{6}$ there is a maximum.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

25. (a) From the diagram we have: $\overline{AP} = x$, $\overline{RA} = \sqrt{L - x^2}$, $\overline{PB} = 8.5 - x$, $\overline{CH} = \overline{DR} = 11 - \overline{RA} = 11 - \sqrt{L - x^2}$, $\overline{QB} = \sqrt{x^2 - (8.5 - x)^2}$, $\overline{HQ} = 11 - \overline{CH} - \overline{QB}$
$= 11 - \left[11 - \sqrt{L - x^2} + \sqrt{x^2 - (8.5 - x)^2}\right]$
$= \sqrt{L - x^2} - \sqrt{x^2 - (8.5 - x)^2}$, $\overline{RQ}^2 = \overline{RH}^2 + \overline{HQ}^2$
$= (8.5)^2 + \left(\sqrt{L - x^2} - \sqrt{x^2 - (8.5 - x)^2}\right)^2$. It follows that $\overline{RP}^2 = \overline{PQ}^2 + \overline{RQ}^2 \Rightarrow L^2 = x^2 + \left(\sqrt{L^2 - x^2} - \sqrt{x^2 - (x - 8.5)^2}\right)^2 + (8.5)^2$
$\Rightarrow L^2 = x^2 + L^2 - x^2 - 2\sqrt{L^2 - x^2}\sqrt{17x - (8.5)^2} + 17x - (8.5)^2 + (8.5)^2$
$\Rightarrow 17^2x^2 = 4(L^2 - x^2)(17x - (8.5)^2) \Rightarrow L^2 = x^2 + \frac{17^2x^2}{4[17x - (8.5)^2]} = \frac{17x^3}{17x - (8.5)^2}$
$= \frac{17x^3}{17x - \left(\frac{17}{2}\right)^2} = \frac{4x^3}{4x - 17} = \frac{2x^3}{2x - 8.5}$.

(b) If $f(x) = \frac{4x^3}{4x-17}$ is minimized, then $L^2$ is minimized. Now $f'(x) = \frac{4x^2(8x-51)}{(4x-17)^2} \Rightarrow f'(x) < 0$ when $x < \frac{51}{8}$ and $f'(x) > 0$ when $x > \frac{51}{8}$. Thus $L^2$ is minimized when $x = \frac{51}{8}$.

(c) When $x = \frac{51}{8}$, then $L \approx 11.0$ in.

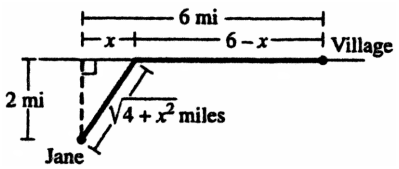
26. (a) From the figure in the text we have $P = 2x + 2y \Rightarrow y = \frac{P}{2} - x$. If $P = 36$, then $y = 18 - x$. When the cylinder is formed, $x = 2\pi r \Rightarrow r = \frac{x}{2\pi}$ and $h = y \Rightarrow h = 18 - x$. The volume of the cylinder is $V = \pi r^2 h \Rightarrow V(x) = \frac{18x^2 - x^3}{4\pi}$. Solving $V'(x) = \frac{3x(12-x)}{4\pi} = 0 \Rightarrow x = 0$ or 12; but when $x = 0$, there is no cylinder. Then $V''(x) = \frac{3}{\pi}\left(3 - \frac{x}{2}\right) \Rightarrow V''(12) < 0 \Rightarrow$ there is a maximum at $x = 12$. The values of $x = 12$ cm and $y = 6$ cm give the largest volume.

(b) In this case $V(x) = \pi x^2(18 - x)$. Solving $V'(x) = 3\pi x(12 - x) = 0 \Rightarrow x = 0$ or 12; but $x = 0$ would result in no cylinder. Then $V''(x) = 6\pi(6 - x) \Rightarrow V''(12) < 0 \Rightarrow$ there is a maximum at $x = 12$. The values of $x = 12$ cm and $y = 6$ cm give the largest volume.

27. Note that $h^2 + r^2 = 3$ and so $r = \sqrt{3 - h^2}$. Then the volume is given by $V = \frac{\pi}{3}r^2h = \frac{\pi}{3}(3 - h^2)h = \pi h - \frac{\pi}{3}h^3$ for $0 < h < \sqrt{3}$, and so $\frac{dV}{dh} = \pi - \pi r^2 = \pi(1 - r^2)$. The critical point (for $h > 0$) occurs at $h = 1$. Since $\frac{dV}{dh} > 0$ for $0 < h < 1$, and $\frac{dV}{dh} < 0$ for $1 < h < \sqrt{3}$, the critical point corresponds to the maximum volume. The cone of greatest volume has radius $\sqrt{2}$ m, height 1m, and volume $\frac{2\pi}{3}$ m$^3$.

28. (a) $f(x) = x^2 + \frac{a}{x} \Rightarrow f'(x) = x^{-2}(2x^3 - a)$, so that $f'(x) = 0$ when $x = 2$ implies $a = 16$
(b) $f(x) = x^2 + \frac{a}{x} \Rightarrow f''(x) = 2x^{-3}(x^3 + a)$, so that $f''(x) = 0$ when $x = 1$ implies $a = -1$

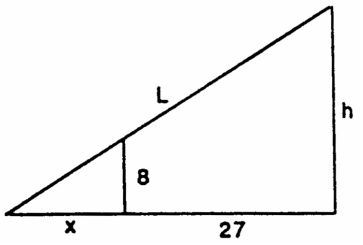
29. If $f(x) = x^2 + \frac{a}{x}$, then $f'(x) = 2x - ax^{-2}$ and $f''(x) = 2 + 2ax^{-3}$. The critical points are 0 and $\sqrt[3]{\frac{a}{2}}$, but $x \neq 0$. Now $f''\left(\sqrt[3]{\frac{a}{2}}\right) = 6 > 0 \Rightarrow$ at $x = \sqrt[3]{\frac{a}{2}}$ there is a local minimum. However, no local maximum exists for any a.



30. If $f(x) = x^3 + ax^2 + bx$, then $f'(x) = 3x^2 + 2ax + b$ and $f''(x) = 6x + 2a$.
(a) A local maximum at $x = -1$ and local minimum at $x = 3 \Rightarrow f'(-1) = 0$ and $f'(3) = 0 \Rightarrow 3 - 2a + b = 0$ and $27 + 6a + b = 0 \Rightarrow a = -3$ and $b = -9$.
(b) A local minimum at $x = 4$ and a point of inflection at $x = 1 \Rightarrow f'(4) = 0$ and $f''(1) = 0 \Rightarrow 48 + 8a + b = 0$

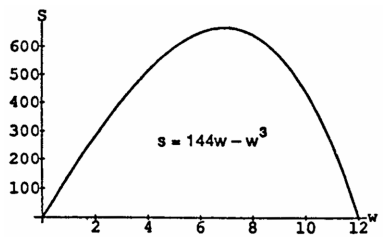
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

and $6 + 2a = 0 \Rightarrow a = -3$ and $b = -24$.



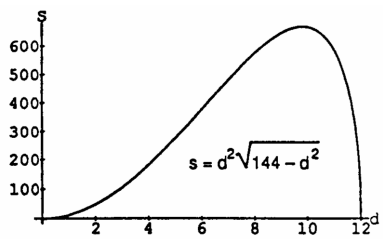
31. (a) $s(t) = -16t^2 + 96t + 112 \Rightarrow v(t) = s'(t) = -32t + 96$. At $t = 0$, the velocity is $v(0) = 96$ ft/sec.
(b) The maximum height ocurs when $v(t) = 0$, when $t = 3$. The maximum height is $s(3) = 256$ ft and it occurs at $t = 3$ sec.
(c) Note that $s(t) = -16t^2 + 96t + 112 = -16(t + 1)(t - 7)$, so $s = 0$ at $t = -1$ or $t = 7$. Choosing the positive value of t, the velocity when $s = 0$ is $v(7) = -128$ ft/sec.

32.



Let x be the distance from the point on the shoreline nearest Jane's boat to the point where she lands her boat. Then she needs to row $\sqrt{4 + x^2}$ mi at 2 mph and walk $6 - x$ mi at 5 mph. The total amount of time to reach the village is $f(x) = \frac{\sqrt{4+x^2}}{2} + \frac{6-x}{5}$ hours $(0 \le x \le 6)$. Then $f'(x) = \frac{1}{2}\frac{1}{2\sqrt{4+x^2}}(2x) - \frac{1}{5} = \frac{x}{2\sqrt{4+x^2}} - \frac{1}{5}$. Solving $f'(x) = 0$, we have: $\frac{x}{2\sqrt{4+x^2}} = \frac{1}{5} \Rightarrow 5x = 2\sqrt{4 + x^2} \Rightarrow 25x^2 = 4(4 + x^2) \Rightarrow 21x^2 = 16 \Rightarrow x = \pm\frac{4}{\sqrt{21}}$. We discard the negative value of x because it is not in the domain. Checking the endpoints and critical point, we have $f(0) = 2.2$, $f\left(\frac{4}{\sqrt{21}}\right) \approx 2.12$, and $f(6) \approx 3.16$. Jane should land her boat $\frac{4}{\sqrt{21}} \approx 0.87$ miles donw the shoreline from the point nearest her boat.

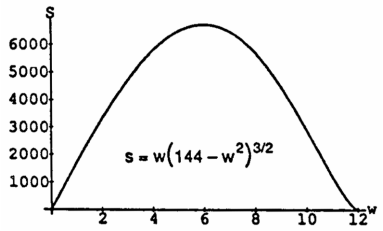
33. $\frac{8}{x} = \frac{h}{x+27} \Rightarrow h = 8 + \frac{216}{x}$ and $L(x) = \sqrt{h^2 + (x + 27)^2}$
$= \sqrt{\left(8 + \frac{216}{x}\right)^2 + (x + 27)^2}$ when $x \ge 0$. Note that $L(x)$ is minimized when $f(x) = \left(8 + \frac{216}{x}\right)^2 + (x + 27)^2$ is minimized. If $f'(x) = 0$, then
$2\left(8 + \frac{216}{x}\right)\left(-\frac{216}{x^2}\right) + 2(x + 27) = 0$
$\Rightarrow (x + 27)\left(1 - \frac{1728}{x^3}\right) = 0 \Rightarrow x = -27$ (not acceptable since distance is never negative or $x = 12$. Then $L(12) = \sqrt{2197} \approx 46.87$ ft.



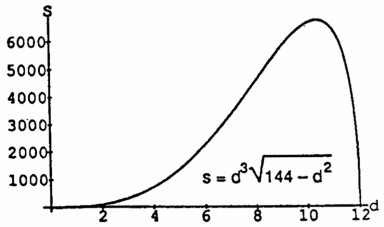
34. (a) From the diagram we have $d^2 = 4r^2 - w^2$. The strength of the beam is $S = kwd^2 = kw\left(4r^2 - w^2\right)$. When $r = 6$, then $S = 144kw - kw^3$. Also, $S'(w) = 144k - 3kw^2 = 3k\left(48 - w^2\right)$ so $S'(w) = 0 \Rightarrow w = \pm 4\sqrt{3}$; $S''\left(4\sqrt{3}\right) < 0$ and $-4\sqrt{3}$ is not acceptable. Therefore $S\left(4\sqrt{3}\right)$ is the maximum strength. The dimensions of the strongest beam are $4\sqrt{3}$ by $4\sqrt{6}$ inches.

(b)

(c)



Both graphs indicate the same maximum value and are consistent with each other. Changing k does not change the dimensions that give the strongest beam (i.e., do not change the values of w and d that produce the strongest beam).



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

35. (a) From the situation we have $w^2 = 144 - d^2$. The stiffness of the beam is $S = kwd^3 = kd^3\,(144 - d^2)^{1/2}$, where $0 \le d \le 12$. Also, $S'(d) = \frac{4kd^2\,(108 - d^2)}{\sqrt{144 - d^2}} \Rightarrow$ critical points at 0, 12, and $6\sqrt{3}$. Both $d = 0$ and $d = 12$ cause $S = 0$. The maximum occurs at $d = 6\sqrt{3}$. The dimensions are 6 by $6\sqrt{3}$ inches.

(b)

(c)

Both graphs indicate the same maximum value and are consistent with each other. The changing of k has no effect.

36. (a) $s_1 = s_2 \Rightarrow \sin t = \sin\left(t + \frac{\pi}{3}\right) \Rightarrow \sin t = \sin t \cos\frac{\pi}{3} + \sin\frac{\pi}{3}\cos t \Rightarrow \sin t = \frac{1}{2}\sin t + \frac{\sqrt{3}}{2}\cos t \Rightarrow \tan t = \sqrt{3}$ $\Rightarrow t = \frac{\pi}{3}$ or $\frac{4\pi}{3}$

(b) The distance between the particles is $s(t) = |s_1 - s_2| = \left|\sin t - \sin\left(t + \frac{\pi}{3}\right)\right| = \frac{1}{2}\left|\sin t - \sqrt{3}\cos t\right|$

$\Rightarrow s'(t) = \dfrac{\left(\sin t - \sqrt{3}\cos t\right)\left(\cos t + \sqrt{3}\sin t\right)}{2\left|\sin t - \sqrt{3}\cos t\right|}$ since $\frac{d}{dx}|x| = \frac{x}{|x|} \Rightarrow$ critical times and endpoints are 0, $\frac{\pi}{3}$, $\frac{5\pi}{6}$, $\frac{4\pi}{3}$, $\frac{11\pi}{6}$, $2\pi$; then $s(0) = \frac{\sqrt{3}}{2}$, $s\left(\frac{\pi}{3}\right) = 0$, $s\left(\frac{5\pi}{6}\right) = 1$, $s\left(\frac{4\pi}{3}\right) = 0$, $s\left(\frac{11\pi}{6}\right) = 1$, $s(2\pi) = \frac{\sqrt{3}}{2} \Rightarrow$ the greatest distance between the particles is 1.

(c) Since $s'(t) = \dfrac{\left(\sin t - \sqrt{3}\cos t\right)\left(\cos t + \sqrt{3}\sin t\right)}{2\left|\sin t - \sqrt{3}\cos t\right|}$ we can conclude that at $t = \frac{\pi}{3}$ and $\frac{4\pi}{3}$, $s'(t)$ has cusps and the distance between the particles is changing the fastest near these points.

37. (a) $s = 10\cos(\pi t) \Rightarrow v = -10\pi\sin(\pi t) \Rightarrow$ speed $= |10\pi\sin(\pi t)| = 10\pi\,|\sin(\pi t)| \Rightarrow$ the maximum speed is $10\pi \approx 31.42$ cm/sec since the maximum value of $|\sin(\pi t)|$ is 1; the cart is moving the fastest at $t = 0.5$ sec, 1.5 sec, 2.5 sec and 3.5 sec when $|\sin(\pi t)|$ is 1. At these times the distance is $s = 10\cos\left(\frac{\pi}{2}\right) = 0$ cm and $a = -10\pi^2\cos(\pi t) \Rightarrow |a| = 10\pi^2\,|\cos(\pi t)| \Rightarrow |a| = 0$ cm/sec$^2$

(b) $|a| = 10\pi^2\,|\cos(\pi t)|$ is greatest at $t = 0.0$ sec, 1.0 sec, 2.0 sec, 3.0 sec and 4.0 sec, and at these times the magnitude of the cart's position is $|s| = 10$ cm from the rest position and the speed is 0 cm/sec.

38. (a) $2\sin t = \sin 2t \Rightarrow 2\sin t - 2\sin t\cos t = 0 \Rightarrow (2\sin t)(1 - \cos t) = 0 \Rightarrow t = k\pi$ where k is a positive integer

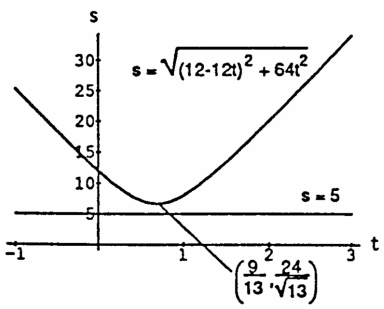
(b) The vertical distance between the masses is $s(t) = |s_1 - s_2| = \left((s_1 - s_2)^2\right)^{1/2} = ((\sin 2t - 2\sin t)^2)^{1/2}$

$\Rightarrow s'(t) = \left(\frac{1}{2}\right)((\sin 2t - 2\sin t)^2)^{-1/2}(2)(\sin 2t - 2\sin t)(2\cos 2t - 2\cos t)$

$= \frac{2(\cos 2t - \cos t)(\sin 2t - 2\sin t)}{|\sin 2t - 2\sin t|} = \frac{4(2\cos t + 1)(\cos t - 1)(\sin t)(\cos t - 1)}{|\sin 2t - 2\sin t|} \Rightarrow$ critical times at

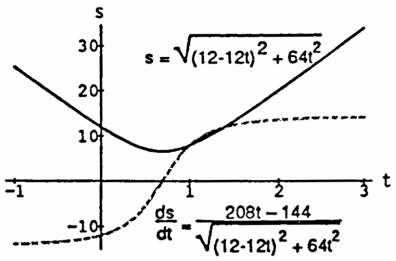
$0, \frac{2\pi}{3}, \pi, \frac{4\pi}{3}, 2\pi$; then $s(0) = 0$, $s\left(\frac{2\pi}{3}\right) = \left|\sin\left(\frac{4\pi}{3}\right) - 2\sin\left(\frac{2\pi}{3}\right)\right| = \frac{3\sqrt{3}}{2}$, $s(\pi) = 0$, $s\left(\frac{4\pi}{3}\right)$

$= \left|\sin\left(\frac{8\pi}{3}\right) - 2\sin\left(\frac{4\pi}{3}\right)\right| = \frac{3\sqrt{3}}{2}$, $s(2\pi) = 0 \Rightarrow$ the greatest distance is $\frac{3\sqrt{3}}{2}$ at $t = \frac{2\pi}{3}$ and $\frac{4\pi}{3}$



39. (a) $s = \sqrt{(12 - 12t)^2 + (8t)^2} = ((12 - 12t)^2 + 64t^2)^{1/2}$

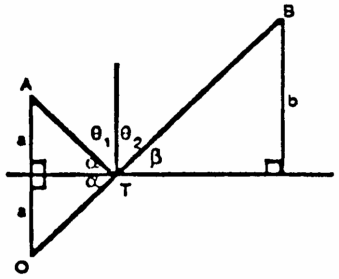
(b) $\frac{ds}{dt} = \frac{1}{2}((12 - 12t)^2 + 64t^2)^{-1/2}[2(12 - 12t)(-12) + 128t] = \frac{208t - 144}{\sqrt{(12 - 12t)^2 + 64t^2}}$



$\Rightarrow \left.\frac{ds}{dt}\right|_{t=0} = -12$ knots and $\left.\frac{ds}{dt}\right|_{t=1} = 8$ knots

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(c) The graph indicates that the ships did not see each other because $s(t) > 5$ for all values of t.



(d) The graph supports the conclusions in parts (b) and (c).

(e) $\lim_{t\to\infty} \frac{ds}{dt} = \sqrt{\lim_{t\to\infty} \frac{(208t-144)^2}{144(1-t)^2+64t^2}} = \sqrt{\lim_{t\to\infty} \frac{\left(208-\frac{144}{t}\right)^2}{144\left(\frac{1}{t}-1\right)^2+64}} = \sqrt{\frac{208^2}{144+64}} = \sqrt{208} = 4\sqrt{13}$

which equals the square root of the sums of the squares of the individual speeds.

40. The distance $\overline{OT} + \overline{TB}$ is minimized when $\overline{OB}$ is a straight line. Hence $\angle\alpha = \angle\beta \Rightarrow \theta_1 = \theta_2$.

41. If $v = kax - kx^2$, then $v' = ka - 2kx$ and $v'' = -2k$, so $v' = 0 \Rightarrow x = \frac{a}{2}$. At $x = \frac{a}{2}$ there is a maximum since $v''\left(\frac{a}{2}\right) = -2k < 0$. The maximum value of v is $\frac{ka^2}{4}$.

42. (a) According to the graph, $y'(0) = 0$.
(b) According to the graph, $y'(-L) = 0$.
(c) $y(0) = 0$, so $d = 0$. Now $y'(x) = 3ax^2 + 2bx + c$, so $y'(0) = 0$ implies that $c = 0$. There fore, $y(x) = ax^3 + bx^2$ and $y'(x) = 3ax^2 + 2bx$. Then $y(-L) = -aL^3 + bL^2 = H$ and $y'(-L) = 3aL^2 - 2bL = 0$, so we have two linear equations in two unknowns a and b. The second equation gives $b = \frac{3aL}{2}$. Substituting into the first equation, we have $-aL^3 + \frac{3aL^3}{2} = H$, or $\frac{aL^3}{2} = H$, so $a = 2\frac{H}{L^3}$. Therefore, $b = 3\frac{H}{L^2}$ and the equation for y is $y(x) = 2\frac{H}{L^3}x^3 + 3\frac{H}{L^2}x^2$, or $y(x) = H\left[2\left(\frac{x}{L}\right)^3 + 3\left(\frac{x}{L}\right)^2\right]$.

43. The profit is $p = nx - nc = n(x - c) = [a(x - c)^{-1} + b(100 - x)](x - c) = a + b(100 - x)(x - c)$ $= a + (bc + 100b)x - 100bc - bx^2$. Then $p'(x) = bc + 100b - 2bx$ and $p''(x) = -2b$. Solving $p'(x) = 0 \Rightarrow x = \frac{c}{2} + 50$. At $x = \frac{c}{2} + 50$ there is a maximum profit since $p''(x) = -2b < 0$ for all x.

44. Let x represent the number of people over 50. The profit is $p(x) = (50 + x)(200 - 2x) - 32(50 + x) - 6000$ $= -2x^2 + 68x + 2400$. Then $p'(x) = -4x + 68$ and $p'' = -4$. Solving $p'(x) = 0 \Rightarrow x = 17$. At $x = 17$ there is a maximum since $p''(17) < 0$. It would take 67 people to maximize the profit.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

45. (a) $A(q) = kmq^{-1} + cm + \frac{h}{2}q$, where $q > 0 \Rightarrow A'(q) = -kmq^{-2} + \frac{h}{2} = \frac{hq^2 - 2km}{2q^2}$ and $A''(q) = 2kmq^{-3}$. The critical points are $-\sqrt{\frac{2km}{h}}$, 0, and $\sqrt{\frac{2km}{h}}$, but only $\sqrt{\frac{2km}{h}}$ is in the domain. Then $A''\left(\sqrt{\frac{2km}{h}}\right) > 0 \Rightarrow$ at $q = \sqrt{\frac{2km}{h}}$ there is a minimum average weekly cost.

    (b) $A(q) = \frac{(k+bq)m}{q} + cm + \frac{h}{2}q = kmq^{-1} + bm + cm + \frac{h}{2}q$, where $q > 0 \Rightarrow A'(q) = 0$ at $q = \sqrt{\frac{2km}{h}}$ as in (a). Also $A''(q) = 2kmq^{-3} > 0$ so the most economical quantity to order is still $q = \sqrt{\frac{2km}{h}}$ which minimizes the average weekly cost.

46. We start with $c(x) =$ the cost of producing x items, $x > 0$, and $\frac{c(x)}{x} =$ the average cost of producing x items, assumed to be differentiable. If the average cost can be minimized, it will be at a production level at which $\frac{d}{dx}\left(\frac{c(x)}{x}\right) = 0$ $\Rightarrow \frac{x\,c'(x) - c(x)}{x^2} = 0$ (by the quotient rule) $\Rightarrow x\,c'(x) - c(x) = 0$ (multiply both sides by $x^2$) $\Rightarrow c'(x) = \frac{c(x)}{x}$ where $c'(x)$ is the marginal cost. This concludes the proof. (Note: The theorem does not assure a production level that will give a minimum cost, but rather, it indicates where to look to see if there is one. Find the production levels where the average cost equals the marginal cost, then check to see if any of them give a mimimum.)

47. The profit $p(x) = r(x) - c(x) = 6x - (x^3 - 6x^2 + 15x) = -x^3 + 6x^2 - 9x$, where $x \geq 0$. Then $p'(x) = -3x^2 + 12x - 9 = -3(x-3)(x-1)$ and $p''(x) = -6x + 12$. The critical points are 1 and 3. Thus $p''(1) = 6 > 0 \Rightarrow$ at $x = 1$ there is a local minimum, and $p''(3) = -6 < 0 \Rightarrow$ at $x = 3$ there is a local maximum. But $p(3) = 0 \Rightarrow$ the best you can do is break even.

48. The average cost of producing x items is $\overline{c}(x) = \frac{c(x)}{x} = x^2 - 20x + 20,000 \Rightarrow \overline{c}'(x) = 2x - 20 = 0 \Rightarrow x = 10$, the only critical value. The average cost is $\overline{c}(10) = \$19,900$ per item is a minimum cost because $\overline{c}''(10) = 2 > 0$.

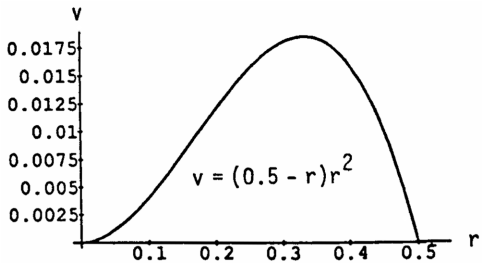
49. (a) The artisan should order px units of material in order to have enough until the next delivery.

    (b) The average number of units in storage until the next delivery is $\frac{px}{2}$ and so the cost of storing then is $s\left(\frac{px}{2}\right)$ per day, and the total cost for x days is $\left(\frac{px}{2}\right)sx$. When added to the delivery cost, the total cost for delivery and storage for each cycle is: cost per cycle $= d + \frac{px}{2}sx$.

    (c) The average cost per day for storage and delivery of materials is: average cost per day $= \frac{\left(d + \frac{ps}{2}x^2\right)}{x} + \frac{d}{x} + \frac{ps}{2}x$. To minimize the average cost per day, set the derivative equal to zero. $\frac{d}{dx}\left(d(x)^{-1} + \frac{ps}{2}x\right) = -d(x)^{-2} + \frac{ps}{2} = 0$ $\Rightarrow x = \pm\sqrt{\frac{2d}{ps}}$. Only the positive root makes sense in this context so that $x^* = \sqrt{\frac{2d}{ps}}$. To verify that $x^*$ gives a minimum, check the second derivative $\left[\frac{d}{dx}\left(-d(x)^{-2} + \frac{ps}{2}\right)\right]\Big|_{\sqrt{\frac{2d}{ps}}} = \frac{2d}{x^3}\Big|_{\sqrt{\frac{2d}{ps}}} = \frac{2d}{\left(\sqrt{\frac{2d}{ps}}\right)^3} > 0 \Rightarrow$ a minimum.

    The amount to deliver is $px^* = \sqrt{\frac{2pd}{s}}$.

    (d) The line and the hyperbola intersect when $\frac{d}{x} = \frac{ps}{2}x$. Solving for x gives $x_{\text{intersection}} = \pm\sqrt{\frac{2d}{ps}}$. For $x > 0$, $x_{\text{intersection}} = \sqrt{\frac{2d}{ps}} = x^*$. From this result, the average cost per day is minimized when the average daily cost of delivery is equal to the average daily cost of storage.



50. Average Cost: $\frac{c(x)}{x} = \frac{2000}{x} + 96 + 4x^{1/2} \Rightarrow \frac{d}{dx}\left(\frac{c(x)}{x}\right) = -\frac{2000}{x^2} + 2x^{-1/2} = 0 \Rightarrow x = 100$. Check for a minimum: $\frac{d^2}{dx^2}\left(\frac{c(x)}{x}\right)\Big|_{x=100} = \frac{4000}{100^3} - 100^{-3/2} = 0.003 > 0 \Rightarrow$ a minimum at $x = 100$. At a production level of $100,000$ units, the average cost will be minimized at $\$156$ per unit.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

51. We have $\frac{dR}{dM} = CM - M^2$. Solving $\frac{d^2R}{dM^2} = C - 2M = 0 \Rightarrow M = \frac{C}{2}$. Also, $\frac{d^3R}{dM^3} = -2 < 0 \Rightarrow$ at $M = \frac{C}{2}$ there is a maximum.

52. (a) If $v = cr_0r^2 - cr^3$, then $v' = 2cr_0r - 3cr^2 = cr(2r_0 - 3r)$ and $v'' = 2cr_0 - 6cr = 2c(r_0 - 3r)$. The solution of $v' = 0$ is $r = 0$ or $\frac{2r_0}{3}$, but 0 is not in the domain. Also, $v' > 0$ for $r < \frac{2r_0}{3}$ and $v' < 0$ for $r > \frac{2r_0}{3} \Rightarrow$ at $r = \frac{2r_0}{3}$ there is a maximum.

(b) The graph confirms the findings in (a).

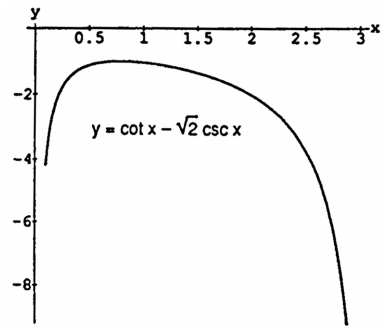
53. If $x > 0$, then $(x-1)^2 \geq 0 \Rightarrow x^2 + 1 \geq 2x \Rightarrow \frac{x^2+1}{x} \geq 2$. In particular if a, b, c and d are positive integers, then $\left(\frac{a^2+1}{a}\right)\left(\frac{b^2+1}{b}\right)\left(\frac{c^2+1}{c}\right)\left(\frac{d^2+1}{d}\right) \geq 16$.

54. (a) $f(x) = \frac{x}{\sqrt{a^2+x^2}} \Rightarrow f'(x) = \frac{(a^2+x^2)^{1/2} - x^2(a^2+x^2)^{-1/2}}{(a^2+x^2)} = \frac{a^2+x^2-x^2}{(a^2+x^2)^{3/2}} = \frac{a^2}{(a^2+x^2)^{3/2}} > 0$
$\Rightarrow$ f(x) is an increasing function of x

(b) $g(x) = \frac{d-x}{\sqrt{b^2+(d-x)^2}} \Rightarrow g'(x) = \frac{-(b^2+(d-x)^2)^{1/2} + (d-x)^2(b^2+(d-x)^2)^{-1/2}}{b^2+(d-x)^2}$
$= \frac{-(b^2+(d-x)^2)+(d-x)^2}{(b^2+(d-x)^2)^{3/2}} = \frac{-b^2}{(b^2+(d-x)^2)^{3/2}} < 0 \Rightarrow$ g(x) is a decreasing function of x

(c) Since $c_1, c_2 > 0$, the derivative $\frac{dt}{dx}$ is an increasing function of x (from part (a)) minus a decreasing function of x (from part (b)): $\frac{dt}{dx} = \frac{1}{c_1}f(x) - \frac{1}{c_2}g(x) \Rightarrow \frac{d^2t}{dx^2} = \frac{1}{c_1}f'(x) - \frac{1}{c_2}g'(x) > 0$ since $f'(x) > 0$ and $g'(x) < 0 \Rightarrow \frac{dt}{dx}$ is an increasing function of x.

55. At $x = c$, the tangents to the curves are parallel. Justification: The vertical distance between the curves is $D(x) = f(x) - g(x)$, so $D'(x) = f'(x) - g'(x)$. The maximum value of D will occur at a point c where $D' = 0$. At such a point, $f'(c) - g'(c) = 0$, or $f'(c) = g'(c)$.

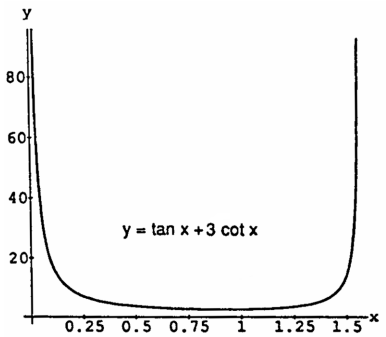


56. (a) $f(x) = 3 + 4\cos x + \cos 2x$ is a periodic function with period $2\pi$

(b) No, $f(x) = 3 + 4\cos x + \cos 2x = 3 + 4\cos x + (2\cos^2 x - 1) = 2(1 + 2\cos x + \cos^2 x) = 2(1+\cos x)^2 \geq 0$
$\Rightarrow$ f(x) is never negative

57. (a) If $y = \cot x - \sqrt{2}\csc x$ where $0 < x < \pi$, then $y' = (\csc x)\left(\sqrt{2}\cot x - \csc x\right)$. Solving $y' = 0$
$\Rightarrow \cos x = \frac{1}{\sqrt{2}} \Rightarrow x = \frac{\pi}{4}$. For $0 < x < \frac{\pi}{4}$ we have $y' > 0$, and $y' < 0$ when $\frac{\pi}{4} < x < \pi$. Therefore, at $x = \frac{\pi}{4}$ there is a maximum value of $y = -1$.

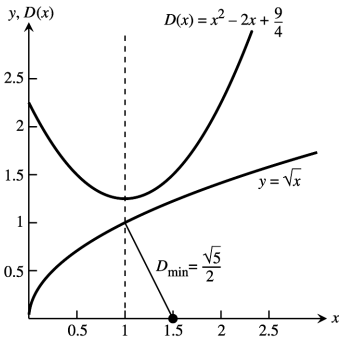
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



(b)

The graph confirms the findings in (a).

58. (a) If $y = \tan x + 3 \cot x$ where $0 < x < \frac{\pi}{2}$, then $y' = \sec^2 x - 3 \csc^2 x$. Solving $y' = 0 \Rightarrow \tan x = \pm\sqrt{3}$ $\Rightarrow x = \pm\frac{\pi}{3}$, but $-\frac{\pi}{3}$ is not in the domain. Also, $y'' = 2 \sec^2 x \tan x + 3 \csc^2 x \cot x > 0$ for all $0 < x < \frac{\pi}{2}$. Therefore at $x = \frac{\pi}{3}$ there is a minimum value of $y = 2\sqrt{3}$.



(b)

The graph confirms the findings in (a).

59. (a) The square of the distance is $D(x) = \left(x - \frac{3}{2}\right)^2 + \left(\sqrt{x} + 0\right)^2 = x^2 - 2x + \frac{9}{4}$, so $D'(x) = 2x - 2$ and the critical point occurs at $x = 1$. Since $D'(x) < 0$ for $x < 1$ and $D'(x) > 0$ for $x > 1$, the critical point corresponds to the minimum distance. The minimum distance is $\sqrt{D(1)} = \frac{\sqrt{5}}{2}$.

(b)

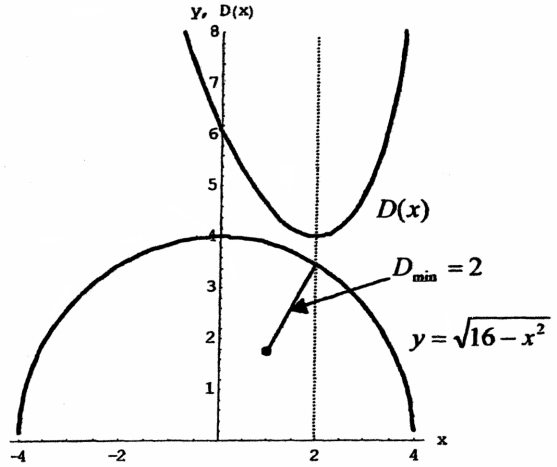
The minimum distance is from the point $\left(\frac{3}{2}, 0\right)$ to the point $(1, 1)$ on the graph of $y = \sqrt{x}$, and this occurs at the value $x = 1$ where $D(x)$, the distance squared, has its minimum value.

60. (a) Calculus Method:

The square of the distance from the point $\left(1, \sqrt{3}\right)$ to $\left(x, \sqrt{16 - x^2}\right)$ is given by

$$D(x) = (x-1)^2 + \left(\sqrt{16 - x^2} - \sqrt{3}\right)^2 = x^2 - 2x + 1 + 16 - x^2 - 2\sqrt{48 - 3x^2} + 3 = -2x + 20 - 2\sqrt{48 - 3x^2}.$$

Then $D'(x) = -2 - \frac{2}{\sqrt{48 - 3x^2}}(-6x) = -2 + \frac{6x}{\sqrt{48 - 3x^2}}$. Solving $D'(x) = 0$ we have: $6x = 2\sqrt{48 - 3x^2}$



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$\Rightarrow 36x^2 = 4(48 - 3x^2) \Rightarrow 9x^2 = 48 - 3x^2 \Rightarrow 12x^2 = 48 \Rightarrow x = \pm 2$. We discard $x = -2$ as an extraneous solution, leaving $x = 2$. Since $D'(x) < 0$ for $-4 < x < 2$ and $D'(x) > 0$ for $2 < x < 4$, the critical point corresponds to the minimum distance. The minimum distance is $\sqrt{D(2)} = 2$.

Geometry Method:

The semicircle is centered at the origin and has radius 4. The distance from the origin to $\left(1,\ \sqrt{3}\right)$ is $\sqrt{1^2 + \left(\sqrt{3}\right)^2} = 2$. The shortest distance from the point to the semicircle is the distance along the radius containing the point $\left(1,\ \sqrt{3}\right)$. That distance is $4 - 2 = 2$.

(b)

The minimum distance is from the point $\left(1,\ \sqrt{3}\right)$ to the point $\left(2,\ 2\sqrt{3}\right)$ on the graph of $y = \sqrt{16 - x^2}$, and this occurs at the value $x = 2$ where $D(x)$, the distance squared, has its minimum value.

61. (a) The base radius of the cone is $r = \frac{2\pi a - x}{2\pi}$ and so the height is $h = \sqrt{a^2 - r^2} = \sqrt{a^2 - \left(\frac{2\pi a - x}{2\pi}\right)^2}$. Therefore, $V(x) = \frac{\pi}{3}r^2h = \frac{\pi}{3}\left(\frac{2\pi a - x}{2\pi}\right)^2\sqrt{a^2 - \left(\frac{2\pi a - x}{2\pi}\right)^2}$.

(b) To simplify the calculations, we shall consider the volume as a function of r: volume $= f(r) = \frac{\pi}{3}r^2\sqrt{a^2 - r^2}$, where $0 < r < a$. $f'(r) = \frac{\pi}{3}\frac{d}{dr}\left(r^2\sqrt{a^2 - r^2}\right) = \frac{\pi}{3}\left[r^2 \cdot \frac{1}{2\sqrt{a^2 - r^2}}(-2r) + \left(\sqrt{a^2 - r^2}\right)(2r)\right] = \frac{\pi}{3}\left[\frac{-r^3 + 2r(a^2 - r^2)}{\sqrt{a^2 - r^2}}\right]$ $= \frac{\pi}{3}\left[\frac{2a^2r - 3r^3}{\sqrt{a^2 - r^2}}\right] = \frac{\pi r(2a^2 - 3r^2)}{3\sqrt{a^2 - r^2}}$. The critical point occurs when $r^2 = \frac{2a^2}{3}$, which gives $r = a\sqrt{\frac{2}{3}} = \frac{a\sqrt{6}}{3}$. Then $h = \sqrt{a^2 - r^2} = \sqrt{a^2 - \frac{2a^2}{3}} = \sqrt{\frac{a^2}{3}} = \frac{a\sqrt{3}}{3}$. Using $r = \frac{a\sqrt{6}}{3}$ and $h = \frac{a\sqrt{3}}{3}$, we may now find the values of r and h for the given values of a.

When $a = 4$: $r = \frac{4\sqrt{6}}{3}$, $h = \frac{4\sqrt{3}}{3}$;

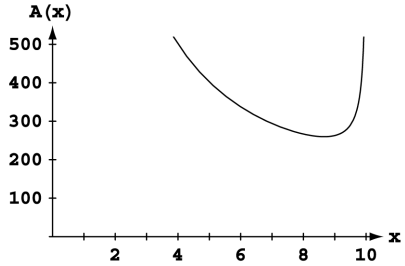
When $a = 5$: $r = \frac{5\sqrt{6}}{3}$, $h = \frac{5\sqrt{3}}{3}$;

When $a = 6$: $r = 2\sqrt{6}$, $h = 2\sqrt{3}$;

When $a = 8$: $r = \frac{8\sqrt{6}}{3}$, $h = \frac{8\sqrt{3}}{3}$;

(c) Since $r = \frac{a\sqrt{6}}{3}$ and $h = \frac{a\sqrt{3}}{3}$, the relationship is $\frac{r}{h} = \sqrt{2}$.

62. (a) Let $x_0$ represent the fixed value of x at the point P, so that P has the coordinates $(x_0,\ a)$, and let $m = f'(x_0)$ be the slope of the line RT. Then the equation of the line RT is $y = m(x - x_0) + a$. The y-intercept of this line is $m(0 - x_0) + a = a - mx_0$, and the x-intercept is the solution of $m(x - x_0) + a = 0$, or $x = \frac{mx_0 - a}{m}$. Let O designate the origin. Then



(Area of triangle RST)

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$= 2$(Area of triangle ORT)
$= 2 \cdot \frac{1}{2}$(x-intercept of line RT)(y-intercept of line RT)
$= 2 \cdot \frac{1}{2}\left(\frac{mx_0 - a}{m}\right)(a - mx_0)$
$= -m\left(\frac{mx_0 - a}{m}\right)\left(\frac{mx_0 - a}{m}\right)$
$= -m\left(\frac{mx_0 - a}{m}\right)^2$
$= -m\left(x_0 - \frac{a}{m}\right)^2$

Substituting x for $x_0$, $f'(x)$ for m, and $f(x)$ for a, we have $A(x) = -f'(x)\left[x - \frac{f(x)}{f'(x)}\right]^2$.

(b) The domain is the open interval $(0, 10)$. To graph, let $y_1 = f(x) = 5 + 5\sqrt{1 - \frac{x^2}{100}}$, $y_2 = f'(x) = \text{NDER}(y_1)$, and $y_3 = A(x) = -y_2\left(x - \frac{y_1}{y_2}\right)^2$. The graph of the area function $y_3 = A(x)$ is shown below.

The vertical asymptotes at $x = 0$ and $x = 10$ correspond to horizontal or vertical tangent lines, which do not form triangles.

(c) Using our expression for the y-intercept of the tangent line, the height of the triangle is
$a - mx = f(x) - f'(x) \cdot x = 5 + \frac{1}{2}\sqrt{100 - x^2} - \frac{-x}{2\sqrt{100 - x^2}}x = 5 + \frac{1}{2}\sqrt{100 - x^2} + \frac{x^2}{2\sqrt{100 - x^2}}$
We may use graphing methods or the analytic method in part (d) to find that the minimum value of $A(x)$ occurs at $x \approx 8.66$. Substituting this value into the expression above, the height of the triangle is 15. This is 3 times the y-coordinate of the center of the ellipse.

(d) Part (a) remains unchanged. Assuming $C \geq B$, the domain is $(0, C)$. To graph, note that
$f(x) = B + B\sqrt{1 - \frac{x^2}{C^2}} = B + \frac{B}{C}\sqrt{C^2 - x^2}$ and $f'(x) = \frac{B}{C}\frac{1}{2\sqrt{C^2 - x^2}}(-2x) = \frac{-Bx}{C\sqrt{C^2 - x^2}}$. Therefore we have

$$A(x) = -f'(x)\left[x - \frac{f(x)}{f'(x)}\right]^2 = \frac{Bx}{C\sqrt{C^2 - x^2}}\left(x - \frac{B + \frac{B}{C}\sqrt{C^2 - x^2}}{\frac{-Bx}{C\sqrt{C^2 - x^2}}}\right)^2 = \frac{Bx}{C\sqrt{C^2 - x^2}}\left(x - \frac{\left(BC + B\sqrt{C^2 - x^2}\right)\left(\sqrt{C^2 - x^2}\right)}{-Bx}\right)^2$$

$$= \frac{1}{BCx\sqrt{C^2 - x^2}}\left[Bx^2 + \left(BC + B\sqrt{C^2 - x^2}\right)\left(\sqrt{C^2 - x^2}\right)\right]^2 = \frac{1}{BCx\sqrt{C^2 - x^2}}\left[Bx^2 + BC\sqrt{C^2 - x^2} + B(C^2 - x^2)\right]^2$$

$$= \frac{1}{BCx\sqrt{C^2 - x^2}}\left[BC\left(C + \sqrt{C^2 - x^2}\right)\right]^2 = \frac{BC\left(C + \sqrt{C^2 - x^2}\right)^2}{x\sqrt{C^2 - x^2}}$$

$$A'(x) = BC \cdot \frac{\left(x\sqrt{C^2 - x^2}\right)(2)\left(C + \sqrt{C^2 - x^2}\right)\left(\frac{-x}{\sqrt{C^2 - x^2}}\right) - \left(C + \sqrt{C^2 - x^2}\right)^2\left(x\frac{-x}{\sqrt{C^2 - x^2}} + \sqrt{C^2 - x^2}(1)\right)}{x^2(C^2 - x^2)}$$

$$= \frac{BC\left(C + \sqrt{C^2 - x^2}\right)}{x^2(C^2 - x^2)}\left[-2x^2 - \left(C + \sqrt{C^2 - x^2}\right)\left(\frac{-x^2}{\sqrt{C^2 - x^2}} + \sqrt{C^2 - x^2}\right)\right]$$

$$= \frac{BC\left(C + \sqrt{C^2 - x^2}\right)}{x^2(C^2 - x^2)}\left[-2x^2 + \frac{Cx^2}{\sqrt{C^2 - x^2}} - C\sqrt{C^2 - x^2} + x^2 - (C^2 - x^2)\right]$$

$$= \frac{BC\left(C + \sqrt{C^2 - x^2}\right)}{x^2(C^2 - x^2)}\left(\frac{Cx^2}{\sqrt{C^2 - x^2}} - C\sqrt{C^2 - x^2} - C^2\right) = \frac{BC\left(C + \sqrt{C^2 - x^2}\right)}{x^2(C^2 - x^2)^{3/2}}\left[Cx^2 - C(C^2 - x^2) - C^2\sqrt{C^2 - x^2}\right]$$

$$= \frac{BC^2\left(C + \sqrt{C^2 - x^2}\right)}{x^2(C^2 - x^2)^{3/2}}\left(2x^2 - C^2 - C\sqrt{C^2 - x^2}\right)$$

To find the critical points for $0 < x < C$, we solve: $2x^2 - C^2 = C\sqrt{C^2 - x^2} \Rightarrow 4x^4 - 4C^2x^2 + C^4 = C^4 - C^2x^2$
$\Rightarrow 4x^4 - 3C^2x^2 = 0 \Rightarrow x^2(4x^2 - 3C^2) = 0$. The minimum value of $A(x)$ for $0 < x < C$ occurs at the critical point

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$x = \frac{C\sqrt{3}}{2}$, or $x^2 = \frac{3C^2}{4}$. The corresponding triangle height is

$$\begin{aligned} a - mx &= f(x) - f'(x)\cdot x \\ &= B + \frac{B}{C}\sqrt{C^2 - x^2} + \frac{Bx^2}{C\sqrt{C^2 - \frac{3C^2}{4}}} \\ &= B + \frac{B}{C}\sqrt{C^2 - x^2} + \frac{B\left(\frac{3C^2}{4}\right)}{C\sqrt{C^2 - \frac{3C^2}{4}}} \\ &= B + \frac{B}{C}\left(\frac{C}{2}\right) + \frac{\frac{3BC^2}{4}}{\frac{C^2}{2}} \\ &= B + \frac{B}{2} + \frac{3B}{2} \\ &= 3B \end{aligned}$$

This shows that the traingle has minimum arrea when its height is 3B.

## 4.6 INDETERMINATE FORMS AND L'HÔPITAL'S RULE

1. l'Hôpital: $\lim_{x\to 2} \frac{x-2}{x^2-4} = \frac{1}{2x}\Big|_{x=2} = \frac{1}{4}$ or $\lim_{x\to 2} \frac{x-2}{x^2-4} = \lim_{x\to 2} \frac{x-2}{(x-2)(x+2)} = \lim_{x\to 2} \frac{1}{x+2} = \frac{1}{4}$

2. l'Hôpital: $\lim_{x\to 0} \frac{\sin 5x}{x} = \frac{5\cos 5x}{1}\Big|_{x=0} = 5$ or $\lim_{x\to 0} \frac{\sin 5x}{x} = 5\lim_{5x\to 0} \frac{\sin 5x}{5x} = 5\cdot 1 = 5$

3. l'Hôpital: $\lim_{x\to\infty} \frac{5x^2-3x}{7x^2+1} = \lim_{x\to\infty} \frac{10x-3}{14x} = \lim_{x\to\infty} \frac{10}{14} = \frac{5}{7}$ or $\lim_{x\to\infty} \frac{5x^2-3x}{7x^2+1} = \lim_{x\to\infty} \frac{5-\frac{3}{x}}{7+\frac{1}{x}} = \frac{5}{7}$

4. l'Hôpital: $\lim_{x\to 1} \frac{x^3-1}{4x^3-x-3} = \lim_{x\to 1} \frac{3x^2}{12x^2-1} = \frac{3}{11}$ or $\lim_{x\to 1} \frac{x^3-1}{4x^3-x-3} = \lim_{x\to 1} \frac{(x-1)(x^2+x+1)}{(x-1)(4x^2+4x+3)}$
$= \lim_{x\to 1} \frac{(x^2+x+1)}{(4x^2+4x+3)} = \frac{3}{11}$

5. l'Hôpital: $\lim_{x\to 0} \frac{1-\cos x}{x^2} = \lim_{x\to 0} \frac{\sin x}{2x} = \lim_{x\to 0} \frac{\cos x}{2} = \frac{1}{2}$ or $\lim_{x\to 0} \frac{1-\cos x}{x^2} = \lim_{x\to 0} \left[\frac{(1-\cos x)}{x^2}\left(\frac{1+\cos x}{1+\cos x}\right)\right]$
$= \lim_{x\to 0} \frac{\sin^2 x}{x^2(1+\cos x)} = \lim_{x\to 0} \left[\left(\frac{\sin x}{x}\right)\left(\frac{\sin x}{x}\right)\left(\frac{1}{1+\cos x}\right)\right] = \frac{1}{2}$

6. l'Hôpital: $\lim_{x\to\infty} \frac{2x^2+3x}{x^3+x+1} = \lim_{x\to\infty} \frac{4x+3}{3x^2+1} = \lim_{x\to\infty} \frac{4}{6x} = 0$ or $\lim_{x\to\infty} \frac{2x^2+3x}{x^3+x+1} = \lim_{x\to\infty} \frac{\frac{2}{x}+\frac{3}{x^2}}{1+\frac{1}{x^2}+\frac{1}{x^3}} = \frac{0}{1} = 0$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

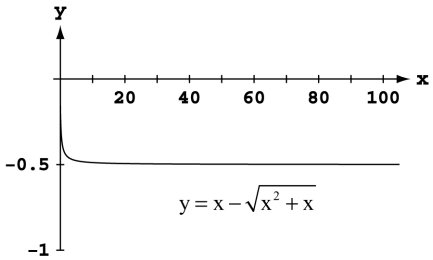
31. Part (b) is correct because part (a) is neither in the $\frac{0}{0}$ nor $\frac{\infty}{\infty}$ form and so l'Hôpital's rule may not be used.

32. Answers may vary.
(a) $f(x) = 3x + 1; g(x) = x$
$\lim_{x \to \infty} \frac{f(x)}{g(x)} = \lim_{x \to \infty} \frac{3x+1}{x} = \lim_{x \to \infty} \frac{3}{1} = 3$
(b) $f(x) = x + 1; g(x) = x^2$
$\lim_{x \to \infty} \frac{f(x)}{g(x)} = \lim_{x \to \infty} \frac{x+1}{x^2} = \lim_{x \to \infty} \frac{1}{2x} = 0$
(c) $f(x) = x^2; g(x) = x + 1$
$\lim_{x \to \infty} \frac{f(x)}{g(x)} = \lim_{x \to \infty} \frac{x^2}{x+1} = \lim_{x \to \infty} \frac{2x}{1} = \infty$



33. If $f(x)$ is to be continuous at $x = 0$, then $\lim_{x \to 0} f(x) = f(0) \Rightarrow c = f(0) = \lim_{x \to 0} \frac{9x - 3\sin 3x}{5x^3} = \lim_{x \to 0} \frac{9 - 9\cos 3x}{15x^2}$
$= \lim_{x \to 0} \frac{27 \sin 3x}{30x} = \lim_{x \to 0} \frac{81 \cos 3x}{30} = \frac{27}{10}$.

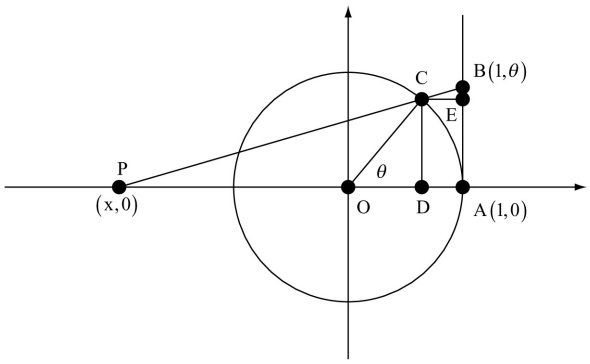
34. (a) For $x \neq 0$, $f'(x) = \frac{d}{dx}(x + 2) = 1$ and $g'(x) = \frac{d}{dx}(x + 1) = 1$. Therefore, $\lim_{x \to 0} \frac{f'(x)}{g'(x)} = \frac{1}{1} = 1$, while $\lim_{x \to 0} \frac{f(x)}{g(x)}$
$= \frac{x+2}{x+1} = \frac{0+2}{0+1} = 2$.
(b) This does not contradict l'Hôpital's rule because neither f nor g is differentiable at $x = 0$
(as evidenced by the fact that neither is continuous at $x = 0$), so l'Hôpital's rule does not apply.

35. The graph indicates a limit near $-1$. The limit leads to the indeterminate form $\frac{0}{0}$: $\lim_{x \to 1} \frac{2x^2 - (3x+1)\sqrt{x} + 2}{x - 1}$
$= \lim_{x \to 1} \frac{2x^2 - 3x^{3/2} - x^{1/2} + 2}{x - 1} = \lim_{x \to 1} \frac{4x - \frac{9}{2}x^{1/2} - \frac{1}{2}x^{-1/2}}{1}$
$= \frac{4 - \frac{9}{2} - \frac{1}{2}}{1} = \frac{4-5}{1} = -1$

36. (a)

(b) The limit leads to the indeterminate form $\infty - \infty$:
$\lim_{x \to \infty} \left(x - \sqrt{x^2 + x}\right) = \lim_{x \to \infty} \left(x - \sqrt{x^2 + x}\right)\left(\frac{x + \sqrt{x^2+x}}{x + \sqrt{x^2+x}}\right) = \lim_{x \to \infty} \left(\frac{x^2 - (x^2 + x)}{x + \sqrt{x^2 + x}}\right) = \lim_{x \to \infty} \frac{-x}{x + \sqrt{x^2 + x}}$
$= \lim_{x \to \infty} \frac{-1}{1 + \sqrt{1 + \frac{1}{x}}} = \frac{-1}{1 + \sqrt{1+0}} = -\frac{1}{2}$

37. Graphing $f(x) = \frac{1 - \cos x^6}{x^{12}}$ on th window $[-1, 1]$ by $[-0.5, 1]$ it appears that $\lim_{x \to 0} f(x) = 0$. However, we see that if we let $u = x^6$, then $\lim_{x \to 0} f(x) = \lim_{u \to 0} \frac{1 - \cos u}{u^2} = \lim_{u \to 0} \frac{\sin u}{2u} = \lim_{u \to 0} \frac{\cos u}{2} = \frac{1}{2}$.



38. (a) We seek c in $(-2, 0)$ so that $\frac{f'(c)}{g'(c)} = \frac{f(0) - f(-2)}{g(0) - g(-2)} = \frac{0+2}{0-4} = -\frac{1}{2}$. Since $f'(c) = 1$ and $g'(c) = 2c$ we have that $\frac{1}{2c} = -\frac{1}{2}$
$\Rightarrow c = -1$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(b) We seek c in any open interval $(a, b)$ so that $\frac{f'(c)}{g'(c)} = \frac{f(b)-f(a)}{g(b)-g(a)} = \frac{b-a}{b^2-a^2} = \frac{b-a}{(b-a)(b+a)} = \frac{1}{b+a} \Rightarrow \frac{1}{2c} = \frac{1}{b+a} \Rightarrow c = \frac{b+a}{2}$

(c) We seek c in $(0, 3)$ so that $\frac{f'(c)}{g'(c)} = \frac{f(3)-f(0)}{g(3)-g(0)} = \frac{-3-0}{9-0} = -\frac{1}{3} \Rightarrow \frac{c^2-4}{2c} = -\frac{1}{3} \Rightarrow 3c^2 + 2c - 12 = 0 \Rightarrow c = \frac{-1+\sqrt{37}}{3}$.
(Note that $c = \frac{-1-\sqrt{37}}{3}$ is not in the given interval $(0, 3)$.)

39. (a) By similar triangles, $\frac{PA}{AB} = \frac{CE}{EB}$ where E is the point on $\overleftrightarrow{AB}$ such that $\overleftrightarrow{CE} \perp \overleftrightarrow{AB}$:

Thus $\frac{1-x}{\theta} = \frac{1-\cos\theta}{\theta-\sin\theta}$, since the coordinates of C are $(\cos\theta, \sin\theta)$. Hence, $1 - x = \frac{\theta(1-\cos\theta)}{\theta-\sin\theta}$.

(b) $\lim_{\theta\to 0}(1-x) = \lim_{\theta\to 0}\frac{\theta(1-\cos\theta)}{\theta-\sin\theta} = \lim_{\theta\to 0}\frac{\theta\sin\theta+1-\cos\theta}{1-\cos\theta} = \lim_{\theta\to 0}\frac{\theta\cos\theta+\sin\theta+\sin\theta}{\sin\theta} = \lim_{\theta\to 0}\frac{\theta\cos\theta+2\sin\theta}{\sin\theta}$
$= \lim_{\theta\to 0}\frac{\theta(-\sin\theta)+\cos\theta+2\cos\theta}{\cos\theta} = \lim_{\theta\to 0}\frac{-\theta\sin\theta+3\cos\theta}{\cos\theta} = \frac{0+3}{1} = 3$

(c) We have that $\lim_{\theta\to\infty}\left[(1-x)-(1-\cos\theta)\right] = \lim_{\theta\to\infty}\left[\frac{\theta(1-\cos\theta)}{\theta-\sin\theta} - (1-\cos\theta)\right] = \lim_{\theta\to\infty}(1-\cos\theta)\left[\frac{\theta}{\theta-\sin\theta} - 1\right]$
As $\theta \to \infty$, $(1-\cos\theta)$ oscillates between 0 and 2, and so it is bounded. Since $\lim_{\theta\to\infty}\left(\frac{\theta}{\theta-\sin\theta} - 1\right) = 1 - 1 = 0$,
$\lim_{\theta\to\infty}(1-\cos\theta)\left[\frac{\theta}{\theta-\sin\theta} - 1\right] = 0$. Geometrically, this means that as $\theta \to \infty$, the distance between points P and D approaches 0.

40. Throughout this problem note that $r^2 = y^2 + 1$, $r > y$ and that both $r \to \infty$ and $y \to \infty$ as $\theta \to \frac{\pi}{2}$.

(a) $\lim_{\theta\to\pi/2} r - y = \lim_{\theta\to\pi/2}\frac{1}{r+y} = 0$

(b) $\lim_{\theta\to\pi/2} r^2 - y^2 = \lim_{\theta\to\pi/2} 1 = 1$

(c) We have that $r^3 - y^3 = (r-y)(r^2+ry+y^2) = \frac{r^2+ry+y^2}{r+y} > \frac{y^2+y\cdot y+y^2}{r} = \frac{3y^2}{r} = 3y\cdot\frac{y}{r}$.
Since $\lim_{\theta\to\pi/2} 3y\cdot\frac{y}{r} = \lim_{\theta\to\pi/2} 3\sin\theta\cdot y = \infty$ we have that $\lim_{\theta\to\pi/2} r^3 - y^3 = \infty$.

## 4.7 NEWTON'S METHOD

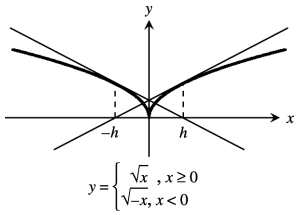
1. $y = x^2 + x - 1 \Rightarrow y' = 2x + 1 \Rightarrow x_{n+1} = x_n - \frac{x_n^2+x_n-1}{2x_n+1}$; $x_0 = 1 \Rightarrow x_1 = 1 - \frac{1+1-1}{2+1} = \frac{2}{3}$
$\Rightarrow x_2 = \frac{2}{3} - \frac{\frac{4}{9}+\frac{2}{3}-1}{\frac{4}{3}+1} \Rightarrow x_2 = \frac{2}{3} - \frac{4+6-9}{12+9} = \frac{2}{3} - \frac{1}{21} = \frac{13}{21} \approx .61905$; $x_0 = -1 \Rightarrow x_1 = 1 - \frac{1-1-1}{-2+1} = -2$
$\Rightarrow x_2 = -2 - \frac{4-2-1}{-4+1} = -\frac{5}{3} \approx -1.66667$

2. $y = x^3 + 3x + 1 \Rightarrow y' = 3x^2 + 3 \Rightarrow x_{n+1} = x_n - \frac{x_n^3+3x_n+1}{3x_n^2+3}$; $x_0 = 0 \Rightarrow x_1 = 0 - \frac{1}{3} = -\frac{1}{3}$
$\Rightarrow x_2 = -\frac{1}{3} - \frac{-\frac{1}{27}-1+1}{\frac{1}{3}+3} = -\frac{1}{3} + \frac{1}{90} = -\frac{29}{90} \approx -0.32222$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

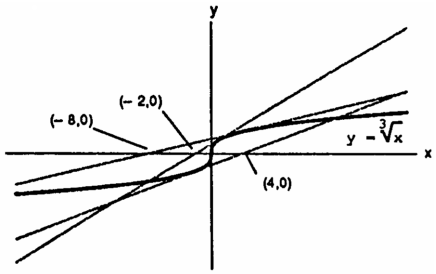
3. $y = x^4 + x - 3 \Rightarrow y' = 4x^3 + 1 \Rightarrow x_{n+1} = x_n - \frac{x_n^4 + x_n - 3}{4x_n^3 + 1}$; $x_0 = 1 \Rightarrow x_1 = 1 - \frac{1+1-3}{4+1} = \frac{6}{5}$
$\Rightarrow x_2 = \frac{6}{5} - \frac{\frac{1296}{625} + \frac{6}{5} - 3}{\frac{864}{125} + 1} = \frac{6}{5} - \frac{1296+750-1875}{4320+625} = \frac{6}{5} - \frac{171}{4945} = \frac{5763}{4945} \approx 1.16542$; $x_0 = -1 \Rightarrow x_1 = -1 - \frac{1-1-3}{-4+1}$
$= -2 \Rightarrow x_2 = -2 - \frac{16-2-3}{-32+1} = -2 + \frac{11}{31} = -\frac{51}{31} \approx -1.64516$

4. $y = 2x - x^2 + 1 \Rightarrow y' = 2 - 2x \Rightarrow x_{n+1} = x_n - \frac{2x_n - x_n^2 + 1}{2 - 2x_n}$; $x_0 = 0 \Rightarrow x_1 = 0 - \frac{0-0+1}{2-0} = -\frac{1}{2}$
$\Rightarrow x_2 = -\frac{1}{2} - \frac{-1-\frac{1}{4}+1}{2+1} = -\frac{1}{2} + \frac{1}{12} = -\frac{5}{12} \approx -.41667$; $x_0 = 2 \Rightarrow x_1 = 2 - \frac{4-4+1}{2-4} = \frac{5}{2} \Rightarrow x_2 = \frac{5}{2} - \frac{5-\frac{25}{4}+1}{2-5}$
$= \frac{5}{2} - \frac{20-25+4}{-12} = \frac{5}{2} - \frac{1}{12} = \frac{29}{12} \approx 2.41667$



5. $y = x^4 - 2 \Rightarrow y' = 4x^3 \Rightarrow x_{n+1} = x_n - \frac{x_n^4 - 2}{4x_n^3}$; $x_0 = 1 \Rightarrow x_1 = 1 - \frac{1-2}{4} = \frac{5}{4} \Rightarrow x_2 = \frac{5}{4} - \frac{\frac{625}{256} - 2}{\frac{125}{16}} = \frac{5}{4} - \frac{625-512}{2000}$
$= \frac{5}{4} - \frac{113}{2000} = \frac{2500-113}{2000} = \frac{2387}{2000} \approx 1.1935$

6. From Exercise 5, $x_{n+1} = x_n - \frac{x_n^4 - 2}{4x_n^3}$; $x_0 = -1 \Rightarrow x_1 = -1 - \frac{1-2}{-4} = -1 - \frac{1}{4} = -\frac{5}{4} \Rightarrow x_2 = -\frac{5}{4} - \frac{\frac{625}{256} - 2}{-\frac{125}{16}}$
$= -\frac{5}{4} - \frac{625-512}{-2000} = -\frac{5}{4} + \frac{113}{2000} \approx -1.1935$



7. $f(x_0) = 0$ and $f'(x_0) \neq 0 \Rightarrow x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$ gives $x_1 = x_0 \Rightarrow x_2 = x_0 \Rightarrow x_n = x_0$ for all $n \geq 0$. That is, all of the approximations in Newton's method will be the root of $f(x) = 0$.

