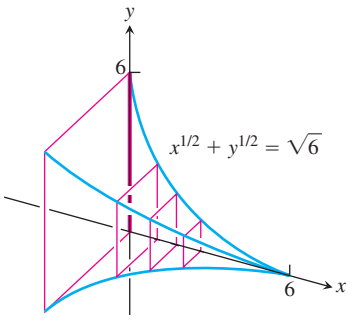
**1.** The solid lies between planes perpendicular to the $x$-axis at $x = 0$ and $x = 1$. The cross-sections perpendicular to the $x$-axis between these planes are circular disks whose diameters run from the parabola $y = x^2$ to the parabola $y = \sqrt{x}$.



**2.** The base of the solid is the region in the first quadrant between the line $y = x$ and the parabola $y = 2\sqrt{x}$. The cross-sections of

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

the solid perpendicular to the $x$-axis are equilateral triangles whose bases stretch from the line to the curve.

3. The solid lies between planes perpendicular to the $x$-axis at $x = \pi/4$ and $x = 5\pi/4$. The cross-sections between these planes are circular disks whose diameters run from the curve $y = 2\cos x$ to the curve $y = 2\sin x$.

4. The solid lies between planes perpendicular to the $x$-axis at $x = 0$ and $x = 6$. The cross-sections between these planes are squares whose bases run from the $x$-axis up to the curve $x^{1/2} + y^{1/2} = \sqrt{6}$.

5. The solid lies between planes perpendicular to the $x$-axis at $x = 0$ and $x = 4$. The cross-sections of the solid perpendicular to the $x$-axis between these planes are circular disks whose diameters run from the curve $x^2 = 4y$ to the curve $y^2 = 4x$.

6. The base of the solid is the region bounded by the parabola $y^2 = 4x$ and the line $x = 1$ in the $xy$-plane. Each cross-section perpendicular to the $x$-axis is an equilateral triangle with one edge in the plane. (The triangles all lie on the same side of the plane.)

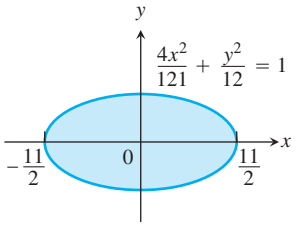
7. Find the volume of the solid generated by revolving the region bounded by the $x$-axis, the curve $y = 3x^4$, and the lines $x = 1$ and $x = -1$ about **(a)** the $x$-axis; **(b)** the $y$-axis; **(c)** the line $x = 1$; **(d)** the line $y = 3$.

8. Find the volume of the solid generated by revolving the "triangular" region bounded by the curve $y = 4/x^3$ and the lines $x = 1$ and $y = 1/2$ about **(a)** the $x$-axis; **(b)** the $y$-axis; **(c)** the line $x = 2$; **(d)** the line $y = 4$.

9. Find the volume of the solid generated by revolving the region bounded on the left by the parabola $x = y^2 + 1$ and on the right by the line $x = 5$ about **(a)** the $x$-axis; **(b)** the $y$-axis; **(c)** the line $x = 5$.

10. Find the volume of the solid generated by revolving the region bounded by the parabola $y^2 = 4x$ and the line $y = x$ about **(a)** the $x$-axis; **(b)** the $y$-axis; **(c)** the line $x = 4$; **(d)** the line $y = 4$.

11. Find the volume of the solid generated by revolving the "triangular" region bounded by the $x$-axis, the line $x = \pi/3$, and the curve $y = \tan x$ in the first quadrant about the $x$-axis.



12. Find the volume of the solid generated by revolving the region bounded by the curve $y = \sin x$ and the lines $x = 0, x = \pi$, and $y = 2$ about the line $y = 2$.

13. Find the volume of the solid generated by revolving the region between the $x$-axis and the curve $y = x^2 - 2x$ about **(a)** the $x$-axis; **(b)** the line $y = -1$; **(c)** the line $x = 2$; **(d)** the line $y = 2$.

14. Find the volume of the solid generated by revolving about the $x$-axis the region bounded by $y = 2\tan x, y = 0, x = -\pi/4$, and $x = \pi/4$. (The region lies in the first and third quadrants and resembles a skewed bowtie.)

15. **Volume of a solid sphere hole** A round hole of radius $\sqrt{3}$ ft is bored through the center of a solid sphere of a radius 2 ft. Find the volume of material removed from the sphere.

16. **Volume of a football** The profile of a football resembles the ellipse shown here. Find the football's volume to the nearest cubic inch.

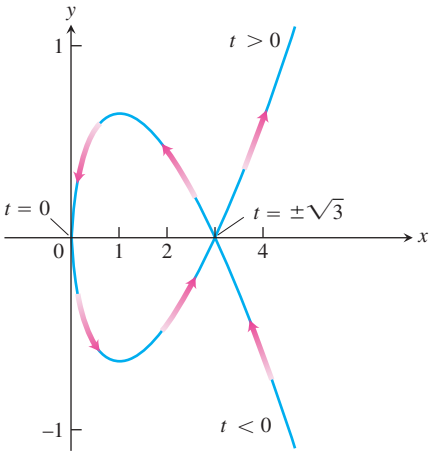
## Lengths of Curves

Find the lengths of the curves in Exercises 17–23.

17. $y = x^{1/2} - (1/3)x^{3/2}, \quad 1 \le x \le 4$

18. $x = y^{2/3}, \quad 1 \le y \le 8$

19. $y = (5/12)x^{6/5} - (5/8)x^{4/5}, \quad 1 \le x \le 32$



20. $x = (y^3/12) + (1/y), \quad 1 \le y \le 2$

21. $x = 5\cos t - \cos 5t, \quad y = 5\sin t - \sin 5t, \quad 0 \le t \le \pi/2$

22. $x = t^3 - 6t^2, \quad y = t^3 + 6t^2, \quad 0 \le t \le 1$

23. $x = 3\cos\theta, \quad y = 3\sin\theta, \quad 0 \le \theta \le \dfrac{3\pi}{2}$

24. Find the length of the enclosed loop $x = t^2, y = (t^3/3) - t$ shown here. The loop starts at $t = -\sqrt{3}$ and ends at $t = \sqrt{3}$.

## Centroids and Centers of Mass

25. Find the centroid of a thin, flat plate covering the region enclosed by the parabolas $y = 2x^2$ and $y = 3 - x^2$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**26.** Find the centroid of a thin, flat plate covering the region enclosed by the $x$-axis, the lines $x = 2$ and $x = -2$, and the parabola $y = x^2$.

**27.** Find the centroid of a thin, flat plate covering the "triangular" region in the first quadrant bounded by the $y$-axis, the parabola $y = x^2/4$, and the line $y = 4$.

**28.** Find the centroid of a thin, flat plate covering the region enclosed by the parabola $y^2 = x$ and the line $x = 2y$.

**29.** Find the center of mass of a thin, flat plate covering the region enclosed by the parabola $y^2 = x$ and the line $x = 2y$ if the density function is $\delta(y) = 1 + y$. (Use horizontal strips.)

**30.** **a.** Find the center of mass of a thin plate of constant density covering the region between the curve $y = 3/x^{3/2}$ and the $x$-axis from $x = 1$ to $x = 9$.

**b.** Find the plate's center of mass if, instead of being constant, the density is $\delta(x) = x$. (Use vertical strips.)

## Areas of Surfaces of Revolution

In Exercises 31–36, find the areas of the surfaces generated by revolving the curves about the given axes.

**31.** $y = \sqrt{2x + 1}, \quad 0 \le x \le 3; \quad x$-axis

**32.** $y = x^3/3, \quad 0 \le x \le 1; \quad x$-axis

**33.** $x = \sqrt{4y - y^2}, \quad 1 \le y \le 2; \quad y$-axis

**34.** $x = \sqrt{y}, \quad 2 \le y \le 6; \quad y$-axis

**35.** $x = t^2/2, \quad y = 2t, \quad 0 \le t \le \sqrt{5}; \quad x$-axis

**36.** $x = t^2 + 1/(2t), \quad y = 4\sqrt{t}, \quad 1/\sqrt{2} \le t \le 1; \quad y$-axis

## Work

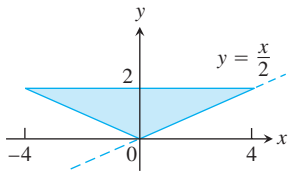
**37.** **Lifting equipment** A rock climber is about to haul up 100 N (about 22.5 lb) of equipment that has been hanging beneath her on 40 m of rope that weighs 0.8 newton per meter. How much work will it take? (*Hint:* Solve for the rope and equipment separately, then add.)

**38.** **Leaky tank truck** You drove an 800-gal tank truck of water from the base of Mt. Washington to the summit and discovered on arrival that the tank was only half full. You started with a full tank, climbed at a steady rate, and accomplished the 4750-ft elevation change in 50 min. Assuming that the water leaked out at a steady rate, how much work was spent in carrying water to the top? Do not count the work done in getting yourself and the truck there. Water weighs 8 lb/U.S. gal.

**39.** **Stretching a spring** If a force of 20 lb is required to hold a spring 1 ft beyond its unstressed length, how much work does it take to stretch the spring this far? An additional foot?

**40.** **Garage door spring** A force of 200 N will stretch a garage door spring 0.8 m beyond its unstressed length. How far will a 300-N force stretch the spring? How much work does it take to stretch the spring this far from its unstressed length?

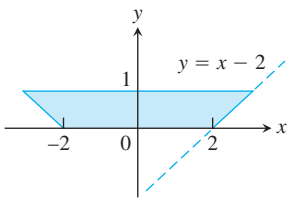
**41.** **Pumping a reservoir** A reservoir shaped like a right circular cone, point down, 20 ft across the top and 8 ft deep, is full of water. How much work does it take to pump the water to a level 6 ft above the top?



**42.** **Pumping a reservoir** (*Continuation of Exercise 41.*) The reservoir is filled to a depth of 5 ft, and the water is to be pumped to the same level as the top. How much work does it take?

**43.** **Pumping a conical tank** A right circular conical tank, point down, with top radius 5 ft and height 10 ft is filled with a liquid whose weight-density is 60 lb/ft$^3$. How much work does it take to pump the liquid to a point 2 ft above the tank? If the pump is driven by a motor rated at 275 ft-lb/sec (1/2 hp), how long will it take to empty the tank?

**44.** **Pumping a cylindrical tank** A storage tank is a right circular cylinder 20 ft long and 8 ft in diameter with its axis horizontal. If the tank is half full of olive oil weighing 57 lb/ft$^3$, find the work done in emptying it through a pipe that runs from the bottom of the tank to an outlet that is 6 ft above the top of the tank.

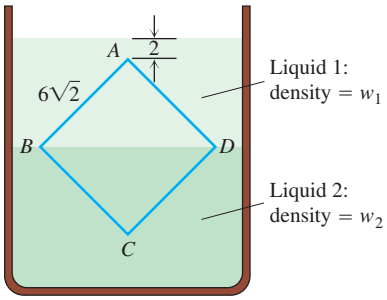


## Fluid Force

**45.** **Trough of water** The vertical triangular plate shown here is the end plate of a trough full of water ($w = 62.4$). What is the fluid force against the plate?

UNITS IN FEET

**46.** **Trough of maple syrup** The vertical trapezoid plate shown here is the end plate of a trough full of maple syrup weighing 75 lb/ft$^3$. What is the force exerted by the syrup against the end plate of the trough when the syrup is 10 in. deep?

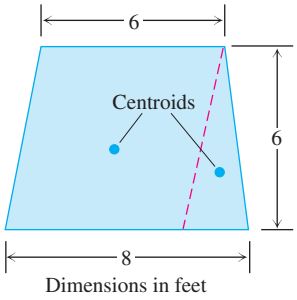


UNITS IN FEET

**47.** **Force on a parabolic gate** A flat vertical gate in the face of a dam is shaped like the parabolic region between the curve $y = 4x^2$ and the line $y = 4$, with measurements in feet. The top of the gate lies 5 ft below the surface of the water. Find the force exerted by the water against the gate ($w = 62.4$).

T **48.** You plan to store mercury ($w = 849$ lb/ft$^3$) in a vertical rectangular tank with a 1 ft square base side whose interior side wall can withstand a total fluid force of 40,000 lb. About how many cubic feet of mercury can you store in the tank at any one time?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



**49.** The container profiled in the accompanying figure is filled with two nonmixing liquids of weight-density $w_1$ and $w_2$. Find the fluid force on one side of the vertical square plate $ABCD$. The points $B$ and $D$ lie in the boundary layer and the square is $6\sqrt{2}$ ft on a side.

**50.** The isosceles trapezoidal plate shown here is submerged vertically in water ($w = 62.4$) with its upper edge 4 ft below the surface. Find the fluid force on one side of the plate in two different ways:

**a.** By evaluating an integral.

**b.** By dividing the plate into a parallelogram and an isosceles triangle, locating their centroids, and using the equation $F = w\bar{h}A$ from Section 6.7.

# Chapter 6 Questions to Guide Your Review

1. How do you define and calculate the volumes of solids by the method of slicing? Give an example.
2. How are the disk and washer methods for calculating volumes derived from the method of slicing? Give examples of volume calculations by these methods.
3. Describe the method of cylindrical shells. Give an example.
4. How do you define the length of a smooth parametrized curve $x = f(t), y = g(t), a \le t \le b$? What does smoothness have to do with length? What else do you need to know about the parametrization to find the curve's length? Give examples.
5. How do you find the length of the graph of a smooth function over a closed interval? Give an example. What about functions that do not have continuous first derivatives?
6. What is a center of mass?
7. How do you locate the center of mass of a straight, narrow rod or strip of material? Give an example. If the density of the material is constant, you can tell right away where the center of mass is. Where is it?
8. How do you locate the center of mass of a thin flat plate of material? Give an example.
9. How do you define and calculate the area of the surface swept out by revolving the graph of a smooth function $y = f(x)$, $a \le x \le b$, about the $x$-axis? Give an example.
10. Under what conditions can you find the area of the surface generated by revolving a curve $x = f(t), y = g(t), a \le t \le b$, about the $x$-axis? The $y$-axis? Give examples.
11. What do Pappus's two theorems say? Give examples of how they are used to calculate surface areas and volumes and to locate centroids.
12. How do you define and calculate the work done by a variable force directed along a portion of the $x$-axis? How do you calculate the work it takes to pump a liquid from a tank? Give examples.
13. How do you calculate the force exerted by a liquid against a portion of a vertical wall? Give an example.

# TRANSCENDENTAL FUNCTIONS

**OVERVIEW** Functions can be classified into two broad groups (see Section 1.4). Polynomial functions are called *algebraic*, as are functions obtained from them by addition, multiplication, division, or taking powers and roots. Functions that are not algebraic are called *transcendental.* The trigonometric, exponential, logarithmic, and hyperbolic functions are transcendental, as are their inverses.

Transcendental functions occur frequently in many calculus settings and applications, including growths of populations, vibrations and waves, efficiencies of computer algorithms, and the stability of engineered structures. In this chapter we introduce several important transcendental functions and investigate their graphs, properties, derivatives, and integrals.

## 7.1 Inverse Functions and Their Derivatives

A function that undoes, or inverts, the effect of a function $f$ is called the *inverse* of $f$. Many common functions, though not all, are paired with an inverse. Important inverse functions often show up in formulas for antiderivatives and solutions of differential equations. Inverse functions also play a key role in the development and properties of the logarithmic and exponential functions, as we will see in Section 7.3.

### One-to-One Functions

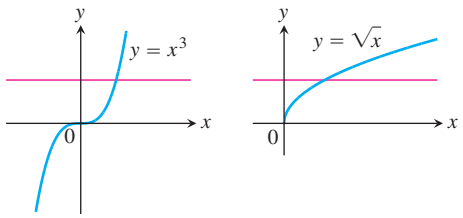
A function is a rule that assigns a value from its range to each element in its domain. Some functions assign the same range value to more than one element in the domain. The function $f(x) = x^2$ assigns the same value, 1, to both of the numbers $-1$ and $+1$; the sines of $\pi/3$ and $2\pi/3$ are both $\sqrt{3}/2$. Other functions assume each value in their range no more than once. The square roots and cubes of different numbers are always different. A function that has distinct values at distinct elements in its domain is called one-to-one. These functions take on any one value in their range exactly once.

**DEFINITION One-to-One Function**

A function $f(x)$ is **one-to-one** on a domain $D$ if $f(x_1) \neq f(x_2)$ whenever $x_1 \neq x_2$ in $D$.

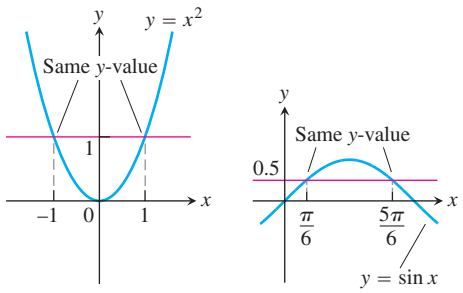
Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 1** Domains of One-to-One Functions



**(a)** $f(x) = \sqrt{x}$ is one-to-one on any domain of nonnegative numbers because $\sqrt{x_1} \neq \sqrt{x_2}$ whenever $x_1 \neq x_2$.

**(b)** $g(x) = \sin x$ is *not* one-to-one on the interval $[0, \pi]$ because $\sin(\pi/6) = \sin(5\pi/6)$. The sine *is* one-to-one on $[0, \pi/2]$, however, because it is a strictly increasing function on $[0, \pi/2]$. ■



The graph of a one-to-one function $y = f(x)$ can intersect a given horizontal line at most once. If it intersects the line more than once, it assumes the same $y$-value more than once, and is therefore not one-to-one (Figure 7.1).

**The Horizontal Line Test for One-to-One Functions**
A function $y = f(x)$ is one-to-one if and only if its graph intersects each horizontal line at most once.

One-to-one: Graph meets each horizontal line at most once.

Not one-to-one: Graph meets one or more horizontal lines more than once.

**FIGURE 7.1** Using the horizontal line test, we see that $y = x^3$ and $y = \sqrt{x}$ are one-to-one on their domains $(-\infty, \infty)$ and $[0, \infty)$, but $y = x^2$ and $y = \sin x$ are not one-to-one on their domains $(-\infty, \infty)$.

## Inverse Functions

Since each output of a one-to-one function comes from just one input, the effect of the function can be inverted to send an output back to the input from which it came.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**DEFINITION Inverse Function**

Suppose that $f$ is a one-to-one function on a domain $D$ with range $R$. The **inverse function** $f^{-1}$ is defined by

$$f^{-1}(a) = b \text{ if } f(b) = a.$$

The domain of $f^{-1}$ is $R$ and the range of $f^{-1}$ is $D$.

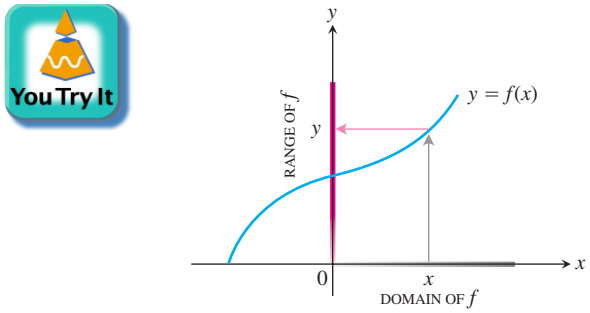
The domains and ranges of $f$ and $f^{-1}$ are interchanged. The symbol $f^{-1}$ for the inverse of $f$ is read "$f$ inverse." The "$-1$" in $f^{-1}$ is *not* an exponent: $f^{-1}(x)$ does not mean $1/f(x)$.

If we apply $f$ to send an input $x$ to the output $f(x)$ and follow by applying $f^{-1}$ to $f(x)$ we get right back to $x$, just where we started. Similarly, if we take some number $y$ in the range of $f$, apply $f^{-1}$ to it, and then apply $f$ to the resulting value $f^{-1}(y)$, we get back the value $y$ with which we began. Composing a function and its inverse has the same effect as doing nothing.

$$(f^{-1} \circ f)(x) = x, \qquad \text{for all } x \text{ in the domain of } f$$

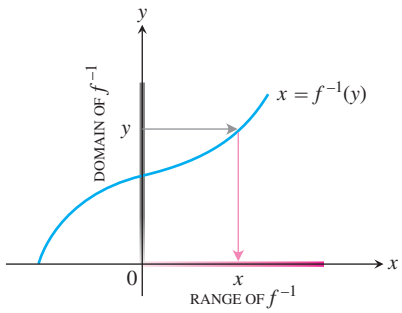
$$(f \circ f^{-1})(y) = y, \qquad \text{for all } y \text{ in the domain of } f^{-1} \text{ (or range of } f)$$

Only a one-to-one function can have an inverse. The reason is that if $f(x_1) = y$ and $f(x_2) = y$ for two distinct inputs $x_1$ and $x_2$, then there is no way to assign a value to $f^{-1}(y)$ that satisfies both $f^{-1}(f(x_1)) = x_1$ and $f^{-1}(f(x_2)) = x_2$.



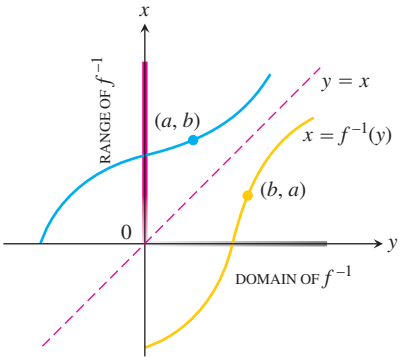
A function that is increasing on an interval, satisfying $f(x_2) > f(x_1)$ when $x_2 > x_1$, is one-to-one and has an inverse. Decreasing functions also have an inverse (Exercise 39). Functions that have positive derivatives at all $x$ are increasing (Corollary 3 of the Mean Value Theorem, Section 4.2), and so they have inverses. Similarly, functions with negative derivatives at all $x$ are decreasing and have inverses. Functions that are neither increasing nor decreasing may still be one-to-one and have an inverse, as with the function $\sec^{-1} x$ in Section 7.7.

## Finding Inverses

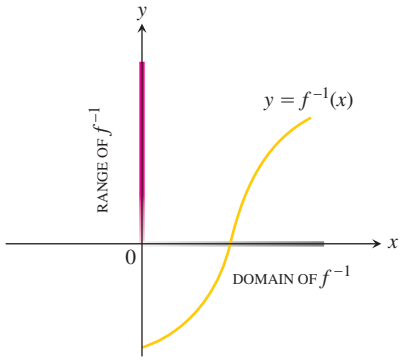


The graphs of a function and its inverse are closely related. To read the value of a function from its graph, we start at a point $x$ on the $x$-axis, go vertically to the graph, and then move horizontally to the $y$-axis to read the value of $y$. The inverse function can be read from the graph by reversing this process. Start with a point $y$ on the $y$-axis, go horizontally to the graph, and then move vertically to the $x$-axis to read the value of $x = f^{-1}(y)$ (Figure 7.2).

We want to set up the graph of $f^{-1}$ so that its input values lie along the $x$-axis, as is usually done for functions, rather then on the $y$-axis. To achieve this we interchange the $x$ and $y$ axes by reflecting across the 45° line $y = x$. After this reflection we have a new graph that represents $f^{-1}$. The value of $f^{-1}(x)$ can now be read from the graph in the usual way, by starting with a point $x$ on the $x$-axis, going vertically to the graph and then horizontally to the $y$-axis to get the value of $f^{-1}(x)$. Figure 7.2 indicates the relation between the graphs of $f$ and $f^{-1}$. The graphs are interchanged by reflection through the line $y = x$.



Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



(a) To find the value of $f$ at $x$, we start at $x$, go up to the curve, and then over to the $y$-axis.

(b) The graph of $f$ is already the graph of $f^{-1}$, but with $x$ and $y$ interchanged. To find the $x$ that gave $y$, we start at $y$ and go over to the curve and down to the $x$-axis. The domain of $f^{-1}$ is the range of $f$. The range of $f^{-1}$ is the domain of $f$.

(c) To draw the graph of $f^{-1}$ in the more usual way, we reflect the system in the line $y = x$.

(d) Then we interchange the letters $x$ and $y$. We now have a normal-looking graph of $f^{-1}$ as a function of $x$.

**FIGURE 7.2** Determining the graph of $y = f^{-1}(x)$ from the graph of $y = f(x)$.

The process of passing from $f$ to $f^{-1}$ can be summarized as a two-step process.

1. Solve the equation $y = f(x)$ for $x$. This gives a formula $x = f^{-1}(y)$ where $x$ is expressed as a function of $y$.
2. Interchange $x$ and $y$, obtaining a formula $y = f^{-1}(x)$ where $f^{-1}$ is expressed in the conventional format with $x$ as the independent variable and $y$ as the dependent variable.

## EXAMPLE 2 Finding an Inverse Function

Find the inverse of $y = \frac{1}{2}x + 1$, expressed as a function of $x$.

### Solution

1. *Solve for x in terms of y:*
$$y = \frac{1}{2}x + 1$$
$$2y = x + 2$$
$$x = 2y - 2.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

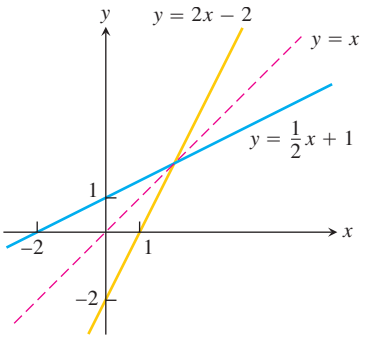


**FIGURE 7.3** Graphing $f(x) = (1/2)x + 1$ and $f^{-1}(x) = 2x - 2$ together shows the graphs' symmetry with respect to the line $y = x$. The slopes are reciprocals of each other (Example 2).

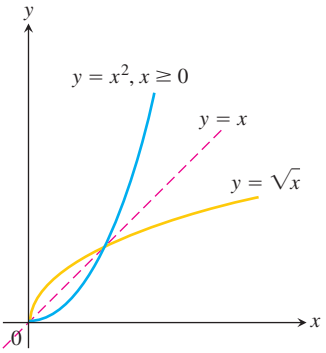

**FIGURE 7.4** The functions $y = \sqrt{x}$ and $y = x^2, x \geq 0$, are inverses of one another (Example 3).

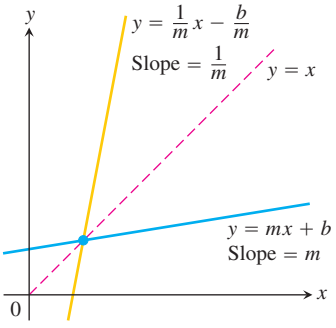

**FIGURE 7.5** The slopes of nonvertical lines reflected through the line $y = x$ are reciprocals of each other.

**2.** *Interchange $x$ and $y$:* $y = 2x - 2$.

The inverse of the function $f(x) = (1/2)x + 1$ is the function $f^{-1}(x) = 2x - 2$. To check, we verify that both composites give the identity function:

$$f^{-1}(f(x)) = 2\left(\frac{1}{2}x + 1\right) - 2 = x + 2 - 2 = x$$

$$f(f^{-1}(x)) = \frac{1}{2}(2x - 2) + 1 = x - 1 + 1 = x.$$

See Figure 7.3. ■

### EXAMPLE 3 Finding an Inverse Function

Find the inverse of the function $y = x^2, x \geq 0$, expressed as a function of $x$.

**Solution** We first solve for $x$ in terms of $y$:

$$y = x^2$$

$$\sqrt{y} = \sqrt{x^2} = |x| = x \qquad |x| = x \text{ because } x \geq 0$$

We then interchange $x$ and $y$, obtaining

$$y = \sqrt{x}.$$

The inverse of the function $y = x^2, x \geq 0$, is the function $y = \sqrt{x}$ (Figure 7.4).

Notice that, unlike the restricted function $y = x^2, x \geq 0$, the unrestricted function $y = x^2$ is not one-to-one and therefore has no inverse. ■

## Derivatives of Inverses of Differentiable Functions

If we calculate the derivatives of $f(x) = (1/2)x + 1$ and its inverse $f^{-1}(x) = 2x - 2$ from Example 2, we see that

$$\frac{d}{dx}f(x) = \frac{d}{dx}\left(\frac{1}{2}x + 1\right) = \frac{1}{2}$$

$$\frac{d}{dx}f^{-1}(x) = \frac{d}{dx}(2x - 2) = 2.$$

The derivatives are reciprocals of one another. The graph of $f$ is the line $y = (1/2)x + 1$, and the graph of $f^{-1}$ is the line $y = 2x - 2$ (Figure 7.3). Their slopes are reciprocals of one another.

This is not a special case. Reflecting any nonhorizontal or nonvertical line across the line $y = x$ always inverts the line's slope. If the original line has slope $m \neq 0$ (Figure 7.5), the reflected line has slope $1/m$ (Exercise 36).

The reciprocal relationship between the slopes of $f$ and $f^{-1}$ holds for other functions as well, but we must be careful to compare slopes at corresponding points. If the slope of $y = f(x)$ at the point $(a, f(a))$ is $f'(a)$ and $f'(a) \neq 0$, then the slope of $y = f^{-1}(x)$ at the point $(f(a), a)$ is the reciprocal $1/f'(a)$ (Figure 7.6). If we set $b = f(a)$, then

$$(f^{-1})'(b) = \frac{1}{f'(a)} = \frac{1}{f'(f^{-1}(b))}.$$

If $y = f(x)$ has a horizontal tangent line at $(a, f(a))$ then the inverse function $f^{-1}$ has a vertical tangent line at $(f(a), a)$, and this infinite slope implies that $f^{-1}$ is not differentiable

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

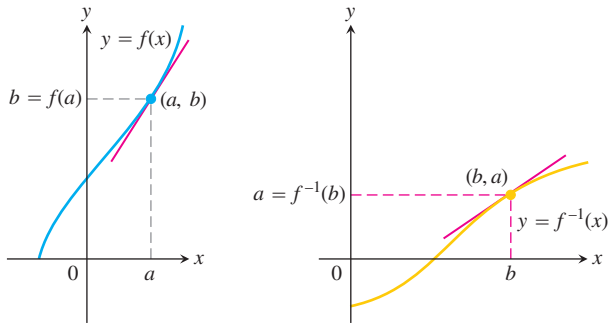

**FIGURE 7.6** The graphs of inverse functions have reciprocal slopes at corresponding points.

at $f(a)$. Theorem 1 gives the conditions under which $f^{-1}$ is differentiable in its domain, which is the same as the range of $f$.

**THEOREM 1 The Derivative Rule for Inverses**

If $f$ has an interval $I$ as domain and $f'(x)$ exists and is never zero on $I$, then $f^{-1}$ is differentiable at every point in its domain. The value of $(f^{-1})'$ at a point $b$ in the domain of $f^{-1}$ is the reciprocal of the value of $f'$ at the point $a = f^{-1}(b)$:

$$(f^{-1})'(b) = \frac{1}{f'(f^{-1}(b))}$$

or

$$\left.\frac{df^{-1}}{dx}\right|_{x=b} = \frac{1}{\left.\dfrac{df}{dx}\right|_{x=f^{-1}(b)}} \tag{1}$$

The proof of Theorem 1 is omitted, but here is another way to view it. When $y = f(x)$ is differentiable at $x = a$ and we change $x$ by a small amount $dx$, the corresponding change in $y$ is approximately

$$dy = f'(a)\,dx.$$

This means that $y$ changes about $f'(a)$ times as fast as $x$ when $x = a$ and that $x$ changes about $1/f'(a)$ times as fast as $y$ when $y = b$. It is reasonable that the derivative of $f^{-1}$ at $b$ is the reciprocal of the derivative of $f$ at $a$.

**EXAMPLE 4** Applying Theorem 1

The function $f(x) = x^2, x \geq 0$ and its inverse $f^{-1}(x) = \sqrt{x}$ have derivatives $f'(x) = 2x$ and $(f^{-1})'(x) = 1/(2\sqrt{x})$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

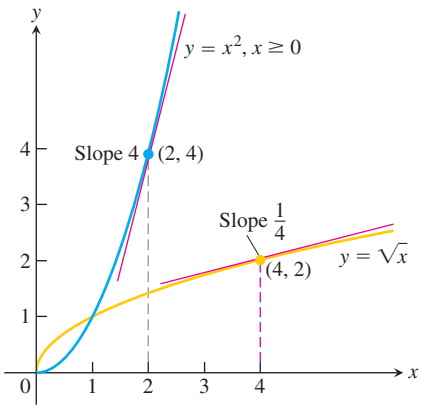

**FIGURE 7.7** The derivative of $f^{-1}(x) = \sqrt{x}$ at the point (4, 2) is the reciprocal of the derivative of $f(x) = x^2$ at (2, 4) (Example 4).

Theorem 1 predicts that the derivative of $f^{-1}(x)$ is

$$(f^{-1})'(x) = \frac{1}{f'(f^{-1}(x))} = \frac{1}{2(f^{-1}(x))} = \frac{1}{2(\sqrt{x})}.$$

Theorem 1 gives a derivative that agrees with our calculation using the Power Rule for the derivative of the square root function.

Let's examine Theorem 1 at a specific point. We pick $x = 2$ (the number $a$) and $f(2) = 4$ (the value $b$). Theorem 1 says that the derivative of $f$ at 2, $f'(2) = 4$, and the derivative of $f^{-1}$ at $f(2)$, $(f^{-1})'(4)$, are reciprocals. It states that

$$(f^{-1})'(4) = \frac{1}{f'(f^{-1}(4))} = \frac{1}{f'(2)} = \frac{1}{2x}\bigg|_{x=2} = \frac{1}{4}.$$

See Figure 7.7. ■

Equation (1) sometimes enables us to find specific values of $df^{-1}/dx$ without knowing a formula for $f^{-1}$.

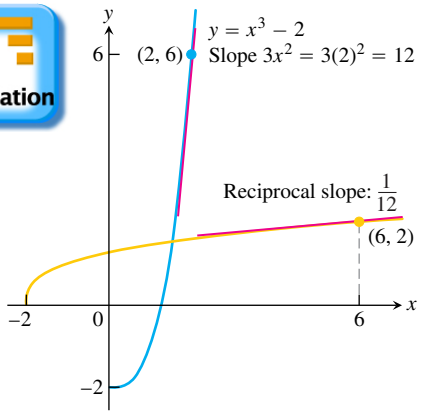

**FIGURE 7.8** The derivative of $f(x) = x^3 - 2$ at $x = 2$ tells us the derivative of $f^{-1}$ at $x = 6$ (Example 5).

### EXAMPLE 5 Finding a Value of the Inverse Derivative

Let $f(x) = x^3 - 2$. Find the value of $df^{-1}/dx$ at $x = 6 = f(2)$ without finding a formula for $f^{-1}(x)$.

**Solution**

$$\frac{df}{dx}\bigg|_{x=2} = 3x^2\bigg|_{x=2} = 12$$

$$\frac{df^{-1}}{dx}\bigg|_{x=f(2)} = \frac{1}{\dfrac{df}{dx}\bigg|_{x=2}} = \frac{1}{12} \quad \text{Eq. (1)}$$

See Figure 7.8. ■

## Parametrizing Inverse Functions

We can graph or represent any function $y = f(x)$ parametrically as

$$x = t \quad \text{and} \quad y = f(t).$$

Interchanging $t$ and $f(t)$ produces parametric equations for the inverse:

$$x = f(t) \quad \text{and} \quad y = t$$

(see Section 3.5).

For example, to graph the one-to-one function $f(x) = x^2, x \geq 0$, on a grapher together with its inverse and the line $y = x, x \geq 0$, use the parametric graphing option with

$$\begin{aligned} &\text{Graph of } f: && x_1 = t, && y_1 = t^2, && t \geq 0 \\ &\text{Graph of } f^{-1}: && x_2 = t^2, && y_2 = t \\ &\text{Graph of } y = x: && x_3 = t, && y_3 = t \end{aligned}$$

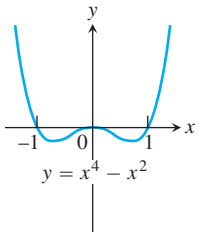
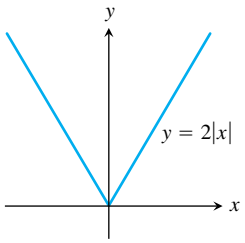
# EXERCISES 7.1

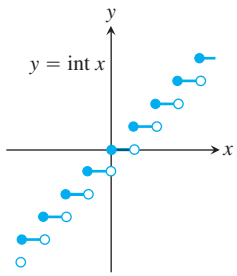


## Identifying One-to-One Functions Graphically

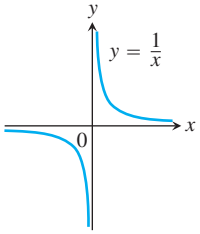
Which of the functions graphed in Exercises 1–6 are one-to-one, and which are not?



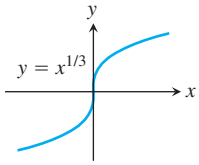
**1.**



**2.**

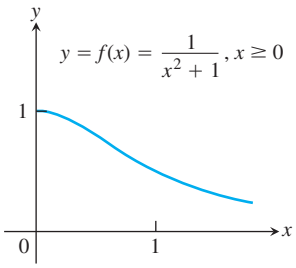


**3.**

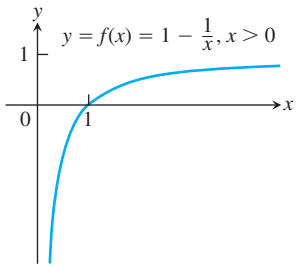


**4.**

**5.**

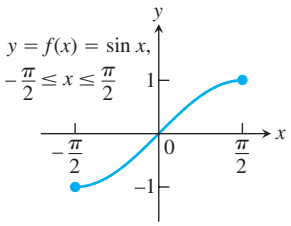


**6.**

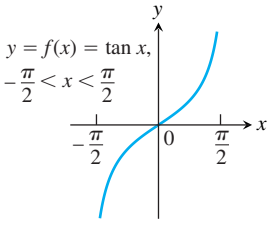


## Graphing Inverse Functions

Each of Exercises 7–10 shows the graph of a function $y = f(x)$. Copy the graph and draw in the line $y = x$. Then use symmetry with respect to the line $y = x$ to add the graph of $f^{-1}$ to your sketch. (It is not necessary to find a formula for $f^{-1}$.) Identify the domain and range of $f^{-1}$.



**7.**



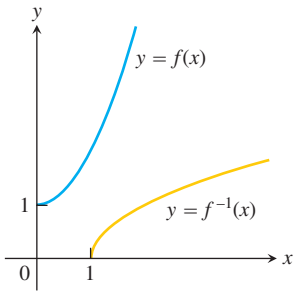
**8.**

**9.**

**10.**

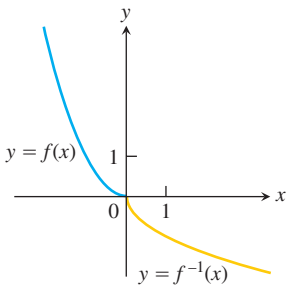
**11. a.** Graph the function $f(x) = \sqrt{1 - x^2}, 0 \leq x \leq 1$. What symmetry does the graph have?

**b.** Show that $f$ is its own inverse. (Remember that $\sqrt{x^2} = x$ if $x \geq 0$.)



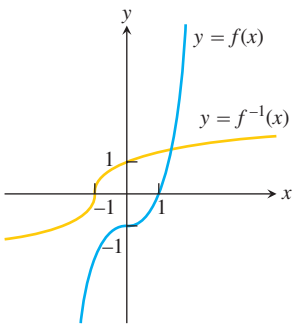
**12. a.** Graph the function $f(x) = 1/x$. What symmetry does the graph have?

**b.** Show that $f$ is its own inverse.

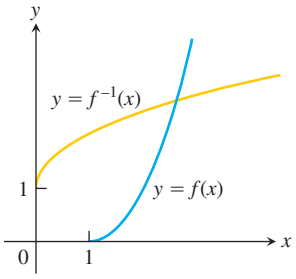


## Formulas for Inverse Functions

Each of Exercises 13–18 gives a formula for a function $y = f(x)$ and shows the graphs of $f$ and $f^{-1}$. Find a formula for $f^{-1}$ in each case.

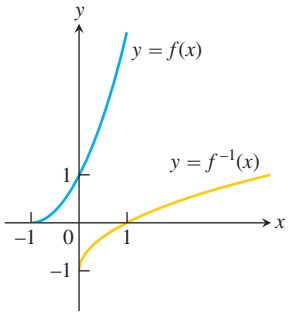


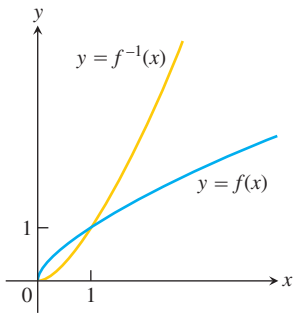
**13.** $f(x) = x^2 + 1, \quad x \geq 0$



**14.** $f(x) = x^2, \quad x \leq 0$

**15.** $f(x) = x^3 - 1$





**16.** $f(x) = x^2 - 2x + 1, \quad x \geq 1$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**17.** $f(x) = (x + 1)^2, \quad x \geq -1$ **18.** $f(x) = x^{2/3}, \quad x \geq 0$

Each of Exercises 19–24 gives a formula for a function $y = f(x)$. In each case, find $f^{-1}(x)$ and identify the domain and range of $f^{-1}$. As a check, show that $f(f^{-1}(x)) = f^{-1}(f(x)) = x$.

**19.** $f(x) = x^5$ **20.** $f(x) = x^4, \quad x \geq 0$

**21.** $f(x) = x^3 + 1$ **22.** $f(x) = (1/2)x - 7/2$

**23.** $f(x) = 1/x^2, \quad x > 0$ **24.** $f(x) = 1/x^3, \quad x \neq 0$

## Derivatives of Inverse Functions

In Exercises 25–28:

**a.** Find $f^{-1}(x)$.

**b.** Graph $f$ and $f^{-1}$ together.

**c.** Evaluate $df/dx$ at $x = a$ and $df^{-1}/dx$ at $x = f(a)$ to show that at these points $df^{-1}/dx = 1/(df/dx)$.

**25.** $f(x) = 2x + 3, \quad a = -1$ **26.** $f(x) = (1/5)x + 7, \quad a = -1$

**27.** $f(x) = 5 - 4x, \quad a = 1/2$ **28.** $f(x) = 2x^2, \quad x \geq 0, \quad a = 5$

**29. a.** Show that $f(x) = x^3$ and $g(x) = \sqrt[3]{x}$ are inverses of one another.

**b.** Graph $f$ and $g$ over an $x$-interval large enough to show the graphs intersecting at $(1, 1)$ and $(-1, -1)$. Be sure the picture shows the required symmetry about the line $y = x$.

**c.** Find the slopes of the tangents to the graphs of $f$ and $g$ at $(1, 1)$ and $(-1, -1)$ (four tangents in all).

**d.** What lines are tangent to the curves at the origin?

**30. a.** Show that $h(x) = x^3/4$ and $k(x) = (4x)^{1/3}$ are inverses of one another.

**b.** Graph $h$ and $k$ over an $x$-interval large enough to show the graphs intersecting at $(2, 2)$ and $(-2, -2)$. Be sure the picture shows the required symmetry about the line $y = x$.

**c.** Find the slopes of the tangents to the graphs at $h$ and $k$ at $(2, 2)$ and $(-2, -2)$.

**d.** What lines are tangent to the curves at the origin?

**31.** Let $f(x) = x^3 - 3x^2 - 1, x \geq 2$. Find the value of $df^{-1}/dx$ at the point $x = -1 = f(3)$.

**32.** Let $f(x) = x^2 - 4x - 5, x > 2$. Find the value of $df^{-1}/dx$ at the point $x = 0 = f(5)$.

**33.** Suppose that the differentiable function $y = f(x)$ has an inverse and that the graph of $f$ passes through the point $(2, 4)$ and has a slope of $1/3$ there. Find the value of $df^{-1}/dx$ at $x = 4$.

**34.** Suppose that the differentiable function $y = g(x)$ has an inverse and that the graph of $g$ passes through the origin with slope 2. Find the slope of the graph of $g^{-1}$ at the origin.

## Inverses of Lines

**35. a.** Find the inverse of the function $f(x) = mx$, where $m$ is a constant different from zero.

**b.** What can you conclude about the inverse of a function $y = f(x)$ whose graph is a line through the origin with a nonzero slope $m$?

**36.** Show that the graph of the inverse of $f(x) = mx + b$, where $m$ and $b$ are constants and $m \neq 0$, is a line with slope $1/m$ and $y$-intercept $-b/m$.

**37. a.** Find the inverse of $f(x) = x + 1$. Graph $f$ and its inverse together. Add the line $y = x$ to your sketch, drawing it with dashes or dots for contrast.

**b.** Find the inverse of $f(x) = x + b$ ($b$ constant). How is the graph of $f^{-1}$ related to the graph of $f$?

**c.** What can you conclude about the inverses of functions whose graphs are lines parallel to the line $y = x$?

**38. a.** Find the inverse of $f(x) = -x + 1$. Graph the line $y = -x + 1$ together with the line $y = x$. At what angle do the lines intersect?

**b.** Find the inverse of $f(x) = -x + b$ ($b$ constant). What angle does the line $y = -x + b$ make with the line $y = x$?

**c.** What can you conclude about the inverses of functions whose graphs are lines perpendicular to the line $y = x$?

## Increasing and Decreasing Functions

**39.** As in Section 4.3, a function $f(x)$ increases on an interval $I$ if for any two points $x_1$ and $x_2$ in $I$,

$$x_2 > x_1 \quad \Rightarrow \quad f(x_2) > f(x_1).$$

Similarly, a function decreases on $I$ if for any two points $x_1$ and $x_2$ in $I$,

$$x_2 > x_1 \quad \Rightarrow \quad f(x_2) < f(x_1).$$

Show that increasing functions and decreasing functions are one-to-one. That is, show that for any $x_1$ and $x_2$ in $I$, $x_2 \neq x_1$ implies $f(x_2) \neq f(x_1)$.

Use the results of Exercise 39 to show that the functions in Exercises 40–44 have inverses over their domains. Find a formula for $df^{-1}/dx$ using Theorem 1.

**40.** $f(x) = (1/3)x + (5/6)$ **41.** $f(x) = 27x^3$

**42.** $f(x) = 1 - 8x^3$ **43.** $f(x) = (1 - x)^3$

**44.** $f(x) = x^{5/3}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Theory and Applications

**45.** If $f(x)$ is one-to-one, can anything be said about $g(x) = -f(x)$? Is it also one-to-one? Give reasons for your answer.

**46.** If $f(x)$ is one-to-one and $f(x)$ is never zero, can anything be said about $h(x) = 1/f(x)$? Is it also one-to-one? Give reasons for your answer.

**47.** Suppose that the range of $g$ lies in the domain of $f$ so that the composite $f \circ g$ is defined. If $f$ and $g$ are one-to-one, can anything be said about $f \circ g$? Give reasons for your answer.

**48.** If a composite $f \circ g$ is one-to-one, must $g$ be one-to-one? Give reasons for your answer.

**49.** Suppose $f(x)$ is positive, continuous, and increasing over the interval $[a, b]$. By interpreting the graph of $f$ show that

$$\int_a^b f(x)\,dx + \int_{f(a)}^{f(b)} f^{-1}(y)\,dy = bf(b) - af(a).$$

**50.** Determine conditions on the constants $a$, $b$, $c$, and $d$ so that the rational function

$$f(x) = \frac{ax + b}{cx + d}$$

has an inverse.

**51.** If we write $g(x)$ for $f^{-1}(x)$, Equation (1) can be written as

$$g'(f(a)) = \frac{1}{f'(a)}, \quad \text{or} \quad g'(f(a)) \cdot f'(a) = 1.$$

If we then write $x$ for $a$, we get

$$g'(f(x)) \cdot f'(x) = 1.$$

The latter equation may remind you of the Chain Rule, and indeed there is a connection.

Assume that $f$ and $g$ are differentiable functions that are inverses of one another, so that $(g \circ f)(x) = x$. Differentiate both sides of this equation with respect to $x$, using the Chain Rule to express $(g \circ f)'(x)$ as a product of derivatives of $g$ and $f$. What do you find? (This is not a proof of Theorem 1 because we assume here the theorem's conclusion that $g = f^{-1}$ is differentiable.)

**52. Equivalence of the washer and shell methods for finding volume** Let $f$ be differentiable and increasing on the interval $a \le x \le b$, with $a > 0$, and suppose that $f$ has a differentiable inverse, $f^{-1}$. Revolve about the $y$-axis the region bounded by the graph of $f$ and the lines $x = a$ and $y = f(b)$ to generate a solid. Then the values of the integrals given by the washer and shell methods for the volume have identical values:

$$\int_{f(a)}^{f(b)} \pi((f^{-1}(y))^2 - a^2)\,dy = \int_a^b 2\pi x(f(b) - f(x))\,dx.$$

To prove this equality, define

$$W(t) = \int_{f(a)}^{f(t)} \pi((f^{-1}(y))^2 - a^2)\,dy$$

$$S(t) = \int_a^t 2\pi x(f(t) - f(x))\,dx.$$

Then show that the functions $W$ and $S$ agree at a point of $[a, b]$ and have identical derivatives on $[a, b]$. As you saw in Section 4.8, Exercise 102, this will guarantee $W(t) = S(t)$ for all $t$ in $[a, b]$. In particular, $W(b) = S(b)$. (*Source:* "Disks and Shells Revisited," by Walter Carlip, *American Mathematical Monthly*, Vol. 98, No. 2, Feb. 1991, pp. 154–156.)

### COMPUTER EXPLORATIONS

In Exercises 53–60, you will explore some functions and their inverses together with their derivatives and linear approximating functions at specified points. Perform the following steps using your CAS:

**a.** Plot the function $y = f(x)$ together with its derivative over the given interval. Explain why you know that $f$ is one-to-one over the interval.

**b.** Solve the equation $y = f(x)$ for $x$ as a function of $y$, and name the resulting inverse function $g$.

**c.** Find the equation for the tangent line to $f$ at the specified point $(x_0, f(x_0))$.

**d.** Find the equation for the tangent line to $g$ at the point $(f(x_0), x_0)$ located symmetrically across the 45° line $y = x$ (which is the graph of the identity function). Use Theorem 1 to find the slope of this tangent line.

**e.** Plot the functions $f$ and $g$, the identity, the two tangent lines, and the line segment joining the points $(x_0, f(x_0))$ and $(f(x_0), x_0)$. Discuss the symmetries you see across the main diagonal.

**53.** $y = \sqrt{3x - 2}, \quad \frac{2}{3} \le x \le 4, \quad x_0 = 3$

**54.** $y = \frac{3x + 2}{2x - 11}, \quad -2 \le x \le 2, \quad x_0 = 1/2$

**55.** $y = \frac{4x}{x^2 + 1}, \quad -1 \le x \le 1, \quad x_0 = 1/2$

**56.** $y = \frac{x^3}{x^2 + 1}, \quad -1 \le x \le 1, \quad x_0 = 1/2$

**57.** $y = x^3 - 3x^2 - 1, \quad 2 \le x \le 5, \quad x_0 = \frac{27}{10}$

**58.** $y = 2 - x - x^3, \quad -2 \le x \le 2, \quad x_0 = \frac{3}{2}$

**59.** $y = e^x, \quad -3 \le x \le 5, \quad x_0 = 1$

**60.** $y = \sin x, \quad -\frac{\pi}{2} \le x \le \frac{\pi}{2}, \quad x_0 = 1$

In Exercises 61 and 62, repeat the steps above to solve for the functions $y = f(x)$ and $x = f^{-1}(y)$ defined implicitly by the given equations over the interval.

**61.** $y^{1/3} - 1 = (x + 2)^3, \quad -5 \le x \le 5, \quad x_0 = -3/2$

**62.** $\cos y = x^{1/5}, \quad 0 \le x \le 1, \quad x_0 = 1/2$

# 7.2 Natural Logarithms

For any positive number $a$, the function value $f(x) = a^x$ is easy to define when $x$ is an integer or rational number. When $x$ is irrational, the meaning of $a^x$ is not so clear. Similarly, the definition of the logarithm $\log_a x$, the inverse function of $f(x) = a^x$, is not completely obvious. In this section we use integral calculus to define the *natural logarithm* function, for which the number $a$ is a particularly important value. This function allows us to define and analyze general exponential and logarithmic functions, $y = a^x$ and $y = \log_a x$.

Logarithms originally played important roles in arithmetic computations. Historically, considerable labor went into producing long tables of logarithms, correct to five, eight, or even more, decimal places of accuracy. Prior to the modern age of electronic calculators and computers, every engineer owned slide rules marked with logarithmic scales. Calculations with logarithms made possible the great seventeenth-century advances in offshore navigation and celestial mechanics. Today we know such calculations are done using calculators or computers, but the properties and numerous applications of logarithms are as important as ever.

## Definition of the Natural Logarithm Function

One solid approach to defining and understanding logarithms begins with a study of the natural logarithm function defined as an integral through the Fundamental Theorem of Calculus. While this approach may seem indirect, it enables us to derive quickly the familiar properties of logarithmic and exponential functions. The functions we have studied so far were analyzed using the techniques of calculus, but here we do something more fundamental. We use calculus for the very definition of the logarithmic and exponential functions.

The natural logarithm of a positive number $x$, written as $\ln x$, is the value of an integral.

**DEFINITION The Natural Logarithm Function**

$$\ln x = \int_1^x \frac{1}{t}\,dt, \qquad x > 0$$

If $x > 1$, then $\ln x$ is the area under the curve $y = 1/t$ from $t = 1$ to $t = x$ (Figure 7.9). For $0 < x < 1$, $\ln x$ gives the negative of the area under the curve from $x$ to 1. The function is not defined for $x \le 0$. From the Zero Width Interval Rule for definite integrals, we also have

$$\ln 1 = \int_1^1 \frac{1}{t}\,dt = 0.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

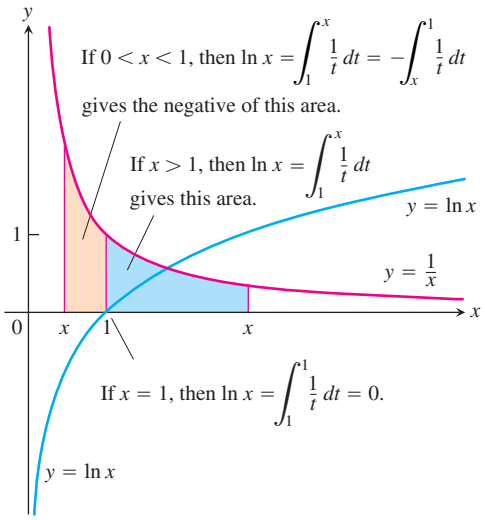

**FIGURE 7.9** The graph of $y = \ln x$ and its relation to the function $y = 1/x, x > 0$. The graph of the logarithm rises above the $x$-axis as $x$ moves from 1 to the right, and it falls below the axis as $x$ moves from 1 to the left.

**TABLE 7.1** Typical 2-place values of ln $x$

| $x$ | $\ln x$ |
|---|---|
| 0 | undefined |
| 0.05 | −3.00 |
| 0.5 | −0.69 |
| 1 | 0 |
| 2 | 0.69 |
| 3 | 1.10 |
| 4 | 1.39 |
| 10 | 2.30 |

Notice that we show the graph of $y = 1/x$ in Figure 7.9 but use $y = 1/t$ in the integral. Using $x$ for everything would have us writing

$$\ln x = \int_1^x \frac{1}{x}\,dx,$$

with $x$ meaning two different things. So we change the variable of integration to $t$.

By using rectangles to obtain finite approximations of the area under the graph of $y = 1/t$ and over the interval between $t = 1$ and $t = x$, as in Section 5.1, we can approximate the values of the function ln $x$. Several values are given in Table 7.1. There is an important number whose natural logarithm equals 1.

**DEFINITION The Number $e$**

The number $e$ is that number in the domain of the natural logarithm satisfying

$$\ln(e) = 1$$

Geometrically, the number $e$ corresponds to the point on the $x$-axis for which the area under the graph of $y = 1/t$ and above the interval $[1, e]$ is the exact area of the unit square. The area of the region shaded blue in Figure 7.9 is 1 sq unit when $x = e$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## The Derivative of $y = \ln x$

By the first part of the Fundamental Theorem of Calculus (Section 5.4),

$$\frac{d}{dx}\ln x = \frac{d}{dx}\int_1^x \frac{1}{t}\,dt = \frac{1}{x}.$$

For every positive value of $x$, we have

$$\frac{d}{dx}\ln x = \frac{1}{x}.$$

Therefore, the function $y = \ln x$ is a solution to the initial value problem $dy/dx = 1/x$, $x > 0$, with $y(1) = 0$. Notice that the derivative is always positive so the natural logarithm is an increasing function, hence it is one-to-one and invertible. Its inverse is studied in Section 7.3.

If $u$ is a differentiable function of $x$ whose values are positive, so that $\ln u$ is defined, then applying the Chain Rule

$$\frac{dy}{dx} = \frac{dy}{du}\frac{du}{dx}$$

to the function $y = \ln u$ gives

$$\frac{d}{dx}\ln u = \frac{d}{du}\ln u \cdot \frac{du}{dx} = \frac{1}{u}\frac{du}{dx}.$$

$$\frac{d}{dx}\ln u = \frac{1}{u}\frac{du}{dx}, \qquad u > 0 \tag{1}$$

**EXAMPLE 1** Derivatives of Natural Logarithms

**(a)** $\dfrac{d}{dx}\ln 2x = \dfrac{1}{2x}\dfrac{d}{dx}(2x) = \dfrac{1}{2x}(2) = \dfrac{1}{x}$

**(b)** Equation (1) with $u = x^2 + 3$ gives

$$\frac{d}{dx}\ln(x^2+3) = \frac{1}{x^2+3}\cdot\frac{d}{dx}(x^2+3) = \frac{1}{x^2+3}\cdot 2x = \frac{2x}{x^2+3}.$$

■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Notice the remarkable occurrence in Example 1a. The function $y = \ln 2x$ has the same derivative as the function $y = \ln x$. This is true of $y = \ln ax$ for any positive number $a$:

$$\frac{d}{dx}\ln ax = \frac{1}{ax}\cdot\frac{d}{dx}(ax) = \frac{1}{ax}(a) = \frac{1}{x}. \tag{2}$$

Since they have the same derivative, the functions $y = \ln ax$ and $y = \ln x$ differ by a constant.