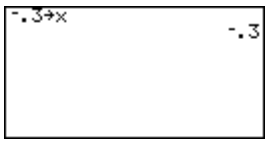
8. It does matter. If you start too far away from $x = \frac{\pi}{2}$, the calculated values may approach some other root. Starting with $x_0 = -0.5$, for instance, leads to $x = -\frac{\pi}{2}$ as the root, not $x = \frac{\pi}{2}$.

9. If $x_0 = h > 0 \Rightarrow x_1 = x_0 - \frac{f(x_0)}{f'(x_0)} = h - \frac{f(h)}{f'(h)}$
$= h - \frac{\sqrt{h}}{\left(\frac{1}{2\sqrt{h}}\right)} = h - \left(\sqrt{h}\right)\left(2\sqrt{h}\right) = -h$;
if $x_0 = -h < 0 \Rightarrow x_1 = x_0 - \frac{f(x_0)}{f'(x_0)} = -h - \frac{f(-h)}{f'(-h)}$
$= -h - \frac{\sqrt{h}}{\left(\frac{-1}{2\sqrt{h}}\right)} = -h + \left(\sqrt{h}\right)\left(2\sqrt{h}\right) = h$.

10. $f(x) = x^{1/3} \Rightarrow f'(x) = \left(\frac{1}{3}\right)x^{-2/3} \Rightarrow x_{n+1} = x_n - \frac{x_n^{1/3}}{\left(\frac{1}{3}\right)x_n^{-2/3}}$
$= -2x_n$; $x_0 = 1 \Rightarrow x_1 = -2$, $x_2 = 4$, $x_3 = -8$, and $x_4 = 16$ and so forth. Since $|x_n| = 2|x_{n-1}|$ we may conclude that $n \to \infty \Rightarrow |x_n| \to \infty$.

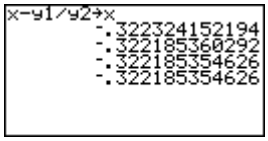
11. i) is equivalent to solving $x^3 - 3x - 1 = 0$.
ii) is equivalent to solving $x^3 - 3x - 1 = 0$.
iii) is equivalent to solving $x^3 - 3x - 1 = 0$.
iv) is equivalent to solving $x^3 - 3x - 1 = 0$.
All four equations are equivalent.

12. $f(x) = x - 1 - 0.5 \sin x \Rightarrow f'(x) = 1 - 0.5 \cos x \Rightarrow x_{n+1} = x_n - \frac{x_n - 1 - 0.5 \sin x_n}{1 - 0.5 \cos x_n}$; if $x_0 = 1.5$, then $x_1 = 1.49870$

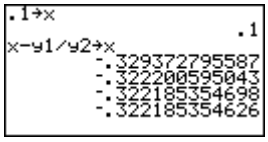


Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

13. For $x_0 = -0.3$, the procedure converges to the root $-0.32218535\ldots$.

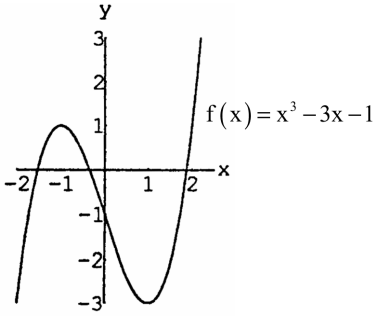


(a)

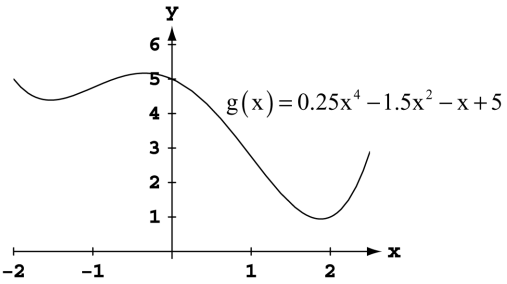


(b)

(c)



(d) Values for x will vary. One possible choice is $x_0 = 0.1$.

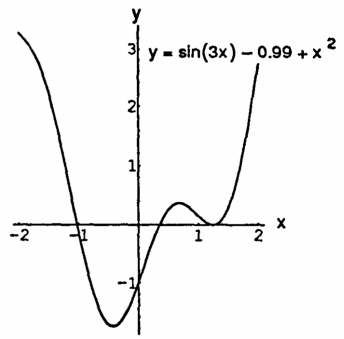


(e) Values for x will vary.

14. (a) $f(x) = x^3 - 3x - 1 \Rightarrow f'(x) = 3x^2 - 3 \Rightarrow x_{n+1} = x_n - \frac{x_n^3 - 3x_n - 1}{3x_n^2 - 3} \Rightarrow$ the two negative zeros are $-1.53209$ and $-0.34730$

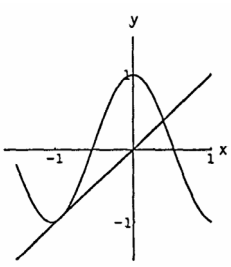
(b) The estimated solutions of $x^3 - 3x - 1 = 0$ are $-1.53209$, $-0.34730$, $1.87939$.

(c) The estimated x-values where $g(x) = 0.25x^4 - 1.5x^2 - x + 5$ has horizontal tangents are the roots of $g'(x) = x^3 - 3x - 1$, and these are $-1.53209$, $-0.34730$, $1.87939$.

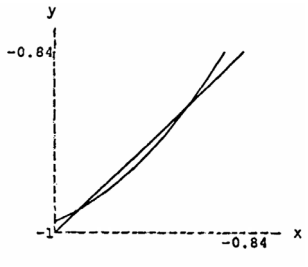


15. $f(x) = \tan x - 2x \Rightarrow f'(x) = \sec^2 x - 2 \Rightarrow x_{n+1} = x_n - \frac{\tan(x_n) - 2x_n}{\sec^2(x_n)}$; $x_0 = 1 \Rightarrow x_1 = 12920445$ $\Rightarrow x_2 = 1.155327774 \Rightarrow x_{16} = x_{17} = 1.165561185$

16. $f(x) = x^4 - 2x^3 - x^2 - 2x + 2 \Rightarrow f'(x) = 4x^3 - 6x^2 - 2x - 2 \Rightarrow x_{n+1} = x_n - \frac{x_n^4 - 2x_n^3 - x_n^2 - 2x_n + 2}{4x_n^3 - 6x_n^2 - 2x_n - 2}$; if $x_0 = 0.5$, then $x_4 = 0.630115396$; if $x_0 = 2.5$, then $x_4 = 2.57327196$



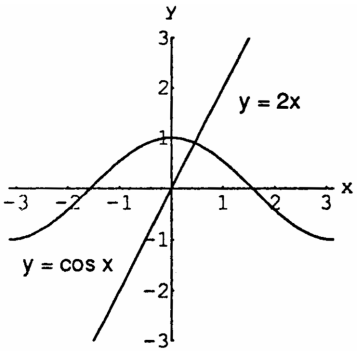
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



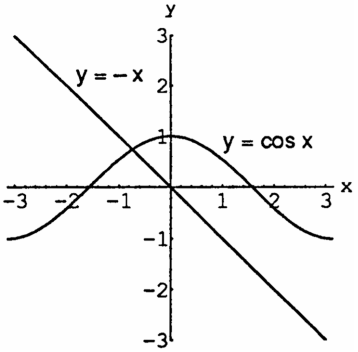
17. (a) The graph of $f(x) = \sin 3x - 0.99 + x^2$ in the window $-2 \le x \le 2$, $-2 \le y \le 3$ suggests three roots. However, when you zoom in on the x-axis near $x = 1.2$, you can see that the graph lies above the axis there. There are only two roots, one near $x = -1$, the other near $x = 0.4$.

(b) $f(x) = \sin 3x - 0.99 + x^2 \Rightarrow f'(x) = 3\cos 3x + 2x$
$\Rightarrow x_{n+1} = x_n - \frac{\sin(3x_n) - 0.99 + x_n^2}{3\cos(3x_n) + 2x_n}$ and the solutions are approximately 0.35003501505249 and $-1.0261731615301$

18. (a) Yes, three times as indicted by the graphs



(b) $f(x) = \cos 3x - x \Rightarrow f'(x)$
$= -3\sin 3x - 1 \Rightarrow x_{n+1}$
$= x_n - \frac{\cos(3x_n) - x_n}{-3\sin(3x_n) - 1}$; at approximately $-0.979367$, $-0.887726$, and 0.39004 we have $\cos 3x = x$



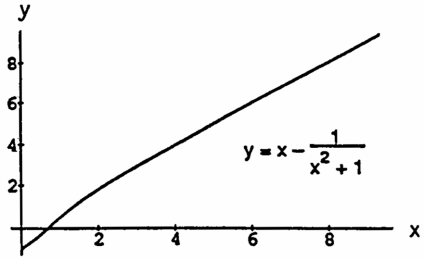
19. $f(x) = 2x^4 - 4x^2 + 1 \Rightarrow f'(x) = 8x^3 - 8x \Rightarrow x_{n+1} = x_n - \frac{2x_n^4 - 4x_n^2 + 1}{8x_n^3 - 8x_n}$; if $x_0 = -2$, then $x_6 = -1.30656296$; if $x_0 = -0.5$, then $x_3 = -0.5411961$; the roots are approximately $\pm 0.5411961$ and $\pm 1.30656296$ because $f(x)$ is an even function.

20. $f(x) = \tan x \Rightarrow f'(x) = \sec^2 x \Rightarrow x_{n+1} = x_n - \frac{\tan(x_n)}{\sec^2(x_n)}$; $x_0 = 3 \Rightarrow x_1 = 3.13971 \Rightarrow x_2 = 3.14159$ and we approximate $\pi$ to be 3.14159.

21. From the graph we let $x_0 = 0.5$ and $f(x) = \cos x - 2x$
$\Rightarrow x_{n+1} = x_n - \frac{\cos(x_n) - 2x_n}{-\sin(x_n) - 2} \Rightarrow x_1 = .45063$
$\Rightarrow x_2 = .45018 \Rightarrow$ at $x \approx 0.45$ we have $\cos x = 2x$.

22. From the graph we let $x_0 = -0.7$ and $f(x) = \cos x + x$
$\Rightarrow x_{n+1} = x_n - \frac{x_n + \cos(x_n)}{1 - \sin(x_n)} \Rightarrow x_1 = -.73944$
$\Rightarrow x_2 = -.73908 \Rightarrow$ at $x \approx -0.74$ we have $\cos x = -x$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



23. If $f(x) = x^3 + 2x - 4$, then $f(1) = -1 < 0$ and $f(2) = 8 > 0 \Rightarrow$ by the Intermediate Value Theorem the equation $x^3 + 2x - 4 = 0$ has a solution between 1 and 2. Consequently, $f'(x) = 3x^2 + 2$ and $x_{n+1} = x_n - \frac{x_n^3 + 2x_n - 4}{3x_n^2 + 2}$.
Then $x_0 = 1 \Rightarrow x_1 = 1.2 \Rightarrow x_2 = 1.17975 \Rightarrow x_3 = 1.179509 \Rightarrow x_4 = 1.1795090 \Rightarrow$ the root is approximately 1.17951.

24. We wish to solve $8x^4 - 14x^3 - 9x^2 + 11x - 1 = 0$. Let $f(x) = 8x^4 - 14x^3 - 9x^2 + 11x - 1$, then $f'(x) = 32x^3 - 42x^2 - 18x + 11 \Rightarrow x_{n+1} = x_n - \frac{8x_n^4 - 14x_n^3 - 9x_n^2 + 11x_n - 1}{32x_n^3 - 42x_n^2 - 18x_n + 11}$.

| $x_0$ | approximation of corresponding root |
|---|---|
| $-1.0$ | $-0.976823589$ |
| 0.1 | 0.100363332 |
| 0.6 | 0.642746671 |
| 2.0 | 1.983713587 |

25. $f(x) = 4x^4 - 4x^2 \Rightarrow f'(x) = 16x^3 - 8x \Rightarrow x_{i+1} = x_i - \frac{f(x_i)}{f'(x_i)} = x_i - \frac{x_i^3 - x_i}{4x_i^2 - 2}$. Iterations are performed using the procedure in problem 13 in this section.
(a) For $x_0 = 2$ or $x_0 = -0.8$, $x_i \to -1$ as i gets large.
(b) For $x_0 = -0.5$ or $x_0 = 0.25$, $x_i \to 0$ as i gets large.
(c) For $x_0 = 0.8$ or $x_0 = 2$, $x_i \to 1$ as i gets large.
(d) (If your calculator has a CAS, put it in exact mode, otherwise approximate the radicals with a decimal value.)
For $x_0 = -\frac{\sqrt{21}}{7}$ or $x_0 = -\frac{\sqrt{21}}{7}$, Newton's method does not converge. The values of $x_i$ alternate between $x_0 = -\frac{\sqrt{21}}{7}$ or $x_0 = -\frac{\sqrt{21}}{7}$ as i increases.

26. (a) The distance can be represented by $D(x) = \sqrt{(x-2)^2 + \left(x^2 + \frac{1}{2}\right)^2}$, where $x \geq 0$. The distance D(x) is minimized when $f(x) = (x-2)^2 + \left(x^2 + \frac{1}{2}\right)^2$ is minimized. If $f(x) = (x-2)^2 + \left(x^2 + \frac{1}{2}\right)^2$, then $f'(x) = 4\left(x^3 + x - 1\right)$ and $f''(x) = 4\left(3x^2 + 1\right) > 0$.
Now $f'(x) = 0 \Rightarrow x^3 + x - 1 = 0 \Rightarrow x\left(x^2 + 1\right) = 1$
$\Rightarrow x = \frac{1}{x^2+1}$.

(b) Let $g(x) = \frac{1}{x^2+1} - x = \left(x^2 + 1\right)^{-1} - x \Rightarrow g'(x) = -\left(x^2 + 1\right)^{-2}(2x) - 1 = \frac{-2x}{\left(x^2+1\right)^2} - 1$
$\Rightarrow x_{n+1} = x_n - \frac{\left(\frac{1}{x_n^2+1} - x_n\right)}{\left(\frac{-2x_n}{\left(x_n^2+1\right)^2} - 1\right)}$; $x_0 = 1 \Rightarrow x_4 = 0.68233$ to five decimal places.

27. $f(x) = (x-1)^{40} \Rightarrow f'(x) = 40(x-1)^{39} \Rightarrow x_{n+1} = x_n - \frac{(x_n - 1)^{40}}{40(x_n - 1)^{39}} = \frac{39x_n + 1}{40}$. With $x_0 = 2$, our computer gave $x_{87} = x_{88} = x_{89} = \cdots = x_{200} = 1.11051$, coming within 0.11051 of the root $x = 1$.

28. $f(x) = 4x^4 - 4x^2 \Rightarrow f'(x) = 16x^3 - 8x = 8x\left(2x^2 - 1\right) \Rightarrow x_{n+1} = x_n - \frac{x_n\left(x_n^2 - 1\right)}{2\left(2x_n^2 - 1\right)}$; if $x_0 = .65$, then $x_{12} \approx -.000004$, if $x_0 = .7$, then $x_{12} = -1.000004$; if $x_0 = .8$, then $x_6 = 1.000000$. NOTE: $\frac{\sqrt{21}}{7} \approx .654654$

29. $f(x) = x^3 + 3.6x^2 - 36.4 \Rightarrow f'(x) = 3x^2 + 7.2x \Rightarrow x_{n+1} = x_n - \frac{x_n^3 + 3.6x_n^2 - 36.4}{3x_n^2 + 7.2x_n}$; $x_0 = 2 \Rightarrow x_1 = 2.5\overline{303}$
$\Rightarrow x_2 = 2.45418225 \Rightarrow x_3 = 2.45238021 \Rightarrow x_4 = 2.45237921$ which is 2.45 to two decimal places. Recall that

$r = \frac{1}{t} + 2t - 2$

82. $\frac{d^2s}{dt^2} = \frac{3t}{8} \Rightarrow \frac{ds}{dt} = \frac{3t^2}{16} + C_1$; at $\frac{ds}{dt} = 3$ and $t = 4$ we have $3 = \frac{3(4)^2}{16} + C_1 \Rightarrow C_1 = 0 \Rightarrow \frac{ds}{dt} = \frac{3t^2}{16} \Rightarrow s = \frac{t^3}{16} + C_2$; at $s = 4$ and $t = 4$ we have $4 = \frac{4^3}{16} + C_2 \Rightarrow C_2 = 0 \Rightarrow s = \frac{t^3}{16}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

83. $\frac{d^3y}{dx^3} = 6 \Rightarrow \frac{d^2y}{dx^2} = 6x + C_1$; at $\frac{d^2y}{dx^2} = -8$ and $x = 0$ we have $-8 = 6(0) + C_1 \Rightarrow C_1 = -8 \Rightarrow \frac{d^2y}{dx^2} = 6x - 8$
$\Rightarrow \frac{dy}{dx} = 3x^2 - 8x + C_2$; at $\frac{dy}{dx} = 0$ and $x = 0$ we have $0 = 3(0)^2 - 8(0) + C_2 \Rightarrow C_2 = 0 \Rightarrow \frac{dy}{dx} = 3x^2 - 8x$
$\Rightarrow y = x^3 - 4x^2 + C_3$; at $y = 5$ and $x = 0$ we have $5 = 0^3 - 4(0)^2 + C_3 \Rightarrow C_3 = 5 \Rightarrow y = x^3 - 4x^2 + 5$

84. $\frac{d^3\theta}{dt^3} = 0 \Rightarrow \frac{d^2\theta}{dt^2} = C_1$; at $\frac{d^2\theta}{dt^2} = -2$ and $t = 0$ we have $\frac{d^2\theta}{dt^2} = -2 \Rightarrow \frac{d\theta}{dt} = -2t + C_2$; at $\frac{d\theta}{dt} = -\frac{1}{2}$ and $t = 0$ we have $-\frac{1}{2} = -2(0) + C_2 \Rightarrow C_2 = -\frac{1}{2} \Rightarrow \frac{d\theta}{dt} = -2t - \frac{1}{2} \Rightarrow \theta = -t^2 - \frac{1}{2}t + C_3$; at $\theta = \sqrt{2}$ and $t = 0$ we have $\sqrt{2} = -0^2 - \frac{1}{2}(0) + C_3 \Rightarrow C_3 = \sqrt{2} \Rightarrow \theta = -t^2 - \frac{1}{2}t + \sqrt{2}$

85. $y^{(4)} = -\sin t + \cos t \Rightarrow y''' = \cos t + \sin t + C_1$; at $y''' = 7$ and $t = 0$ we have $7 = \cos(0) + \sin(0) + C_1$
$\Rightarrow C_1 = 6 \Rightarrow y''' = \cos t + \sin t + 6 \Rightarrow y'' = \sin t - \cos t + 6t + C_2$; at $y'' = -1$ and $t = 0$ we have
$-1 = \sin(0) - \cos(0) + 6(0) + C_2 \Rightarrow C_2 = 0 \Rightarrow y'' = \sin t - \cos t + 6t \Rightarrow y' = -\cos t - \sin t + 3t^2 + C_3$;
at $y' = -1$ and $t = 0$ we have $-1 = -\cos(0) - \sin(0) + 3(0)^2 + C_3 \Rightarrow C_3 = 0 \Rightarrow y' = -\cos t - \sin t + 3t^2$
$\Rightarrow y = -\sin t + \cos t + t^3 + C_4$; at $y = 0$ and $t = 0$ we have $0 = -\sin(0) + \cos(0) + 0^3 + C_4 \Rightarrow C_4 = -1$
$\Rightarrow y = -\sin t + \cos t + t^3 - 1$

86. $y^{(4)} = -\cos x + 8\sin(2x) \Rightarrow y''' = -\sin x - 4\cos(2x) + C_1$; at $y''' = 0$ and $x = 0$ we have
$0 = -\sin(0) - 4\cos(2(0)) + C_1 \Rightarrow C_1 = 4 \Rightarrow y''' = -\sin x - 4\cos(2x) + 4 \Rightarrow y'' = \cos x - 2\sin(2x) + 4x + C_2$;
at $y'' = 1$ and $x = 0$ we have $1 = \cos(0) - 2\sin(2(0)) + 4(0) + C_2 \Rightarrow C_2 = 0 \Rightarrow y'' = \cos x - 2\sin(2x) + 4x$
$\Rightarrow y' = \sin x + \cos(2x) + 2x^2 + C_3$; at $y' = 1$ and $x = 0$ we have $1 = \sin(0) + \cos(2(0)) + 2(0)^2 + C_3 \Rightarrow C_3 = 0$
$\Rightarrow y' = \sin x + \cos(2x) + 2x^2 \Rightarrow y = -\cos x + \frac{1}{2}\sin(2x) + \frac{2}{3}x^3 + C_4$; at $y = 3$ and $x = 0$ we have
$3 = -\cos(0) + \frac{1}{2}\sin(2(0)) + \frac{2}{3}(0)^3 + C_4 \Rightarrow C_4 = 4 \Rightarrow y = -\cos x + \frac{1}{2}\sin(2x) + \frac{2}{3}x^3 + 4$

87. $m = y' = 3\sqrt{x} = 3x^{1/2} \Rightarrow y = 2x^{3/2} + C$; at $(9, 4)$ we have $4 = 2(9)^{3/2} + C \Rightarrow C = -50 \Rightarrow y = 2x^{3/2} - 50$

88. (a) $\frac{d^2y}{dx^2} = 6x \Rightarrow \frac{dy}{dx} = 3x^2 + C_1$; at $y' = 0$ and $x = 0$ we have $0 = 3(0)^2 + C_1 \Rightarrow C_1 = 0 \Rightarrow \frac{dy}{dx} = 3x^2$
$\Rightarrow y = x^3 + C_2$; at $y = 1$ and $x = 0$ we have $C_2 = 1 \Rightarrow y = x^3 + 1$
(b) One, because any other possible function would differ from $x^3 + 1$ by a constant that must be zero because of the initial conditions

89. $\frac{dy}{dx} = 1 - \frac{4}{3}x^{1/3} \Rightarrow y = \int \left(1 - \frac{4}{3}x^{1/3}\right) dx = x - x^{4/3} + C$; at $(1, 0.5)$ on the curve we have $0.5 = 1 - 1^{4/3} + C$
$\Rightarrow C = 0.5 \Rightarrow y = x - x^{4/3} + \frac{1}{2}$

90. $\frac{dy}{dx} = x - 1 \Rightarrow y = \int (x - 1)\, dx = \frac{x^2}{2} - x + C$; at $(-1, 1)$ on the curve we have $1 = \frac{(-1)^2}{2} - (-1) + C$
$\Rightarrow C = -\frac{1}{2} \Rightarrow y = \frac{x^2}{2} - x - \frac{1}{2}$

91. $\frac{dy}{dx} = \sin x - \cos x \Rightarrow y = \int (\sin x - \cos x)\, dx = -\cos x - \sin x + C$; at $(-\pi, -1)$ on the curve we have
$-1 = -\cos(-\pi) - \sin(-\pi) + C \Rightarrow C = -2 \Rightarrow y = -\cos x - \sin x - 2$

92. $\frac{dy}{dx} = \frac{1}{2\sqrt{x}} + \pi\sin \pi x = \frac{1}{2}x^{-1/2} + \pi\sin \pi x \Rightarrow y = \int \left(\frac{1}{2}x^{-1/2} + \sin \pi x\right) dx = x^{1/2} - \cos \pi x + C$; at $(1, 2)$ on the curve we have $2 = 1^{1/2} - \cos \pi(1) + C \Rightarrow C = 0 \Rightarrow y = \sqrt{x} - \cos \pi x$

93. (a) $\frac{ds}{dt} = 9.8t - 3 \Rightarrow s = 4.9t^2 - 3t + C$; (i) at $s = 5$ and $t = 0$ we have $C = 5 \Rightarrow s = 4.9t^2 - 3t + 5$;
displacement $= s(3) - s(1) = ((4.9)(9) - 9 + 5) - (4.9 - 3 + 5) = 33.2$ units; (ii) at $s = -2$ and $t = 0$ we have
$C = -2 \Rightarrow s = 4.9t^2 - 3t - 2$; displacement $= s(3) - s(1) = ((4.9)(9) - 9 - 2) - (4.9 - 3 - 2) = 33.2$ units;
(iii) at $s = s_0$ and $t = 0$ we have $C = s_0 \Rightarrow s = 4.9t^2 - 3t + s_0$; displacement $= s(3) - s(1)$
$= ((4.9)(9) - 9 + s_0) - (4.9 - 3 + s_0) = 33.2$ units

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(b) True. Given an antiderivative f(t) of the velocity function, we know that the body's position function is $s = f(t) + C$ for some constant C. Therefore, the displacement from $t = a$ to $t = b$ is $(f(b) + C) - (f(a) + C) = f(b) - f(a)$. Thus we can find the displacement from any antiderivative f as the numerical difference $f(b) - f(a)$ without knowing the exact values of C and s.

94. $a(t) = v'(t) = 20 \Rightarrow v(t) = 20t + C$; at $(0, 0)$ we have $C = 0 \Rightarrow v(t) = 20t$. When $t = 60$, then $v(60) = 20(60) = 1200$ m/sec.

95. Step 1: $\frac{d^2s}{dt^2} = -k \Rightarrow \frac{ds}{dt} = -kt + C_1$; at $\frac{ds}{dt} = 88$ and $t = 0$ we have $C_1 = 88 \Rightarrow \frac{ds}{dt} = -kt + 88 \Rightarrow s = -k\left(\frac{t^2}{2}\right) + 88t + C_2$; at $s = 0$ and $t = 0$ we have $C_2 = 0 \Rightarrow s = -\frac{kt^2}{2} + 88t$

Step 2: $\frac{ds}{dt} = 0 \Rightarrow 0 = -kt + 88 \Rightarrow t = \frac{88}{k}$

Step 3: $242 = \frac{-k\left(\frac{88}{k}\right)^2}{2} + 88\left(\frac{88}{k}\right) \Rightarrow 242 = -\frac{(88)^2}{2k} + \frac{(88)^2}{k} \Rightarrow 242 = \frac{(88)^2}{2k} \Rightarrow k = 16$

96. $\frac{d^2s}{dt^2} = -k \Rightarrow \frac{ds}{dt} = \int -k\,dt = -kt + C$; at $\frac{ds}{dt} = 44$ when $t = 0$ we have $44 = -k(0) + C \Rightarrow C = 44$
$\Rightarrow \frac{ds}{dt} = -kt + 44 \Rightarrow s = -\frac{kt^2}{2} + 44t + C_1$; at $s = 0$ when $t = 0$ we have $0 = -\frac{k(0)^2}{2} + 44(0) + C_1 \Rightarrow C_1 = 0$
$\Rightarrow s = -\frac{kt^2}{2} + 44t$. Then $\frac{ds}{dt} = 0 \Rightarrow -kt + 44 = 0 \Rightarrow t = \frac{44}{k}$ and $s\left(\frac{44}{k}\right) = -\frac{k\left(\frac{44}{k}\right)^2}{2} + 44\left(\frac{44}{k}\right) = 45$
$\Rightarrow -\frac{968}{k} + \frac{1936}{k} = 45 \Rightarrow \frac{968}{k} = 45 \Rightarrow k = \frac{968}{45} \approx 21.5 \frac{ft}{sec^2}$.

97. (a) $v = \int a\,dt = \int \left(15t^{1/2} - 3t^{-1/2}\right) dt = 10t^{3/2} - 6t^{1/2} + C$; $\frac{ds}{dt}(1) = 4 \Rightarrow 4 = 10(1)^{3/2} - 6(1)^{1/2} + C \Rightarrow C = 0$
$\Rightarrow v = 10t^{3/2} - 6t^{1/2}$

(b) $s = \int v\,dt = \int \left(10t^{3/2} - 6t^{1/2}\right) dt = 4t^{5/2} - 4t^{3/2} + C$; $s(1) = 0 \Rightarrow 0 = 4(1)^{5/2} - 4(1)^{3/2} + C \Rightarrow C = 0$
$\Rightarrow s = 4t^{5/2} - 4t^{3/2}$

98. $\frac{d^2s}{dt^2} = -5.2 \Rightarrow \frac{ds}{dt} = -5.2t + C_1$; at $\frac{ds}{dt} = 0$ and $t = 0$ we have $C_1 = 0 \Rightarrow \frac{ds}{dt} = -5.2t \Rightarrow s = -2.6t^2 + C_2$; at $s = 4$ and $t = 0$ we have $C_2 = 4 \Rightarrow s = -2.6t^2 + 4$. Then $s = 0 \Rightarrow 0 = -2.6t^2 + 4 \Rightarrow t = \sqrt{\frac{4}{2.6}} \approx 1.24$ sec, since $t > 0$

99. $\frac{d^2s}{dt^2} = a \Rightarrow \frac{ds}{dt} = \int a\,dt = at + C$; $\frac{ds}{dt} = v_0$ when $t = 0 \Rightarrow C = v_0 \Rightarrow \frac{ds}{dt} = at + v_0 \Rightarrow s = \frac{at^2}{2} + v_0t + C_1$; $s = s_0$ when $t = 0 \Rightarrow s_0 = \frac{a(0)^2}{2} + v_0(0) + C_1 \Rightarrow C_1 = s_0 \Rightarrow s = \frac{at^2}{2} + v_0t + s_0$

100. The appropriate initial value problem is: Differential Equation: $\frac{d^2s}{dt^2} = -g$ with Initial Conditions: $\frac{ds}{dt} = v_0$ and $s = s_0$ when $t = 0$. Thus, $\frac{ds}{dt} = \int -g\,dt = -gt + C_1$; $\frac{ds}{dt}(0) = v_0 \Rightarrow v_0 = (-g)(0) + C_1 \Rightarrow C_1 = v_0$
$\Rightarrow \frac{ds}{dt} = -gt + v_0$. Thus $s = \int (-gt + v_0)\,dt = -\frac{1}{2}gt^2 + v_0t + C_2$; $s(0) = s_0 = -\frac{1}{2}(g)(0)^2 + v_0(0) + C_2 \Rightarrow C_2 = s_0$
Thus $s = -\frac{1}{2}gt^2 + v_0t + s_0$.

101. (a) $\int f(x)\,dx = 1 - \sqrt{x} + C_1 = -\sqrt{x} + C$ (b) $\int g(x)\,dx = x + 2 + C_1 = x + C$
(c) $\int -f(x)\,dx = -\left(1 - \sqrt{x}\right) + C_1 = \sqrt{x} + C$ (d) $\int -g(x)\,dx = -(x + 2) + C_1 = -x + C$
(e) $\int [f(x) + g(x)]\,dx = \left(1 - \sqrt{x}\right) + (x + 2) + C_1 = x - \sqrt{x} + C$
(f) $\int [f(x) - g(x)]\,dx = \left(1 - \sqrt{x}\right) - (x + 2) + C_1 = -x - \sqrt{x} + C$

102. Yes. If F(x) and G(x) both solve the initial value problem on an interval I then they both have the same first derivative. Therefore, by Corollary 2 of the Mean Value Theorem there is a constant C such that $F(x) = G(x) + C$ for all x. In particular, $F(x_0) = G(x_0) + C$, so $C = F(x_0) - G(x_0) = 0$. Hence $F(x) = G(x)$ for all x.

103 – 106 Example CAS commands:

Maple:

```
with(student):
f := x -> cos(x)^2 + sin(x);
ic := [x=Pi,y=1];
F := unapply( int( f(x), x ) + C, x );
eq := eval( y=F(x), ic );
solnC := solve( eq, {C} );
Y := unapply( eval( F(x), solnC ), x );
DEplot( diff(y(x),x) = f(x), y(x), x=0..2*Pi, [[y(Pi)=1]],
    color=black, linecolor=black, stepsize=0.05, title="Section 4.8 #103" );
```

Mathematica: (functions and values may vary)

The following commands use the definite integral and the Fundamental Theorem of calculus to construct the solution of the initial value problems for exercises 103 - 105.

```
Clear[x, y, yprime]
yprime[x_] = Cos[x]^2 + Sin[x];
initxvalue = π; inityvalue = 1;
y[x_] = Integrate[yprime[t], {t, initxvalue, x}] + inityvalue
```

If the solution satisfies the differential equation and initial condition, the following yield True

```
yprime[x]==D[y[x], x] //Simplify
y[initxvalue]==inityvalue
```

Since exercise 106 is a second order differential equation, two integrations will be required.

```
Clear[x, y, yprime]
y2prime[x_] = 3 Exp[x/2] + 1;
initxval = 0; inityval = 4; inityprimeval = −1;
yprime[x_] = Integrate[y2prime[t],{t, initxval, x}] + inityprimeval
y[x_] = Integrate[yprime[t], {t, initxval, x}] + inityval
```

Verify that y[x] solves the differential equation and initial condition and plot the solution (red) and its derivative (blue).

```
y2prime[x]==D[y[x], {x, 2}]//Simplify
y[initxval]==inityval
yprime[initxval]==inityprimeval
Plot[{y[x], yprime[x]}, {x, initxval − 3, initxval + 3}, PlotStyle → {RGBColor[1,0,0], RGBColor[0,0,1]}]
```

## CHAPTER 4 PRACTICE EXERCISES

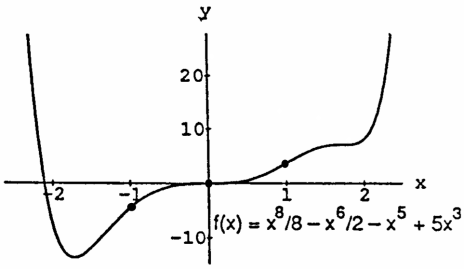
1. No, since $f(x) = x^3 + 2x + \tan x \Rightarrow f'(x) = 3x^2 + 2 + \sec^2 x > 0 \Rightarrow$ f(x) is always increasing on its domain

2. No, since $g(x) = \csc x + 2\cot x \Rightarrow g'(x) = -\csc x \cot x - 2\csc^2 x = -\frac{\cos x}{\sin^2 x} - \frac{2}{\sin^2 x} = -\frac{1}{\sin^2 x}(\cos x + 2) < 0$ $\Rightarrow$ g(x) is always decreasing on its domain

3. No absolute minimum because $\lim_{x \to \infty} (7 + x)(11 - 3x)^{1/3} = -\infty$. Next $f'(x) = (11 - 3x)^{1/3} - (7 + x)(11 - 3x)^{-2/3} = \frac{(11-3x)-(7+x)}{(11-3x)^{2/3}} = \frac{4(1-x)}{(11-3x)^{2/3}} \Rightarrow x = 1$ and $x = \frac{11}{3}$ are critical points. Since $f' > 0$ if $x < 1$ and $f' < 0$ if $x > 1$, $f(1) = 16$ is the absolute maximum.

4. $f(x) = \frac{ax+b}{x^2-1} \Rightarrow f'(x) = \frac{a(x^2-1) - 2x(ax+b)}{(x^2-1)^2} = \frac{-(ax^2+2bx+a)}{(x^2-1)^2}$; $f'(3) = 0 \Rightarrow -\frac{1}{64}(9a + 6b + a) = 0 \Rightarrow 5a + 3b = 0$. We require also that $f(3) = 1$. Thus $1 = \frac{3a+b}{8} \Rightarrow 3a + b = 8$. Solving both equations yields $a = 6$ and $b = -10$. Now, $f'(x) = \frac{-2(3x-1)(x-3)}{(x^2-1)^2}$ so that $f' = \underset{-1}{---} | \underset{1/3}{---} | \underset{1}{+++} | \underset{3}{+++} | ---$. Thus $f'$ changes sign at $x = 3$ from positive to negative so there is a local maximum at $x = 3$ which has a value $f(3) = 1$.

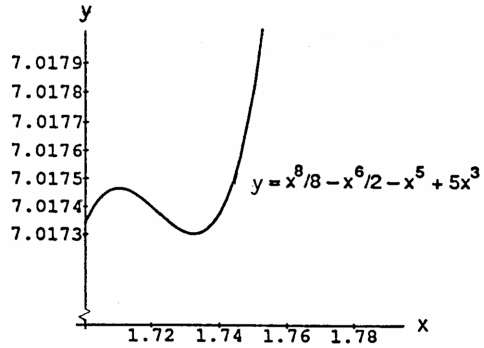
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



5. Yes, because at each point of $[0, 1)$ except $x = 0$, the function's value is a local minimum value as well as a local maximum value. At $x = 0$ the function's value, 0, is not a local minimum value because each open interval around $x = 0$ on the x-axis contains points to the left of 0 where f equals $-1$.

6. (a) The first derivative of the function $f(x) = x^3$ is zero at $x = 0$ even though f has no local extreme value at $x = 0$.
   (b) Theorem 2 says only that if f is differentiable and f has a local extreme at $x = c$ then $f'(c) = 0$. It does not assert the (false) reverse implication $f'(c) = 0 \Rightarrow$ f has a local extreme at $x = c$.

7. No, because the interval $0 < x < 1$ fails to be closed. The Extreme Value Theorem says that if the function is continuous throughout a finite closed interval $a \le x \le b$ then the existence of absolute extrema is guaranteed on that interval.



8. The absolute maximum is $|-1| = 1$ and the absolute minimum is $|0| = 0$. This is not inconsistent with the Extreme Value Theorem for continuous functions, which says a continuous function on a closed interval attains its extreme values on that interval. The theorem says nothing about the behavior of a continuous function on an interval which is half open and half closed, such as $[-1, 1)$, so there is nothing to contradict.

9. (a) There appear to be local minima at $x = -1.75$ and 1.8. Points of inflection are indicated at approximately $x = 0$ and $x = \pm 1$.

   (b) $f'(x) = x^7 - 3x^5 - 5x^4 + 15x^2 = x^2(x^2 - 3)(x^3 - 5)$. The pattern $y' = \underset{-\sqrt{3}}{---} | \underset{0}{+++} | \underset{\sqrt[3]{5}}{+++} | \underset{\sqrt{3}}{---} | +++$ indicates a local maximum at $x = \sqrt[3]{5}$ and local minima at $x = \pm\sqrt{3}$.

   (c)

10. (a) The graph does not indicate any local extremum. Points of inflection are indicated at approximately $x = -\frac{3}{4}$ and $x = 1$.

   (b) $f'(x) = x^7 - 2x^4 - 5 + \frac{10}{x^3} = x^{-3}(x^3 - 2)(x^7 - 5)$. The pattern $f' = ---)\underset{0}{(}+++ | \underset{\sqrt[7]{5}}{---} | \underset{\sqrt[3]{2}}{+++}$ indicates

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

a local maximum at $x = \sqrt[7]{5}$ and a local minimum at $x = \sqrt[3]{2}$.

(c)

11. (a) $g(t) = \sin^2 t - 3t \Rightarrow g'(t) = 2 \sin t \cos t - 3 = \sin(2t) - 3 \Rightarrow g' < 0 \Rightarrow g(t)$ is always falling and hence must decrease on every interval in its domain.

    (b) One, since $\sin^2 t - 3t - 5 = 0$ and $\sin^2 t - 3t = 5$ have the same solutions: $f(t) = \sin^2 t - 3t - 5$ has the same derivative as g(t) in part (a) and is always decreasing with $f(-3) > 0$ and $f(0) < 0$. The Intermediate Value Theorem guarantees the continuous function f has a root in $[-3, 0]$.

12. (a) $y = \tan\theta \Rightarrow \frac{dy}{d\theta} = \sec^2\theta > 0 \Rightarrow y = \tan\theta$ is always rising on its domain $\Rightarrow y = \tan\theta$ increases on every interval in its domain

    (b) The interval $\left[\frac{\pi}{4}, \pi\right]$ is not in the tangent's domain because $\tan\theta$ is undefined at $\theta = \frac{\pi}{2}$. Thus the tangent need not increase on this interval.

13. (a) $f(x) = x^4 + 2x^2 - 2 \Rightarrow f'(x) = 4x^3 + 4x$. Since $f(0) = -2 < 0$, $f(1) = 1 > 0$ and $f'(x) \geq 0$ for $0 \leq x \leq 1$, we may conclude from the Intermediate Value Theorem that f(x) has exactly one solution when $0 \leq x \leq 1$.

    (b) $x^2 = \frac{-2 \pm \sqrt{4+8}}{2} > 0 \Rightarrow x^2 = \sqrt{3} - 1$ and $x \geq 0 \Rightarrow x \approx \sqrt{.7320508076} \approx .8555996772$

14. (a) $y = \frac{x}{x+1} \Rightarrow y' = \frac{1}{(x+1)^2} > 0$, for all x in the domain of $\frac{x}{x+1} \Rightarrow y = \frac{x}{x+1}$ is increasing in every interval in its domain

    (b) $y = x^3 + 2x \Rightarrow y' = 3x^2 + 2 > 0$ for all $x \Rightarrow$ the graph of $y = x^3 + 2x$ is always increasing and can never have a local maximum or minimum

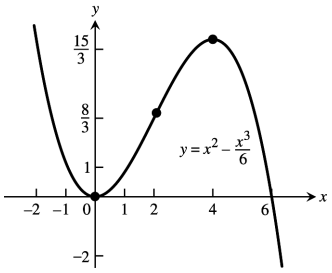
15. Let V(t) represent the volume of the water in the reservoir at time t, in minutes, let $V(0) = a_0$ be the initial amount and $V(1440) = a_0 + (1400)(43{,}560)(7.48)$ gallons be the amount of water contained in the reservoir after the rain, where 24 hr = 1440 min. Assume that V(t) is continuous on $[0, 1440]$ and differentiable on $(0, 1440)$. The Mean Value Theorem says that for some $t_0$ in $(0, 1440)$ we have $V'(t_0) = \frac{V(1440) - V(0)}{1440 - 0}$ $= \frac{a_0 + (1400)(43{,}560)(7.48) - a_0}{1440} = \frac{456{,}160{,}320 \text{ gal}}{1440 \text{ min}} = 316{,}778$ gal/min. Therefore at $t_0$ the reservoir's volume was increasing at a rate in excess of 225,000 gal/min.

16. Yes, all differentiable functions g(x) having 3 as a derivative differ by only a constant. Consequently, the difference $3x - g(x)$ is a constant K because $g'(x) = 3 = \frac{d}{dx}(3x)$. Thus $g(x) = 3x + K$, the same form as F(x).

17. No, $\frac{x}{x+1} = 1 + \frac{-1}{x+1} \Rightarrow \frac{x}{x+1}$ differs from $\frac{-1}{x+1}$ by the constant 1. Both functions have the same derivative $\frac{d}{dx}\left(\frac{x}{x+1}\right) = \frac{(x+1) - x(1)}{(x+1)^2} = \frac{1}{(x+1)^2} = \frac{d}{dx}\left(\frac{-1}{x+1}\right)$.

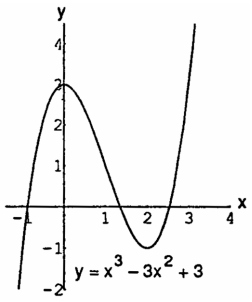
18. $f'(x) = g'(x) = \frac{2x}{(x^2+1)^2} \Rightarrow f(x) - g(x) = C$ for some constant C $\Rightarrow$ the graphs differ by a vertical shift.

19. The global minimum value of $\frac{1}{2}$ occurs at $x = 2$.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

20. (a) The function is increasing on the intervals $[-3, -2]$ and $[1, 2]$.
    (b) The function is decreasing on the intervals $[-2, 0)$ and $(0, 1]$.
    (c) The local maximum values occur only at $x = -2$, and at $x = 2$; local minimum values occur at $x = -3$ and at $x = 1$ provided f is continuous at $x = 0$.



21. (a) $t = 0, 6, 12$ (b) $t = 3, 9$ (c) $6 < t < 12$ (d) $0 < t < 6, 12 < t < 14$

22. (a) $t = 4$ (b) at no time (c) $0 < t < 4$ (d) $4 < t < 8$

(b)

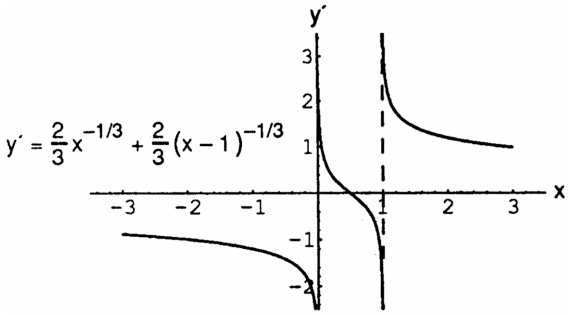
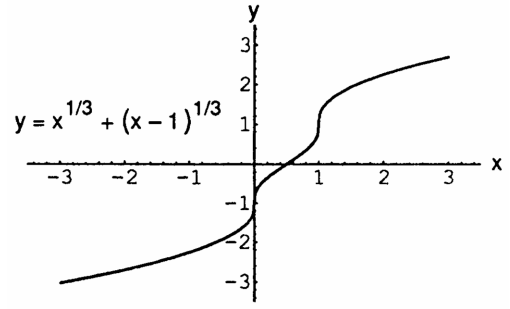
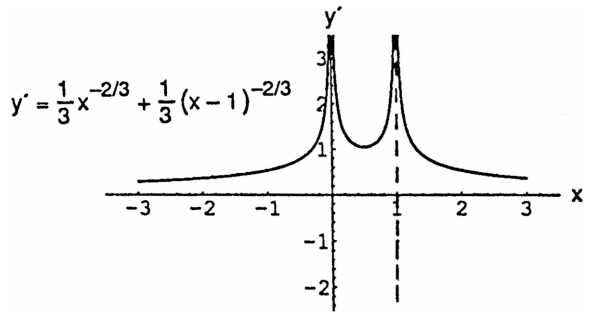
39. The values of the first derivative indicate that the curve is rising on $(0, \infty)$ and falling on $(-\infty, 0)$. The slope of the curve approaches $-\infty$ as $x \to 0^-$, and approaches $\infty$ as $x \to 0^+$ and $x \to 1$. The curve should therefore have a cusp and local minimum at $x = 0$, and a vertical tangent at $x = 1$.

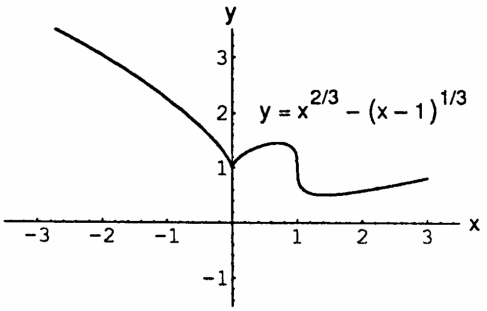


Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

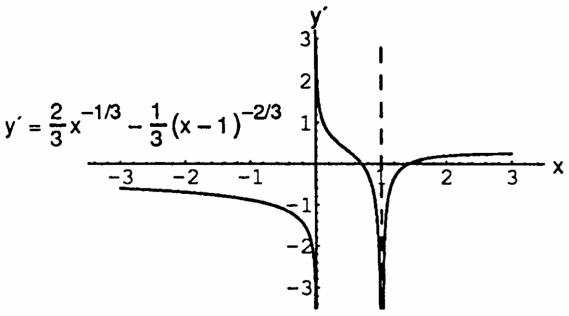


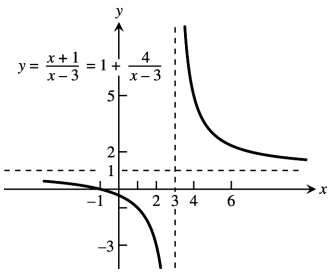


40. The values of the first derivative indicate that the curve is rising on $\left(0, \frac{1}{2}\right)$ and $(1, \infty)$, and falling on $(-\infty, 0)$ and $\left(\frac{1}{2}, 1\right)$. The derivative changes from positive to negative at $x = \frac{1}{2}$, indicating a local maximum there. The slope of the curve approaches $-\infty$ as $x \to 0^-$ and $x \to 1^-$, and approaches $\infty$ as $x \to 0^+$ and as $x \to 1^+$, indicating cusps and local minima at both $x = 0$ and $x = 1$.



41. The values of the first derivative indicate that the curve is always rising. The slope of the curve approaches $\infty$ as $x \to 0$ and as $x \to 1$, indicating vertical tangents at both $x = 0$ and $x = 1$.





42. The graph of the first derivative indicates that the curve is rising on $\left(0, \frac{17-\sqrt{33}}{16}\right)$ and $\left(\frac{17+\sqrt{33}}{16}, \infty\right)$, falling on $(-\infty, 0)$ and $\left(\frac{17-\sqrt{33}}{16}, \frac{17+\sqrt{33}}{16}\right) \Rightarrow$ a local maximum at $x = \frac{17-\sqrt{33}}{16}$, a local minimum at $x = \frac{17+\sqrt{33}}{16}$. The derivative approaches $-\infty$ as $x \to 0^-$ and $x \to 1$, and approaches $\infty$ as $x \to 0^+$, indicating a cusp and local minimum at $x = 0$ and a vertical tangent at $x = 1$.

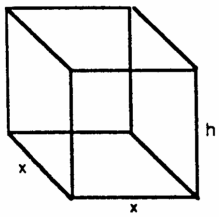
$=\lim_{x\to\infty}\frac{2x+1}{\sqrt{x^2+x+1}+\sqrt{x^2-x}}$
Notice that $x=\sqrt{x^2}$ for $x>0$ so this is equivalent to
$=\lim_{x\to\infty}\frac{\frac{2x+1}{x}}{\sqrt{\frac{x^2+x+1}{x^2}}+\sqrt{\frac{x^2-x}{x^2}}}=\lim_{x\to\infty}\frac{2+\frac{1}{x}}{\sqrt{1+\frac{1}{x}+\frac{1}{x^2}}+\sqrt{1-\frac{1}{x}}}=\frac{2}{\sqrt{1}+\sqrt{1}}=1$

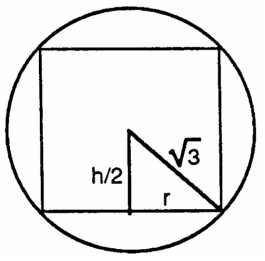
62. $\lim_{x\to\infty}\left(\frac{x^3}{x^2-1}-\frac{x^3}{x^2+1}\right)=\lim_{x\to\infty}\frac{x^3(x^2+1)-x^3(x^2-1)}{(x^2-1)(x^2+1)}=\lim_{x\to\infty}\frac{2x^3}{x^4-1}=\lim_{x\to\infty}\frac{6x^2}{4x^3}=\lim_{x\to\infty}\frac{12x}{12x^2}$
$=\lim_{x\to\infty}\frac{12}{24x}=\lim_{x\to\infty}\frac{1}{2x}=0$



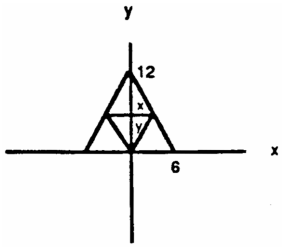
63. (a) Maximize $f(x)=\sqrt{x}-\sqrt{36-x}=x^{1/2}-(36-x)^{1/2}$ where $0\le x\le 36$
$\Rightarrow f'(x)=\frac{1}{2}x^{-1/2}-\frac{1}{2}(36-x)^{-1/2}(-1)=\frac{\sqrt{36-x}+\sqrt{x}}{2\sqrt{x}\sqrt{36-x}}\Rightarrow$ derivative fails to exist at 0 and 36; $f(0)=-6$, and $f(36)=6\Rightarrow$ the numbers are 0 and 36
(b) Maximize $g(x)=\sqrt{x}+\sqrt{36-x}=x^{1/2}+(36-x)^{1/2}$ where $0\le x\le 36$
$\Rightarrow g'(x)=\frac{1}{2}x^{-1/2}+\frac{1}{2}(36-x)^{-1/2}(-1)=\frac{\sqrt{36-x}-\sqrt{x}}{2\sqrt{x}\sqrt{36-x}}\Rightarrow$ critical points at 0, 18 and 36; $g(0)=6$, $g(18)=2\sqrt{18}=6\sqrt{2}$ and $g(36)=6\Rightarrow$ the numbers are 18 and 18

64. (a) Maximize $f(x)=\sqrt{x}(20-x)=20x^{1/2}-x^{3/2}$ where $0\le x\le 20\Rightarrow f'(x)=10x^{-1/2}-\frac{3}{2}x^{1/2}$
$=\frac{20-3x}{2\sqrt{x}}=0\Rightarrow x=0$ and $x=\frac{20}{3}$ are critical points; $f(0)=f(20)=0$ and $f\left(\frac{20}{3}\right)=\sqrt{\frac{20}{3}}\left(20-\frac{20}{3}\right)$
$=\frac{40\sqrt{20}}{3\sqrt{3}}\Rightarrow$ the numbers are $\frac{20}{3}$ and $\frac{40}{3}$.
(b) Maximize $g(x)=x+\sqrt{20-x}=x+(20-x)^{1/2}$ where $0\le x\le 20\Rightarrow g'(x)=\frac{2\sqrt{20-x}-1}{2\sqrt{20-x}}=0$
$\Rightarrow\sqrt{20-x}=\frac{1}{2}\Rightarrow x=\frac{79}{4}$. The critical points are $x=\frac{79}{4}$ and $x=20$. Since $g\left(\frac{79}{4}\right)=\frac{81}{4}$ and $g(20)=20$, the numbers must be $\frac{79}{4}$ and $\frac{1}{4}$.

65. $A(x)=\frac{1}{2}(2x)(27-x^2)$ for $0\le x\le\sqrt{27}$
$\Rightarrow A'(x)=3(3+x)(3-x)$ and $A''(x)=-6x$.
The critical points are $-3$ and 3, but $-3$ is not in the domain. Since $A''(3)=-18<0$ and $A\left(\sqrt{27}\right)=0$, the maximum occurs at $x=3\Rightarrow$ the largest area is $A(3)=54$ sq units.

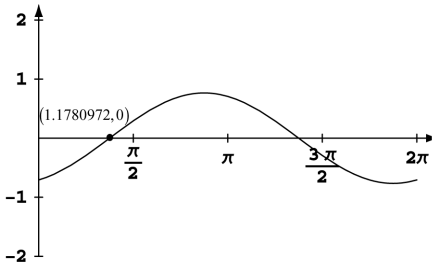


66. The volume is $V=x^2h=32\Rightarrow h=\frac{32}{x^2}$. The surface area is $S(x)=x^2+4x\left(\frac{32}{x^2}\right)=x^2+\frac{128}{x}$, where $x>0\Rightarrow S'(x)=\frac{2(x-4)(x^2+4x+16)}{x^2}$
$\Rightarrow$ the critical points are 0 and 4, but 0 is not in the domain. Now $S''(4)=2+\frac{256}{4^3}>0\Rightarrow$ at $x=4$ there is a minimum. The dimensions 4 ft by 4 ft by 2 ft minimize the surface area.



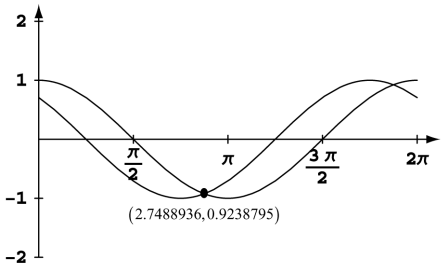
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

67. From the diagram we have $\left(\frac{h}{2}\right)^2 + r^2 = \left(\sqrt{3}\right)^2$ $\Rightarrow$ $r^2 = \frac{12-h^2}{4}$. The volume of the cylinder is $V = \pi r^2 h = \pi\left(\frac{12-h^2}{4}\right)h = \frac{\pi}{4}(12h - h^3)$, where $0 \le h \le 2\sqrt{3}$. Then $V'(h) = \frac{3\pi}{4}(2+h)(2-h)$ $\Rightarrow$ the critical points are $-2$ and 2, but $-2$ is not in the domain. At $h = 2$ there is a maximum since $V''(2) = -3\pi < 0$. The dimensions of the largest cylinder are radius $= \sqrt{2}$ and height $= 2$.



68. From the diagram we have $x$ = radius and $y$ = height $= 12 - 2x$ and $V(x) = \frac{1}{3}\pi x^2(12-2x)$, where $0 \le x \le 6$ $\Rightarrow$ $V'(x) = 2\pi x(4-x)$ and $V''(4) = -8\pi$. The critical points are 0 and 4; $V(0) = V(6) = 0$ $\Rightarrow$ $x = 4$ gives the maximum. Thus the values of $r = 4$ and $h = 4$ yield the largest volume for the smaller cone.

69. The profit $P = 2px + py = 2px + p\left(\frac{40-10x}{5-x}\right)$, where p is the profit on grade B tires and $0 \le x \le 4$. Thus $P'(x) = \frac{2p}{(5-x)^2}(x^2 - 10x + 20)$ $\Rightarrow$ the critical points are $\left(5-\sqrt{5}\right)$, 5, and $\left(5+\sqrt{5}\right)$, but only $\left(5-\sqrt{5}\right)$ is in the domain. Now $P'(x) > 0$ for $0 < x < \left(5-\sqrt{5}\right)$ and $P'(x) < 0$ for $\left(5-\sqrt{5}\right) < x < 4$ $\Rightarrow$ at $x = \left(5-\sqrt{5}\right)$ there is a local maximum. Also $P(0) = 8p$, $P\left(5-\sqrt{5}\right) = 4p\left(5-\sqrt{5}\right) \approx 11p$, and $P(4) = 8p$ $\Rightarrow$ at $x = \left(5-\sqrt{5}\right)$ there is an absolute maximum. The maximum occurs when $x = \left(5-\sqrt{5}\right)$ and $y = 2\left(5-\sqrt{5}\right)$, the units are hundreds of tires, i.e., $x \approx 276$ tires and $y \approx 553$ tires.

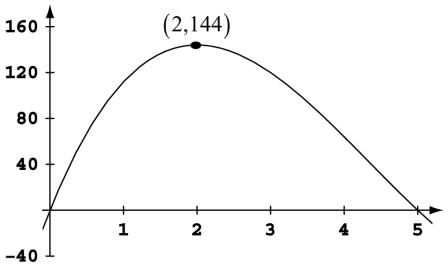


70. (a) The distance between the particles is $|f(t)|$ where $f(t) = -\cos t + \cos\left(t + \frac{\pi}{4}\right)$. Then, $f'(t) = \sin t - \sin\left(t + \frac{\pi}{4}\right)$. Solving $f'(t) = 0$ graphically, we obtain $t \approx 1.178$, $t \approx 4.320$, and so on.

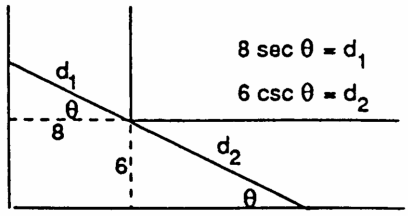
Alternatively, $f'(t) = 0$ may be solved analytically as follows. $f'(t) = \sin\left[\left(t + \frac{\pi}{8}\right) - \frac{\pi}{8}\right] - \sin\left[\left(t + \frac{\pi}{8}\right) + \frac{\pi}{8}\right]$ $= \left[\sin\left(t + \frac{\pi}{8}\right)\cos\frac{\pi}{8} - \cos\left(t + \frac{\pi}{8}\right)\sin\frac{\pi}{8}\right] - \left[\sin\left(t + \frac{\pi}{8}\right)\cos\frac{\pi}{8} + \cos\left(t + \frac{\pi}{8}\right)\sin\frac{\pi}{8}\right] = -2\sin\frac{\pi}{8}\cos\left(t + \frac{\pi}{8}\right)$ so the critical points occur when $\cos\left(t + \frac{\pi}{8}\right) = 0$, or $t = \frac{3\pi}{8} + k\pi$. At each of these values, $f(t) = \pm\cos\frac{3\pi}{8}$ $\approx \pm 0.765$ units, so the maximum distance between the particles is 0.765 units.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(b) Solving $\cos t = \cos\left(t + \frac{\pi}{4}\right)$ graphically, we obtain $t \approx 2.749$, $t \approx 5.890$, and so on.



Alternatively, this problem can be solved analytically as follows.



$$\cos t = \cos\left(t + \tfrac{\pi}{4}\right)$$
$$\cos\left[\left(t + \tfrac{\pi}{8}\right) - \tfrac{\pi}{8}\right] = \cos\left[\left(t + \tfrac{\pi}{8}\right) + \tfrac{\pi}{8}\right]$$
$$\cos\left(t + \tfrac{\pi}{8}\right)\cos\tfrac{\pi}{8} + \sin\left(t + \tfrac{\pi}{8}\right)\sin\tfrac{\pi}{8} = \cos\left(t + \tfrac{\pi}{8}\right)\cos\tfrac{\pi}{8} - \sin\left(t + \tfrac{\pi}{8}\right)\sin\tfrac{\pi}{8}$$
$$2\sin\left(t + \tfrac{\pi}{8}\right)\sin\tfrac{\pi}{8} = 0$$
$$\sin\left(t + \tfrac{\pi}{8}\right) = 0$$
$$t = \tfrac{7\pi}{8} + k\pi$$

The particles collide when $t = \frac{7\pi}{8} \approx 2.749$. (plus multiples of $\pi$ if they keep going.)

71. The dimensions will be x in. by $10 - 2x$ in. by $16 - 2x$ in., so $V(x) = x(10 - 2x)(16 - 2x) = 4x^3 - 52x^2 + 160x$ for $0 < x < 5$. Then $V'(x) = 12x^2 - 104x + 160 = 4(x - 2)(3x - 20)$ , so the critical point in the correct domain is $x = 2$. This critical point corresponds to the maximum possible volume because $V'(x) > 0$ for $0 < x < 2$ and $V'(x) < 0$ for $2 < x < 5$. The box of largest volume has a height of 2 in. and a base measuring 6 in. by 12 in., and its volume is 144 in.$^3$ Graphical support:

72. The length of the ladder is $d_1 + d_2 = 8 \sec\theta + 6 \csc\theta$. We wish to maximize $I(\theta) = 8 \sec\theta + 6 \csc\theta \Rightarrow I'(\theta) = 8 \sec\theta \tan\theta - 6 \csc\theta \cot\theta$. Then $I'(\theta) = 0 \Rightarrow 8 \sin^3\theta - 6 \cos^3\theta = 0 \Rightarrow \tan\theta = \frac{\sqrt[3]{6}}{2} \Rightarrow d_1 = 4\sqrt{4 + \sqrt[3]{36}}$ and $d_2 = \sqrt[3]{36}\sqrt{4 + \sqrt[3]{36}}$ $\Rightarrow$ the length of the ladder is about $\left(4 + \sqrt[3]{36}\right)\sqrt{4 + \sqrt[3]{36}} = \left(4 + \sqrt[3]{36}\right)^{3/2} \approx 19.7$ ft.