HISTORICAL BIOGRAPHY

John Napier
(1550–1617)

## Properties of Logarithms

Logarithms were invented by John Napier and were the single most important improvement in arithmetic calculation before the modern electronic computer. What made them so useful is that the properties of logarithms enable multiplication of positive numbers by addition of their logarithms, division of positive numbers by subtraction of their logarithms, and exponentiation of a number by multiplying its logarithm by the exponent. We summarize these properties as a series of rules in Theorem 2. For the moment, we restrict the exponent $r$ in Rule 4 to be a rational number; you will see why when we prove the rule.

**THEOREM 2 Properties of Logarithms**

For any numbers $a > 0$ and $x > 0$, the natural logarithm satisfies the following rules:

| | | | |
|---|---|---|---|
| **1.** | *Product Rule*: | $\ln ax = \ln a + \ln x$ | |
| **2.** | *Quotient Rule*: | $\ln \frac{a}{x} = \ln a - \ln x$ | |
| **3.** | *Reciprocal Rule*: | $\ln \frac{1}{x} = -\ln x$ | Rule 2 with $a = 1$ |
| **4.** | *Power Rule*: | $\ln x^r = r \ln x$ | $r$ rational |

We illustrate how these rules apply.

**EXAMPLE 2** Interpreting the Properties of Logarithms

**(a)** $\ln 6 = \ln(2 \cdot 3) = \ln 2 + \ln 3$ Product

**(b)** $\ln 4 - \ln 5 = \ln \frac{4}{5} = \ln 0.8$ Quotient

**(c)** $\ln \frac{1}{8} = -\ln 8$ Reciprocal

$= -\ln 2^3 = -3 \ln 2$ Power ■

**EXAMPLE 3** Applying the Properties to Function Formulas

**(a)** $\ln 4 + \ln \sin x = \ln(4 \sin x)$ Product

**(b)** $\ln \frac{x+1}{2x-3} = \ln(x+1) - \ln(2x-3)$ Quotient

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**(c)** $\ln \sec x = \ln \dfrac{1}{\cos x} = -\ln \cos x$ Reciprocal

**(d)** $\ln \sqrt[3]{x+1} = \ln (x+1)^{1/3} = \dfrac{1}{3}\ln (x+1)$ Power ■

We now give the proof of Theorem 2. The steps in the proof are similar to those used in solving problems involving logarithms.

**Proof that $\ln ax = \ln a + \ln x$** The argument is unusual—and elegant. It starts by observing that $\ln ax$ and $\ln x$ have the same derivative (Equation 2). According to Corollary 2 of the Mean Value Theorem, then, the functions must differ by a constant, which means that

$$\ln ax = \ln x + C$$

for some $C$.

Since this last equation holds for all positive values of $x$, it must hold for $x = 1$. Hence,

$$\ln (a \cdot 1) = \ln 1 + C$$
$$\ln a = 0 + C \qquad \ln 1 = 0$$
$$C = \ln a.$$

By substituting we conclude,

$$\ln ax = \ln a + \ln x.$$

**Proof that $\ln x^r = r \ln x$ (assuming $r$ rational)** We use the same-derivative argument again. For all positive values of $x$,

$$\frac{d}{dx}\ln x^r = \frac{1}{x^r}\frac{d}{dx}(x^r) \qquad \text{Eq. (1) with } u = x^r$$
$$= \frac{1}{x^r} r x^{r-1} \qquad \text{Here is where we need } r \text{ to be rational, at least for now. We have proved the Power Rule only for rational exponents.}$$
$$= r \cdot \frac{1}{x} = \frac{d}{dx}(r \ln x).$$

Since $\ln x^r$ and $r \ln x$ have the same derivative,

$$\ln x^r = r \ln x + C$$

for some constant $C$. Taking $x$ to be 1 identifies $C$ as zero, and we're done.

You are asked to prove Rule 2 in Exercise 84. Rule 3 is a special case of Rule 2, obtained by setting $a = 1$ and noting that $\ln 1 = 0$. So we have established all cases of Theorem 2. ■

We have not yet proved Rule 4 for $r$ irrational; we will return to this case in Section 7.3. The rule does hold for all $r$, rational or irrational.

## The Graph and Range of $\ln x$

The derivative $d(\ln x)/dx = 1/x$ is positive for $x > 0$, so $\ln x$ is an increasing function of $x$. The second derivative, $-1/x^2$, is negative, so the graph of $\ln x$ is concave down.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

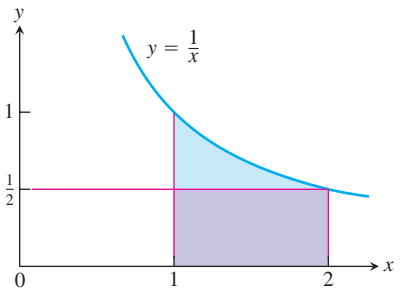

**FIGURE 7.10** The rectangle of height $y = 1/2$ fits beneath the graph of $y = 1/x$ for the interval $1 \le x \le 2$.

We can estimate the value of $\ln 2$ by considering the area under the graph of $y = 1/x$ and above the interval $[1, 2]$. In Figure 7.10 a rectangle of height $1/2$ over the interval $[1, 2]$ fits under the graph. Therefore the area under the graph, which is $\ln 2$, is greater than the area, $1/2$, of the rectangle. So $\ln 2 > 1/2$. Knowing this we have,

$$\ln 2^n = n \ln 2 > n\left(\frac{1}{2}\right) = \frac{n}{2}$$

and

$$\ln 2^{-n} = -n \ln 2 < -n\left(\frac{1}{2}\right) = -\frac{n}{2}.$$

It follows that

$$\lim_{x \to \infty} \ln x = \infty \qquad \text{and} \qquad \lim_{x \to 0^+} \ln x = -\infty.$$

We defined $\ln x$ for $x > 0$, so the domain of $\ln x$ is the set of positive real numbers. The above discussion and the Intermediate Value Theorem show that its range is the entire real line giving the graph of $y = \ln x$ shown in Figure 7.9.

## The Integral $\int (1/u)\, du$

Equation (1) leads to the integral formula

$$\int \frac{1}{u}\, du = \ln u + C \tag{3}$$

when $u$ is a positive differentiable function, but what if $u$ is negative? If $u$ is negative, then $-u$ is positive and

$$\int \frac{1}{u}\, du = \int \frac{1}{(-u)}\, d(-u) \qquad \text{Eq. (3) with } u \text{ replaced by } -u$$

$$= \ln (-u) + C. \tag{4}$$

We can combine Equations (3) and (4) into a single formula by noticing that in each case the expression on the right is $\ln |u| + C$. In Equation (3), $\ln u = \ln |u|$ because $u > 0$; in Equation (4), $\ln (-u) = \ln |u|$ because $u < 0$. Whether $u$ is positive or negative, the integral of $(1/u)\, du$ is $\ln |u| + C$.

If $u$ is a differentiable function that is never zero,

$$\int \frac{1}{u}\, du = \ln |u| + C. \tag{5}$$

Equation (5) applies anywhere on the domain of $1/u$, the points where $u \neq 0$.

We know that

$$\int u^n\, du = \frac{u^{n+1}}{n+1} + C, \qquad n \neq -1 \text{ and rational}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Equation (5) explains what to do when $n$ equals $-1$. Equation (5) says integrals of a certain *form* lead to logarithms. If $u = f(x)$, then $du = f'(x)\,dx$ and

$$\int \frac{1}{u}\,du = \int \frac{f'(x)}{f(x)}\,dx.$$

So Equation (5) gives

$$\int \frac{f'(x)}{f(x)}\,dx = \ln|f(x)| + C$$

whenever $f(x)$ is a differentiable function that maintains a constant sign on the domain given for it.

**EXAMPLE 4** Applying Equation (5)

**(a)** $\displaystyle\int_0^2 \frac{2x}{x^2 - 5}\,dx = \int_{-5}^{-1} \frac{du}{u} = \ln|u|\Big]_{-5}^{-1}$ $\quad u = x^2 - 5,\ du = 2x\,dx,\ u(0) = -5,\ u(2) = -1$

$$= \ln|-1| - \ln|-5| = \ln 1 - \ln 5 = -\ln 5$$

**(b)** $\displaystyle\int_{-\pi/2}^{\pi/2} \frac{4\cos\theta}{3 + 2\sin\theta}\,d\theta = \int_1^5 \frac{2}{u}\,du$ $\quad u = 3 + 2\sin\theta,\ du = 2\cos\theta\,d\theta,\ u(-\pi/2) = 1,\ u(\pi/2) = 5$

$$= 2\ln|u|\Big]_1^5$$

$$= 2\ln|5| - 2\ln|1| = 2\ln 5$$

Note that $u = 3 + 2\sin\theta$ is always positive on $[-\pi/2, \pi/2]$, so Equation (5) applies. ■

## The Integrals of tan *x* and cot *x*

Equation (5) tells us at last how to integrate the tangent and cotangent functions. For the tangent function,

$$\int \tan x\,dx = \int \frac{\sin x}{\cos x}\,dx = \int \frac{-du}{u}$$ $\quad u = \cos x > 0$ on $(-\pi/2, \pi/2)$, $du = -\sin x\,dx$

$$= -\int \frac{du}{u} = -\ln|u| + C$$

$$= -\ln|\cos x| + C = \ln\frac{1}{|\cos x|} + C$$ $\quad$ Reciprocal Rule

$$= \ln|\sec x| + C.$$

For the cotangent,

$$\int \cot x\,dx = \int \frac{\cos x\,dx}{\sin x} = \int \frac{du}{u}$$ $\quad u = \sin x,\ du = \cos x\,dx$

$$= \ln|u| + C = \ln|\sin x| + C = -\ln|\csc x| + C.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$$\int \tan u\, du = -\ln|\cos u| + C = \ln|\sec u| + C$$

$$\int \cot u\, du = \ln|\sin u| + C = -\ln|\csc x| + C$$

**EXAMPLE 5**

$$\int_0^{\pi/6} \tan 2x\, dx = \int_0^{\pi/3} \tan u \cdot \frac{du}{2} = \frac{1}{2}\int_0^{\pi/3} \tan u\, du$$

$$= \frac{1}{2}\ln|\sec u|\Big]_0^{\pi/3} = \frac{1}{2}(\ln 2 - \ln 1) = \frac{1}{2}\ln 2$$

Substitute $u = 2x$, $dx = du/2$, $u(0) = 0$, $u(\pi/6) = \pi/3$

## Logarithmic Differentiation

The derivatives of positive functions given by formulas that involve products, quotients, and powers can often be found more quickly if we take the natural logarithm of both sides before differentiating. This enables us to use the laws of logarithms to simplify the formulas before differentiating. The process, called **logarithmic differentiation**, is illustrated in the next example.

**EXAMPLE 6** Using Logarithmic Differentiation

Find $dy/dx$ if

$$y = \frac{(x^2 + 1)(x + 3)^{1/2}}{x - 1}, \qquad x > 1.$$

**Solution** We take the natural logarithm of both sides and simplify the result with the properties of logarithms:

$$\ln y = \ln \frac{(x^2 + 1)(x + 3)^{1/2}}{x - 1}$$

$$= \ln((x^2 + 1)(x + 3)^{1/2}) - \ln(x - 1) \qquad \text{Rule 2}$$

$$= \ln(x^2 + 1) + \ln(x + 3)^{1/2} - \ln(x - 1) \qquad \text{Rule 1}$$

$$= \ln(x^2 + 1) + \frac{1}{2}\ln(x + 3) - \ln(x - 1). \qquad \text{Rule 3}$$

We then take derivatives of both sides with respect to $x$, using Equation (1) on the left:

$$\frac{1}{y}\frac{dy}{dx} = \frac{1}{x^2 + 1} \cdot 2x + \frac{1}{2} \cdot \frac{1}{x + 3} - \frac{1}{x - 1}.$$

Next we solve for $dy/dx$:

$$\frac{dy}{dx} = y\left(\frac{2x}{x^2 + 1} + \frac{1}{2x + 6} - \frac{1}{x - 1}\right).$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Finally, we substitute for $y$:

$$\frac{dy}{dx} = \frac{(x^2 + 1)(x + 3)^{1/2}}{x - 1}\left(\frac{2x}{x^2 + 1} + \frac{1}{2x + 6} - \frac{1}{x - 1}\right).$$

A direct computation in Example 6, using the Quotient and Product Rules, would be much longer.

# EXERCISES 7.2

## Using the Properties of Logarithms

**1.** Express the following logarithms in terms of ln 2 and ln 3.

**a.** $\ln 0.75$ **b.** $\ln (4/9)$ **c.** $\ln (1/2)$

**d.** $\ln \sqrt[3]{9}$ **e.** $\ln 3\sqrt{2}$ **f.** $\ln \sqrt{13.5}$

**2.** Express the following logarithms in terms of ln 5 and ln 7.

**a.** $\ln (1/125)$ **b.** $\ln 9.8$ **c.** $\ln 7\sqrt{7}$

**d.** $\ln 1225$ **e.** $\ln 0.056$

**f.** $(\ln 35 + \ln (1/7))/(\ln 25)$

Use the properties of logarithms to simplify the expressions in Exercises 3 and 4.

**3. a.** $\ln \sin\theta - \ln\left(\dfrac{\sin\theta}{5}\right)$ **b.** $\ln (3x^2 - 9x) + \ln\left(\dfrac{1}{3x}\right)$

**c.** $\dfrac{1}{2}\ln (4t^4) - \ln 2$

**4. a.** $\ln \sec\theta + \ln \cos\theta$ **b.** $\ln (8x + 4) - 2\ln 2$

**c.** $3\ln \sqrt[3]{t^2 - 1} - \ln (t + 1)$

## Derivatives of Logarithms

In Exercises 5–36, find the derivative of $y$ with respect to $x$, $t$, or $\theta$, as appropriate.

**5.** $y = \ln 3x$ **6.** $y = \ln kx$, $k$ constant

**7.** $y = \ln (t^2)$ **8.** $y = \ln (t^{3/2})$

**9.** $y = \ln \dfrac{3}{x}$ **10.** $y = \ln \dfrac{10}{x}$

**11.** $y = \ln (\theta + 1)$ **12.** $y = \ln (2\theta + 2)$

**13.** $y = \ln x^3$ **14.** $y = (\ln x)^3$

**15.** $y = t(\ln t)^2$ **16.** $y = t\sqrt{\ln t}$

**17.** $y = \dfrac{x^4}{4}\ln x - \dfrac{x^4}{16}$ **18.** $y = \dfrac{x^3}{3}\ln x - \dfrac{x^3}{9}$

**19.** $y = \dfrac{\ln t}{t}$ **20.** $y = \dfrac{1 + \ln t}{t}$

**21.** $y = \dfrac{\ln x}{1 + \ln x}$ **22.** $y = \dfrac{x\ln x}{1 + \ln x}$

**23.** $y = \ln (\ln x)$ **24.** $y = \ln (\ln (\ln x))$

**25.** $y = \theta(\sin (\ln\theta) + \cos (\ln\theta))$

**26.** $y = \ln (\sec\theta + \tan\theta)$

**27.** $y = \ln \dfrac{1}{x\sqrt{x + 1}}$ **28.** $y = \dfrac{1}{2}\ln \dfrac{1 + x}{1 - x}$

**29.** $y = \dfrac{1 + \ln t}{1 - \ln t}$ **30.** $y = \sqrt{\ln \sqrt{t}}$

**31.** $y = \ln (\sec (\ln\theta))$ **32.** $y = \ln\left(\dfrac{\sqrt{\sin\theta\cos\theta}}{1 + 2\ln\theta}\right)$

**33.** $y = \ln\left(\dfrac{(x^2 + 1)^5}{\sqrt{1 - x}}\right)$ **34.** $y = \ln\sqrt{\dfrac{(x + 1)^5}{(x + 2)^{20}}}$

**35.** $y = \displaystyle\int_{x^2/2}^{x^2} \ln\sqrt{t}\, dt$ **36.** $y = \displaystyle\int_{\sqrt{x}}^{\sqrt[3]{x}} \ln t\, dt$

## Integration

Evaluate the integrals in Exercises 37–54.

**37.** $\displaystyle\int_{-3}^{-2} \frac{dx}{x}$ **38.** $\displaystyle\int_{-1}^{0} \frac{3\, dx}{3x - 2}$

**39.** $\displaystyle\int \frac{2y\, dy}{y^2 - 25}$ **40.** $\displaystyle\int \frac{8r\, dr}{4r^2 - 5}$

**41.** $\displaystyle\int_0^{\pi} \frac{\sin t}{2 - \cos t}\, dt$ **42.** $\displaystyle\int_0^{\pi/3} \frac{4\sin\theta}{1 - 4\cos\theta}\, d\theta$

**43.** $\displaystyle\int_1^2 \frac{2\ln x}{x}\, dx$ **44.** $\displaystyle\int_2^4 \frac{dx}{x\ln x}$

**45.** $\displaystyle\int_2^4 \frac{dx}{x(\ln x)^2}$ **46.** $\displaystyle\int_2^{16} \frac{dx}{2x\sqrt{\ln x}}$

**47.** $\displaystyle\int \frac{3\sec^2 t}{6 + 3\tan t}\, dt$ **48.** $\displaystyle\int \frac{\sec y\tan y}{2 + \sec y}\, dy$

**49.** $\displaystyle\int_0^{\pi/2} \tan\frac{x}{2}\, dx$ **50.** $\displaystyle\int_{\pi/4}^{\pi/2} \cot t\, dt$

**51.** $\displaystyle\int_{\pi/2}^{\pi} 2\cot\frac{\theta}{3}\, d\theta$ **52.** $\displaystyle\int_0^{\pi/12} 6\tan 3x\, dx$

**53.** $\displaystyle\int \frac{dx}{2\sqrt{x} + 2x}$ **54.** $\displaystyle\int \frac{\sec x\, dx}{\sqrt{\ln (\sec x + \tan x)}}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Logarithmic Differentiation

In Exercises 55–68, use logarithmic differentiation to find the derivative of $y$ with respect to the given independent variable.

**55.** $y = \sqrt{x(x+1)}$

**56.** $y = \sqrt{(x^2+1)(x-1)^2}$

**57.** $y = \sqrt{\dfrac{t}{t+1}}$

**58.** $y = \sqrt{\dfrac{1}{t(t+1)}}$

**59.** $y = \sqrt{\theta + 3}\sin\theta$

**60.** $y = (\tan\theta)\sqrt{2\theta+1}$

**61.** $y = t(t+1)(t+2)$

**62.** $y = \dfrac{1}{t(t+1)(t+2)}$

**63.** $y = \dfrac{\theta+5}{\theta\cos\theta}$

**64.** $y = \dfrac{\theta\sin\theta}{\sqrt{\sec\theta}}$

**65.** $y = \dfrac{x\sqrt{x^2+1}}{(x+1)^{2/3}}$

**66.** $y = \sqrt{\dfrac{(x+1)^{10}}{(2x+1)^5}}$

**67.** $y = \sqrt[3]{\dfrac{x(x-2)}{x^2+1}}$

**68.** $y = \sqrt[3]{\dfrac{x(x+1)(x-2)}{(x^2+1)(2x+3)}}$

## Theory and Applications

**69.** Locate and identify the absolute extreme values of

**a.** $\ln(\cos x)$ on $[-\pi/4, \pi/3]$,

**b.** $\cos(\ln x)$ on $[1/2, 2]$.

**70. a.** Prove that $f(x) = x - \ln x$ is increasing for $x > 1$.

**b.** Using part (a), show that $\ln x < x$ if $x > 1$.

**71.** Find the area between the curves $y = \ln x$ and $y = \ln 2x$ from $x = 1$ to $x = 5$.

**72.** Find the area between the curve $y = \tan x$ and the $x$-axis from $x = -\pi/4$ to $x = \pi/3$.

**73.** The region in the first quadrant bounded by the coordinate axes, the line $y = 3$, and the curve $x = 2/\sqrt{y+1}$ is revolved about the $y$-axis to generate a solid. Find the volume of the solid.

**74.** The region between the curve $y = \sqrt{\cot x}$ and the $x$-axis from $x = \pi/6$ to $x = \pi/2$ is revolved about the $x$-axis to generate a solid. Find the volume of the solid.

**75.** The region between the curve $y = 1/x^2$ and the $x$-axis from $x = 1/2$ to $x = 2$ is revolved about the $y$-axis to generate a solid. Find the volume of the solid.

**76.** In Section 6.2, Exercise 6, we revolved about the $y$-axis the region between the curve $y = 9x/\sqrt{x^3+9}$ and the $x$-axis from $x = 0$ to $x = 3$ to generate a solid of volume $36\pi$. What volume do you get if you revolve the region about the $x$-axis instead? (See Section 6.2, Exercise 6, for a graph.)

**77.** Find the lengths of the following curves.

**a.** $y = (x^2/8) - \ln x, \quad 4 \le x \le 8$

**b.** $x = (y/4)^2 - 2\ln(y/4), \quad 4 \le y \le 12$

**78.** Find a curve through the point $(1, 0)$ whose length from $x = 1$ to $x = 2$ is

$$L = \int_1^2 \sqrt{1 + \frac{1}{x^2}}\,dx.$$

**T** **79. a.** Find the centroid of the region between the curve $y = 1/x$ and the $x$-axis from $x = 1$ to $x = 2$. Give the coordinates to two decimal places.

**b.** Sketch the region and show the centroid in your sketch.

**80. a.** Find the center of mass of a thin plate of constant density covering the region between the curve $y = 1/\sqrt{x}$ and the $x$-axis from $x = 1$ to $x = 16$.

**b.** Find the center of mass if, instead of being constant, the density function is $\delta(x) = 4/\sqrt{x}$.

Solve the initial value problems in Exercises 81 and 82.

**81.** $\dfrac{dy}{dx} = 1 + \dfrac{1}{x}, \quad y(1) = 3$

**82.** $\dfrac{d^2y}{dx^2} = \sec^2 x, \quad y(0) = 0 \quad \text{and} \quad y'(0) = 1$

**T** **83. The linearization of $\ln(1+x)$ at $x = 0$** Instead of approximating $\ln x$ near $x = 1$, we approximate $\ln(1+x)$ near $x = 0$. We get a simpler formula this way.

**a.** Derive the linearization $\ln(1+x) \approx x$ at $x = 0$.

**b.** Estimate to five decimal places the error involved in replacing $\ln(1+x)$ by $x$ on the interval $[0, 0.1]$.

**c.** Graph $\ln(1+x)$ and $x$ together for $0 \le x \le 0.5$. Use different colors, if available. At what points does the approximation of $\ln(1+x)$ seem best? Least good? By reading coordinates from the graphs, find as good an upper bound for the error as your grapher will allow.

**84.** Use the same-derivative argument, as was done to prove Rules 1 and 4 of Theorem 2, to prove the Quotient Rule property of logarithms.

## Grapher Explorations

**85.** Graph $\ln x$, $\ln 2x$, $\ln 4x$, $\ln 8x$, and $\ln 16x$ (as many as you can) together for $0 < x \le 10$. What is going on? Explain.

**86.** Graph $y = \ln|\sin x|$ in the window $0 \le x \le 22$, $-2 \le y \le 0$. Explain what you see. How could you change the formula to turn the arches upside down?

**87. a.** Graph $y = \sin x$ and the curves $y = \ln(a + \sin x)$ for $a = 2$, 4, 8, 20, and 50 together for $0 \le x \le 23$.

**b.** Why do the curves flatten as $a$ increases? (*Hint:* Find an $a$-dependent upper bound for $|y'|$.)

**88.** Does the graph of $y = \sqrt{x} - \ln x$, $x > 0$, have an inflection point? Try to answer the question **(a)** by graphing, **(b)** by using calculus.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# 7.3 The Exponential Function

Having developed the theory of the function $\ln x$, we introduce the exponential function $\exp x = e^x$ as the inverse of $\ln x$. We study its properties and compute its derivative and integral. Knowing its derivative, we prove the power rule to differentiate $x^n$ when $n$ is *any* real number, rational or irrational.

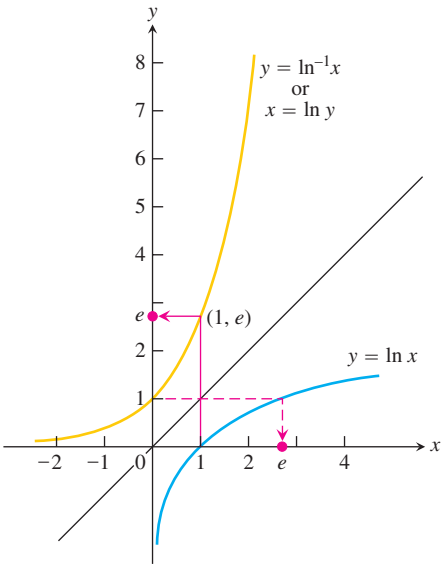

**FIGURE 7.11** The graphs of $y = \ln x$ and $y = \ln^{-1} x = \exp x$. The number $e$ is $\ln^{-1} 1 = \exp(1)$.

## The Inverse of ln $x$ and the Number $e$

The function $\ln x$, being an increasing function of $x$ with domain $(0, \infty)$ and range $(-\infty, \infty)$, has an inverse $\ln^{-1} x$ with domain $(-\infty, \infty)$ and range $(0, \infty)$. The graph of $\ln^{-1} x$ is the graph of $\ln x$ reflected across the line $y = x$. As you can see in Figure 7.11,

$$\lim_{x \to \infty} \ln^{-1} x = \infty \qquad \text{and} \qquad \lim_{x \to -\infty} \ln^{-1} x = 0.$$

The function $\ln^{-1} x$ is also denoted by $\exp x$.

In Section 7.2 we defined the number $e$ by the equation $\ln(e) = 1$, so $e = \ln^{-1}(1) = \exp(1)$. Although $e$ is not a rational number, later in this section we see one way to express it as a limit. In Chapter 11, we will calculate its value with a computer to as many places of accuracy as we want with a different formula (Section 11.9, Example 6). To 15 places,

$$e = 2.718281828459045.$$

## The Function $y = e^x$

We can raise the number $e$ to a rational power $r$ in the usual way:

$$e^2 = e \cdot e, \qquad e^{-2} = \frac{1}{e^2}, \qquad e^{1/2} = \sqrt{e},$$

and so on. Since $e$ is positive, $e^r$ is positive too. Thus, $e^r$ has a logarithm. When we take the logarithm, we find that

$$\ln e^r = r \ln e = r \cdot 1 = r.$$

Since $\ln x$ is one-to-one and $\ln(\ln^{-1} r) = r$, this equation tells us that

$$e^r = \ln^{-1} r = \exp r \qquad \text{for } r \text{ rational}. \tag{1}$$

We have not yet found a way to give an obvious meaning to $e^x$ for $x$ irrational. But $\ln^{-1} x$ has meaning for any $x$, rational or irrational. So Equation (1) provides a way to extend the definition of $e^x$ to irrational values of $x$. The function $\ln^{-1} x$ is defined for all $x$, so we use it to assign a value to $e^x$ at every point where $e^x$ had no previous definition.

Typical values of $e^x$

| $x$ | $e^x$ (rounded) |
|---|---|
| −1 | 0.37 |
| 0 | 1 |
| 1 | 2.72 |
| 2 | 7.39 |
| 10 | 22026 |
| 100 | $2.6881 \times 10^{43}$ |

**DEFINITION The Natural Exponential Function**

For every real number $x$, $e^x = \ln^{-1} x = \exp x$.

For the first time we have a precise meaning for an irrational exponent. Usually the exponential function is denoted by $e^x$ rather than $\exp x$. Since $\ln x$ and $e^x$ are inverses of one another, we have

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Inverse Equations for $e^x$ and $\ln x$**

$$e^{\ln x} = x \qquad (\text{all } x > 0) \tag{2}$$

$$\ln(e^x) = x \qquad (\text{all } x) \tag{3}$$

The domain of $\ln x$ is $(0, \infty)$ and its range is $(-\infty, \infty)$. So the domain of $e^x$ is $(-\infty, \infty)$ and its range is $(0, \infty)$.

**EXAMPLE 1** Using the Inverse Equations

**(a)** $\ln e^2 = 2$

**(b)** $\ln e^{-1} = -1$

**(c)** $\ln \sqrt{e} = \frac{1}{2}$

**(d)** $\ln e^{\sin x} = \sin x$

**(e)** $e^{\ln 2} = 2$

**(f)** $e^{\ln(x^2+1)} = x^2 + 1$

**(g)** $e^{3\ln 2} = e^{\ln 2^3} = e^{\ln 8} = 8$ One way

**(h)** $e^{3\ln 2} = (e^{\ln 2})^3 = 2^3 = 8$ Another way ■

**EXAMPLE 2** Solving for an Exponent

Find $k$ if $e^{2k} = 10$.