73. $g(x) = 3x - x^3 + 4 \Rightarrow g(2) = 2 > 0$ and $g(3) = -14 < 0 \Rightarrow g(x) = 0$ in the interval $[2, 3]$ by the Intermediate Value Theorem. Then $g'(x) = 3 - 3x^2 \Rightarrow x_{n+1} = x_n - \frac{3x_n - x_n^3 + 4}{3 - 3x_n^2}$ ; $x_0 = 2 \Rightarrow x_1 = 2.\overline{22} \Rightarrow x_2 = 2.196215$, and so forth to $x_5 = 2.195823345$.

$\int \frac{\theta}{\sqrt{7 + \theta^2}}\, d\theta = \int \frac{1}{\sqrt{u}}\left(\frac{1}{2}\, du\right) = \frac{1}{2}\int u^{-1/2}\, du = \frac{1}{2}\left(\frac{u^{1/2}}{\frac{1}{2}}\right) + C = u^{1/2} + C = \sqrt{7 + \theta^2} + C$

83. Let $u = 1 + x^4 \Rightarrow du = 4x^3\, dx \Rightarrow \frac{1}{4}\, du = x^3\, dx$
$\int x^3 (1 + x^4)^{-1/4}\, dx = \int u^{-1/4}\left(\frac{1}{4}\, du\right) = \frac{1}{4}\int u^{-1/4}\, du = \frac{1}{4}\left(\frac{u^{3/4}}{\frac{3}{4}}\right) + C = \frac{1}{3}\, u^{3/4} + C = \frac{1}{3}\,(1 + x^4)^{3/4} + C$

84. Let $u = 2 - x \Rightarrow du = -dx \Rightarrow -du = dx$
$\int (2 - x)^{3/5}\, dx = \int u^{3/5}(-du) = -\int u^{3/5}\, du = -\frac{u^{8/5}}{\left(\frac{8}{5}\right)} + C = -\frac{5}{8}\, u^{8/5} + C = -\frac{5}{8}\,(2 - x)^{8/5} + C$

85. Let $u = \frac{s}{10} \Rightarrow du = \frac{1}{10}\, ds \Rightarrow 10\, du = ds$
$\int \sec^2 \frac{s}{10}\, ds = \int (\sec^2 u)\,(10\, du) = 10\int \sec^2 u\, du = 10 \tan u + C = 10 \tan \frac{s}{10} + C$

86. Let $u = \pi s \Rightarrow du = \pi\, ds \Rightarrow \frac{1}{\pi}\, du = ds$
$\int \csc^2 \pi s\, ds = \int (\csc^2 u)\left(\frac{1}{\pi}\, du\right) = \frac{1}{\pi}\int \csc^2 u\, du = -\frac{1}{\pi}\cot u + C = -\frac{1}{\pi}\cot \pi s + C$

87. Let $u = \sqrt{2}\,\theta \Rightarrow du = \sqrt{2}\, d\theta \Rightarrow \frac{1}{\sqrt{2}}\, du = d\theta$
$\int \csc \sqrt{2}\theta \cot \sqrt{2}\theta\, d\theta = \int (\csc u \cot u)\left(\frac{1}{\sqrt{2}}\, du\right) = \frac{1}{\sqrt{2}}(-\csc u) + C = -\frac{1}{\sqrt{2}} \csc \sqrt{2}\theta + C$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

88. Let $u = \frac{\theta}{3} \Rightarrow du = \frac{1}{3}\,d\theta \Rightarrow 3\,du = d\theta$
$\int \sec\frac{\theta}{3}\tan\frac{\theta}{3}\,d\theta = \int (\sec u \tan u)(3\,du) = 3\sec u + C = 3\sec\frac{\theta}{3} + C$

89. Let $u = \frac{x}{4} \Rightarrow du = \frac{1}{4}\,dx \Rightarrow 4\,du = dx$
$\int \sin^2\frac{x}{4}\,dx = \int (\sin^2 u)(4\,du) = \int 4\left(\frac{1-\cos 2u}{2}\right)du = 2\int(1-\cos 2u)\,du = 2\left(u - \frac{\sin 2u}{2}\right) + C$
$= 2u - \sin 2u + C = 2\left(\frac{x}{4}\right) - \sin 2\left(\frac{x}{4}\right) + C = \frac{x}{2} - \sin\frac{x}{2} + C$

90. Let $u = \frac{x}{2} \Rightarrow du = \frac{1}{2}\,dx \Rightarrow 2\,du = dx$
$\int \cos^2\frac{x}{2}\,dx = \int (\cos^2 u)(2\,du) = \int 2\left(\frac{1+\cos 2u}{2}\right)du = \int(1+\cos 2u)\,du = u + \frac{\sin 2u}{2} + C$
$= \frac{x}{2} + \frac{1}{2}\sin x + C$

91. $y = \int \frac{x^2+1}{x^2}\,dx = \int (1 + x^{-2})\,dx = x - x^{-1} + C = x - \frac{1}{x} + C$; $y = -1$ when $x = 1 \Rightarrow 1 - \frac{1}{1} + C = -1$
$\Rightarrow C = -1 \Rightarrow y = x - \frac{1}{x} - 1$

92. $y = \int \left(x + \frac{1}{x}\right)^2 dx = \int \left(x^2 + 2 + \frac{1}{x^2}\right)dx = \int (x^2 + 2 + x^{-2})\,dx = \frac{x^3}{3} + 2x - x^{-1} + C = \frac{x^3}{3} + 2x - \frac{1}{x} + C$;
$y = 1$ when $x = 1 \Rightarrow \frac{1}{3} + 2 - \frac{1}{1} + C = 1 \Rightarrow C = -\frac{1}{3} \Rightarrow y = \frac{x^3}{3} + 2x - \frac{1}{x} - \frac{1}{3}$

93. $\frac{dr}{dt} = \int \left(15\sqrt{t} + \frac{3}{\sqrt{t}}\right)dt = \int \left(15t^{1/2} + 3t^{-1/2}\right)dt = 10t^{3/2} + 6t^{1/2} + C$; $\frac{dr}{dt} = 8$ when $t = 1$
$\Rightarrow 10(1)^{3/2} + 6(1)^{1/2} + C = 8 \Rightarrow C = -8$. Thus $\frac{dr}{dt} = 10t^{3/2} + 6t^{1/2} - 8 \Rightarrow r = \int \left(10t^{3/2} + 6t^{1/2} - 8\right)dt$
$= 4t^{5/2} + 4t^{3/2} - 8t + C$; $r = 0$ when $t = 1 \Rightarrow 4(1)^{5/2} + 4(1)^{3/2} - 8(1) + C_1 = 0 \Rightarrow C_1 = 0$. Therefore,
$r = 4t^{5/2} + 4t^{3/2} - 8t$

94. $\frac{d^2r}{dt^2} = \int -\cos t\,dt = -\sin t + C$; $r'' = 0$ when $t = 0 \Rightarrow -\sin 0 + C = 0 \Rightarrow C = 0$. Thus, $\frac{d^2r}{dt^2} = -\sin t$
$\Rightarrow \frac{dr}{dt} = \int -\sin t\,dt = \cos t + C_1$; $r' = 0$ when $t = 0 \Rightarrow 1 + C_1 = 0 \Rightarrow C_1 = -1$. Then $\frac{dr}{dt} = \cos t - 1$
$\Rightarrow r = \int(\cos t - 1)\,dt = \sin t - t + C_2$; $r = -1$ when $t = 0 \Rightarrow 0 - 0 + C_2 = -1 \Rightarrow C_2 = -1$. Therefore,
$r = \sin t - t - 1$

## CHAPTER 4 ADDITIONAL AND ADVANCED EXERCISES

1. If M and m are the maximum and minimum values, respectively, then $m \le f(x) \le M$ for all $x \in I$. If $m = M$ then f is constant on I.

2. No, the function $f(x) = \begin{cases} 3x + 6, & -2 \le x < 0 \\ 9 - x^2, & 0 \le x \le 2 \end{cases}$ has an absolute minimum value of 0 at $x = -2$ and an absolute maximum value of 9 at $x = 0$, but it is discontinuous at $x = 0$.

3. On an open interval the extreme values of a continuous function (if any) must occur at an interior critical point. On a half-open interval the extreme values of a continuous function may be at a critical point or at the closed endpoint. Extreme values occur only where $f' = 0$, $f'$ does not exist, or at the endpoints of the interval. Thus the extreme points will not be at the ends of an open interval.

4. The pattern $f' = +++ \underset{1}{|} ---- \underset{2}{|} ---- \underset{3}{|} ++++ \underset{4}{|} +++$ indicates a local maximum at $x = 1$ and a local minimum at $x = 3$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

5. (a) If $y' = 6(x+1)(x-2)^2$, then $y' < 0$ for $x < -1$ and $y' > 0$ for $x > -1$. The sign pattern is $f' = ---\,\underset{-1}{|}\,+++\,\underset{2}{|}\,+++ \Rightarrow$ f has a local minimum at $x = -1$. Also $y'' = 6(x-2)^2 + 12(x+1)(x-2)$ $= 6(x-2)(3x) \Rightarrow y'' > 0$ for $x < 0$ or $x > 2$, while $y'' < 0$ for $0 < x < 2$. Therefore f has points of inflection at $x = 0$ and $x = 2$. There is no local maximum.

   (b) If $y' = 6x(x+1)(x-2)$, then $y' < 0$ for $x < -1$ and $0 < x < 2$; $y' > 0$ for $-1 < x < 0$ and $x > 2$. The sign sign pattern is $y' = ---\,\underset{-1}{|}\,+++\,\underset{0}{|}\,---\,\underset{2}{|}\,+++$. Therefore f has a local maximum at $x = 0$ and local minima at $x = -1$ and $x = 2$. Also, $y'' = 18\left[x - \left(\frac{1-\sqrt{7}}{3}\right)\right]\left[x - \left(\frac{1+\sqrt{7}}{3}\right)\right]$, so $y'' < 0$ for $\frac{1-\sqrt{7}}{3} < x < \frac{1+\sqrt{7}}{3}$ and $y'' > 0$ for all other x $\Rightarrow$ f has points of inflection at $x = \frac{1\pm\sqrt{7}}{3}$.

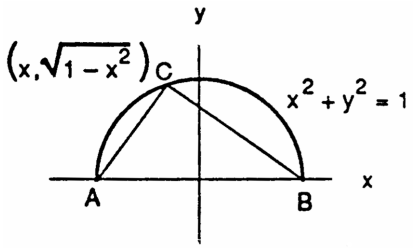
6. The Mean Value Theorem indicates that $\frac{f(6)-f(0)}{6-0} = f'(c) \le 2$ for some c in $(0, 6)$. Then $f(6) - f(0) \le 12$ indicates the most that f can increase is 12.

7. If f is continuous on $[a, c)$ and $f'(x) \le 0$ on $[a, c)$, then by the Mean Value Theorem for all $x \in [a, c)$ we have $\frac{f(c)-f(x)}{c-x} \le 0 \Rightarrow f(c) - f(x) \le 0 \Rightarrow f(x) \ge f(c)$. Also if f is continuous on $(c, b]$ and $f'(x) \ge 0$ on $(c, b]$, then for all $x \in (c, b]$ we have $\frac{f(x)-f(c)}{x-c} \ge 0 \Rightarrow f(x) - f(c) \ge 0 \Rightarrow f(x) \ge f(c)$. Therefore $f(x) \ge f(c)$ for all $x \in [a, b]$.

8. (a) For all x, $-(x+1)^2 \le 0 \le (x-1)^2 \Rightarrow -(1+x^2) \le 2x \le (1+x^2) \Rightarrow -\frac{1}{2} \le \frac{x}{1+x^2} \le \frac{1}{2}$.

   (b) There exists $c \in (a, b)$ such that $\frac{c}{1+c^2} = \frac{f(b)-f(a)}{b-a} \Rightarrow \left|\frac{f(b)-f(a)}{b-a}\right| = \left|\frac{c}{1+c^2}\right| \le \frac{1}{2}$, from part (a) $\Rightarrow |f(b) - f(a)| \le \frac{1}{2}|b-a|$.

9. No. Corollary 1 requires that $f'(x) = 0$ for <u>all</u> x in some interval I, not $f'(x) = 0$ at a single point in I.



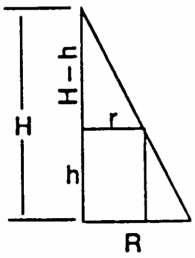
10. (a) $h(x) = f(x)g(x) \Rightarrow h'(x) = f'(x)g(x) + f(x)g'(x)$ which changes signs at $x = a$ since $f'(x), g'(x) > 0$ when $x < a$, $f'(x), g'(x) < 0$ when $x > a$ and $f(x), g(x) > 0$ for all x. Therefore h(x) does have a local maximum at $x = a$.

    (b) No, let $f(x) = g(x) = x^3$ which have points of inflection at $x = 0$, but $h(x) = x^6$ has no point of inflection (it has a local minimum at $x = 0$).

11. From (ii), $f(-1) = \frac{-1+a}{b-c+2} = 0 \Rightarrow a = 1$; from (iii), either $1 = \lim_{x\to\infty} f(x)$ or $1 = \lim_{x\to-\infty} f(x)$. In either case, $\lim_{x\to\pm\infty} f(x) = \lim_{x\to\pm\infty} \frac{x+1}{bx^2+cx+2} = \lim_{x\to\pm\infty} \frac{1+\frac{1}{x}}{bx+c+\frac{2}{x}} = 1 \Rightarrow b = 0$ and $c = 1$. For if $b = 1$, then $\lim_{x\to\pm\infty} \frac{1+\frac{1}{x}}{x+c+\frac{2}{x}} = 0$ and if $c = 0$, then $\lim_{x\to\pm\infty} \frac{1+\frac{1}{x}}{bx+\frac{2}{x}} = \lim_{x\to\pm\infty} \frac{1+\frac{1}{x}}{\frac{2}{x}} = \pm\infty$. Thus $a = 1$, $b = 0$, and $c = 1$.

12. $\frac{dy}{dx} = 3x^2 + 2kx + 3 = 0 \Rightarrow x = \frac{-2k \pm \sqrt{4k^2-36}}{6} \Rightarrow$ x has only one value when $4k^2 - 36 = 0 \Rightarrow k^2 = 9$ or $k = \pm 3$.

13. The area of the $\Delta ABC$ is $A(x) = \frac{1}{2}(2)\sqrt{1-x^2} = (1-x^2)^{1/2}$, where $0 \le x \le 1$. Thus $A'(x) = \frac{-x}{\sqrt{1-x^2}} \Rightarrow 0$ and $\pm 1$ are critical points. Also $A(\pm 1) = 0$ so $A(0) = 1$ is the maximum. When $x = 0$ the $\Delta ABC$ is isosceles since $AC = BC = \sqrt{2}$.



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

14. $\lim_{h\to 0} \frac{f'(c+h)-f'(c)}{h} = f''(c) \Rightarrow$ for $\epsilon = \frac{1}{2}|f''(c)| > 0$ there exists a $\delta > 0$ such that $0 < |h| < \delta$
$\Rightarrow \left|\frac{f'(c+h)-f'(c)}{h} - f''(c)\right| < \frac{1}{2}|f''(c)|$. Then $f'(c) = 0 \Rightarrow -\frac{1}{2}|f''(c)| < \frac{f'(c+h)}{h} - f''(c) < \frac{1}{2}|f''(c)|$
$\Rightarrow f''(c) - \frac{1}{2}|f''(c)| < \frac{f'(c+h)}{h} < f''(c) + \frac{1}{2}|f''(c)|$. If $f''(c) < 0$, then $|f''(c)| = -f''(c)$
$\Rightarrow \frac{3}{2}f''(c) < \frac{f'(c+h)}{h} < \frac{1}{2}f''(c) < 0$; likewise if $f''(c) > 0$, then $0 < \frac{1}{2}f''(c) < \frac{f'(c+h)}{h} < \frac{3}{2}f''(c)$.
(a) If $f''(c) < 0$, then $-\delta < h < 0 \Rightarrow f'(c+h) > 0$ and $0 < h < \delta \Rightarrow f'(c+h) < 0$. Therefore, $f(c)$ is a local maximum.
(b) If $f''(c) > 0$, then $-\delta < h < 0 \Rightarrow f'(c+h) < 0$ and $0 < h < \delta \Rightarrow f'(c+h) > 0$. Therefore, $f(c)$ is a local minimum.

15. The time it would take the water to hit the ground from height y is $\sqrt{\frac{2y}{g}}$, where g is the acceleration of gravity. The product of time and exit velocity (rate) yields the distance the water travels:
$D(y) = \sqrt{\frac{2y}{g}}\sqrt{64(h-y)} = 8\sqrt{\frac{2}{g}}(hy - y^2)^{1/2}$, $0 \le y \le h \Rightarrow D'(y) = -4\sqrt{\frac{2}{g}}(hy-y^2)^{-1/2}(h-2y) \Rightarrow 0, \frac{h}{2}$ and h are critical points. Now $D(0) = 0$, $D\left(\frac{h}{2}\right) = \frac{8h}{\sqrt{g}}$ and $D(h) = 0 \Rightarrow$ the best place to drill the hole is at $y = \frac{h}{2}$.

16. From the figure in the text, $\tan(\beta+\theta) = \frac{b+a}{h}$; $\tan(\beta+\theta) = \frac{\tan\beta + \tan\theta}{1-\tan\beta\tan\theta}$; and $\tan\theta = \frac{a}{h}$. These equations give $\frac{b+a}{h} = \frac{\tan\beta + \frac{a}{h}}{1-\frac{a}{h}\tan\beta} = \frac{h\tan\beta + a}{h - a\tan\beta}$. Solving for $\tan\beta$ gives $\tan\beta = \frac{bh}{h^2 + a(b+a)}$ or
$(h^2 - a(b+a))\tan\beta = bh$. Differentiating both sides with respect to h gives
$2h\tan\beta + (h^2 + a(b+a))\sec^2\beta\frac{d\beta}{dh} = b$. Then $\frac{d\beta}{dh} = 0 \Rightarrow 2h\tan\beta = b \Rightarrow 2h\left(\frac{bh}{h^2+a(b+a)}\right) = b$
$\Rightarrow 2bh^2 = bh^2 + ab(b+a) \Rightarrow h^2 = a(b+a) \Rightarrow h = \sqrt{a(a+b)}$.

17. The surface area of the cylinder is $S = 2\pi r^2 + 2\pi rh$. From the diagram we have $\frac{r}{R} = \frac{H-h}{H} \Rightarrow h = \frac{RH - rH}{R}$ and
$S(r) = 2\pi r(r+h) = 2\pi r\left(r + H - r\frac{H}{R}\right)$
$= 2\pi\left(1 - \frac{H}{R}\right)r^2 + 2\pi Hr$, where $0 \le r \le R$.

Case 1: $H < R \Rightarrow S(r)$ is a quadratic equation containing the origin and concave upward $\Rightarrow S(r)$ is maximum at $r = R$.
Case 2: $H = R \Rightarrow S(r)$ is a linear equation containing the origin with a positive slope $\Rightarrow S(r)$ is maximum at $r = R$.
Case 3: $H > R \Rightarrow S(r)$ is a quadratic equation containing the origin and concave downward. Then $\frac{dS}{dr} = 4\pi\left(1 - \frac{H}{R}\right)r + 2\pi H$ and $\frac{dS}{dr} = 0 \Rightarrow 4\pi\left(1-\frac{H}{R}\right)r + 2\pi H = 0 \Rightarrow r = \frac{RH}{2(H-R)}$. For simplification we let $r^* = \frac{RH}{2(H-R)}$.
(a) If $R < H < 2R$, then $0 > H - 2R \Rightarrow H > 2(H-R) \Rightarrow \frac{RH}{2(H-R)} > R$ which is impossible.
(b) If $H = 2R$, then $r^* = \frac{2R^2}{2R} = R \Rightarrow S(r)$ is maximum at $r = R$.
(c) If $H > 2R$, then $2R + H < 2H \Rightarrow H < 2(H-R) \Rightarrow \frac{H}{2(H-R)} < 1 \Rightarrow \frac{RH}{2(H-R)} < R \Rightarrow r^* < R$. Therefore, $S(r)$ is a maximum at $r = r^* = \frac{RH}{2(H-R)}$.
Conclusion: If $H \in (0, R]$ or $H = 2R$, then the maximum surface area is at $r = R$. If $H \in (R, 2R)$, then $r > R$ which is not possible. If $H \in (2R, \infty)$, then the maximum is at $r = r^* = \frac{RH}{2(H-R)}$.

18. $f(x) = mx - 1 + \frac{1}{x} \Rightarrow f'(x) = m - \frac{1}{x^2}$ and $f''(x) = \frac{2}{x^3} > 0$ when $x > 0$. Then $f'(x) = 0 \Rightarrow x = \frac{1}{\sqrt{m}}$ yields a minimum. If $f\left(\frac{1}{\sqrt{m}}\right) \ge 0$, then $\sqrt{m} - 1 + \sqrt{m} = 2\sqrt{m} - 1 \ge 0 \Rightarrow m \ge \frac{1}{4}$. Thus the smallest acceptable value

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

for m is $\frac{1}{4}$.

19. (a) $\lim\limits_{x\to 0}\frac{2\sin(5x)}{3x}=\lim\limits_{x\to 0}\frac{2\sin(5x)}{\frac{3}{5}(5x)}=\lim\limits_{x\to 0}\frac{10}{3}\frac{\sin(5x)}{(5x)}=\frac{10}{3}\cdot 1=\frac{10}{3}$

(b) $\lim\limits_{x\to 0}\sin(5x)\cot(3x)=\lim\limits_{x\to 0}\frac{\sin(5x)\cos(3x)}{\sin(3x)}=\lim\limits_{x\to 0}\frac{-3\sin(5x)\sin(3x)+5\cos(5x)\cos(3x)}{3\cos(3x)}=\frac{5}{3}$

(c) $\lim\limits_{x\to 0}x\csc^2\sqrt{2x}=\lim\limits_{x\to 0}\frac{x}{\sin^2\sqrt{2x}}=\lim\limits_{x\to 0}\frac{1}{\frac{2\sin\sqrt{2x}\cos\sqrt{2x}}{\sqrt{2x}}}=\lim\limits_{x\to 0}\frac{\sqrt{2x}}{\sin\left(2\sqrt{2x}\right)}=\lim\limits_{x\to 0}\frac{\frac{1}{\sqrt{2x}}}{\cos\left(2\sqrt{2x}\right)\frac{2}{\sqrt{2x}}}$
$=\lim\limits_{x\to 0}\frac{1}{\cos\left(2\sqrt{2x}\right)\cdot 2}=\frac{1}{2}$

(d) $\lim\limits_{x\to \pi/2}(\sec x-\tan x)=\lim\limits_{x\to \pi/2}\frac{1-\sin x}{\cos x}=\lim\limits_{x\to \pi/2}\frac{-\cos x}{-\sin x}=0.$

(e) $\lim\limits_{x\to 0}\frac{x-\sin x}{x-\tan x}=\lim\limits_{x\to 0}\frac{1-\cos x}{1-\sec^2 x}=\lim\limits_{x\to 0}\frac{1-\cos x}{-\tan^2 x}=\lim\limits_{x\to 0}\frac{\cos x-1}{\tan^2 x}=\lim\limits_{x\to 0}\frac{-\sin x}{2\tan x\sec^2 x}=\lim\limits_{x\to 0}\frac{-\sin x}{\frac{2\sin x}{\cos^3 x}}=$
$=\lim\limits_{x\to 0}\frac{\cos^3 x}{-2}=-\frac{1}{2}$

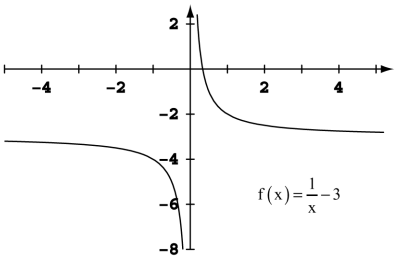
(f) $\lim\limits_{x\to 0}\frac{\sin(x^2)}{x\sin x}=\lim\limits_{x\to 0}\frac{2x\cos(x^2)}{x\cos x+\sin x}=\lim\limits_{x\to 0}\frac{-(2x^2)\sin(x^2)+2\cos(x^2)}{-x\sin x+2\cos x}=\frac{2}{2}=1$

(g) $\lim\limits_{x\to 0}\frac{\sec x-1}{x^2}=\lim\limits_{x\to 0}\frac{\sec x\tan x}{2x}=\lim\limits_{x\to 0}\frac{\sec^3 x+\tan^2 x\sec x}{2}=\frac{1+0}{2}=\frac{1}{2}$

(h) $\lim\limits_{x\to 2}\frac{x^3-8}{x^2-4}=\lim\limits_{x\to 2}\frac{(x-2)(x^2+2x+4)}{(x-2)(x+2)}=\lim\limits_{x\to 2}\frac{x^2+2x+4}{x+2}=\frac{4+4+4}{4}=3$

20. (a) $\lim\limits_{x\to\infty}\frac{\sqrt{x+5}}{\sqrt{x}+5}=\lim\limits_{x\to\infty}\frac{\frac{\sqrt{x+5}}{\sqrt{x}}}{\frac{\sqrt{x}+5}{\sqrt{x}}}=\lim\limits_{x\to\infty}\frac{\sqrt{1+\frac{5}{x}}}{1+\frac{5}{\sqrt{x}}}=\frac{1}{1}=1$

(b) $\lim\limits_{x\to\infty}\frac{2x}{x+7\sqrt{x}}=\lim\limits_{x\to\infty}\frac{\frac{2x}{x}}{\frac{x+7\sqrt{x}}{x}}=\lim\limits_{x\to\infty}\frac{2}{1+7\sqrt{\frac{1}{x}}}=\frac{2}{1+0}=2$



21. (a) The profit function is $P(x)=(c-ex)x-(a+bx)=-ex^2+(c-b)x-a$. $P'(x)=-2ex+c-b=0$ $\Rightarrow x=\frac{c-b}{2e}$. $P''(x)=-2e<0$ if $e>0$ so that the profit function is maximized at $x=\frac{c-b}{2e}$.

(b) The price therefore that corresponds to a production level yeilding a maximum profit is $p\Big|_{x=\frac{c-b}{2e}}=c-e\left(\frac{c-b}{2e}\right)=\frac{c+b}{2}$ dollars.

(c) The weekly profit at this production level is $P(x)=-e\left(\frac{c-b}{2e}\right)^2+(c-b)\left(\frac{c-b}{2e}\right)-a=\frac{(c-b)^2}{4e}-a$.

(d) The tax increases cost to the new profit function is $F(x)=(c-ex)x-(a+bx+tx)=-ex^2+(c-b-t)x-a$. Now $F'(x)=-2ex+c-b-t=0$ when $x=\frac{t+b-c}{-2e}=\frac{c-b-t}{2e}$. Since $F''(x)=-2e<0$ if $e>0$, F is maximized when $x=\frac{c-b-t}{2e}$ units per week. Thus the price per unit is $p=c-e\left(\frac{c-b-t}{2e}\right)=\frac{c+b+t}{2}$ dollars. Thus, such a tax increases the cost per unit by $\frac{c+b+t}{2}-\frac{c+b}{2}=\frac{t}{2}$ dollars if units are priced to maximize profit.

22. (a)

The x-intercept occurs when $\frac{1}{x}-3=0\Rightarrow\frac{1}{x}=3\Rightarrow x=\frac{1}{3}$.

(b) By Newton's method, $x_{n+1}=x_n-\frac{f(x_n)}{f'(x_n)}$. Here $f'(x_n)=-x_n^{-2}=\frac{-1}{x_n^2}$. So $x_{n+1}=x_n-\frac{\frac{1}{x_n}-3}{\frac{-1}{x_n^2}}=x_n+\left(\frac{1}{x_n}-3\right)x_n^2$
$=x_n+x_n-3x_n^2=2x_n-3x_n^2=x_n(2-3x_n)$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

23. $x_1 = x_0 - \frac{f(x_0)}{f'(x_0)} = x_0 - \frac{x_0^q - a}{qx_0^{q-1}} = \frac{qx_0^q - x_0^q - a}{qx_0^{q-1}} = \frac{x_0^q(q-1) - a}{qx_0^{q-1}} = x_0\left(\frac{q-1}{q}\right) + \frac{a}{x_0^{q-1}}\left(\frac{1}{q}\right)$ so that $x_1$ is a weighted average of $x_0$ and $\frac{a}{x_0^{q-1}}$ with weights $m_0 = \frac{q-1}{q}$ and $m_1 = \frac{1}{q}$.

In the case where $x_0 = \frac{a}{x_0^{q-1}}$ we have $x_0^q = a$ and $x_1 = \frac{a}{x_0^{q-1}}\left(\frac{q-1}{q}\right) + \frac{a}{x_0^{q-1}}\left(\frac{1}{q}\right) = \frac{a}{x_0^{q-1}}\left(\frac{q-1}{q} + \frac{1}{q}\right) = \frac{a}{x_0^{q-1}}$.

24. We have that $(x-h)^2 + (y-h)^2 = r^2$ and so $2(x-h) + 2(y-h)\frac{dy}{dx} = 0$ and $2 + 2\frac{dy}{dx} + 2(y-h)\frac{d^2y}{dx^2} = 0$ hold.

Thus $2x + 2y\frac{dy}{dx} = 2h + 2h\frac{dy}{dx}$, by the former. Solving for h, we obtain $h = \frac{x + y\frac{dy}{dx}}{1 + \frac{dy}{dx}}$. Substituting this into the second equation yields $2 + 2\frac{dy}{dx} + 2y\frac{d^2y}{dx^2} - 2\left(\frac{x + y\frac{dy}{dx}}{1 + \frac{dy}{dx}}\right) = 0$. Dividing by 2 results in $1 + \frac{dy}{dx} + y\frac{d^2y}{dx^2} - \left(\frac{x + y\frac{dy}{dx}}{1 + \frac{dy}{dx}}\right) = 0$.

25. (a) $a(t) = s''(t) = -k \quad (k > 0) \Rightarrow s'(t) = -kt + C_1$, where $s'(0) = 88 \Rightarrow C_1 = 88 \Rightarrow s'(t) = -kt + 88$. So $s(t) = \frac{-kt^2}{2} + 88t + C_2$ where $s(0) = 0 \Rightarrow C_2 = 0$ so $s(t) = \frac{-kt^2}{2} + 88t$. Now $s(t) = 100$ when $\frac{-kt^2}{2} + 88t = 100$. Solving for t we obtain $t = \frac{88 \pm \sqrt{88^2 - 200k}}{k}$. At such t we want $s'(t) = 0$, thus $-k\left(\frac{88 + \sqrt{88^2 - 200k}}{k}\right) + 88 = 0$ or $-k\left(\frac{88 - \sqrt{88^2 - 200k}}{k}\right) + 88 = 0$. In either case we obtain $88^2 - 200k = 0$ so that $k = \frac{88^2}{200} \approx 38.72$ ft/sec$^2$.

(b) The initial condition that $s'(0) = 44$ ft/sec implies that $s'(t) = -kt + 44$ and $s(t) = \frac{-kt^2}{2} + 44t$ where k is as above. The car is stopped at a time t such that $s'(t) = -kt + 44 = 0 \Rightarrow t = \frac{44}{k}$. At this time the car has traveled a distance $s\left(\frac{44}{k}\right) = \frac{-k}{2}\left(\frac{44}{k}\right)^2 + 44\left(\frac{44}{k}\right) = \frac{44^2}{2k} = \frac{968}{k} = 968\left(\frac{200}{88^2}\right) = 25$ feet. Thus halving the initial velocity quarters stopping distance.

26. $h(x) = f^2(x) + g^2(x) \Rightarrow h'(x) = 2f(x)f'(x) + 2g(x)g'(x) = 2\big[f(x)f'(x) + g(x)g'(x)\big] = 2\big[f(x)g(x) + g(x)(-f(x))\big]$ $= 2 \cdot 0 = 0$. Thus $h(x) = c$, a constant. Since $h(0) = 5$, $h(x) = 5$ for all x in the domain of h. Thus $h(10) = 5$.

27. Yes. The curve $y = x$ satisfies all three conditions since $\frac{dy}{dx} = 1$ everywhere, when $x = 0$, $y = 0$, and $\frac{d^2y}{dx^2} = 0$ everywhere.

28. $y' = 3x^2 + 2$ for all $x \Rightarrow y = x^3 + 2x + C$ where $-1 = 1^3 + 2 \cdot 1 + C \Rightarrow C = -4 \Rightarrow y = x^3 + 2x - 4$.

29. $s''(t) = a = -t^2 \Rightarrow v = s'(t) = \frac{-t^3}{3} + C$. We seek $v_0 = s'(0) = C$. We know that $s(t^*) = b$ for some $t^*$ and s is at a maximum for this $t^*$. Since $s(t) = \frac{-t^4}{12} + Ct + k$ and $s(0) = 0$ we have that $s(t) = \frac{-t^4}{12} + Ct$ and also $s'(t^*) = 0$ so that $t^* = (3C)^{1/3}$. So $\frac{\left[-(3C)^{1/3}\right]^4}{12} + C(3C)^{1/3} = b \Rightarrow (3C)^{1/3}\left(C - \frac{3C}{12}\right) = b \Rightarrow (3C)^{1/3}\left(\frac{3C}{4}\right) = b \Rightarrow 3^{1/3}C^{4/3} = \frac{4b}{3}$ $\Rightarrow C = \frac{(4b)^{3/4}}{3}$. Thus $v_0 = s'(0) = \frac{(4b)^{3/4}}{3} = \frac{2\sqrt{2}}{3}b^{3/4}$.

30. (a) $s''(t) = t^{1/2} - t^{-1/2} \Rightarrow v(t) = s'(t) = \frac{2}{3}t^{3/2} - 2t^{1/2} + k$ where $v(0) = k = \frac{4}{3} \Rightarrow v(t) = \frac{2}{3}t^{3/2} - 2t^{1/2} + \frac{4}{3}$.

(b) $s(t) = \frac{4}{15}t^{5/2} - \frac{4}{3}t^{3/2} + \frac{4}{3}t + k_2$ where $s(0) = k_2 = -\frac{4}{15}$. Thus $s(t) = \frac{4}{15}t^{5/2} - \frac{4}{3}t^{3/2} + \frac{4}{3}t - \frac{4}{15}$.

31. The graph of $f(x) = ax^2 + bx + c$ with $a > 0$ is a parabola opening upwards. Thus $f(x) \geq 0$ for all x if $f(x) = 0$ for at most one real value of x. The solutions to $f(x) = 0$ are, by the quadratic equation $\frac{-2b \pm \sqrt{(2b)^2 - 4ac}}{2a}$. Thus we require $(2b)^2 - 4ac \leq 0 \Rightarrow b^2 - ac \leq 0$.

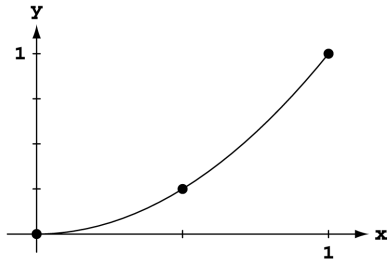
32. (a) Clearly $f(x) = (a_1x + b_1)^2 + \ldots + (a_nx + b_n)^2 \geq 0$ for all x. Expanding we see
$f(x) = (a_1^2x^2 + 2a_1b_1x + b_1^2) + \ldots + (a_n^2x^2 + 2a_nb_nx + b_n^2)$
$= (a_1^2 + a_2^2 + \ldots + a_n^2)x^2 + 2(a_1b_1 + a_2b_2 + \ldots + a_nb_n)x + (b_1^2 + b_2^2 + \ldots + b_n^2) \geq 0$.
Thus $(a_1b_1 + a_2b_2 + \ldots + a_nb_n)^2 - (a_1^2 + a_2^2 + \ldots + a_n^2)(b_1^2 + b_2^2 + \ldots + b_n^2) \leq 0$ by Exercise 31.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Thus $(a_1b_1 + a_2b_2 + \ldots + a_nb_n)^2 \le (a_1^2 + a_2^2 + \ldots + a_n^2)(b_1^2 + b_2^2 + \ldots + b_n^2)$.

(b) Referring to Exercise 31: It is clear that $f(x) = 0$ for some real $x \Leftrightarrow b^2 - 4ac = 0$, by quadratic formula.
Now notice that this implies that

$$\begin{aligned} f(x) &= (a_1x + b_1)^2 + \ldots + (a_nx + b_n)^2 \\ &= (a_1^2 + a_2^2 + \ldots + a_n^2)x^2 + 2(a_1b_1 + a_2b_2 + \ldots + a_nb_n)x + (b_1^2 + b_2^2 + \ldots + b_n^2) = 0 \\ &\Leftrightarrow (a_1b_1 + a_2b_2 + \ldots + a_nb_n)^2 - (a_1^2 + a_2^2 + \ldots + a_n^2)(b_1^2 + b_2^2 + \ldots + b_n^2) = 0 \\ &\Leftrightarrow (a_1b_1 + a_2b_2 + \ldots + a_nb_n)^2 = (a_1^2 + a_2^2 + \ldots + a_n^2)(b_1^2 + b_2^2 + \ldots + b_n^2) \end{aligned}$$



But now $f(x) = 0 \Leftrightarrow a_ix + b_i = 0$ for all $i = 1, 2, \ldots, n \Leftrightarrow a_ix = -b_i = 0$ for all $i = 1, 2, \ldots, n$.

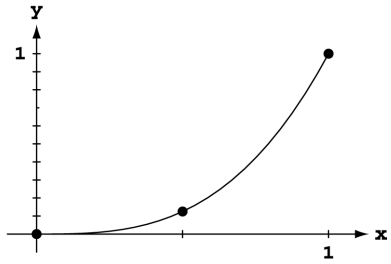
# CHAPTER 5 INTEGRATION

## 5.1 ESTIMATING WITH FINITE SUMS

1. $f(x) = x^2$

Since f is increasing on $[0, 1]$, we use left endpoints to obtain lower sums and right endpoints to obtain upper sums.



(a) $\triangle x = \frac{1-0}{2} = \frac{1}{2}$ and $x_i = i\triangle x = \frac{i}{2} \Rightarrow$ a lower sum is $\sum_{i=0}^{1} \left(\frac{i}{2}\right)^2 \cdot \frac{1}{2} = \frac{1}{2}\left(0^2 + \left(\frac{1}{2}\right)^2\right) = \frac{1}{8}$

(b) $\triangle x = \frac{1-0}{4} = \frac{1}{4}$ and $x_i = i\triangle x = \frac{i}{4} \Rightarrow$ a lower sum is $\sum_{i=0}^{3} \left(\frac{i}{4}\right)^2 \cdot \frac{1}{4} = \frac{1}{4}\left(0^2 + \left(\frac{1}{4}\right)^2 + \left(\frac{1}{2}\right)^2 + \left(\frac{3}{4}\right)^2\right) = \frac{1}{4} \cdot \frac{7}{8} = \frac{7}{32}$

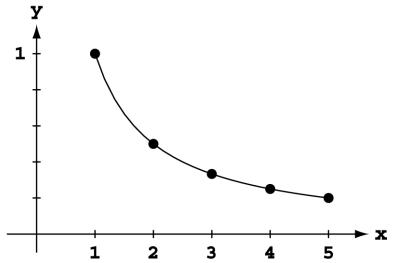
(c) $\triangle x = \frac{1-0}{2} = \frac{1}{2}$ and $x_i = i\triangle x = \frac{i}{2} \Rightarrow$ an upper sum is $\sum_{i=1}^{2} \left(\frac{i}{2}\right)^2 \cdot \frac{1}{2} = \frac{1}{2}\left(\left(\frac{1}{2}\right)^2 + 1^2\right) = \frac{5}{8}$

(d) $\triangle x = \frac{1-0}{4} = \frac{1}{4}$ and $x_i = i\triangle x = \frac{i}{4} \Rightarrow$ an upper sum is $\sum_{i=1}^{4} \left(\frac{i}{4}\right)^2 \cdot \frac{1}{4} = \frac{1}{4}\left(\left(\frac{1}{4}\right)^2 + \left(\frac{1}{2}\right)^2 + \left(\frac{3}{4}\right)^2 + 1^2\right) = \frac{1}{4} \cdot \left(\frac{30}{16}\right) = \frac{15}{32}$

2. $f(x) = x^3$

Since f is increasing on $[0, 1]$, we use left endpoints to obtain lower sums and right endpoints to obtain upper sums.

(a) $\triangle x = \frac{1-0}{2} = \frac{1}{2}$ and $x_i = i\triangle x = \frac{i}{2} \Rightarrow$ a lower sum is $\sum_{i=0}^{1} \left(\frac{i}{2}\right)^3 \cdot \frac{1}{2} = \frac{1}{2}\left(0^3 + \left(\frac{1}{2}\right)^3\right) = \frac{1}{16}$



(b) $\triangle x = \frac{1-0}{4} = \frac{1}{4}$ and $x_i = i\triangle x = \frac{i}{4} \Rightarrow$ a lower sum is $\sum_{i=0}^{3} \left(\frac{i}{4}\right)^3 \cdot \frac{1}{4} = \frac{1}{4}\left(0^3 + \left(\frac{1}{4}\right)^3 + \left(\frac{1}{2}\right)^3 + \left(\frac{3}{4}\right)^3\right) = \frac{36}{256} = \frac{9}{64}$

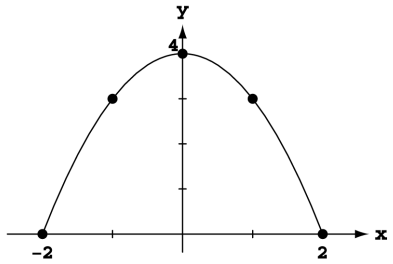
(c) $\triangle x = \frac{1-0}{2} = \frac{1}{2}$ and $x_i = i\triangle x = \frac{i}{2} \Rightarrow$ an upper sum is $\sum_{i=1}^{2} \left(\frac{i}{2}\right)^3 \cdot \frac{1}{2} = \frac{1}{2}\left(\left(\frac{1}{2}\right)^3 + 1^3\right) = \frac{1}{2} \cdot \frac{9}{8} = \frac{9}{16}$

(d) $\triangle x = \frac{1-0}{4} = \frac{1}{4}$ and $x_i = i\triangle x = \frac{i}{4} \Rightarrow$ an upper sum is $\sum_{i=1}^{4} \left(\frac{i}{4}\right)^3 \cdot \frac{1}{4} = \frac{1}{4}\left(\left(\frac{1}{4}\right)^3 + \left(\frac{1}{2}\right)^3 + \left(\frac{3}{4}\right)^3 + 1^3\right) = \; = \frac{100}{256} = \frac{25}{64}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

3. $f(x) = \frac{1}{x}$

Since f is decreasing on $[0, 1]$, we use left endpoints to obtain upper sums and right endpoints to obtain lower sums.



(a) $\triangle x = \frac{5-1}{2} = 2$ and $x_i = 1 + i\triangle x = 1 + 2i \Rightarrow$ a lower sum is $\sum_{i=1}^{2} \frac{1}{x_i} \cdot 2 = 2\left(\frac{1}{3} + \frac{1}{5}\right) = \frac{16}{15}$

(b) $\triangle x = \frac{5-1}{4} = 1$ and $x_i = 1 + i\triangle x = 1 + i \Rightarrow$ a lower sum is $\sum_{i=1}^{4} \frac{1}{x_i} \cdot 1 = 1\left(\frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5}\right) = \frac{77}{60}$

(c) $\triangle x = \frac{5-1}{2} = 2$ and $x_i = 1 + i\triangle x = 1 + 2i \Rightarrow$ an upper sum is $\sum_{i=0}^{1} \frac{1}{x_i} \cdot 2 = 2\left(1 + \frac{1}{3}\right) = \frac{8}{3}$

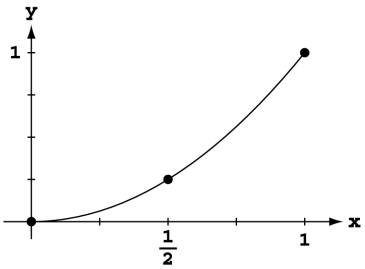
(d) $\triangle x = \frac{5-1}{4} = 1$ and $x_i = 1 + i\triangle x = 1 + i \Rightarrow$ an upper sum is $\sum_{i=0}^{3} \frac{1}{x_i} \cdot 1 = 1\left(1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4}\right) = \frac{25}{12}$

4. $f(x) = 4 - x^2$

Since f is increasing on $[-2, 0]$ and decreasing on $[0, 2]$, we use left endpoints on $[-2, 0]$ and right endpoints on $[0, 2]$ to obtain lower sums and use right endpoints on $[-2, 0]$ and left endpoints on $[0, 2]$ to obtain upper sums.

(a) $\triangle x = \frac{2-(-2)}{2} = 2$ and $x_i = -2 + i\triangle x = -2 + 2i \Rightarrow$ a lower sum is $2 \cdot \left(4 - (-2)^2\right) + 2 \cdot (4 - 2^2) = 0$

(b) $\triangle x = \frac{2-(-2)}{4} = 1$ and $x_i = -2 + i\triangle x = -2 + i \Rightarrow$ a lower sum is $\sum_{i=0}^{1} \left(4 - (x_i)^2\right) \cdot 1 + \sum_{i=3}^{4} \left(4 - (x_i)^2\right) \cdot 1$



$= 1\left(\left(4 - (-2)^2\right) + \left(4 - (-1)^2\right) + (4 - 1^2) + (4 - 2^2)\right) = 6$

(c) $\triangle x = \frac{2-(-2)}{2} = 2$ and $x_i = -2 + i\triangle x = -2 + 2i \Rightarrow$ a upper sum is $2 \cdot \left(4 - (0)^2\right) + 2 \cdot (4 - 0^2) = 16$

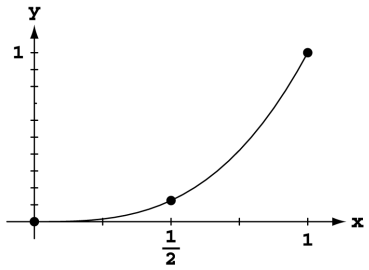
(d) $\triangle x = \frac{2-(-2)}{4} = 1$ and $x_i = -2 + i\triangle x = -2 + i \Rightarrow$ a upper sum is $\sum_{i=1}^{2} \left(4 - (x_i)^2\right) \cdot 1 + \sum_{i=2}^{3} \left(4 - (x_i)^2\right) \cdot 1$

$= 1\left(\left(4 - (-1)^2\right) + (4 - 0^2) + (4 - 0^2) + (4 - 1^2)\right) = 14$

5. $f(x) = x^2$

Using 2 rectangles $\Rightarrow \triangle x = \frac{1-0}{2} = \frac{1}{2} \Rightarrow \frac{1}{2}\left(f\left(\frac{1}{4}\right) + f\left(\frac{3}{4}\right)\right)$

$= \frac{1}{2}\left(\left(\frac{1}{4}\right)^2 + \left(\frac{3}{4}\right)^2\right) = \frac{10}{32} = \frac{5}{16}$

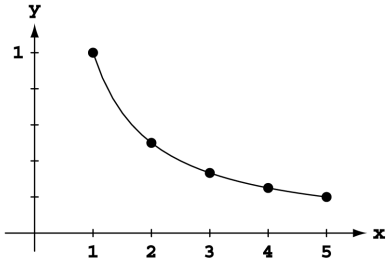


Using 4 rectangles $\Rightarrow \triangle x = \frac{1-0}{4} = \frac{1}{4}$

$\Rightarrow \frac{1}{4}\left(f\left(\frac{1}{8}\right) + f\left(\frac{3}{8}\right) + f\left(\frac{5}{8}\right) + f\left(\frac{7}{8}\right)\right)$

$= \frac{1}{4}\left(\left(\frac{1}{8}\right)^2 + \left(\frac{3}{8}\right)^2 + \left(\frac{5}{8}\right)^2 + \left(\frac{7}{8}\right)^2\right) = \frac{21}{64}$

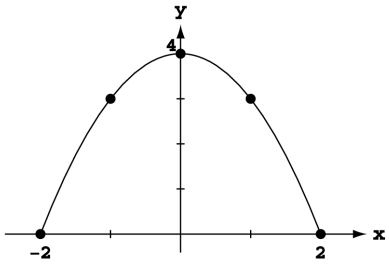
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



6. $f(x) = x^3$

Using 2 rectangles $\Rightarrow \triangle x = \frac{1-0}{2} = \frac{1}{2} \Rightarrow \frac{1}{2}\left(f\left(\frac{1}{4}\right) + f\left(\frac{3}{4}\right)\right)$
$= \frac{1}{2}\left(\left(\frac{1}{4}\right)^3 + \left(\frac{3}{4}\right)^3\right) = \frac{28}{2 \cdot 64} = \frac{7}{32}$

Using 4 rectangles $\Rightarrow \triangle x = \frac{1-0}{4} = \frac{1}{4}$
$\Rightarrow \frac{1}{4}\left(f\left(\frac{1}{8}\right) + f\left(\frac{3}{8}\right) + f\left(\frac{5}{8}\right) + f\left(\frac{7}{8}\right)\right)$
$= \frac{1}{4}\left(\frac{1^3+3^3+5^3+7^3}{8^3}\right) = \frac{496}{4 \cdot 8^3} = \frac{124}{8^3} = \frac{31}{128}$



7. $f(x) = \frac{1}{x}$

Using 2 rectangles $\Rightarrow \triangle x = \frac{5-1}{2} = 2 \Rightarrow 2(f(2) + f(4))$
$= 2\left(\frac{1}{2} + \frac{1}{4}\right) = \frac{3}{2}$

Using 4 rectangles $\Rightarrow \triangle x = \frac{5-1}{4} = 1$
$\Rightarrow 1\left(f\left(\frac{3}{2}\right) + f\left(\frac{5}{2}\right) + f\left(\frac{7}{2}\right) + f\left(\frac{9}{2}\right)\right)$
$= 1\left(\frac{2}{3} + \frac{2}{5} + \frac{2}{7} + \frac{2}{9}\right) = \frac{1488}{3 \cdot 5 \cdot 7 \cdot 9} = \frac{496}{5 \cdot 7 \cdot 9} = \frac{496}{315}$

8. $f(x) = 4 - x^2$

Using 2 rectangles $\Rightarrow \triangle x = \frac{2-(-2)}{2} = 2 \Rightarrow 2(f(-1) + f(1))$
$= 2(3 + 3) = 12$

Using 4 rectangles $\Rightarrow \triangle x = \frac{2-(-2)}{4} = 1$
$\Rightarrow 1\left(f\left(-\frac{3}{2}\right) + f\left(-\frac{1}{2}\right) + f\left(\frac{1}{2}\right) + f\left(\frac{3}{2}\right)\right)$
$= 1\left(\left(4 - \left(-\frac{3}{2}\right)^2\right) + \left(4 - \left(-\frac{1}{2}\right)^2\right) + \left(4 - \left(\frac{1}{2}\right)^2\right) + \left(4 - \left(\frac{3}{2}\right)^2\right)\right)$
$= 16 - \left(\frac{9}{4} \cdot 2 + \frac{1}{4} \cdot 2\right) = 16 - \frac{10}{2} = 11$

9. (a) $D \approx (0)(1) + (12)(1) + (22)(1) + (10)(1) + (5)(1) + (13)(1) + (11)(1) + (6)(1) + (2)(1) + (6)(1) = 87$ inches
(b) $D \approx (12)(1) + (22)(1) + (10)(1) + (5)(1) + (13)(1) + (11)(1) + (6)(1) + (2)(1) + (6)(1) + (0)(1) = 87$ inches

10. (a) $D \approx (1)(300) + (1.2)(300) + (1.7)(300) + (2.0)(300) + (1.8)(300) + (1.6)(300) + (1.4)(300) + (1.2)(300)$
$+ (1.0)(300) + (1.8)(300) + (1.5)(300) + (1.2)(300) = 5220$ meters (NOTE: 5 minutes $= 300$ seconds)
(b) $D \approx (1.2)(300) + (1.7)(300) + (2.0)(300) + (1.8)(300) + (1.6)(300) + (1.4)(300) + (1.2)(300) + (1.0)(300)$
$+ (1.8)(300) + (1.5)(300) + (1.2)(300) + (0)(300) = 4920$ meters (NOTE: 5 minutes $= 300$ seconds)

11. (a) $D \approx (0)(10) + (44)(10) + (15)(10) + (35)(10) + (30)(10) + (44)(10) + (35)(10) + (15)(10) + (22)(10)$
$+ (35)(10) + (44)(10) + (30)(10) = 3490$ feet $\approx 0.66$ miles
(b) $D \approx (44)(10) + (15)(10) + (35)(10) + (30)(10) + (44)(10) + (35)(10) + (15)(10) + (22)(10) + (35)(10)$
$+ (44)(10) + (30)(10) + (35)(10) = 3840$ feet $\approx 0.73$ miles

12. (a) The distance traveled will be the area under the curve. We will use the approximate velocities at the midpoints of each time interval to approximate this area using rectangles. Thus,
$D \approx (20)(0.001) + (50)(0.001) + (72)(0.001) + (90)(0.001) + (102)(0.001) + (112)(0.001) + (120)(0.001)$
$+ (128)(0.001) + (134)(0.001) + (139)(0.001) \approx 0.967$ miles
(b) Roughly, after 0.0063 hours, the car would have gone 0.484 miles, where 0.0060 hours $= 22.7$ sec. At 22.7 sec, the velocity was approximately 120 mi/hr.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

13. (a) Because the acceleration is decreasing, an upper estimate is obtained using left end-points in summing acceleration $\cdot\, \Delta t$. Thus, $\Delta t = 1$ and speed $\approx [32.00 + 19.41 + 11.77 + 7.14 + 4.33](1) = 74.65$ ft/sec

(b) Using right end-points we obtain a lower estimate: speed $\approx [19.41 + 11.77 + 7.14 + 4.33 + 2.63](1) = 45.28$ ft/sec

(c) Upper estimates for the speed at each second are:

| t | 0 | 1 | 2 | 3 | 4 | 5 |
|---|---|---|---|---|---|---|
| v | 0 | 32.00 | 51.41 | 63.18 | 70.32 | 74.65 |

Thus, the distance fallen when $t = 3$ seconds is $s \approx [32.00 + 51.41 + 63.18](1) = 146.59$ ft.

14. (a) The speed is a decreasing function of time $\Rightarrow$ right end-points give an lower estimate for the height (distance) attained. Also

| t | 0 | 1 | 2 | 3 | 4 | 5 |
|---|---|---|---|---|---|---|
| v | 400 | 368 | 336 | 304 | 272 | 240 |

gives the time-velocity table by subtracting the constant $g = 32$ from the speed at each time increment $\Delta t = 1$ sec. Thus, the speed $\approx 240$ ft/sec after 5 seconds.

(b) A lower estimate for height attained is $h \approx [368 + 336 + 304 + 272 + 240](1) = 1520$ ft.

15. Partition $[0, 2]$ into the four subintervals $[0, 0.5]$, $[0.5, 1]$, $[1, 1.5]$, and $[1.5, 2]$. The midpoints of these subintervals are $m_1 = 0.25$, $m_2 = 0.75$, $m_3 = 1.25$, and $m_4 = 1.75$. The heights of the four approximating rectangles are $f(m_1) = (0.25)^3 = \frac{1}{64}$, $f(m_2) = (0.75)^3 = \frac{27}{64}$, $f(m_3) = (1.25)^3 = \frac{125}{64}$, and $f(m_4) = (1.75)^3 = \frac{343}{64}$ Notice that the average value is approximated by $\frac{1}{2}\left[\left(\frac{1}{4}\right)^3\left(\frac{1}{2}\right) + \left(\frac{3}{4}\right)^3\left(\frac{1}{2}\right) + \left(\frac{5}{4}\right)^3\left(\frac{1}{2}\right) + \left(\frac{7}{4}\right)^3\left(\frac{1}{2}\right)\right] = \frac{31}{16}$ $= \frac{1}{\text{length of } [0,2]} \cdot \left[\begin{array}{c}\text{approximate area under} \\ \text{curve } f(x) = x^3\end{array}\right]$. We use this observation in solving the next several exercises.

16. Partition $[1, 9]$ into the four subintervals $[1, 3]$, $[3, 5]$, $[5, 7]$, and $[7, 9]$. The midpoints of these subintervals are $m_1 = 2$, $m_2 = 4$, $m_3 = 6$, and $m_4 = 8$. The heights of the four approximating rectangles are $f(m_1) = \frac{1}{2}$, $f(m_2) = \frac{1}{4}$, $f(m_3) = \frac{1}{6}$, and $f(m_4) = \frac{1}{8}$. The width of each rectangle is $\Delta x = 2$. Thus, Area $\approx 2\left(\frac{1}{2}\right) + 2\left(\frac{1}{4}\right) + 2\left(\frac{1}{6}\right) + 2\left(\frac{1}{8}\right) = \frac{25}{12} \Rightarrow$ average value $\approx \frac{\text{area}}{\text{length of } [1,9]} = \frac{\left(\frac{25}{12}\right)}{8} = \frac{25}{96}$.

17. Partition $[0, 2]$ into the four subintervals $[0, 0.5]$, $[0.5, 1]$, $[1, 1.5]$, and $[1.5, 2]$. The midpoints of the subintervals are $m_1 = 0.25$, $m_2 = 0.75$, $m_3 = 1.25$, and $m_4 = 1.75$. The heights of the four approximating rectangles are $f(m_1) = \frac{1}{2} + \sin^2\frac{\pi}{4} = \frac{1}{2} + \frac{1}{2} = 1$, $f(m_2) = \frac{1}{2} + \sin^2\frac{3\pi}{4} = \frac{1}{2} + \frac{1}{2} = 1$, $f(m_3) = \frac{1}{2} + \sin^2\frac{5\pi}{4} = \frac{1}{2} + \left(-\frac{1}{\sqrt{2}}\right)^2$ $= \frac{1}{2} + \frac{1}{2} = 1$, and $f(m_4) = \frac{1}{2} + \sin^2\frac{7\pi}{4} = \frac{1}{2} + \left(-\frac{1}{\sqrt{2}}\right)^2 = 1$. The width of each rectangle is $\Delta x = \frac{1}{2}$. Thus, Area $\approx (1 + 1 + 1 + 1)\left(\frac{1}{2}\right) = 2 \Rightarrow$ average value $\approx \frac{\text{area}}{\text{length of } [0,2]} = \frac{2}{2} = 1$.

18. Partition $[0, 4]$ into the four subintervals $[0, 1]$, $[1, 2, ]$, $[2, 3]$, and $[3, 4]$. The midpoints of the subintervals are $m_1 = \frac{1}{2}$, $m_2 = \frac{3}{2}$, $m_3 = \frac{5}{2}$, and $m_4 = \frac{7}{2}$. The heights of the four approximating rectangles are $f(m_1) = 1 - \left(\cos\left(\frac{\pi\left(\frac{1}{2}\right)}{4}\right)\right)^4 = 1 - \left(\cos\left(\frac{\pi}{8}\right)\right)^4 = 0.27145$ (to 5 decimal places), $f(m_2) = 1 - \left(\cos\left(\frac{\pi\left(\frac{3}{2}\right)}{4}\right)\right)^4 = 1 - \left(\cos\left(\frac{3\pi}{8}\right)\right)^4 = 0.97855$, $f(m_3) = 1 - \left(\cos\left(\frac{\pi\left(\frac{5}{2}\right)}{4}\right)\right)^4 = 1 - \left(\cos\left(\frac{5\pi}{8}\right)\right)^4$ $= 0.97855$, and $f(m_4) = 1 - \left(\cos\left(\frac{\pi\left(\frac{7}{2}\right)}{4}\right)\right)^4 = 1 - \left(\cos\left(\frac{7\pi}{8}\right)\right)^4 = 0.27145$. The width of each rectangle is $\Delta x = 1$. Thus, Area $\approx (0.27145)(1) + (0.97855)(1) + (0.97855)(1) + (0.27145)(1) = 2.5 \Rightarrow$ average value $\approx \frac{\text{area}}{\text{length of } [0,4]} = \frac{2.5}{4} = \frac{5}{8}$.

19. Since the leakage is increasing, an upper estimate uses right endpoints and a lower estimate uses left endpoints:
(a) upper estimate $= (70)(1) + (97)(1) + (136)(1) + (190)(1) + (265)(1) = 758$ gal,
lower estimate $= (50)(1) + (70)(1) + (97)(1) + (136)(1) + (190)(1) = 543$ gal.
(b) upper estimate $= (70 + 97 + 136 + 190 + 265 + 369 + 516 + 720) = 2363$ gal,
lower estimate $= (50 + 70 + 97 + 136 + 190 + 265 + 369 + 516) = 1693$ gal.
(c) worst case: $2363 + 720t = 25{,}000 \Rightarrow t \approx 31.4$ hrs;
best case: $1693 + 720t = 25{,}000 \Rightarrow t \approx 32.4$ hrs

20. Since the pollutant release increases over time, an upper estimate uses right endpoints and a lower estimate uses left endpoints:
(a) upper estimate $= (0.2)(30) + (0.25)(30) + (0.27)(30) + (0.34)(30) + (0.45)(30) + (0.52)(30) = 60.9$ tons
lower estimate $= (0.05)(30) + (0.2)(30) + (0.25)(30) + (0.27)(30) + (0.34)(30) + (0.45)(30) = 46.8$ tons
(b) Using the lower (best case) estimate: $46.8 + (0.52)(30) + (0.63)(30) + (0.70)(30) + (0.81)(30) = 126.6$ tons, so near the end of September 125 tons of pollutants will have been released.

21. (a) The diagonal of the square has length 2, so the side length is $\sqrt{2}$. Area $= \left(\sqrt{2}\right)^2 = 2$
(b) Think of the octagon as a collection of 16 right triangles with a hypotenuse of length 1 and an acute angle measuring $\frac{2\pi}{16} = \frac{\pi}{8}$.
Area $= 16\left(\frac{1}{2}\right)\left(\sin\frac{\pi}{8}\right)\left(\cos\frac{\pi}{8}\right) = 4\sin\frac{\pi}{4} = 2\sqrt{2} \approx 2.828$
(c) Think of the 16-gon as a collection of 32 right triangles with a hypotenuse of length 1 and an acute angle measuring $\frac{2\pi}{32} = \frac{\pi}{16}$.
Area $= 32\left(\frac{1}{2}\right)\left(\sin\frac{\pi}{16}\right)\left(\cos\frac{\pi}{16}\right) = 8\sin\frac{\pi}{8} = 2\sqrt{2} \approx 3.061$
(d) Each area is less than the area of the circle, $\pi$. As n increases, the area approaches $\pi$.