**Solution** Take the natural logarithm of both sides:

$$e^{2k} = 10$$

$$\ln e^{2k} = \ln 10$$

$$2k = \ln 10 \qquad \text{Eq. (3)}$$

$$k = \frac{1}{2}\ln 10.$$

■

## The General Exponential Function $a^x$

Since $a = e^{\ln a}$ for any positive number $a$, we can think of $a^x$ as $(e^{\ln a})^x = e^{x \ln a}$. We therefore make the following definition.

**DEFINITION** **General Exponential Functions**

For any numbers $a > 0$ and $x$, the exponential function with base $a$ is

$$a^x = e^{x \ln a}.$$

When $a = e$, the definition gives $a^x = e^{x \ln a} = e^{x \ln e} = e^{x \cdot 1} = e^x$.

### Transcendental Numbers and Transcendental Functions

Numbers that are solutions of polynomial equations with rational coefficients are called **algebraic**: $-2$ is algebraic because it satisfies the equation $x + 2 = 0$, and $\sqrt{3}$ is algebraic because it satisfies the equation $x^2 - 3 = 0$. Numbers that are not algebraic are called **transcendental**, like $e$ and $\pi$. In 1873, Charles Hermite proved the transcendence of $e$ in the sense that we describe. In 1882, C.L.F. Lindemann proved the transcendence of $\pi$.

Today, we call a function $y = f(x)$ algebraic if it satisfies an equation of the form

$$P_n y^n + \cdots + P_1 y + P_0 = 0$$

in which the $P$'s are polynomials in $x$ with rational coefficients. The function $y = 1/\sqrt{x+1}$ is algebraic because it satisfies the equation $(x+1)y^2 - 1 = 0$. Here the polynomials are $P_2 = x + 1$, $P_1 = 0$, and $P_0 = -1$. Functions that are not algebraic are called transcendental.

HISTORICAL BIOGRAPHY

Siméon Denis Poisson
(1781–1840)

**EXAMPLE 3** Evaluating Exponential Functions

**(a)** $2^{\sqrt{3}} = e^{\sqrt{3}\ln 2} \approx e^{1.20} \approx 3.32$

**(b)** $2^{\pi} = e^{\pi \ln 2} \approx e^{2.18} \approx 8.8$ ■

We study the calculus of general exponential functions and their inverses in the next section. Here we need the definition in order to discuss the laws of exponents for $e^x$.

## Laws of Exponents

Even though $e^x$ is defined in a seemingly roundabout way as $\ln^{-1} x$, it obeys the familiar laws of exponents from algebra. Theorem 3 shows us that these laws are consequences of the definitions of $\ln x$ and $e^x$.

**THEOREM 3 Laws of Exponents for $e^x$**

For all numbers $x$, $x_1$, and $x_2$, the natural exponential $e^x$ obeys the following laws:

1. $e^{x_1} \cdot e^{x_2} = e^{x_1 + x_2}$
2. $e^{-x} = \dfrac{1}{e^x}$
3. $\dfrac{e^{x_1}}{e^{x_2}} = e^{x_1 - x_2}$
4. $(e^{x_1})^{x_2} = e^{x_1 x_2} = (e^{x_2})^{x_1}$

**Proof of Law 1** Let

$$y_1 = e^{x_1} \quad \text{and} \quad y_2 = e^{x_2}. \tag{4}$$

Then

$$\begin{aligned} x_1 &= \ln y_1 \quad \text{and} \quad x_2 = \ln y_2 && \text{Take logs of both sides of Eqs. (4).} \\ x_1 + x_2 &= \ln y_1 + \ln y_2 \\ &= \ln y_1 y_2 && \text{Product Rule for logarithms} \\ e^{x_1 + x_2} &= e^{\ln y_1 y_2} && \text{Exponentiate.} \\ &= y_1 y_2 && e^{\ln u} = u \\ &= e^{x_1} e^{x_2}. \end{aligned}$$

■

The proof of Law 4 is similar. Laws 2 and 3 follow from Law 1 (Exercise 78).

**EXAMPLE 4** Applying the Exponent Laws

**(a)** $e^{x + \ln 2} = e^x \cdot e^{\ln 2} = 2e^x$ Law 1

**(b)** $e^{-\ln x} = \dfrac{1}{e^{\ln x}} = \dfrac{1}{x}$ Law 2

**(c)** $\dfrac{e^{2x}}{e} = e^{2x-1}$ Law 3

**(d)** $(e^3)^x = e^{3x} = (e^x)^3$ Law 4 ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Theorem 3 is also valid for $a^x$, the exponential function with base $a$. For example,

$$\begin{aligned} a^{x_1} \cdot a^{x_2} &= e^{x_1 \ln a} \cdot e^{x_2 \ln a} && \text{Definition of } a^x \\ &= e^{x_1 \ln a + x_2 \ln a} && \text{Law 1} \\ &= e^{(x_1 + x_2)\ln a} && \text{Factor } \ln a \\ &= a^{x_1 + x_2}. && \text{Definition of } a^x \end{aligned}$$

## The Derivative and Integral of $e^x$

The exponential function is differentiable because it is the inverse of a differentiable function whose derivative is never zero (Theorem 1). We calculate its derivative using Theorem 1 and our knowledge of the derivative of $\ln x$. Let

$$f(x) = \ln x \qquad \text{and} \qquad y = e^x = \ln^{-1} x = f^{-1}(x).$$

Then,

$$\begin{aligned} \frac{dy}{dx} = \frac{d}{dx}(e^x) &= \frac{d}{dx} \ln^{-1} x \\ &= \frac{d}{dx} f^{-1}(x) \\ &= \frac{1}{f'(f^{-1}(x))} && \text{Theorem 1} \\ &= \frac{1}{f'(e^x)} && f^{-1}(x) = e^x \\ &= \frac{1}{\left(\frac{1}{e^x}\right)} && f'(z) = \tfrac{1}{z} \text{ with } z = e^x \\ &= e^x. \end{aligned}$$

That is, for $y = e^x$, we find that $dy/dx = e^x$ so the natural exponential function $e^x$ is its own derivative. We will see in Section 7.5 that the only functions that behave this way are constant multiples of $e^x$. In summary,

$$\frac{d}{dx} e^x = e^x \tag{5}$$

**EXAMPLE 5** Differentiating an Exponential

$$\begin{aligned} \frac{d}{dx}(5e^x) &= 5\frac{d}{dx} e^x \\ &= 5e^x \end{aligned}$$

■

The Chain Rule extends Equation (5) in the usual way to a more general form.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

If $u$ is any differentiable function of $x$, then

$$\frac{d}{dx}e^u = e^u\frac{du}{dx}. \tag{6}$$

**EXAMPLE 6** Applying the Chain Rule with Exponentials

**(a)** $\dfrac{d}{dx}e^{-x} = e^{-x}\dfrac{d}{dx}(-x) = e^{-x}(-1) = -e^{-x}$ Eq. (6) with $u = -x$

**(b)** $\dfrac{d}{dx}e^{\sin x} = e^{\sin x}\dfrac{d}{dx}(\sin x) = e^{\sin x}\cdot\cos x$ Eq. (6) with $u = \sin x$ ■

The integral equivalent of Equation (6) is

$$\int e^u\,du = e^u + C.$$

**EXAMPLE 7** Integrating Exponentials

**(a)** $\displaystyle\int_0^{\ln 2} e^{3x}\,dx = \int_0^{\ln 8} e^u\cdot\frac{1}{3}\,du$ $u = 3x,\ \frac{1}{3}du = dx,\ u(0) = 0,$ $u(\ln 2) = 3\ln 2 = \ln 2^3 = \ln 8$

$$= \frac{1}{3}\int_0^{\ln 8} e^u\,du$$

$$= \frac{1}{3}e^u\Big]_0^{\ln 8}$$

$$= \frac{1}{3}(8 - 1) = \frac{7}{3}$$

**(b)** $\displaystyle\int_0^{\pi/2} e^{\sin x}\cos x\,dx = e^{\sin x}\Big]_0^{\pi/2}$ Antiderivative from Example 6

$$= e^1 - e^0 = e - 1$$ ■

**EXAMPLE 8** Solving an Initial Value Problem

Solve the initial value problem

$$e^y\frac{dy}{dx} = 2x, \qquad x > \sqrt{3}; \qquad y(2) = 0.$$

**Solution** We integrate both sides of the differential equation with respect to $x$ to obtain

$$e^y = x^2 + C.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We use the initial condition $y(2) = 0$ to determine $C$:

$$C = e^0 - (2)^2$$
$$= 1 - 4 = -3.$$

This completes the formula for $e^y$:

$$e^y = x^2 - 3.$$

To find $y$, we take logarithms of both sides:

$$\ln e^y = \ln (x^2 - 3)$$
$$y = \ln (x^2 - 3).$$

Notice that the solution is valid for $x > \sqrt{3}$.

Let's check the solution in the original equation.

$$e^y \frac{dy}{dx} = e^y \frac{d}{dx} \ln (x^2 - 3)$$
$$= e^y \frac{2x}{x^2 - 3} \qquad \text{Derivative of } \ln (x^2 - 3)$$
$$= e^{\ln (x^2 - 3)} \frac{2x}{x^2 - 3} \qquad y = \ln (x^2 - 3)$$
$$= (x^2 - 3) \frac{2x}{x^2 - 3} \qquad e^{\ln y} = y$$
$$= 2x.$$

The solution checks. ■

## The Number $e$ Expressed as a Limit

We have defined the number $e$ as the number for which $\ln e = 1$, or the value $\exp(1)$. We see that $e$ is an important constant for the logarithmic and exponential functions, but what is its numerical value? The next theorem shows one way to calculate $e$ as a limit.

**THEOREM 4 The Number $e$ as a Limit**

The number $e$ can be calculated as the limit

$$e = \lim_{x \to 0} (1 + x)^{1/x}.$$

**Proof** If $f(x) = \ln x$, then $f'(x) = 1/x$, so $f'(1) = 1$. But, by the definition of derivative,

$$f'(1) = \lim_{h \to 0} \frac{f(1 + h) - f(1)}{h} = \lim_{x \to 0} \frac{f(1 + x) - f(1)}{x}$$
$$= \lim_{x \to 0} \frac{\ln (1 + x) - \ln 1}{x} = \lim_{x \to 0} \frac{1}{x} \ln (1 + x) \qquad \ln 1 = 0$$
$$= \lim_{x \to 0} \ln (1 + x)^{1/x} = \ln \left[ \lim_{x \to 0} (1 + x)^{1/x} \right] \qquad \ln \text{ is continuous.}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Because $f'(1) = 1$, we have

$$\ln\left[\lim_{x\to 0}(1+x)^{1/x}\right] = 1$$

Therefore,

$$\lim_{x\to 0}(1+x)^{1/x} = e \qquad \ln e = 1 \text{ and } \ln \text{ is one-to-one}$$ ■

By substituting $y = 1/x$, we can also express the limit in Theorem 4 as

$$e = \lim_{y\to\infty}\left(1+\frac{1}{y}\right)^{y}. \tag{7}$$

At the beginning of the section we noted that $e = 2.718281828459045$ to 15 decimal places.

## The Power Rule (General Form)

We can now define $x^n$ for any $x > 0$ and any real number $n$ as $x^n = e^{n\ln x}$. Therefore, the $n$ in the equation $\ln x^n = n\ln x$ no longer needs to be rational—it can be any number as long as $x > 0$:

$$\ln x^n = \ln\left(e^{n\ln x}\right) = n\ln x \qquad \ln e^u = u, \text{ any } u$$

Together, the law $a^x/a^y = a^{x-y}$ and the definition $x^n = e^{n\ln x}$ enable us to establish the Power Rule for differentiation in its final form. Differentiating $x^n$ with respect to $x$ gives

$$\begin{aligned}
\frac{d}{dx}x^n &= \frac{d}{dx}e^{n\ln x} && \text{Definition of } x^n,\ x>0\\
&= e^{n\ln x}\cdot\frac{d}{dx}(n\ln x) && \text{Chain Rule for } e^u\\
&= x^n\cdot\frac{n}{x} && \text{The definition again}\\
&= nx^{n-1}.
\end{aligned}$$

In short, as long as $x > 0$,

$$\frac{d}{dx}x^n = nx^{n-1}.$$

The Chain Rule extends this equation to the Power Rule's general form.

**Power Rule (General Form)**
If $u$ is a positive differentiable function of $x$ and $n$ is any real number, then $u^n$ is a differentiable function of $x$ and

$$\frac{d}{dx}u^n = nu^{n-1}\frac{du}{dx}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 9** Using the Power Rule with Irrational Powers

**(a)** $\dfrac{d}{dx}x^{\sqrt{2}} = \sqrt{2}x^{\sqrt{2}-1} \qquad (x > 0)$

**(b)** $\dfrac{d}{dx}(2 + \sin 3x)^{\pi} = \pi(2 + \sin 3x)^{\pi-1}(\cos 3x) \cdot 3$

$= 3\pi(2 + \sin 3x)^{\pi-1}(\cos 3x).$

# EXERCISES 7.3

## Algebraic Calculations with the Exponential and Logarithm

Find simpler expressions for the quantities in Exercises 1–4.

1. **a.** $e^{\ln 7.2}$ **b.** $e^{-\ln x^2}$ **c.** $e^{\ln x - \ln y}$
2. **a.** $e^{\ln (x^2+y^2)}$ **b.** $e^{-\ln 0.3}$ **c.** $e^{\ln \pi x - \ln 2}$
3. **a.** $2 \ln \sqrt{e}$ **b.** $\ln (\ln e^e)$ **c.** $\ln (e^{-x^2-y^2})$
4. **a.** $\ln (e^{\sec \theta})$ **b.** $\ln (e^{(e^x)})$ **c.** $\ln (e^{2 \ln x})$

## Solving Equations with Logarithmic or Exponential Terms

In Exercises 5–10, solve for $y$ in terms of $t$ or $x$, as appropriate.

5. $\ln y = 2t + 4$
6. $\ln y = -t + 5$
7. $\ln (y - 40) = 5t$
8. $\ln (1 - 2y) = t$
9. $\ln (y - 1) - \ln 2 = x + \ln x$
10. $\ln (y^2 - 1) - \ln (y + 1) = \ln (\sin x)$

In Exercises 11 and 12, solve for $k$.

11. **a.** $e^{2k} = 4$ **b.** $100e^{10k} = 200$ **c.** $e^{k/1000} = a$
12. **a.** $e^{5k} = \frac{1}{4}$ **b.** $80e^{k} = 1$ **c.** $e^{(\ln 0.8)k} = 0.8$

In Exercises 13–16, solve for $t$.

13. **a.** $e^{-0.3t} = 27$ **b.** $e^{kt} = \frac{1}{2}$ **c.** $e^{(\ln 0.2)t} = 0.4$
14. **a.** $e^{-0.01t} = 1000$ **b.** $e^{kt} = \frac{1}{10}$ **c.** $e^{(\ln 2)t} = \frac{1}{2}$
15. $e^{\sqrt{t}} = x^2$
16. $e^{(x^2)}e^{(2x+1)} = e^t$

## Derivatives

In Exercises 17–36, find the derivative of $y$ with respect to $x$, $t$, or $\theta$, as appropriate.

17. $y = e^{-5x}$
18. $y = e^{2x/3}$
19. $y = e^{5-7x}$
20. $y = e^{(4\sqrt{x}+x^2)}$
21. $y = xe^x - e^x$
22. $y = (1 + 2x)e^{-2x}$
23. $y = (x^2 - 2x + 2)e^x$
24. $y = (9x^2 - 6x + 2)e^{3x}$
25. $y = e^{\theta}(\sin \theta + \cos \theta)$
26. $y = \ln (3\theta e^{-\theta})$
27. $y = \cos (e^{-\theta^2})$
28. $y = \theta^3 e^{-2\theta} \cos 5\theta$
29. $y = \ln (3te^{-t})$
30. $y = \ln (2e^{-t} \sin t)$
31. $y = \ln \left( \dfrac{e^{\theta}}{1 + e^{\theta}} \right)$
32. $y = \ln \left( \dfrac{\sqrt{\theta}}{1 + \sqrt{\theta}} \right)$
33. $y = e^{(\cos t + \ln t)}$
34. $y = e^{\sin t}(\ln t^2 + 1)$
35. $y = \displaystyle\int_0^{\ln x} \sin e^t \, dt$
36. $y = \displaystyle\int_{e^{4\sqrt{x}}}^{e^{2x}} \ln t \, dt$

In Exercises 37–40, find $dy/dx$.

37. $\ln y = e^y \sin x$
38. $\ln xy = e^{x+y}$
39. $e^{2x} = \sin (x + 3y)$
40. $\tan y = e^x + \ln x$

## Integrals

Evaluate the integrals in Exercises 41–62.

41. $\displaystyle\int (e^{3x} + 5e^{-x}) \, dx$
42. $\displaystyle\int (2e^x - 3e^{-2x}) \, dx$
43. $\displaystyle\int_{\ln 2}^{\ln 3} e^x \, dx$
44. $\displaystyle\int_{-\ln 2}^{0} e^{-x} \, dx$
45. $\displaystyle\int 8e^{(x+1)} \, dx$
46. $\displaystyle\int 2e^{(2x-1)} \, dx$
47. $\displaystyle\int_{\ln 4}^{\ln 9} e^{x/2} \, dx$
48. $\displaystyle\int_{0}^{\ln 16} e^{x/4} \, dx$
49. $\displaystyle\int \frac{e^{\sqrt{r}}}{\sqrt{r}} \, dr$
50. $\displaystyle\int \frac{e^{-\sqrt{r}}}{\sqrt{r}} \, dr$
51. $\displaystyle\int 2t \, e^{-t^2} \, dt$
52. $\displaystyle\int t^3 e^{(t^4)} \, dt$
53. $\displaystyle\int \frac{e^{1/x}}{x^2} \, dx$
54. $\displaystyle\int \frac{e^{-1/x^2}}{x^3} \, dx$
55. $\displaystyle\int_0^{\pi/4} (1 + e^{\tan \theta}) \sec^2 \theta \, d\theta$
56. $\displaystyle\int_{\pi/4}^{\pi/2} (1 + e^{\cot \theta}) \csc^2 \theta \, d\theta$
57. $\displaystyle\int e^{\sec \pi t} \sec \pi t \tan \pi t \, dt$
58. $\displaystyle\int e^{\csc (\pi + t)} \csc (\pi + t) \cot (\pi + t) \, dt$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

**59.** $\displaystyle\int_{\ln(\pi/6)}^{\ln(\pi/2)} 2e^v \cos e^v \, dv$ **60.** $\displaystyle\int_0^{\sqrt{\ln \pi}} 2x\, e^{x^2} \cos(e^{x^2})\, dx$

**61.** $\displaystyle\int \frac{e^r}{1+e^r}\, dr$ **62.** $\displaystyle\int \frac{dx}{1+e^x}$

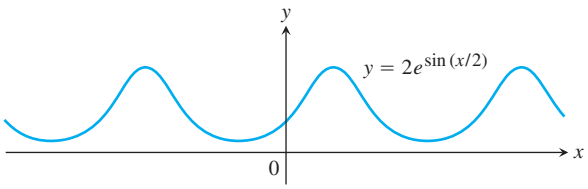
## Initial Value Problems

Solve the initial value problems in Exercises 63–66.

Exercises

**63.** $\dfrac{dy}{dt} = e^t \sin(e^t - 2), \quad y(\ln 2) = 0$

**64.** $\dfrac{dy}{dt} = e^{-t} \sec^2(\pi e^{-t}), \quad y(\ln 4) = 2/\pi$



**65.** $\dfrac{d^2y}{dx^2} = 2e^{-x}, \quad y(0) = 1 \quad \text{and} \quad y'(0) = 0$

**66.** $\dfrac{d^2y}{dt^2} = 1 - e^{2t}, \quad y(1) = -1 \quad \text{and} \quad y'(1) = 0$

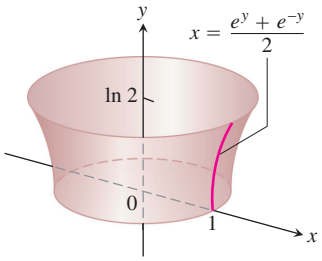
## Theory and Applications

**67.** Find the absolute maximum and minimum values of $f(x) = e^x - 2x$ on $[0, 1]$.

**68.** Where does the periodic function $f(x) = 2e^{\sin(x/2)}$ take on its extreme values and what are these values?

**69.** Find the absolute maximum value of $f(x) = x^2 \ln(1/x)$ and say where it is assumed.

T **70.** Graph $f(x) = (x-3)^2 e^x$ and its first derivative together. Comment on the behavior of $f$ in relation to the signs and values of $f'$. Identify significant points on the graphs with calculus, as necessary.



**71.** Find the area of the "triangular" region in the first quadrant that is bounded above by the curve $y = e^{2x}$, below by the curve $y = e^x$, and on the right by the line $x = \ln 3$.

**72.** Find the area of the "triangular" region in the first quadrant that is bounded above by the curve $y = e^{x/2}$, below by the curve $y = e^{-x/2}$, and on the right by the line $x = 2 \ln 2$.

**73.** Find a curve through the origin in the $xy$-plane whose length from $x = 0$ to $x = 1$ is

$$L = \int_0^1 \sqrt{1 + \frac{1}{4} e^x}\, dx.$$

**74.** Find the area of the surface generated by revolving the curve $x = (e^y + e^{-y})/2$, $0 \le y \le \ln 2$, about the $y$-axis.

**75.** **a.** Show that $\int \ln x\, dx = x \ln x - x + C$.

**b.** Find the average value of $\ln x$ over $[1, e]$.

**76.** Find the average value of $f(x) = 1/x$ on $[1, 2]$.

**77.** **The linearization of $e^x$ at $x = 0$**

**a.** Derive the linear approximation $e^x \approx 1 + x$ at $x = 0$.

T **b.** Estimate to five decimal places the magnitude of the error involved in replacing $e^x$ by $1 + x$ on the interval $[0, 0.2]$.

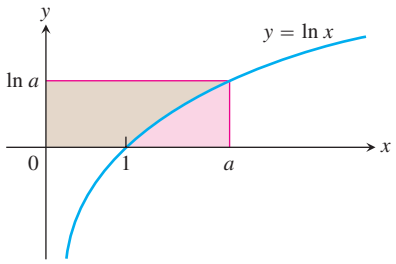
T **c.** Graph $e^x$ and $1 + x$ together for $-2 \le x \le 2$. Use different colors, if available. On what intervals does the approximation appear to overestimate $e^x$? Underestimate $e^x$?

**78.** **Laws of Exponents**

**a.** Starting with the equation $e^{x_1} e^{x_2} = e^{x_1 + x_2}$, derived in the text, show that $e^{-x} = 1/e^x$ for any real number $x$. Then show that $e^{x_1}/e^{x_2} = e^{x_1 - x_2}$ for any numbers $x_1$ and $x_2$.

**b.** Show that $(e^{x_1})^{x_2} = e^{x_1 x_2} = (e^{x_2})^{x_1}$ for any numbers $x_1$ and $x_2$.

T **79.** **A decimal representation of e** Find $e$ to as many decimal places as your calculator allows by solving the equation $\ln x = 1$.



T **80.** **The inverse relation between $e^x$ and $\ln x$** Find out how good your calculator is at evaluating the composites

$$e^{\ln x} \quad \text{and} \quad \ln(e^x).$$

**81.** Show that for any number $a > 1$

$$\int_1^a \ln x\, dx + \int_0^{\ln a} e^y\, dy = a \ln a.$$

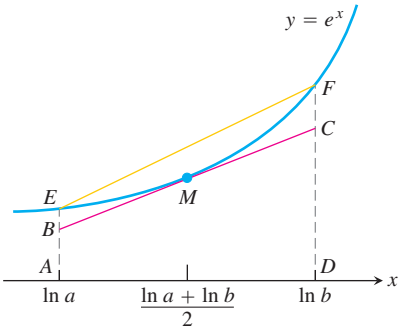
(See accompanying figure.)

**82.** **The geometric, logarithmic, and arithmetic mean inequality**

**a.** Show that the graph of $e^x$ is concave up over every interval of $x$-values.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**b.** Show, by reference to the accompanying figure, that if $0 < a < b$ then



$$e^{(\ln a + \ln b)/2} \cdot (\ln b - \ln a) < \int_{\ln a}^{\ln b} e^x \, dx < \frac{e^{\ln a} + e^{\ln b}}{2} \cdot (\ln b - \ln a).$$

**c.** Use the inequality in part (b) to conclude that

$$\sqrt{ab} < \frac{b - a}{\ln b - \ln a} < \frac{a + b}{2}.$$

This inequality says that the geometric mean of two positive numbers is less than their logarithmic mean, which in turn is less than their arithmetic mean.

(For more about this inequality, see "The Geometric, Logarithmic, and Arithmetic Mean Inequality" by Frank Burk, *American Mathematical Monthly*, Vol. 94, No. 6, June–July 1987, pp. 527–528.)

# 7.4 $a^x$ and $\log_a x$

We have defined general exponential functions such as $2^x$, $10^x$, and $\pi^x$. In this section we compute their derivatives and integrals. We also define the general logarithmic functions such as $\log_2 x$, $\log_{10} x$, and $\log_\pi x$, and find their derivatives and integrals as well.

## The Derivative of $a^u$

We start with the definition $a^x = e^{x \ln a}$:

$$\frac{d}{dx} a^x = \frac{d}{dx} e^{x \ln a} = e^{x \ln a} \cdot \frac{d}{dx}(x \ln a) \qquad \frac{d}{dx} e^u = e^u \frac{du}{dx}$$
$$= a^x \ln a.$$

If $a > 0$, then

$$\frac{d}{dx} a^x = a^x \ln a.$$

With the Chain Rule, we get a more general form.

If $a > 0$ and $u$ is a differentiable function of $x$, then $a^u$ is a differentiable function of $x$ and

$$\frac{d}{dx} a^u = a^u \ln a \frac{du}{dx}. \tag{1}$$

These equations show why $e^x$ is the exponential function preferred in calculus. If $a = e$, then $\ln a = 1$ and the derivative of $a^x$ simplifies to

$$\frac{d}{dx} e^x = e^x \ln e = e^x.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

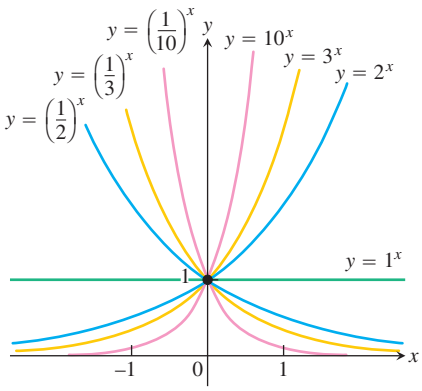

**FIGURE 7.12** Exponential functions decrease if $0 < a < 1$ and increase if $a > 1$. As $x \to \infty$, we have $a^x \to 0$ if $0 < a < 1$ and $a^x \to \infty$ if $a > 1$. As $x \to -\infty$, we have $a^x \to \infty$ if $0 < a < 1$ and $a^x \to 0$ if $a > 1$.

**EXAMPLE 1** Differentiating General Exponential Functions

**(a)** $\dfrac{d}{dx}3^x = 3^x \ln 3$

**(b)** $\dfrac{d}{dx}3^{-x} = 3^{-x}(\ln 3)\dfrac{d}{dx}(-x) = -3^{-x}\ln 3$

**(c)** $\dfrac{d}{dx}3^{\sin x} = 3^{\sin x}(\ln 3)\dfrac{d}{dx}(\sin x) = 3^{\sin x}(\ln 3)\cos x$

■

From Equation (1), we see that the derivative of $a^x$ is positive if $\ln a > 0$, or $a > 1$, and negative if $\ln a < 0$, or $0 < a < 1$. Thus, $a^x$ is an increasing function of $x$ if $a > 1$ and a decreasing function of $x$ if $0 < a < 1$. In each case, $a^x$ is one-to-one. The second derivative

$$\frac{d^2}{dx^2}(a^x) = \frac{d}{dx}(a^x \ln a) = (\ln a)^2 a^x$$

is positive for all $x$, so the graph of $a^x$ is concave up on every interval of the real line (Figure 7.12).

## Other Power Functions

The ability to raise positive numbers to arbitrary real powers makes it possible to define functions like $x^x$ and $x^{\ln x}$ for $x > 0$. We find the derivatives of such functions by rewriting the functions as powers of $e$.

**EXAMPLE 2** Differentiating a General Power Function

Find $dy/dx$ if $y = x^x, \quad x > 0$.

**Solution** Write $x^x$ as a power of $e$:

$$y = x^x = e^{x \ln x}. \qquad a^x \text{ with } a = x.$$

Then differentiate as usual:

$$\frac{dy}{dx} = \frac{d}{dx}e^{x \ln x}$$

$$= e^{x \ln x}\frac{d}{dx}(x \ln x)$$

$$= x^x\left(x \cdot \frac{1}{x} + \ln x\right)$$

$$= x^x(1 + \ln x).$$

■

## The Integral of $a^u$

If $a \neq 1$, so that $\ln a \neq 0$, we can divide both sides of Equation (1) by $\ln a$ to obtain

$$a^u \frac{du}{dx} = \frac{1}{\ln a}\frac{d}{dx}(a^u).$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Integrating with respect to $x$ then gives

$$\int a^u \frac{du}{dx}\,dx = \int \frac{1}{\ln a}\frac{d}{dx}(a^u)\,dx = \frac{1}{\ln a}\int \frac{d}{dx}(a^u)\,dx = \frac{1}{\ln a}a^u + C.$$

Writing the first integral in differential form gives

$$\int a^u\,du = \frac{a^u}{\ln a} + C. \tag{2}$$

**EXAMPLE 3** Integrating General Exponential Functions

**(a)** $\displaystyle\int 2^x\,dx = \frac{2^x}{\ln 2} + C$ Eq. (2) with $a = 2$, $u = x$

**(b)** $\displaystyle\int 2^{\sin x}\cos x\,dx$

$\displaystyle= \int 2^u\,du = \frac{2^u}{\ln 2} + C$ $u = \sin x$, $du = \cos x\,dx$, and Eq. (2)

$\displaystyle= \frac{2^{\sin x}}{\ln 2} + C$ $u$ replaced by $\sin x$

## Logarithms with Base $a$

As we saw earlier, if $a$ is any positive number other than 1, the function $a^x$ is one-to-one and has a nonzero derivative at every point. It therefore has a differentiable inverse. We call the inverse the **logarithm of $x$ with base $a$** and denote it by $\log_a x$.

**DEFINITION** $\log_a x$

For any positive number $a \neq 1$,

$\log_a x$ is the inverse function of $a^x$.

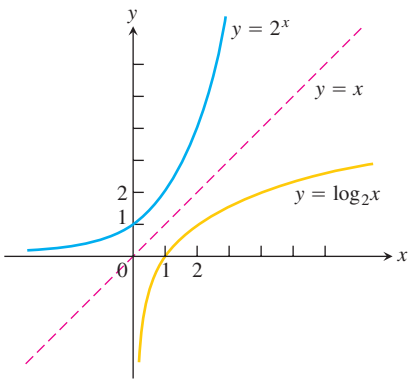

**FIGURE 7.13** The graph of $2^x$ and its inverse, $\log_2 x$.

The graph of $y = \log_a x$ can be obtained by reflecting the graph of $y = a^x$ across the 45° line $y = x$ (Figure 7.13). When $a = e$, we have $\log_e x =$ inverse of $e^x = \ln x$. Since $\log_a x$ and $a^x$ are inverses of one another, composing them in either order gives the identity function.

**Inverse Equations for $a^x$ and $\log_a x$**

$$a^{\log_a x} = x \qquad (x > 0) \tag{3}$$

$$\log_a(a^x) = x \qquad (\text{all } x) \tag{4}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 4** Applying the Inverse Equations

**(a)** $\log_2(2^5) = 5$ **(b)** $\log_{10}(10^{-7}) = -7$

**(c)** $2^{\log_2(3)} = 3$ **(d)** $10^{\log_{10}(4)} = 4$ ■

## Evaluation of $\log_a x$

The evaluation of $\log_a x$ is simplified by the observation that $\log_a x$ is a numerical multiple of $\ln x$.

$$\log_a x = \frac{1}{\ln a} \cdot \ln x = \frac{\ln x}{\ln a} \tag{5}$$

We can derive this equation from Equation (3):

$$\begin{aligned} a^{\log_a(x)} &= x && \text{Eq. (3)} \\ \ln a^{\log_a(x)} &= \ln x && \text{Take the natural logarithm of both sides.} \\ \log_a(x) \cdot \ln a &= \ln x && \text{The Power Rule in Theorem 2} \\ \log_a x &= \frac{\ln x}{\ln a} && \text{Solve for } \log_a x. \end{aligned}$$

For example,

$$\log_{10} 2 = \frac{\ln 2}{\ln 10} \approx \frac{0.69315}{2.30259} \approx 0.30103$$

The arithmetic rules satisfied by $\log_a x$ are the same as the ones for $\ln x$ (Theorem 2). These rules, given in Table 7.2, can be proved by dividing the corresponding rules for the natural logarithm function by $\ln a$. For example,

$$\begin{aligned} \ln xy &= \ln x + \ln y && \text{Rule 1 for natural logarithms } \ldots \\ \frac{\ln xy}{\ln a} &= \frac{\ln x}{\ln a} + \frac{\ln y}{\ln a} && \ldots \text{ divided by } \ln a \ \ldots \\ \log_a xy &= \log_a x + \log_a y. && \ldots \text{ gives Rule 1 for base } a \text{ logarithms.} \end{aligned}$$

**TABLE 7.2** Rules for base $a$ logarithms

For any numbers $x > 0$ and $y > 0$,

1. *Product Rule:* $\log_a xy = \log_a x + \log_a y$
2. *Quotient Rule:* $\log_a \frac{x}{y} = \log_a x - \log_a y$
3. *Reciprocal Rule:* $\log_a \frac{1}{y} = -\log_a y$
4. *Power Rule:* $\log_a x^y = y \log_a x$

## Derivatives and Integrals Involving $\log_a x$

To find derivatives or integrals involving base $a$ logarithms, we convert them to natural logarithms.

If $u$ is a positive differentiable function of $x$, then

$$\frac{d}{dx}(\log_a u) = \frac{d}{dx}\left(\frac{\ln u}{\ln a}\right) = \frac{1}{\ln a}\frac{d}{dx}(\ln u) = \frac{1}{\ln a} \cdot \frac{1}{u}\frac{du}{dx}.$$

$$\frac{d}{dx}(\log_a u) = \frac{1}{\ln a} \cdot \frac{1}{u}\frac{du}{dx}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 5**

**(a)** $$\frac{d}{dx}\log_{10}(3x+1) = \frac{1}{\ln 10}\cdot\frac{1}{3x+1}\frac{d}{dx}(3x+1) = \frac{3}{(\ln 10)(3x+1)}$$

**(b)** $$\int \frac{\log_2 x}{x}\,dx = \frac{1}{\ln 2}\int \frac{\ln x}{x}\,dx \qquad \log_2 x = \frac{\ln x}{\ln 2}$$

$$= \frac{1}{\ln 2}\int u\,du \qquad u = \ln x, \quad du = \frac{1}{x}dx$$

$$= \frac{1}{\ln 2}\frac{u^2}{2} + C = \frac{1}{\ln 2}\frac{(\ln x)^2}{2} + C = \frac{(\ln x)^2}{2\ln 2} + C$$

■

## Base 10 Logarithms

Base 10 logarithms, often called **common logarithms**, appear in many scientific formulas. For example, earthquake intensity is often reported on the logarithmic **Richter scale**. Here the formula is

$$\text{Magnitude } R = \log_{10}\left(\frac{a}{T}\right) + B,$$

where $a$ is the amplitude of the ground motion in microns at the receiving station, $T$ is the period of the seismic wave in seconds, and $B$ is an empirical factor that accounts for the weakening of the seismic wave with increasing distance from the epicenter of the earthquake.

**EXAMPLE 6** Earthquake Intensity

For an earthquake 10,000 km from the receiving station, $B = 6.8$. If the recorded vertical ground motion is $a = 10$ microns and the period is $T = 1$ sec, the earthquake's magnitude is

$$R = \log_{10}\left(\frac{10}{1}\right) + 6.8 = 1 + 6.8 = 7.8.$$

An earthquake of this magnitude can do great damage near its epicenter. ■

The **pH scale** for measuring the acidity of a solution is a base 10 logarithmic scale. The pH value (hydrogen potential) of the solution is the common logarithm of the reciprocal of the solution's hydronium ion concentration, $[H_3O^+]$:

$$\text{pH} = \log_{10}\frac{1}{[H_3O^+]} = -\log_{10}[H_3O^+].$$

The hydronium ion concentration is measured in moles per liter. Vinegar has a pH of three, distilled water a pH of 7, seawater a pH of 8.15, and household ammonia a pH of 12. The total scale ranges from about 0.1 for normal hydrochloric acid to 14 for a normal solution of sodium hydroxide.

Another example of the use of common logarithms is the **decibel** or dB ("dee bee") **scale** for measuring loudness. If $I$ is the **intensity** of sound in watts per square meter, the decibel level of the sound is

$$\textbf{Sound level} = 10\log_{10}(I \times 10^{12})\ \text{dB}. \tag{6}$$

Most foods are acidic (pH $<$ 7).

| Food | pH Value |
|---|---|
| Bananas | 4.5–4.7 |
| Grapefruit | 3.0–3.3 |
| Oranges | 3.0–4.0 |
| Limes | 1.8–2.0 |
| Milk | 6.3–6.6 |
| Soft drinks | 2.0–4.0 |
| Spinach | 5.1–5.7 |

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Typical sound levels

| | |
|---|---|
| Threshold of hearing | 0 dB |
| Rustle of leaves | 10 dB |
| Average whisper | 20 dB |
| Quiet automobile | 50 dB |
| Ordinary conversation | 65 dB |
| Pneumatic drill 10 feet away | 90 dB |
| Threshold of pain | 120 dB |

If you ever wondered why doubling the power of your audio amplifier increases the sound level by only a few decibels, Equation (6) provides the answer. As the following example shows, doubling $I$ adds only about 3 dB.

**EXAMPLE 7** Sound Intensity

Doubling $I$ in Equation (6) adds about 3 dB. Writing log for $\log_{10}$ (a common practice), we have

$$\begin{aligned}
\text{Sound level with } I \text{ doubled} &= 10 \log (2I \times 10^{12}) && \text{Eq. (6) with } 2I \text{ for } I \\
&= 10 \log (2 \cdot I \times 10^{12}) \\
&= 10 \log 2 + 10 \log (I \times 10^{12}) \\
&= \text{original sound level} + 10 \log 2 \\
&\approx \text{original sound level} + 3. && \log_{10} 2 \approx 0.30
\end{aligned}$$

# EXERCISES 7.4

## Algebraic Calculations With $a^x$ and $\log_a x$

Simplify the expressions in Exercises 1–4.

**1.** **a.** $5^{\log_5 7}$ **b.** $8^{\log_8 \sqrt{2}}$ **c.** $1.3^{\log_{1.3} 75}$
**d.** $\log_4 16$ **e.** $\log_3 \sqrt{3}$ **f.** $\log_4 \left(\frac{1}{4}\right)$

**2.** **a.** $2^{\log_2 3}$ **b.** $10^{\log_{10}(1/2)}$ **c.** $\pi^{\log_\pi 7}$
**d.** $\log_{11} 121$ **e.** $\log_{121} 11$ **f.** $\log_3 \left(\frac{1}{9}\right)$

**3.** **a.** $2^{\log_4 x}$ **b.** $9^{\log_3 x}$ **c.** $\log_2 (e^{(\ln 2)(\sin x)})$

**4.** **a.** $25^{\log_5 (3x^2)}$ **b.** $\log_e (e^x)$ **c.** $\log_4 (2^{e^x \sin x})$

Express the ratios in Exercises 5 and 6 as ratios of natural logarithms and simplify.

**5.** **a.** $\dfrac{\log_2 x}{\log_3 x}$ **b.** $\dfrac{\log_2 x}{\log_8 x}$ **c.** $\dfrac{\log_x a}{\log_{x^2} a}$

**6.** **a.** $\dfrac{\log_9 x}{\log_3 x}$ **b.** $\dfrac{\log_{\sqrt{10}} x}{\log_{\sqrt{2}} x}$ **c.** $\dfrac{\log_a b}{\log_b a}$

Solve the equations in Exercises 7–10 for $x$.

**7.** $3^{\log_3 (7)} + 2^{\log_2 (5)} = 5^{\log_5 (x)}$

**8.** $8^{\log_8 (3)} - e^{\ln 5} = x^2 - 7^{\log_7 (3x)}$

**9.** $3^{\log_3 (x^2)} = 5e^{\ln x} - 3 \cdot 10^{\log_{10} (2)}$

**10.** $\ln e + 4^{-2 \log_4 (x)} = \dfrac{1}{x} \log_{10} (100)$

## Derivatives

In Exercises 11–38, find the derivative of $y$ with respect to the given independent variable.

**11.** $y = 2^x$ **12.** $y = 3^{-x}$
**13.** $y = 5^{\sqrt{s}}$ **14.** $y = 2^{(s^2)}$
**15.** $y = x^\pi$ **16.** $y = t^{1-e}$
**17.** $y = (\cos \theta)^{\sqrt{2}}$ **18.** $y = (\ln \theta)^\pi$
**19.** $y = 7^{\sec \theta} \ln 7$ **20.** $y = 3^{\tan \theta} \ln 3$
**21.** $y = 2^{\sin 3t}$ **22.** $y = 5^{-\cos 2t}$
**23.** $y = \log_2 5\theta$ **24.** $y = \log_3 (1 + \theta \ln 3)$
**25.** $y = \log_4 x + \log_4 x^2$ **26.** $y = \log_{25} e^x - \log_5 \sqrt{x}$
**27.** $y = \log_2 r \cdot \log_4 r$ **28.** $y = \log_3 r \cdot \log_9 r$
**29.** $y = \log_3 \left(\left(\dfrac{x+1}{x-1}\right)^{\ln 3}\right)$ **30.** $y = \log_5 \sqrt{\left(\dfrac{7x}{3x+2}\right)^{\ln 5}}$
**31.** $y = \theta \sin (\log_7 \theta)$ **32.** $y = \log_7 \left(\dfrac{\sin \theta \cos \theta}{e^\theta 2^\theta}\right)$
**33.** $y = \log_5 e^x$ **34.** $y = \log_2 \left(\dfrac{x^2 e^2}{2\sqrt{x+1}}\right)$
**35.** $y = 3^{\log_2 t}$ **36.** $y = 3 \log_8 (\log_2 t)$
**37.** $y = \log_2 (8t^{\ln 2})$ **38.** $y = t \log_3 \left(e^{(\sin t)(\ln 3)}\right)$

## Logarithmic Differentiation

In Exercises 39–46, use logarithmic differentiation to find the derivative of $y$ with respect to the given independent variable.

**39.** $y = (x+1)^x$ **40.** $y = x^{(x+1)}$
**41.** $y = (\sqrt{t})^t$ **42.** $y = t^{\sqrt{t}}$
**43.** $y = (\sin x)^x$ **44.** $y = x^{\sin x}$
**45.** $y = x^{\ln x}$ **46.** $y = (\ln x)^{\ln x}$

## Integration

Evaluate the integrals in Exercises 47–56.

**47.** $\displaystyle\int 5^x \, dx$ **48.** $\displaystyle\int (1.3)^x \, dx$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

**49.** $\int_0^1 2^{-\theta}\, d\theta$ **50.** $\int_{-2}^0 5^{-\theta}\, d\theta$

**51.** $\int_1^{\sqrt{2}} x2^{(x^2)}\, dx$ **52.** $\int_1^4 \frac{2^{\sqrt{x}}}{\sqrt{x}}\, dx$

**53.** $\int_0^{\pi/2} 7^{\cos t} \sin t\, dt$ **54.** $\int_0^{\pi/4} \left(\frac{1}{3}\right)^{\tan t} \sec^2 t\, dt$

**55.** $\int_2^4 x^{2x}(1 + \ln x)\, dx$ **56.** $\int_1^2 \frac{2^{\ln x}}{x}\, dx$

Evaluate the integrals in Exercises 57–60.

Exercises

**57.** $\int 3x^{\sqrt{3}}\, dx$ **58.** $\int x^{\sqrt{2}-1}\, dx$

**59.** $\int_0^3 (\sqrt{2} + 1)x^{\sqrt{2}}\, dx$ **60.** $\int_1^e x^{(\ln 2)-1}\, dx$

Evaluate the integrals in Exercises 61–70.

Exercises

**61.** $\int \frac{\log_{10} x}{x}\, dx$ **62.** $\int_1^4 \frac{\log_2 x}{x}\, dx$

**63.** $\int_1^4 \frac{\ln 2 \log_2 x}{x}\, dx$ **64.** $\int_1^e \frac{2 \ln 10 \log_{10} x}{x}\, dx$

**65.** $\int_0^2 \frac{\log_2 (x + 2)}{x + 2}\, dx$ **66.** $\int_{1/10}^{10} \frac{\log_{10} (10x)}{x}\, dx$

**67.** $\int_0^9 \frac{2 \log_{10} (x + 1)}{x + 1}\, dx$ **68.** $\int_2^3 \frac{2 \log_2 (x - 1)}{x - 1}\, dx$

**69.** $\int \frac{dx}{x \log_{10} x}$ **70.** $\int \frac{dx}{x(\log_8 x)^2}$

Evaluate the integrals in Exercises 71–74.

Exercises

**71.** $\int_1^{\ln x} \frac{1}{t}\, dt, \quad x > 1$ **72.** $\int_1^{e^x} \frac{1}{t}\, dt$

**73.** $\int_1^{1/x} \frac{1}{t}\, dt, \quad x > 0$ **74.** $\frac{1}{\ln a} \int_1^x \frac{1}{t}\, dt, \quad x > 0$

## Theory and Applications

**75.** Find the area of the region between the curve $y = 2x/(1 + x^2)$ and the interval $-2 \le x \le 2$ of the $x$-axis.

**76.** Find the area of the region between the curve $y = 2^{1-x}$ and the interval $-1 \le x \le 1$ of the $x$-axis.

**77. Blood pH** The pH of human blood normally falls between 7.37 and 7.44. Find the corresponding bounds for $[H_3O^+]$.

**78. Brain fluid pH** The cerebrospinal fluid in the brain has a hydronium ion concentration of about $[H_3O^+] = 4.8 \times 10^{-8}$ moles per liter. What is the pH?

**79. Audio amplifiers** By what factor $k$ do you have to multiply the intensity of $I$ of the sound from your audio amplifier to add 10 dB to the sound level?

**80. Audio amplifiers** You multiplied the intensity of the sound of your audio system by a factor of 10. By how many decibels did this increase the sound level?

**81.** In any solution, the product of the hydronium ion concentration $[H_3O^+]$ (moles/L) and the hydroxyl ion concentration $[OH^-]$ (moles/L) is about $10^{-14}$.

**a.** What value of $[H_3O^+]$ minimizes the sum of the concentrations, $S = [H_3O^+] + [OH^-]$? (*Hint:* Change notation. Let $x = [H_3O^+]$.)

**b.** What is the pH of a solution in which $S$ has this minimum value?

**c.** What ratio of $[H_3O^+]$ to $[OH^-]$ minimizes $S$?

**82.** Could $\log_a b$ possibly equal $1/\log_b a$? Give reasons for your answer.

T **83.** The equation $x^2 = 2^x$ has three solutions: $x = 2, x = 4$, and one other. Estimate the third solution as accurately as you can by graphing.

T **84.** Could $x^{\ln 2}$ possibly be the same as $2^{\ln x}$ for $x > 0$? Graph the two functions and explain what you see.

**85. The linearization of $2^x$**

**a.** Find the linearization of $f(x) = 2^x$ at $x = 0$. Then round its coefficients to two decimal places.

T **b.** Graph the linearization and function together for $-3 \le x \le 3$ and $-1 \le x \le 1$.

**86. The linearization of $\log_3 x$**

**a.** Find the linearization of $f(x) = \log_3 x$ at $x = 3$. Then round its coefficients to two decimal places.

T **b.** Graph the linearization and function together in the window $0 \le x \le 8$ and $2 \le x \le 4$.

## Calculations with Other Bases

T **87.** Most scientific calculators have keys for $\log_{10} x$ and $\ln x$. To find logarithms to other bases, we use the Equation (5), $\log_a x = (\ln x)/(\ln a)$.

Find the following logarithms to five decimal places.

**a.** $\log_3 8$ **b.** $\log_7 0.5$

**c.** $\log_{20} 17$ **d.** $\log_{0.5} 7$

**e.** $\ln x$, given that $\log_{10} x = 2.3$

**f.** $\ln x$, given that $\log_2 x = 1.4$

**g.** $\ln x$, given that $\log_2 x = -1.5$

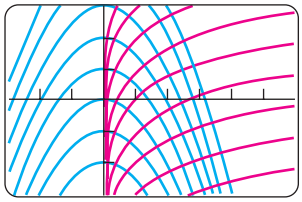
**h.** $\ln x$, given that $\log_{10} x = -0.7$

**88. Conversion factors**

**a.** Show that the equation for converting base 10 logarithms to base 2 logarithms is

$$\log_2 x = \frac{\ln 10}{\ln 2} \log_{10} x.$$

**b.** Show that the equation for converting base $a$ logarithms to base $b$ logarithms is



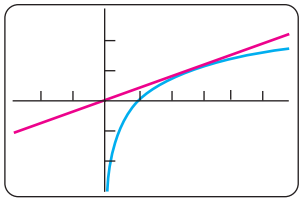
$$\log_b x = \frac{\ln a}{\ln b} \log_a x.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**89. Orthogonal families of curves** Prove that all curves in the family

$$y = -\frac{1}{2}x^2 + k$$

($k$ any constant) are perpendicular to all curves in the family $y = \ln x + c$ ($c$ any constant) at their points of intersection. (See the accompanying figure.)



**T 90. The inverse relation between $e^x$ and $\ln x$** Find out how good your calculator is at evaluating the composites

$$e^{\ln x} \quad \text{and} \quad \ln(e^x).$$

**T 91. A decimal representation of $e$** Find $e$ to as many decimal places as your calculator allows by solving the equation $\ln x = 1$.

**T 92. Which is bigger, $\pi^e$ or $e^\pi$?** Calculators have taken some of the mystery out of this once-challenging question. (Go ahead and check; you will see that it is a surprisingly close call.) You can answer the question without a calculator, though.

**a.** Find an equation for the line through the origin tangent to the graph of $y = \ln x$.

[–3, 6] by [–3, 3]

**b.** Give an argument based on the graphs of $y = \ln x$ and the tangent line to explain why $\ln x < x/e$ for all positive $x \neq e$.

**c.** Show that $\ln(x^e) < x$ for all positive $x \neq e$.

**d.** Conclude that $x^e < e^x$ for all positive $x \neq e$.

**e.** So which is bigger, $\pi^e$ or $e^\pi$?

# 7.5 Exponential Growth and Decay

Exponential functions increase or decrease very rapidly with changes in the independent variable. They describe growth or decay in a wide variety of natural and industrial situations. The variety of models based on these functions partly accounts for their importance.

## The Law of Exponential Change

In modeling many real-world situations, a quantity $y$ increases or decreases at a rate proportional to its size at a given time $t$. Examples of such quantities include the amount of a decaying radioactive material, funds earning interest in a bank account, the size of a population, and the temperature difference between a hot cup of coffee and the room in which it sits. Such quantities change according to the *law of exponential change*, which we derive in this section.

If the amount present at time $t = 0$ is called $y_0$, then we can find $y$ as a function of $t$ by solving the following initial value problem:

$$\begin{aligned} &\text{Differential equation:} && \frac{dy}{dt} = ky \\ &\text{Initial condition:} && y = y_0 \quad \text{when} \quad t = 0. \end{aligned} \tag{1}$$

If $y$ is positive and increasing, then $k$ is positive, and we use Equation (1) to say that the rate of growth is proportional to what has already been accumulated. If $y$ is positive and decreasing, then $k$ is negative, and we use Equation (1) to say that the rate of decay is proportional to the amount still left.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We see right away that the constant function $y = 0$ is a solution of Equation (1) if $y_0 = 0$. To find the nonzero solutions, we divide Equation (1) by $y$:

$$\frac{1}{y} \cdot \frac{dy}{dt} = k$$

$$\int \frac{1}{y}\frac{dy}{dt}\,dt = \int k\,dt \qquad \text{Integrate with respect to } t;$$

$$\ln|y| = kt + C \qquad \int (1/u)\,du = \ln|u| + C.$$

$$|y| = e^{kt+C} \qquad \text{Exponentiate.}$$

$$|y| = e^C \cdot e^{kt} \qquad e^{a+b} = e^a \cdot e^b$$

$$y = \pm e^C e^{kt} \qquad \text{If } |y| = r, \text{ then } y = \pm r.$$

$$y = Ae^{kt}. \qquad A \text{ is a shorter name for } \pm e^C.$$

By allowing $A$ to take on the value 0 in addition to all possible values $\pm e^C$, we can include the solution $y = 0$ in the formula.

We find the value of $A$ for the initial value problem by solving for $A$ when $y = y_0$ and $t = 0$:

$$y_0 = Ae^{k \cdot 0} = A.$$

The solution of the initial value problem is therefore $y = y_0 e^{kt}$.

Quantities changing in this way are said to undergo **exponential growth** if $k > 0$, and **exponential decay** if $k < 0$.

**The Law of Exponential Change**

$$y = y_0 e^{kt} \qquad (2)$$

Growth: $k > 0$ Decay: $k < 0$

The number $k$ is the **rate constant** of the equation.

The derivation of Equation (2) shows that the only functions that are their own derivatives are constant multiples of the exponential function.

## Unlimited Population Growth

Strictly speaking, the number of individuals in a population (of people, plants, foxes, or bacteria, for example) is a discontinuous function of time because it takes on discrete values. However, when the number of individuals becomes large enough, the population can be approximated by a continuous function. Differentiability of the approximating function is another reasonable hypothesis in many settings, allowing for the use of calculus to model and predict population sizes.

If we assume that the proportion of reproducing individuals remains constant and assume a constant fertility, then at any instant $t$ the birth rate is proportional to the number $y(t)$ of individuals present. Let's assume, too, that the death rate of the population is stable and proportional to $y(t)$. If, further, we neglect departures and arrivals, the growth rate

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$dy/dt$ is the birth rate minus the death rate, which is the difference of the two proportionalities under our assumptions. In other words, $dy/dt = ky$, so that $y = y_0 e^{kt}$, where $y_0$ is the size of the population at time $t = 0$. As with all kinds of growth, there may be limitations imposed by the surrounding environment, but we will not go into these here. (This situation is analyzed in Section 9.5.)

In the following example we assume this population model to look at how the number of individuals infected by a disease within a given population decreases as the disease is appropriately treated.

**EXAMPLE 1** Reducing the Cases of an Infectious Disease

One model for the way diseases die out when properly treated assumes that the rate $dy/dt$ at which the number of infected people changes is proportional to the number $y$. The number of people cured is proportional to the number that have the disease. Suppose that in the course of any given year the number of cases of a disease is reduced by 20%. If there are 10,000 cases today, how many years will it take to reduce the number to 1000?

**Solution** We use the equation $y = y_0 e^{kt}$. There are three things to find: the value of $y_0$, the value of $k$, and the time $t$ when $y = 1000$.

*The value of* $y_0$. We are free to count time beginning anywhere we want. If we count from today, then $y = 10{,}000$ when $t = 0$, so $y_0 = 10{,}000$. Our equation is now

$$y = 10{,}000\, e^{kt}. \tag{3}$$

*The value of* $k$. When $t = 1$ year, the number of cases will be 80% of its present value, or 8000. Hence,

$$\begin{aligned} 8000 &= 10{,}000\, e^{k(1)} && \text{Eq. (3) with } t = 1 \text{ and } y = 8000 \\ e^k &= 0.8 \\ \ln(e^k) &= \ln 0.8 && \text{Logs of both sides} \\ k &= \ln 0.8 < 0. \end{aligned}$$

At any given time $t$,

$$y = 10{,}000\, e^{(\ln 0.8)t}. \tag{4}$$

*The value of* $t$ *that makes* $y = 1000$. We set $y$ equal to 1000 in Equation (4) and solve for $t$:

$$\begin{aligned} 1000 &= 10{,}000 e^{(\ln 0.8)t} \\ e^{(\ln 0.8)t} &= 0.1 \\ (\ln 0.8)t &= \ln 0.1 && \text{Logs of both sides} \\ t &= \frac{\ln 0.1}{\ln 0.8} \approx 10.32 \text{ years}. \end{aligned}$$

It will take a little more than 10 years to reduce the number of cases to 1000. ■

## Continuously Compounded Interest

If you invest an amount $A_0$ of money at a fixed annual interest rate $r$ (expressed as a decimal) and if interest is added to your account $k$ times a year, the formula for the amount of money you will have at the end of $t$ years is

$$A_t = A_0 \left(1 + \frac{r}{k}\right)^{kt}. \tag{5}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The interest might be added ("compounded," bankers say) monthly ($k = 12$), weekly ($k = 52$), daily ($k = 365$), or even more frequently, say by the hour or by the minute. By taking the limit as interest is compounded more and more often, we arrive at the following formula for the amount after $t$ years,

$$\begin{aligned}
\lim_{k\to\infty} A_t &= \lim_{k\to\infty} A_0\left(1 + \frac{r}{k}\right)^{kt} \\
&= A_0 \lim_{k\to\infty}\left(1 + \frac{r}{k}\right)^{\frac{k}{r}\cdot rt} \\
&= A_0\left[\lim_{\frac{r}{k}\to 0}\left(1 + \frac{r}{k}\right)^{\frac{k}{r}}\right]^{rt} && \text{As } k\to\infty, \frac{r}{k}\to 0 \\
&= A_0\left[\lim_{x\to 0}(1 + x)^{1/x}\right]^{rt} && \text{Substitute } x = \frac{r}{k} \\
&= A_0 e^{rt} && \text{Theorem 4}
\end{aligned}$$

The resulting formula for the amount of money in your account after $t$ years is

$$A(t) = A_0 e^{rt}. \tag{6}$$

Interest paid according to this formula is said to be **compounded continuously**. The number $r$ is called the **continuous interest rate.** The amount of money after $t$ years is calculated with the law of exponential change given in Equation (6).