22. (a) Each of the isosceles triangles is made up of two right triangles having hypotenuse 1 and an acute angle measuring $\frac{2\pi}{2n} = \frac{\pi}{n}$. The area of each isosceles triangle is $A_T = 2\left(\frac{1}{2}\right)\left(\sin\frac{\pi}{n}\right)\left(\cos\frac{\pi}{n}\right) = \frac{1}{2}\sin\frac{2\pi}{n}$.
(b) The area of the polygon is $A_P = nA_T = \frac{n}{2}\sin\frac{2\pi}{n}$, so $\lim\limits_{n\to\infty}\frac{n}{2}\sin\frac{2\pi}{n} = \lim\limits_{n\to\infty}\pi\cdot\frac{\sin\frac{2\pi}{n}}{\left(\frac{2\pi}{n}\right)} = \pi$
(c) Multiply each area by $r^2$.
$A_T = \frac{1}{2}r^2\sin\frac{2\pi}{n}$
$A_P = \frac{n}{2}r^2\sin\frac{2\pi}{n}$
$\lim\limits_{n\to\infty} A_P = \pi r^2$

23-26. Example CAS commands:

Maple:

```
with( Student[Calculus1] );
f := x -> sin(x);
a := 0;
b := Pi;
plot( f(x), x=a..b, title="#23(a) (Section 5.1)" );
N := [ 100, 200, 1000 ];                          # (b)
for n in N do
  Xlist := [ a+1.*(b-a)/n*i $ i=0..n ];
  Ylist := map( f, Xlist );
end do:
for n in N do                                     # (c)
  Avg[n] := evalf(add(y,y=Ylist)/nops(Ylist));
```

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

```
end do;
avg := FunctionAverage( f(x), x=a..b, output=value );
evalf( avg );
FunctionAverage(f(x),x=a..b,output=plot);     # (d)
fsolve( f(x)=avg, x=0.5 );
fsolve( f(x)=avg, x=2.5 );
fsolve( f(x)=Avg[1000], x=0.5 );
fsolve( f(x)=Avg[1000], x=2.5 );
```

Mathematica: (assigned function and values for a and b may vary):

Symbols for $\pi$, $\rightarrow$, powers, roots, fractions, etc. are available in Palettes (under File).

Never insert a space between the name of a function and its argument.

```
Clear[x]
f[x_]:=x  Sin[1/x]
{a,b}={π/4, π}
Plot[f[x],{x, a, b}]
```

The following code computes the value of the function for each interval midpoint and then finds the average. Each sequence of commands for a different value of n (number of subdivisions) should be placed in a separate cell.

```
n =100; dx = (b − a) /n;
values = Table[N[f[x]], {x, a + dx/2, b, dx}]
average=Sum[values[[i]],{i, 1, Length[values]}] / n
n =200; dx = (b − a) /n;
values = Table[N[f[x]],{x, a + dx/2, b, dx}]
average=Sum[values[[i]],{i, 1, Length[values]}] / n
n =1000; dx = (b − a) /n;
values = Table[N[f[x]],{x, a + dx/2, b, dx}]
average=Sum[values[[i]],{i, 1, Length[values]}] / n
FindRoot[f[x] == average,{x, a}]
```

## 5.2 SIGMA NOTATION AND LIMITS OF FINITE SUMS

1. $\displaystyle\sum_{k=1}^{2} \frac{6k}{k+1} = \frac{6(1)}{1+1} + \frac{6(2)}{2+1} = \frac{6}{2} + \frac{12}{3} = 7$

2. $\displaystyle\sum_{k=1}^{3} \frac{k-1}{k} = \frac{1-1}{1} + \frac{2-1}{2} + \frac{3-1}{3} = 0 + \frac{1}{2} + \frac{2}{3} = \frac{7}{6}$

3. $\displaystyle\sum_{k=1}^{4} \cos k\pi = \cos(1\pi) + \cos(2\pi) + \cos(3\pi) + \cos(4\pi) = -1 + 1 - 1 + 1 = 0$

4. $\displaystyle\sum_{k=1}^{5} \sin k\pi = \sin(1\pi) + \sin(2\pi) + \sin(3\pi) + \sin(4\pi) + \sin(5\pi) = 0 + 0 + 0 + 0 + 0 = 0$

5. $\displaystyle\sum_{k=1}^{3} (-1)^{k+1} \sin\frac{\pi}{k} = (-1)^{1+1}\sin\frac{\pi}{1} + (-1)^{2+1}\sin\frac{\pi}{2} + (-1)^{3+1}\sin\frac{\pi}{3} = 0 - 1 + \frac{\sqrt{3}}{2} = \frac{\sqrt{3}-2}{2}$

6. $\displaystyle\sum_{k=1}^{4} (-1)^{k} \cos k\pi = (-1)^{1}\cos(1\pi) + (-1)^{2}\cos(2\pi) + (-1)^{3}\cos(3\pi) + (-1)^{4}\cos(4\pi)$

   $= -(-1) + 1 - (-1) + 1 = 4$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

7. (a) $\sum_{k=1}^{6} 2^{k-1} = 2^{1-1} + 2^{2-1} + 2^{3-1} + 2^{4-1} + 2^{5-1} + 2^{6-1} = 1 + 2 + 4 + 8 + 16 + 32$

   (b) $\sum_{k=0}^{5} 2^{k} = 2^{0} + 2^{1} + 2^{2} + 2^{3} + 2^{4} + 2^{5} = 1 + 2 + 4 + 8 + 16 + 32$

   (c) $\sum_{k=-1}^{4} 2^{k+1} = 2^{-1+1} + 2^{0+1} + 2^{1+1} + 2^{2+1} + 2^{3+1} + 2^{4+1} = 1 + 2 + 4 + 8 + 16 + 32$

   All of them represent $1 + 2 + 4 + 8 + 16 + 32$

8. (a) $\sum_{k=1}^{6} (-2)^{k-1} = (-2)^{1-1} + (-2)^{2-1} + (-2)^{3-1} + (-2)^{4-1} + (-2)^{5-1} + (-2)^{6-1} = 1 - 2 + 4 - 8 + 16 - 32$

   (b) $\sum_{k=0}^{5} (-1)^{k}2^{k} = (-1)^{0}2^{0} + (-1)^{1}2^{1} + (-1)^{2}2^{2} + (-1)^{3}2^{3} + (-1)^{4}2^{4} + (-1)^{5}2^{5} = 1 - 2 + 4 - 8 + 16 - 32$

   (c) $\sum_{k=-2}^{3} (-1)^{k+1}2^{k+2} = (-1)^{-2+1}2^{-2+2} + (-1)^{-1+1}2^{-1+2} + (-1)^{0+1}2^{0+2} + (-1)^{1+1}2^{1+2} + (-1)^{2+1}2^{2+2}$
   $+ (-1)^{3+1}2^{3+2} = -1 + 2 - 4 + 8 - 16 + 32;$

   (a) and (b) represent $1 - 2 + 4 - 8 + 16 - 32$; (c) is not equivalent to the other two

9. (a) $\sum_{k=2}^{4} \frac{(-1)^{k-1}}{k-1} = \frac{(-1)^{2-1}}{2-1} + \frac{(-1)^{3-1}}{3-1} + \frac{(-1)^{4-1}}{4-1} = -1 + \frac{1}{2} - \frac{1}{3}$

   (b) $\sum_{k=0}^{2} \frac{(-1)^{k}}{k+1} = \frac{(-1)^{0}}{0+1} + \frac{(-1)^{1}}{1+1} + \frac{(-1)^{2}}{2+1} = 1 - \frac{1}{2} + \frac{1}{3}$

   (c) $\sum_{k=-1}^{1} \frac{(-1)^{k}}{k+2} = \frac{(-1)^{-1}}{-1+2} + \frac{(-1)^{0}}{0+2} + \frac{(-1)^{1}}{1+2} = -1 + \frac{1}{2} - \frac{1}{3}$

   (a) and (c) are equivalent; (b) is not equivalent to the other two.

10. (a) $\sum_{k=1}^{4} (k-1)^2 = (1-1)^2 + (2-1)^2 + (3-1)^2 + (4-1)^2 = 0 + 1 + 4 + 9$

    (b) $\sum_{k=-1}^{3} (k+1)^2 = (-1+1)^2 + (0+1)^2 + (1+1)^2 + (2+1)^2 + (3+1)^2 = 0 + 1 + 4 + 9 + 16$

    (c) $\sum_{k=-3}^{-1} k^2 = (-3)^2 + (-2)^2 + (-1)^2 = 9 + 4 + 1$

    (a) and (c) are equivalent to each other; (b) is not equivalent to the other two.

17. (a) $\sum_{k=1}^{n} 3a_k = 3\sum_{k=1}^{n} a_k = 3(-5) = -15$

    (b) $\sum_{k=1}^{n} \frac{b_k}{6} = \frac{1}{6}\sum_{k=1}^{n} b_k = \frac{1}{6}(6) = 1$

    (c) $\sum_{k=1}^{n} (a_k + b_k) = \sum_{k=1}^{n} a_k + \sum_{k=1}^{n} b_k = -5 + 6 = 1$

    (d) $\sum_{k=1}^{n} (a_k - b_k) = \sum_{k=1}^{n} a_k - \sum_{k=1}^{n} b_k = -5 - 6 = -11$

    (e) $\sum_{k=1}^{n} (b_k - 2a_k) = \sum_{k=1}^{n} b_k - 2\sum_{k=1}^{n} a_k = 6 - 2(-5) = 16$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

18. (a) $\sum_{k=1}^{n} 8a_k = 8\sum_{k=1}^{n} a_k = 8(0) = 0$

(b) $\sum_{k=1}^{n} 250b_k = 250\sum_{k=1}^{n} b_k = 250(1) = 250$

(c) $\sum_{k=1}^{n} (a_k + 1) = \sum_{k=1}^{n} a_k + \sum_{k=1}^{n} 1 = 0 + n = n$

(d) $\sum_{k=1}^{n} (b_k - 1) = \sum_{k=1}^{n} b_k - \sum_{k=1}^{n} 1 = 1 - n$

19. (a) $\sum_{k=1}^{10} k = \frac{10(10+1)}{2} = 55$

(b) $\sum_{k=1}^{10} k^2 = \frac{10(10+1)(2(10)+1)}{6} = 385$

(c) $\sum_{k=1}^{10} k^3 = \left[\frac{10(10+1)}{2}\right]^2 = 55^2 = 3025$

20. (a) $\sum_{k=1}^{13} k = \frac{13(13+1)}{2} = 91$

(b) $\sum_{k=1}^{13} k^2 = \frac{13(13+1)(2(13)+1)}{6} = 819$

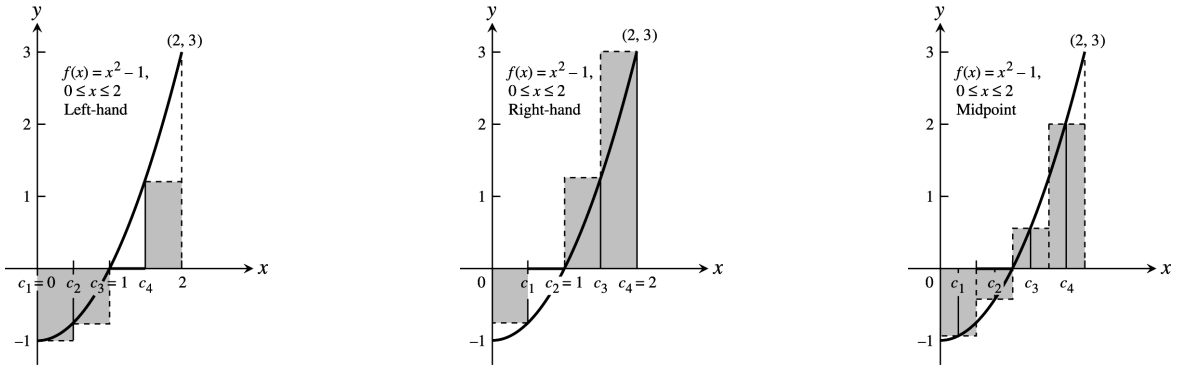
(c) $\sum_{k=1}^{13} k^3 = \left[\frac{13(13+1)}{2}\right]^2 = 91^2 = 8281$

21. $\sum_{k=1}^{7} -2k = -2\sum_{k=1}^{7} k = -2\left(\frac{7(7+1)}{2}\right) = -56$

22. $\sum_{k=1}^{5} \frac{\pi k}{15} = \frac{\pi}{15}\sum_{k=1}^{5} k = \frac{\pi}{15}\left(\frac{5(5+1)}{2}\right) = \pi$

23. $\sum_{k=1}^{6} (3 - k^2) = \sum_{k=1}^{6} 3 - \sum_{k=1}^{6} k^2 = 3(6) - \frac{6(6+1)(2(6)+1)}{6} = -73$

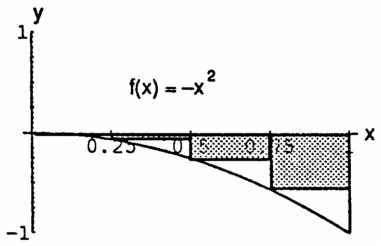
24. $\sum_{k=1}^{6} (k^2 - 5) = \sum_{k=1}^{6} k^2 - \sum_{k=1}^{6} 5 = \frac{6(6+1)(2(6)+1)}{6} - 5(6) = 61$



25. $\sum_{k=1}^{5} k(3k+5) = \sum_{k=1}^{5} (3k^2 + 5k) = 3\sum_{k=1}^{5} k^2 + 5\sum_{k=1}^{5} k = 3\left(\frac{5(5+1)(2(5)+1)}{6}\right) + 5\left(\frac{5(5+1)}{2}\right) = 240$

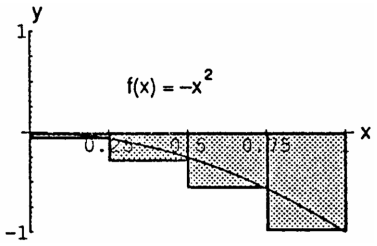
26. $\sum_{k=1}^{7} k(2k+1) = \sum_{k=1}^{7} (2k^2 + k) = 2\sum_{k=1}^{7} k^2 + \sum_{k=1}^{7} k = 2\left(\frac{7(7+1)(2(7)+1)}{6}\right) + \frac{7(7+1)}{2} = 308$

27. $\sum_{k=1}^{5} \frac{k^3}{225} + \left(\sum_{k=1}^{5} k\right)^3 = \frac{1}{225}\sum_{k=1}^{5} k^3 + \left(\sum_{k=1}^{5} k\right)^3 = \frac{1}{225}\left(\frac{5(5+1)}{2}\right)^2 + \left(\frac{5(5+1)}{2}\right)^3 = 3376$

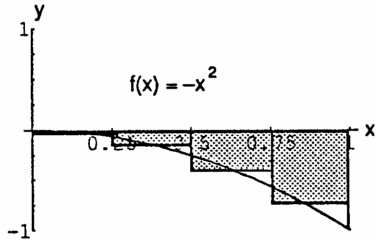


28. $\left(\sum_{k=1}^{7} k\right)^2 - \sum_{k=1}^{7} \frac{k^3}{4} = \left(\sum_{k=1}^{7} k\right)^2 - \frac{1}{4}\sum_{k=1}^{7} k^3 = \left(\frac{7(7+1)}{2}\right)^2 - \frac{1}{4}\left(\frac{7(7+1)}{2}\right)^2 = 588$

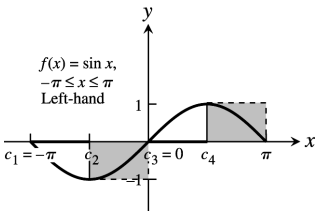
29. (a) (b) (c)



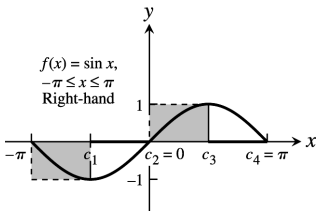
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



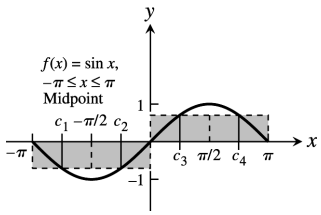
30. (a)



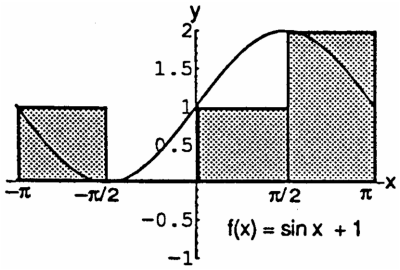
(b)



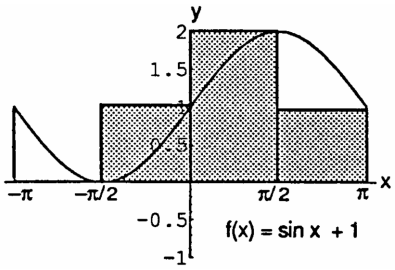
(c)



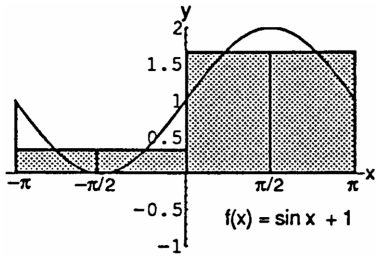
31. (a)



(b)

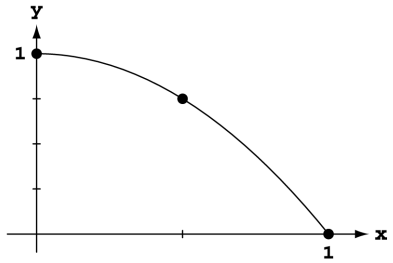


(c)



32. (a)

(b)



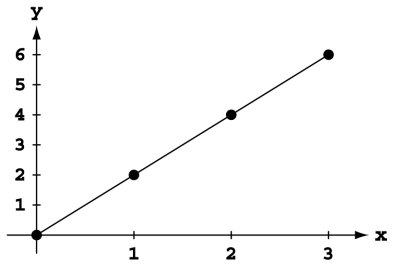
(c)

33. $|x_1 - x_0| = |1.2 - 0| = 1.2$, $|x_2 - x_1| = |1.5 - 1.2| = 0.3$, $|x_3 - x_2| = |2.3 - 1.5| = 0.8$, $|x_4 - x_3| = |2.6 - 2.3| = 0.3$, and $|x_5 - x_4| = |3 - 2.6| = 0.4$; the largest is $\|P\| = 1.2$.

34. $|x_1 - x_0| = |-1.6 - (-2)| = 0.4$, $|x_2 - x_1| = |-0.5 - (-1.6)| = 1.1$, $|x_3 - x_2| = |0 - (-0.5)| = 0.5$, $|x_4 - x_3| = |0.8 - 0| = 0.8$, and $|x_5 - x_4| = |1 - 0.8| = 0.2$; the largest is $\|P\| = 1.1$.

35. $f(x) = 1 - x^2$

Since f is decreasing on $[0, 1]$ we use left endpoints to obtain upper sums. $\triangle x = \frac{1-0}{n} = \frac{1}{n}$ and $x_i = i\triangle x = \frac{i}{n}$. So an upper sum is $\sum_{i=0}^{n-1}(1 - x_i^2)\frac{1}{n} = \frac{1}{n}\sum_{i=0}^{n-1}\left(1 - \left(\frac{i}{n}\right)^2\right) = \frac{1}{n^3}\sum_{i=0}^{n-1}(n^2 - i^2)$

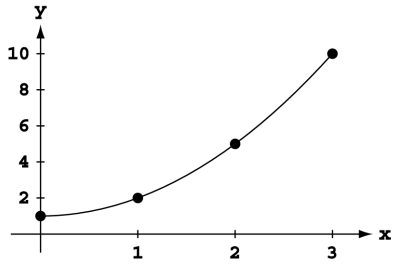


$= \frac{n^3}{n^3} - \frac{1}{n^3}\sum_{i=0}^{n} i^2 = 1 - \frac{(n-1)n(2(n-1)+1)}{6n^3} = 1 - \frac{2n^3 - 3n^2 + n}{6n^3}$

$= 1 - \frac{2 - \frac{3}{n} + \frac{1}{n^2}}{6}$. Thus,

$\lim_{n\to\infty}\sum_{i=0}^{n-1}(1 - x_i^2)\frac{1}{n} = \lim_{n\to\infty}\left(1 - \frac{2 - \frac{3}{n} + \frac{1}{n^2}}{6}\right) = 1 - \frac{1}{3} = \frac{2}{3}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

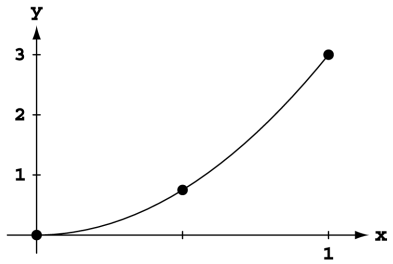


36. $f(x) = 2x$

Since f is increasing on $[0, 3]$ we use right endpoints to obtain upper sums. $\triangle x = \frac{3-0}{n} = \frac{3}{n}$ and $x_i = i\triangle x = \frac{3i}{n}$. So an upper sum is $\sum_{i=1}^{n} 2x_i\left(\frac{3}{n}\right) = \sum_{i=1}^{n} \frac{6i}{n} \cdot \frac{3}{n} = \frac{18}{n^2}\sum_{i=1}^{n} i = \frac{18}{n^2} \cdot \frac{n(n+1)}{2} = \frac{9n^2+9n}{n^2}$

Thus, $\lim_{n\to\infty} \sum_{i=1}^{n} \frac{6i}{n} \cdot \frac{3}{n} = \lim_{n\to\infty} \frac{9n^2+9n}{n^2} = \lim_{n\to\infty} \left(9 + \frac{9}{n}\right) = 9.$

37. $f(x) = x^2 + 1$



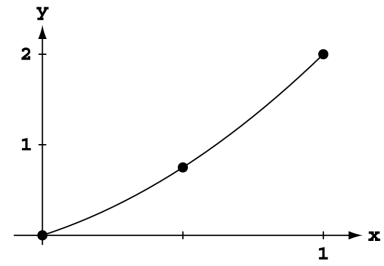
Since f is increasing on $[0, 3]$ we use right endpoints to obtain upper sums. $\triangle x = \frac{3-0}{n} = \frac{3}{n}$ and $x_i = i\triangle x = \frac{3i}{n}$. So an upper sum is $\sum_{i=1}^{n}(x_i^2 + 1)\frac{3}{n} = \sum_{i=1}^{n}\left(\left(\frac{3i}{n}\right)^2 + 1\right)\frac{3}{n} = \frac{3}{n}\sum_{i=1}^{n}\left(\frac{9i^2}{n^2} + 1\right)$

$= \frac{27}{n}\sum_{i=1}^{n} i^2 + \frac{3}{n} \cdot n = \frac{27}{n^3}\left(\frac{n(n+1)(2n+1)}{6}\right) + 3$

$= \frac{9(2n^3+3n^2+n)}{2n^3} + 3 = \frac{18+\frac{27}{n}+\frac{9}{n^2}}{2} + 3$. Thus,

$\lim_{n\to\infty} \sum_{i=1}^{n}(x_i^2 + 1)\frac{3}{n} = \lim_{n\to\infty}\left(\frac{18+\frac{27}{n}+\frac{9}{n^2}}{2} + 3\right) = 9 + 3 = 12.$

38. $f(x) = 3x^2$

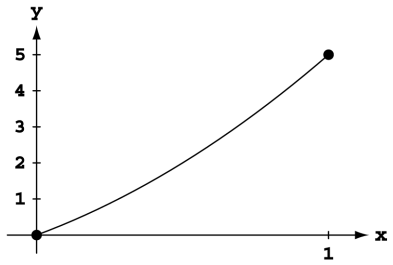


Since f is increasing on $[0, 1]$ we use right endpoints to obtain upper sums. $\triangle x = \frac{1-0}{n} = \frac{1}{n}$ and $x_i = i\triangle x = \frac{i}{n}$. So an upper sum is $\sum_{i=1}^{n} 3x_i^2\left(\frac{1}{n}\right) = \sum_{i=1}^{n} 3\left(\frac{i}{n}\right)^2\left(\frac{1}{n}\right) = \frac{3}{n^3}\sum_{i=1}^{n} i^2 = \frac{3}{n^3} \cdot \left(\frac{n(n+1)(2n+1)}{6}\right)$

$= \frac{2n^3+3n^2+n}{2n^3} = \frac{2+\frac{3}{n}+\frac{1}{n^2}}{2}$. Thus, $\lim_{n\to\infty} \sum_{i=1}^{n} 3x_i^2\left(\frac{1}{n}\right)$

$= \lim_{n\to\infty}\left(\frac{2+\frac{3}{n}+\frac{1}{n^2}}{2}\right) = \frac{2}{2} = 1.$

39. $f(x) = x + x^2 = x(1 + x)$



Since f is increasing on $[0, 1]$ we use right endpoints to obtain upper sums. $\triangle x = \frac{1-0}{n} = \frac{1}{n}$ and $x_i = i\triangle x = \frac{i}{n}$. So an upper sum is $\sum_{i=1}^{n}(x_i + x_i^2)\frac{1}{n} = \sum_{i=1}^{n}\left(\frac{i}{n} + \left(\frac{i}{n}\right)^2\right)\frac{1}{n} = \frac{1}{n^2}\sum_{i=1}^{n} i + \frac{1}{n^3}\sum_{i=1}^{n} i^2$

$= \frac{1}{n^2}\left(\frac{n(n+1)}{2}\right) + \frac{1}{n^3}\left(\frac{n(n+1)(2n+1)}{6}\right) = \frac{n^2+n}{2n^2} + \frac{2n^3+3n^2+n}{6n^3}$

$= \frac{1+\frac{1}{n}}{2} + \frac{2+\frac{3}{n}+\frac{1}{n^2}}{6}$. Thus, $\lim_{n\to\infty} \sum_{i=1}^{n}(x_i + x_i^2)\frac{1}{n}$

$= \lim_{n\to\infty}\left[\left(\frac{1+\frac{1}{n}}{2}\right) + \left(\frac{2+\frac{3}{n}+\frac{1}{n^2}}{6}\right)\right] = \frac{1}{2} + \frac{2}{6} = \frac{5}{6}.$

40. $f(x) = 3x + 2x^2$

Since f is increasing on $[0, 1]$ we use right endpoints to obtain upper sums. $\triangle x = \frac{1-0}{n} = \frac{1}{n}$ and $x_i = i\triangle x = \frac{i}{n}$. So an upper sum is $\sum_{i=1}^{n}(3x_i + 2x_i^2)\frac{1}{n} = \sum_{i=1}^{n}\left(\frac{3i}{n} + 2\left(\frac{i}{n}\right)^2\right)\frac{1}{n} = \frac{3}{n^2}\sum_{i=1}^{n} i + \frac{2}{n^3}\sum_{i=1}^{n} i^2$

$= \frac{3}{n^2}\left(\frac{n(n+1)}{2}\right) + \frac{2}{n^3}\left(\frac{n(n+1)(2n+1)}{6}\right) = \frac{3n^2+3n}{2n^2} + \frac{2n^2+3n+1}{3n^2}$

$= \frac{3+\frac{3}{n}}{2} + \frac{2+\frac{3}{n}+\frac{1}{n^2}}{3}$. Thus, $\lim_{n\to\infty} \sum_{i=1}^{n}(3x_i + 2x_i^2)\frac{1}{n}$

$= \lim_{n\to\infty}\left[\left(\frac{3+\frac{3}{n}}{2}\right) + \left(\frac{2+\frac{3}{n}+\frac{1}{n^2}}{3}\right)\right] = \frac{3}{2} + \frac{2}{3} = \frac{13}{6}.$

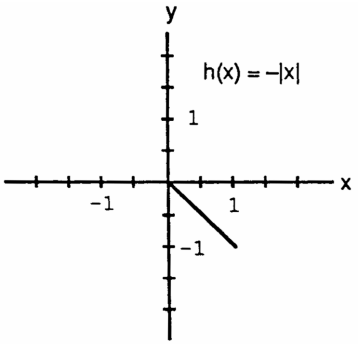
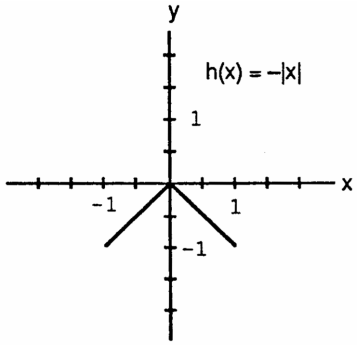
(b) $\text{av}(g) = \left(\frac{1}{3-1}\right)\int_1^3 (|x| - 1)\,dx = \frac{1}{2}\int_1^3 (x - 1)\,dx$
$= \frac{1}{2}\int_1^3 x\,dx - \frac{1}{2}\int_1^3 1\,dx = \frac{1}{2}\left(\frac{3^2}{2} - \frac{1^2}{2}\right) - \frac{1}{2}(3 - 1)$
$= 1.$



(c) $\text{av}(g) = \left(\frac{1}{3-(-1)}\right)\int_{-1}^3 (|x| - 1)\,dx$
$= \frac{1}{4}\int_{-1}^1 (|x| - 1)\,dx + \frac{1}{4}\int_1^3 (|x| - 1)\,dx$
$= \frac{1}{4}(-1 + 2) = \frac{1}{4}$ (see parts (a) and (b) above).



62. (a) $\text{av}(h) = \left(\frac{1}{0-(-1)}\right)\int_{-1}^0 -|x|\,dx = \int_{-1}^0 -(-x)\,dx$
$= \int_{-1}^0 x\,dx = \frac{0^2}{2} - \frac{(-1)^2}{2} = -\frac{1}{2}.$

(b) $\text{av}(h) = \left(\frac{1}{1-0}\right)\int_0^1 -|x|\,dx = -\int_0^1 x\,dx$
$= -\left(\frac{1^2}{2} - \frac{0^2}{2}\right) = -\frac{1}{2}.$

(c) $\text{av}(h) = \left(\frac{1}{1-(-1)}\right)\int_{-1}^1 -|x|\,dx$
$= \frac{1}{2}\left(\int_{-1}^0 -|x|\,dx + \int_0^1 -|x|\,dx\right)$
$= \frac{1}{2}\left(-\frac{1}{2} + \left(-\frac{1}{2}\right)\right) = -\frac{1}{2}$ (see parts (a) and (b) above).

63. To find where $x - x^2 \geq 0$, let $x - x^2 = 0 \Rightarrow x(1 - x) = 0 \Rightarrow x = 0$ or $x = 1$. If $0 < x < 1$, then $0 < x - x^2 \Rightarrow a = 0$ and $b = 1$ maximize the integral.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

64. To find where $x^4 - 2x^2 \le 0$, let $x^4 - 2x^2 = 0 \Rightarrow x^2(x^2-2) = 0 \Rightarrow x = 0$ or $x = \pm\sqrt{2}$. By the sign graph, $\underset{-\sqrt{2}}{++++++0} \underset{0}{--0--} \underset{\sqrt{2}}{0+++++++}$, we can see that $x^4 - 2x^2 \le 0$ on $\left[-\sqrt{2}, \sqrt{2}\right] \Rightarrow a = -\sqrt{2}$ and $b = \sqrt{2}$ minimize the integral.

65. $f(x) = \frac{1}{1+x^2}$ is decreasing on $[0,1] \Rightarrow$ maximum value of f occurs at $0 \Rightarrow \max f = f(0) = 1$; minimum value of f occurs at $1 \Rightarrow \min f = f(1) = \frac{1}{1+1^2} = \frac{1}{2}$. Therefore, $(1-0)\min f \le \int_0^1 \frac{1}{1+x^2}\,dx \le (1-0)\max f$ $\Rightarrow \frac{1}{2} \le \int_0^1 \frac{1}{1+x^2}\,dx \le 1$. That is, an upper bound $= 1$ and a lower bound $= \frac{1}{2}$.

66. See Exercise 65 above. On $[0, 0.5]$, $\max f = \frac{1}{1+0^2} = 1$, $\min f = \frac{1}{1+(0.5)^2} = 0.8$. Therefore $(0.5-0)\min f \le \int_0^{0.5} f(x)\,dx \le (0.5-0)\max f \Rightarrow \frac{2}{5} \le \int_0^{0.5} \frac{1}{1+x^2}\,dx \le \frac{1}{2}$. On $[0.5, 1]$, $\max f = \frac{1}{1+(0.5)^2} = 0.8$ and $\min f = \frac{1}{1+1^2} = 0.5$. Therefore $(1-0.5)\min f \le \int_{0.5}^1 \frac{1}{1+x^2}\,dx \le (1-0.5)\max f \Rightarrow \frac{1}{4} \le \int_{0.5}^1 \frac{1}{1+x^2}\,dx \le \frac{2}{5}$. Then $\frac{1}{4} + \frac{2}{5} \le \int_0^{0.5} \frac{1}{1+x^2}\,dx + \int_{0.5}^1 \frac{1}{1+x^2}\,dx \le \frac{1}{2} + \frac{2}{5} \Rightarrow \frac{13}{20} \le \int_0^1 \frac{1}{1+x^2}\,dx \le \frac{9}{10}$.

67. $-1 \le \sin(x^2) \le 1$ for all $x \Rightarrow (1-0)(-1) \le \int_0^1 \sin(x^2)\,dx \le (1-0)(1)$ or $\int_0^1 \sin x^2\,dx \le 1 \Rightarrow \int_0^1 \sin x^2\,dx$ cannot equal 2.

68. $f(x) = \sqrt{x+8}$ is increasing on $[0,1] \Rightarrow \max f = f(1) = \sqrt{1+8} = 3$ and $\min f = f(0) = \sqrt{0+8} = 2\sqrt{2}$. Therefore, $(1-0)\min f \le \int_0^1 \sqrt{x+8}\,dx \le (1-0)\max f \Rightarrow 2\sqrt{2} \le \int_0^1 \sqrt{x+8}\,dx \le 3$.

69. If $f(x) \ge 0$ on $[a,b]$, then $\min f \ge 0$ and $\max f \ge 0$ on $[a,b]$. Now, $(b-a)\min f \le \int_a^b f(x)\,dx \le (b-a)\max f$. Then $b \ge a \Rightarrow b - a \ge 0 \Rightarrow (b-a)\min f \ge 0 \Rightarrow \int_a^b f(x)\,dx \ge 0$.

70. If $f(x) \le 0$ on $[a,b]$, then $\min f \le 0$ and $\max f \le 0$. Now, $(b-a)\min f \le \int_a^b f(x)\,dx \le (b-a)\max f$. Then $b \ge a \Rightarrow b - a \ge 0 \Rightarrow (b-a)\max f \le 0 \Rightarrow \int_a^b f(x)\,dx \le 0$.

71. $\sin x \le x$ for $x \ge 0 \Rightarrow \sin x - x \le 0$ for $x \ge 0 \Rightarrow \int_0^1 (\sin x - x)\,dx \le 0$ (see Exercise 70) $\Rightarrow \int_0^1 \sin x\,dx - \int_0^1 x\,dx \le 0 \Rightarrow \int_0^1 \sin x\,dx \le \int_0^1 x\,dx \Rightarrow \int_0^1 \sin x\,dx \le \left(\frac{1^2}{2} - \frac{0^2}{2}\right) \Rightarrow \int_0^1 \sin x\,dx \le \frac{1}{2}$. Thus an upper bound is $\frac{1}{2}$.

72. $\sec x \ge 1 + \frac{x^2}{2}$ on $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right) \Rightarrow \sec x - \left(1 + \frac{x^2}{2}\right) \ge 0$ on $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right) \Rightarrow \int_0^1 \left[\sec x - \left(1 + \frac{x^2}{2}\right)\right] dx \ge 0$ (see Exercise 69) since $[0,1]$ is contained in $\left(-\frac{\pi}{2}, \frac{\pi}{2}\right) \Rightarrow \int_0^1 \sec x\,dx - \int_0^1 \left(1 + \frac{x^2}{2}\right) dx \ge 0 \Rightarrow \int_0^1 \sec x\,dx \ge \int_0^1 \left(1 + \frac{x^2}{2}\right) dx \Rightarrow \int_0^1 \sec x\,dx \ge \int_0^1 1\,dx + \frac{1}{2}\int_0^1 x^2\,dx \Rightarrow \int_0^1 \sec x\,dx \ge (1-0) + \frac{1}{2}\left(\frac{1^3}{3}\right) \Rightarrow \int_0^1 \sec x\,dx \ge \frac{7}{6}$. Thus a lower bound is $\frac{7}{6}$.

73. Yes, for the following reasons: $\text{av}(f) = \frac{1}{b-a}\int_a^b f(x)\,dx$ is a constant K. Thus $\int_a^b \text{av}(f)\,dx = \int_a^b K\,dx = K(b-a) \Rightarrow \int_a^b \text{av}(f)\,dx = (b-a)K = (b-a)\cdot\frac{1}{b-a}\int_a^b f(x)\,dx = \int_a^b f(x)\,dx$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

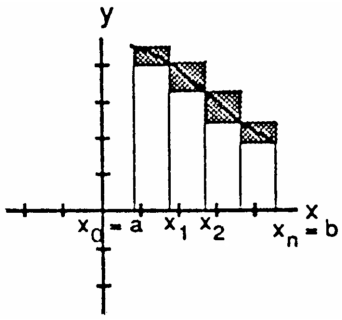
74. All three rules hold. The reasons: On any interval $[a, b]$ on which f and g are integrable, we have:

(a) $\text{av}(f+g) = \frac{1}{b-a}\int_a^b [f(x)+g(x)]\,dx = \frac{1}{b-a}\left[\int_a^b f(x)\,dx + \int_a^b g(x)\,dx\right] = \frac{1}{b-a}\int_a^b f(x)\,dx + \frac{1}{b-a}\int_a^b g(x)\,dx$
$= \text{av}(f) + \text{av}(g)$

(b) $\text{av}(kf) = \frac{1}{b-a}\int_a^b kf(x)\,dx = \frac{1}{b-a}\left[k\int_a^b f(x)\,dx\right] = k\left[\frac{1}{b-a}\int_a^b f(x)\,dx\right] = k\,\text{av}(f)$

(c) $\text{av}(f) = \frac{1}{b-a}\int_a^b f(x)\,dx \le \frac{1}{b-a}\int_a^b g(x)\,dx$ since $f(x) \le g(x)$ on $[a, b]$, and $\frac{1}{b-a}\int_a^b g(x)\,dx = \text{av}(g)$. Therefore, $\text{av}(f) \le \text{av}(g)$.

75. Consider the partition P that subdivides the interval $[a, b]$ into n subintervals of width $\triangle x = \frac{b-a}{n}$ and let $c_k$ be the right endpoint of each subinterval. So the partition is $P = \{a, a+\frac{b-a}{n}, a+\frac{2(b-a)}{n}, \ldots, a+\frac{n(b-a)}{n}\}$ and $c_k = a + \frac{k(b-a)}{n}$. We get the Riemann sum $\sum_{k=1}^{n} f(c_k)\triangle x = \sum_{k=1}^{n} c \cdot \frac{b-a}{n} = \frac{c(b-a)}{n}\sum_{k=1}^{n} 1 = \frac{c(b-a)}{n} \cdot n = c(b-a)$. As $n \to \infty$ and $\|P\| \to 0$ this expression remains $c(b-a)$. Thus, $\int_a^b c\,dx = c(b-a)$.



76. Consider the partition P that subdivides the interval $[a, b]$ into n subintervals of width $\triangle x = \frac{b-a}{n}$ and let $c_k$ be the right endpoint of each subinterval. So the partition is $P = \{a, a+\frac{b-a}{n}, a+\frac{2(b-a)}{n}, \ldots, a+\frac{n(b-a)}{n}\}$ and $c_k = a + \frac{k(b-a)}{n}$.
We get the Riemann sum $\sum_{k=1}^{n} f(c_k)\triangle x = \sum_{k=1}^{n} c_k^2\left(\frac{b-a}{n}\right) = \frac{b-a}{n}\sum_{k=1}^{n}\left(a+\frac{k(b-a)}{n}\right)^2 = \frac{b-a}{n}\sum_{k=1}^{n}\left(a^2 + \frac{2ak(b-a)}{n} + \frac{k^2(b-a)^2}{n^2}\right)$
$= \frac{b-a}{n}\left(\sum_{k=1}^{n} a^2 + \frac{2a(b-a)}{n}\sum_{k=1}^{n} k + \frac{(b-a)^2}{n^2}\sum_{k=1}^{n} k^2\right) = \frac{b-a}{n} \cdot na^2 + \frac{2a(b-a)^2}{n^2} \cdot \frac{n(n+1)}{2} + \frac{(b-a)^3}{n^3} \cdot \frac{n(n+1)(2n+1)}{6}$
$= (b-a)a^2 + a(b-a)^2 \cdot \frac{n+1}{n} + \frac{(b-a)^3}{6} \cdot \frac{(n+1)(2n+1)}{n^2} = (b-a)a^2 + a(b-a)^2 \cdot \frac{1+\frac{1}{n}}{1} + \frac{(b-a)^3}{6} \cdot \frac{2+\frac{3}{n}+\frac{1}{n^2}}{1}$
As $n \to \infty$ and $\|P\| \to 0$ this expression has value $(b-a)a^2 + a(b-a)^2 \cdot 1 + \frac{(b-a)^3}{6} \cdot 2$
$= ba^2 - a^3 + ab^2 - 2a^2b + a^3 + \frac{1}{3}(b^3 - 3b^2a + 3ba^2 - a^3) = \frac{b^3}{3} - \frac{a^3}{3}$. Thus, $\int_a^b x^2 dx = \frac{b^3}{3} - \frac{a^3}{3}$.

77. (a) $U = \max_1 \Delta x + \max_2 \Delta x + \ldots + \max_n \Delta x$ where $\max_1 = f(x_1)$, $\max_2 = f(x_2)$, $\ldots$, $\max_n = f(x_n)$ since f is increasing on $[a, b]$; $L = \min_1 \Delta x + \min_2 \Delta x + \ldots + \min_n \Delta x$ where $\min_1 = f(x_0)$, $\min_2 = f(x_1)$, $\ldots$, $\min_n = f(x_{n-1})$ since f is increasing on $[a, b]$. Therefore
$U - L = (\max_1 - \min_1)\Delta x + (\max_2 - \min_2)\Delta x + \ldots + (\max_n - \min_n)\Delta x$
$= (f(x_1) - f(x_0))\Delta x + (f(x_2) - f(x_1))\Delta x + \ldots + (f(x_n) - f(x_{n-1}))\Delta x = (f(x_n) - f(x_0))\Delta x = (f(b) - f(a))\Delta x$.

(b) $U = \max_1 \Delta x_1 + \max_2 \Delta x_2 + \ldots + \max_n \Delta x_n$ where $\max_1 = f(x_1)$, $\max_2 = f(x_2)$, $\ldots$, $\max_n = f(x_n)$ since f is increasing on$[a, b]$; $L = \min_1 \Delta x_1 + \min_2 \Delta x_2 + \ldots + \min_n \Delta x_n$ where
$\min_1 = f(x_0)$, $\min_2 = f(x_1)$, $\ldots$, $\min_n = f(x_{n-1})$ since f is increasing on $[a, b]$. Therefore
$U - L = (\max_1 - \min_1)\Delta x_1 + (\max_2 - \min_2)\Delta x_2 + \ldots + (\max_n - \min_n)\Delta x_n$
$= (f(x_1) - f(x_0))\Delta x_1 + (f(x_2) - f(x_1))\Delta x_2 + \ldots + (f(x_n) - f(x_{n-1}))\Delta x_n$
$\le (f(x_1) - f(x_0))\Delta x_{max} + (f(x_2) - f(x_1))\Delta x_{max} + \ldots + (f(x_n) - f(x_{n-1}))\Delta x_{max}$. Then
$U - L \le (f(x_n) - f(x_0))\Delta x_{max} = (f(b) - f(a))\Delta x_{max} = |f(b) - f(a)|\,\Delta x_{max}$ since $f(b) \ge f(a)$. Thus
$\lim_{\|P\| \to 0}(U - L) = \lim_{\|P\| \to 0}(f(b) - f(a))\Delta x_{max} = 0$, since $\Delta x_{max} = \|P\|$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

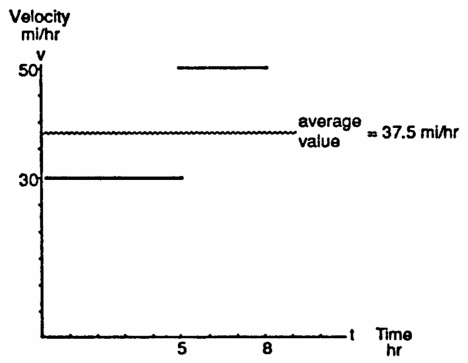
78. (a) $U = \max_1 \Delta x + \max_2 \Delta x + \ldots + \max_n \Delta x$ where $\max_1 = f(x_0)$, $\max_2 = f(x_1)$, $\ldots$, $\max_n = f(x_{n-1})$ since f is decreasing on $[a, b]$;
$L = \min_1 \Delta x + \min_2 \Delta x + \ldots + \min_n \Delta x$ where $\min_1 = f(x_1)$, $\min_2 = f(x_2)$, $\ldots$, $\min_n = f(x_n)$ since f is decreasing on $[a, b]$. Therefore
$U - L = (\max_1 - \min_1)\Delta x + (\max_2 - \min_2)\Delta x$
$+ \ldots + (\max_n - \min_n)\Delta x$
$= (f(x_0) - f(x_1))\Delta x + (f(x_1) - f(x_2))\Delta x$
$+ \ldots + (f(x_{n-1}) - f(x_n))\Delta x = (f(x_0) - f(x_n))\Delta x$
$= (f(a) - f(b))\Delta x.$

(b) $U = \max_1 \Delta x_1 + \max_2 \Delta x_2 + \ldots + \max_n \Delta x_n$ where $\max_1 = f(x_0)$, $\max_2 = f(x_1)$, $\ldots$, $\max_n = f(x_{n-1})$ since f is decreasing on$[a, b]$; $L = \min_1 \Delta x_1 + \min_2 \Delta x_2 + \ldots + \min_n \Delta x_n$ where $\min_1 = f(x_1)$, $\min_2 = f(x_2)$, $\ldots$, $\min_n = f(x_n)$ since f is decreasing on $[a, b]$. Therefore
$U - L = (\max_1 - \min_1)\Delta x_1 + (\max_2 - \min_2)\Delta x_2 + \ldots + (\max_n - \min_n)\Delta x_n$
$= (f(x_0) - f(x_1))\Delta x_1 + (f(x_1) - f(x_2))\Delta x_2 + \ldots + (f(x_{n-1}) - f(x_n))\Delta x_n$
$\le (f(x_0) - f(x_n))\Delta x_{max} = (f(a) - f(b)\Delta x_{max} = |f(b) - f(a)|\Delta x_{max}$ since $f(b) \le f(a)$. Thus
$\lim_{\|P\| \to 0} (U - L) = \lim_{\|P\| \to 0} |f(b) - f(a)|\Delta x_{max} = 0$, since $\Delta x_{max} = \|P\|$.

79. (a) Partition $\left[0, \frac{\pi}{2}\right]$ into n subintervals, each of length $\Delta x = \frac{\pi}{2n}$ with points $x_0 = 0$, $x_1 = \Delta x$, $x_2 = 2\Delta x, \ldots, x_n = n\Delta x = \frac{\pi}{2}$. Since sin x is increasing on $\left[0, \frac{\pi}{2}\right]$, the upper sum U is the sum of the areas of the circumscribed rectangles of areas $f(x_1)\Delta x = (\sin \Delta x)\Delta x$, $f(x_2)\Delta x = (\sin 2\Delta x)\Delta x, \ldots, f(x_n)\Delta x$
$= (\sin n\Delta x)\Delta x$. Then $U = (\sin \Delta x + \sin 2\Delta x + \ldots + \sin n\Delta x)\Delta x = \left[\frac{\cos\frac{\Delta x}{2} - \cos\left(\left(n + \frac{1}{2}\right)\Delta x\right)}{2\sin\frac{\Delta x}{2}}\right]\Delta x$
$= \left[\frac{\cos\frac{\pi}{4n} - \cos\left(\left(n + \frac{1}{2}\right)\frac{\pi}{2n}\right)}{2\sin\frac{\pi}{4n}}\right]\left(\frac{\pi}{2n}\right) = \frac{\pi\left(\cos\frac{\pi}{4n} - \cos\left(\frac{\pi}{2} + \frac{\pi}{4n}\right)\right)}{4n\sin\frac{\pi}{4n}} = \frac{\cos\frac{\pi}{4n} - \cos\left(\frac{\pi}{2} + \frac{\pi}{4n}\right)}{\left(\frac{\sin\frac{\pi}{4n}}{\frac{\pi}{4n}}\right)}$

(b) The area is $\int_0^{\pi/2} \sin x\, dx = \lim_{n \to \infty} \frac{\cos\frac{\pi}{4n} - \cos\left(\frac{\pi}{2} + \frac{\pi}{4n}\right)}{\left(\frac{\sin\frac{\pi}{4n}}{\frac{\pi}{4n}}\right)} = \frac{1 - \cos\frac{\pi}{2}}{1} = 1.$

80. (a) The area of the shaded region is $\sum_{i=1}^{n} \triangle x_i \cdot m_i$ which is equal to L.



(b) The area of the shaded region is $\sum_{i=1}^{n} \triangle x_i \cdot M_i$ which is equal to U.

(c) The area of the shaded region is the difference in the areas of the shaded regions shown in the second part of the figure and the first part of the figure. Thus this area is $U - L$.

81. By Exercise 80, $U - L = \sum_{i=1}^{n} \triangle x_i \cdot M_i - \sum_{i=1}^{n} \triangle x_i \cdot m_i$ where $M_i = \max\{f(x)$ on the ith subinterval$\}$ and $m_i = \min\{f(x)$ on the ith subinterval$\}$. Thus $U - L = \sum_{i=1}^{n} (M_i - m_i)\triangle x_i < \sum_{i=1}^{n} \epsilon \cdot \triangle x_i$ provided $\triangle x_i < \delta$ for each $i = 1, \ldots, n$. Since $\sum_{i=1}^{n} \epsilon \cdot \triangle x_i = \epsilon \sum_{i=1}^{n} \triangle x_i = \epsilon(b - a)$ the result, $U - L < \epsilon(b - a)$ follows.

## 5.4 THE FUNDAMENTAL THEOREM OF CALCULUS

1. $\int_{-2}^{0}(2x+5)\,dx = [x^2+5x]_{-2}^{0} = (0^2+5(0)) - ((-2)^2+5(-2)) = 6$

2. $\int_{-3}^{4}\left(5-\frac{x}{2}\right)dx = \left[5x-\frac{x^2}{4}\right]_{-3}^{4} = \left(5(4)-\frac{4^2}{4}\right) - \left(5(-3)-\frac{(-3)^2}{4}\right) = \frac{133}{4}$

3. $\int_{0}^{4}\left(3x-\frac{x^3}{4}\right)dx = \left[\frac{3x^2}{2}-\frac{x^4}{16}\right]_{0}^{4} = \left(\frac{3(4)^2}{2}-\frac{4^4}{16}\right) - \left(\frac{3(0)^2}{2}-\frac{(0)^4}{16}\right) = 8$

4. $\int_{-2}^{2}(x^3-2x+3)\,dx = \left[\frac{x^4}{4}-x^2+3x\right]_{-2}^{2} = \left(\frac{2^4}{4}-2^2+3(2)\right) - \left(\frac{(-2)^4}{4}-(-2)^2+3(-2)\right) = 12$

5. $\int_{0}^{1}\left(x^2+\sqrt{x}\right)dx = \left[\frac{x^3}{3}+\frac{2}{3}x^{3/2}\right]_{0}^{1} = \left(\frac{1}{3}+\frac{2}{3}\right) - 0 = 1$

6. $\int_{0}^{5}x^{3/2}\,dx = \left[\frac{2}{5}x^{5/2}\right]_{0}^{5} = \frac{2}{5}(5)^{5/2} - 0 = 2(5)^{3/2} = 10\sqrt{5}$

7. $\int_{1}^{32}x^{-6/5}\,dx = \left[-5x^{-1/5}\right]_{1}^{32} = \left(-\frac{5}{2}\right) - (-5) = \frac{5}{2}$

8. $\int_{-2}^{-1}\frac{2}{x^2}\,dx = \int_{-2}^{-1}2x^{-2}\,dx = \left[-2x^{-1}\right]_{-2}^{-1} = \left(\frac{-2}{-1}\right) - \left(\frac{-2}{-2}\right) = 1$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

9. $\int_0^{\pi} \sin x\, dx = [-\cos x]_0^{\pi} = (-\cos \pi) - (-\cos 0) = -(-1) - (-1) = 2$

10. $\int_0^{\pi} (1 + \cos x)\, dx = [x + \sin x]_0^{\pi} = (\pi + \sin \pi) - (0 + \sin 0) = \pi$

11. $\int_0^{\pi/3} 2\sec^2 x\, dx = [2\tan x]_0^{\pi/3} = \left(2\tan\left(\frac{\pi}{3}\right)\right) - (2\tan 0) = 2\sqrt{3} - 0 = 2\sqrt{3}$

12. $\int_{\pi/6}^{5\pi/6} \csc^2 x\, dx = [-\cot x]_{\pi/6}^{5\pi/6} = \left(-\cot\left(\frac{5\pi}{6}\right)\right) - \left(-\cot\left(\frac{\pi}{6}\right)\right) = -\left(-\sqrt{3}\right) - \left(-\sqrt{3}\right) = 2\sqrt{3}$

13. $\int_{\pi/4}^{3\pi/4} \csc\theta \cot\theta\, d\theta = [-\csc\theta]_{\pi/4}^{3\pi/4} = \left(-\csc\left(\frac{3\pi}{4}\right)\right) - \left(-\csc\left(\frac{\pi}{4}\right)\right) = -\sqrt{2} - \left(-\sqrt{2}\right) = 0$

14. $\int_0^{\pi/3} 4\sec u \tan u\, du = [4\sec u]_0^{\pi/3} = 4\sec\left(\frac{\pi}{3}\right) - 4\sec 0 = 4(2) - 4(1) = 4$

15. $\int_{\pi/2}^{0} \frac{1+\cos 2t}{2}\, dt = \int_{\pi/2}^{0} \left(\frac{1}{2} + \frac{1}{2}\cos 2t\right) dt = \left[\frac{1}{2}t + \frac{1}{4}\sin 2t\right]_{\pi/2}^{0} = \left(\frac{1}{2}(0) + \frac{1}{4}\sin 2(0)\right) - \left(\frac{1}{2}\left(\frac{\pi}{2}\right) + \frac{1}{4}\sin 2\left(\frac{\pi}{2}\right)\right)$
$= -\frac{\pi}{4}$

16. $\int_{-\pi/3}^{\pi/3} \frac{1-\cos 2t}{2}\, dt = \int_{-\pi/3}^{\pi/3} \left(\frac{1}{2} - \frac{1}{2}\cos 2t\right) dt = \left[\frac{1}{2}t - \frac{1}{4}\sin 2t\right]_{-\pi/3}^{\pi/3}$
$= \left(\frac{1}{2}\left(\frac{\pi}{3}\right) - \frac{1}{4}\sin 2\left(\frac{\pi}{3}\right)\right) - \left(\frac{1}{2}\left(-\frac{\pi}{3}\right) - \frac{1}{4}\sin 2\left(-\frac{\pi}{3}\right)\right) = \frac{\pi}{6} - \frac{1}{4}\sin\frac{2\pi}{3} + \frac{\pi}{6} + \frac{1}{4}\sin\left(\frac{-2\pi}{3}\right) = \frac{\pi}{3} - \frac{\sqrt{3}}{4}$

17. $\int_{-\pi/2}^{\pi/2} (8y^2 + \sin y)\, dy = \left[\frac{8y^3}{3} - \cos y\right]_{-\pi/2}^{\pi/2} = \left(\frac{8\left(\frac{\pi}{2}\right)^3}{3} - \cos\frac{\pi}{2}\right) - \left(\frac{8\left(-\frac{\pi}{2}\right)^3}{3} - \cos\left(-\frac{\pi}{2}\right)\right) = \frac{2\pi^3}{3}$

18. $\int_{-\pi/3}^{-\pi/4} \left(4\sec^2 t + \frac{\pi}{t^2}\right) dt = \int_{-\pi/3}^{-\pi/4} (4\sec^2 t + \pi t^{-2})\, dt = \left[4\tan t - \frac{\pi}{t}\right]_{-\pi/3}^{-\pi/4}$
$= \left(4\tan\left(-\frac{\pi}{4}\right) - \frac{\pi}{\left(-\frac{\pi}{4}\right)}\right) - \left(4\tan\left(\frac{\pi}{3}\right) - \frac{\pi}{\left(-\frac{\pi}{3}\right)}\right) = (4(-1) + 4) - \left(4\left(-\sqrt{3}\right) + 3\right) = 4\sqrt{3} - 3$

19. $\int_1^{-1} (r+1)^2\, dr = \int_1^{-1} (r^2 + 2r + 1)\, dr = \left[\frac{r^3}{3} + r^2 + r\right]_1^{-1} = \left(\frac{(-1)^3}{3} + (-1)^2 + (-1)\right) - \left(\frac{1^3}{3} + 1^2 + 1\right) = -\frac{8}{3}$

20. $\int_{-\sqrt{3}}^{\sqrt{3}} (t+1)(t^2+4)\, dt = \int_{-\sqrt{3}}^{\sqrt{3}} (t^3 + t^2 + 4t + 4)\, dt = \left[\frac{t^4}{4} + \frac{t^3}{3} + 2t^2 + 4t\right]_{-\sqrt{3}}^{\sqrt{3}}$
$= \left(\frac{\left(\sqrt{3}\right)^4}{4} + \frac{\left(\sqrt{3}\right)^3}{3} + 2\left(\sqrt{3}\right)^2 + 4\sqrt{3}\right) - \left(\frac{\left(-\sqrt{3}\right)^4}{4} + \frac{\left(-\sqrt{3}\right)^3}{3} + 2\left(-\sqrt{3}\right)^2 + 4\left(-\sqrt{3}\right)\right) = 10\sqrt{3}$

21. $\int_{\sqrt{2}}^{1} \left(\frac{u^7}{2} - \frac{1}{u^5}\right) du = \int_{\sqrt{2}}^{1} \left(\frac{u^7}{2} - u^{-5}\right) du = \left[\frac{u^8}{16} + \frac{1}{4u^4}\right]_{\sqrt{2}}^{1} = \left(\frac{1^8}{16} + \frac{1}{4(1)^4}\right) - \left(\frac{\left(\sqrt{2}\right)^8}{16} + \frac{1}{4\left(\sqrt{2}\right)^4}\right) = -\frac{3}{4}$

22. $\int_{1/2}^{1} \left(\frac{1}{v^3} - \frac{1}{v^4}\right) dv = \int_{1/2}^{1} (v^{-3} - v^{-4})\, dv = \left[\frac{-1}{2v^2} + \frac{1}{3v^3}\right]_{1/2}^{1} = \left(\frac{-1}{2(1)^2} + \frac{1}{3(1)^3}\right) - \left(\frac{-1}{2\left(\frac{1}{2}\right)^2} + \frac{1}{3\left(\frac{1}{2}\right)^3}\right) = -\frac{5}{6}$

23. $\int_1^{\sqrt{2}} \frac{s^2 + \sqrt{s}}{s^2}\, ds = \int_1^{\sqrt{2}} \left(1 + s^{-3/2}\right) ds = \left[s - \frac{2}{\sqrt{s}}\right]_1^{\sqrt{2}} = \left(\sqrt{2} - \frac{2}{\sqrt{\sqrt{2}}}\right) - \left(1 - \frac{2}{\sqrt{1}}\right) = \sqrt{2} - 2^{3/4} + 1$
$= \sqrt{2} - \sqrt[4]{8} + 1$

$$- \left[\left(\tfrac{3}{4}(8)^{4/3} - \tfrac{8^2}{2}\right) - \left(\tfrac{3}{4}(1)^{4/3} - \tfrac{1^2}{2}\right)\right]$$
$$= \tfrac{1}{4} + \tfrac{1}{4} - \left(-20 - \tfrac{3}{4} + \tfrac{1}{2}\right) = \tfrac{83}{4}$$

43. The area of the rectangle bounded by the lines $y = 2$, $y = 0$, $x = \pi$, and $x = 0$ is $2\pi$. The area under the curve $y = 1 + \cos x$ on $[0, \pi]$ is $\int_0^{\pi}(1 + \cos x)\,dx = [x + \sin x]_0^{\pi} = (\pi + \sin \pi) - (0 + \sin 0) = \pi$. Therefore the area of the shaded region is $2\pi - \pi = \pi$.

44. The area of the rectangle bounded by the lines $x = \frac{\pi}{6}$, $x = \frac{5\pi}{6}$, $y = \sin\frac{\pi}{6} = \frac{1}{2} = \sin\frac{5\pi}{6}$, and $y = 0$ is $\frac{1}{2}\left(\frac{5\pi}{6} - \frac{\pi}{6}\right) = \frac{\pi}{3}$. The area under the curve $y = \sin x$ on $\left[\frac{\pi}{6}, \frac{5\pi}{6}\right]$ is $\int_{\pi/6}^{5\pi/6}\sin x\,dx = [-\cos x]_{\pi/6}^{5\pi/6}$ $= \left(-\cos\frac{5\pi}{6}\right) - \left(-\cos\frac{\pi}{6}\right) = -\left(-\frac{\sqrt{3}}{2}\right) + \frac{\sqrt{3}}{2} = \sqrt{3}$. Therefore the area of the shaded region is $\sqrt{3} - \frac{\pi}{3}$.

45. On $\left[-\frac{\pi}{4}, 0\right]$: The area of the rectangle bounded by the lines $y = \sqrt{2}$, $y = 0$, $\theta = 0$, and $\theta = -\frac{\pi}{4}$ is $\sqrt{2}\left(\frac{\pi}{4}\right)$ $= \frac{\pi\sqrt{2}}{4}$. The area between the curve $y = \sec\theta\tan\theta$ and $y = 0$ is $-\int_{-\pi/4}^{0}\sec\theta\tan\theta\,d\theta = [-\sec\theta]_{-\pi/4}^{0}$ $= (-\sec 0) - \left(-\sec\left(-\frac{\pi}{4}\right)\right) = \sqrt{2} - 1$. Therefore the area of the shaded region on $\left[-\frac{\pi}{4}, 0\right]$ is $\frac{\pi\sqrt{2}}{4} + \left(\sqrt{2} - 1\right)$.
On $\left[0, \frac{\pi}{4}\right]$: The area of the rectangle bounded by $\theta = \frac{\pi}{4}$, $\theta = 0$, $y = \sqrt{2}$, and $y = 0$ is $\sqrt{2}\left(\frac{\pi}{4}\right) = \frac{\pi\sqrt{2}}{4}$. The area under the curve $y = \sec\theta\tan\theta$ is $\int_0^{\pi/4}\sec\theta\tan\theta\,d\theta = [\sec\theta]_0^{\pi/4} = \sec\frac{\pi}{4} - \sec 0 = \sqrt{2} - 1$. Therefore the area of the shaded region on $\left[0, \frac{\pi}{4}\right]$ is $\frac{\pi\sqrt{2}}{4} - \left(\sqrt{2} - 1\right)$. Thus, the area of the total shaded region is $\left(\frac{\pi\sqrt{2}}{4} + \sqrt{2} - 1\right) + \left(\frac{\pi\sqrt{2}}{4} - \sqrt{2} + 1\right) = \frac{\pi\sqrt{2}}{2}$.