**EXAMPLE 2** A Savings Account

Suppose you deposit \$621 in a bank account that pays 6% compounded continuously. How much money will you have 8 years later?

**Solution** We use Equation (6) with $A_0 = 621$, $r = 0.06$, and $t = 8$:

$$A(8) = 621e^{(0.06)(8)} = 621e^{0.48} = 1003.58 \qquad \text{Nearest cent}$$

Had the bank paid interest quarterly ($k = 4$ in Equation 5), the amount in your account would have been \$1000.01. Thus the effect of continuous compounding, as compared with quarterly compounding, has been an addition of \$3.57. A bank might decide it would be worth this additional amount to be able to advertise, "We compound interest every second, night and day—better yet, we compound the interest continuously." ■

## Radioactivity

Some atoms are unstable and can spontaneously emit mass or radiation. This process is called **radioactive decay**, and an element whose atoms go spontaneously through this process is called **radioactive**. Sometimes when an atom emits some of its mass through this process of radioactivity, the remainder of the atom re-forms to make an atom of some new element. For example, radioactive carbon-14 decays into nitrogen; radium, through a number of intermediate radioactive steps, decays into lead.

Experiments have shown that at any given time the rate at which a radioactive element decays (as measured by the number of nuclei that change per unit time) is approximately proportional to the number of radioactive nuclei present. Thus, the decay of a radioactive element is described by the equation $dy/dt = -ky, k > 0$. It is conventional to use

For radon-222 gas, $t$ is measured in days and $k = 0.18$. For radium-226, which used to be painted on watch dials to make them glow at night (a dangerous practice), $t$ is measured in years and $k = 4.3 \times 10^{-4}$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$-k(k > 0)$ here instead of $k(k < 0)$ to emphasize that $y$ is decreasing. If $y_0$ is the number of radioactive nuclei present at time zero, the number still present at any later time $t$ will be

$$y = y_0 e^{-kt}, \qquad k > 0.$$

### EXAMPLE 3 Half-Life of a Radioactive Element

The **half-life** of a radioactive element is the time required for half of the radioactive nuclei present in a sample to decay. It is an interesting fact that the half-life is a constant that does not depend on the number of radioactive nuclei initially present in the sample, but only on the radioactive substance.

To see why, let $y_0$ be the number of radioactive nuclei initially present in the sample. Then the number $y$ present at any later time $t$ will be $y = y_0 e^{-kt}$. We seek the value of $t$ at which the number of radioactive nuclei present equals half the original number:

$$y_0 e^{-kt} = \frac{1}{2} y_0$$

$$e^{-kt} = \frac{1}{2}$$

$$-kt = \ln \frac{1}{2} = -\ln 2 \qquad \text{Reciprocal Rule for logarithms}$$

$$t = \frac{\ln 2}{k}$$

This value of $t$ is the half-life of the element. It depends only on the value of $k$; the number $y_0$ does not enter in.

$$\text{Half-life} = \frac{\ln 2}{k} \tag{7}$$

■

### EXAMPLE 4 Half-Life of Polonium-210

The effective radioactive lifetime of polonium-210 is so short we measure it in days rather than years. The number of radioactive atoms remaining after $t$ days in a sample that starts with $y_0$ radioactive atoms is

$$y = y_0 e^{-5 \times 10^{-3} t}.$$

Find the element's half-life.

**Solution**

$$\text{Half-life} = \frac{\ln 2}{k} \qquad \text{Eq. (7)}$$

$$= \frac{\ln 2}{5 \times 10^{-3}} \qquad \text{The } k \text{ from polonium's decay equation}$$

$$\approx 139 \text{ days}$$

■

### EXAMPLE 5 Carbon-14 Dating

The decay of radioactive elements can sometimes be used to date events from the Earth's past. In a living organism, the ratio of radioactive carbon, carbon-14, to ordinary carbon stays fairly constant during the lifetime of the organism, being approximately equal to the

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

ratio in the organism's surroundings at the time. After the organism's death, however, no new carbon is ingested, and the proportion of carbon-14 in the organism's remains decreases as the carbon-14 decays.

Scientists who do carbon-14 dating use a figure of 5700 years for its half-life (more about carbon-14 dating in the exercises). Find the age of a sample in which 10% of the radioactive nuclei originally present have decayed.

**Solution** We use the decay equation $y = y_0 e^{-kt}$. There are two things to find: the value of $k$ and the value of $t$ when $y$ is $0.9y_0$ (90% of the radioactive nuclei are still present). That is, find $t$ when $y_0 e^{-kt} = 0.9y_0$, or $e^{-kt} = 0.9$.

*The value of k.* We use the half-life Equation (7):

$$k = \frac{\ln 2}{\text{half-life}} = \frac{\ln 2}{5700} \qquad (\text{about } 1.2 \times 10^{-4})$$

*The value of t that makes* $e^{-kt} = 0.9$:

$$\begin{aligned} e^{-kt} &= 0.9 \\ e^{-(\ln 2/5700)t} &= 0.9 \\ -\frac{\ln 2}{5700}\, t &= \ln 0.9 && \text{Logs of both sides} \\ t &= -\frac{5700 \ln 0.9}{\ln 2} \approx 866 \text{ years}. \end{aligned}$$

The sample is about 866 years old. ■

## Heat Transfer: Newton's Law of Cooling

Hot soup left in a tin cup cools to the temperature of the surrounding air. A hot silver ingot immersed in a large tub of water cools to the temperature of the surrounding water. In situations like these, the rate at which an object's temperature is changing at any given time is roughly proportional to the difference between its temperature and the temperature of the surrounding medium. This observation is called *Newton's law of cooling*, although it applies to warming as well, and there is an equation for it.

If $H$ is the temperature of the object at time $t$ and $H_S$ is the constant surrounding temperature, then the differential equation is

$$\frac{dH}{dt} = -k(H - H_S). \tag{8}$$

If we substitute $y$ for $(H - H_S)$, then

$$\begin{aligned} \frac{dy}{dt} &= \frac{d}{dt}(H - H_S) = \frac{dH}{dt} - \frac{d}{dt}(H_S) \\ &= \frac{dH}{dt} - 0 && H_S \text{ is a constant.} \\ &= \frac{dH}{dt} \\ &= -k(H - H_S) && \text{Eq. (8)} \\ &= -ky. && H - H_S = y. \end{aligned}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Now we know that the solution of $dy/dt = -ky$ is $y = y_0 e^{-kt}$, where $y(0) = y_0$. Substituting $(H - H_S)$ for $y$, this says that

$$H - H_S = (H_0 - H_S)e^{-kt}, \tag{9}$$

where $H_0$ is the temperature at $t = 0$. This is the equation for Newton's Law of Cooling.

**EXAMPLE 6** Cooling a Hard-Boiled Egg

A hard-boiled egg at 98°C is put in a sink of 18°C water. After 5 min, the egg's temperature is 38°C. Assuming that the water has not warmed appreciably, how much longer will it take the egg to reach 20°C?

**Solution** We find how long it would take the egg to cool from 98°C to 20°C and subtract the 5 min that have already elapsed. Using Equation (9) with $H_S = 18$ and $H_0 = 98$, the egg's temperature $t$ min after it is put in the sink is

$$H = 18 + (98 - 18)e^{-kt} = 18 + 80e^{-kt}.$$

To find $k$, we use the information that $H = 38$ when $t = 5$:

$$\begin{aligned} 38 &= 18 + 80e^{-5k} \\ e^{-5k} &= \frac{1}{4} \\ -5k &= \ln\frac{1}{4} = -\ln 4 \\ k &= \frac{1}{5}\ln 4 = 0.2\ln 4 \qquad (\text{about } 0.28). \end{aligned}$$

The egg's temperature at time $t$ is $H = 18 + 80e^{-(0.2\ln 4)t}$. Now find the time $t$ when $H = 20$:

$$\begin{aligned} 20 &= 18 + 80e^{-(0.2\ln 4)t} \\ 80e^{-(0.2\ln 4)t} &= 2 \\ e^{-(0.2\ln 4)t} &= \frac{1}{40} \\ -(0.2\ln 4)t &= \ln\frac{1}{40} = -\ln 40 \\ t &= \frac{\ln 40}{0.2\ln 4} \approx 13 \text{ min}. \end{aligned}$$

The egg's temperature will reach 20°C about 13 min after it is put in the water to cool. Since it took 5 min to reach 38°C, it will take about 8 min more to reach 20°C. ■

## EXERCISES 7.5

The answers to most of the following exercises are in terms of logarithms and exponentials. A calculator can be helpful, enabling you to express the answers in decimal form.

1. **Human evolution continues** The analysis of tooth shrinkage by C. Loring Brace and colleagues at the University of Michigan's Museum of Anthropology indicates that human tooth size is continuing to decrease and that the evolutionary process did not come to a halt some 30,000 years ago as many scientists contend. In northern Europeans, for example, tooth size reduction now has a rate of 1% per 1000 years.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**a.** If $t$ represents time in years and $y$ represents tooth size, use the condition that $y = 0.99y_0$ when $t = 1000$ to find the value of $k$ in the equation $y = y_0e^{kt}$. Then use this value of $k$ to answer the following questions.

**b.** In about how many years will human teeth be 90% of their present size?

**c.** What will be our descendants' tooth size 20,000 years from now (as a percentage of our present tooth size)?

(*Source: LSA Magazine*, Spring 1989, Vol. 12, No. 2, p. 19, Ann Arbor, MI.)

**2. Atmospheric pressure** The earth's atmospheric pressure $p$ is often modeled by assuming that the rate $dp/dh$ at which $p$ changes with the altitude $h$ above sea level is proportional to $p$. Suppose that the pressure at sea level is 1013 millibars (about 14.7 pounds per square inch) and that the pressure at an altitude of 20 km is 90 millibars.

**a.** Solve the initial value problem

Differential equation: $dp/dh = kp$ ($k$ a constant)
Initial condition: $p = p_0$ when $h = 0$

to express $p$ in terms of $h$. Determine the values of $p_0$ and $k$ from the given altitude-pressure data.

**b.** What is the atmospheric pressure at $h = 50$ km?

**c.** At what altitude does the pressure equal 900 millibars?

**3. First-order chemical reactions** In some chemical reactions, the rate at which the amount of a substance changes with time is proportional to the amount present. For the change of δ-glucono lactone into gluconic acid, for example,

$$\frac{dy}{dt} = -0.6y$$

when $t$ is measured in hours. If there are 100 grams of δ-glucono lactone present when $t = 0$, how many grams will be left after the first hour?

**4. The inversion of sugar** The processing of raw sugar has a step called "inversion" that changes the sugar's molecular structure. Once the process has begun, the rate of change of the amount of raw sugar is proportional to the amount of raw sugar remaining. If 1000 kg of raw sugar reduces to 800 kg of raw sugar during the first 10 hours, how much raw sugar will remain after another 14 hours?

**5. Working underwater** The intensity $L(x)$ of light $x$ feet beneath the surface of the ocean satisfies the differential equation

$$\frac{dL}{dx} = -kL.$$

As a diver, you know from experience that diving to 18 ft in the Caribbean Sea cuts the intensity in half. You cannot work without artificial light when the intensity falls below one-tenth of the surface value. About how deep can you expect to work without artificial light?

**6. Voltage in a discharging capacitor** Suppose that electricity is draining from a capacitor at a rate that is proportional to the voltage $V$ across its terminals and that, if $t$ is measured in seconds,

$$\frac{dV}{dt} = -\frac{1}{40}V.$$

Solve this equation for $V$, using $V_0$ to denote the value of $V$ when $t = 0$. How long will it take the voltage to drop to 10% of its original value?

**7. Cholera bacteria** Suppose that the bacteria in a colony can grow unchecked, by the law of exponential change. The colony starts with 1 bacterium and doubles every half-hour. How many bacteria will the colony contain at the end of 24 hours? (Under favorable laboratory conditions, the number of cholera bacteria can double every 30 min. In an infected person, many bacteria are destroyed, but this example helps explain why a person who feels well in the morning may be dangerously ill by evening.)

**8. Growth of bacteria** A colony of bacteria is grown under ideal conditions in a laboratory so that the population increases exponentially with time. At the end of 3 hours there are 10,000 bacteria. At the end of 5 hours there are 40,000. How many bacteria were present initially?

**9. The incidence of a disease** (*Continuation of Example 1.*) Suppose that in any given year the number of cases can be reduced by 25% instead of 20%.

**a.** How long will it take to reduce the number of cases to 1000?

**b.** How long will it take to eradicate the disease, that is, reduce the number of cases to less than 1?

**10. The U.S. population** The Museum of Science in Boston displays a running total of the U.S. population. On May 11, 1993, the total was increasing at the rate of 1 person every 14 sec. The displayed population figure for 3:45 P.M. that day was 257,313,431.

**a.** Assuming exponential growth at a constant rate, find the rate constant for the population's growth (people per 365-day year).

**b.** At this rate, what will the U.S. population be at 3:45 P.M. Boston time on May 11, 2008?

**11. Oil depletion** Suppose the amount of oil pumped from one of the canyon wells in Whittier, California, decreases at the continuous rate of 10% per year. When will the well's output fall to one-fifth of its present value?

**12. Continuous price discounting** To encourage buyers to place 100-unit orders, your firm's sales department applies a continuous discount that makes the unit price a function $p(x)$ of the number of units $x$ ordered. The discount decreases the price at the rate of \$0.01 per unit ordered. The price per unit for a 100-unit order is $p(100) = \$20.09$.

**a.** Find $p(x)$ by solving the following initial value problem:

Differential equation: $\frac{dp}{dx} = -\frac{1}{100}p$
Initial condition: $p(100) = 20.09$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**b.** Find the unit price $p(10)$ for a 10-unit order and the unit price $p(90)$ for a 90-unit order.

**c.** The sales department has asked you to find out if it is discounting so much that the firm's revenue, $r(x) = x \cdot p(x)$, will actually be less for a 100-unit order than, say, for a 90-unit order. Reassure them by showing that $r$ has its maximum value at $x = 100$.

T **d.** Graph the revenue function $r(x) = xp(x)$ for $0 \le x \le 200$.

Exercises

**13. Continuously compounded interest** You have just placed $A_0$ dollars in a bank account that pays 4% interest, compounded continuously.

**a.** How much money will you have in the account in 5 years?

**b.** How long will it take your money to double? To triple?

**14. John Napier's question** John Napier (1550–1617), the Scottish laird who invented logarithms, was the first person to answer the question, What happens if you invest an amount of money at 100% interest, compounded continuously?

**a.** What does happen?

**b.** How long does it take to triple your money?

**c.** How much can you earn in a year?

Give reasons for your answers.

**15. Benjamin Franklin's will** The Franklin Technical Institute of Boston owes its existence to a provision in a codicil to Benjamin Franklin's will. In part the codicil reads:

> I wish to be useful even after my Death, if possible, in forming and advancing other young men that may be serviceable to their Country in both Boston and Philadelphia. To this end I devote Two thousand Pounds Sterling, which I give, one thousand thereof to the Inhabitants of the Town of Boston in Massachusetts, and the other thousand to the inhabitants of the City of Philadelphia, in Trust and for the Uses, Interests and Purposes hereinafter mentioned and declared.

Franklin's plan was to lend money to young apprentices at 5% interest with the provision that each borrower should pay each year along

> . . . with the yearly Interest, one tenth part of the Principal, which sums of Principal and Interest shall be again let to fresh Borrowers. . . . If this plan is executed and succeeds as projected without interruption for one hundred Years, the Sum will then be one hundred and thirty-one thousand Pounds of which I would have the Managers of the Donation to the Inhabitants of the Town of Boston, then lay out at their discretion one hundred thousand Pounds in Public Works. . . . The remaining thirty-one thousand Pounds, I would have continued to be let out on Interest in the manner above directed for another hundred Years. . . . At the end of this second term if no unfortunate accident has prevented the operation the sum will be Four Millions and Sixty-one Thousand Pounds.

It was not always possible to find as many borrowers as Franklin had planned, but the managers of the trust did the best they could. At the end of 100 years from the reception of the Franklin gift, in January 1894, the fund had grown from 1000 pounds to almost exactly 90,000 pounds. In 100 years the original capital had multiplied about 90 times instead of the 131 times Franklin had imagined.

What rate of interest, compounded continuously for 100 years, would have multiplied Benjamin Franklin's original capital by 90?

**16.** (*Continuation of Exercise 15.*) In Benjamin Franklin's estimate that the original 1000 pounds would grow to 131,000 in 100 years, he was using an annual rate of 5% and compounding once each year. What rate of interest per year when compounded continuously for 100 years would multiply the original amount by 131?

Exercises

**17. Radon-222** The decay equation for radon-222 gas is known to be $y = y_0 e^{-0.18t}$, with $t$ in days. About how long will it take the radon in a sealed sample of air to fall to 90% of its original value?

**18. Polonium-210** The half-life of polonium is 139 days, but your sample will not be useful to you after 95% of the radioactive nuclei present on the day the sample arrives has disintegrated. For about how many days after the sample arrives will you be able to use the polonium?

**19. The mean life of a radioactive nucleus** Physicists using the radioactivity equation $y = y_0 e^{-kt}$ call the number $1/k$ the *mean life* of a radioactive nucleus. The mean life of a radon nucleus is about $1/0.18 = 5.6$ days. The mean life of a carbon-14 nucleus is more than 8000 years. Show that 95% of the radioactive nuclei originally present in a sample will disintegrate within three mean lifetimes, i.e., by time $t = 3/k$. Thus, the mean life of a nucleus gives a quick way to estimate how long the radioactivity of a sample will last.

**20. Californium-252** What costs $27 million per gram and can be used to treat brain cancer, analyze coal for its sulfur content, and detect explosives in luggage? The answer is californium-252, a radioactive isotope so rare that only 8 g of it have been made in the western world since its discovery by Glenn Seaborg in 1950. The half-life of the isotope is 2.645 years—long enough for a useful service life and short enough to have a high radioactivity per unit mass. One microgram of the isotope releases 170 million neutrons per second.

**a.** What is the value of $k$ in the decay equation for this isotope?

**b.** What is the isotope's mean life? (See Exercise 19.)

**c.** How long will it take 95% of a sample's radioactive nuclei to disintegrate?

**21. Cooling soup** Suppose that a cup of soup cooled from 90°C to 60°C after 10 min in a room whose temperature was 20°C. Use Newton's law of cooling to answer the following questions.

**a.** How much longer would it take the soup to cool to 35°C?

**b.** Instead of being left to stand in the room, the cup of 90°C soup is put in a freezer whose temperature is −15°C. How long will it take the soup to cool from 90°C to 35°C?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

22. **A beam of unknown temperature** An aluminum beam was brought from the outside cold into a machine shop where the temperature was held at 65°F. After 10 min, the beam warmed to 35°F and after another 10 min it was 50°F. Use Newton's law of cooling to estimate the beam's initial temperature.

23. **Surrounding medium of unknown temperature** A pan of warm water (46°C) was put in a refrigerator. Ten minutes later, the water's temperature was 39°C; 10 min after that, it was 33°C. Use Newton's law of cooling to estimate how cold the refrigerator was.

24. **Silver cooling in air** The temperature of an ingot of silver is 60°C above room temperature right now. Twenty minutes ago, it was 70°C above room temperature. How far above room temperature will the silver be
    **a.** 15 min from now?
    **b.** 2 hours from now?
    **c.** When will the silver be 10°C above room temperature?

25. **The age of Crater Lake** The charcoal from a tree killed in the volcanic eruption that formed Crater Lake in Oregon contained 44.5% of the carbon-14 found in living matter. About how old is Crater Lake?

26. **The sensitivity of carbon-14 dating to measurement** To see the effect of a relatively small error in the estimate of the amount of carbon-14 in a sample being dated, consider this hypothetical situation:
    **a.** A fossilized bone found in central Illinois in the year A.D. 2000 contains 17% of its original carbon-14 content. Estimate the year the animal died.
    **b.** Repeat part (a) assuming 18% instead of 17%.
    **c.** Repeat part (a) assuming 16% instead of 17%.

27. **Art forgery** A painting attributed to Vermeer (1632–1675), which should contain no more than 96.2% of its original carbon-14, contains 99.5% instead. About how old is the forgery?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# 7.6 Relative Rates of Growth

It is often important in mathematics, computer science, and engineering to compare the rates at which functions of $x$ grow as $x$ becomes large. Exponential functions are important in these comparisons because of their very fast growth, and logarithmic functions because of their very slow growth. In this section we introduce the *little-oh* and *big-oh* notation used to describe the results of these comparisons. We restrict our attention to functions whose values eventually become and remain positive as $x \to \infty$.

## Growth Rates of Functions

You may have noticed that exponential functions like $2^x$ and $e^x$ seem to grow more rapidly as $x$ gets large than do polynomials and rational functions. These exponentials certainly grow more rapidly than $x$ itself, and you can see $2^x$ outgrowing $x^2$ as $x$ increases in Figure 7.14. In fact, as $x \to \infty$, the functions $2^x$ and $e^x$ grow faster than any power of $x$, even $x^{1{,}000{,}000}$ (Exercise 19).

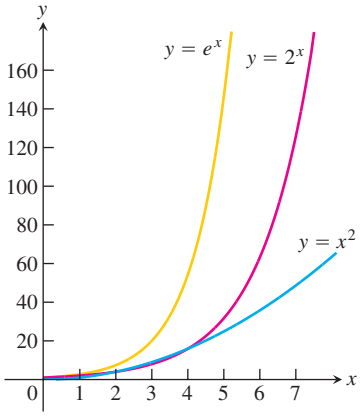

**FIGURE 7.14** The graphs of $e^x$, $2^x$, and $x^2$.

To get a feeling for how rapidly the values of $y = e^x$ grow with increasing $x$, think of graphing the function on a large blackboard, with the axes scaled in centimeters. At $x = 1$ cm, the graph is $e^1 \approx 3$ cm above the $x$-axis. At $x = 6$ cm, the graph is $e^6 \approx 403$ cm $\approx 4$ m high (it is about to go through the ceiling if it hasn't done so already). At $x = 10$ cm, the graph is $e^{10} \approx 22{,}026$ cm $\approx 220$ m high, higher than most buildings. At $x = 24$ cm, the graph is more than halfway to the moon, and at $x = 43$ cm from the origin, the graph is high enough to reach past the sun's closest stellar neighbor, the red dwarf star Proxima Centauri:

$$\begin{aligned} e^{43} &\approx 4.73 \times 10^{18} \text{ cm} \\ &= 4.73 \times 10^{13} \text{ km} \\ &\approx 1.58 \times 10^{8} \text{ light-seconds} \\ &\approx 5.0 \text{ light-years} \end{aligned}$$

In a vacuum, light travels at 300,000 km/sec.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

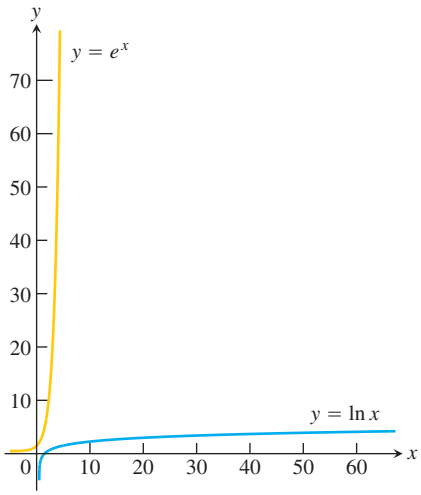

**FIGURE 7.15** Scale drawings of the graphs of $e^x$ and $\ln x$.

The distance to Proxima Centauri is about 4.22 light-years. Yet with $x = 43$ cm from the origin, the graph is still less than 2 feet to the right of the $y$-axis.

In contrast, logarithmic functions like $y = \log_2 x$ and $y = \ln x$ grow more slowly as $x \to \infty$ than any positive power of $x$ (Exercise 21). With axes scaled in centimeters, you have to go nearly 5 light-years out on the $x$-axis to find a point where the graph of $y = \ln x$ is even $y = 43$ cm high. See Figure 7.15.

These important comparisons of exponential, polynomial, and logarithmic functions can be made precise by defining what it means for a function $f(x)$ to grow faster than another function $g(x)$ as $x \to \infty$.

**DEFINITION Rates of Growth as $x \to \infty$**

Let $f(x)$ and $g(x)$ be positive for $x$ sufficiently large.

1. $f$ **grows faster than** $g$ as $x \to \infty$ if

$$\lim_{x\to\infty} \frac{f(x)}{g(x)} = \infty$$

or, equivalently, if

$$\lim_{x\to\infty} \frac{g(x)}{f(x)} = 0.$$

We also say that $g$ **grows slower than** $f$ as $x \to \infty$.

2. $f$ and $g$ **grow at the same rate** as $x \to \infty$ if

$$\lim_{x\to\infty} \frac{f(x)}{g(x)} = L$$

where $L$ is finite and positive.

According to these definitions, $y = 2x$ does not grow faster than $y = x$. The two functions grow at the same rate because

$$\lim_{x\to\infty} \frac{2x}{x} = \lim_{x\to\infty} 2 = 2,$$

which is a finite, nonzero limit. The reason for this apparent disregard of common sense is that we want "$f$ grows faster than $g$" to mean that for large $x$-values $g$ is negligible when compared with $f$.

**EXAMPLE 1** Several Useful Comparisons of Growth Rates

**(a)** $e^x$ grows faster than $x^2$ as $x \to \infty$ because

$$\underbrace{\lim_{x\to\infty} \frac{e^x}{x^2}}_{\infty\,/\,\infty} = \underbrace{\lim_{x\to\infty} \frac{e^x}{2x}}_{\infty\,/\,\infty} = \lim_{x\to\infty} \frac{e^x}{2} = \infty. \qquad \text{Using l'Hôpital's Rule twice}$$

**(b)** $3^x$ grows faster than $2^x$ as $x \to \infty$ because

$$\lim_{x\to\infty} \frac{3^x}{2^x} = \lim_{x\to\infty} \left(\frac{3}{2}\right)^x = \infty.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**(c)** $x^2$ grows faster than $\ln x$ as $x \to \infty$, because

$$\lim_{x\to\infty} \frac{x^2}{\ln x} = \lim_{x\to\infty} \frac{2x}{1/x} = \lim_{x\to\infty} 2x^2 = \infty. \qquad \text{l'Hôpital's Rule}$$

**(d)** $\ln x$ grows slower than $x$ as $x \to \infty$ because

$$\lim_{x\to\infty} \frac{\ln x}{x} = \lim_{x\to\infty} \frac{1/x}{1} \qquad \text{l'Hôpital's Rule}$$

$$= \lim_{x\to\infty} \frac{1}{x} = 0.$$

■

**EXAMPLE 2** Exponential and Logarithmic Functions with Different Bases

**(a)** As Example 1b suggests, exponential functions with different bases never grow at the same rate as $x \to \infty$. If $a > b > 0$, then $a^x$ grows faster than $b^x$. Since $(a/b) > 1$,

$$\lim_{x\to\infty} \frac{a^x}{b^x} = \lim_{x\to\infty} \left(\frac{a}{b}\right)^x = \infty.$$

**(b)** In contrast to exponential functions, logarithmic functions with different bases $a$ and $b$ always grow at the same rate as $x \to \infty$:

$$\lim_{x\to\infty} \frac{\log_a x}{\log_b x} = \lim_{x\to\infty} \frac{\ln x/\ln a}{\ln x/\ln b} = \frac{\ln b}{\ln a}.$$

The limiting ratio is always finite and never zero. ■

If $f$ grows at the same rate as $g$ as $x \to \infty$, and $g$ grows at the same rate as $h$ as $x \to \infty$, then $f$ grows at the same rate as $h$ as $x \to \infty$. The reason is that

$$\lim_{x\to\infty} \frac{f}{g} = L_1 \qquad \text{and} \qquad \lim_{x\to\infty} \frac{g}{h} = L_2$$

together imply

$$\lim_{x\to\infty} \frac{f}{h} = \lim_{x\to\infty} \frac{f}{g} \cdot \frac{g}{h} = L_1 L_2.$$

If $L_1$ and $L_2$ are finite and nonzero, then so is $L_1 L_2$.

**EXAMPLE 3** Functions Growing at the Same Rate

Show that $\sqrt{x^2 + 5}$ and $(2\sqrt{x} - 1)^2$ grow at the same rate as $x \to \infty$.