46. The area of the rectangle bounded by the lines $y = 2$, $y = 0$, $t = -\frac{\pi}{4}$, and $t = 1$ is $2\left(1 - \left(-\frac{\pi}{4}\right)\right) = 2 + \frac{\pi}{2}$. The area under the curve $y = \sec^2 t$ on $\left[-\frac{\pi}{4}, 0\right]$ is $\int_{-\pi/4}^{0}\sec^2 t\,dt = [\tan t]_{-\pi/4}^{0} = \tan 0 - \tan\left(-\frac{\pi}{4}\right) = 1$. The area under the curve $y = 1 - t^2$ on $[0, 1]$ is $\int_0^1(1 - t^2)\,dt = \left[t - \frac{t^3}{3}\right]_0^1 = \left(1 - \frac{1^3}{3}\right) - \left(0 - \frac{0^3}{3}\right) = \frac{2}{3}$. Thus, the total area under the curves on $\left[-\frac{\pi}{4}, 1\right]$ is $1 + \frac{2}{3} = \frac{5}{3}$. Therefore the area of the shaded region is $\left(2 + \frac{\pi}{2}\right) - \frac{5}{3} = \frac{1}{3} + \frac{\pi}{2}$.

47. $y = \int_{\pi}^{x}\frac{1}{t}\,dt - 3 \Rightarrow \frac{dy}{dx} = \frac{1}{x}$ and $y(\pi) = \int_{\pi}^{\pi}\frac{1}{t}\,dt - 3 = 0 - 3 = -3 \Rightarrow$ (d) is a solution to this problem.

48. $y = \int_{-1}^{x}\sec t\,dt + 4 \Rightarrow \frac{dy}{dx} = \sec x$ and $y(-1) = \int_{-1}^{-1}\sec t\,dt + 4 = 0 + 4 = 4 \Rightarrow$ (c) is a solution to this problem.

49. $y = \int_0^x\sec t\,dt + 4 \Rightarrow \frac{dy}{dx} = \sec x$ and $y(0) = \int_0^0\sec t\,dt + 4 = 0 + 4 = 4 \Rightarrow$ (b) is a solution to this problem.

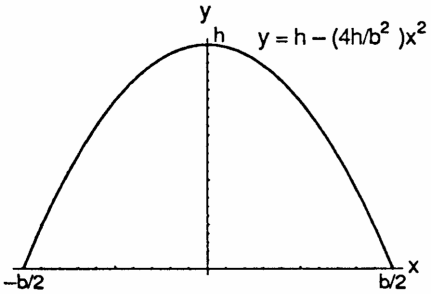
50. $y = \int_1^x \frac{1}{t}\,dt - 3 \Rightarrow \frac{dy}{dx} = \frac{1}{x}$ and $y(1) = \int_1^1 \frac{1}{t}\,dt - 3 = 0 - 3 = -3 \Rightarrow$ (a) is a solution to this problem.



51. $y = \int_2^x \sec t\,dt + 3$

52. $y = \int_1^x \sqrt{1+t^2}\,dt - 2$

53. $s = \int_{t_0}^t f(x)\,dx + s_0$

54. $v = \int_{t_0}^t g(x)\,dx + v_0$

55. Area $= \int_{-b/2}^{b/2} \left(h - \left(\frac{4h}{b^2}\right)x^2\right) dx = \left[hx - \frac{4hx^3}{3b^2}\right]_{-b/2}^{b/2}$
$= \left(h\left(\frac{b}{2}\right) - \frac{4h\left(\frac{b}{2}\right)^3}{3b^2}\right) - \left(h\left(-\frac{b}{2}\right) - \frac{4h\left(-\frac{b}{2}\right)^3}{3b^2}\right)$
$= \left(\frac{bh}{2} - \frac{bh}{6}\right) - \left(-\frac{bh}{2} + \frac{bh}{6}\right) = bh - \frac{bh}{3} = \frac{2}{3}bh$

56. $r = \int_0^3 \left(2 - \frac{2}{(x+1)^2}\right) dx = 2\int_0^3 \left(1 - \frac{1}{(x+1)^2}\right) dx = 2\left[x - \left(\frac{-1}{x+1}\right)\right]_0^3 = 2\left[\left(3 + \frac{1}{(3+1)}\right) - \left(0 + \frac{1}{(0+1)}\right)\right]$
$= 2\left[3\frac{1}{4} - 1\right] = 2\left(2\frac{1}{4}\right) = 4.5$ or \$4500

57. $\frac{dc}{dx} = \frac{1}{2\sqrt{x}} = \frac{1}{2}x^{-1/2} \Rightarrow c = \int_0^x \frac{1}{2}t^{-1/2}dt = \left[t^{1/2}\right]_0^x = \sqrt{x}$
$c(100) - c(1) = \sqrt{100} - \sqrt{1} =$ \$9.00

58. By Exercise 57, $c(400) - c(100) = \sqrt{400} - \sqrt{100} = 20 - 10 =$ \$10.00

59. (a) $v = \frac{ds}{dt} = \frac{d}{dt}\int_0^t f(x)\,dx = f(t) \Rightarrow v(5) = f(5) = 2$ m/sec
(b) $a = \frac{df}{dt}$ is negative since the slope of the tangent line at $t = 5$ is negative
(c) $s = \int_0^3 f(x)\,dx = \frac{1}{2}(3)(3) = \frac{9}{2}$ m since the integral is the area of the triangle formed by $y = f(x)$, the x-axis, and $x = 3$
(d) $t = 6$ since from $t = 6$ to $t = 9$, the region lies below the x-axis
(e) At $t = 4$ and $t = 7$, since there are horizontal tangents there
(f) Toward the origin between $t = 6$ and $t = 9$ since the velocity is negative on this interval. Away from the origin between $t = 0$ and $t = 6$ since the velocity is positive there.
(g) Right or positive side, because the integral of f from 0 to 9 is positive, there being more area above the x-axis than below it.

60. (a) $v = \frac{dg}{dt} = \frac{d}{dt}\int_0^t g(x)\,dx = g(t) \Rightarrow v(3) = g(3) = 0$ m/sec.
(b) $a = \frac{df}{dt}$ is positive, since the slope of the tangent line at $t = 3$ is positive
(c) At $t = 3$, the particle's position is $\int_0^3 g(x)\,dx = \frac{1}{2}(3)(-6) = -9$
(d) The particle passes through the origin at $t = 6$ because $s(6) = \int_0^6 g(x)\,dx = 0$
(e) At $t = 7$, since there is a horizontal tangent there
(f) The particle starts at the origin and moves away to the left for $0 < t < 3$. It moves back toward the origin for $3 < t < 6$, passes through the origin at $t = 6$, and moves away to the right for $t > 6$.
(g) Right side, since its position at $t = 9$ is positive, there being more area above the x-axis than below it at $t = 9$.

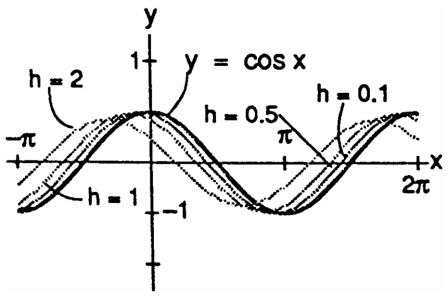
61. $k > 0 \Rightarrow$ one arch of $y = \sin kx$ will occur over the interval $\left[0, \frac{\pi}{k}\right] \Rightarrow$ the area $= \int_0^{\pi/k} \sin kx\, dx = \left[-\frac{1}{k}\cos kx\right]_0^{\pi/k}$
$= -\frac{1}{k}\cos\left(k\left(\frac{\pi}{k}\right)\right) - \left(-\frac{1}{k}\cos(0)\right) = \frac{2}{k}$

62. $\lim_{x\to 0}\frac{1}{x^3}\int_0^x \frac{t^2}{t^4+1}dt = \lim_{x\to 0}\frac{\int_0^x \frac{t^2}{t^4+1}dt}{x^3} = \lim_{x\to 0}\frac{\frac{x^2}{x^4+1}}{3x^2} = \lim_{x\to 0}\frac{1}{3(x^4+1)} = \infty.$

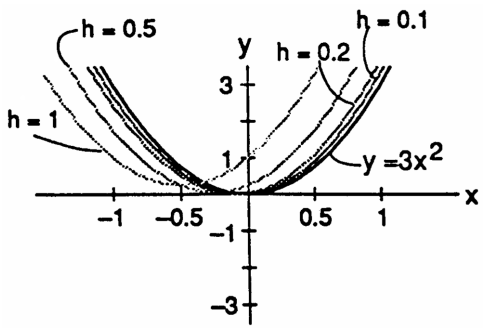
63. $\int_1^x f(t)\,dt = x^2 - 2x + 1 \Rightarrow f(x) = \frac{d}{dx}\int_1^x f(t)\,dt = \frac{d}{dx}(x^2 - 2x + 1) = 2x - 2$

64. $\int_0^x f(t)\,dt = x\cos \pi x \Rightarrow f(x) = \frac{d}{dx}\int_0^x f(t)\,dt = \cos \pi x - \pi x \sin \pi x \Rightarrow f(4) = \cos \pi(4) - \pi(4)\sin \pi(4) = 1$



65. $f(x) = 2 - \int_2^{x+1} \frac{9}{1+t}\,dt \Rightarrow f'(x) = -\frac{9}{1+(x+1)} = \frac{-9}{x+2} \Rightarrow f'(1) = -3; f(1) = 2 - \int_2^{1+1}\frac{9}{1+t}\,dt = 2 - 0 = 2;$
$L(x) = -3(x-1) + f(1) = -3(x-1) + 2 = -3x + 5$

66. $g(x) = 3 + \int_1^{x^2} \sec(t-1)\,dt \Rightarrow g'(x) = (\sec(x^2-1))(2x) = 2x\sec(x^2-1) \Rightarrow g'(-1) = 2(-1)\sec((-1)^2-1)$
$= -2; g(-1) = 3 + \int_1^{(-1)^2} \sec(t-1)\,dt = 3 + \int_1^1 \sec(t-1)\,dt = 3 + 0 = 3; L(x) = -2(x-(-1)) + g(-1)$
$= -2(x+1) + 3 = -2x + 1$



67. (a) True: since f is continuous, g is differentiable by Part 1 of the Fundamental Theorem of Calculus.
(b) True: g is continuous because it is differentiable.
(c) True, since $g'(1) = f(1) = 0$.
(d) False, since $g''(1) = f'(1) > 0$.
(e) True, since $g'(1) = 0$ and $g''(1) = f'(1) > 0$.
(f) False: $g''(x) = f'(x) > 0$, so $g''$ never changes sign.
(g) True, since $g'(1) = f(1) = 0$ and $g'(x) = f(x)$ is an increasing function of x (because $f'(x) > 0$).

68. (a) True: by Part 1 of the Fundamental Theorem of Calculus, $h'(x) = f(x)$. Since f is differentiable for all x, h has a second derivative for all x.
(b) True: they are continuous because they are differentiable.
(c) True, since $h'(1) = f(1) = 0$.
(d) True, since $h'(1) = 0$ and $h''(1) = f'(1) < 0$.
(e) False, since $h''(1) = f'(1) < 0$.
(f) False, since $h''(x) = f'(x) < 0$ never changes sign.
(g) True, since $h'(1) = f(1) = 0$ and $h'(x) = f(x)$ is a decreasing function of x (because $f'(x) < 0$).

69.

70. The limit is $3x^2$

71-74. Example CAS commands:

Maple:

```
with( plots );
f := x -> x^3-4*x^2+3*x;
a := 0;
b := 4;
F := unapply( int(f(t),t=a..x), x );                    # (a)
p1 := plot( [f(x),F(x)], x=a..b, legend=["y = f(x)","y = F(x)"], title="#71(a) (Section 5.4)" ):
p1;
dF := D(F);                                              # (b)
q1 := solve( dF(x)=0, x );
pts1 := [ seq( [x,f(x)], x=remove(has,evalf([q1]),I) ) ];
p2 := plot( pts1, style=point, color=blue, symbolsize=18, symbol=diamond, legend="(x,f(x)) where F '(x)=0" ):
display( [p1,p2], title="71(b) (Section 5.4)" );
incr := solve( dF(x)>0, x );                             # (c)
decr := solve( dF(x)<0, x );
df := D(f);                                              # (d)
p3 := plot( [df(x),F(x)], x=a..b, legend=["y = f '(x)","y = F(x)"], title="#71(d) (Section 5.4)" ):
p3;
q2 := solve( df(x)=0, x );
pts2 := [ seq( [x,F(x)], x=remove(has,evalf([q2]),I) ) ];
p4 := plot( pts2, style=point, color=blue, symbolsize=18, symbol=diamond, legend="(x,f(x)) where f '(x)=0" ):
display( [p3,p4], title="71(d) (Section 5.4)" );
```

75-78. Example CAS commands:

Maple:

```
a := 1;
u := x -> x^2;
f := x -> sqrt(1-x^2);
F := unapply( int( f(t), t=a..u(x) ), x );
dF := D(F);                    # (b)
cp := solve( dF(x)=0, x );
solve( dF(x)>0, x );
solve( dF(x)<0, x );
d2F := D(dF);                  # (c)
solve( d2F(x)=0, x );
plot( F(x), x=-1..1, title="#75(d) (Section 5.4)" );
```

79. Example CAS commands:

Maple:

```
f := `f`;
q1 := Diff( Int( f(t), t=a..u(x) ), x );
d1 := value( q1 );
```

80. Example CAS commands:

Maple:

```
f := `f`;
q2 := Diff( Int( f(t), t=a..u(x) ), x,x );
```

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

value( q2 );

71-80. Example CAS commands:

Mathematica: (assigned function and values for a, and b may vary)

For transcendental functions the FindRoot is needed instead of the Solve command.

The Map command executes FindRoot over a set of initial guesses

Initial guesses will vary as the functions vary.

```
Clear[x, f, F]
{a, b}= {0, 2π}; f[x_] = Sin[2x] Cos[x/3]
F[x_] = Integrate[f[t], {t, a, x}]
Plot[{f[x], F[x]},{x, a, b}]
x/.Map[FindRoot[F'[x]==0, {x, #}] &,{2, 3, 5, 6}]
x/.Map[FindRoot[f'[x]==0, {x, #}] &,{1, 2, 4, 5, 6}]
```

Slightly alter above commands for 75 - 80.

```
Clear[x, f, F, u]
a=0;  f[x_] = x^2 − 2x − 3
u[x_] = 1 − x^2
F[x_] = Integrate[f[t], {t, a, u(x)}]
x/.Map[FindRoot[F'[x]==0,{x, #}] &,{1, 2, 3, 4}]
x/.Map[FindRoot[F''[x]==0,{x,#}] &,{1, 2, 3, 4}]
```

After determining an appropriate value for b, the following can be entered

```
b = 4;
Plot[{F[x], {x, a, b}]
```

## 5.5 INDEFINTE INTEGRALS AND THE SUBSTITUTION RULE

1. Let $u = 3x \Rightarrow du = 3\,dx \Rightarrow \frac{1}{3}\,du = dx$

   $\int \sin 3x\,dx = \int \frac{1}{3}\sin u\,du = -\frac{1}{3}\cos u + C = -\frac{1}{3}\cos 3x + C$

2. Let $u = 2x^2 \Rightarrow du = 4x\,dx \Rightarrow \frac{1}{4}\,du = x\,dx$

   $\int x\sin(2x^2)\,dx = \int \frac{1}{4}\sin u\,du = -\frac{1}{4}\cos u + C = -\frac{1}{4}\cos 2x^2 + C$

3. Let $u = 2t \Rightarrow du = 2\,dt \Rightarrow \frac{1}{2}\,du = dt$

   $\int \sec 2t\tan 2t\,dt = \int \frac{1}{2}\sec u\tan u\,du = \frac{1}{2}\sec u + C = \frac{1}{2}\sec 2t + C$

4. Let $u = 1 - \cos\frac{t}{2} \Rightarrow du = \frac{1}{2}\sin\frac{t}{2}\,dt \Rightarrow 2\,du = \sin\frac{t}{2}\,dt$

   $\int \left(1-\cos\frac{t}{2}\right)^2\left(\sin\frac{t}{2}\right)dt = \int 2u^2\,du = \frac{2}{3}u^3 + C = \frac{2}{3}\left(1-\cos\frac{t}{2}\right)^3 + C$

5. Let $u = 7x - 2 \Rightarrow du = 7\,dx \Rightarrow \frac{1}{7}\,du = dx$

   $\int 28(7x-2)^{-5}\,dx = \int \frac{1}{7}(28)u^{-5}\,du = \int 4u^{-5}\,du = -u^{-4} + C = -(7x-2)^{-4} + C$

6. Let $u = x^4 - 1 \Rightarrow du = 4x^3\,dx \Rightarrow \frac{1}{4}\,du = x^3\,dx$

   $\int x^3(x^4-1)^2\,dx = \int \frac{1}{4}u^2\,du = \frac{u^3}{12} + C = \frac{1}{12}(x^4-1)^3 + C$

$= \int \sin u\,du + 8t + C_2 = -\cos(\pi t) + 8t + C_2$; at $t = 0$ and $s = 0$ we have $0 = -1 + C_2 \Rightarrow C_2 = 1$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$\Rightarrow\ s = 8t - \cos(\pi t) + 1\ \Rightarrow\ s(1) = 8 - \cos\pi + 1 = 10$ m

61. All three integrations are correct. In each case, the derivative of the function on the right is the integrand on the left, and each formula has an arbitrary constant for generating the remaining antiderivatives. Moreover, $\sin^2 x + C_1 = 1 - \cos^2 x + C_1\ \Rightarrow\ C_2 = 1 + C_1$; also $-\cos^2 x + C_2 = -\frac{\cos 2x}{2} - \frac{1}{2} + C_2\ \Rightarrow\ C_3 = C_2 - \frac{1}{2} = C_1 + \frac{1}{2}$.

62. Both integrations are correct. In each case, the derivative of the function on the right is the integrand on the left, and each formula has an arbitrary constant for generating the remaining antiderivatives. Moreover, $\frac{\tan^2 x}{2} + C = \frac{\sec^2 x - 1}{2} + C = \frac{\sec^2 x}{2} + \underbrace{\left(C - \frac{1}{2}\right)}_{\text{a constant}}$

63. (a) $\left(\frac{1}{\frac{1}{60} - 0}\right)\int_0^{1/60} V_{max}\sin 120\pi t\,dt = 60\left[-V_{max}\left(\frac{1}{120\pi}\right)\cos(120\pi t)\right]_0^{1/60} = -\frac{V_{max}}{2\pi}[\cos 2\pi - \cos 0]$
$= -\frac{V_{max}}{2\pi}[1 - 1] = 0$

(b) $V_{max} = \sqrt{2}\,V_{rms} = \sqrt{2}\,(240) \approx 339$ volts

(c) $\int_0^{1/60} (V_{max})^2 \sin^2 120\pi t\,dt = (V_{max})^2\int_0^{1/60}\left(\frac{1 - \cos 240\pi t}{2}\right)dt = \frac{(V_{max})^2}{2}\int_0^{1/60}(1 - \cos 240\pi t)\,dt$
$= \frac{(V_{max})^2}{2}\left[t - \left(\frac{1}{240\pi}\right)\sin 240\pi t\right]_0^{1/60} = \frac{(V_{max})^2}{2}\left[\left(\frac{1}{60} - \left(\frac{1}{240\pi}\right)\sin(4\pi)\right) - \left(0 - \left(\frac{1}{240\pi}\right)\sin(0)\right)\right] = \frac{(V_{max})^2}{120}$

## 5.6 SUBSTITUTION AND AREA BETWEEN CURVES

1. (a) Let $u = y + 1\ \Rightarrow\ du = dy$; $y = 0\ \Rightarrow\ u = 1$, $y = 3\ \Rightarrow\ u = 4$
$\int_0^3 \sqrt{y+1}\,dy = \int_1^4 u^{1/2}\,du = \left[\frac{2}{3}u^{3/2}\right]_1^4 = \left(\frac{2}{3}\right)(4)^{3/2} - \left(\frac{2}{3}\right)(1)^{3/2} = \left(\frac{2}{3}\right)(8) - \left(\frac{2}{3}\right)(1) = \frac{14}{3}$

(b) Use the same substitution for u as in part (a); $y = -1\ \Rightarrow\ u = 0$, $y = 0\ \Rightarrow\ u = 1$
$\int_{-1}^0 \sqrt{y+1}\,dy = \int_0^1 u^{1/2}\,du = \left[\frac{2}{3}u^{3/2}\right]_0^1 = \left(\frac{2}{3}\right)(1)^{3/2} - 0 = \frac{2}{3}$

2. (a) Let $u = 1 - r^2\ \Rightarrow\ du = -2r\,dr\ \Rightarrow\ -\frac{1}{2}du = r\,dr$; $r = 0\ \Rightarrow\ u = 1$, $r = 1\ \Rightarrow\ u = 0$
$\int_0^1 r\sqrt{1 - r^2}\,dr = \int_1^0 -\frac{1}{2}\sqrt{u}\,du = \left[-\frac{1}{3}u^{3/2}\right]_1^0 = 0 - \left(-\frac{1}{3}\right)(1)^{3/2} = \frac{1}{3}$

(b) Use the same substitution for u as in part (a); $r = -1\ \Rightarrow\ u = 0$, $r = 1\ \Rightarrow\ u = 0$
$\int_{-1}^1 r\sqrt{1 - r^2}\,dr = \int_0^0 -\frac{1}{2}\sqrt{u}\,du = 0$

3. (a) Let $u = \tan x\ \Rightarrow\ du = \sec^2 x\,dx$; $x = 0\ \Rightarrow\ u = 0$, $x = \frac{\pi}{4}\ \Rightarrow\ u = 1$
$\int_0^{\pi/4} \tan x\sec^2 x\,dx = \int_0^1 u\,du = \left[\frac{u^2}{2}\right]_0^1 = \frac{1^2}{2} - 0 = \frac{1}{2}$

(b) Use the same substitution as in part (a); $x = -\frac{\pi}{4}\ \Rightarrow\ u = -1$, $x = 0\ \Rightarrow\ u = 0$
$\int_{-\pi/4}^0 \tan x\sec^2 x\,dx = \int_{-1}^0 u\,du = \left[\frac{u^2}{2}\right]_{-1}^0 = 0 - \frac{1}{2} = -\frac{1}{2}$

4. (a) Let $u = \cos x\ \Rightarrow\ du = -\sin x\,dx\ \Rightarrow\ -du = \sin x\,dx$; $x = 0\ \Rightarrow\ u = 1$, $x = \pi\ \Rightarrow\ u = -1$
$\int_0^\pi 3\cos^2 x\sin x\,dx = \int_1^{-1} -3u^2\,du = [-u^3]_1^{-1} = -(-1)^3 - (-(1)^3) = 2$

(b) Use the same substitution as in part (a); $x = 2\pi\ \Rightarrow\ u = 1$, $x = 3\pi\ \Rightarrow\ u = -1$
$\int_{2\pi}^{3\pi} 3\cos^2 x\sin x\,dx = \int_1^{-1} -3u^2\,du = 2$

30. For the sketch given, $a = -\frac{\pi}{3}$, $b = \frac{\pi}{3}$; $f(t) - g(t) = \frac{1}{2}\sec^2 t - (-4\sin^2 t) = \frac{1}{2}\sec^2 t + 4\sin^2 t$;
$A = \int_{-\pi/3}^{\pi/3}\left(\frac{1}{2}\sec^2 t + 4\sin^2 t\right)dt = \frac{1}{2}\int_{-\pi/3}^{\pi/3}\sec^2 t\,dt + 4\int_{-\pi/3}^{\pi/3}\sin^2 t\,dt = \frac{1}{2}\int_{-\pi/3}^{\pi/3}\sec^2 t\,dt + 4\int_{-\pi/3}^{\pi/3}\frac{(1 - \cos 2t)}{2}\,dt$
$= \frac{1}{2}\int_{-\pi/3}^{\pi/3}\sec^2 t\,dt + 2\int_{-\pi/3}^{\pi/3}(1 - \cos 2t)\,dt = \frac{1}{2}[\tan t]_{-\pi/3}^{\pi/3} + 2[t - \frac{\sin 2t}{2}]_{-\pi/3}^{\pi/3} = \sqrt{3} + 4\cdot\frac{\pi}{3} - \sqrt{3} = \frac{4\pi}{3}$

31. For the sketch given, $a = -2$, $b = 2$; $f(x) - g(x) = 2x^2 - (x^4 - 2x^2) = 4x^2 - x^4$;
$A = \int_{-2}^{2}(4x^2 - x^4)\,dx = \left[\frac{4x^3}{3} - \frac{x^5}{5}\right]_{-2}^{2} = \left(\frac{32}{3} - \frac{32}{5}\right) - \left[-\frac{32}{3} - \left(-\frac{32}{5}\right)\right] = \frac{64}{3} - \frac{64}{5} = \frac{320 - 192}{15} = \frac{128}{15}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

32. For the sketch given, $c = 0$, $d = 1$; $f(y) - g(y) = y^2 - y^3$;
$A = \int_0^1 (y^2 - y^3)\,dy = \int_0^1 y^2\,dy - \int_0^1 y^3\,dy = \left[\frac{y^3}{3}\right]_0^1 - \left[\frac{y^4}{4}\right]_0^1 = \frac{(1-0)}{3} - \frac{(1-0)}{4} = \frac{1}{3} - \frac{1}{4} = \frac{1}{12}$

33. For the sketch given, $c = 0$, $d = 1$; $f(y) - g(y) = (12y^2 - 12y^3) - (2y^2 - 2y) = 10y^2 - 12y^3 + 2y$;
$A = \int_0^1 (10y^2 - 12y^3 + 2y)\,dy = \int_0^1 10y^2\,dy - \int_0^1 12y^3\,dy + \int_0^1 2y\,dy = \left[\frac{10}{3}y^3\right]_0^1 - \left[\frac{12}{4}y^4\right]_0^1 + \left[\frac{2}{2}y^2\right]_0^1$
$= \left(\frac{10}{3} - 0\right) - (3 - 0) + (1 - 0) = \frac{4}{3}$

34. For the sketch given, $a = -1$, $b = 1$; $f(x) - g(x) = x^2 - (-2x^4) = x^2 + 2x^4$;
$A = \int_{-1}^1 (x^2 + 2x^4)\,dx = \left[\frac{x^3}{3} + \frac{2x^5}{5}\right]_{-1}^1 = \left(\frac{1}{3} + \frac{2}{5}\right) - \left[-\frac{1}{3} + \left(-\frac{2}{5}\right)\right] = \frac{2}{3} + \frac{4}{5} = \frac{10+12}{15} = \frac{22}{15}$

35. We want the area between the line $y = 1$, $0 \le x \le 2$, and the curve $y = \frac{x^2}{4}$, *minus* the area of a triangle (formed by $y = x$ and $y = 1$) with base 1 and height 1. Thus, $A = \int_0^2 \left(1 - \frac{x^2}{4}\right)dx - \frac{1}{2}(1)(1) = \left[x - \frac{x^3}{12}\right]_0^2 - \frac{1}{2}$
$= \left(2 - \frac{8}{12}\right) - \frac{1}{2} = 2 - \frac{2}{3} - \frac{1}{2} = \frac{5}{6}$

36. We want the area between the x-axis and the curve $y = x^2$, $0 \le x \le 1$ *plus* the area of a triangle (formed by $x = 1$, $x + y = 2$, and the x-axis) with base 1 and height 1. Thus, $A = \int_0^1 x^2\,dx + \frac{1}{2}(1)(1) = \left[\frac{x^3}{3}\right]_0^1 + \frac{1}{2} = \frac{1}{3} + \frac{1}{2} = \frac{5}{6}$

37. AREA = A1 + A2
A1: For the sketch given, $a = -3$ and we find b by solving the equations $y = x^2 - 4$ and $y = -x^2 - 2x$ simultaneously for x: $x^2 - 4 = -x^2 - 2x \Rightarrow 2x^2 + 2x - 4 = 0 \Rightarrow 2(x+2)(x-1) \Rightarrow x = -2$ or $x = 1$ so $b = -2$: $f(x) - g(x) = (x^2 - 4) - (-x^2 - 2x) = 2x^2 + 2x - 4 \Rightarrow A1 = \int_{-3}^{-2} (2x^2 + 2x - 4)\,dx$
$= \left[\frac{2x^3}{3} + \frac{2x^2}{2} - 4x\right]_{-3}^{-2} = \left(-\frac{16}{3} + 4 + 8\right) - (-18 + 9 + 12) = 9 - \frac{16}{3} = \frac{11}{3}$;
A2: For the sketch given, $a = -2$ and $b = 1$: $f(x) - g(x) = (-x^2 - 2x) - (x^2 - 4) = -2x^2 - 2x + 4$
$\Rightarrow A2 = -\int_{-2}^1 (2x^2 + 2x - 4)\,dx = -\left[\frac{2x^3}{3} + x^2 - 4x\right]_{-2}^1 = -\left(\frac{2}{3} + 1 - 4\right) + \left(-\frac{16}{3} + 4 + 8\right)$
$= -\frac{2}{3} - 1 + 4 - \frac{16}{3} + 4 + 8 = 9$;
Therefore, AREA = A1 + A2 = $\frac{11}{3} + 9 = \frac{38}{3}$

38. AREA = A1 + A2
A1: For the sketch given, $a = -2$ and $b = 0$: $f(x) - g(x) = (2x^3 - x^2 - 5x) - (-x^2 + 3x) = 2x^3 - 8x$
$\Rightarrow A1 = \int_{-2}^0 (2x^3 - 8x)\,dx = \left[\frac{2x^4}{4} - \frac{8x^2}{2}\right]_{-2}^0 = 0 - (8 - 16) = 8$;
A2: For the sketch given, $a = 0$ and $b = 2$: $f(x) - g(x) = (-x^2 + 3x) - (2x^3 - x^2 - 5x) = 8x - 2x^3$
$\Rightarrow A2 = \int_0^2 (8x - 2x^3)\,dx = \left[\frac{8x^2}{2} - \frac{2x^4}{4}\right]_0^2 = (16 - 8) = 8$;
Therefore, AREA = A1 + A2 = 16

39. AREA = A1 + A2 + A3
A1: For the sketch given, $a = -2$ and $b = -1$: $f(x) - g(x) = (-x + 2) - (4 - x^2) = x^2 - x - 2$
$\Rightarrow A1 = \int_{-2}^{-1} (x^2 - x - 2)\,dx = \left[\frac{x^3}{3} - \frac{x^2}{2} - 2x\right]_{-2}^{-1} = \left(-\frac{1}{3} - \frac{1}{2} + 2\right) - \left(-\frac{8}{3} - \frac{4}{2} + 4\right) = \frac{7}{3} - \frac{1}{2} = \frac{14-3}{6} = \frac{11}{6}$;
A2: For the sketch given, $a = -1$ and $b = 2$: $f(x) - g(x) = (4 - x^2) - (-x + 2) = -(x^2 - x - 2)$
$\Rightarrow A2 = -\int_{-1}^2 (x^2 - x - 2)\,dx = -\left[\frac{x^3}{3} - \frac{x^2}{2} - 2x\right]_{-1}^2 = -\left(\frac{8}{3} - \frac{4}{2} - 4\right) + \left(-\frac{1}{3} - \frac{1}{2} + 2\right) = -3 + 8 - \frac{1}{2} = \frac{9}{2}$;

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

A3: For the sketch given, $a = 2$ and $b = 3$: $f(x) - g(x) = (-x + 2) - (4 - x^2) = x^2 - x - 2$

$\Rightarrow A3 = \int_2^3 (x^2 - x - 2)\,dx = \left[\frac{x^3}{3} - \frac{x^2}{2} - 2x\right]_2^3 = \left(\frac{27}{3} - \frac{9}{2} - 6\right) - \left(\frac{8}{3} - \frac{4}{2} - 4\right) = 9 - \frac{9}{2} - \frac{8}{3}$;

Therefore, AREA $= A1 + A2 + A3 = \frac{11}{6} + \frac{9}{2} + \left(9 - \frac{9}{2} - \frac{8}{3}\right) = 9 - \frac{5}{6} = \frac{49}{6}$

40. AREA $= A1 + A2 + A3$

A1: For the sketch given, $a = -2$ and $b = 0$: $f(x) - g(x) = \left(\frac{x^3}{3} - x\right) - \frac{x}{3} = \frac{x^3}{3} - \frac{4}{3}x = \frac{1}{3}(x^3 - 4x)$

$\Rightarrow A1 = \frac{1}{3}\int_{-2}^0 (x^3 - 4x)\,dx = \frac{1}{3}\left[\frac{x^4}{4} - 2x^2\right]_{-2}^0 = 0 - \frac{1}{3}(4 - 8) = \frac{4}{3}$;

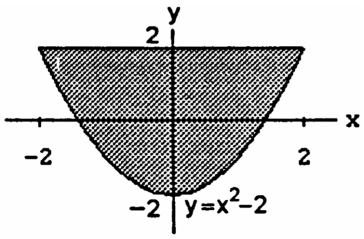
A2: For the sketch given, $a = 0$ and we find b by solving the equations $y = \frac{x^3}{3} - x$ and $y = \frac{x}{3}$ simultaneously for x: $\frac{x^3}{3} - x = \frac{x}{3} \Rightarrow \frac{x^3}{3} - \frac{4}{3}x = 0 \Rightarrow \frac{x}{3}(x - 2)(x + 2) = 0 \Rightarrow x = -2$, $x = 0$, or $x = 2$ so $b = 2$:

$f(x) - g(x) = \frac{x}{3} - \left(\frac{x^3}{3} - x\right) = -\frac{1}{3}(x^3 - 4x) \Rightarrow A2 = -\frac{1}{3}\int_0^2 (x^3 - 4x)\,dx = \frac{1}{3}\int_0^2 (4x - x^3) = \frac{1}{3}\left[2x^2 - \frac{x^4}{4}\right]_0^2$

$= \frac{1}{3}(8 - 4) = \frac{4}{3}$;

A3: For the sketch given, $a = 2$ and $b = 3$: $f(x) - g(x) = \left(\frac{x^3}{3} - x\right) - \frac{x}{3} = \frac{1}{3}(x^3 - 4x)$

$\Rightarrow A3 = \frac{1}{3}\int_2^3 (x^3 - 4x)\,dx = \frac{1}{3}\left[\frac{x^4}{4} - 2x^2\right]_2^3 = \frac{1}{3}\left[\left(\frac{81}{4} - 2 \cdot 9\right) - \left(\frac{16}{4} - 8\right)\right] = \frac{1}{3}\left(\frac{81}{4} - 14\right) = \frac{25}{12}$;



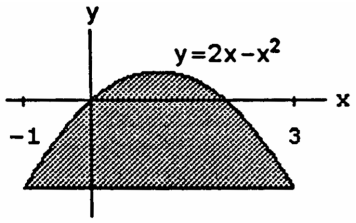
Therefore, AREA $= A1 + A2 + A3 = \frac{4}{3} + \frac{4}{3} + \frac{25}{12} = \frac{32+25}{12} = \frac{19}{4}$

41. $a = -2$, $b = 2$;

$f(x) - g(x) = 2 - (x^2 - 2) = 4 - x^2$

$\Rightarrow A = \int_{-2}^2 (4 - x^2)dx = \left[4x - \frac{x^3}{3}\right]_{-2}^2 = \left(8 - \frac{8}{3}\right) - \left(-8 + \frac{8}{3}\right)$

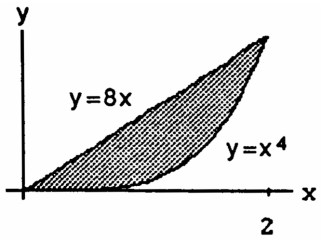
$= 2 \cdot \left(\frac{24}{3} - \frac{8}{3}\right) = \frac{32}{3}$



42. $a = -1$, $b = 3$;

$f(x) - g(x) = (2x - x^2) - (-3) = 2x - x^2 + 3$

$\Rightarrow A = \int_{-1}^3 (2x - x^2 + 3)\,dx = \left[x^2 - \frac{x^3}{3} + 3x\right]_{-1}^3$

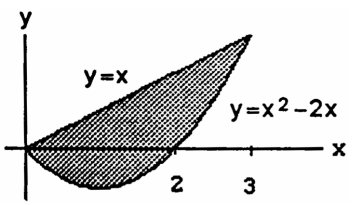


$= \left(9 - \frac{27}{3} + 9\right) - \left(1 + \frac{1}{3} - 3\right) = 11 - \frac{1}{3} = \frac{32}{3}$

43. $a = 0$, $b = 2$;

$f(x) - g(x) = 8x - x^4 \Rightarrow A = \int_0^2 (8x - x^4)\,dx$

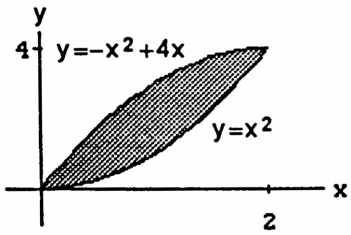
$= \left[\frac{8x^2}{2} - \frac{x^5}{5}\right]_0^2 = 16 - \frac{32}{5} = \frac{80-32}{5} = \frac{48}{5}$



44. Limits of integration: $x^2 - 2x = x \Rightarrow x^2 = 3x$

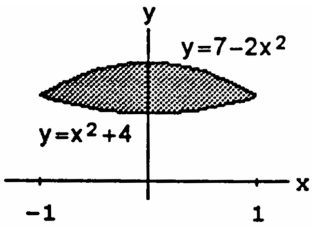
$\Rightarrow x(x - 3) = 0 \Rightarrow a = 0$ and $b = 3$;

$f(x) - g(x) = x - (x^2 - 2x) = 3x - x^2$

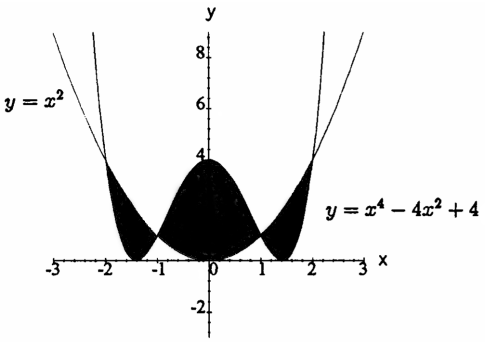


$\Rightarrow A = \int_0^3 (3x - x^2)\,dx = \left[\frac{3x^2}{2} - \frac{x^3}{3}\right]_0^3$

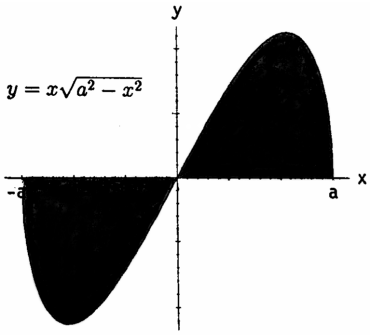
$= \frac{27}{2} - 9 = \frac{27-18}{2} = \frac{9}{2}$



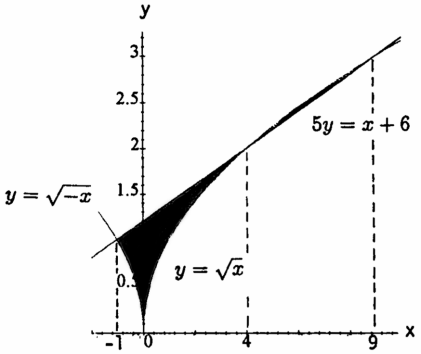
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



45. Limits of integration: $x^2 = -x^2 + 4x \Rightarrow 2x^2 - 4x = 0$
$\Rightarrow 2x(x-2) = 0 \Rightarrow a = 0$ and $b = 2$;
$f(x) - g(x) = (-x^2 + 4x) - x^2 = -2x^2 + 4x$
$\Rightarrow A = \int_0^2 (-2x^2 + 4x)\,dx = \left[\frac{-2x^3}{3} + \frac{4x^2}{2}\right]_0^2$
$= -\frac{16}{3} + \frac{16}{2} = \frac{-32+48}{6} = \frac{8}{3}$



46. Limits of integration: $7 - 2x^2 = x^2 + 4 \Rightarrow 3x^2 - 3 = 0$
$\Rightarrow 3(x-1)(x+1) = 0 \Rightarrow a = -1$ and $b = 1$;
$f(x) - g(x) = (7 - 2x^2) - (x^2 + 4) = 3 - 3x^2$
$\Rightarrow A = \int_{-1}^{1} (3 - 3x^2)\,dx = 3\left[x - \frac{x^3}{3}\right]_{-1}^{1}$
$= 3\left[\left(1 - \frac{1}{3}\right) - \left(-1 + \frac{1}{3}\right)\right] = 6\left(\frac{2}{3}\right) = 4$



47. Limits of integration: $x^4 - 4x^2 + 4 = x^2$
$\Rightarrow x^4 - 5x^2 + 4 = 0 \Rightarrow (x^2 - 4)(x^2 - 1) = 0$
$\Rightarrow (x+2)(x-2)(x+1)(x-1) = 0 \Rightarrow x = -2, -1, 1, 2$;
$f(x) - g(x) = (x^4 - 4x^2 + 4) - x^2 = x^4 - 5x^2 + 4$ and
$g(x) - f(x) = x^2 - (x^4 - 4x^2 + 4) = -x^4 + 5x^2 - 4$
$\Rightarrow A = \int_{-2}^{-1} (-x^4 + 5x^2 - 4)dx + \int_{-1}^{1} (x^4 - 5x^2 + 4)dx$
$+ \int_1^2 (-x^4 + 5x^2 - 4)dx$
$= \left[-\frac{x^5}{5} + \frac{5x^3}{3} - 4x\right]_{-2}^{-1} + \left[\frac{x^5}{5} - \frac{5x^3}{3} + 4x\right]_{-1}^{1} + \left[\frac{-x^5}{5} + \frac{5x^3}{3} - 4x\right]_1^2$
$= \left(\frac{1}{5} - \frac{5}{3} + 4\right) - \left(\frac{32}{5} - \frac{40}{3} + 8\right) + \left(\frac{1}{5} - \frac{5}{3} + 4\right) - \left(-\frac{1}{5} + \frac{5}{3} - 4\right) + \left(-\frac{32}{5} + \frac{40}{3} - 8\right) - \left(-\frac{1}{5} + \frac{5}{3} - 4\right)$
$= -\frac{60}{5} + \frac{60}{3} = \frac{300-180}{15} = 8$

48. Limits of integration: $x\sqrt{a^2 - x^2} = 0 \Rightarrow x = 0$ or
$\sqrt{a^2 - x^2} = 0 \Rightarrow x = 0$ or $a^2 - x^2 = 0 \Rightarrow x = -a, 0, a$;
$A = \int_{-a}^{0} -x\sqrt{a^2 - x^2}\,dx + \int_0^a x\sqrt{a^2 - x^2}\,dx$
$= \frac{1}{2}\left[\frac{2}{3}(a^2 - x^2)^{3/2}\right]_{-a}^{0} - \frac{1}{2}\left[\frac{2}{3}(a^2 - x^2)^{3/2}\right]_0^a$
$= \frac{1}{3}(a^2)^{3/2} - \left[-\frac{1}{3}(a^2)^{3/2}\right] = \frac{2a^3}{3}$

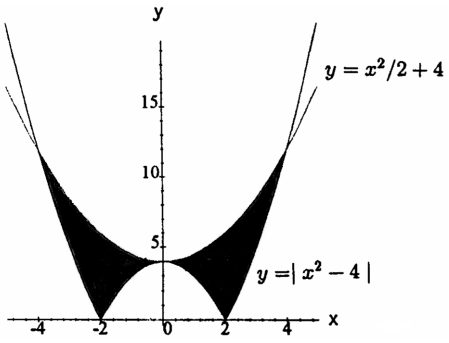
49. Limits of integration: $y = \sqrt{|x|} = \begin{cases} \sqrt{-x}, & x \le 0 \\ \sqrt{x}, & x \ge 0 \end{cases}$ and
$5y = x + 6$ or $y = \frac{x}{5} + \frac{6}{5}$; for $x \le 0$: $\sqrt{-x} = \frac{x}{5} + \frac{6}{5}$
$\Rightarrow 5\sqrt{-x} = x + 6 \Rightarrow 25(-x) = x^2 + 12x + 36$
$\Rightarrow x^2 + 37x + 36 = 0 \Rightarrow (x+1)(x+36) = 0$
$\Rightarrow x = -1, -36$ (but $x = -36$ is not a solution);
for $x \ge 0$: $5\sqrt{x} = x + 6 \Rightarrow 25x = x^2 + 12x + 36$
$\Rightarrow x^2 - 13x + 36 = 0 \Rightarrow (x-4)(x-9) = 0$
$\Rightarrow x = 4, 9$; there are three intersection points and
$A = \int_{-1}^{0} \left(\frac{x+6}{5} - \sqrt{-x}\right)dx + \int_0^4 \left(\frac{x+6}{5} - \sqrt{x}\right)dx + \int_4^9 \left(\sqrt{x} - \frac{x+6}{5}\right)dx$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$= \left[\frac{(x+6)^2}{10} + \frac{2}{3}(-x)^{3/2}\right]_{-1}^{0} + \left[\frac{(x+6)^2}{10} - \frac{2}{3}x^{3/2}\right]_{0}^{4} + \left[\frac{2}{3}x^{3/2} - \frac{(x+6)^2}{10}\right]_{4}^{9}$

$= \left(\frac{36}{10} - \frac{25}{10} - \frac{2}{3}\right) + \left(\frac{100}{10} - \frac{2}{3}\cdot 4^{3/2} - \frac{36}{10} + 0\right) + \left(\frac{2}{3}\cdot 9^{3/2} - \frac{225}{10} - \frac{2}{3}\cdot 4^{3/2} + \frac{100}{10}\right) = -\frac{50}{10} + \frac{20}{3} = \frac{5}{3}$

50. Limits of integration:



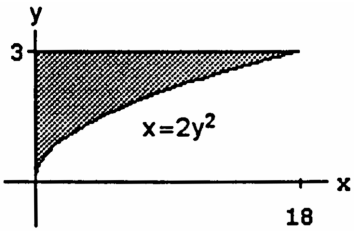
$y = |x^2 - 4| = \begin{cases} x^2 - 4, & x \le -2 \text{ or } x \ge 2 \\ 4 - x^2, & -2 \le x \le 2 \end{cases}$

for $x \le -2$ and $x \ge 2$: $x^2 - 4 = \frac{x^2}{2} + 4$

$\Rightarrow 2x^2 - 8 = x^2 + 8 \Rightarrow x^2 = 16 \Rightarrow x = \pm 4$;

for $-2 \le x \le 2$: $4 - x^2 = \frac{x^2}{2} + 4 \Rightarrow 8 - 2x^2 = x^2 + 8$

$\Rightarrow x^2 = 0 \Rightarrow x = 0$; by symmetry of the graph,



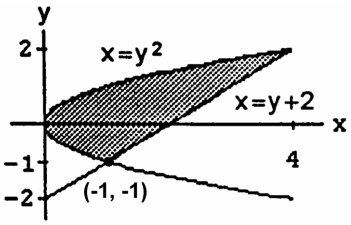
$A = 2\int_0^2 \left[\left(\frac{x^2}{2} + 4\right) - (4 - x^2)\right]dx + 2\int_2^4 \left[\left(\frac{x^2}{2} + 4\right) - (x^2 - 4)\right]dx = 2\left[\frac{x^3}{2}\right]_0^2 + 2\left[8x - \frac{x^3}{6}\right]_2^4$

$= 2\left(\frac{8}{2} - 0\right) + 2\left(32 - \frac{64}{6} - 16 + \frac{8}{6}\right) = 40 - \frac{56}{3} = \frac{64}{3}$

51. Limits of integration: $c = 0$ and $d = 3$;

$f(y) - g(y) = 2y^2 - 0 = 2y^2$

$\Rightarrow A = \int_0^3 2y^2\,dy = \left[\frac{2y^3}{3}\right]_0^3 = 2 \cdot 9 = 18$



52. Limits of integration: $y^2 = y + 2 \Rightarrow (y+1)(y-2) = 0$

$\Rightarrow c = -1$ and $d = 2$; $f(y) - g(y) = (y+2) - y^2$

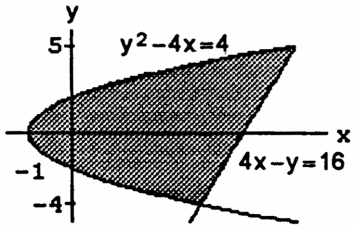
$\Rightarrow A = \int_{-1}^{2}(y + 2 - y^2)\,dy = \left[\frac{y^2}{2} + 2y - \frac{y^3}{3}\right]_{-1}^{2}$

$= \left(\frac{4}{2} + 4 - \frac{8}{3}\right) - \left(\frac{1}{2} - 2 + \frac{1}{3}\right) = 6 - \frac{8}{3} - \frac{1}{2} + 2 - \frac{1}{3} = \frac{9}{2}$

53. Limits of integration: $4x = y^2 - 4$ and $4x = 16 + y$

$\Rightarrow y^2 - 4 = 16 + y \Rightarrow y^2 - y - 20 = 0 \Rightarrow$

$(y-5)(y+4) = 0 \Rightarrow c = -4$ and $d = 5$;



$f(y) - g(y) = \left(\frac{16+y}{4}\right) - \left(\frac{y^2-4}{4}\right) = \frac{-y^2+y+20}{4}$

$\Rightarrow A = \frac{1}{4}\int_{-4}^{5}(-y^2 + y + 20)\,dy$

$= \frac{1}{4}\left[-\frac{y^3}{3} + \frac{y^2}{2} + 20y\right]_{-4}^{5}$

$= \frac{1}{4}\left(-\frac{125}{3} + \frac{25}{2} + 100\right) - \frac{1}{4}\left(\frac{64}{3} + \frac{16}{2} - 80\right)$

$= \frac{1}{4}\left(-\frac{189}{3} + \frac{9}{2} + 180\right) = \frac{243}{8}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$\Rightarrow y^2 = 3 - 2y^2 \Rightarrow 3y^2 = 3 \Rightarrow 3(y-1)(y+1) = 0$

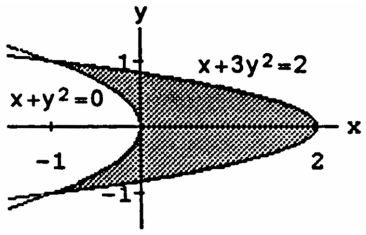
$\Rightarrow c = -1$ and $d = 1$; $f(y) - g(y) = (3 - 2y^2) - y^2$

$= 3 - 3y^2 = 3(1 - y^2) \Rightarrow A = 3\int_{-1}^{1}(1 - y^2)\,dy$

$= 3\left[y - \frac{y^3}{3}\right]_{-1}^{1} = 3\left(1 - \frac{1}{3}\right) - 3\left(-1 + \frac{1}{3}\right)$

$= 3 \cdot 2\left(1 - \frac{1}{3}\right) = 4$

55. Limits of integration: $x = -y^2$ and $x = 2 - 3y^2$



$\Rightarrow -y^2 = 2 - 3y^2 \Rightarrow 2y^2 - 2 = 0$

$\Rightarrow 2(y-1)(y+1) = 0 \Rightarrow c = -1$ and $d = 1$;

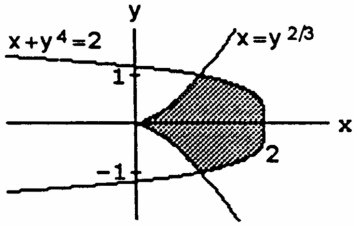
$f(y) - g(y) = (2 - 3y^2) - (-y^2) = 2 - 2y^2 = 2(1 - y^2)$

$\Rightarrow A = 2\int_{-1}^{1}(1 - y^2)\,dy = 2\left[y - \frac{y^3}{3}\right]_{-1}^{1}$

$= 2\left(1 - \frac{1}{3}\right) - 2\left(-1 + \frac{1}{3}\right) = 4\left(\frac{2}{3}\right) = \frac{8}{3}$

56. Limits of integration: $x = y^{2/3}$ and $x = 2 - y^4$

$\Rightarrow y^{2/3} = 2 - y^4 \Rightarrow c = -1$ and $d = 1$;



$f(y) - g(y) = (2 - y^4) - y^{2/3}$

$\Rightarrow A = \int_{-1}^{1}\left(2 - y^4 - y^{2/3}\right)dy$

$= \left[2y - \frac{y^5}{5} - \frac{3}{5}y^{5/3}\right]_{-1}^{1}$

$= \left(2 - \frac{1}{5} - \frac{3}{5}\right) - \left(-2 + \frac{1}{5} + \frac{3}{5}\right)$

$= 2\left(2 - \frac{1}{5} - \frac{3}{5}\right) = \frac{12}{5}$

57. Limits of integration: $x = y^2 - 1$ and $x = |y|\sqrt{1 - y^2}$

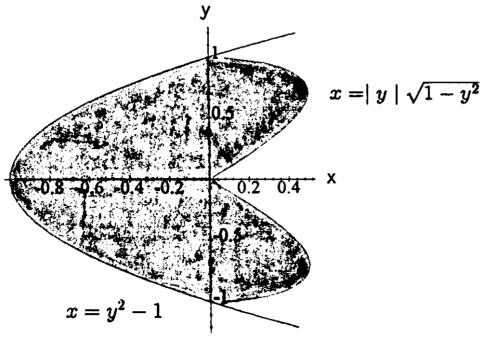
$\Rightarrow y^2 - 1 = |y|\sqrt{1 - y^2} \Rightarrow y^4 - 2y^2 + 1 = y^2(1 - y^2)$

$\Rightarrow y^4 - 2y^2 + 1 = y^2 - y^4 \Rightarrow 2y^4 - 3y^2 + 1 = 0$

$\Rightarrow (2y^2 - 1)(y^2 - 1) = 0 \Rightarrow 2y^2 - 1 = 0$ or $y^2 - 1 = 0$

$\Rightarrow y^2 = \frac{1}{2}$ or $y^2 = 1 \Rightarrow y = \pm\frac{\sqrt{2}}{2}$ or $y = \pm 1$.

Substitution shows that $\frac{\pm\sqrt{2}}{2}$ are not solutions $\Rightarrow y = \pm 1$;

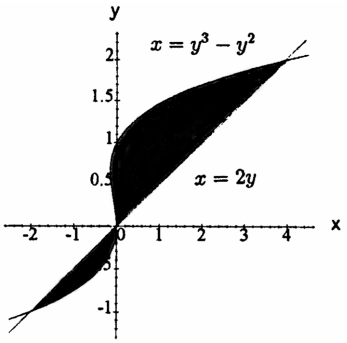


for $-1 \le y \le 0$, $f(x) - g(x) = -y\sqrt{1 - y^2} - (y^2 - 1)$

$= 1 - y^2 - y(1 - y^2)^{1/2}$, and by symmetry of the graph,

$A = 2\int_{-1}^{0}\left[1 - y^2 - y(1 - y^2)^{1/2}\right]dy$

$= 2\int_{-1}^{0}(1 - y^2)\,dy - 2\int_{-1}^{0}y(1 - y^2)^{1/2}\,dy$



$= 2\left[y - \frac{y^3}{3}\right]_{-1}^{0} + 2\left(\frac{1}{2}\right)\left[\frac{2(1 - y^2)^{3/2}}{3}\right]_{-1}^{0} = 2\left[(0 - 0) - \left(-1 + \frac{1}{3}\right)\right] + \left(\frac{2}{3} - 0\right) = 2$

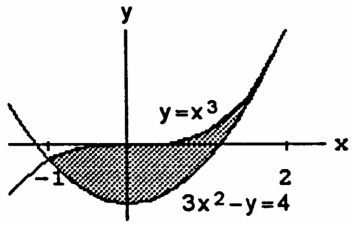
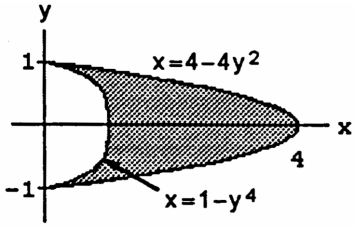
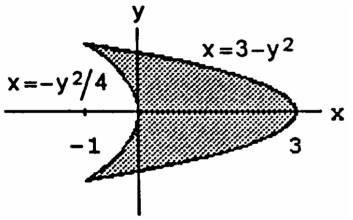
58. AREA = A1 + A2



Limits of integration: $x = 2y$ and $x = y^3 - y^2 \Rightarrow$
$y^3 - y^2 = 2y \Rightarrow y(y^2 - y - 2) = y(y+1)(y-2) = 0$
$\Rightarrow y = -1, 0, 2$:
for $-1 \le y \le 0$, $f(y) - g(y) = y^3 - y^2 - 2y$
$\Rightarrow A1 = \int_{-1}^{0} (y^3 - y^2 - 2y)\,dy = \left[\frac{y^4}{4} - \frac{y^3}{3} - y^2\right]_{-1}^{0}$
$= 0 - \left(\frac{1}{4} + \frac{1}{3} - 1\right) = \frac{5}{12}$;
for $0 \le y \le 2$, $f(y) - g(y) = 2y - y^3 + y^2$
$\Rightarrow A2 = \int_{0}^{2} (2y - y^3 + y^2)\,dy = \left[y^2 - \frac{y^4}{4} + \frac{y^3}{3}\right]_{0}^{2}$
$\Rightarrow \left(4 - \frac{16}{4} + \frac{8}{3}\right) - 0 = \frac{8}{3}$;
Therefore, $A1 + A2 = \frac{5}{12} + \frac{8}{3} = \frac{37}{12}$



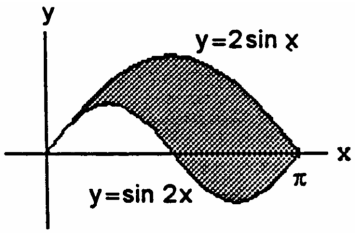
59. Limits of integration: $y = -4x^2 + 4$ and $y = x^4 - 1$
$\Rightarrow x^4 - 1 = -4x^2 + 4 \Rightarrow x^4 + 4x^2 - 5 = 0$
$\Rightarrow (x^2 + 5)(x - 1)(x + 1) = 0 \Rightarrow a = -1$ and $b = 1$;
$f(x) - g(x) = -4x^2 + 4 - x^4 + 1 = -4x^2 - x^4 + 5$
$\Rightarrow A = \int_{-1}^{1} (-4x^2 - x^4 + 5)\,dx = \left[-\frac{4x^3}{3} - \frac{x^5}{5} + 5x\right]_{-1}^{1}$
$= \left(-\frac{4}{3} - \frac{1}{5} + 5\right) - \left(\frac{4}{3} + \frac{1}{5} - 5\right) = 2\left(-\frac{4}{3} - \frac{1}{5} + 5\right) = \frac{104}{15}$



60. Limits of integration: $y = x^3$ and $y = 3x^2 - 4$
$\Rightarrow x^3 - 3x^2 + 4 = 0 \Rightarrow (x^2 - x - 2)(x - 2) = 0$
$\Rightarrow (x + 1)(x - 2)^2 = 0 \Rightarrow a = -1$ and $b = 2$;
$f(x) - g(x) = x^3 - (3x^2 - 4) = x^3 - 3x^2 + 4$
$\Rightarrow A = \int_{-1}^{2} (x^3 - 3x^2 + 4)\,dx = \left[\frac{x^4}{4} - \frac{3x^3}{3} + 4x\right]_{-1}^{2}$
$= \left(\frac{16}{4} - \frac{24}{3} + 8\right) - \left(\frac{1}{4} + 1 - 4\right) = \frac{27}{4}$

61. Limits of integration: $x = 4 - 4y^2$ and $x = 1 - y^4$
$\Rightarrow 4 - 4y^2 = 1 - y^4 \Rightarrow y^4 - 4y^2 + 3 = 0$
$\Rightarrow \left(y - \sqrt{3}\right)\left(y + \sqrt{3}\right)(y - 1)(y + 1) = 0 \Rightarrow c = -1$
and $d = 1$ since $x \ge 0$; $f(y) - g(y) = (4 - 4y^2) - (1 - y^4)$
$= 3 - 4y^2 + y^4 \Rightarrow A = \int_{-1}^{1} (3 - 4y^2 + y^4)\,dy$
$= \left[3y - \frac{4y^3}{3} + \frac{y^5}{5}\right]_{-1}^{1} = 2\left(3 - \frac{4}{3} + \frac{1}{5}\right) = \frac{56}{15}$

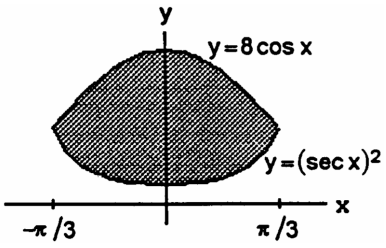
62. Limits of integration: $x = 3 - y^2$ and $x = -\frac{y^2}{4}$
$\Rightarrow 3 - y^2 = -\frac{y^2}{4} \Rightarrow \frac{3y^2}{4} - 3 = 0 \Rightarrow \frac{3}{4}(y - 2)(y + 2) = 0$
$\Rightarrow c = -2$ and $d = 2$; $f(y) - g(y) = (3 - y^2) - \left(\frac{-y^2}{4}\right)$
$= 3\left(1 - \frac{y^2}{4}\right) \Rightarrow A = 3\int_{-2}^{2}\left(1 - \frac{y^2}{4}\right) dy = 3\left[y - \frac{y^3}{12}\right]_{-2}^{2}$
$= 3\left[\left(2 - \frac{8}{12}\right) - \left(-2 + \frac{8}{12}\right)\right] = 3\left(4 - \frac{16}{12}\right) = 12 - 4 = 8$



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

63. $a = 0, b = \pi$; $f(x) - g(x) = 2 \sin x - \sin 2x$

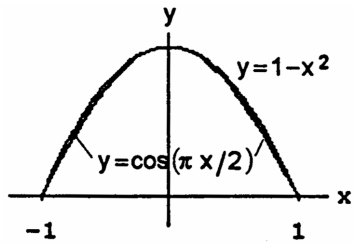
$\Rightarrow A = \int_0^{\pi} (2 \sin x - \sin 2x)\, dx = \left[-2 \cos x + \frac{\cos 2x}{2}\right]_0^{\pi}$



$= \left[-2(-1) + \frac{1}{2}\right] - \left(-2 \cdot 1 + \frac{1}{2}\right) = 4$

64. $a = -\frac{\pi}{3}, b = \frac{\pi}{3}$; $f(x) - g(x) = 8 \cos x - \sec^2 x$

$\Rightarrow A = \int_{-\pi/3}^{\pi/3} (8 \cos x - \sec^2 x)\, dx = [8 \sin x - \tan x]_{-\pi/3}^{\pi/3}$



$= \left(8 \cdot \frac{\sqrt{3}}{2} - \sqrt{3}\right) - \left(-8 \cdot \frac{\sqrt{3}}{2} + \sqrt{3}\right) = 6\sqrt{3}$

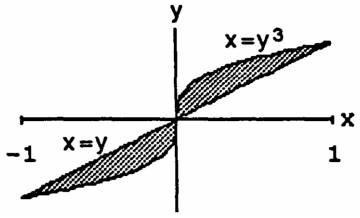
$= \left(\frac{3}{\pi}\sqrt{3} - \frac{3}{4}\right) - \left[\frac{3}{\pi}\left(-\sqrt{3}\right) - \frac{3}{4}\right] = \frac{6\sqrt{3}}{\pi}$

71. $A = A_1 + A_2$

Limits of integration: $x = y^3$ and $x = y \Rightarrow y = y^3$



$\Rightarrow y^3 - y = 0 \Rightarrow y(y - 1)(y + 1) = 0 \Rightarrow c_1 = -1, d_1 = 0$

and $c_2 = 0, d_2 = 1$; $f_1(y) - g_1(y) = y^3 - y$ and

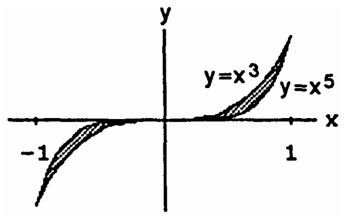
$f_2(y) - g_2(y) = y - y^3 \Rightarrow$ by symmetry about the origin,

$A_1 + A_2 = 2A_2 \Rightarrow A = 2\int_0^1 (y - y^3)\, dy = 2\left[\frac{y^2}{2} - \frac{y^4}{4}\right]_0^1$

$= 2\left(\frac{1}{2} - \frac{1}{4}\right) = \frac{1}{2}$

72. $A = A_1 + A_2$

Limits of integration: $y = x^3$ and $y = x^5 \Rightarrow x^3 = x^5$



$\Rightarrow x^5 - x^3 = 0 \Rightarrow x^3(x - 1)(x + 1) = 0 \Rightarrow a_1 = -1, b_1 = 0$

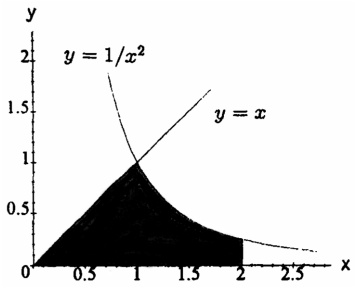
and $a_2 = 0, b_2 = 1$; $f_1(x) - g_1(x) = x^3 - x^5$ and

$f_2(x) - g_2(x) = x^5 - x^3 \Rightarrow$ by symmetry about the origin,

$A_1 + A_2 = 2A_2 \Rightarrow A = 2\int_0^1 (x^3 - x^5)\, dx = 2\left[\frac{x^4}{4} - \frac{x^6}{6}\right]_0^1$

$= 2\left(\frac{1}{4} - \frac{1}{6}\right) = \frac{1}{6}$

73. $A = A_1 + A_2$



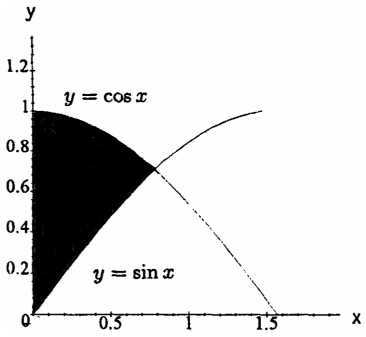
Limits of integration: $y = x$ and $y = \frac{1}{x^2} \Rightarrow x = \frac{1}{x^2}, x \neq 0$

$\Rightarrow x^3 = 1 \Rightarrow x = 1$, $f_1(x) - g_1(x) = x - 0 = x$

$\Rightarrow A_1 = \int_0^1 x\, dx = \left[\frac{x^2}{2}\right]_0^1 = \frac{1}{2}$; $f_2(x) - g_2(x) = \frac{1}{x^2} - 0$

$= x^{-2} \Rightarrow A_2 = \int_1^2 x^{-2}\, dx = \left[\frac{-1}{x}\right]_1^2 = -\frac{1}{2} + 1 = \frac{1}{2}$;

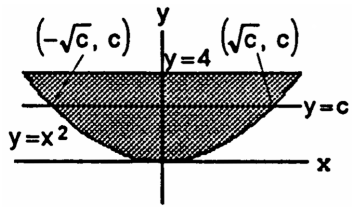
$A = A_1 + A_2 = \frac{1}{2} + \frac{1}{2} = 1$



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

74. Limits of integration: $\sin x = \cos x \Rightarrow x = \frac{\pi}{4} \Rightarrow a = 0$ and $b = \frac{\pi}{4}$; $f(x) - g(x) = \cos x - \sin x$

$\Rightarrow A = \int_0^{\pi/4} (\cos x - \sin x)\,dx = [\sin x + \cos x]_0^{\pi/4}$



$= \left(\frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2}\right) - (0 + 1) = \sqrt{2} - 1$

75. (a) The coordinates of the points of intersection of the line and parabola are $c = x^2 \Rightarrow x = \pm\sqrt{c}$ and $y = c$

(b) $f(y) - g(y) = \sqrt{y} - \left(-\sqrt{y}\right) = 2\sqrt{y} \Rightarrow$ the area of the lower section is, $A_L = \int_0^c [f(y) - g(y)]\,dy$

$= 2\int_0^c \sqrt{y}\,dy = 2\left[\frac{2}{3}y^{3/2}\right]_0^c = \frac{4}{3}c^{3/2}$. The area of the entire shaded region can be found by setting $c = 4$: $A = \left(\frac{4}{3}\right)4^{3/2} = \frac{4\cdot 8}{3} = \frac{32}{3}$. Since we want c to divide the region into subsections of equal area we have $A = 2A_L \Rightarrow \frac{32}{3} = 2\left(\frac{4}{3}c^{3/2}\right) \Rightarrow c = 4^{2/3}$

(c) $f(x) - g(x) = c - x^2 \Rightarrow A_L = \int_{-\sqrt{c}}^{\sqrt{c}} [f(x) - g(x)]\,dx = \int_{-\sqrt{c}}^{\sqrt{c}} (c - x^2)\,dx = \left[cx - \frac{x^3}{3}\right]_{-\sqrt{c}}^{\sqrt{c}} = 2\left[c^{3/2} - \frac{c^{3/2}}{3}\right]$

$= \frac{4}{3}c^{3/2}$. Again, the area of the whole shaded region can be found by setting $c = 4 \Rightarrow A = \frac{32}{3}$. From the condition $A = 2A_L$, we get $\frac{4}{3}c^{3/2} = \frac{32}{3} \Rightarrow c = 4^{2/3}$ as in part (b).