**Solution** We show that the functions grow at the same rate by showing that they both grow at the same rate as the function $g(x) = x$:

$$\lim_{x\to\infty} \frac{\sqrt{x^2 + 5}}{x} = \lim_{x\to\infty} \sqrt{1 + \frac{5}{x^2}} = 1,$$

$$\lim_{x\to\infty} \frac{(2\sqrt{x} - 1)^2}{x} = \lim_{x\to\infty} \left(\frac{2\sqrt{x} - 1}{\sqrt{x}}\right)^2 = \lim_{x\to\infty} \left(2 - \frac{1}{\sqrt{x}}\right)^2 = 4.$$

■

## Order and Oh-Notation

Here we introduce the "little-oh" and "big-oh" notation invented by number theorists a hundred years ago and now commonplace in mathematical analysis and computer science.

**DEFINITION Little-oh**

A function $f$ is **of smaller order than** $g$ as $x \to \infty$ if $\lim_{x\to\infty} \frac{f(x)}{g(x)} = 0$. We indicate this by writing $\boldsymbol{f = o(g)}$ ("$f$ is little-oh of $g$").

Notice that saying $f = o(g)$ as $x \to \infty$ is another way to say that $f$ grows slower than $g$ as $x \to \infty$.

**EXAMPLE 4** Using Little-oh Notation

**(a)** $\ln x = o(x)$ as $x \to \infty$ because $\lim_{x\to\infty} \frac{\ln x}{x} = 0$

**(b)** $x^2 = o(x^3 + 1)$ as $x \to \infty$ because $\lim_{x\to\infty} \frac{x^2}{x^3 + 1} = 0$ ■

**DEFINITION Big-oh**

Let $f(x)$ and $g(x)$ be positive for $x$ sufficiently large. Then $f$ is **of at most the order of** $g$ as $x \to \infty$ if there is a positive integer $M$ for which

$$\frac{f(x)}{g(x)} \le M,$$

for $x$ sufficiently large. We indicate this by writing $\boldsymbol{f = O(g)}$ ("$f$ is big-oh of $g$").

**EXAMPLE 5** Using Big-oh Notation

**(a)** $x + \sin x = O(x)$ as $x \to \infty$ because $\frac{x + \sin x}{x} \le 2$ for $x$ sufficiently large.

**(b)** $e^x + x^2 = O(e^x)$ as $x \to \infty$ because $\frac{e^x + x^2}{e^x} \to 1$ as $x \to \infty$.

**(c)** $x = O(e^x)$ as $x \to \infty$ because $\frac{x}{e^x} \to 0$ as $x \to \infty$. ■

If you look at the definitions again, you will see that $f = o(g)$ implies $f = O(g)$ for functions that are positive for $x$ sufficiently large. Also, if $f$ and $g$ grow at the same rate, then $f = O(g)$ and $g = O(f)$ (Exercise 11).

## Sequential vs. Binary Search

Computer scientists often measure the efficiency of an algorithm by counting the number of steps a computer must take to execute the algorithm. There can be significant differences

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

in how efficiently algorithms perform, even if they are designed to accomplish the same task. These differences are often described in big-oh notation. Here is an example.

*Webster's Third New International Dictionary* lists about 26,000 words that begin with the letter *a*. One way to look up a word, or to learn if it is not there, is to read through the list one word at a time until you either find the word or determine that it is not there. This method, called sequential search, makes no particular use of the words' alphabetical arrangement. You are sure to get an answer, but it might take 26,000 steps.

Another way to find the word or to learn it is not there is to go straight to the middle of the list (give or take a few words). If you do not find the word, then go to the middle of the half that contains it and forget about the half that does not. (You know which half contains it because you know the list is ordered alphabetically.) This method eliminates roughly 13,000 words in a single step. If you do not find the word on the second try, then jump to the middle of the half that contains it. Continue this way until you have either found the word or divided the list in half so many times there are no words left. How many times do you have to divide the list to find the word or learn that it is not there? At most 15, because

$$(26{,}000/2^{15}) < 1.$$

That certainly beats a possible 26,000 steps.

For a list of length $n$, a sequential search algorithm takes on the order of $n$ steps to find a word or determine that it is not in the list. A binary search, as the second algorithm is called, takes on the order of $\log_2 n$ steps. The reason is that if $2^{m-1} < n \le 2^m$, then $m - 1 < \log_2 n \le m$, and the number of bisections required to narrow the list to one word will be at most $m = \lceil \log_2 n \rceil$, the integer ceiling for $\log_2 n$.

Big-oh notation provides a compact way to say all this. The number of steps in a sequential search of an ordered list is $O(n)$; the number of steps in a binary search is $O(\log_2 n)$. In our example, there is a big difference between the two (26,000 vs. 15), and the difference can only increase with $n$ because $n$ grows faster than $\log_2 n$ as $n \to \infty$ (as in Example 1d).

# EXERCISES 7.6

## Comparisons with the Exponential $e^x$

1. Which of the following functions grow faster than $e^x$ as $x \to \infty$? Which grow at the same rate as $e^x$? Which grow slower?

   **a.** $x + 3$ **b.** $x^3 + \sin^2 x$
   **c.** $\sqrt{x}$ **d.** $4^x$
   **e.** $(3/2)^x$ **f.** $e^{x/2}$
   **g.** $e^x/2$ **h.** $\log_{10} x$

2. Which of the following functions grow faster than $e^x$ as $x \to \infty$? Which grow at the same rate as $e^x$? Which grow slower?

   **a.** $10x^4 + 30x + 1$ **b.** $x \ln x - x$
   **c.** $\sqrt{1 + x^4}$ **d.** $(5/2)^x$
   **e.** $e^{-x}$ **f.** $xe^x$
   **g.** $e^{\cos x}$ **h.** $e^{x-1}$

## Comparisons with the Power $x^2$

3. Which of the following functions grow faster than $x^2$ as $x \to \infty$? Which grow at the same rate as $x^2$? Which grow slower?

   **a.** $x^2 + 4x$ **b.** $x^5 - x^2$
   **c.** $\sqrt{x^4 + x^3}$ **d.** $(x + 3)^2$
   **e.** $x \ln x$ **f.** $2^x$
   **g.** $x^3 e^{-x}$ **h.** $8x^2$

4. Which of the following functions grow faster than $x^2$ as $x \to \infty$? Which grow at the same rate as $x^2$? Which grow slower?

   **a.** $x^2 + \sqrt{x}$ **b.** $10x^2$
   **c.** $x^2 e^{-x}$ **d.** $\log_{10}(x^2)$
   **e.** $x^3 - x^2$ **f.** $(1/10)^x$
   **g.** $(1.1)^x$ **h.** $x^2 + 100x$

## Comparisons with the Logarithm ln x

Exercises

**5.** Which of the following functions grow faster than $\ln x$ as $x \to \infty$? Which grow at the same rate as $\ln x$? Which grow slower?

**a.** $\log_3 x$ **b.** $\ln 2x$

**c.** $\ln \sqrt{x}$ **d.** $\sqrt{x}$

**e.** $x$ **f.** $5 \ln x$

**g.** $1/x$ **h.** $e^x$

**6.** Which of the following functions grow faster than $\ln x$ as $x \to \infty$? Which grow at the same rate as $\ln x$? Which grow slower?

**a.** $\log_2 (x^2)$ **b.** $\log_{10} 10x$

**c.** $1/\sqrt{x}$ **d.** $1/x^2$

**e.** $x - 2 \ln x$ **f.** $e^{-x}$

**g.** $\ln (\ln x)$ **h.** $\ln (2x + 5)$

## Ordering Functions by Growth Rates

**7.** Order the following functions from slowest growing to fastest growing as $x \to \infty$.

**a.** $e^x$ **b.** $x^x$

**c.** $(\ln x)^x$ **d.** $e^{x/2}$

**8.** Order the following functions from slowest growing to fastest growing as $x \to \infty$.

**a.** $2^x$ **b.** $x^2$

**c.** $(\ln 2)^x$ **d.** $e^x$

## Big-oh and Little-oh; Order

Exercises

**9.** True, or false? As $x \to \infty$,

**a.** $x = o(x)$ **b.** $x = o(x + 5)$

**c.** $x = O(x + 5)$ **d.** $x = O(2x)$

**e.** $e^x = o(e^{2x})$ **f.** $x + \ln x = O(x)$

**g.** $\ln x = o(\ln 2x)$ **h.** $\sqrt{x^2 + 5} = O(x)$

**10.** True, or false? As $x \to \infty$,

**a.** $\dfrac{1}{x + 3} = O\left(\dfrac{1}{x}\right)$ **b.** $\dfrac{1}{x} + \dfrac{1}{x^2} = O\left(\dfrac{1}{x}\right)$

**c.** $\dfrac{1}{x} - \dfrac{1}{x^2} = o\left(\dfrac{1}{x}\right)$ **d.** $2 + \cos x = O(2)$

**e.** $e^x + x = O(e^x)$ **f.** $x \ln x = o(x^2)$

**g.** $\ln (\ln x) = O(\ln x)$ **h.** $\ln (x) = o(\ln (x^2 + 1))$

**11.** Show that if positive functions $f(x)$ and $g(x)$ grow at the same rate as $x \to \infty$, then $f = O(g)$ and $g = O(f)$.

**12.** When is a polynomial $f(x)$ of smaller order than a polynomial $g(x)$ as $x \to \infty$? Give reasons for your answer.

**13.** When is a polynomial $f(x)$ of at most the order of a polynomial $g(x)$ as $x \to \infty$? Give reasons for your answer.

**14.** What do the conclusions we drew in Section 2.4 about the limits of rational functions tell us about the relative growth of polynomials as $x \to \infty$?

## Other Comparisons

T **15.** Investigate

$$\lim_{x \to \infty} \frac{\ln (x + 1)}{\ln x} \quad \text{and} \quad \lim_{x \to \infty} \frac{\ln (x + 999)}{\ln x}.$$

Then use l'Hôpital's Rule to explain what you find.

**16.** (*Continuation of Exercise 15.*) Show that the value of

$$\lim_{x \to \infty} \frac{\ln (x + a)}{\ln x}$$

is the same no matter what value you assign to the constant $a$. What does this say about the relative rates at which the functions $f(x) = \ln (x + a)$ and $g(x) = \ln x$ grow?

**17.** Show that $\sqrt{10x + 1}$ and $\sqrt{x + 1}$ grow at the same rate as $x \to \infty$ by showing that they both grow at the same rate as $\sqrt{x}$ as $x \to \infty$.

**18.** Show that $\sqrt{x^4 + x}$ and $\sqrt{x^4 - x^3}$ grow at the same rate as $x \to \infty$ by showing that they both grow at the same rate as $x^2$ as $x \to \infty$.

**19.** Show that $e^x$ grows faster as $x \to \infty$ than $x^n$ for any positive integer $n$, even $x^{1{,}000{,}000}$. (*Hint:* What is the $n$th derivative of $x^n$?)

**20. The function $e^x$ outgrows any polynomial** Show that $e^x$ grows faster as $x \to \infty$ than any polynomial

$$a_n x^n + a_{n-1} x^{n-1} + \cdots + a_1 x + a_0.$$

**21. a.** Show that $\ln x$ grows slower as $x \to \infty$ than $x^{1/n}$ for any positive integer $n$, even $x^{1/1{,}000{,}000}$.

T **b.** Although the values of $x^{1/1{,}000{,}000}$ eventually overtake the values of $\ln x$, you have to go way out on the $x$-axis before this happens. Find a value of $x$ greater than 1 for which $x^{1/1{,}000{,}000} > \ln x$. You might start by observing that when $x > 1$ the equation $\ln x = x^{1/1{,}000{,}000}$ is equivalent to the equation $\ln (\ln x) = (\ln x)/1{,}000{,}000$.

T **c.** Even $x^{1/10}$ takes a long time to overtake $\ln x$. Experiment with a calculator to find the value of $x$ at which the graphs of $x^{1/10}$ and $\ln x$ cross, or, equivalently, at which $\ln x = 10 \ln (\ln x)$. Bracket the crossing point between powers of 10 and then close in by successive halving.

T **d.** (*Continuation of part (c).*) The value of $x$ at which $\ln x = 10 \ln (\ln x)$ is too far out for some graphers and root finders to identify. Try it on the equipment available to you and see what happens.

**22. The function $\ln x$ grows slower than any polynomial** Show that $\ln x$ grows slower as $x \to \infty$ than any nonconstant polynomial.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Algorithms and Searches

**23. a.** Suppose you have three different algorithms for solving the same problem and each algorithm takes a number of steps that is of the order of one of the functions listed here:

$$n \log_2 n, \quad n^{3/2}, \quad n(\log_2 n)^2.$$

Which of the algorithms is the most efficient in the long run? Give reasons for your answer.

**T** **b.** Graph the functions in part (a) together to get a sense of how rapidly each one grows.

**24.** Repeat Exercise 23 for the functions

$$n, \quad \sqrt{n} \log_2 n, \quad (\log_2 n)^2.$$

**T** **25.** Suppose you are looking for an item in an ordered list one million items long. How many steps might it take to find that item with a sequential search? A binary search?

**T** **26.** You are looking for an item in an ordered list 450,000 items long (the length of *Webster's Third New International Dictionary*). How many steps might it take to find the item with a sequential search? A binary search?

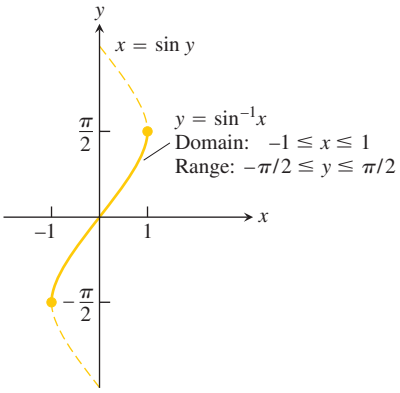
Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

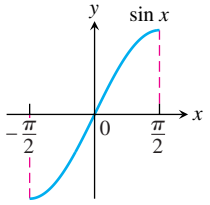
# 7.7 Inverse Trigonometric Functions

Inverse trigonometric functions arise when we want to calculate angles from side measurements in triangles. They also provide useful antiderivatives and appear frequently in the solutions of differential equations. This section shows how these functions are defined, graphed, and evaluated, how their derivatives are computed, and why they appear as important antiderivatives.

## Defining the Inverses

The six basic trigonometric functions are not one-to-one (their values repeat periodically). However we can restrict their domains to intervals on which they are one-to-one. The sine function increases from $-1$ at $x = -\pi/2$ to $+1$ at $x = \pi/2$. By restricting its domain to the interval $[-\pi/2, \pi/2]$ we make it one-to-one, so that it has an inverse $\sin^{-1} x$ (Figure 7.16). Similar domain restrictions can be applied to all six trigonometric functions.





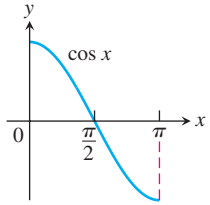


**FIGURE 7.16** The graph of $y = \sin^{-1} x$.

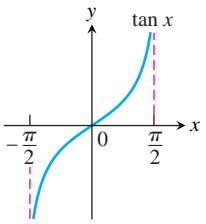

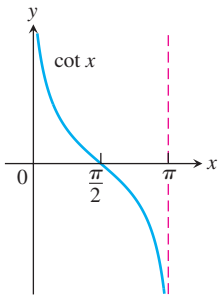

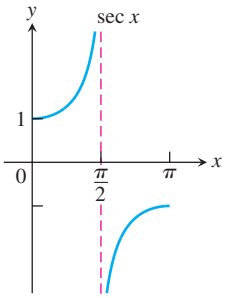

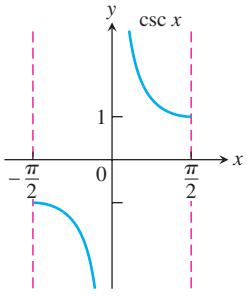

Domain restrictions that make the trigonometric functions one-to-one

| Function | Domain | Range | |
|---|---|---|---|
| $\sin x$ | $[-\pi/2, \pi/2]$ | $[-1, 1]$ |  |
| $\cos x$ | $[0, \pi]$ | $[-1, 1]$ |  |

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

| | | | |
|---|---|---|---|
| $\tan x$ | $(-\pi/2, \pi/2)$ | $(-\infty, \infty)$ |  |
| $\cot x$ | $(0, \pi)$ | $(-\infty, \infty)$ |  |
| $\sec x$ | $[0, \pi/2) \cup (\pi/2, \pi]$ | $(-\infty, -1] \cup [1, \infty)$ |  |
| $\csc x$ | $[-\pi/2, 0) \cup (0, \pi/2]$ | $(-\infty, -1] \cup [1, \infty)$ |  |

Since these restricted functions are now one-to-one, they have inverses, which we denote by

$$y = \sin^{-1} x \quad \text{or} \quad y = \arcsin x$$
$$y = \cos^{-1} x \quad \text{or} \quad y = \arccos x$$
$$y = \tan^{-1} x \quad \text{or} \quad y = \arctan x$$
$$y = \cot^{-1} x \quad \text{or} \quad y = \operatorname{arccot} x$$
$$y = \sec^{-1} x \quad \text{or} \quad y = \operatorname{arcsec} x$$
$$y = \csc^{-1} x \quad \text{or} \quad y = \operatorname{arccsc} x$$

These equations are read "$y$ equals the arcsine of $x$" or "$y$ equals arcsin $x$" and so on.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**CAUTION** The $-1$ in the expressions for the inverse means "inverse." It does *not* mean reciprocal. For example, the *reciprocal* of $\sin x$ is $(\sin x)^{-1} = 1/\sin x = \csc x$.

The graphs of the six inverse trigonometric functions are shown in Figure 7.17. We can obtain these graphs by reflecting the graphs of the restricted trigonometric functions through the line $y = x$, as in Section 7.1. We now take a closer look at these functions and their derivatives.

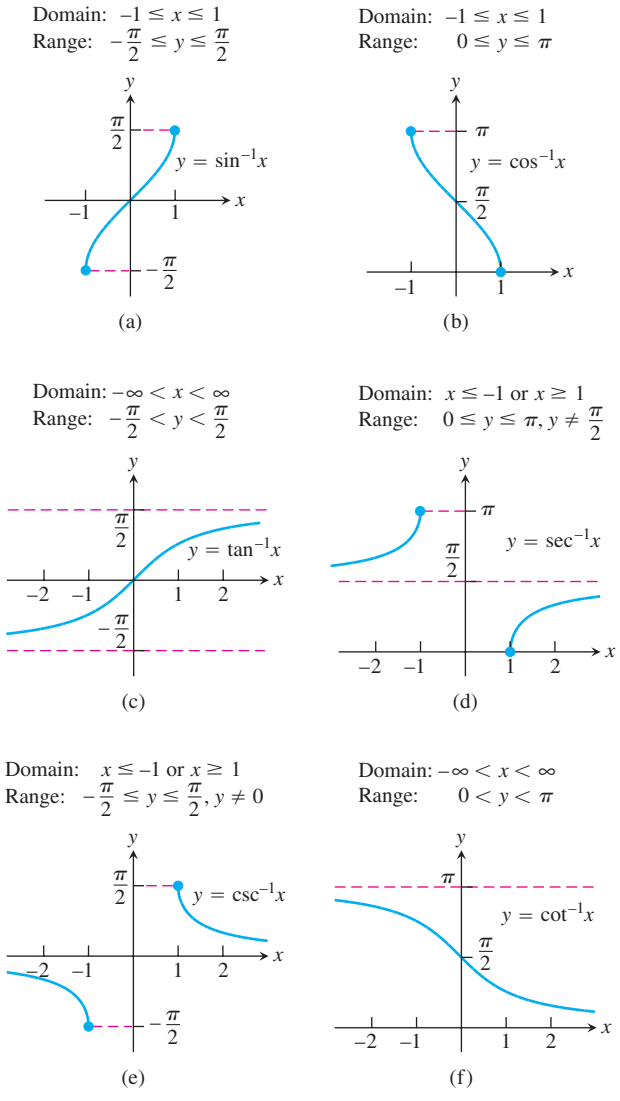

**FIGURE 7.17** Graphs of the six basic inverse trigonometric functions.

## The Arcsine and Arccosine Functions

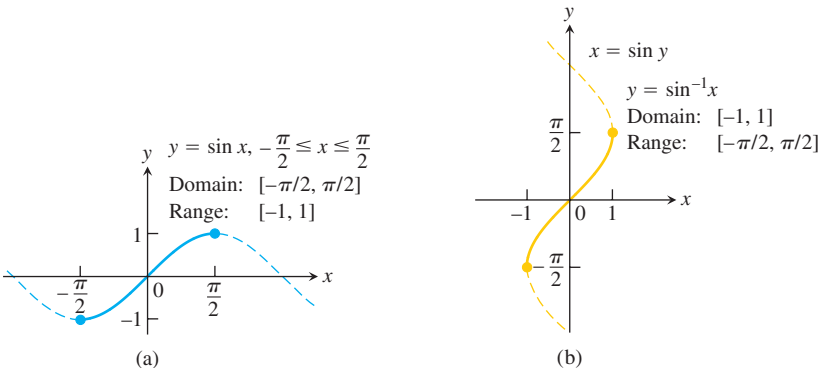
The arcsine of $x$ is the angle in $[-\pi/2, \pi/2]$ whose sine is $x$. The arccosine is an angle in $[0, \pi]$ whose cosine is $x$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**DEFINITION Arcsine and Arccosine Functions**

$y = \sin^{-1} x$ is the number in $[-\pi/2, \pi/2]$ for which $\sin y = x$.

$y = \cos^{-1} x$ is the number in $[0, \pi]$ for which $\cos y = x$.



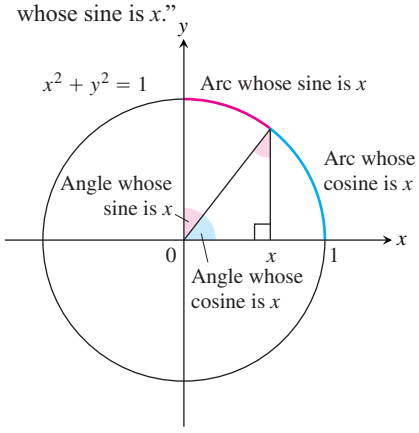


**FIGURE 7.18** The graphs of (a) $y = \sin x$, $-\pi/2 \le x \le \pi/2$, and (b) its inverse, $y = \sin^{-1} x$. The graph of $\sin^{-1} x$, obtained by reflection across the line $y = x$, is a portion of the curve $x = \sin y$.

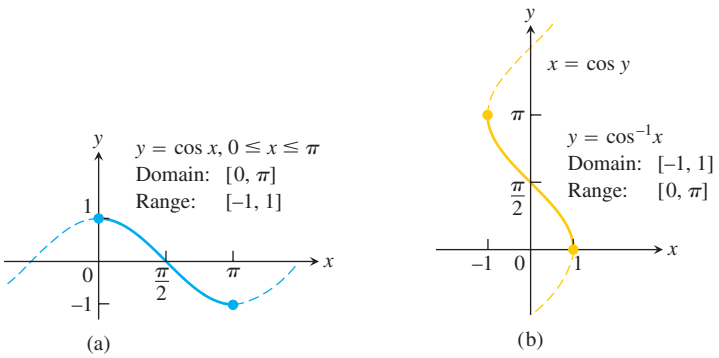
## The "Arc" in Arc Sine and Arc Cosine

The accompanying figure gives a geometric interpretation of $y = \sin^{-1} x$ and $y = \cos^{-1} x$ for radian angles in the first quadrant. For a unit circle, the equation $s = r\theta$ becomes $s = \theta$, so central angles and the arcs they subtend have the same measure. If $x = \sin y$, then, in addition to being the angle whose sine is $x$, $y$ is also the length of arc on the unit circle that subtends an angle whose sine is $x$. So we call $y$ "the arc whose sine is $x$."

The graph of $y = \sin^{-1} x$ (Figure 7.18) is symmetric about the origin (it lies along the graph of $x = \sin y$). The arcsine is therefore an odd function:

$$\sin^{-1}(-x) = -\sin^{-1} x. \tag{1}$$

The graph of $y = \cos^{-1} x$ (Figure 7.19) has no such symmetry.



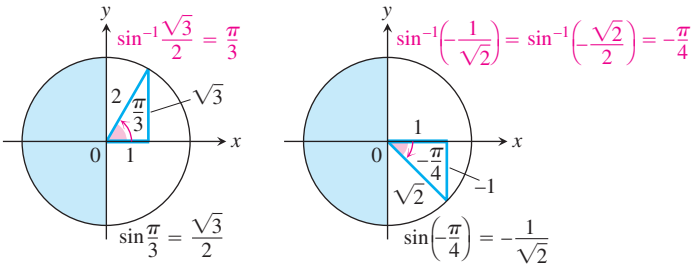


**FIGURE 7.19** The graphs of (a) $y = \cos x$, $0 \le x \le \pi$, and (b) its inverse, $y = \cos^{-1} x$. The graph of $\cos^{-1} x$, obtained by reflection across the line $y = x$, is a portion of the curve $x = \cos y$.

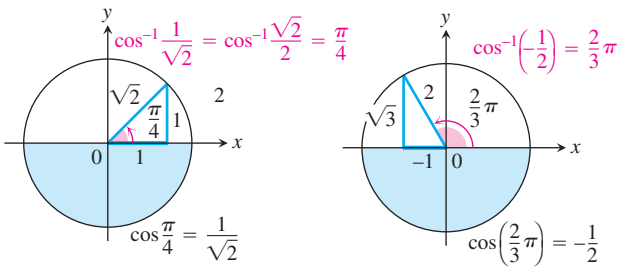
Known values of $\sin x$ and $\cos x$ can be inverted to find values of $\sin^{-1} x$ and $\cos^{-1} x$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 1** Common Values of $\sin^{-1} x$



| $x$ | $\sin^{-1} x$ |
|---|---|
| $\sqrt{3}/2$ | $\pi/3$ |
| $\sqrt{2}/2$ | $\pi/4$ |
| $1/2$ | $\pi/6$ |
| $-1/2$ | $-\pi/6$ |
| $-\sqrt{2}/2$ | $-\pi/4$ |
| $-\sqrt{3}/2$ | $-\pi/3$ |

The angles come from the first and fourth quadrants because the range of $\sin^{-1} x$ is $[-\pi/2, \pi/2]$. ■

**EXAMPLE 2** Common Values of $\cos^{-1} x$

| $x$ | $\cos^{-1} x$ |
|---|---|
| $\sqrt{3}/2$ | $\pi/6$ |
| $\sqrt{2}/2$ | $\pi/4$ |
| $1/2$ | $\pi/3$ |
| $-1/2$ | $2\pi/3$ |
| $-\sqrt{2}/2$ | $3\pi/4$ |
| $-\sqrt{3}/2$ | $5\pi/6$ |

The angles come from the first and second quadrants because the range of $\cos^{-1} x$ is $[0, \pi]$. ■

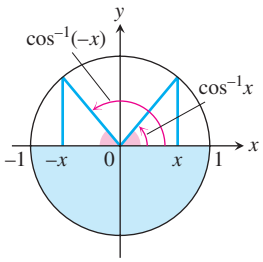


**FIGURE 7.20** $\cos^{-1} x$ and $\cos^{-1}(-x)$ are supplementary angles (so their sum is $\pi$).

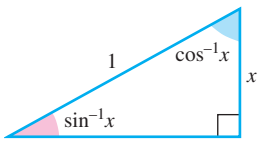

**FIGURE 7.21** $\sin^{-1} x$ and $\cos^{-1} x$ are complementary angles (so their sum is $\pi/2$).

## Identities Involving Arcsine and Arccosine

As we can see from Figure 7.20, the arccosine of $x$ satisfies the identity

$$\cos^{-1} x + \cos^{-1}(-x) = \pi, \tag{2}$$

or

$$\cos^{-1}(-x) = \pi - \cos^{-1} x. \tag{3}$$

Also, we can see from the triangle in Figure 7.21 that for $x > 0$,

$$\sin^{-1} x + \cos^{-1} x = \pi/2. \tag{4}$$

Equation (4) holds for the other values of $x$ in $[-1, 1]$ as well, but we cannot conclude this from the triangle in Figure 7.21. It is, however, a consequence of Equations (1) and (3) (Exercise 131).

## Inverses of tan $x$, cot $x$, sec $x$, and csc $x$

The arctangent of $x$ is an angle whose tangent is $x$. The arccotangent of $x$ is an angle whose cotangent is $x$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

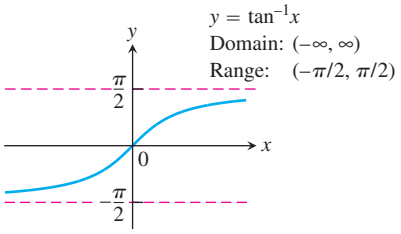

**FIGURE 7.22** The graph of $y = \tan^{-1} x$.

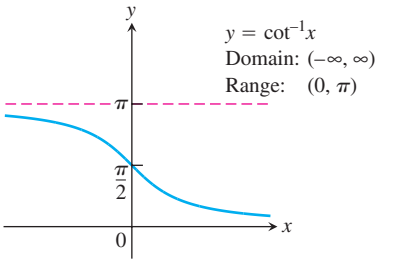

**FIGURE 7.23** The graph of $y = \cot^{-1} x$.

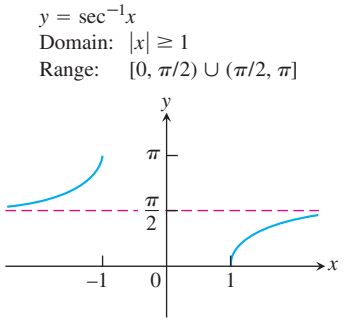

**FIGURE 7.24** The graph of $y = \sec^{-1} x$.

**DEFINITION Arctangent and Arccotangent Functions**

$y = \tan^{-1} x$ is the number in $(-\pi/2, \pi/2)$ for which $\tan y = x$.