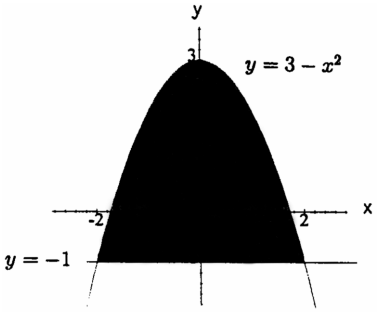
76. (a) Limits of integration: $y = 3 - x^2$ and $y = -1$

$\Rightarrow 3 - x^2 = -1 \Rightarrow x^2 = 4 \Rightarrow a = -2$ and $b = 2$;

$f(x) - g(x) = (3 - x^2) - (-1) = 4 - x^2$

$\Rightarrow A = \int_{-1}^{2} (4 - x^2)\,dx = \left[4x - \frac{x^3}{3}\right]_{-2}^{2}$

$= \left(8 - \frac{8}{3}\right) - \left(-8 + \frac{8}{3}\right) = 16 - \frac{16}{3} = \frac{32}{3}$



(b) Limits of integration: let $x = 0$ in $y = 3 - x^2$

$\Rightarrow y = 3$; $f(y) - g(y) = \sqrt{3 - y} - \left(-\sqrt{3 - y}\right)$

$= 2(3 - y)^{1/2}$

$\Rightarrow A = 2\int_{-1}^{3} (3 - y)^{1/2}\,dy = -2\int_{-1}^{3} (3 - y)^{1/2}(-1)\,dy = (-2)\left[\frac{2(3-y)^{3/2}}{3}\right]_{-1}^{3} = \left(-\frac{4}{3}\right)\left[0 - (3 + 1)^{3/2}\right]$

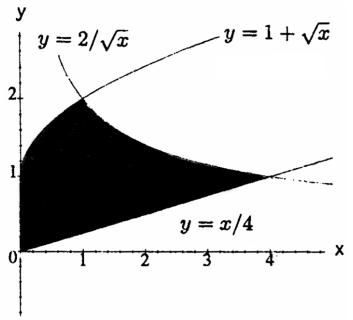
$= \left(\frac{4}{3}\right)(8) = \frac{32}{3}$

77. Limits of integration: $y = 1 + \sqrt{x}$ and $y = \frac{2}{\sqrt{x}}$

$\Rightarrow 1 + \sqrt{x} = \frac{2}{\sqrt{x}}, x \neq 0 \Rightarrow \sqrt{x} + x = 2 \Rightarrow x = (2 - x)^2$

$\Rightarrow x = 4 - 4x + x^2 \Rightarrow x^2 - 5x + 4 = 0$

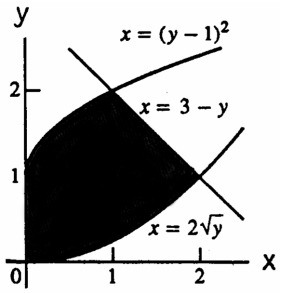
$\Rightarrow (x - 4)(x - 1) = 0 \Rightarrow x = 1, 4$ (but $x = 4$ does not satisfy the equation); $y = \frac{2}{\sqrt{x}}$ and $y = \frac{x}{4} \Rightarrow \frac{2}{\sqrt{x}} = \frac{x}{4}$



$\Rightarrow 8 = x\sqrt{x} \Rightarrow 64 = x^3 \Rightarrow x = 4$.

Therefore, AREA $= A_1 + A_2$: $f_1(x) - g_1(x) = \left(1 + x^{1/2}\right) - \frac{x}{4}$

$\Rightarrow A_1 = \int_0^1 \left(1 + x^{1/2} - \frac{x}{4}\right)dx = \left[x + \frac{2}{3}x^{3/2} - \frac{x^2}{8}\right]_0^1$



$= \left(1 + \frac{2}{3} - \frac{1}{8}\right) - 0 = \frac{37}{24}$; $f_2(x) - g_2(x) = 2x^{-1/2} - \frac{x}{4} \Rightarrow A_2 = \int_1^4 \left(2x^{-1/2} - \frac{x}{4}\right)dx = \left[4x^{1/2} - \frac{x^2}{8}\right]_1^4$

$= \left(4 \cdot 2 - \frac{16}{8}\right) - \left(4 - \frac{1}{8}\right) = 4 - \frac{15}{8} = \frac{17}{8}$; Therefore, AREA $= A_1 + A_2 = \frac{37}{24} + \frac{17}{8} = \frac{37+51}{24} = \frac{88}{24} = \frac{11}{3}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

78. Limits of integration: $(y-1)^2 = 3-y \Rightarrow y^2-2y+1 = 3-y \Rightarrow y^2-y-2=0 \Rightarrow (y-2)(y+1)=0$
$\Rightarrow y = 2$ since $y > 0$; also, $2\sqrt{y} = 3-y$
$\Rightarrow 4y = 9-6y+y^2 \Rightarrow y^2-10y+9=0$
$\Rightarrow (y-9)(y-1)=0 \Rightarrow y=1$ since $y=9$ does not satisfy the equation;
AREA $= A_1 + A_2$
$f_1(y) - g_1(y) = 2\sqrt{y} - 0 = 2y^{1/2}$

$\Rightarrow A_1 = 2\int_0^1 y^{1/2}\,dy = 2\left[\frac{2y^{3/2}}{3}\right]_0^1 = \frac{4}{3}$; $f_2(y) - g_2(y) = (3-y) - (y-1)^2$

$\Rightarrow A_2 = \int_1^2 [3-y-(y-1)^2]\,dy = \left[3y - \frac{1}{2}y^2 - \frac{1}{3}(y-1)^3\right]_1^2 = \left(6-2-\frac{1}{3}\right) - \left(3-\frac{1}{2}+0\right) = 1-\frac{1}{3}+\frac{1}{2} = \frac{7}{6}$;
Therefore, $A_1 + A_2 = \frac{4}{3}+\frac{7}{6} = \frac{15}{6} = \frac{5}{2}$

79. Area between parabola and $y = a^2$: $A = 2\int_0^a (a^2-x^2)\,dx = 2\left[a^2x - \frac{1}{3}x^3\right]_0^a = 2\left(a^3 - \frac{a^3}{3}\right) - 0 = \frac{4a^3}{3}$;
Area of triangle AOC: $\frac{1}{2}(2a)(a^2) = a^3$; limit of ratio $= \lim_{a\to 0^+} \frac{a^3}{\left(\frac{4a^3}{3}\right)} = \frac{3}{4}$ which is independent of a.

80. $A = \int_a^b 2f(x)\,dx - \int_a^b f(x)\,dx = 2\int_a^b f(x)\,dx - \int_a^b f(x)\,dx = \int_a^b f(x)\,dx = 4$

81. Neither one; they are both zero. Neither integral takes into account the changes in the formulas for the region's upper and lower bounding curves at $x = 0$. The area of the shaded region is actually
$A = \int_{-1}^0 [-x-(x)]\,dx + \int_0^1 [x-(-x)]\,dx = \int_{-1}^0 -2x\,dx + \int_0^1 2x\,dx = 2$.

82. It is sometimes true. It is true if $f(x) \geq g(x)$ for all x between a and b. Otherwise it is false. If the graph of f lies below the graph of g for a portion of the interval of integration, the integral over that portion will be negative and the integral over [a, b] will be less than the area between the curves (see Exercise 53).

83. Let $u = 2x \Rightarrow du = 2\,dx \Rightarrow \frac{1}{2}\,du = dx$; $x = 1 \Rightarrow u = 2$, $x = 3 \Rightarrow u = 6$
$\int_1^3 \frac{\sin 2x}{x}\,dx = \int_2^6 \frac{\sin u}{\left(\frac{u}{2}\right)}\left(\frac{1}{2}\,du\right) = \int_2^6 \frac{\sin u}{u}\,du = [F(u)]_2^6 = F(6) - F(2)$

84. Let $u = 1-x \Rightarrow du = -dx \Rightarrow -du = dx$; $x = 0 \Rightarrow u = 1$, $x = 1 \Rightarrow u = 0$
$\int_0^1 f(1-x)\,dx = \int_1^0 f(u)(-du) = -\int_1^0 f(u)\,du = \int_0^1 f(u)\,du = \int_0^1 f(x)\,dx$

85. (a) Let $u = -x \Rightarrow du = -dx$; $x = -1 \Rightarrow u = 1$, $x = 0 \Rightarrow u = 0$
f odd $\Rightarrow f(-x) = -f(x)$. Then $\int_{-1}^0 f(x)\,dx = \int_1^0 f(-u)(-du) = \int_1^0 -f(u)(-du) = \int_1^0 f(u)\,du = -\int_0^1 f(u)\,du$
$= -3$

(b) Let $u = -x \Rightarrow du = -dx$; $x = -1 \Rightarrow u = 1$, $x = 0 \Rightarrow u = 0$
f even $\Rightarrow f(-x) = f(x)$. Then $\int_{-1}^0 f(x)\,dx = \int_1^0 f(-u)(-du) = -\int_1^0 f(u)\,du = \int_0^1 f(u)\,du = 3$

86. (a) Consider $\int_{-a}^0 f(x)\,dx$ when f is odd. Let $u = -x \Rightarrow du = -dx \Rightarrow -du = dx$ and $x = -a \Rightarrow u = a$ and $x = 0$
$\Rightarrow u = 0$. Thus $\int_{-a}^0 f(x)\,dx = \int_a^0 -f(-u)\,du = \int_a^0 f(u)\,du = -\int_0^a f(u)\,du = -\int_0^a f(x)\,dx$.
Thus $\int_{-a}^a f(x)\,dx = \int_{-a}^0 f(x)\,dx + \int_0^a f(x)\,dx = -\int_0^a f(x)\,dx + \int_0^a f(x)\,dx = 0$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

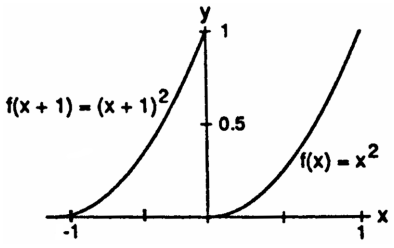
(b) $\int_{-\pi/2}^{\pi/2} \sin x\, dx = [-\cos x]_{-\pi/2}^{\pi/2} = -\cos\left(\frac{\pi}{2}\right) + \cos\left(-\frac{\pi}{2}\right) = 0 + 0 = 0.$

87. Let $u = a - x \Rightarrow du = -dx$; $x = 0 \Rightarrow u = a$, $x = a \Rightarrow u = 0$

$$I = \int_0^a \frac{f(x)\,dx}{f(x)+f(a-x)} = \int_a^0 \frac{f(a-u)}{f(a-u)+f(u)}(-du) = \int_0^a \frac{f(a-u)\,du}{f(u)+f(a-u)} = \int_0^a \frac{f(a-x)\,dx}{f(x)+f(a-x)}$$

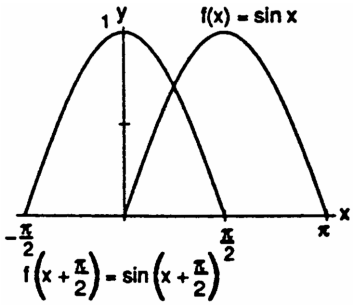
$$\Rightarrow I + I = \int_0^a \frac{f(x)\,dx}{f(x)+f(a-x)} + \int_0^a \frac{f(a-x)\,dx}{f(x)+f(a-x)} = \int_0^a \frac{f(x)+f(a-x)}{f(x)+f(a-x)}\,dx = \int_0^a dx = [x]_0^a = a - 0 = a.$$

Therefore, $2I = a \Rightarrow I = \frac{a}{2}$.



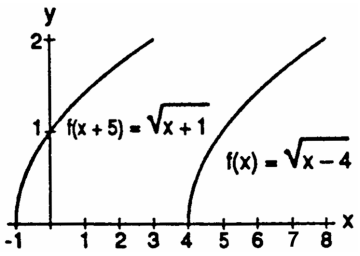
88. Let $u = \frac{xy}{t} \Rightarrow du = -\frac{xy}{t^2}\,dt \Rightarrow -\frac{t}{xy}\,du = \frac{1}{t}\,dt \Rightarrow -\frac{1}{u}\,du = \frac{1}{t}\,dt$; $t = x \Rightarrow u = y$, $t = xy \Rightarrow u = 1$. Therefore,

$$\int_x^{xy} \frac{1}{t}\,dt = \int_y^1 -\frac{1}{u}\,du = -\int_y^1 \frac{1}{u}\,du = \int_1^y \frac{1}{u}\,du = \int_1^y \frac{1}{t}\,dt$$



89. Let $u = x + c \Rightarrow du = dx$; $x = a - c \Rightarrow u = a$, $x = b - c \Rightarrow u = b$

$$\int_{a-c}^{b-c} f(x + c)\,dx = \int_a^b f(u)\,du = \int_a^b f(x)\,dx$$



90. (a)

(b)

(c)

91-94. Example CAS commands:

Maple:

```
f := x -> x^3/3-x^2/2-2*x+1/3;
g := x -> x-1;
plot( [f(x),g(x)], x=-5..5, legend=["y = f(x)","y = g(x)"], title="#91(a) (Section 5.6)" );
q1 := [ -5, -2, 1, 4 ];                    # (b)
q2 := [seq( fsolve( f(x)=g(x), x=q1[i]..q1[i+1] ), i=1..nops(q1)-1 )];
for i from 1 to nops(q2)-1 do        # (c)
  area[i] := int( abs(f(x)-g(x)),x=q2[i]..q2[i+1] );
end do;
add( area[i], i=1..nops(q2)-1 );     # (d)
```

Mathematica: (assigned functions may vary)

```
Clear[x, f, g]
f[x_] = x^2 Cos[x]
g[x_] = x^3 − x
Plot[{f[x], g[x]}, {x, −2, 2}]
```

After examining the plots, the initial guesses for FindRoot can be determined.

```
pts = x/.Map[FindRoot[f[x]==g[x],{x, #}]&, {−1, 0, 1}]
i1=NIntegrate[f[x] − g[x], {x, pts[[1]], pts[[2]]}]
i2=NIntegrate[f[x] − g[x], {x, pts[[2]], pts[[3]]}]
i1 + i2
```

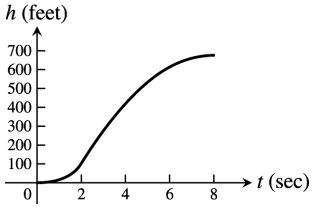
## CHAPTER 5 PRACTICE EXERCISES

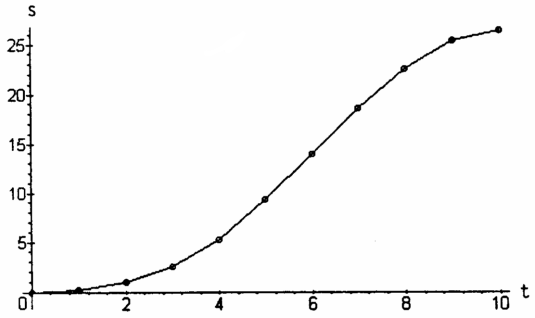


1. (a) Each time subinterval is of length $\Delta t = 0.4$ sec. The distance traveled over each subinterval, using the midpoint rule, is $\Delta h = \frac{1}{2}(v_i + v_{i+1})\,\Delta t$, where $v_i$ is the velocity at the left endpoint and $v_{i+1}$ the velocity at the right endpoint of the subinterval. We then add $\Delta h$ to the height attained so far at the left endpoint $v_i$ to arrive at the height associated with velocity $v_{i+1}$ at the right endpoint. Using this methodology we build the following table based on the figure in the text:

| t (sec) | 0 | 0.4 | 0.8 | 1.2 | 1.6 | 2.0 | 2.4 | 2.8 | 3.2 | 3.6 | 4.0 | 4.4 | 4.8 | 5.2 | 5.6 | 6.0 |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| v (fps) | 0 | 10 | 25 | 55 | 100 | 190 | 180 | 165 | 150 | 140 | 130 | 115 | 105 | 90 | 76 | 65 |
| h (ft) | 0 | 2 | 9 | 25 | 56 | 114 | 188 | 257 | 320 | 378 | 432 | 481 | 525 | 564 | 592 | 620.2 |

| t (sec) | 6.4 | 6.8 | 7.2 | 7.6 | 8.0 |
|---|---|---|---|---|---|
| v (fps) | 50 | 37 | 25 | 12 | 0 |
| h (ft) | 643.2 | 660.6 | 672 | 679.4 | 681.8 |

NOTE: Your table values may vary slightly from ours depending on the v-values you read from the graph. Remember that some shifting of the graph occurs in the printing process.
The total height attained is about 680 ft.



(b) The graph is based on the table in part (a).

2. (a) Each time subinterval is of length $\Delta t = 1$ sec. The distance traveled over each subinterval, using the midpoint rule, is $\Delta s = \frac{1}{2}(v_i + v_{i+1})\,\Delta t$, where $v_i$ is the velocity at the left, and $v_{i+1}$ the velocity at the right, endpoint of the subinterval. We then add $\Delta s$ to the distance attained so far at the left endpoint $v_i$ to arrive at the distance associated with velocity $v_{i+1}$ at the right endpoint. Using this methodology we build the table given below based on the figure in the text, obtaining approximately 26 m for the total distance traveled:

| t (sec) | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 |
|---|---|---|---|---|---|---|---|---|---|---|---|
| v (m/sec) | 0 | 0.5 | 1.2 | 2 | 3.4 | 4.5 | 4.8 | 4.5 | 3.5 | 2 | 0 |
| s (m) | 0 | 0.25 | 1.1 | 2.7 | 5.4 | 9.35 | 14 | 18.65 | 22.65 | 25.4 | 26.4 |

(b) The graph shows the distance traveled by the moving body as a function of time for $0 \le t \le 10$.

3. (a) $\displaystyle\sum_{k=1}^{10} \frac{a_k}{4} = \frac{1}{4}\sum_{k=1}^{10} a_k = \frac{1}{4}(-2) = -\frac{1}{2}$ (b) $\displaystyle\sum_{k=1}^{10}(b_k - 3a_k) = \sum_{k=1}^{10} b_k - 3\sum_{k=1}^{10} a_k = 25 - 3(-2) = 31$

(c) $\displaystyle\sum_{k=1}^{10}(a_k + b_k - 1) = \sum_{k=1}^{10} a_k + \sum_{k=1}^{10} b_k - \sum_{k=1}^{10} 1 = -2 + 25 - (1)(10) = 13$

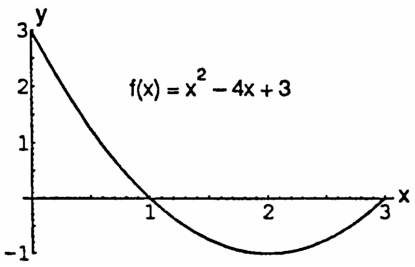
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(d) $\sum_{k=1}^{10}\left(\frac{5}{2}-b_k\right)=\sum_{k=1}^{10}\frac{5}{2}-\sum_{k=1}^{10}b_k=\frac{5}{2}(10)-25=0$

4. (a) $\sum_{k=1}^{20}3a_k=3\sum_{k=1}^{20}a_k=3(0)=0$ (b) $\sum_{k=1}^{20}(a_k+b_k)=\sum_{k=1}^{20}a_k+\sum_{k=1}^{20}b_k=0+7=7$
(c) $\sum_{k=1}^{20}\left(\frac{1}{2}-\frac{2b_k}{7}\right)=\sum_{k=1}^{20}\frac{1}{2}-\frac{2}{7}\sum_{k=1}^{20}b_k=\frac{1}{2}(20)-\frac{2}{7}(7)=8$
(d) $\sum_{k=1}^{20}(a_k-2)=\sum_{k=1}^{20}a_k-\sum_{k=1}^{20}2=0-2(20)=-40$

5. Let $u=2x-1\Rightarrow du=2\,dx\Rightarrow\frac{1}{2}\,du=dx$; $x=1\Rightarrow u=1$, $x=5\Rightarrow u=9$
$\int_1^5(2x-1)^{-1/2}\,dx=\int_1^9u^{-1/2}\left(\frac{1}{2}\,du\right)=\left[u^{1/2}\right]_1^9=3-1=2$

6. Let $u=x^2-1\Rightarrow du=2x\,dx\Rightarrow\frac{1}{2}\,du=x\,dx$; $x=1\Rightarrow u=0$, $x=3\Rightarrow u=8$
$\int_1^3x\,(x^2-1)^{1/3}\,dx=\int_0^8u^{1/3}\left(\frac{1}{2}\,du\right)=\left[\frac{3}{8}u^{4/3}\right]_0^8=\frac{3}{8}(16-0)=6$

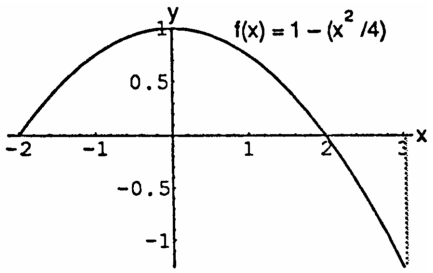


7. Let $u=\frac{x}{2}\Rightarrow 2\,du=dx$; $x=-\pi\Rightarrow u=-\frac{\pi}{2}$, $x=0\Rightarrow u=0$
$\int_{-\pi}^0\cos\left(\frac{x}{2}\right)dx=\int_{-\pi/2}^0(\cos u)(2\,du)=[2\sin u]_{-\pi/2}^0=2\sin 0-2\sin\left(-\frac{\pi}{2}\right)=2(0-(-1))=2$

8. Let $u=\sin x\Rightarrow du=\cos x\,dx$; $x=0\Rightarrow u=0$, $x=\frac{\pi}{2}\Rightarrow u=1$
$\int_0^{\pi/2}(\sin x)(\cos x)\,dx=\int_0^1u\,du=\left[\frac{u^2}{2}\right]_0^1=\frac{1}{2}$

9. (a) $\int_{-2}^2f(x)\,dx=\frac{1}{3}\int_{-2}^2 3\,f(x)\,dx=\frac{1}{3}(12)=4$ (b) $\int_2^5f(x)\,dx=\int_{-2}^5f(x)\,dx-\int_{-2}^2f(x)\,dx=6-4=2$
(c) $\int_5^{-2}g(x)\,dx=-\int_{-2}^5g(x)\,dx=-2$ (d) $\int_{-2}^5(-\pi\,g(x))\,dx=-\pi\int_{-2}^5g(x)\,dx=-\pi(2)=-2\pi$
(e) $\int_{-2}^5\left(\frac{f(x)+g(x)}{5}\right)dx=\frac{1}{5}\int_{-2}^5f(x)\,dx+\frac{1}{5}\int_{-2}^5g(x)\,dx=\frac{1}{5}(6)+\frac{1}{5}(2)=\frac{8}{5}$

10. (a) $\int_0^2g(x)\,dx=\frac{1}{7}\int_0^2 7\,g(x)\,dx=\frac{1}{7}(7)=1$ (b) $\int_1^2g(x)\,dx=\int_0^2g(x)\,dx-\int_0^1g(x)\,dx=1-2=-1$
(c) $\int_2^0f(x)\,dx=-\int_0^2f(x)\,dx=-\pi$ (d) $\int_0^2\sqrt{2}\,f(x)\,dx=\sqrt{2}\int_0^2f(x)\,dx=\sqrt{2}(\pi)=\pi\sqrt{2}$
(e) $\int_0^2[g(x)-3\,f(x)]\,dx=\int_0^2g(x)\,dx-3\int_0^2f(x)\,dx=1-3\pi$



11. $x^2-4x+3=0\Rightarrow(x-3)(x-1)=0\Rightarrow x=3$ or $x=1$;
Area $=\int_0^1(x^2-4x+3)\,dx-\int_1^3(x^2-4x+3)\,dx$
$=\left[\frac{x^3}{3}-2x^2+3x\right]_0^1-\left[\frac{x^3}{3}-2x^2+3x\right]_1^3$
$=\left[\left(\frac{1^3}{3}-2(1)^2+3(1)\right)-0\right]$
$-\left[\left(\frac{3^3}{3}-2(3)^2+3(3)\right)-\left(\frac{1^3}{3}-2(1)^2+3(1)\right)\right]$
$=\left(\frac{1}{3}+1\right)-\left[0-\left(\frac{1}{3}+1\right)\right]=\frac{8}{3}$

$$\int_0^{\pi/3} \frac{\tan\theta}{\sqrt{2}\sec\theta}\,d\theta = \int_0^{\pi/3} \frac{\sec\theta\tan\theta}{\sec\theta\sqrt{2}\sec\theta}\,d\theta = \int_0^{\pi/3} \frac{\sec\theta\tan\theta}{\sqrt{2}(\sec\theta)^{3/2}}\,d\theta = \int_1^2 \frac{1}{\sqrt{2}u^{3/2}}\,du = \frac{1}{\sqrt{2}}\int_1^2 u^{-3/2}\,du$$

$$= \frac{1}{\sqrt{2}}\left[\frac{u^{-1/2}}{(-\frac{1}{2})}\right]_1^2 = \left[-\frac{2}{\sqrt{2u}}\right]_1^2 = -\frac{2}{\sqrt{2(2)}} - \left(-\frac{2}{\sqrt{2(1)}}\right) = \sqrt{2} - 1$$

70. Let $u = \sin\sqrt{t} \Rightarrow du = \left(\cos\sqrt{t}\right)\left(\frac{1}{2}t^{-1/2}\right)dt = \frac{\cos\sqrt{t}}{2\sqrt{t}}\,dt \Rightarrow 2\,du = \frac{\cos\sqrt{t}}{\sqrt{t}}\,dt$; $t = \frac{\pi^2}{36} \Rightarrow u = \sin\frac{\pi}{6} = \frac{1}{2}$,

$t = \frac{\pi^2}{4} \Rightarrow u = \sin\frac{\pi}{2} = 1$

$$\int_{\pi^2/36}^{\pi^2/4} \frac{\cos\sqrt{t}}{\sqrt{t}\sin\sqrt{t}}\,dt = \int_{1/2}^1 \frac{1}{\sqrt{u}}(2\,du) = 2\int_{1/2}^1 u^{-1/2}\,du = \left[4\sqrt{u}\right]_{1/2}^1 = 4\sqrt{1} - 4\sqrt{\tfrac{1}{2}} = 2\left(2 - \sqrt{2}\right)$$

71. (a) $\text{av}(f) = \frac{1}{1-(-1)}\int_{-1}^1 (mx+b)\,dx = \frac{1}{2}\left[\frac{mx^2}{2} + bx\right]_{-1}^1 = \frac{1}{2}\left[\left(\frac{m(1)^2}{2} + b(1)\right) - \left(\frac{m(-1)^2}{2} + b(-1)\right)\right] = \frac{1}{2}(2b) = b$

(b) $\text{av}(f) = \frac{1}{k-(-k)}\int_{-k}^k (mx+b)\,dx = \frac{1}{2k}\left[\frac{mx^2}{2} + bx\right]_{-k}^k = \frac{1}{2k}\left[\left(\frac{m(k)^2}{2} + b(k)\right) - \left(\frac{m(-k)^2}{2} + b(-k)\right)\right]$

$= \frac{1}{2k}(2bk) = b$

72. (a) $y_{av} = \frac{1}{3-0}\int_0^3 \sqrt{3x}\,dx = \frac{1}{3}\int_0^3 \sqrt{3}\,x^{1/2}\,dx = \frac{\sqrt{3}}{3}\left[\frac{2}{3}x^{3/2}\right]_0^3 = \frac{\sqrt{3}}{3}\left[\frac{2}{3}(3)^{3/2} - \frac{2}{3}(0)^{3/2}\right] = \frac{\sqrt{3}}{3}\left(2\sqrt{3}\right) = 2$

(b) $y_{av} = \frac{1}{a-0}\int_0^a \sqrt{ax}\,dx = \frac{1}{a}\int_0^a \sqrt{a}\,x^{1/2}\,dx = \frac{\sqrt{a}}{a}\left[\frac{2}{3}x^{3/2}\right]_0^a = \frac{\sqrt{a}}{a}\left(\frac{2}{3}(a)^{3/2} - \frac{2}{3}(0)^{3/2}\right) = \frac{\sqrt{a}}{a}\left(\frac{2}{3}a\sqrt{a}\right) = \frac{2}{3}a$

73. $f'_{av} = \frac{1}{b-a}\int_a^b \sqrt{ax}f'(x)\,dx = \frac{1}{b-a}[f(x)]_a^b = \frac{1}{b-a}[f(b) - f(a)] = \frac{f(b)-f(a)}{b-a}$ so the average value of $f'$ over $[a, b]$ is the slope of the secant line joining the points $(a, f(a))$ and $(b, f(b))$, which is the average rate of change of f over $[a, b]$.

74. Yes, because the average value of f on $[a, b]$ is $\frac{1}{b-a}\int_a^b f(x)\,dx$. If the length of the interval is 2, then $b - a = 2$ and the average value of the function is $\frac{1}{2}\int_a^b f(x)\,dx$.

75. We want to evaluate

$$\frac{1}{365-0}\int_0^{365} f(x)\,dx = \frac{1}{365}\int_0^{365}\left(37\sin\left[\frac{2\pi}{365}(x-101)\right] + 25\right)dx = \frac{37}{365}\int_0^{365}\sin\left[\frac{2\pi}{365}(x-101)\right]dx + \frac{25}{365}\int_0^{365} dx$$

Notice that the period of $y = \sin\left[\frac{2\pi}{365}(x-101)\right]$ is $\frac{2\pi}{\frac{2\pi}{365}} = 365$ and that we are integrating this function over an interval of length 365. Thus the value of $\frac{37}{365}\int_0^{365}\sin\left[\frac{2\pi}{365}(x-101)\right]dx + \frac{25}{365}\int_0^{365} dx$ is $\frac{37}{365}\cdot 0 + \frac{25}{365}\cdot 365 = 25$.

76. $\frac{1}{675-20}\int_{20}^{675}(8.27 + 10^{-5}(26T - 1.87T^2))dT = \frac{1}{655}\left[8.27T + \frac{26T^2}{2\cdot 10^5} - \frac{1.87T^3}{3\cdot 10^5}\right]_{20}^{675}$

$= \frac{1}{655}\left(\left[8.27(675) + \frac{26(675)^2}{2\cdot 10^5} - \frac{1.87(675)^3}{3\cdot 10^5}\right] - \left[8.27(20) + \frac{26(20)^2}{2\cdot 10^5} - \frac{1.87(20)^3}{3\cdot 10^5}\right]\right) \approx \frac{1}{655}(3724.44 - 165.40)$

$= 5.43 =$ the average value of $C_v$ on $[20, 675]$. To find the temperature T at which $C_v = 5.43$, solve $5.43 = 8.27 + 10^{-5}(26T - 1.87T^2)$ for T. We obtain $1.87T^2 - 26T - 284000 = 0$

$\Rightarrow T = \frac{26 \pm \sqrt{(26)^2 - 4(1.87)(-284000)}}{2(1.87)} = \frac{26 \pm \sqrt{2124996}}{3.74}$. So $T = -382.82$ or $T = 396.72$. Only $T = 396.72$ lies in the interval $[20, 675]$, so $T = 396.72°C$.

77. $\frac{dy}{dx} = \sqrt{2 + \cos^3 x}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

78. $\frac{dy}{dx} = \sqrt{2+\cos^3(7x^2)} \cdot \frac{d}{dx}(7x^2) = 14x\sqrt{2+\cos^3(7x^2)}$

79. $\frac{dy}{dx} = \frac{d}{dx}\left(-\int_1^x \frac{6}{3+t^4}dt\right) = -\frac{6}{3+x^4}$

80. $\frac{dy}{dx} = \frac{d}{dx}\left(\int_{\sec x}^2 \frac{1}{t^2+1}dt\right) = -\frac{d}{dx}\left(\int_2^{\sec x} \frac{1}{t^2+1}dt\right) = -\frac{1}{\sec^2 x+1}\frac{d}{dx}(\sec x) = -\frac{\sec x \tan x}{1+\sec^2 x}$

81. Yes. The function f, being differentiable on [a, b], is then continuous on [a, b]. The Fundamental Theorem of Calculus says that every continuous function on [a, b] is the derivative of a function on [a, b].

82. The second part of the Fundamental Theorem of Calculus states that if F(x) is an antiderivative of f(x) on [a, b], then $\int_a^b f(x)\,dx = F(b) - F(a)$. In particular, if F(x) is an antiderivaitve of $\sqrt{1+x^4}$ on [0, 1], then $\int_0^1 \sqrt{1+x^4}\,dx = F(1) - F(0)$.

83. $y = \int_1^x \sqrt{1+t^2}\,dt = -\int_1^x \sqrt{1+t^2}\,dt \Rightarrow \frac{dy}{dx} = \frac{d}{dx}\left[-\int_1^x \sqrt{1+t^2}\,dt\right] = -\frac{d}{dx}\left[\int_1^x \sqrt{1+t^2}\,dt\right] = -\sqrt{1+x^2}$

84. $y = \int_{\cos x}^0 \frac{1}{1-t^2}\,dt = -\int_0^{\cos x} \frac{1}{1-t^2}\,dt \Rightarrow \frac{dy}{dx} = \frac{d}{dx}\left[-\int_0^{\cos x} \frac{1}{1-t^2}\,dt\right] = -\frac{d}{dx}\left[\int_0^{\cos x} \frac{1}{1-t^2}\,dt\right]$
$= -\left(\frac{1}{1-\cos^2 x}\right)\left(\frac{d}{dx}(\cos x)\right) = -\left(\frac{1}{\sin^2 x}\right)(-\sin x) = \frac{1}{\sin x} = \csc x$

85. We estimate the area A using midpoints of the vertical intervals, and we will estimate the width of the parking lot on each interval by averaging the widths at top and bottom. This gives the estimate
$A \approx 15 \cdot \left(\frac{0+36}{2} + \frac{36+54}{2} + \frac{54+51}{2} + \frac{51+49.5}{2} + \frac{49.5+54}{2} + \frac{54+64.4}{2} + \frac{64.4+67.5}{2} + \frac{67.5+42}{2}\right)$
$A \approx 5961$ ft$^2$. The cost is Area $\cdot$ (\$2.10/ft$^2$) $\approx$ (5961 ft$^2$) (\$2.10/ft$^2$) = \$12,518.10 $\Rightarrow$ the job cannot be done for \$11,000.

86. (a) Before the chute opens for A, $a = -32$ ft/sec$^2$. Since the helicopter is hovering, $v_0 = 0$ ft/sec
$\Rightarrow v = \int -32\,dt = -32t + v_0 = -32t$. Then $s_0 = 6400$ ft $\Rightarrow s = \int -32t\,dt = -16t^2 + s_0 = -16t^2 + 6400$.
At $t = 4$ sec, $s = -16(4)^2 + 6400 = 6144$ ft when A's chute opens;
(b) For B, $s_0 = 7000$ ft, $v_0 = 0$, $a = -32$ ft/sec$^2$ $\Rightarrow v = \int -32\,dt = -32t + v_0 = -32t \Rightarrow s = \int -32t\,dt$
$= -16t^2 + s_0 = -16t^2 + 7000$. At $t = 13$ sec, $s = -16(13)^2 + 7000 = 4296$ ft when B's chute opens;
(c) After the chutes open, $v = -16$ ft/sec $\Rightarrow s = \int -16\,dt = -16t + s_0$. For A, $s_0 = 6144$ ft and for B, $s_0 = 4296$ ft. Therefore, for A, $s = -16t + 6144$ and for B, $s = -16t + 4296$. When they hit the ground, $s = 0 \Rightarrow$ for A, $0 = -16t + 6144 \Rightarrow t = \frac{6144}{16} = 384$ seconds, and for B, $0 = -16t + 4296 \Rightarrow t = \frac{4296}{16}$
$= 268.5$ seconds to hit the ground after the chutes open. Since B's chute opens 58 seconds after A's opens
$\Rightarrow$ B hits the ground first.

87. $\text{av}(I) = \frac{1}{30}\int_0^{30} (1200 - 40t)\,dt = \frac{1}{30}\left[1200t - 20t^2\right]_0^{30} = \frac{1}{30}\left[((1200(30) - 20(30)^2) - (1200(0) - 20(0)^2)\right]$
$= \frac{1}{30}(18{,}000) = 600$; Average Daily Holding Cost $= (600)(\$0.03) = \$18$

88. $\text{av}(I) = \frac{1}{14}\int_0^{14} (600 + 600t)\,dt = \frac{1}{14}\left[600t + 300t^2\right]_0^{14} = \frac{1}{14}\left[600(14) + 300(14)^2 - 0\right] = 4800$; Average Daily Holding Cost $= (4800)(\$0.04) = \$192$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

89. $\text{av(I)} = \frac{1}{30}\int_0^{30}\left(450 - \frac{t^2}{2}\right)dt = \frac{1}{30}\left[450t - \frac{t^3}{6}\right]_0^{30} = \frac{1}{30}\left[450(30) - \frac{30^3}{6} - 0\right] = 300$; Average Daily Holding Cost
$= (300)(\$0.02) = \$6$

90. $\text{av(I)} = \frac{1}{60}\int_0^{60}\left(600 - 20\sqrt{15t}\right)dt = \frac{1}{60}\int_0^{60}\left(600 - 20\sqrt{15}\,t^{1/2}\right)dt = \frac{1}{60}\left[600t - 20\sqrt{15}\left(\frac{2}{3}\right)t^{3/2}\right]_0^{60}$
$= \frac{1}{60}\left[600(60) - \frac{40\sqrt{15}}{3}(60)^{3/2} - 0\right] = \frac{1}{60}\left(36{,}000 - \left(\frac{320}{3}\right)15^2\right) = 200$; Average Daily Holding Cost
$= (200)(\$0.005) = \$1.00$

## CHAPTER 5 ADDITIONAL AND ADVANCED EXERCISES

1. (a) Yes, because $\int_0^1 f(x)\,dx = \frac{1}{7}\int_0^1 7f(x)\,dx = \frac{1}{7}(7) = 1$

   (b) No. For example, $\int_0^1 8x\,dx = [4x^2]_0^1 = 4$, but $\int_0^1 \sqrt{8x}\,dx = \left[2\sqrt{2}\left(\frac{x^{3/2}}{\frac{3}{2}}\right)\right]_0^1 = \frac{4\sqrt{2}}{3}\left(1^{3/2} - 0^{3/2}\right)$
   $= \frac{4\sqrt{2}}{3} \neq \sqrt{4}$

2. (a) True: $\int_5^2 f(x)\,dx = -\int_2^5 f(x)\,dx = -3$

   (b) True: $\int_{-2}^5 [f(x) + g(x)]\,dx = \int_{-2}^5 f(x)\,dx + \int_{-2}^5 g(x)\,dx = \int_{-2}^2 f(x)\,dx + \int_2^5 f(x)\,dx + \int_{-2}^5 g(x)\,dx$
   $= 4 + 3 + 2 = 9$

   (c) False: $\int_{-2}^5 f(x)\,dx = 4 + 3 = 7 > 2 = \int_{-2}^5 g(x)\,dx \Rightarrow \int_{-2}^5 [f(x) - g(x)]\,dx > 0 \Rightarrow \int_{-2}^5 [g(x) - f(x)]\,dx < 0.$
   On the other hand, $f(x) \le g(x) \Rightarrow [g(x) - f(x)] \ge 0 \Rightarrow \int_{-2}^5 [g(x) - f(x)]\,dx \ge 0$ which is a contradiction.

3. $y = \frac{1}{a}\int_0^x f(t)\sin a(x - t)\,dt = \frac{1}{a}\int_0^x f(t)\sin ax\cos at\,dt - \frac{1}{a}\int_0^x f(t)\cos ax\sin at\,dt$
   $= \frac{\sin ax}{a}\int_0^x f(t)\cos at\,dt - \frac{\cos ax}{a}\int_0^x f(t)\sin at\,dt \Rightarrow \frac{dy}{dx} = \cos ax\left(\int_0^x f(t)\cos at\,dt\right)$
   $+ \frac{\sin ax}{a}\left(\frac{d}{dx}\int_0^x f(t)\cos at\,dt\right) + \sin ax\int_0^x f(t)\sin at\,dt - \frac{\cos ax}{a}\left(\frac{d}{dx}\int_0^x f(t)\sin at\,dt\right)$
   $= \cos ax\int_0^x f(t)\cos at\,dt + \frac{\sin ax}{a}(f(x)\cos ax) + \sin ax\int_0^x f(t)\sin at\,dt - \frac{\cos ax}{a}(f(x)\sin ax)$
   $\Rightarrow \frac{dy}{dx} = \cos ax\int_0^x f(t)\cos at\,dt + \sin ax\int_0^x f(t)\sin at\,dt.$ Next,
   $\frac{d^2y}{dx^2} = -a\sin ax\int_0^x f(t)\cos at\,dt + (\cos ax)\left(\frac{d}{dx}\int_0^x f(t)\cos at\,dt\right) + a\cos ax\int_0^x f(t)\sin at\,dt$
   $+ (\sin ax)\left(\frac{d}{dx}\int_0^x f(t)\sin at\,dt\right) = -a\sin ax\int_0^x f(t)\cos at\,dt + (\cos ax)f(x)\cos ax$
   $+ a\cos ax\int_0^x f(t)\sin at\,dt + (\sin ax)f(x)\sin ax = -a\sin ax\int_0^x f(t)\cos at\,dt + a\cos ax\int_0^x f(t)\sin at\,dt + f(x).$
   Therefore, $y'' + a^2y = a\cos ax\int_0^x f(t)\sin at\,dt - a\sin ax\int_0^x f(t)\cos at\,dt + f(x)$
   $+ a^2\left(\frac{\sin ax}{a}\int_0^x f(t)\cos at\,dt - \frac{\cos ax}{a}\int_0^x f(t)\sin at\,dt\right) = f(x).$ Note also that $y'(0) = y(0) = 0.$

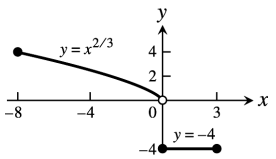
4. $x = \int_0^y \frac{1}{\sqrt{1 + 4t^2}}\,dt \Rightarrow \frac{d}{dx}(x) = \frac{d}{dx}\int_0^y \frac{1}{\sqrt{1 + 4t^2}}\,dt = \frac{d}{dy}\left[\int_0^y \frac{1}{\sqrt{1 + 4t^2}}\,dt\right]\left(\frac{dy}{dx}\right)$ from the chain rule
   $\Rightarrow 1 = \frac{1}{\sqrt{1 + 4y^2}}\left(\frac{dy}{dx}\right) \Rightarrow \frac{dy}{dx} = \sqrt{1 + 4y^2}.$ Then $\frac{d^2y}{dx^2} = \frac{d}{dx}\left(\sqrt{1 + 4y^2}\right) = \frac{d}{dy}\left(\sqrt{1 + 4y^2}\right)\left(\frac{dy}{dx}\right)$
   $= \frac{1}{2}(1 + 4y^2)^{-1/2}(8y)\left(\frac{dy}{dx}\right) = \frac{4y\left(\frac{dy}{dx}\right)}{\sqrt{1 + 4y^2}} = \frac{4y\left(\sqrt{1 + 4y^2}\right)}{\sqrt{1 + 4y^2}} = 4y.$ Thus $\frac{d^2y}{dx^2} = 4y$, and the constant of

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

proportionality is 4.

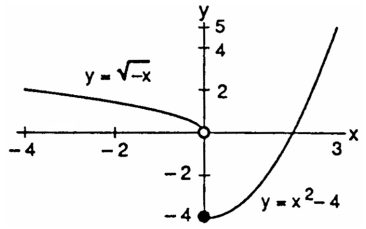
5. (a) $\int_0^{x^2} f(t)\,dt = x\cos\pi x \Rightarrow \frac{d}{dx}\int_0^{x^2} f(t)\,dt = \cos\pi x - \pi x\sin\pi x \Rightarrow f(x^2)(2x) = \cos\pi x - \pi x\sin\pi x$
$\Rightarrow f(x^2) = \frac{\cos\pi x - \pi x\sin\pi x}{2x}$. Thus, $x = 2 \Rightarrow f(4) = \frac{\cos 2\pi - 2\pi\sin 2\pi}{4} = \frac{1}{4}$
(b) $\int_0^{f(x)} t^2\,dt = \left[\frac{t^3}{3}\right]_0^{f(x)} = \frac{1}{3}(f(x))^3 \Rightarrow \frac{1}{3}(f(x))^3 = x\cos\pi x \Rightarrow (f(x))^3 = 3x\cos\pi x \Rightarrow f(x) = \sqrt[3]{3x\cos\pi x}$
$\Rightarrow f(4) = \sqrt[3]{3(4)\cos 4\pi} = \sqrt[3]{12}$

6. $\int_0^a f(x)\,dx = \frac{a^2}{2} + \frac{a}{2}\sin a + \frac{\pi}{2}\cos a$. Let $F(a) = \int_0^a f(t)\,dt \Rightarrow f(a) = F'(a)$. Now $F(a) = \frac{a^2}{2} + \frac{a}{2}\sin a + \frac{\pi}{2}\cos a$
$\Rightarrow f(a) = F'(a) = a + \frac{1}{2}\sin a + \frac{a}{2}\cos a - \frac{\pi}{2}\sin a \Rightarrow f\left(\frac{\pi}{2}\right) = \frac{\pi}{2} + \frac{1}{2}\sin\frac{\pi}{2} + \frac{\left(\frac{\pi}{2}\right)}{2}\cos\frac{\pi}{2} - \frac{\pi}{2}\sin\frac{\pi}{2} = \frac{\pi}{2} + \frac{1}{2} - \frac{\pi}{2} = \frac{1}{2}$



7. $\int_1^b f(x)\,dx = \sqrt{b^2+1} - \sqrt{2} \Rightarrow f(b) = \frac{d}{db}\int_1^b f(x)\,dx = \frac{1}{2}(b^2+1)^{-1/2}(2b) = \frac{b}{\sqrt{b^2+1}} \Rightarrow f(x) = \frac{x}{\sqrt{x^2+1}}$

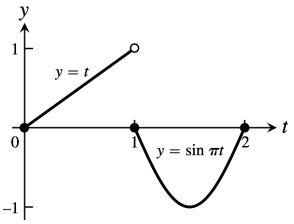
8. The derivative of the left side of the equation is: $\frac{d}{dx}\left[\int_0^x\left[\int_0^u f(t)\,dt\right]du\right] = \int_0^x f(t)\,dt$; the derivative of the right side of the equation is: $\frac{d}{dx}\left[\int_0^x f(u)(x-u)\,du\right] = \frac{d}{dx}\int_0^x f(u)\,x\,du - \frac{d}{dx}\int_0^x u\,f(u)\,du$
$= \frac{d}{dx}\left[x\int_0^x f(u)\,du\right] - \frac{d}{dx}\int_0^x u\,f(u)\,du = \int_0^x f(u)\,du + x\left[\frac{d}{dx}\int_0^x f(u)\,du\right] - xf(x) = \int_0^x f(u)\,du + xf(x) - xf(x)$
$= \int_0^x f(u)\,du$. Since each side has the same derivative, they differ by a constant, and since both sides equal 0 when $x = 0$, the constant must be 0. Therefore, $\int_0^x\left[\int_0^u f(t)\,dt\right]du = \int_0^x f(u)(x-u)\,du$.



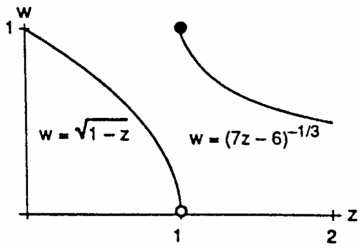
9. $\frac{dy}{dx} = 3x^2 + 2 \Rightarrow y = \int(3x^2+2)\,dx = x^3 + 2x + C$. Then $(1,-1)$ on the curve $\Rightarrow 1^3 + 2(1) + C = -1 \Rightarrow C = -4$
$\Rightarrow y = x^3 + 2x - 4$

10. The acceleration due to gravity downward is $-32$ ft/sec$^2 \Rightarrow v = \int -32\,dt = -32t + v_0$, where $v_0$ is the initial velocity $\Rightarrow v = -32t + 32 \Rightarrow s = \int(-32t+32)\,dt = -16t^2 + 32t + C$. If the release point, at $t = 0$, is $s = 0$, then $C = 0 \Rightarrow s = -16t^2 + 32t$. Then $s = 17 \Rightarrow 17 = -16t^2 + 32t \Rightarrow 16t^2 - 32t + 17 = 0$. The discriminant of this quadratic equation is $-64$ which says there is no real time when $s = 17$ ft. You had better duck.

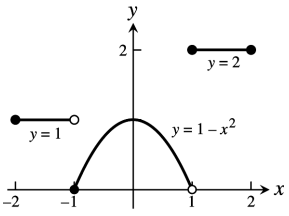
11. $\int_{-8}^3 f(x)\,dx = \int_{-8}^0 x^{2/3}\,dx + \int_0^3 -4\,dx$
$= \left[\frac{3}{5}x^{5/3}\right]_{-8}^0 + [-4x]_0^3$
$= \left(0 - \frac{3}{5}(-8)^{5/3}\right) + (-4(3) - 0) = \frac{96}{5} - 12$
$= \frac{36}{5}$



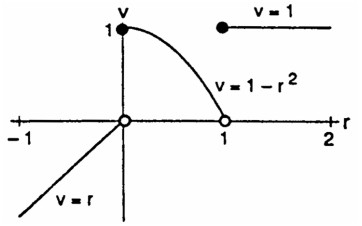
12. $\int_{-4}^3 f(x)\,dx = \int_{-4}^0 \sqrt{-x}\,dx + \int_0^3 (x^2-4)\,dx$
$= \left[-\frac{2}{3}(-x)^{3/2}\right]_{-4}^0 + \left[\frac{x^3}{3} - 4x\right]_0^3$
$= \left[0 - \left(-\frac{2}{3}(4)^{3/2}\right)\right] + \left[\left(\frac{3^3}{3} - 4(3)\right) - 0\right]$
$= \frac{16}{3} - 3 = \frac{7}{3}$



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



13. $\int_0^2 g(t)\,dt = \int_0^1 t\,dt + \int_1^2 \sin \pi t\,dt$
$= \left[\frac{t^2}{2}\right]_0^1 + \left[-\frac{1}{\pi}\cos \pi t\right]_1^2$
$= \left(\frac{1}{2} - 0\right) + \left[-\frac{1}{\pi}\cos 2\pi - \left(-\frac{1}{\pi}\cos \pi\right)\right]$
$= \frac{1}{2} - \frac{2}{\pi}$



14. $\int_0^2 h(z)\,dz = \int_0^1 \sqrt{1-z}\,dz + \int_1^2 (7z-6)^{-1/3}\,dz$
$= \left[-\frac{2}{3}(1-z)^{3/2}\right]_0^1 + \left[\frac{3}{14}(7z-6)^{2/3}\right]_1^2$
$= \left[-\frac{2}{3}(1-1)^{3/2} - \left(-\frac{2}{3}(1-0)^{3/2}\right)\right]$
$+ \left[\frac{3}{14}(7(2)-6)^{2/3} - \frac{3}{14}(7(1)-6)^{2/3}\right]$
$= \frac{2}{3} + \left(\frac{6}{7} - \frac{3}{14}\right) = \frac{55}{42}$

15. $\int_{-2}^2 f(x)\,dx = \int_{-2}^{-1} dx + \int_{-1}^1 (1-x^2)\,dx + \int_1^2 2\,dx$
$= [x]_{-2}^{-1} + \left[x - \frac{x^3}{3}\right]_{-1}^1 + [2x]_1^2$
$= (-1-(-2)) + \left[\left(1-\frac{1^3}{3}\right) - \left(-1-\frac{(-1)^3}{3}\right)\right] + [2(2)-2(1)]$
$= 1 + \frac{2}{3} - \left(-\frac{2}{3}\right) + 4 - 2 = \frac{13}{3}$

16. $\int_{-1}^2 h(r)\,dr = \int_{-1}^0 r\,dr + \int_0^1 (1-r^2)\,dr + \int_1^2 dr$
$= \left[\frac{r^2}{2}\right]_{-1}^0 + \left[r - \frac{r^3}{3}\right]_0^1 + [r]_1^2$
$= \left(0 - \frac{(-1)^2}{2}\right) + \left(\left(1-\frac{1^3}{3}\right) - 0\right) + (2-1)$
$= -\frac{1}{2} + \frac{2}{3} + 1 = \frac{7}{6}$

17. Ave. value $= \frac{1}{b-a}\int_a^b f(x)\,dx = \frac{1}{2-0}\int_0^2 f(x)\,dx = \frac{1}{2}\left[\int_0^1 x\,dx + \int_1^2 (x-1)\,dx\right] = \frac{1}{2}\left[\frac{x^2}{2}\right]_0^1 + \frac{1}{2}\left[\frac{x^2}{2} - x\right]_1^2$
$= \frac{1}{2}\left[\left(\frac{1^2}{2} - 0\right) + \left(\frac{2^2}{2} - 2\right) - \left(\frac{1^2}{2} - 1\right)\right] = \frac{1}{2}$

18. Ave. value $= \frac{1}{b-a}\int_a^b f(x)\,dx = \frac{1}{3-0}\int_0^3 f(x)\,dx = \frac{1}{3}\left[\int_0^1 dx + \int_1^2 0\,dx + \int_2^3 dx\right] = \frac{1}{3}[1-0+0+3-2] = \frac{2}{3}$

19. $f(x) = \int_{1/x}^x \frac{1}{t}\,dt \Rightarrow f'(x) = \frac{1}{x}\left(\frac{dx}{dx}\right) - \left(\frac{1}{\frac{1}{x}}\right)\left(\frac{d}{dx}\left(\frac{1}{x}\right)\right) = \frac{1}{x} - x\left(-\frac{1}{x^2}\right) = \frac{1}{x} + \frac{1}{x} = \frac{2}{x}$

20. $f(x) = \int_{\cos x}^{\sin x} \frac{1}{t}\frac{1}{1-t^2}\,dt \Rightarrow f'(x) = \left(\frac{1}{1-\sin^2 x}\right)\left(\frac{d}{dx}(\sin x)\right) - \left(\frac{1}{1-\cos^2 x}\right)\left(\frac{d}{dx}(\cos x)\right) = \frac{\cos x}{\cos^2 x} + \frac{\sin x}{\sin^2 x}$
$= \frac{1}{\cos x} + \frac{1}{\sin x}$

21. $g(y) = \int_{\sqrt{y}}^{2\sqrt{y}} \sin t^2\,dt \Rightarrow g'(y) = \left(\sin\left(2\sqrt{y}\right)^2\right)\left(\frac{d}{dy}\left(2\sqrt{y}\right)\right) - \left(\sin\left(\sqrt{y}\right)^2\right)\left(\frac{d}{dy}\left(\sqrt{y}\right)\right) = \frac{\sin 4y}{\sqrt{y}} - \frac{\sin y}{2\sqrt{y}}$

22. $f(x) = \int_x^{x+3} t(5-t)\,dt \Rightarrow f'(x) = (x+3)(5-(x+3))\left(\frac{d}{dx}(x+3)\right) - x(5-x)\left(\frac{dx}{dx}\right) = (x+3)(2-x) - x(5-x)$
$= 6 - x - x^2 - 5x + x^2 = 6 - 6x$. Thus $f'(x) = 0 \Rightarrow 6 - 6x = 0 \Rightarrow x = 1$. Also, $f''(x) = -6 < 0 \Rightarrow x = 1$ gives a

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

maximum.

23. Let $f(x) = x^5$ on $[0, 1]$. Partition $[0, 1]$ into n subintervals with $\Delta x = \frac{1-0}{n} = \frac{1}{n}$. Then $\frac{1}{n}, \frac{2}{n}, \ldots, \frac{n}{n}$ are the right-hand endpoints of the subintervals. Since f is increasing on $[0, 1]$, $U = \sum_{j=1}^{\infty} \left(\frac{j}{n}\right)^5 \left(\frac{1}{n}\right)$ is the upper sum for $f(x) = x^5$ on $[0, 1] \Rightarrow \lim_{n\to\infty} \sum_{j=1}^{\infty} \left(\frac{j}{n}\right)^5 \left(\frac{1}{n}\right) = \lim_{n\to\infty} \frac{1}{n}\left[\left(\frac{1}{n}\right)^5 + \left(\frac{2}{n}\right)^5 + \ldots + \left(\frac{n}{n}\right)^5\right] = \lim_{n\to\infty} \left[\frac{1^5+2^5+\ldots+n^5}{n^6}\right]$
$= \int_0^1 x^5\, dx = \left[\frac{x^6}{6}\right]_0^1 = \frac{1}{6}$

24. Let $f(x) = x^3$ on $[0, 1]$. Partition $[0, 1]$ into n subintervals with $\Delta x = \frac{1-0}{n} = \frac{1}{n}$. Then $\frac{1}{n}, \frac{2}{n}, \ldots, \frac{n}{n}$ are the right-hand endpoints of the subintervals. Since f is increasing on $[0, 1]$, $U = \sum_{j=1}^{\infty} \left(\frac{j}{n}\right)^3 \left(\frac{1}{n}\right)$ is the upper sum for $f(x) = x^3$ on $[0, 1] \Rightarrow \lim_{n\to\infty} \sum_{j=1}^{\infty} \left(\frac{j}{n}\right)^3 \left(\frac{1}{n}\right) = \lim_{n\to\infty} \frac{1}{n}\left[\left(\frac{1}{n}\right)^3 + \left(\frac{2}{n}\right)^3 + \ldots + \left(\frac{n}{n}\right)^3\right] = \lim_{n\to\infty} \left[\frac{1^3+2^3+\ldots+n^3}{n^4}\right]$
$= \int_0^1 x^3\, dx = \left[\frac{x^4}{4}\right]_0^1 = \frac{1}{4}$

25. Let $y = f(x)$ on $[0, 1]$. Partition $[0, 1]$ into n subintervals with $\Delta x = \frac{1-0}{n} = \frac{1}{n}$. Then $\frac{1}{n}, \frac{2}{n}, \ldots, \frac{n}{n}$ are the right-hand endpoints of the subintervals. Since f is continuous on $[0, 1]$, $\sum_{j=1}^{\infty} f\left(\frac{j}{n}\right)\left(\frac{1}{n}\right)$ is a Riemann sum of $y = f(x)$ on $[0, 1] \Rightarrow \lim_{n\to\infty} \sum_{j=1}^{\infty} f\left(\frac{j}{n}\right)\left(\frac{1}{n}\right) = \lim_{n\to\infty} \frac{1}{n}\left[f\left(\frac{1}{n}\right) + f\left(\frac{2}{n}\right) + \ldots + f\left(\frac{n}{n}\right)\right] = \int_0^1 f(x)\, dx$

26. (a) $\lim_{n\to\infty} \frac{1}{n^2}[2 + 4 + 6 + \ldots + 2n] = \lim_{n\to\infty} \frac{1}{n}\left[\frac{2}{n} + \frac{4}{n} + \frac{6}{n} + \ldots + \frac{2n}{n}\right] = \int_0^1 2x\, dx = [x^2]_0^1 = 1$, where $f(x) = 2x$ on $[0, 1]$ (see Exercise 25)

(b) $\lim_{n\to\infty} \frac{1}{n^{16}}[1^{15} + 2^{15} + \ldots + n^{15}] = \lim_{n\to\infty} \frac{1}{n}\left[\left(\frac{1}{n}\right)^{15} + \left(\frac{2}{n}\right)^{15} + \ldots + \left(\frac{n}{n}\right)^{15}\right] = \int_0^1 x^{15}\, dx = \left[\frac{x^{16}}{16}\right]_0^1 = \frac{1}{16}$, where $f(x) = x^{15}$ on $[0, 1]$ (see Exercise 25)

(c) $\lim_{n\to\infty} \frac{1}{n}\left[\sin\frac{\pi}{n} + \sin\frac{2\pi}{n} + \ldots + \sin\frac{n\pi}{n}\right] = \int_0^1 \sin n\pi\, dx = \left[-\frac{1}{\pi}\cos\pi x\right]_0^1 = -\frac{1}{\pi}\cos\pi - \left(-\frac{1}{\pi}\cos 0\right)$
$= \frac{2}{\pi}$, where $f(x) = \sin\pi x$ on $[0, 1]$ (see Exercise 25)

(d) $\lim_{n\to\infty} \frac{1}{n^{17}}[1^{15} + 2^{15} + \ldots + n^{15}] = \left(\lim_{n\to\infty} \frac{1}{n}\right)\left(\lim_{n\to\infty} \frac{1}{n^{16}}[1^{15} + 2^{15} + \ldots + n^{15}]\right) = \left(\lim_{n\to\infty} \frac{1}{n}\right)\int_0^1 x^{15}\, dx$
$= 0\left(\frac{1}{16}\right) = 0$ (see part (b) above)

(e) $\lim_{n\to\infty} \frac{1}{n^{15}}[1^{15} + 2^{15} + \ldots + n^{15}] = \lim_{n\to\infty} \frac{n}{n^{16}}[1^{15} + 2^{15} + \ldots + n^{15}]$
$= \left(\lim_{n\to\infty} n\right)\left(\lim_{n\to\infty} \frac{1}{n^{16}}[1^{15} + 2^{15} + \ldots + n^{15}]\right) = \left(\lim_{n\to\infty} n\right)\int_0^1 x^{15}\, dx = \infty$ (see part (b) above)

27. (a) Let the polygon be inscribed in a circle of radius r. If we draw a radius from the center of the circle (and the polygon) to each vertex of the polygon, we have n isosceles triangles formed (the equal sides are equal to r, the radius of the circle) and a vertex angle of $\theta_n$ where $\theta_n = \frac{2\pi}{n}$. The area of each triangle is $A_n = \frac{1}{2} r^2 \sin\theta_n \Rightarrow$ the area of the polygon is $A = nA_n = \frac{nr^2}{2}\sin\theta_n = \frac{nr^2}{2}\sin\frac{2\pi}{n}$.

(b) $\lim_{n\to\infty} A = \lim_{n\to\infty} \frac{nr^2}{2}\sin\frac{2\pi}{n} = \lim_{n\to\infty} \frac{n\pi r^2}{2\pi}\sin\frac{2\pi}{n} = \lim_{n\to\infty} (\pi r^2)\frac{\sin\left(\frac{2\pi}{n}\right)}{\left(\frac{2\pi}{n}\right)} = (\pi r^2)\lim_{2\pi/n\to 0} \frac{\sin\left(\frac{2\pi}{n}\right)}{\left(\frac{2\pi}{n}\right)} = \pi r^2$

28. $y = \sin x + \int_x^{\pi} \cos 2t\, dt + 1 = \sin x - \int_{\pi}^{x} \cos 2t\, dt + 1 \Rightarrow y' = \cos x - \cos(2x)$; when $x = \pi$ we have $y' = \cos\pi - \cos(2\pi) = -1 - 1 = -2$. And $y'' = -\sin x + 2\sin(2x)$; when $x = \pi$, $y = \sin\pi + \int_x^{\pi} \cos 2t\, dt + 1$
$= 0 + 0 + 1 = 1$.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

29. (a) $g(1) = \int_1^1 f(t)\,dt = 0$

(b) $g(3) = \int_1^3 f(t)\,dt = -\frac{1}{2}(2)(1) = -1$

(c) $g(-1) = \int_1^{-1} f(t)\,dt = -\int_{-1}^1 f(t)\,dt = -\frac{1}{4}(\pi\, 2^2) = -\pi$

(d) $g'(x) = f(x) = 0 \Rightarrow x = -3, 1, 3$ and the sign chart for $g'(x) = f(x)$ is $\underset{-3}{|}\,+++\,\underset{1}{|}\,---\,\underset{3}{|}\,+++$. So g has a relative maximum at $x = 1$.

(e) $g'(-1) = f(-1) = 2$ is the slope and $g(-1) = \int_1^{-1} f(t)\,dt = -\pi$, by (c). Thus the equation is $y + \pi = 2(x + 1)$ $y = 2x + 2 - \pi$.

(f) $g''(x) = f'(x) = 0$ at $x = -1$ and $g''(x) = f'(x)$ is negative on $(-3,\ -1)$ and positive on $(-1,\ 1)$ so there is an inflection point for g at $x = -1$. We notice that $g''(x) = f'(x) < 0$ for x on $(-1,\ 2)$ and $g''(x) = f'(x) > 0$ for x on $(2,\ 4)$, even though $g''(2)$ does not exist, g has a tangent line at $x = 2$, so there is an inflection point at $x = 2$.

(g) g is continuous on $[-3,\ 4]$ and so it attains its absolute maximum and minimum values on this interval. We saw in (d) that $g'(x) = 0 \Rightarrow x = -3, 1, 3$. We have that

$g(-3) = \int_1^{-3} f(t)\,dt = -\int_{-3}^1 f(t)\,dt = -\frac{\pi\, 2^2}{2} = -2\pi$

$g(1) = \int_1^1 f(t)\,dt = 0$

$g(3) = \int_1^3 f(t)\,dt = -1$

$g(4) = \int_1^4 f(t)\,dt = -1 + \frac{1}{2} \cdot 1 \cdot 1 = -\frac{1}{2}$

Thus, the absolute minimum is $-2\pi$ and the absolute maximum is 0. Thus, the range is $[-2\pi,\ 0]$.

# CHAPTER 6 APPLICATIONS OF DEFINITE INTEGRALS

## 6.1 VOLUMES BY SLICING AND ROTATION ABOUT AN AXIS

1. (a) $A = \pi(\text{radius})^2$ and radius $= \sqrt{1-x^2} \Rightarrow A(x) = \pi(1-x^2)$

   (b) $A = \text{width} \cdot \text{height}$, width $=$ height $= 2\sqrt{1-x^2} \Rightarrow A(x) = 4(1-x^2)$

   (c) $A = (\text{side})^2$ and diagonal $= \sqrt{2}(\text{side}) \Rightarrow A = \frac{(\text{diagonal})^2}{2}$; diagonal $= 2\sqrt{1-x^2} \Rightarrow A(x) = 2(1-x^2)$

   (d) $A = \frac{\sqrt{3}}{4}(\text{side})^2$ and side $= 2\sqrt{1-x^2} \Rightarrow A(x) = \sqrt{3}(1-x^2)$

2. (a) $A = \pi(\text{radius})^2$ and radius $= \sqrt{x} \Rightarrow A(x) = \pi x$

   (b) $A = \text{width} \cdot \text{height}$, width $=$ height $= 2\sqrt{x} \Rightarrow A(x) = 4x$

   (c) $A = (\text{side})^2$ and diagonal $= \sqrt{2}(\text{side}) \Rightarrow A = \frac{(\text{diagonal})^2}{2}$; diagonal $= 2\sqrt{x} \Rightarrow A(x) = 2x$

   (d) $A = \frac{\sqrt{3}}{4}(\text{side})^2$ and side $= 2\sqrt{x} \Rightarrow A(x) = \sqrt{3}x$

3. $A(x) = \frac{(\text{diagonal})^2}{2} = \frac{\left(\sqrt{x} - (-\sqrt{x})\right)^2}{2} = 2x$ (see Exercise 1c); $a = 0$, $b = 4$;
   $V = \int_a^b A(x)\,dx = \int_0^4 2x\,dx = [x^2]_0^4 = 16$

4. $A(x) = \frac{\pi(\text{diameter})^2}{4} = \frac{\pi[(2-x^2)-x^2]^2}{4} = \frac{\pi[2(1-x^2)]^2}{4} = \pi(1-2x^2+x^4)$; $a = -1$, $b = 1$;
   $V = \int_a^b A(x)\,dx = \int_{-1}^1 \pi(1-2x^2+x^4)\,dx = \pi\left[x - \frac{2}{3}x^3 + \frac{x^5}{5}\right]_{-1}^1 = 2\pi\left(1 - \frac{2}{3} + \frac{1}{5}\right) = \frac{16\pi}{15}$

5. $A(x) = (\text{edge})^2 = \left[\sqrt{1-x^2} - \left(-\sqrt{1-x^2}\right)\right]^2 = \left(2\sqrt{1-x^2}\right)^2 = 4(1-x^2)$; $a = -1$, $b = 1$;
   $V = \int_a^b A(x)\,dx = \int_{-1}^1 4(1-x^2)\,dx = 4\left[x - \frac{x^3}{3}\right]_{-1}^1 = 8\left(1 - \frac{1}{3}\right) = \frac{16}{3}$

6. $A(x) = \frac{(\text{diagonal})^2}{2} = \frac{\left[\sqrt{1-x^2} - \left(-\sqrt{1-x^2}\right)\right]^2}{2} = \frac{\left(2\sqrt{1-x^2}\right)^2}{2} = 2(1-x^2)$ (see Exercise 1c); $a = -1$, $b = 1$;
   $V = \int_a^b A(x)\,dx = 2\int_{-1}^1 (1-x^2)\,dx = 2\left[x - \frac{x^3}{3}\right]_{-1}^1 = 4\left(1 - \frac{1}{3}\right) = \frac{8}{3}$

7. (a) STEP 1) $A(x) = \frac{1}{2}(\text{side}) \cdot (\text{side}) \cdot \left(\sin\frac{\pi}{3}\right) = \frac{1}{2} \cdot \left(2\sqrt{\sin x}\right) \cdot \left(2\sqrt{\sin x}\right)\left(\sin\frac{\pi}{3}\right) = \sqrt{3}\sin x$

   STEP 2) $a = 0$, $b = \pi$

   STEP 3) $V = \int_a^b A(x)\,dx = \sqrt{3}\int_0^\pi \sin x\,dx = \left[-\sqrt{3}\cos x\right]_0^\pi = \sqrt{3}(1+1) = 2\sqrt{3}$

   (b) STEP 1) $A(x) = (\text{side})^2 = \left(2\sqrt{\sin x}\right)\left(2\sqrt{\sin x}\right) = 4\sin x$

   STEP 2) $a = 0$, $b = \pi$

   STEP 3) $V = \int_a^b A(x)\,dx = \int_0^\pi 4\sin x\,dx = [-4\cos x]_0^\pi = 8$

8. (a) STEP 1) $A(x) = \frac{\pi(\text{diameter})^2}{4} = \frac{\pi}{4}(\sec x - \tan x)^2 = \frac{\pi}{4}(\sec^2 x + \tan^2 x - 2\sec x\tan x)$
   $= \frac{\pi}{4}\left[\sec^2 x + (\sec^2 x - 1) - 2\frac{\sin x}{\cos^2 x}\right]$

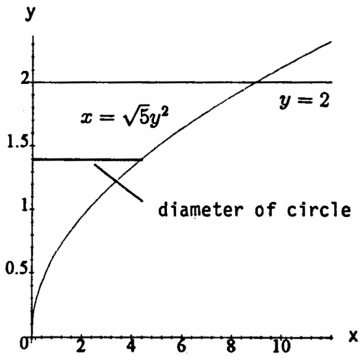
   STEP 2) $a = -\frac{\pi}{3}$, $b = \frac{\pi}{3}$

   STEP 3) $V = \int_a^b A(x)\,dx = \int_{-\pi/3}^{\pi/3} \frac{\pi}{4}\left(2\sec^2 x - 1 - \frac{2\sin x}{\cos^2 x}\right)dx = \frac{\pi}{4}\left[2\tan x - x + 2\left(-\frac{1}{\cos x}\right)\right]_{-\pi/3}^{\pi/3}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$$= \frac{\pi}{4}\left[2\sqrt{3} - \frac{\pi}{3} + 2\left(-\frac{1}{\left(\frac{1}{2}\right)}\right) - \left(-2\sqrt{3} + \frac{\pi}{3} + 2\left(-\frac{1}{\left(\frac{1}{2}\right)}\right)\right)\right] = \frac{\pi}{4}\left(4\sqrt{3} - \frac{2\pi}{3}\right)$$

(b) STEP 1) $A(x) = (\text{edge})^2 = (\sec x - \tan x)^2 = \left(2\sec^2 x - 1 - 2\,\frac{\sin x}{\cos^2 x}\right)$



STEP 2) $a = -\frac{\pi}{3}$, $b = \frac{\pi}{3}$

STEP 3) $V = \int_a^b A(x)\,dx = \int_{-\pi/3}^{\pi/3}\left(2\sec^2 x - 1 - \frac{2\sin x}{\cos^2 x}\right)dx = 2\left(2\sqrt{3} - \frac{\pi}{3}\right) = 4\sqrt{3} - \frac{2\pi}{3}$

9. $A(y) = \frac{\pi}{4}(\text{diameter})^2 = \frac{\pi}{4}\left(\sqrt{5}y^2 - 0\right)^2 = \frac{5\pi}{4}y^4$;

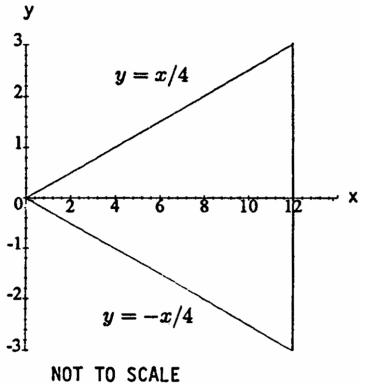
$c = 0$, $d = 2$; $V = \int_c^d A(y)\,dy = \int_0^2 \frac{5\pi}{4}y^4\,dy$

$= \left[\left(\frac{5\pi}{4}\right)\left(\frac{y^5}{5}\right)\right]_0^2 = \frac{\pi}{4}(2^5 - 0) = 8\pi$

10. $A(y) = \frac{1}{2}(\text{leg})(\text{leg}) = \frac{1}{2}\left[\sqrt{1-y^2} - \left(-\sqrt{1-y^2}\right)\right]^2 = \frac{1}{2}\left(2\sqrt{1-y^2}\right)^2 = 2(1-y^2)$; $c = -1$, $d = 1$;

$V = \int_c^d A(y)\,dy = \int_{-1}^1 2(1-y^2)\,dy = 2\left[y - \frac{y^3}{3}\right]_{-1}^1 = 4\left(1 - \frac{1}{3}\right) = \frac{8}{3}$

11. (a) It follows from Cavalieri's Principle that the volume of a column is the same as the volume of a right prism with a square base of side length s and altitude h. Thus, STEP 1) $A(x) = (\text{side length})^2 = s^2$;



STEP 2) $a = 0$, $b = h$; STEP 3) $V = \int_a^b A(x)\,dx = \int_0^h s^2\,dx = s^2h$

(b) From Cavalieri's Principle we conclude that the volume of the column is the same as the volume of the prism described above, regardless of the number of turns $\Rightarrow$ $V = s^2h$

12. 1) The solid and the cone have the same altitude of 12.

2) The cross sections of the solid are disks of diameter $x - \left(\frac{x}{2}\right) = \frac{x}{2}$. If we place the vertex of the cone at the origin of the coordinate system and make its axis of symmetry coincide with the x-axis then the cone's cross sections will be circular disks of diameter $\frac{x}{4} - \left(-\frac{x}{4}\right) = \frac{x}{2}$ (see accompanying figure).

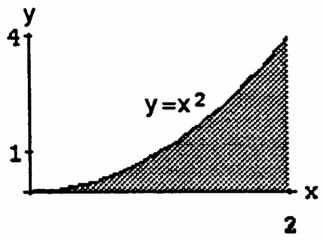
3) The solid and the cone have equal altitudes and identical parallel cross sections. From Cavalieri's Principle we conclude that the solid and the cone have the same volume.

13. $R(x) = y = 1 - \frac{x}{2} \Rightarrow V = \int_0^2 \pi[R(x)]^2\,dx = \pi\int_0^2\left(1 - \frac{x}{2}\right)^2 dx = \pi\int_0^2\left(1 - x + \frac{x^2}{4}\right)dx = \pi\left[x - \frac{x^2}{2} + \frac{x^3}{12}\right]_0^2$

$= \pi\left(2 - \frac{4}{2} + \frac{8}{12}\right) = \frac{2\pi}{3}$

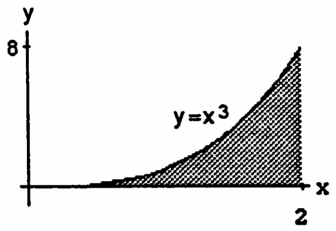
14. $R(y) = x = \frac{3y}{2} \Rightarrow V = \int_0^2 \pi[R(y)]^2\,dy = \pi\int_0^2\left(\frac{3y}{2}\right)^2 dy = \pi\int_0^2 \frac{9}{4}y^2\,dy = \pi\left[\frac{3}{4}y^3\right]_0^2 = \pi\cdot\frac{3}{4}\cdot 8 = 6\pi$

15. $R(x) = \tan\left(\frac{\pi}{4}y\right)$; $u = \frac{\pi}{4}y \Rightarrow du = \frac{\pi}{4}dy \Rightarrow 4\,du = \pi\,dy$; $y = 0 \Rightarrow u = 0$, $y = 1 \Rightarrow u = \frac{\pi}{4}$;



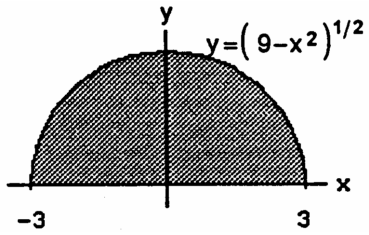
$V = \int_0^1 \pi[R(y)]^2\,dy = \pi\int_0^1\left[\tan\left(\frac{\pi}{4}y\right)\right]^2 dy = 4\int_0^{\pi/4}\tan^2 u\,du = 4\int_0^{\pi/4}(-1 + \sec^2 u)\,du = 4[-u + \tan u]_0^{\pi/4}$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

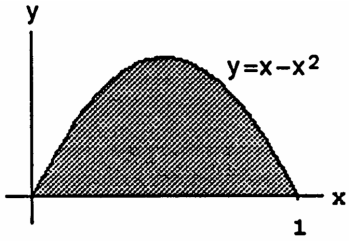


$= 4\left(-\frac{\pi}{4} + 1 - 0\right) = 4 - \pi$

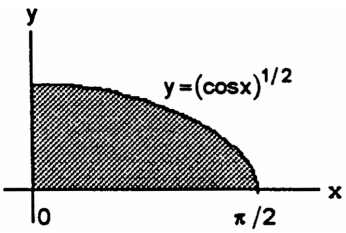
16. $R(x) = \sin x \cos x$; $R(x) = 0 \Rightarrow a = 0$ and $b = \frac{\pi}{2}$ are the limits of integration; $V = \int_0^{\pi/2} \pi[R(x)]^2\,dx$
$= \pi\int_0^{\pi/2} (\sin x \cos x)^2\,dx = \pi\int_0^{\pi/2} \frac{(\sin 2x)^2}{4}\,dx$; $\left[u = 2x \Rightarrow du = 2\,dx \Rightarrow \frac{du}{8} = \frac{dx}{4}\right.$; $x = 0 \Rightarrow u = 0$,
$\left. x = \frac{\pi}{2} \Rightarrow u = \pi\right] \rightarrow V = \pi\int_0^{\pi} \frac{1}{8}\sin^2 u\,du = \frac{\pi}{8}\left[\frac{u}{2} - \frac{1}{4}\sin 2u\right]_0^{\pi} = \frac{\pi}{8}\left[\left(\frac{\pi}{2} - 0\right) - 0\right] = \frac{\pi^2}{16}$



17. $R(x) = x^2 \Rightarrow V = \int_0^2 \pi[R(x)]^2\,dx = \pi\int_0^2 (x^2)^2\,dx$
$= \pi\int_0^2 x^4\,dx = \pi\left[\frac{x^5}{5}\right]_0^2 = \frac{32\pi}{5}$

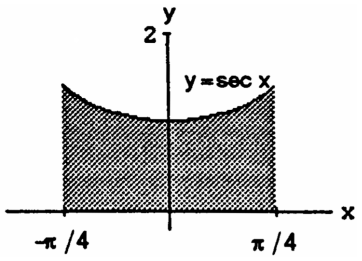


18. $R(x) = x^3 \Rightarrow V = \int_0^2 \pi[R(x)]^2\,dx = \pi\int_0^2 (x^3)^2\,dx$
$= \pi\int_0^2 x^6\,dx = \pi\left[\frac{x^7}{7}\right]_0^2 = \frac{128\pi}{7}$

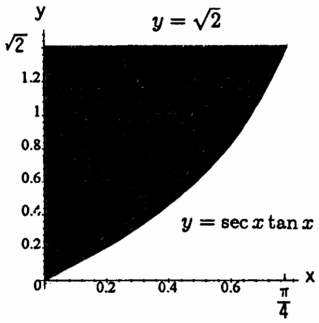


19. $R(x) = \sqrt{9 - x^2} \Rightarrow V = \int_{-3}^3 \pi[R(x)]^2\,dx = \pi\int_{-3}^3 (9 - x^2)\,dx$
$= \pi\left[9x - \frac{x^3}{3}\right]_{-3}^3 = 2\pi\left[9(3) - \frac{27}{3}\right] = 2 \cdot \pi \cdot 18 = 36\pi$

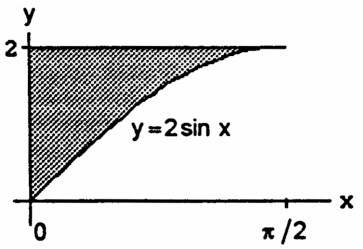
20. $R(x) = x - x^2 \Rightarrow V = \int_0^1 \pi[R(x)]^2\,dx = \pi\int_0^1 (x - x^2)^2\,dx$
$= \pi\int_0^1 (x^2 - 2x^3 + x^4)\,dx = \pi\left[\frac{x^3}{3} - \frac{2x^4}{4} + \frac{x^5}{5}\right]_0^1$
$= \pi\left(\frac{1}{3} - \frac{1}{2} + \frac{1}{5}\right) = \frac{\pi}{30}(10 - 15 + 6) = \frac{\pi}{30}$



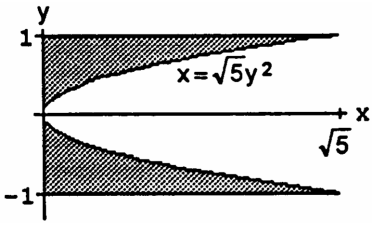
21. $R(x) = \sqrt{\cos x} \Rightarrow V = \int_0^{\pi/2} \pi[R(x)]^2\,dx = \pi\int_0^{\pi/2} \cos x\,dx$
$= \pi\left[\sin x\right]_0^{\pi/2} = \pi(1 - 0) = \pi$



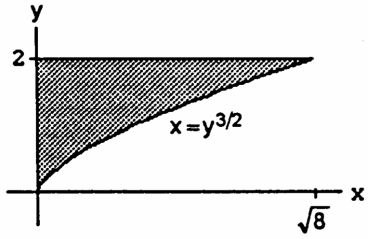
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



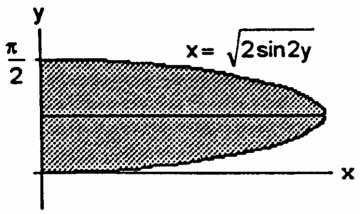
22. $R(x) = \sec x \Rightarrow V = \int_{-\pi/4}^{\pi/4} \pi[R(x)]^2\,dx = \pi\int_{-\pi/4}^{\pi/4} \sec^2 x\,dx$
$= \pi\,[\tan x]_{-\pi/4}^{\pi/4} = \pi[1-(-1)] = 2\pi$



23. $R(x) = \sqrt{2} - \sec x \tan x \Rightarrow V = \int_0^{\pi/4} \pi[R(x)]^2\,dx$
$= \pi\int_0^{\pi/4} \left(\sqrt{2} - \sec x \tan x\right)^2 dx$
$= \pi\int_0^{\pi/4} \left(2 - 2\sqrt{2}\sec x \tan x + \sec^2 x \tan^2 x\right) dx$
$= \pi\left(\int_0^{\pi/4} 2\,dx - 2\sqrt{2}\int_0^{\pi/4} \sec x \tan x\,dx + \int_0^{\pi/4} (\tan x)^2 \sec^2 x\,dx\right)$
$= \pi\left([2x]_0^{\pi/4} - 2\sqrt{2}\,[\sec x]_0^{\pi/4} + \left[\frac{\tan^3 x}{3}\right]_0^{\pi/4}\right)$
$= \pi\left[\left(\frac{\pi}{2} - 0\right) - 2\sqrt{2}\left(\sqrt{2} - 1\right) + \frac{1}{3}(1^3 - 0)\right] = \pi\left(\frac{\pi}{2} + 2\sqrt{2} - \frac{11}{3}\right)$

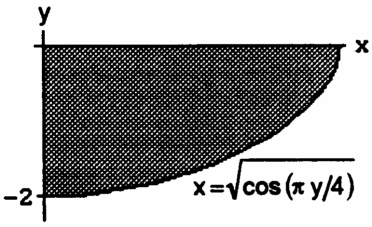


24. $R(x) = 2 - 2\sin x = 2(1-\sin x) \Rightarrow V = \int_0^{\pi/2} \pi[R(x)]^2\,dx$
$= \pi\int_0^{\pi/2} 4(1-\sin x)^2\,dx = 4\pi\int_0^{\pi/2} (1 + \sin^2 x - 2\sin x)\,dx$
$= 4\pi\int_0^{\pi/2} \left[1 + \frac{1}{2}(1-\cos 2x) - 2\sin x\right] dx$
$= 4\pi\int_0^{\pi/2} \left(\frac{3}{2} - \frac{\cos 2x}{2} - 2\sin x\right)$
$= 4\pi\left[\frac{3}{2}x - \frac{\sin 2x}{4} + 2\cos x\right]_0^{\pi/2}$
$= 4\pi\left[\left(\frac{3\pi}{4} - 0 + 0\right) - (0 - 0 + 2)\right] = \pi(3\pi - 8)$

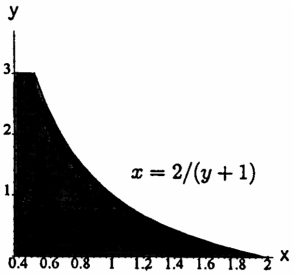


25. $R(y) = \sqrt{5}\cdot y^2 \Rightarrow V = \int_{-1}^{1} \pi[R(y)]^2\,dy = \pi\int_{-1}^{1} 5y^4\,dy$
$= \pi\,[y^5]_{-1}^{1} = \pi[1-(-1)] = 2\pi$

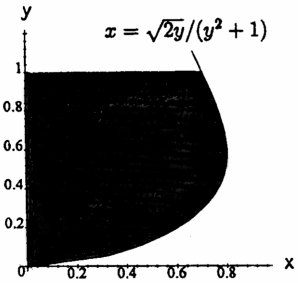
26. $R(y) = y^{3/2} \Rightarrow V = \int_0^2 \pi[R(y)]^2\,dy = \pi\int_0^2 y^3\,dy$
$= \pi\left[\frac{y^4}{4}\right]_0^2 = 4\pi$



27. $R(y) = \sqrt{2\sin 2y} \Rightarrow V = \int_0^{\pi/2} \pi[R(y)]^2\,dy$
$= \pi\int_0^{\pi/2} 2\sin 2y\,dy = \pi\,[-\cos 2y]_0^{\pi/2}$
$= \pi[1-(-1)] = 2\pi$



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley



28. $R(y) = \sqrt{\cos\frac{\pi y}{4}} \Rightarrow V = \int_{-2}^{0} \pi[R(y)]^2\,dy$
$= \pi\int_{-2}^{0}\cos\left(\frac{\pi y}{4}\right)dy = 4\left[\sin\frac{\pi y}{4}\right]_{-2}^{0} = 4[0-(-1)] = 4$

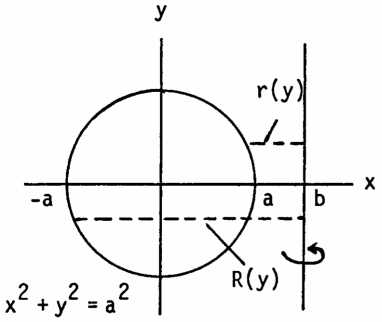
$= \pi h^2\left[\frac{x^3}{3b^2} - \frac{x^2}{b} + x\right]_0^b = \pi h^2\left(\frac{b}{3} - b + b\right) = \frac{\pi h^2 b}{3}$

(b) $r(y) = 0$ and $R(y) = b\left(1 - \frac{y}{h}\right) \Rightarrow V = \int_0^h \pi\left([R(y)]^2 - [r(y)]^2\right) dy = \pi b^2\int_0^h \left(1 - \frac{y}{h}\right)^2 dy$

$= \pi b^2\int_0^h \left(1 - \frac{2y}{h} + \frac{y^2}{h^2}\right) dy = \pi b^2\left[y - \frac{y^2}{h} + \frac{y^3}{3h^2}\right]_0^h = \pi b^2\left(h - h + \frac{h}{3}\right) = \frac{\pi b^2 h}{3}$



49. $R(y) = b + \sqrt{a^2 - y^2}$ and $r(y) = b - \sqrt{a^2 - y^2}$

$\Rightarrow V = \int_{-a}^a \pi\left([R(y)]^2 - [r(y)]^2\right) dy$

$= \pi\int_{-a}^a \left[\left(b + \sqrt{a^2 - y^2}\right)^2 - \left(b - \sqrt{a^2 - y^2}\right)^2\right] dy$

$= \pi\int_{-a}^a 4b\sqrt{a^2 - y^2}\, dy = 4b\pi\int_{-a}^a \sqrt{a^2 - y^2}\, dy$

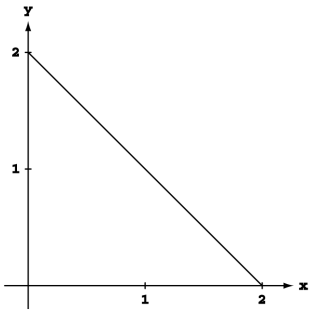
$= 4b\pi \cdot$ area of semicircle of radius $a = 4b\pi \cdot \frac{\pi a^2}{2} = 2a^2 b\pi^2$

50. (a) A cross section has radius $r = \sqrt{2y}$ and area $\pi r^2 = 2\pi y$. The volume is $\int_0^5 2\pi y dy = \pi\left[y^2\right]_0^5 = 25\pi$.

(b) $V(h) = \int A(h)dh$, so $\frac{dV}{dh} = A(h)$. Therefore $\frac{dV}{dt} = \frac{dV}{dh}\cdot\frac{dh}{dt} = A(h)\cdot\frac{dh}{dt}$, so $\frac{dh}{dt} = \frac{1}{A(h)}\cdot\frac{dV}{dt}$.

For $h = 4$, the area is $2\pi(4) = 8\pi$, so $\frac{dh}{dt} = \frac{1}{8\pi}\cdot 3\frac{\text{units}^3}{\text{sec}} = \frac{3}{8\pi}\cdot\frac{\text{units}^3}{\text{sec}}$.

51. (a) $R(y) = \sqrt{a^2 - y^2} \Rightarrow V = \pi\int_{-a}^{h-a} (a^2 - y^2)\, dy = \pi\left[a^2 y - \frac{y^3}{3}\right]_{-a}^{h-a} = \pi\left[a^2 h - a^3 - \frac{(h-a)^3}{3} - \left(-a^3 + \frac{a^3}{3}\right)\right]$



$= \pi\left[a^2 h - \frac{1}{3}\left(h^3 - 3h^2 a + 3ha^2 - a^3\right) - \frac{a^3}{3}\right] = \pi\left(a^2 h - \frac{h^3}{3} + h^2 a - ha^2\right) = \frac{\pi h^2(3a - h)}{3}$

(b) Given $\frac{dV}{dt} = 0.2$ m$^3$/sec and $a = 5$ m, find $\frac{dh}{dt}\big|_{h=4}$. From part (a), $V(h) = \frac{\pi h^2(15 - h)}{3} = 5\pi h^2 - \frac{\pi h^3}{3}$

$\Rightarrow \frac{dV}{dh} = 10\pi h - \pi h^2 \Rightarrow \frac{dV}{dt} = \frac{dV}{dh}\cdot\frac{dh}{dt} = \pi h(10 - h)\frac{dh}{dt} \Rightarrow \frac{dh}{dt}\big|_{h=4} = \frac{0.2}{4\pi(10-4)} = \frac{1}{(20\pi)(6)} = \frac{1}{120\pi}$ m/sec.

52. Suppose the solid is produced by revolving $y = 2 - x$ about the y-axis. Cast a shadow of the solid on a plane parallel to the xy-plane.

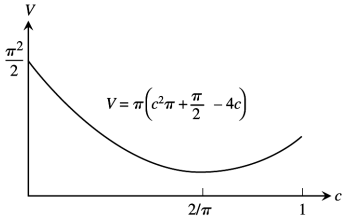
Use an approximation such as the Trapezoid Rule, to estimate $\int_a^b \pi[R(y)]^2\, dy \approx \sum_{k=1}^n \pi\left(\frac{d_k}{2}\right)^2 \triangle y$.

53. The cross section of a solid right circular cylinder with a cone removed is a disk with radius R from which a disk of radius h has been removed. Thus its area is $A_1 = \pi R^2 - \pi h^2 = \pi\left(R^2 - h^2\right)$. The cross section of the hemisphere is a disk of radius $\sqrt{R^2 - h^2}$. Therefore its area is $A_2 = \pi\left(\sqrt{R^2 - h^2}\right)^2 = \pi\left(R^2 - h^2\right)$. We can see that $A_1 = A_2$. The altitudes of both solids are R. Applying Cavalieri's Principle we find

Volume of Hemisphere = (Volume of Cylinder) − (Volume of Cone) $= (\pi R^2)R - \frac{1}{3}\pi\left(R^2\right)R = \frac{2}{3}\pi R^3$.

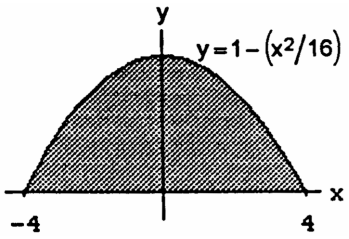
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

54. $R(x) = \frac{rx}{h} \Rightarrow V = \int_0^h \pi[R(x)]^2\,dx = \pi\int_0^h \frac{r^2x^2}{h^2}\,dx = \frac{\pi r^2}{h^2}\left[\frac{x^3}{3}\right]_0^h = \left(\frac{\pi r^2}{h^2}\right)\left(\frac{h^3}{3}\right) = \frac{1}{3}\pi r^2 h$, the volume of a cone of radius r and height h.



55. $R(y) = \sqrt{256 - y^2} \Rightarrow V = \int_{-16}^{-7} \pi[R(y)]^2\,dy = \pi\int_{-16}^{-7}(256 - y^2)\,dy = \pi\left[256y - \frac{y^3}{3}\right]_{-16}^{-7}$
$= \pi\left[(256)(-7) + \frac{7^3}{3} - \left((256)(-16) + \frac{16^3}{3}\right)\right] = \pi\left(\frac{7^3}{3} + 256(16 - 7) - \frac{16^3}{3}\right) = 1053\pi \text{ cm}^3 \approx 3308 \text{ cm}^3$

56. $R(x) = \frac{x}{12}\sqrt{36 - x^2} \Rightarrow V = \int_0^6 \pi[R(x)]^2\,dx = \pi\int_0^6 \frac{x^2}{144}(36 - x^2)\,dx = \frac{\pi}{144}\int_0^6 (36x^2 - x^4)\,dx$
$= \frac{\pi}{144}\left[12x^3 - \frac{x^5}{5}\right]_0^6 = \frac{\pi}{144}\left(12 \cdot 6^3 - \frac{6^5}{5}\right) = \frac{\pi \cdot 6^3}{144}\left(12 - \frac{36}{5}\right) = \left(\frac{196\pi}{144}\right)\left(\frac{60-36}{5}\right) = \frac{36\pi}{5} \text{ cm}^3$. The plumb bob will weigh about $W = (8.5)\left(\frac{36\pi}{5}\right) \approx 192$ gm, to the nearest gram.



57. (a) $R(x) = |c - \sin x|$, so $V = \pi\int_0^\pi [R(x)]^2\,dx = \pi\int_0^\pi (c - \sin x)^2\,dx = \pi\int_0^\pi (c^2 - 2c\sin x + \sin^2 x)\,dx$
$= \pi\int_0^\pi \left(c^2 - 2c\sin x + \frac{1-\cos 2x}{2}\right)dx = \pi\int_0^\pi \left(c^2 + \frac{1}{2} - 2c\sin x - \frac{\cos 2x}{2}\right)dx$
$= \pi\left[\left(c^2 + \frac{1}{2}\right)x + 2c\cos x - \frac{\sin 2x}{4}\right]_0^\pi = \pi\left[\left(c^2\pi + \frac{\pi}{2} - 2c - 0\right) - (0 + 2c - 0)\right] = \pi\left(c^2\pi + \frac{\pi}{2} - 4c\right)$. Let $V(c) = \pi\left(c^2\pi + \frac{\pi}{2} - 4c\right)$. We find the extreme values of V(c): $\frac{dV}{dc} = \pi(2c\pi - 4) = 0 \Rightarrow c = \frac{2}{\pi}$ is a critical point, and $V\left(\frac{2}{\pi}\right) = \pi\left(\frac{4}{\pi} + \frac{\pi}{2} - \frac{8}{\pi}\right) = \pi\left(\frac{\pi}{2} - \frac{4}{\pi}\right) = \frac{\pi^2}{2} - 4$; Evaluate V at the endpoints: $V(0) = \frac{\pi^2}{2}$ and $V(1) = \pi\left(\frac{3}{2}\pi - 4\right) = \frac{\pi^2}{2} - (4 - \pi)\pi$. Now we see that the function's absolute minimum value is $\frac{\pi^2}{2} - 4$, taken on at the critical point $c = \frac{2}{\pi}$. (See also the accompanying graph.)

(b) From the discussion in part (a) we conclude that the function's absolute maximum value is $\frac{\pi^2}{2}$, taken on at the endpoint $c = 0$.

(c) The graph of the solid's volume as a function of c for $0 \le c \le 1$ is given at the right. As c moves away from $[0, 1]$ the volume of the solid increases without bound. If we approximate the solid as a set of solid disks, we can see that the radius of a typical disk increases without bounds as c moves away from $[0, 1]$.

58. (a) $R(x) = 1 - \frac{x^2}{16} \Rightarrow V = \int_{-4}^4 \pi[R(x)]^2\,dx$
$= \pi\int_{-4}^4 \left(1 - \frac{x^2}{16}\right)^2 dx = \pi\int_{-4}^4 \left(1 - \frac{x^2}{8} + \frac{x^4}{16^2}\right)dx$
$= \pi\left[x - \frac{x^3}{24} + \frac{x^5}{5\cdot 16^2}\right]_{-4}^4 = 2\pi\left(4 - \frac{4^3}{24} + \frac{4^5}{5\cdot 16^2}\right)$
$= 2\pi\left(4 - \frac{8}{3} + \frac{4}{5}\right) = \frac{2\pi}{15}(60 - 40 + 12) = \frac{64\pi}{15} \text{ ft}^3$

(b) The helicopter will be able to fly $\left(\frac{64\pi}{15}\right)(7.481)(2) \approx 201$ additional miles.

## 6.2 VOLUME BY CYLINDRICAL SHELLS

1. For the sketch given, $a = 0$, $b = 2$;
$V = \int_a^b 2\pi\left(\begin{smallmatrix}\text{shell}\\ \text{radius}\end{smallmatrix}\right)\left(\begin{smallmatrix}\text{shell}\\ \text{height}\end{smallmatrix}\right)dx = \int_0^2 2\pi x\left(1 + \frac{x^2}{4}\right)dx = 2\pi\int_0^2 \left(x + \frac{x^3}{4}\right)dx = 2\pi\left[\frac{x^2}{2} + \frac{x^4}{16}\right]_0^2 = 2\pi\left(\frac{4}{2} + \frac{16}{16}\right)$
$= 2\pi \cdot 3 = 6\pi$

2. For the sketch given, $a = 0$, $b = 2$;
$V = \int_a^b 2\pi\left(\begin{smallmatrix}\text{shell}\\ \text{radius}\end{smallmatrix}\right)\left(\begin{smallmatrix}\text{shell}\\ \text{height}\end{smallmatrix}\right)dx = \int_0^2 2\pi x\left(2 - \frac{x^2}{4}\right)dx = 2\pi\int_0^2 \left(2x - \frac{x^3}{4}\right)dx = 2\pi\left[x^2 - \frac{x^4}{16}\right]_0^2 = 2\pi(4 - 1) = 6\pi$

35. (a) *Disk*: $V = V_1 - V_2$

$V_1 = \int_{a_1}^{b_1} \pi[R_1(x)]^2\, dx$ and $V_2 = \int_{a_2}^{b_2} \pi[R_2(x)]^2$ with $R_1(x) = \sqrt{\frac{x+2}{3}}$ and $R_2(x) = \sqrt{x}$,

$a_1 = -2$, $b_1 = 1$; $a_2 = 0$, $b_2 = 1$ $\Rightarrow$ two integrals are required

(b) *Washer*: $V = V_1 - V_2$

$V_1 = \int_{a_1}^{b_1} \pi\left([R_1(x)]^2 - [r_1(x)]^2\right) dx$ with $R_1(x) = \sqrt{\frac{x+2}{3}}$ and $r_1(x) = 0$; $a_1 = -2$ and $b_1 = 0$;

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$V_2 = \int_{a_2}^{b_2} \pi\left([R_2(x)]^2 - [r_2(x)]^2\right) dx$ with $R_2(x) = \sqrt{\frac{x+2}{3}}$ and $r_2(x) = \sqrt{x}$; $a_2 = 0$ and $b_2 = 1$

$\Rightarrow$ two integrals are required

(c) *Shell*: $V = \int_c^d 2\pi \left(\begin{smallmatrix}\text{shell}\\ \text{radius}\end{smallmatrix}\right)\left(\begin{smallmatrix}\text{shell}\\ \text{height}\end{smallmatrix}\right) dy = \int_c^d 2\pi y \left(\begin{smallmatrix}\text{shell}\\ \text{height}\end{smallmatrix}\right) dy$ where shell height $= y^2 - (3y^2 - 2) = 2 - 2y^2$; $c = 0$ and $d = 1$. Only *one* integral is required. It is, therefore preferable to use the *shell* method. However, whichever method you use, you will get $V = \pi$.

36. (a) *Disk*: $V = V_1 - V_2 - V_3$

$V_i = \int_{c_i}^{d_i} \pi[R_i(y)]^2\, dy$, $i = 1, 2, 3$ with $R_1(y) = 1$ and $c_1 = -1$, $d_1 = 1$; $R_2(y) = \sqrt{y}$ and $c_2 = 0$ and $d_2 = 1$; $R_3(y) = (-y)^{1/4}$ and $c_3 = -1$, $d_3 = 0$ $\Rightarrow$ three integrals are required

(b) *Washer*: $V = V_1 + V_2$

$V_i = \int_{c_i}^{d_i} \pi([R_i(y)]^2 - [r_i(y)]^2)\, dy$, $i = 1, 2$ with $R_1(y) = 1$, $r_1(y) = \sqrt{y}$, $c_1 = 0$ and $d_1 = 1$;

$R_2(y) = 1$, $r_2(y) = (-y)^{1/4}$, $c_2 = -1$ and $d_2 = 0$ $\Rightarrow$ two integrals are required

(c) *Shell*: $V = \int_a^b 2\pi \left(\begin{smallmatrix}\text{shell}\\ \text{radius}\end{smallmatrix}\right)\left(\begin{smallmatrix}\text{shell}\\ \text{height}\end{smallmatrix}\right) dx = \int_a^b 2\pi x \left(\begin{smallmatrix}\text{shell}\\ \text{height}\end{smallmatrix}\right) dx$, where shell height $= x^2 - (-x^4) = x^2 + x^4$, $a = 0$ and $b = 1$ $\Rightarrow$ only one integral is required. It is, therefore preferable to use the *shell* method. However, whichever method you use, you will get $V = \frac{5\pi}{6}$.

## 6.3 LENGTHS OF PLANE CURVES

1. $\frac{dx}{dt} = -1$ and $\frac{dy}{dt} = 3$ $\Rightarrow$ $\sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} = \sqrt{(-1)^2 + (3)^2} = \sqrt{10}$

$\Rightarrow$ Length $= \int_{-2/3}^{1} \sqrt{10}\, dt = \sqrt{10}\, [t]_{-2/3}^{1} = \sqrt{10} - \left(-\frac{2}{3}\sqrt{10}\right) = \frac{5\sqrt{10}}{3}$

2. $\frac{dx}{dt} = -\sin t$ and $\frac{dy}{dt} = 1 + \cos t$ $\Rightarrow$ $\sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} = \sqrt{(-\sin t)^2 + (1 + \cos t)^2} = \sqrt{2 + 2\cos t}$

$\Rightarrow$ Length $= \int_0^{\pi} \sqrt{2 + 2\cos t}\, dt = \sqrt{2}\int_0^{\pi} \sqrt{\left(\frac{1-\cos t}{1-\cos t}\right)(1 + \cos t)}\, dt = \sqrt{2}\int_0^{\pi} \sqrt{\frac{\sin^2 t}{1-\cos t}}\, dt$

$= \sqrt{2}\int_0^{\pi} \frac{\sin t}{\sqrt{1-\cos t}}\, dt$ (since $\sin t \geq 0$ on $[0, \pi]$); [$u = 1 - \cos t$ $\Rightarrow$ $du = \sin t\, dt$; $t = 0$ $\Rightarrow$ $u = 0$, $t = \pi$ $\Rightarrow$ $u = 2$] $\rightarrow$ $\sqrt{2}\int_0^2 u^{-1/2}\, du = \sqrt{2}\left[2u^{1/2}\right]_0^2 = 4$

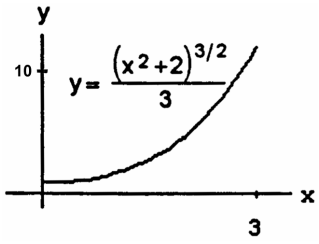
3. $\frac{dx}{dt} = 3t^2$ and $\frac{dy}{dt} = 3t$ $\Rightarrow$ $\sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} = \sqrt{(3t^2)^2 + (3t)^2} = \sqrt{9t^4 + 9t^2} = 3t\sqrt{t^2+1}$ $\left(\text{since } t \geq 0 \text{ on } \left[0, \sqrt{3}\right]\right)$

$\Rightarrow$ Length $= \int_0^{\sqrt{3}} 3t\sqrt{t^2+1}\, dt$; $\left[u = t^2 + 1 \Rightarrow \frac{3}{2}\, du = 3t\, dt;\ t = 0 \Rightarrow u = 1,\ t = \sqrt{3} \Rightarrow u = 4\right]$

$\rightarrow \int_1^4 \frac{3}{2} u^{1/2}\, du = \left[u^{3/2}\right]_1^4 = (8 - 1) = 7$

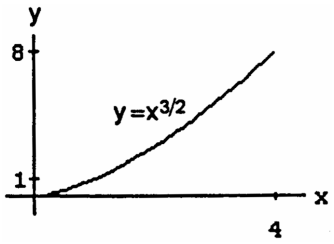
4. $\frac{dx}{dt} = t$ and $\frac{dy}{dt} = (2t + 1)^{1/2}$ $\Rightarrow$ $\sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} = \sqrt{t^2 + (2t+1)} = \sqrt{(t+1)^2} = |t + 1| = t + 1$ since $0 \leq t \leq 4$

$\Rightarrow$ Length $= \int_0^4 (t + 1)\, dt = \left[\frac{t^2}{2} + t\right]_0^4 = (8 + 4) = 12$



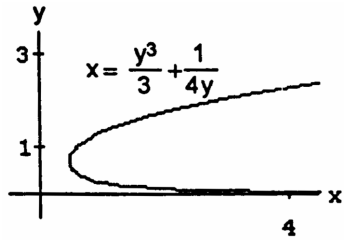
5. $\frac{dx}{dt} = (2t + 3)^{1/2}$ and $\frac{dy}{dt} = 1 + t$ $\Rightarrow$ $\sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} = \sqrt{(2t+3) + (1+t)^2} = \sqrt{t^2 + 4t + 4} = |t + 2| = t + 2$

since $0 \leq t \leq 3$ $\Rightarrow$ Length $= \int_0^3 (t + 2)\, dt = \left[\frac{t^2}{2} + 2t\right]_0^3 = \frac{21}{2}$



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

6. $\frac{dx}{dt} = 8t\cos t$ and $\frac{dy}{dt} = 8t\sin t \Rightarrow \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} = \sqrt{(8t\cos t)^2 + (8t\sin t)^2} = \sqrt{64t^2\cos^2 t + 64t^2\sin^2 t}$
$= |8t| = 8t$ since $0 \le t \le \frac{\pi}{2} \Rightarrow$ Length $= \int_0^{\pi/2} 8t\,dt = [4t^2]_0^{\pi/2} = \pi^2$



7. $\frac{dy}{dx} = \frac{1}{3}\cdot\frac{3}{2}(x^2+2)^{1/2}\cdot 2x = \sqrt{(x^2+2)}\cdot x$
$\Rightarrow L = \int_0^3 \sqrt{1+(x^2+2)x^2}\,dx = \int_0^3 \sqrt{1+2x^2+x^4}\,dx$

25. $\sqrt{2}\,x = \int_0^x \sqrt{1 + \left(\frac{dy}{dt}\right)^2}\, dt,\ x \geq 0 \Rightarrow \sqrt{2} = \sqrt{1 + \left(\frac{dy}{dx}\right)^2} \Rightarrow \frac{dy}{dx} = \pm 1 \Rightarrow y = f(x) = \pm x + C$ where C is any real number.

26. (a) From the accompanying figure and definition of the differential (change along the tangent line) we see that $dy = f'(x_{k-1}) \triangle x_k \Rightarrow$ length of kth tangent fin is $\sqrt{(\triangle x_k)^2 + (dy)^2} = \sqrt{(\triangle x_k)^2 + [f'(x_{k-1}) \triangle x_k]^2}$.

(b) Length of curve $= \lim_{n \to \infty} \sum_{k=1}^{n}$ (length of kth tangent fin) $= \lim_{n \to \infty} \sum_{k=1}^{n} \sqrt{(\triangle x_k)^2 + [f'(x_{k-1}) \triangle x_k]^2}$

$= \lim_{n \to \infty} \sum_{k=1}^{n} \sqrt{1 + [f'(x_{k-1})]^2} \triangle x_k = \int_a^b \sqrt{1 + [f'(x)]^2}\, dx$

27. (a) $\left(\frac{dy}{dx}\right)^2$ correspondes to $\frac{1}{4x}$ here, so take $\frac{dy}{dx}$ as $\frac{1}{2\sqrt{x}}$. Then $y = \sqrt{x} + C$ and since $(1, 1)$ lies on the curve, $C = 0$. So $y = \sqrt{x}$ from $(1, 1)$ to $(4, 2)$.

(b) Only one. We know the derivative of the function and the value of the function at one value of x.

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

28. (a) $\left(\frac{dx}{dy}\right)^2$ correspondes to $\frac{1}{y^4}$ here, so take $\frac{dy}{dx}$ as $\frac{1}{y^2}$. Then $x = -\frac{1}{y} + C$ and, since $(0, 1)$ lies on the curve, $C = 1$
So $y = \frac{1}{1-x}$.

(b) Only one. We know the derivative of the function and the value of the function at one value of x.

29. (a) $\frac{dx}{dt} = -2 \sin 2t$ and $\frac{dy}{dt} = 2 \cos 2t \Rightarrow \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} = \sqrt{(-2 \sin 2t)^2 + (2 \cos 2t)^2} = 2$

$\Rightarrow$ Length $= \int_0^{\pi/2} 2 \, dt = [2t]_0^{\pi/2} = \pi$

(b) $\frac{dx}{dt} = \pi \cos \pi t$ and $\frac{dy}{dt} = -\pi \sin \pi t = \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2} = \sqrt{(\pi \cos \pi t)^2 + (-\pi \sin \pi t)^2} = \pi$

$\Rightarrow$ Length $= \int_{-1/2}^{1/2} \pi \, dt = [\pi t]_{-1/2}^{1/2} = \pi$

30. $x = a(\theta - \sin \theta) \Rightarrow \frac{dx}{d\theta} = a(1 - \cos \theta) \Rightarrow \left(\frac{dx}{d\theta}\right)^2 = a^2 (1 - 2 \cos \theta + \cos^2 \theta)$ and $y = a(1 - \cos \theta)$

$\Rightarrow \frac{dy}{d\theta} = a \sin \theta \Rightarrow \left(\frac{dy}{d\theta}\right)^2 = a^2 \sin^2 \theta \Rightarrow$ Length $= \int_0^{2\pi} \sqrt{\left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2} \, d\theta = \int_0^{2\pi} \sqrt{2a^2(1 - \cos \theta)} \, d\theta$

$= a\sqrt{2}\int_0^{2\pi} \sqrt{2} \sqrt{\frac{1 - \cos \theta}{2}} \, d\theta = 2a \int_0^{2\pi} \left|\sin \frac{\theta}{2}\right| d\theta = 2a \int_0^{2\pi} \sin \frac{\theta}{2} \, d\theta = -4a \left[\cos \frac{\theta}{2}\right]_0^{2\pi} = 8a$

## 6.4 MOMENTS AND CENTERS OF MASS

1. Because the children are balanced, the moment of the system about the origin must be equal to zero: $5 \cdot 80 = x \cdot 100 \Rightarrow x = 4$ ft, the distance of the 100-lb child from the fulcrum.

2. Suppose the log has length 2a. Align the log along the x-axis so the 100-lb end is placed at $x = -a$ and the 200-lb end at $x = a$. Then the center of mass $\bar{x}$ satisfies $\bar{x} = \frac{100(-a) + 200(a)}{300} \Rightarrow \bar{x} = \frac{a}{3}$. That is, $\bar{x}$ is located at a distance $a - \frac{a}{3} = \frac{2a}{3} = \frac{1}{3}(2a)$ which is $\frac{1}{3}$ of the length of the log from the 200-lb (heavier) end (see figure) or $\frac{2}{3}$ of the way from the lighter end toward the heavier end.

3. The center of mass of each rod is in its center (see Example 1). The rod system is equivalent to two point masses located at the centers of the rods at coordinates $\left(\frac{L}{2}, 0\right)$ and $\left(0, \frac{L}{2}\right)$. Therefore $\bar{x} = \frac{m_y}{m}$ $= \frac{x_1 m_1 + x_2 m_2}{m_1 + m_2} = \frac{\frac{L}{2} \cdot m + 0}{m + m} = \frac{L}{4}$ and $\bar{y} = \frac{m_x}{m} = \frac{y_1 m_2 + y_2 m_2}{m_1 + m_2} = \frac{0 + \frac{L}{2} \cdot m}{m + m} = \frac{L}{4} \Rightarrow \left(\frac{L}{4}, \frac{L}{4}\right)$ is the center of mass location.

4. Let the rods have lengths $x = L$ and $y = 2L$. The center of mass of each rod is in its center (see Example 1). The rod system is equivalent to two point masses located at the centers of the rods at coordinates $\left(\frac{L}{2}, 0\right)$ and $(0, L)$. Therefore $\bar{x} = \frac{\frac{L}{2} \cdot m + 0 \cdot 2m}{m + 2m} = \frac{L}{6}$ and $\bar{y} = \frac{0 \cdot m + L \cdot 2m}{m + 2m} = \frac{2L}{3} \Rightarrow \left(\frac{L}{6}, \frac{2L}{3}\right)$ is the center of mass location.

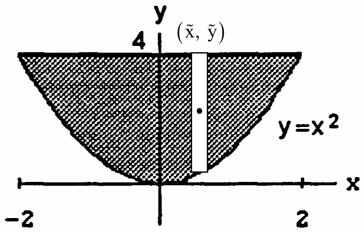
5. $M_0 = \int_0^2 x \cdot 4\, dx = \left[4\,\frac{x^2}{2}\right]_0^2 = 4 \cdot \frac{4}{2} = 8$; $M = \int_0^2 4\, dx = [4x]_0^2 = 4 \cdot 2 = 8 \Rightarrow \bar{x} = \frac{M_0}{M} = 1$

6. $M_0 = \int_1^3 x \cdot 4\, dx = \left[4\,\frac{x^2}{2}\right]_1^3 = \frac{4}{2}(9 - 1) = 16$; $M = \int_1^3 4\, dx = [4x]_1^3 = 12 - 4 = 8 \Rightarrow \bar{x} = \frac{M_0}{M} = \frac{16}{8} = 2$

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

7. $M_0 = \int_0^3 x\left(1+\frac{x}{3}\right)dx = \int_0^3 \left(x+\frac{x^2}{3}\right)dx = \left[\frac{x^2}{2}+\frac{x^3}{9}\right]_0^3 = \left(\frac{9}{2}+\frac{27}{9}\right) = \frac{15}{2}$; $M = \int_0^3 \left(1+\frac{x}{3}\right)dx = \left[x+\frac{x^2}{6}\right]_0^3$
$= 3+\frac{9}{6} = \frac{9}{2} \Rightarrow \bar{x} = \frac{M_0}{M} = \frac{\left(\frac{15}{2}\right)}{\left(\frac{9}{2}\right)} = \frac{15}{9} = \frac{5}{3}$

8. $M_0 = \int_0^4 x\left(2-\frac{x}{4}\right)dx = \int_0^4 \left(2x-\frac{x^2}{4}\right)dx = \left[x^2-\frac{x^3}{12}\right]_0^4 = \left(16-\frac{64}{12}\right) = 16-\frac{16}{3} = 16\cdot\frac{2}{3} = \frac{32}{3}$;
$M = \int_0^4 \left(2-\frac{x}{4}\right)dx = \left[2x-\frac{x^2}{8}\right]_0^4 = 8-\frac{16}{8} = 6 \Rightarrow \bar{x} = \frac{M_0}{M} = \frac{32}{3\cdot 6} = \frac{16}{9}$

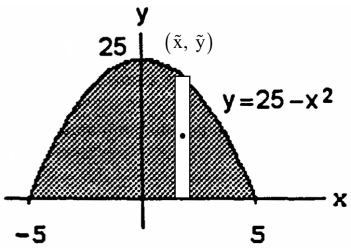


9. $M_0 = \int_1^4 x\left(1+\frac{1}{\sqrt{x}}\right)dx = \int_1^4 \left(x+x^{1/2}\right)dx = \left[\frac{x^2}{2}+\frac{2x^{3/2}}{3}\right]_1^4 = \left(8+\frac{16}{3}\right)-\left(\frac{1}{2}+\frac{2}{3}\right) = \frac{15}{2}+\frac{14}{3} = \frac{45+28}{6} = \frac{73}{6}$;
$M = \int_1^4 \left(1+x^{-1/2}\right)dx = \left[x+2x^{1/2}\right]_1^4 = (4+4)-(1+2) = 5 \Rightarrow \bar{x} = \frac{M_0}{M} = \frac{\left(\frac{73}{6}\right)}{5} = \frac{73}{30}$

10. $M_0 = \int_{1/4}^1 x\cdot 3\left(x^{-3/2}+x^{-5/2}\right)dx = 3\int_{1/4}^1 \left(x^{-1/2}+x^{-3/2}\right)dx = 3\left[2x^{1/2}-\frac{2}{x^{1/2}}\right]_{1/4}^1 = 3\left[(2-2)-\left(2\cdot\frac{1}{2}-\frac{2}{\left(\frac{1}{2}\right)}\right)\right]$
$= 3(4-1) = 9$; $M = 3\int_{1/4}^1 \left(x^{-3/2}+x^{-5/2}\right)dx = 3\left[\frac{-2}{x^{1/2}}-\frac{2}{3x^{3/2}}\right]_{1/4}^1 = 3\left[\left(-2-\frac{2}{3}\right)-\left(-4-\frac{16}{3}\right)\right] = 3\left(2+\frac{14}{3}\right)$
$= 6+14 = 20 \Rightarrow \bar{x} = \frac{M_0}{M} = \frac{9}{20}$

11. $M_0 = \int_0^1 x(2-x)\,dx + \int_1^2 x\cdot x\,dx = \int_0^1 (2x-x^2)\,dx + \int_1^2 x^2\,dx = \left[\frac{2x^2}{2}-\frac{x^3}{3}\right]_0^1 + \left[\frac{x^3}{3}\right]_1^2 = \left(1-\frac{1}{3}\right)+\left(\frac{8}{3}-\frac{1}{3}\right)$
$= \frac{9}{3} = 3$; $M = \int_0^1 (2-x)\,dx + \int_1^2 x\,dx = \left[2x-\frac{x^2}{2}\right]_0^1 + \left[\frac{x^2}{2}\right]_1^2 = \left(2-\frac{1}{2}\right)+\left(\frac{4}{2}-\frac{1}{2}\right) = 3 \Rightarrow \bar{x} = \frac{M_0}{M} = 1$

12. $M_0 = \int_0^1 x(x+1)\,dx + \int_1^2 2x\,dx = \int_0^1 (x^2+x)\,dx + \int_1^2 2x\,dx = \left[\frac{x^3}{3}+\frac{x^2}{2}\right]_0^1 + [x^2]_1^2 = \left(\frac{1}{3}+\frac{1}{2}\right)+(4-1)$
$= 3+\frac{5}{6} = \frac{23}{6}$; $M = \int_0^1 (x+1)\,dx + \int_1^2 2\,dx = \left[\frac{x^2}{2}+x\right]_0^1 + [2x]_1^2 = \left(\frac{1}{2}+1\right)+(4-2) = 2+\frac{3}{2} = \frac{7}{2}$
$\Rightarrow \bar{x} = \frac{M_0}{M} = \left(\frac{23}{6}\right)\left(\frac{2}{7}\right) = \frac{23}{21}$



13. Since the plate is symmetric about the y-axis and its density is constant, the distribution of mass is symmetric about the y-axis and the center of mass lies on the y-axis. This means that $\bar{x} = 0$. It remains to find $\bar{y} = \frac{M_x}{M}$. We model the distribution of mass with *vertical* strips. The typical strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{x^2+4}{2}\right)$, length: $4-x^2$, width: dx, area:

$dA = (4-x^2)\,dx$, mass: $dm = \delta\,dA = \delta(4-x^2)\,dx$. The moment of the strip about the x-axis is $\tilde{y}\ dm = \left(\frac{x^2+4}{2}\right)\delta(4-x^2)\,dx = \frac{\delta}{2}(16-x^4)\,dx$. The moment of the plate about the x-axis is $M_x = \int \tilde{y}\ dm$
$= \int_{-2}^2 \frac{\delta}{2}(16-x^4)\,dx = \frac{\delta}{2}\left[16x-\frac{x^5}{5}\right]_{-2}^2 = \frac{\delta}{2}\left[\left(16\cdot 2-\frac{2^5}{5}\right)-\left(-16\cdot 2+\frac{2^5}{5}\right)\right] = \frac{\delta\cdot 2}{2}\left(32-\frac{32}{5}\right) = \frac{128\delta}{5}$. The mass of the plate is $M = \int \delta(4-x^2)\,dx = \delta\left[4x-\frac{x^3}{3}\right]_{-2}^2 = 2\delta\left(8-\frac{8}{3}\right) = \frac{32\delta}{3}$. Therefore $\bar{y} = \frac{Mx}{M} = \frac{\left(\frac{128\delta}{5}\right)}{\left(\frac{32\delta}{3}\right)} = \frac{12}{5}$. The plate's center of mass is the point $(\bar{x}, \bar{y}) = \left(0, \frac{12}{5}\right)$.

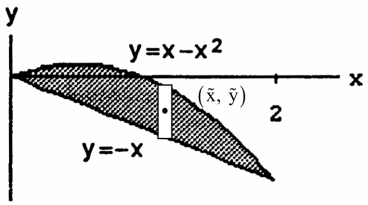
14. Applying the symmetry argument analogous to the one in Exercise 13, we find $\bar{x} = 0$. To find $\bar{y} = \frac{M_x}{M}$, we use the *vertical* strips technique. The typical strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{25-x^2}{2}\right)$, length: $25 - x^2$, width: dx, area: $dA = (25 - x^2)dx$, mass: $dm = \delta\, dA = \delta\,(25 - x^2)\,dx$. The moment of the strip about the x-axis is



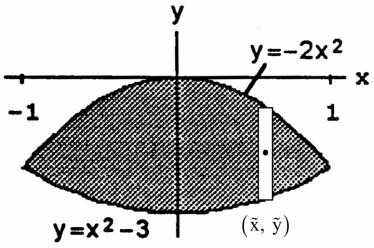
$\tilde{y}\,dm = \left(\frac{25-x^2}{2}\right)\delta\,(25 - x^2)\,dx = \frac{\delta}{2}\,(25 - x^2)^2\,dx$. The moment of the plate about the x-axis is $M_x = \int \tilde{y}\,dm$

$= \int_{-5}^{5} \frac{\delta}{2}\,(25 - x^2)^2\,dx = \frac{\delta}{2}\int_{-5}^{5} (625 - 50x^2 + x^4)\,dx = \frac{\delta}{2}\left[625x - \frac{50}{3}x^3 + \frac{x^5}{5}\right]_{-5}^{5} = 2 \cdot \frac{\delta}{2}\left(625 \cdot 5 - \frac{50}{3} \cdot 5^3 + \frac{5^5}{5}\right)$

$= \delta \cdot 625\left(5 - \frac{10}{3} + 1\right) = \delta \cdot 625 \cdot \left(\frac{8}{3}\right)$. The mass of the plate is $M = \int dm = \int_{-5}^{5} \delta\,(25 - x^2)\,dx = \delta\left[25x - \frac{x^3}{3}\right]_{-5}^{5}$

$= 2\delta\left(5^3 - \frac{5^3}{3}\right) = \frac{4}{3}\,\delta \cdot 5^3$. Therefore $\bar{y} = \frac{M_x}{M} = \frac{\delta \cdot 5^4 \cdot \left(\frac{8}{3}\right)}{\delta \cdot 5^3 \cdot \left(\frac{4}{3}\right)} = 10$. The plate's center of mass is the point $(\bar{x}, \bar{y}) = (0, 10)$.

15. Intersection points: $x - x^2 = -x \;\Rightarrow\; 2x - x^2 = 0$ $\Rightarrow\; x(2 - x) = 0 \;\Rightarrow\; x = 0$ or $x = 2$. The typical *vertical* strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{(x - x^2) + (-x)}{2}\right)$ $= \left(x, -\frac{x^2}{2}\right)$, length: $(x - x^2) - (-x) = 2x - x^2$, width: dx, area: $dA = (2x - x^2)\,dx$, mass: $dm = \delta\, dA = \delta\,(2x - x^2)\,dx$. The moment of the strip about the x-axis is



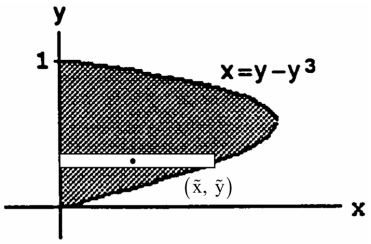
$\tilde{y}\,dm = \left(-\frac{x^2}{2}\right)\delta\,(2x - x^2)\,dx$; about the y-axis it is $\tilde{x}\,dm = x \cdot \delta\,(2x - x^2)\,dx$. Thus, $M_x = \int \tilde{y}\,dm$

$= -\int_0^2 \left(\frac{\delta}{2}x^2\right)(2x - x^2)\,dx = -\frac{\delta}{2}\int_0^2 (2x^3 - x^4)\,dx = -\frac{\delta}{2}\left[\frac{x^4}{2} - \frac{x^5}{5}\right]_0^2 = -\frac{\delta}{2}\left(2^3 - \frac{2^5}{5}\right) = -\frac{\delta}{2} \cdot 2^3\left(1 - \frac{4}{5}\right)$

$= -\frac{4\delta}{5}$; $M_y = \int \tilde{x}\,dm = \int_0^2 x \cdot \delta\,(2x - x^2)\,dx = \delta\int_0^2 (2x^2 - x^3) = \delta\left[\frac{2}{3}x^3 - \frac{x^4}{4}\right]_0^2 = \delta\left(2 \cdot \frac{2^3}{3} - \frac{2^4}{4}\right) = \frac{\delta \cdot 2^4}{12} = \frac{4\delta}{3}$;

$M = \int dm = \int_0^2 \delta\,(2x - x^2)\,dx = \delta\int_0^2 (2x - x^2)\,dx = \delta\left[x^2 - \frac{x^3}{3}\right]_0^2 = \delta\left(4 - \frac{8}{3}\right) = \frac{4\delta}{3}$. Therefore, $\bar{x} = \frac{M_y}{M}$ $= \left(\frac{4\delta}{3}\right)\left(\frac{3}{4\delta}\right) = 1$ and $\bar{y} = \frac{M_x}{M} = \left(-\frac{4\delta}{5}\right)\left(\frac{3}{4\delta}\right) = -\frac{3}{5} \;\Rightarrow\; (\bar{x}, \bar{y}) = \left(1, -\frac{3}{5}\right)$ is the center of mass.

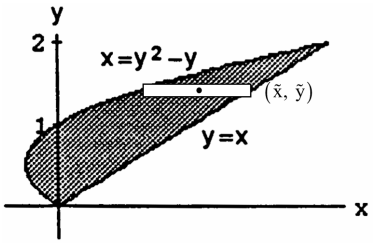
16. Intersection points: $x^2 - 3 = -2x^2 \;\Rightarrow\; 3x^2 - 3 = 0$ $\Rightarrow\; 3(x - 1)(x + 1) = 0 \;\Rightarrow\; x = -1$ or $x = 1$. Applying the symmetry argument analogous to the one in Exercise 13, we find $\bar{x} = 0$. The typical *vertical* strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{-2x^2 + (x^2 - 3)}{2}\right) = \left(x, \frac{-x^2 - 3}{2}\right)$, length: $-2x^2 - (x^2 - 3) = 3\,(1 - x^2)$, width: dx, area: $dA = 3\,(1 - x^2)\,dx$, mass: $dm = \delta\, dA = 3\delta\,(1 - x^2)\,dx$. The moment of the strip about the x-axis is



$\tilde{y}\,dm = \frac{3}{2}\,\delta\,(-x^2 - 3)\,(1 - x^2)\,dx = \frac{3}{2}\,\delta\,(x^4 + 3x^2 - x^2 - 3)\,dx = \frac{3}{2}\,\delta\,(x^4 + 2x^2 - 3)\,dx$; $M_x = \int \tilde{y}\,dm$

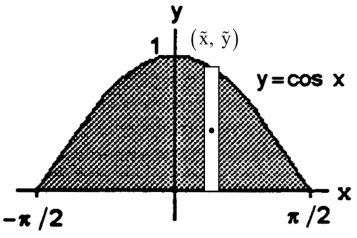
$= \frac{3}{2}\,\delta\int_{-1}^{1}(x^4 + 2x^2 - 3)\,dx = \frac{3}{2}\,\delta\left[\frac{x^5}{5} + \frac{2x^3}{3} - 3x\right]_{-1}^{1} = \frac{3}{2} \cdot \delta \cdot 2\left(\frac{1}{5} + \frac{2}{3} - 3\right) = 3\delta\left(\frac{3+10-45}{15}\right) = -\frac{32\delta}{5}$;

$M = \int dm = 3\delta\int_{-1}^{1}(1 - x^2)\,dx = 3\delta\left[x - \frac{x^3}{3}\right]_{-1}^{1} = 3\delta \cdot 2\left(1 - \frac{1}{3}\right) = 4\delta$. Therefore, $\bar{y} = \frac{M_x}{M} = -\frac{\delta \cdot 32}{5 \cdot \delta \cdot 4} = -\frac{8}{5}$ $\Rightarrow\; (\bar{x}, \bar{y}) = \left(0, -\frac{8}{5}\right)$ is the center of mass.



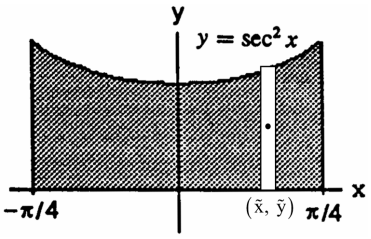
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

17. The typical *horizontal* strip has center of mass:
$(\tilde{x}, \tilde{y}) = \left(\frac{y-y^3}{2}, y\right)$, length: $y - y^3$, width: dy,
area: $dA = (y - y^3)\,dy$, mass: $dm = \delta\,dA = \delta\,(y - y^3)\,dy$.
The moment of the strip about the y-axis is
$\tilde{x}\,dm = \delta\left(\frac{y-y^3}{2}\right)(y - y^3)\,dy = \frac{\delta}{2}(y - y^3)^2\,dy$
$= \frac{\delta}{2}(y^2 - 2y^4 + y^6)\,dy$; the moment about the x-axis is



$\tilde{y}\,dm = \delta y\,(y - y^3)\,dy = \delta\,(y^2 - y^4)\,dy$. Thus, $M_x = \int \tilde{y}\,dm = \delta\int_0^1 (y^2 - y^4)\,dy = \delta\left[\frac{y^3}{3} - \frac{y^5}{5}\right]_0^1 = \delta\left(\frac{1}{3} - \frac{1}{5}\right) = \frac{2\delta}{15}$;
$M_y = \int \tilde{x}\,dm = \frac{\delta}{2}\int_0^1 (y^2 - 2y^4 + y^6)\,dy = \frac{\delta}{2}\left[\frac{y^3}{3} - \frac{2y^5}{5} + \frac{y^7}{7}\right]_0^1 = \frac{\delta}{2}\left(\frac{1}{3} - \frac{2}{5} + \frac{1}{7}\right) = \frac{\delta}{2}\left(\frac{35-42+15}{3\cdot5\cdot7}\right) = \frac{4\delta}{105}$; $M = \int dm$
$= \delta\int_0^1 (y - y^3)\,dy = \delta\left[\frac{y^2}{2} - \frac{y^4}{4}\right]_0^1 = \delta\left(\frac{1}{2} - \frac{1}{4}\right) = \frac{\delta}{4}$. Therefore, $\bar{x} = \frac{M_y}{M} = \left(\frac{4\delta}{105}\right)\left(\frac{4}{\delta}\right) = \frac{16}{105}$ and $\bar{y} = \frac{M_x}{M} = \left(\frac{2\delta}{15}\right)\left(\frac{4}{\delta}\right)$
$= \frac{8}{15} \Rightarrow (\bar{x}, \bar{y}) = \left(\frac{16}{105}, \frac{8}{15}\right)$ is the center of mass.

18. Intersection points: $y = y^2 - y \Rightarrow y^2 - 2y = 0$
$\Rightarrow y(y - 2) = 0 \Rightarrow y = 0$ or $y = 2$. The typical
*horizontal* strip has center of mass:
$(\tilde{x}, \tilde{y}) = \left(\frac{(y^2-y)+y}{2}, y\right) = \left(\frac{y^2}{2}, y\right)$,
length: $y - (y^2 - y) = 2y - y^2$, width: dy,
area: $dA = (2y - y^2)\,dy$, mass: $dm = \delta\,dA = \delta\,(2y - y^2)\,dy$.
The moment about the y-axis is $\tilde{x}\,dm = \frac{\delta}{2}\cdot y^2\,(2y - y^2)\,dy$

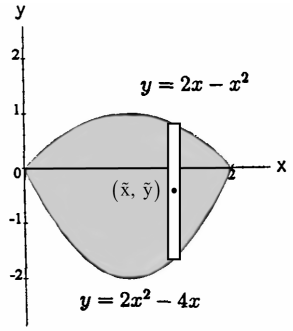


$= \frac{\delta}{2}(2y^3 - y^4)\,dy$; the moment about the x-axis is $\tilde{y}\,dm = \delta y\,(2y - y^2)\,dy = \delta\,(2y^2 - y^3)\,dy$. Thus,
$M_x = \int \tilde{y}\,dm = \int_0^2 \delta\,(2y^2 - y^3)\,dy = \delta\left[\frac{2y^3}{3} - \frac{y^4}{4}\right]_0^2 = \delta\left(\frac{16}{3} - \frac{16}{4}\right) = \frac{16\delta}{12}(4 - 3) = \frac{4\delta}{3}$; $M_y = \int \tilde{x}\,dm$
$= \int_0^2 \frac{\delta}{2}(2y^3 - y^4)\,dy = \frac{\delta}{2}\left[\frac{y^4}{2} - \frac{y^5}{5}\right]_0^2 = \frac{\delta}{2}\left(8 - \frac{32}{5}\right) = \frac{\delta}{2}\left(\frac{40-32}{5}\right) = \frac{4\delta}{5}$; $M = \int dm = \int_0^2 \delta\,(2y - y^2)\,dy$
$= \delta\left[y^2 - \frac{y^3}{3}\right]_0^2 = \delta\left(4 - \frac{8}{3}\right) = \frac{4\delta}{3}$. Therefore, $\bar{x} = \frac{M_y}{M} = \left(\frac{4\delta}{5}\right)\left(\frac{3}{4\delta}\right) = \frac{3}{5}$ and $\bar{y} = \frac{M_x}{M} = \left(\frac{4\delta}{3}\right)\left(\frac{3}{4\delta}\right) = 1$
$\Rightarrow (\bar{x}, \bar{y}) = \left(\frac{3}{5}, 1\right)$ is the center of mass.

19. Applying the symmetry argument analogous to the one used in Exercise 13, we find $\bar{x} = 0$. The typical *vertical* strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{\cos x}{2}\right)$, length: $\cos x$, width: dx, area: $dA = \cos x\,dx$, mass: $dm = \delta\,dA = \delta\cos x\,dx$. The moment of the strip about the x-axis is $\tilde{y}\,dm = \delta\cdot\frac{\cos x}{2}\cdot\cos x\,dx$
$= \frac{\delta}{2}\cos^2 x\,dx = \frac{\delta}{2}\left(\frac{1+\cos 2x}{2}\right)dx = \frac{\delta}{4}(1 + \cos 2x)\,dx$; thus,

$M_x = \int \tilde{y}\,dm = \int_{-\pi/2}^{\pi/2} \frac{\delta}{4}(1 + \cos 2x)\,dx = \frac{\delta}{4}\left[x + \frac{\sin 2x}{2}\right]_{-\pi/2}^{\pi/2} = \frac{\delta}{4}\left[\left(\frac{\pi}{2} + 0\right) - \left(-\frac{\pi}{2}\right)\right] = \frac{\delta\pi}{4}$; $M = \int dm = \delta\int_{-\pi/2}^{\pi/2}\cos x\,dx$
$= \delta[\sin x]_{-\pi/2}^{\pi/2} = 2\delta$. Therefore, $\bar{y} = \frac{M_x}{M} = \frac{\delta\pi}{4\cdot2\delta} = \frac{\pi}{8} \Rightarrow (\bar{x}, \bar{y}) = \left(0, \frac{\pi}{8}\right)$ is the center of mass.

20. Applying the symmetry argument analogous to the one used in Exercise 13, we find $\bar{x} = 0$. The typical vertical strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{\sec^2 x}{2}\right)$, length: $\sec^2 x$, width: dx, area: $dA = \sec^2 x\,dx$, mass: $dm = \delta\,dA = \delta\sec^2 x\,dx$. The moment about the x-axis is $\tilde{y}\,dm = \left(\frac{\sec^2 x}{2}\right)(\delta\sec^2 x)\,dx$
$= \frac{\delta}{2}\sec^4 x\,dx$. $M_x = \int_{-\pi/4}^{\pi/4} \tilde{y}\,dm = \frac{\delta}{2}\int_{-\pi/4}^{\pi/4}\sec^4 x\,dx$



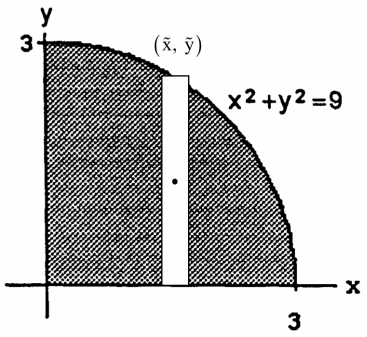
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$= \frac{\delta}{2}\int_{-\pi/4}^{\pi/4}(\tan^2 x + 1)(\sec^2 x)\,dx = \frac{\delta}{2}\int_{-\pi/4}^{\pi/4}(\tan x)^2(\sec^2 x)\,dx + \frac{\delta}{2}\int_{-\pi/4}^{\pi/4}\sec^2 x\,dx = \frac{\delta}{2}\left[\frac{(\tan x)^3}{3}\right]_{-\pi/4}^{\pi/4} + \frac{\delta}{2}[\tan x]_{-\pi/4}^{\pi/4}$

$= \frac{\delta}{2}\left[\frac{1}{3} - \left(-\frac{1}{3}\right)\right] + \frac{\delta}{2}[1-(-1)] = \frac{\delta}{3} + \delta = \frac{4\delta}{3}$; $M = \int dm = \delta\int_{-\pi/4}^{\pi/4}\sec^2 x\,dx = \delta[\tan x]_{-\pi/4}^{\pi/4} = \delta[1-(-1)] = 2\delta$.

Therefore, $\bar{y} = \frac{M_x}{M} = \left(\frac{4\delta}{3}\right)\left(\frac{1}{2\delta}\right) = \frac{2}{3} \Rightarrow (\bar{x}, \bar{y}) = \left(0, \frac{2}{3}\right)$ is the center of mass.

21. Since the plate is symmetric about the line $x = 1$ and its density is constant, the distribution of mass is symmetric about this line and the center of mass lies on it. This means that $\bar{x} = 1$. The typical *vertical* strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{(2x - x^2) + (2x^2 - 4x)}{2}\right) = \left(x, \frac{x^2 - 2x}{2}\right)$, length: $(2x - x^2) - (2x^2 - 4x) = -3x^2 + 6x = 3(2x - x^2)$, width: dx, area: $dA = 3(2x - x^2)\,dx$, mass: $dm = \delta\,dA$ $= 3\delta(2x - x^2)\,dx$. The moment about the x-axis is $\tilde{y}\,dm = \frac{3}{2}\delta(x^2 - 2x)(2x - x^2)\,dx = -\frac{3}{2}\delta(x^2 - 2x)^2\,dx$



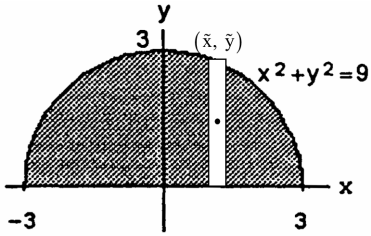
$= -\frac{3}{2}\delta(x^4 - 4x^3 + 4x^2)\,dx$. Thus, $M_x = \int \tilde{y}\,dm = -\int_0^2 \frac{3}{2}\delta(x^4 - 4x^3 + 4x^2)\,dx = -\frac{3}{2}\delta\left[\frac{x^5}{5} - x^4 + \frac{4}{3}x^3\right]_0^2$

$= -\frac{3}{2}\delta\left(\frac{2^5}{5} - 2^4 + \frac{4}{3}\cdot 2^3\right) = -\frac{3}{2}\delta\cdot 2^4\left(\frac{2}{5} - 1 + \frac{2}{3}\right) = -\frac{3}{2}\delta\cdot 2^4\left(\frac{6 - 15 + 10}{15}\right) = -\frac{8\delta}{5}$; $M = \int dm$

$= \int_0^2 3\delta(2x - x^2)\,dx = 3\delta\left[x^2 - \frac{x^3}{3}\right]_0^2 = 3\delta\left(4 - \frac{8}{3}\right) = 4\delta$. Therefore, $\bar{y} = \frac{M_x}{M} = \left(-\frac{8\delta}{5}\right)\left(\frac{1}{4\delta}\right) = -\frac{2}{5}$

$\Rightarrow (\bar{x}, \bar{y}) = \left(1, -\frac{2}{5}\right)$ is the center of mass.

22. (a) Since the plate is symmetric about the line $x = y$ and its density is constant, the distribution of mass is symmetric about this line. This means that $\bar{x} = \bar{y}$. The typical *vertical* strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{\sqrt{9 - x^2}}{2}\right)$, length: $\sqrt{9 - x^2}$, width: dx, area: $dA = \sqrt{9 - x^2}\,dx$, mass: $dm = \delta\,dA = \delta\sqrt{9 - x^2}\,dx$. The moment about the x-axis is

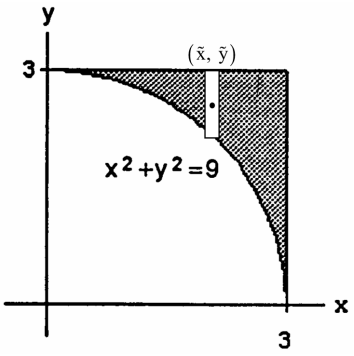


$\tilde{y}\,dm = \delta\left(\frac{\sqrt{9 - x^2}}{2}\right)\sqrt{9 - x^2}\,dx = \frac{\delta}{2}(9 - x^2)\,dx$. Thus, $M_x = \int \tilde{y}\,dm = \int_0^3 \frac{\delta}{2}(9 - x^2)\,dx = \frac{\delta}{2}\left[9x - \frac{x^3}{3}\right]_0^3$

$= \frac{\delta}{2}(27 - 9) = 9\delta$; $M = \int dm = \int \delta\,dA = \delta\int dA = \delta$(Area of a quarter of a circle of radius 3) $= \delta\left(\frac{9\pi}{4}\right) = \frac{9\pi\delta}{4}$.

Therefore, $\bar{y} = \frac{M_x}{M} = (9\delta)\left(\frac{4}{9\pi\delta}\right) = \frac{4}{\pi} \Rightarrow (\bar{x}, \bar{y}) = \left(\frac{4}{\pi}, \frac{4}{\pi}\right)$ is the center of mass.

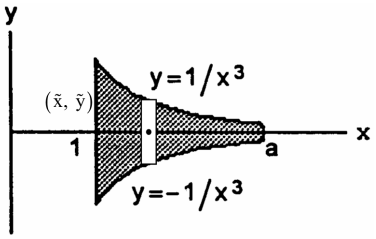
(b) Applying the symmetry argument analogous to the one used in Exercise 13, we find that $\bar{x} = 0$. The typical vertical strip has the same parameters as in part (a). Thus, $M_x = \int \tilde{y}\,dm = \int_{-3}^3 \frac{\delta}{2}(9 - x^2)\,dx$



$= 2\int_0^3 \frac{\delta}{2}(9 - x^2)\,dx = 2(9\delta) = 18\delta$;

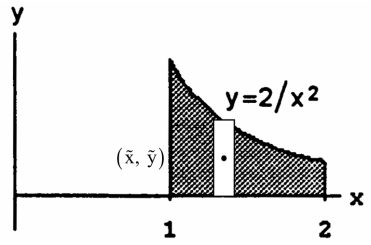
$M = \int dm = \int \delta\,dA = \delta\int dA$

$= \delta$(Area of a semi-circle of radius 3) $= \delta\left(\frac{9\pi}{2}\right) = \frac{9\pi\delta}{2}$. Therefore, $\bar{y} = \frac{M_x}{M} = (18\delta)\left(\frac{2}{9\pi\delta}\right) = \frac{4}{\pi}$, the same $\bar{y}$ as in part (a) $\Rightarrow (\bar{x}, \bar{y}) = \left(0, \frac{4}{\pi}\right)$ is the center of mass.



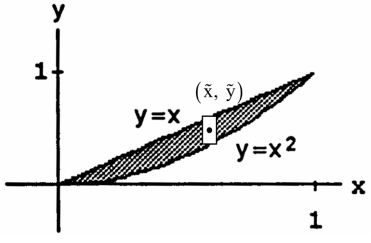
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

23. Since the plate is symmetric about the line $x = y$ and its density is constant, the distribution of mass is symmetric about this line. This means that $\overline{x} = \overline{y}$. The typical *vertical* strip has



center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{3+\sqrt{9-x^2}}{2}\right)$,
length: $3 - \sqrt{9-x^2}$, width: $dx$,
area: $dA = \left(3 - \sqrt{9-x^2}\right) dx$,
mass: $dm = \delta\, dA = \delta\left(3 - \sqrt{9-x^2}\right) dx$.
The moment about the x-axis is
$\tilde{y}\, dm = \delta \frac{\left(3+\sqrt{9-x^2}\right)\left(3-\sqrt{9-x^2}\right)}{2} dx = \frac{\delta}{2}\left[9 - (9-x^2)\right] dx = \frac{\delta x^2}{2} dx$. Thus, $M_x = \int_0^3 \frac{\delta x^2}{2}\, dx = \frac{\delta}{6}\left[x^3\right]_0^3 = \frac{9\delta}{2}$. The area equals the area of a square with side length 3 minus one quarter the area of a disk with radius 3 $\Rightarrow$ $A = 3^2 - \frac{\pi 9}{4}$ $= \frac{9}{4}(4-\pi)$ $\Rightarrow$ $M = \delta A = \frac{9\delta}{4}(4-\pi)$. Therefore, $\overline{y} = \frac{M_x}{M} = \left(\frac{9\delta}{2}\right)\left[\frac{4}{9\delta(4-\pi)}\right] = \frac{2}{4-\pi}$ $\Rightarrow$ $(\overline{x}, \overline{y}) = \left(\frac{2}{4-\pi}, \frac{2}{4-\pi}\right)$ is the center of mass.

24. Applying the symmetry argument analogous to the one used in Exercise 13, we find that $\overline{y} = 0$. The typical *vertical* strip has

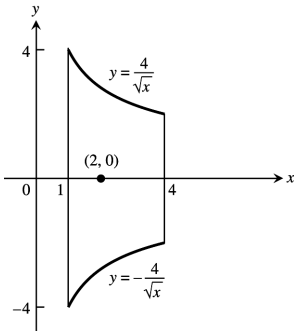


center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{\frac{1}{x^3} - \frac{1}{x^3}}{2}\right) = (x, 0)$,
length: $\frac{1}{x^3} - \left(-\frac{1}{x^3}\right) = \frac{2}{x^3}$, width: $dx$, area: $dA = \frac{2}{x^3} dx$,
mass: $dm = \delta\, dA = \frac{2\delta}{x^3} dx$. The moment about the y-axis is
$\tilde{x}\, dm = x \cdot \frac{2\delta}{x^3} dx = \frac{2\delta}{x^2} dx$. Thus, $M_y = \int \tilde{x}\, dm = \int_1^a \frac{2\delta}{x^2}\, dx$
$= 2\delta\left[-\frac{1}{x}\right]_1^a = 2\delta\left(-\frac{1}{a} + 1\right) = \frac{2\delta(a-1)}{a}$; $M = \int dm = \int_1^a \frac{2\delta}{x^3}\, dx = \delta\left[-\frac{1}{x^2}\right]_1^a = \delta\left(-\frac{1}{a^2} + 1\right) = \frac{\delta(a^2-1)}{a^2}$. Therefore,
$\overline{x} = \frac{M_y}{M} = \left[\frac{2\delta(a-1)}{a}\right]\left[\frac{a^2}{\delta(a^2-1)}\right] = \frac{2a}{a+1}$ $\Rightarrow$ $(\overline{x}, \overline{y}) = \left(\frac{2a}{a+1}, 0\right)$. Also, $\lim_{a \to \infty} \overline{x} = 2$.

25. $M_x = \int \tilde{y}\, dm = \int_1^2 \frac{\left(\frac{2}{x^2}\right)}{2} \cdot \delta \cdot \left(\frac{2}{x^2}\right) dx$
$= \int_1^2 \left(\frac{1}{x^2}\right)(x^2)\left(\frac{2}{x^2}\right) dx = \int_1^2 \frac{2}{x^2}\, dx = 2\int_1^2 x^{-2}\, dx$
$= 2\left[-x^{-1}\right]_1^2 = 2\left[\left(-\frac{1}{2}\right) - (-1)\right] = 2\left(\frac{1}{2}\right) = 1$;
$M_y = \int \tilde{x}\, dm = \int_1^2 x \cdot \delta \cdot \left(\frac{2}{x^2}\right) dx$
$= \int_1^2 x\,(x^2)\left(\frac{2}{x^2}\right) dx = 2\int_1^2 x\, dx = 2\left[\frac{x^2}{2}\right]_1^2$
$= 2\left(2 - \frac{1}{2}\right) = 4 - 1 = 3$; $M = \int dm = \int_1^2 \delta\left(\frac{2}{x^2}\right) dx = \int_1^2 x^2\left(\frac{2}{x^2}\right) dx = 2\int_1^2 dx = 2[x]_1^2 = 2(2-1) = 2$. So
$\overline{x} = \frac{M_y}{M} = \frac{3}{2}$ and $\overline{y} = \frac{M_x}{M} = \frac{1}{2}$ $\Rightarrow$ $(\overline{x}, \overline{y}) = \left(\frac{3}{2}, \frac{1}{2}\right)$ is the center of mass.

26. We use the *vertical* strip approach:
$M_x = \int \tilde{y}\, dm = \int_0^1 \frac{(x+x^2)}{2}(x - x^2) \cdot \delta\, dx$
$= \frac{1}{2}\int_0^1 (x^2 - x^4) \cdot 12x\, dx$
$= 6\int_0^1 (x^3 - x^5)\, dx = 6\left[\frac{x^4}{4} - \frac{x^6}{6}\right]_0^1$
$= 6\left(\frac{1}{4} - \frac{1}{6}\right) = \frac{6}{4} - 1 = \frac{1}{2}$;

$M_y = \int \tilde{x}\, dm = \int_0^1 x\,(x - x^2) \cdot \delta\, dx = \int_0^1 (x^2 - x^3) \cdot 12x\, dx = 12\int_0^1 (x^3 - x^4)\, dx = 12\left[\frac{x^4}{4} - \frac{x^5}{5}\right]_0^1 = 12\left(\frac{1}{4} - \frac{1}{5}\right)$

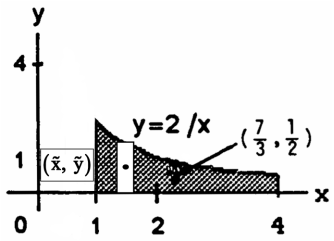


Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$= \frac{12}{20} = \frac{3}{5}$; $M = \int dm = \int_0^1 (x - x^2) \cdot \delta \, dx = 12\int_0^1 (x^2 - x^3)\, dx = 12\left[\frac{x^3}{3} - \frac{x^4}{4}\right]_0^1 = 12\left(\frac{1}{3} - \frac{1}{4}\right) = \frac{12}{12} = 1$. So $\bar{x} = \frac{M_y}{M} = \frac{3}{5}$ and $\bar{y} = \frac{M_x}{M} = \frac{1}{2} \Rightarrow \left(\frac{3}{5}, \frac{1}{2}\right)$ is the center of mass.

27. (a) We use the shell method: $V = \int_a^b 2\pi \left(\begin{smallmatrix}\text{shell}\\ \text{radius}\end{smallmatrix}\right)\left(\begin{smallmatrix}\text{shell}\\ \text{height}\end{smallmatrix}\right) dx = \int_1^4 2\pi x \left[\frac{4}{\sqrt{x}} - \left(-\frac{4}{\sqrt{x}}\right)\right] dx$
$= 16\pi\int_1^4 \frac{x}{\sqrt{x}}\, dx = 16\pi\int_1^4 x^{1/2}\, dx = 16\pi\left[\frac{2}{3}x^{3/2}\right]_1^4 = 16\pi\left(\frac{2}{3}\cdot 8 - \frac{2}{3}\right) = \frac{32\pi}{3}(8-1) = \frac{224\pi}{3}$

(b) Since the plate is symmetric about the x-axis and its density $\delta(x) = \frac{1}{x}$ is a function of x alone, the distribution of its mass is symmetric about the x-axis. This means that $\bar{y} = 0$. We use the vertical strip approach to find $\bar{x}$: $M_y = \int \tilde{x}\, dm = \int_1^4 x \cdot \left[\frac{4}{\sqrt{x}} - \left(-\frac{4}{\sqrt{x}}\right)\right] \cdot \delta \, dx = \int_1^4 x \cdot \frac{8}{\sqrt{x}} \cdot \frac{1}{x}\, dx = 8\int_1^4 x^{-1/2}\, dx$
$= 8\left[2x^{1/2}\right]_1^4 = 8(2\cdot 2 - 2) = 16$; $M = \int dm = \int_1^4 \left[\frac{4}{\sqrt{x}} - \left(\frac{-4}{\sqrt{x}}\right)\right] \cdot \delta \, dx = 8\int_1^4 \left(\frac{1}{\sqrt{x}}\right)\left(\frac{1}{x}\right) dx = 8\int_1^4 x^{-3/2}\, dx$
$= 8\left[-2x^{-1/2}\right]_1^4 = 8[-1 - (-2)] = 8$. So $\bar{x} = \frac{M_y}{M} = \frac{16}{8} = 2 \Rightarrow (\bar{x}, \bar{y}) = (2, 0)$ is the center of mass.

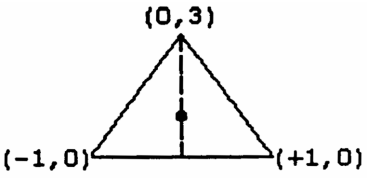


(c)

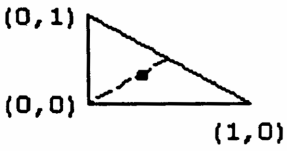
28. (a) We use the disk method: $V = \int_a^b \pi R^2(x)\, dx = \int_1^4 \pi\left(\frac{4}{x^2}\right) dx = 4\pi\int_1^4 x^{-2}\, dx = 4\pi\left[-\frac{1}{x}\right]_1^4$
$= 4\pi\left[\frac{-1}{4} - (-1)\right] = \pi[-1 + 4] = 3\pi$

(b) We model the distribution of mass with vertical strips: $M_x = \int \tilde{y}\, dm = \int_1^4 \frac{\left(\frac{2}{x}\right)}{2} \cdot \left(\frac{2}{x}\right) \cdot \delta \, dx = \int_1^4 \frac{2}{x^2} \cdot \sqrt{x}\, dx$
$= 2\int_1^4 x^{-3/2}\, dx = 2\left[\frac{-2}{\sqrt{x}}\right]_1^4 = 2[-1 - (-2)] = 2$; $M_y = \int \tilde{x}\, dm = \int_1^4 x \cdot \frac{2}{x} \cdot \delta \, dx = 2\int_1^4 x^{1/2}\, dx$
$= 2\left[\frac{2x^{3/2}}{3}\right]_1^4 = 2\left[\frac{16}{3} - \frac{2}{3}\right] = \frac{28}{3}$; $M = \int dm = \int_1^4 \frac{2}{x} \cdot \delta \, dx = 2\int_1^4 \frac{\sqrt{x}}{x}\, dx = 2\int_1^4 x^{-1/2}\, dx = 2\left[2x^{1/2}\right]_1^4$
$= 2(4 - 2) = 4$. So $\bar{x} = \frac{M_y}{M} = \frac{\left(\frac{28}{3}\right)}{4} = \frac{7}{3}$ and $\bar{y} = \frac{M_x}{M} = \frac{2}{4} = \frac{1}{2} \Rightarrow (\bar{x}, \bar{y}) = \left(\frac{7}{3}, \frac{1}{2}\right)$ is the center of mass.

(c)

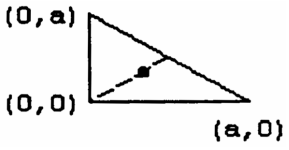


29. The mass of a horizontal strip is $dm = \delta\, dA = \delta L\, dy$, where L is the width of the triangle at a distance of y above its base on the x-axis as shown in the figure in the text. Also, by similar triangles we have $\frac{L}{b} = \frac{h-y}{h}$
$\Rightarrow L = \frac{b}{h}(h - y)$. Thus, $M_x = \int \tilde{y}\, dm = \int_0^h \delta y \left(\frac{b}{h}\right)(h - y)\, dy = \frac{\delta b}{h}\int_0^h (hy - y^2)\, dy = \frac{\delta b}{h}\left[\frac{hy^2}{2} - \frac{y^3}{3}\right]_0^h$
$= \frac{\delta b}{h}\left(\frac{h^3}{2} - \frac{h^3}{3}\right) = \delta bh^2\left(\frac{1}{2} - \frac{1}{3}\right) = \frac{\delta bh^2}{6}$; $M = \int dm = \int_0^h \delta\left(\frac{b}{h}\right)(h - y)\, dy = \frac{\delta b}{h}\int_0^h (h - y)\, dy = \frac{\delta b}{h}\left[hy - \frac{y^2}{2}\right]_0^h$
$= \frac{\delta b}{h}\left(h^2 - \frac{h^2}{2}\right) = \frac{\delta bh}{2}$. So $\bar{y} = \frac{M_x}{M} = \left(\frac{\delta bh^2}{6}\right)\left(\frac{2}{\delta bh}\right) = \frac{h}{3} \Rightarrow$ the center of mass lies above the base of the

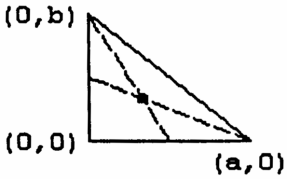


Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

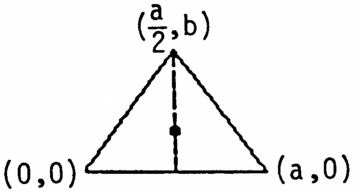
triangle one-third of the way toward the opposite vertex. Similarly the other two sides of the triangle can be placed on the x-axis and the same results will occur. Therefore the centroid does lie at the intersection of the medians, as claimed.



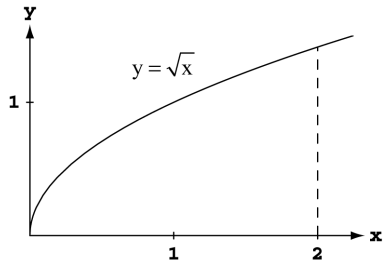
30. From the symmetry about the y-axis it follows that $\bar{x} = 0$. It also follows that the line through the points $(0, 0)$ and $(0, 3)$ is a median $\Rightarrow \bar{y} = \frac{1}{3}(3 - 0) = 1 \Rightarrow (\bar{x}, \bar{y}) = (0, 1)$.



31. From the symmetry about the line $x = y$ it follows that $\bar{x} = \bar{y}$. It also follows that the line through the points $(0, 0)$ and $\left(\frac{1}{2}, \frac{1}{2}\right)$ is a median $\Rightarrow \bar{y} = \bar{x} = \frac{2}{3} \cdot \left(\frac{1}{2} - 0\right) = \frac{1}{3}$ $\Rightarrow (\bar{x}, \bar{y}) = \left(\frac{1}{3}, \frac{1}{3}\right)$.

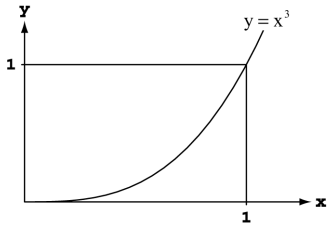


32. From the symmetry about the line $x = y$ it follows that $\bar{x} = \bar{y}$. It also follows that the line through the point $(0, 0)$ and $\left(\frac{a}{2}, \frac{a}{2}\right)$ is a median $\Rightarrow \bar{y} = \bar{x} = \frac{2}{3}\left(\frac{a}{2} - 0\right) = \frac{1}{3}a$ $\Rightarrow (\bar{x}, \bar{y}) = \left(\frac{a}{3}, \frac{a}{3}\right)$.

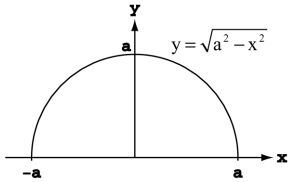


33. The point of intersection of the median from the vertex $(0, b)$ to the opposite side has coordinates $\left(0, \frac{a}{2}\right)$ $\Rightarrow \bar{y} = (b - 0) \cdot \frac{1}{3} = \frac{b}{3}$ and $\bar{x} = \left(\frac{a}{2} - 0\right) \cdot \frac{2}{3} = \frac{a}{3}$ $\Rightarrow (\bar{x}, \bar{y}) = \left(\frac{a}{3}, \frac{b}{3}\right)$.

34. From the symmetry about the line $x = \frac{a}{2}$ it follows that $\bar{x} = \frac{a}{2}$. It also follows that the line through the points $\left(\frac{a}{2}, 0\right)$ and $\left(\frac{a}{2}, b\right)$ is a median $\Rightarrow \bar{y} = \frac{1}{3}(b - 0) = \frac{b}{3}$ $\Rightarrow (\bar{x}, \bar{y}) = \left(\frac{a}{2}, \frac{b}{3}\right)$.



35. $y = x^{1/2} \Rightarrow dy = \frac{1}{2}x^{-1/2}\,dx$
$\Rightarrow ds = \sqrt{(dx)^2 + (dy)^2} = \sqrt{1 + \frac{1}{4x}}\,dx$;
$M_x = \delta \int_0^2 \sqrt{x}\sqrt{1 + \frac{1}{4x}}\,dx$
$= \delta \int_0^2 \sqrt{x + \frac{1}{4}}\,dx = \frac{2\delta}{3}\left[\left(x + \frac{1}{4}\right)^{3/2}\right]_0^2$
$= \frac{2\delta}{3}\left[\left(2 + \frac{1}{4}\right)^{3/2} - \left(\frac{1}{4}\right)^{3/2}\right]$
$= \frac{2\delta}{3}\left[\left(\frac{9}{4}\right)^{3/2} - \left(\frac{1}{4}\right)^{3/2}\right] = \frac{2\delta}{3}\left(\frac{27}{8} - \frac{1}{8}\right) = \frac{13\delta}{6}$



Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

36. $y = x^3 \Rightarrow dy = 3x^2\,dx$
$\Rightarrow dx = \sqrt{(dx)^2 + (3x^2\,dx)^2} = \sqrt{1 + 9x^4}\,dx;$
$M_x = \delta\int_0^1 x^3\sqrt{1 + 9x^4}\,dx;$
$[u = 1 + 9x^4 \Rightarrow du = 36x^3\,dx \Rightarrow \frac{1}{36}\,du = x^3\,dx;$
$x = 0 \Rightarrow u = 1, x = 1 \Rightarrow u = 10]$
$\rightarrow M_x = \delta\int_1^{10}\frac{1}{36}u^{1/2}\,du = \frac{\delta}{36}\left[\frac{2}{3}u^{3/2}\right]_1^{10} = \frac{\delta}{54}\left(10^{3/2} - 1\right)$

37. From Example 6 we have $M_x = \int_0^\pi a(a\sin\theta)(k\sin\theta)\,d\theta = a^2k\int_0^\pi \sin^2\theta\,d\theta = \frac{a^2k}{2}\int_0^\pi (1 - \cos 2\theta)\,d\theta$
$= \frac{a^2k}{2}\left[\theta - \frac{\sin 2\theta}{2}\right]_0^\pi = \frac{a^2k\pi}{2}$; $M_y = \int_0^\pi a(a\cos\theta)(k\sin\theta)\,d\theta = a^2k\int_0^\pi \sin\theta\cos\theta\,d\theta = \frac{a^2k}{2}\left[\sin^2\theta\right]_0^\pi = 0;$
$M = \int_0^\pi ak\sin\theta\,d\theta = ak[-\cos\theta]_0^\pi = 2ak$. Therefore, $\bar{x} = \frac{M_y}{M} = 0$ and $\bar{y} = \frac{M_x}{M} = \left(\frac{a^2k\pi}{2}\right)\left(\frac{1}{2ak}\right) = \frac{a\pi}{4} \Rightarrow \left(0, \frac{a\pi}{4}\right)$ is the center of mass.

38. $M_x = \int \tilde{y}\,dm = \int_0^\pi (a\sin\theta)\cdot\delta\cdot a\,d\theta$
$= \int_0^\pi (a^2\sin\theta)(1 + k|\cos\theta|)\,d\theta$
$= a^2\int_0^{\pi/2}(\sin\theta)(1 + k\cos\theta)\,d\theta$
$\quad + a^2\int_{\pi/2}^{\pi}(\sin\theta)(1 - k\cos\theta)\,d\theta$
$= a^2\int_0^{\pi/2}\sin\theta\,d\theta + a^2k\int_0^{\pi/2}\sin\theta\cos\theta\,d\theta + a^2\int_{\pi/2}^{\pi}\sin\theta\,d\theta - a^2k\int_{\pi/2}^{\pi}\sin\theta\cos\theta\,d\theta$
$= a^2[-\cos\theta]_0^{\pi/2} + a^2k\left[\frac{\sin^2\theta}{2}\right]_0^{\pi/2} + a^2[-\cos\theta]_{\pi/2}^{\pi} - a^2k\left[\frac{\sin^2\theta}{2}\right]_{\pi/2}^{\pi}$
$= a^2[0 - (-1)] + a^2k\left(\frac{1}{2} - 0\right) + a^2[-(-1) - 0] - a^2k\left(0 - \frac{1}{2}\right) = a^2 + \frac{a^2k}{2} + a^2 + \frac{a^2k}{2}$
$= 2a^2 + a^2k = a^2(2 + k);$
$M_y = \int \tilde{x}\,dm = \int_0^\pi (a\cos\theta)\cdot\delta\cdot a\,d\theta = \int_0^\pi (a^2\cos\theta)(1 + k|\cos\theta|)\,d\theta$
$= a^2\int_0^{\pi/2}(\cos\theta)(1 + k\cos\theta)\,d\theta + a^2\int_{\pi/2}^{\pi}(\cos\theta)(1 - k\cos\theta)\,d\theta$
$= a^2\int_0^{\pi/2}\cos\theta\,d\theta + a^2k\int_0^{\pi/2}\left(\frac{1 + \cos 2\theta}{2}\right)d\theta + a^2\int_{\pi/2}^{\pi}\cos\theta\,d\theta - a^2k\int_{\pi/2}^{\pi}\left(\frac{1 + \cos 2\theta}{2}\right)d\theta$
$= a^2[\sin\theta]_0^{\pi/2} + \frac{a^2k}{2}\left[\theta + \frac{\sin 2\theta}{2}\right]_0^{\pi/2} + a^2[\sin\theta]_{\pi/2}^{\pi} - \frac{a^2k}{2}\left[\theta + \frac{\sin 2\theta}{2}\right]_{\pi/2}^{\pi}$
$= a^2(1 - 0) + \frac{a^2k}{2}\left[\left(\frac{\pi}{2} - 0\right) - (0 + 0)\right] + a^2(0 - 1) - \frac{a^2k}{2}\left[(\pi + 0) - \left(\frac{\pi}{2} + 0\right)\right] = a^2 + \frac{a^2k\pi}{4} - a^2 - \frac{a^2k\pi}{4} = 0;$
$M = \int_0^\pi \delta\cdot a\,d\theta = a\int_0^\pi (1 + k|\cos\theta|)\,d\theta = a\int_0^{\pi/2}(1 + k\cos\theta)\,d\theta + a\int_{\pi/2}^{\pi}(1 - k\cos\theta)\,d\theta$
$= a[\theta + k\sin\theta]_0^{\pi/2} + a[\theta - k\sin\theta]_{\pi/2}^{\pi} = a\left[\left(\frac{\pi}{2} + k\right) - 0\right] + a\left[(\pi + 0) - \left(\frac{\pi}{2} - k\right)\right]$
$= \frac{a\pi}{2} + ak + a\left(\frac{\pi}{2} + k\right) = a\pi + 2ak = a(\pi + 2k)$. So $\bar{x} = \frac{M_y}{M} = 0$ and $\bar{y} = \frac{M_x}{M} = \frac{a^2(2 + k)}{a(\pi + 2k)} = \frac{a(2 + k)}{\pi + 2k}$
$\Rightarrow \left(0, \frac{2a + ka}{\pi + 2k}\right)$ is the center of mass.

39. Consider the curve as an infinite number of line segments joined together. From the derivation of arc length we have that the length of a particular segment is $ds = \sqrt{(dx)^2 + (dy)^2}$. This implies that $M_x = \int \delta y\,ds$, $M_y = \int \delta x\,ds$ and $M = \int \delta\,ds$. If $\delta$ is constant, then $\bar{x} = \frac{M_y}{M} = \frac{\int x\,ds}{\int ds} = \frac{\int x\,ds}{\text{length}}$ and $\bar{y} = \frac{M_x}{M} = \frac{\int y\,ds}{\int ds} = \frac{\int y\,ds}{\text{length}}$.

40. Applying the symmetry argument analogous to the one used in Exercise 13, we find that $\bar{x} = 0$. The typical

Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

vertical strip has center of mass: $(\tilde{x}, \tilde{y}) = \left(x, \frac{a+\frac{x^2}{4p}}{2}\right)$, length: $a - \frac{x^2}{4p}$, width: dx, area: $dA = \left(a - \frac{x^2}{4p}\right) dx$, mass: $dm = \delta\, dA = \delta\left(a - \frac{x^2}{4p}\right) dx$. Thus, $M_x = \int \tilde{y}\, dm = \int_{-2\sqrt{pa}}^{2\sqrt{pa}} \frac{1}{2}\left(a + \frac{x^2}{4p}\right)\left(a - \frac{x^2}{4p}\right)\delta\, dx$

$= \frac{\delta}{2}\int_{-2\sqrt{pa}}^{2\sqrt{pa}} \left(a^2 - \frac{x^4}{16p^2}\right) dx = \frac{\delta}{2}\left[a^2x - \frac{x^5}{80p^2}\right]_{-2\sqrt{pa}}^{2\sqrt{pa}} = 2 \cdot \frac{\delta}{2}\left[a^2x - \frac{x^5}{80p^2}\right]_0^{2\sqrt{pa}} = \delta\left(2a^2\sqrt{pa} - \frac{2^5p^2a^2\sqrt{pa}}{80p^2}\right)$

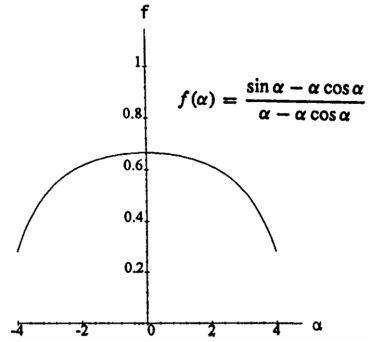
$= 2a^2\delta\sqrt{pa}\left(1 - \frac{16}{80}\right) = 2a^2\delta\sqrt{pa}\left(\frac{80-16}{80}\right) = 2a^2\delta\sqrt{pa}\left(\frac{64}{80}\right) = \frac{8a^2\delta\sqrt{pa}}{5}$; $M = \int dm = \delta \int_{-2\sqrt{pa}}^{2\sqrt{pa}} \left(a - \frac{x^2}{4p}\right) dx$

$= \delta\left[ax - \frac{x^3}{12p}\right]_{-2\sqrt{pa}}^{2\sqrt{pa}} = 2 \cdot \delta\left[ax - \frac{x^3}{12p}\right]_0^{2\sqrt{pa}} = 2\delta\left(2a\sqrt{pa} - \frac{2^3pa\sqrt{pa}}{12p}\right) = 4a\delta\sqrt{pa}\left(1 - \frac{4}{12}\right) = 4a\delta\sqrt{pa}\left(\frac{12-4}{12}\right)$

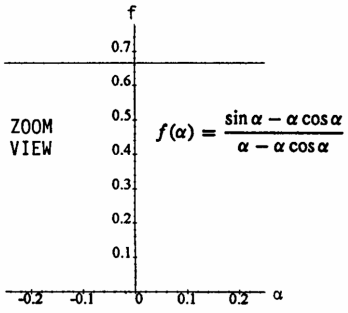
$= \frac{8a\delta\sqrt{pa}}{3}$. So $\bar{y} = \frac{M_x}{M} = \left(\frac{8a^2\delta\sqrt{pa}}{5}\right)\left(\frac{3}{8a\delta\sqrt{pa}}\right) = \frac{3}{5}a$, as claimed.

41. Since the density is constant, its value will not affect our answers, so we can set $\delta = 1$.

A generalization of Example 6 yields $M_x = \int \tilde{y}\, dm = \int_{\pi/2-\alpha}^{\pi/2+\alpha} a^2 \sin\theta\, d\theta = a^2[-\cos\theta]_{\pi/2-\alpha}^{\pi/2+\alpha}$



$= a^2\left[-\cos\left(\frac{\pi}{2} + \alpha\right) + \cos\left(\frac{\pi}{2} - \alpha\right)\right] = a^2(\sin\alpha + \sin\alpha) = 2a^2\sin\alpha$; $M = \int dm = \int_{\pi/2-\alpha}^{\pi/2+\alpha} a\, d\theta = a[\theta]_{\pi/2-\alpha}^{\pi/2+\alpha}$



$= a\left[\left(\frac{\pi}{2} + \alpha\right) - \left(\frac{\pi}{2} - \alpha\right)\right] = 2a\alpha$. Thus, $\bar{y} = \frac{M_x}{M} = \frac{2a^2\sin\alpha}{2a\alpha} = \frac{a\sin\alpha}{\alpha}$. Now $s = a(2\alpha)$ and $a\sin\alpha = \frac{c}{2}$

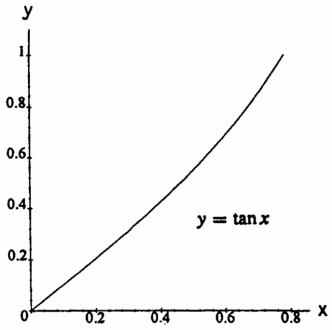
$\Rightarrow c = 2a\sin\alpha$. Then $\bar{y} = \frac{a(2a\sin\alpha)}{2a\alpha} = \frac{ac}{s}$, as claimed.

42. (a) First, we note that $\bar{y} = (\text{distance from origin to } \overline{AB}) + d \Rightarrow \frac{a\sin\alpha}{\alpha} = a\cos\alpha + d \Rightarrow d = \frac{a(\sin\alpha - \alpha\cos\alpha)}{\alpha}$.

Moreover, $h = a - a\cos\alpha \Rightarrow \frac{d}{h} = \frac{a(\sin\alpha - \alpha\cos\alpha)}{a(\alpha - \alpha\cos\alpha)} = \frac{\sin\alpha - \alpha\cos\alpha}{\alpha - \alpha\cos\alpha}$. The graphs below suggest that $\lim_{\alpha \to 0^+} \frac{\sin\alpha - \alpha\cos\alpha}{\alpha - \alpha\cos\alpha} \approx \frac{2}{3}$.

(b)

| $\alpha$ | 0.2 | 0.4 | 0.6 | 0.8 | 1.0 |
|---|---|---|---|---|---|
| f($\alpha$) | 0.666222 | 0.664879 | 0.662615 | 0.659389 | 0.655145 |



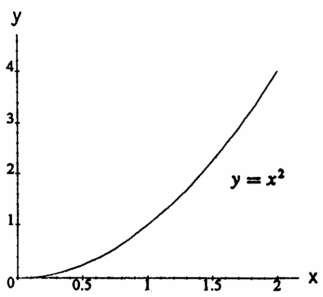
## 6.5 AREAS OF SURFACES OF REVOLUTION AND THE THEOREMS OF PAPPUS

1. (a) $\frac{dy}{dx} = \sec^2 x \Rightarrow \left(\frac{dy}{dx}\right)^2 = \sec^4 x$

$\Rightarrow S = 2\pi\int_0^{\pi/4} (\tan x)\sqrt{1 + \sec^4 x}\, dx$

(c) $S \approx 3.84$

(b)



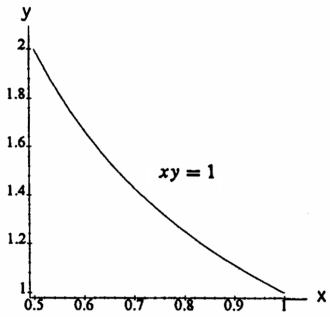
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

2. (a) $\frac{dy}{dx} = 2x \Rightarrow \left(\frac{dy}{dx}\right)^2 = 4x^2$

$\Rightarrow S = 2\pi \int_0^2 x^2 \sqrt{1 + 4x^2}\, dx$

(c) $S \approx 53.23$

(b)

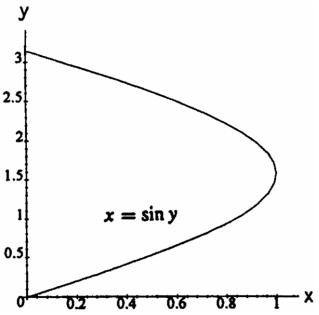


3. (a) $xy = 1 \Rightarrow x = \frac{1}{y} \Rightarrow \frac{dx}{dy} = -\frac{1}{y^2} \Rightarrow \left(\frac{dx}{dy}\right)^2 = \frac{1}{y^4}$

$\Rightarrow S = 2\pi \int_1^2 \frac{1}{y} \sqrt{1 + y^{-4}}\, dy$

(c) $S \approx 5.02$

(b)



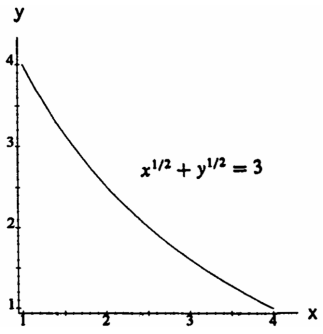
4. (a) $\frac{dx}{dy} = \cos y \Rightarrow \left(\frac{dx}{dy}\right)^2 = \cos^2 y$

$\Rightarrow S = 2\pi \int_0^{\pi} (\sin y) \sqrt{1 + \cos^2 y}\, dy$

(c) $S \approx 14.42$

(b)

5. (a) $x^{1/2} + y^{1/2} = 3 \Rightarrow y = \left(3 - x^{1/2}\right)^2$



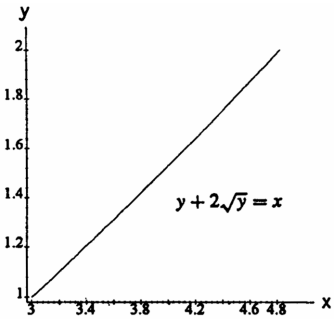
$\Rightarrow \frac{dy}{dx} = 2\left(3 - x^{1/2}\right)\left(-\frac{1}{2}x^{-1/2}\right)$

$\Rightarrow \left(\frac{dy}{dx}\right)^2 = \left(1 - 3x^{-1/2}\right)^2$

$\Rightarrow S = 2\pi \int_1^4 \left(3 - x^{1/2}\right)^2 \sqrt{1 + \left(1 - 3x^{-1/2}\right)^2}\, dx$

(c) $S \approx 63.37$

(b)



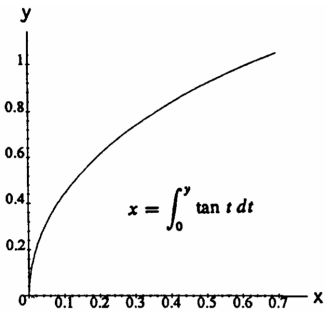
Copyright (c) 2006 Pearson Education, Inc., publishing as Pearson Addison-Wesley

6. (a) $\frac{dx}{dy} = 1 + y^{-1/2} \Rightarrow \left(\frac{dx}{dy}\right)^2 = \left(1 + y^{-1/2}\right)^2$

$\Rightarrow S = 2\pi \int_1^2 \left(y + 2\sqrt{y}\right) \sqrt{1 + \left(1 + y^{-1/2}\right)^2}\, dx$

(c) $S \approx 51.33$

(b)



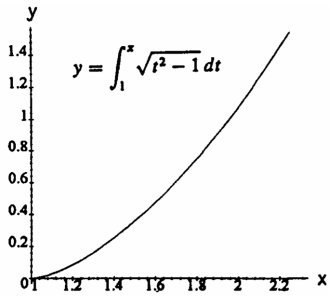
7. (a) $\frac{dx}{dy} = \tan y \Rightarrow \left(\frac{dx}{dy}\right)^2 = \tan^2 y$

$\Rightarrow S = 2\pi \int_0^{\pi/3} \left(\int_0^y \tan t\, dt\right) \sqrt{1 + \tan^2 y}\, dy$

$= 2\pi \int_0^{\pi/3} \left(\int_0^y \tan t\, dt\right) \sec y\, dy$

(c) $S \approx 2.08$

(b)



8. (a) $\frac{dy}{dx} = \sqrt{x^2 - 1} \Rightarrow \left(\frac{dy}{dx}\right)^2 = x^2 - 1$

$\Rightarrow S = 2\pi \int_1^{\sqrt{5}} \left(\int_1^x \sqrt{t^2 - 1}\, dt\right) \sqrt{1 + (x^2 - 1)}\, dx$

$= 2\pi \int_1^{\sqrt{5}} \left(\int_1^x \sqrt{t^2 - 1}\, dt\right) x\, dx$

(c) $S \approx 8.55$

(b)

9. $y = \frac{x}{2} \Rightarrow \frac{dy}{dx} = \frac{1}{2}$; $S = \int_a^b 2\pi y \sqrt{1 + \left(\frac{dy}{dx}\right)^2}\, dx \Rightarrow S = \int_0^4 2\pi \left(\frac{x}{2}\right) \sqrt{1 + \frac{1}{4}}\, dx = \frac{\pi\sqrt{5}}{2} \int_0^4 x\, dx$

$= \frac{\pi\sqrt{5}}{2} \left[\frac{x^2}{2}\right]_0^4 = 4\pi\sqrt{5}$; Geometry formula: base circumference $= 2\pi(2)$, slant height $= \sqrt{4^2 + 2^2} = 2\sqrt{5}$