$y = \cot^{-1} x$ is the number in $(0, \pi)$ for which $\cot y = x$.

We use open intervals to avoid values where the tangent and cotangent are undefined.

The graph of $y = \tan^{-1} x$ is symmetric about the origin because it is a branch of the graph $x = \tan y$ that is symmetric about the origin (Figure 7.22). Algebraically this means that

$$\tan^{-1}(-x) = -\tan^{-1} x;$$

the arctangent is an odd function. The graph of $y = \cot^{-1} x$ has no such symmetry (Figure 7.23).

The inverses of the restricted forms of sec $x$ and csc $x$ are chosen to be the functions graphed in Figures 7.24 and 7.25.

CAUTION There is no general agreement about how to define $\sec^{-1} x$ for negative values of $x$. We chose angles in the second quadrant between $\pi/2$ and $\pi$. This choice makes $\sec^{-1} x = \cos^{-1}(1/x)$. It also makes $\sec^{-1} x$ an increasing function on each interval of its domain. Some tables choose $\sec^{-1} x$ to lie in $[-\pi, -\pi/2)$ for $x < 0$ and some texts choose it to lie in $[\pi, 3\pi/2)$ (Figure 7.26). These choices simplify the formula for the derivative (our formula needs absolute value signs) but fail to satisfy the computational equation $\sec^{-1} x = \cos^{-1}(1/x)$. From this, we can derive the identity

$$\sec^{-1} x = \cos^{-1}\left(\frac{1}{x}\right) = \frac{\pi}{2} - \sin^{-1}\left(\frac{1}{x}\right) \tag{5}$$

by applying Equation (4).

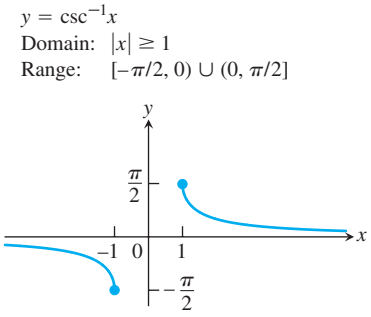

**FIGURE 7.25** The graph of $y = \csc^{-1} x$.

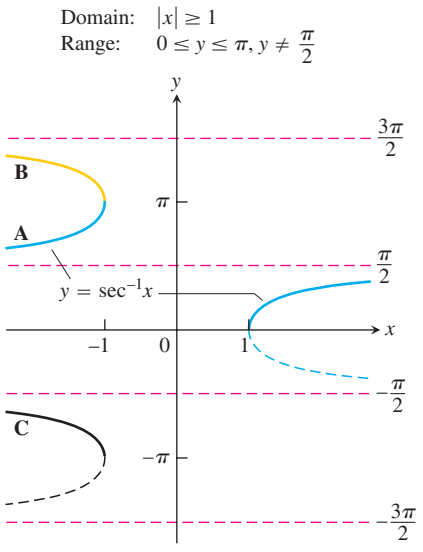

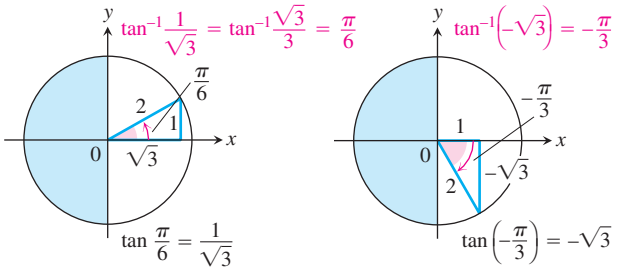

**FIGURE 7.26** There are several logical choices for the left-hand branch of $y = \sec^{-1} x$. With choice **A**, $\sec^{-1} x = \cos^{-1}(1/x)$, a useful identity employed by many calculators.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

|---|---|
| $\sqrt{3}$ | $\pi/3$ |
| $1$ | $\pi/4$ |
| $\sqrt{3}/3$ | $\pi/6$ |
| $-\sqrt{3}/3$ | $-\pi/6$ |
| $-1$ | $-\pi/4$ |
| $-\sqrt{3}$ | $-\pi/3$ |

**EXAMPLE 3** Common Values of $\tan^{-1} x$

The angles come from the first and fourth quadrants because the range of $\tan^{-1} x$ is $(-\pi/2, \pi/2)$. ■

**EXAMPLE 4** Find $\cos\alpha$, $\tan\alpha$, $\sec\alpha$, $\csc\alpha$, and $\cot\alpha$ if

$$\alpha = \sin^{-1}\frac{2}{3}.$$

**Solution** This equation says that $\sin\alpha = 2/3$. We picture $\alpha$ as an angle in a right triangle with opposite side 2 and hypotenuse 3 (Figure 7.27). The length of the remaining side is

$$\sqrt{(3)^2 - (2)^2} = \sqrt{9 - 4} = \sqrt{5}. \quad \text{Pythagorean theorem}$$

We add this information to the figure and then read the values we want from the completed triangle:

$$\cos\alpha = \frac{\sqrt{5}}{3}, \quad \tan\alpha = \frac{2}{\sqrt{5}}, \quad \sec\alpha = \frac{3}{\sqrt{5}}, \quad \csc\alpha = \frac{3}{2}, \quad \cot\alpha = \frac{\sqrt{5}}{2}.$$ ■

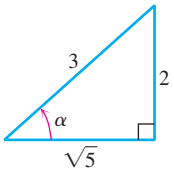

**FIGURE 7.27** If $\alpha = \sin^{-1}(2/3)$, then the values of the other basic trigonometric functions of $\alpha$ can be read from this triangle (Example 4).

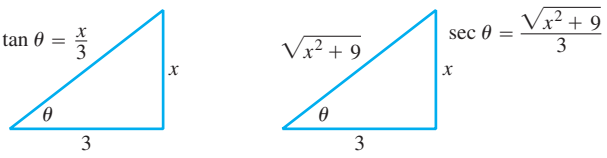

**EXAMPLE 5** Find $\sec\left(\tan^{-1}\frac{x}{3}\right)$.

**Solution** We let $\theta = \tan^{-1}(x/3)$ (to give the angle a name) and picture $\theta$ in a right triangle with

$$\tan\theta = \text{opposite/adjacent} = x/3.$$

The length of the triangle's hypotenuse is

$$\sqrt{x^2 + 3^2} = \sqrt{x^2 + 9}.$$

Thus,

$$\sec\left(\tan^{-1}\frac{x}{3}\right) = \sec\theta$$

$$= \frac{\sqrt{x^2 + 9}}{3}. \quad \sec\theta = \frac{\text{hypotenuse}}{\text{adjacent}}$$ ■

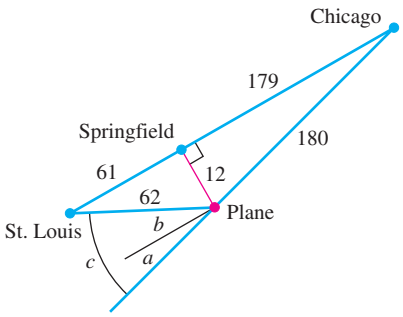

**FIGURE 7.28** Diagram for drift correction (Example 6), with distances rounded to the nearest mile (drawing not to scale).

**EXAMPLE 6** Drift Correction

During an airplane flight from Chicago to St. Louis the navigator determines that the plane is 12 mi off course, as shown in Figure 7.28. Find the angle $a$ for a course parallel to the original, correct course, the angle $b$, and the correction angle $c = a + b$.

**Solution**

$$a = \sin^{-1}\frac{12}{180} \approx 0.067 \text{ radian} \approx 3.8°$$

$$b = \sin^{-1}\frac{12}{62} \approx 0.195 \text{ radian} \approx 11.2°$$

$$c = a + b \approx 15°.$$

■

## The Derivative of $y = \sin^{-1} u$

We know that the function $x = \sin y$ is differentiable in the interval $-\pi/2 < y < \pi/2$ and that its derivative, the cosine, is positive there. Theorem 1 in Section 7.1 therefore assures us that the inverse function $y = \sin^{-1} x$ is differentiable throughout the interval $-1 < x < 1$. We cannot expect it to be differentiable at $x = 1$ or $x = -1$ because the tangents to the graph are vertical at these points (see Figure 7.29).

We find the derivative of $y = \sin^{-1} x$ by applying Theorem 1 with $f(x) = \sin x$ and $f^{-1}(x) = \sin^{-1} x$.

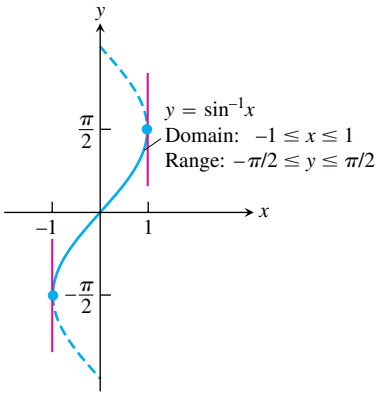

**FIGURE 7.29** The graph of $y = \sin^{-1} x$.

$$(f^{-1})'(x) = \frac{1}{f'(f^{-1}(x))} \qquad \text{Theorem 1}$$

$$= \frac{1}{\cos(\sin^{-1} x)} \qquad f'(u) = \cos u$$

$$= \frac{1}{\sqrt{1 - \sin^2(\sin^{-1} x)}} \qquad \cos u = \sqrt{1 - \sin^2 u}$$

$$= \frac{1}{\sqrt{1 - x^2}} \qquad \sin(\sin^{-1} x) = x$$

**Alternate Derivation:** Instead of applying Theorem 1 directly, we can find the derivative of $y = \sin^{-1} x$ using implicit differentiation as follows:

$$\sin y = x \qquad y = \sin^{-1} x \Leftrightarrow \sin y = x$$

$$\frac{d}{dx}(\sin y) = 1 \qquad \text{Derivative of both sides with respect to } x$$

$$\cos y \frac{dy}{dx} = 1 \qquad \text{Chain Rule}$$

$$\frac{dy}{dx} = \frac{1}{\cos y} \qquad \text{We can divide because } \cos y > 0 \text{ for } -\pi/2 < y < \pi/2.$$

$$= \frac{1}{\sqrt{1 - x^2}} \qquad \cos y = \sqrt{1 - \sin^2 y}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

No matter which derivation we use, we have that the derivative of $y = \sin^{-1} x$ with respect to $x$ is

$$\frac{d}{dx}(\sin^{-1} x) = \frac{1}{\sqrt{1 - x^2}}.$$

If $u$ is a differentiable function of $x$ with $|u| < 1$, we apply the Chain Rule to get

$$\frac{d}{dx}(\sin^{-1} u) = \frac{1}{\sqrt{1 - u^2}}\frac{du}{dx}, \qquad |u| < 1.$$

**EXAMPLE 7** Applying the Derivative Formula

$$\frac{d}{dx}(\sin^{-1} x^2) = \frac{1}{\sqrt{1 - (x^2)^2}} \cdot \frac{d}{dx}(x^2) = \frac{2x}{\sqrt{1 - x^4}}$$

■

## The Derivative of $y = \tan^{-1} u$

We find the derivative of $y = \tan^{-1} x$ by applying Theorem 1 with $f(x) = \tan x$ and $f^{-1}(x) = \tan^{-1} x$. Theorem 1 can be applied because the derivative of $\tan x$ is positive for $-\pi/2 < x < \pi/2$.

$$\begin{aligned}
(f^{-1})'(x) &= \frac{1}{f'(f^{-1}(x))} && \text{Theorem 1} \\
&= \frac{1}{\sec^2(\tan^{-1} x)} && f'(u) = \sec^2 u \\
&= \frac{1}{1 + \tan^2(\tan^{-1} x)} && \sec^2 u = 1 + \tan^2 u \\
&= \frac{1}{1 + x^2} && \tan(\tan^{-1} x) = x
\end{aligned}$$

The derivative is defined for all real numbers. If $u$ is a differentiable function of $x$, we get the Chain Rule form:

$$\frac{d}{dx}(\tan^{-1} u) = \frac{1}{1 + u^2}\frac{du}{dx}.$$

**EXAMPLE 8** A Moving Particle

A particle moves along the $x$-axis so that its position at any time $t \geq 0$ is $x(t) = \tan^{-1}\sqrt{t}$. What is the velocity of the particle when $t = 16$?

**Solution**

$$v(t) = \frac{d}{dt}\tan^{-1}\sqrt{t} = \frac{1}{1 + (\sqrt{t})^2} \cdot \frac{d}{dt}\sqrt{t} = \frac{1}{1 + t} \cdot \frac{1}{2\sqrt{t}}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

When $t = 16$, the velocity is

$$v(16) = \frac{1}{1 + 16} \cdot \frac{1}{2\sqrt{16}} = \frac{1}{136}.$$

## The Derivative of $y = \sec^{-1} u$

Since the derivative of sec $x$ is positive for $0 < x < \pi/2$ and $\pi/2 < x < \pi$, Theorem 1 says that the inverse function $y = \sec^{-1} x$ is differentiable. Instead of applying the formula in Theorem 1 directly, we find the derivative of $y = \sec^{-1} x$, $|x| > 1$, using implicit differentiation and the Chain Rule as follows:

$$\begin{aligned}
y &= \sec^{-1} x && \\
\sec y &= x && \text{Inverse function relationship} \\
\frac{d}{dx}(\sec y) &= \frac{d}{dx} x && \text{Differentiate both sides.} \\
\sec y \tan y \frac{dy}{dx} &= 1 && \text{Chain Rule} \\
\frac{dy}{dx} &= \frac{1}{\sec y \tan y} && \text{Since } |x| > 1, y \text{ lies in } (0, \pi/2) \cup (\pi/2, \pi) \text{ and } \sec y \tan y \neq 0.
\end{aligned}$$

To express the result in terms of $x$, we use the relationships

$$\sec y = x \qquad \text{and} \qquad \tan y = \pm\sqrt{\sec^2 y - 1} = \pm\sqrt{x^2 - 1}$$

to get

$$\frac{dy}{dx} = \pm \frac{1}{x\sqrt{x^2 - 1}}.$$

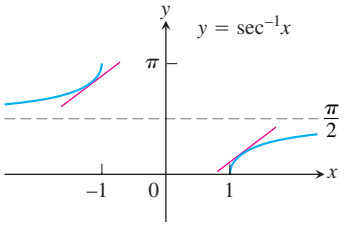

**FIGURE 7.30** The slope of the curve $y = \sec^{-1} x$ is positive for both $x < -1$ and $x > 1$.

Can we do anything about the $\pm$ sign? A glance at Figure 7.30 shows that the slope of the graph $y = \sec^{-1} x$ is always positive. Thus,

$$\frac{d}{dx}\sec^{-1} x = \begin{cases} +\dfrac{1}{x\sqrt{x^2 - 1}} & \text{if } x > 1 \\ -\dfrac{1}{x\sqrt{x^2 - 1}} & \text{if } x < -1. \end{cases}$$

With the absolute value symbol, we can write a single expression that eliminates the "$\pm$" ambiguity:

$$\frac{d}{dx}\sec^{-1} x = \frac{1}{|x|\sqrt{x^2 - 1}}.$$

If $u$ is a differentiable function of $x$ with $|u| > 1$, we have the formula

$$\frac{d}{dx}(\sec^{-1} u) = \frac{1}{|u|\sqrt{u^2 - 1}} \frac{du}{dx}, \qquad |u| > 1.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 9** Using the Formula

$$\frac{d}{dx}\sec^{-1}(5x^4) = \frac{1}{|5x^4|\sqrt{(5x^4)^2 - 1}}\frac{d}{dx}(5x^4)$$

$$= \frac{1}{5x^4\sqrt{25x^8 - 1}}(20x^3) \qquad 5x^4 > 0$$

$$= \frac{4}{x\sqrt{25x^8 - 1}}$$

■

## Derivatives of the Other Three

We could use the same techniques to find the derivatives of the other three inverse trigonometric functions—arccosine, arccotangent, and arccosecant—but there is a much easier way, thanks to the following identities.

**Inverse Function–Inverse Cofunction Identities**

$$\cos^{-1}x = \pi/2 - \sin^{-1}x$$
$$\cot^{-1}x = \pi/2 - \tan^{-1}x$$
$$\csc^{-1}x = \pi/2 - \sec^{-1}x$$

We saw the first of these identities in Equation (4). The others are derived in a similar way. It follows easily that the derivatives of the inverse cofunctions are the negatives of the derivatives of the corresponding inverse functions. For example, the derivative of $\cos^{-1}x$ is calculated as follows:

$$\frac{d}{dx}(\cos^{-1}x) = \frac{d}{dx}\left(\frac{\pi}{2} - \sin^{-1}x\right) \qquad \text{Identity}$$

$$= -\frac{d}{dx}(\sin^{-1}x)$$

$$= -\frac{1}{\sqrt{1 - x^2}} \qquad \text{Derivative of arcsine}$$

**EXAMPLE 10** A Tangent Line to the Arccotangent Curve

Find an equation for the line tangent to the graph of $y = \cot^{-1}x$ at $x = -1$.

**Solution** First we note that

$$\cot^{-1}(-1) = \pi/2 - \tan^{-1}(-1) = \pi/2 - (-\pi/4) = 3\pi/4.$$

The slope of the tangent line is

$$\left.\frac{dy}{dx}\right|_{x=-1} = \left.-\frac{1}{1 + x^2}\right|_{x=-1} = -\frac{1}{1 + (-1)^2} = -\frac{1}{2},$$

so the tangent line has equation $y - 3\pi/4 = (-1/2)(x + 1)$. ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The derivatives of the inverse trigonometric functions are summarized in Table 7.3.

**TABLE 7.3** Derivatives of the inverse trigonometric functions

1. $\dfrac{d(\sin^{-1} u)}{dx} = \dfrac{du/dx}{\sqrt{1-u^2}}, \quad |u| < 1$
2. $\dfrac{d(\cos^{-1} u)}{dx} = -\dfrac{du/dx}{\sqrt{1-u^2}}, \quad |u| < 1$
3. $\dfrac{d(\tan^{-1} u)}{dx} = \dfrac{du/dx}{1+u^2}$
4. $\dfrac{d(\cot^{-1} u)}{dx} = -\dfrac{du/dx}{1+u^2}$
5. $\dfrac{d(\sec^{-1} u)}{dx} = \dfrac{du/dx}{|u|\sqrt{u^2-1}}, \quad |u| > 1$
6. $\dfrac{d(\csc^{-1} u)}{dx} = \dfrac{-du/dx}{|u|\sqrt{u^2-1}}, \quad |u| > 1$

## Integration Formulas

The derivative formulas in Table 7.3 yield three useful integration formulas in Table 7.4. The formulas are readily verified by differentiating the functions on the right-hand sides.

**TABLE 7.4** Integrals evaluated with inverse trigonometric functions

The following formulas hold for any constant $a \neq 0$.

1. $\displaystyle\int \frac{du}{\sqrt{a^2-u^2}} = \sin^{-1}\left(\frac{u}{a}\right) + C$ (Valid for $u^2 < a^2$)
2. $\displaystyle\int \frac{du}{a^2+u^2} = \frac{1}{a}\tan^{-1}\left(\frac{u}{a}\right) + C$ (Valid for all $u$)
3. $\displaystyle\int \frac{du}{u\sqrt{u^2-a^2}} = \frac{1}{a}\sec^{-1}\left|\frac{u}{a}\right| + C$ (Valid for $|u| > a > 0$)

The derivative formulas in Table 7.3 have $a = 1$, but in most integrations $a \neq 1$, and the formulas in Table 7.4 are more useful.

### EXAMPLE 11 Using the Integral Formulas

**(a)** $$\int_{\sqrt{2}/2}^{\sqrt{3}/2} \frac{dx}{\sqrt{1-x^2}} = \sin^{-1} x \Big]_{\sqrt{2}/2}^{\sqrt{3}/2}$$

$$= \sin^{-1}\left(\frac{\sqrt{3}}{2}\right) - \sin^{-1}\left(\frac{\sqrt{2}}{2}\right) = \frac{\pi}{3} - \frac{\pi}{4} = \frac{\pi}{12}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**(b)** $\displaystyle\int_0^1 \frac{dx}{1+x^2} = \tan^{-1} x\Big]_0^1 = \tan^{-1}(1) - \tan^{-1}(0) = \frac{\pi}{4} - 0 = \frac{\pi}{4}$

**(c)** $\displaystyle\int_{2/\sqrt{3}}^{\sqrt{2}} \frac{dx}{x\sqrt{x^2-1}} = \sec^{-1} x\Big]_{2/\sqrt{3}}^{\sqrt{2}} = \frac{\pi}{4} - \frac{\pi}{6} = \frac{\pi}{12}$ ■

**EXAMPLE 12** Using Substitution and Table 7.4

**(a)** $\displaystyle\int \frac{dx}{\sqrt{9-x^2}} = \int \frac{dx}{\sqrt{(3)^2-x^2}} = \sin^{-1}\left(\frac{x}{3}\right) + C$ Table 7.4 Formula 1, with $a = 3$, $u = x$

**(b)** $\displaystyle\int \frac{dx}{\sqrt{3-4x^2}} = \frac{1}{2}\int \frac{du}{\sqrt{a^2-u^2}}$ $a = \sqrt{3}$, $u = 2x$, and $du/2 = dx$

$\displaystyle= \frac{1}{2}\sin^{-1}\left(\frac{u}{a}\right) + C$ Formula 1

$\displaystyle= \frac{1}{2}\sin^{-1}\left(\frac{2x}{\sqrt{3}}\right) + C$ ■

**EXAMPLE 13** Completing the Square

Evaluate

$$\int \frac{dx}{\sqrt{4x-x^2}}.$$

**Solution** The expression $\sqrt{4x-x^2}$ does not match any of the formulas in Table 7.4, so we first rewrite $4x - x^2$ by completing the square:

$$4x - x^2 = -(x^2 - 4x) = -(x^2 - 4x + 4) + 4 = 4 - (x-2)^2.$$

Then we substitute $a = 2$, $u = x - 2$, and $du = dx$ to get

$$\int \frac{dx}{\sqrt{4x-x^2}} = \int \frac{dx}{\sqrt{4-(x-2)^2}}$$

$$= \int \frac{du}{\sqrt{a^2-u^2}} \qquad a = 2,\ u = x-2, \text{ and } du = dx$$

$$= \sin^{-1}\left(\frac{u}{a}\right) + C \qquad \text{Table 7.4, Formula 1}$$

$$= \sin^{-1}\left(\frac{x-2}{2}\right) + C$$ ■

**EXAMPLE 14** Completing the Square

Evaluate

$$\int \frac{dx}{4x^2+4x+2}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** We complete the square on the binomial $4x^2 + 4x$:

$$4x^2 + 4x + 2 = 4(x^2 + x) + 2 = 4\left(x^2 + x + \frac{1}{4}\right) + 2 - \frac{4}{4}$$

$$= 4\left(x + \frac{1}{2}\right)^2 + 1 = (2x + 1)^2 + 1.$$

Then,

$$\int \frac{dx}{4x^2 + 4x + 2} = \int \frac{dx}{(2x + 1)^2 + 1} = \frac{1}{2}\int \frac{du}{u^2 + a^2} \qquad a = 1,\ u = 2x + 1, \text{ and } du/2 = dx$$

$$= \frac{1}{2} \cdot \frac{1}{a} \tan^{-1}\left(\frac{u}{a}\right) + C \qquad \text{Table 7.4, Formula 2}$$

$$= \frac{1}{2} \tan^{-1}(2x + 1) + C \qquad a = 1,\ u = 2x + 1$$ ■

**EXAMPLE 15** Using Substitution

Evaluate

$$\int \frac{dx}{\sqrt{e^{2x} - 6}}.$$

**Solution**

$$\int \frac{dx}{\sqrt{e^{2x} - 6}} = \int \frac{du/u}{\sqrt{u^2 - a^2}} \qquad u = e^x,\ du = e^x\,dx,\ dx = du/e^x = du/u,\ a = \sqrt{6}$$

$$= \int \frac{du}{u\sqrt{u^2 - a^2}}$$

$$= \frac{1}{a} \sec^{-1}\left|\frac{u}{a}\right| + C \qquad \text{Table 7.4, Formula 3}$$

$$= \frac{1}{\sqrt{6}} \sec^{-1}\left(\frac{e^x}{\sqrt{6}}\right) + C$$ ■

## Trigonometric Function Values

**13.** Given that $\alpha = \sin^{-1}(5/13)$, find $\cos\alpha$, $\tan\alpha$, $\sec\alpha$, $\csc\alpha$, and $\cot\alpha$.

**14.** Given that $\alpha = \tan^{-1}(4/3)$, find $\sin\alpha$, $\cos\alpha$, $\sec\alpha$, $\csc\alpha$, and $\cot\alpha$.

**15.** Given that $\alpha = \sec^{-1}(-\sqrt{5})$, find $\sin\alpha$, $\cos\alpha$, $\tan\alpha$, $\csc\alpha$, and $\cot\alpha$.

**16.** Given that $\alpha = \sec^{-1}(-\sqrt{13}/2)$, find $\sin\alpha$, $\cos\alpha$, $\tan\alpha$, $\csc\alpha$, and $\cot\alpha$.

## Evaluating Trigonometric and Inverse Trigonometric Terms

Find the values in Exercises 17–28.

**17.** $\sin\left(\cos^{-1}\left(\frac{\sqrt{2}}{2}\right)\right)$ **18.** $\sec\left(\cos^{-1}\frac{1}{2}\right)$

**19.** $\tan\left(\sin^{-1}\left(-\frac{1}{2}\right)\right)$ **20.** $\cot\left(\sin^{-1}\left(-\frac{\sqrt{3}}{2}\right)\right)$

**21.** $\csc(\sec^{-1}2) + \cos(\tan^{-1}(-\sqrt{3}))$

**22.** $\tan(\sec^{-1}1) + \sin(\csc^{-1}(-2))$

**23.** $\sin\left(\sin^{-1}\left(-\frac{1}{2}\right) + \cos^{-1}\left(-\frac{1}{2}\right)\right)$

**24.** $\cot\left(\sin^{-1}\left(-\frac{1}{2}\right) - \sec^{-1}2\right)$

**25.** $\sec(\tan^{-1}1 + \csc^{-1}1)$ **26.** $\sec(\cot^{-1}\sqrt{3} + \csc^{-1}(-1))$

**27.** $\sec^{-1}\left(\sec\left(-\frac{\pi}{6}\right)\right)$ (The answer is *not* $-\pi/6$.)

**28.** $\cot^{-1}\left(\cot\left(-\frac{\pi}{4}\right)\right)$ (The answer is *not* $-\pi/4$.)

## Finding Trigonometric Expressions

Evaluate the expressions in Exercises 29–40.

**29.** $\sec\left(\tan^{-1}\frac{x}{2}\right)$ **30.** $\sec(\tan^{-1}2x)$

**31.** $\tan(\sec^{-1}3y)$ **32.** $\tan\left(\sec^{-1}\frac{y}{5}\right)$

**33.** $\cos(\sin^{-1}x)$ **34.** $\tan(\cos^{-1}x)$

**35.** $\sin(\tan^{-1}\sqrt{x^2-2x})$, $x \geq 2$

**36.** $\sin\left(\tan^{-1}\frac{x}{\sqrt{x^2+1}}\right)$ **37.** $\cos\left(\sin^{-1}\frac{2y}{3}\right)$

**38.** $\cos\left(\sin^{-1}\frac{y}{5}\right)$ **39.** $\sin\left(\sec^{-1}\frac{x}{4}\right)$

**40.** $\sin\sec^{-1}\left(\frac{\sqrt{x^2+4}}{x}\right)$

## Limits

Find the limits in Exercises 41–48. (If in doubt, look at the function's graph.)

**41.** $\lim_{x\to 1^-}\sin^{-1}x$ **42.** $\lim_{x\to -1^+}\cos^{-1}x$

**43.** $\lim_{x\to\infty}\tan^{-1}x$ **44.** $\lim_{x\to-\infty}\tan^{-1}x$

**45.** $\lim_{x\to\infty}\sec^{-1}x$ **46.** $\lim_{x\to-\infty}\sec^{-1}x$

**47.** $\lim_{x\to\infty}\csc^{-1}x$ **48.** $\lim_{x\to-\infty}\csc^{-1}x$

## Finding Derivatives

In Exercises 49–70, find the derivative of $y$ with respect to the appropriate variable.

**49.** $y = \cos^{-1}(x^2)$ **50.** $y = \cos^{-1}(1/x)$

**51.** $y = \sin^{-1}\sqrt{2}\,t$ **52.** $y = \sin^{-1}(1-t)$

**53.** $y = \sec^{-1}(2s+1)$ **54.** $y = \sec^{-1}5s$

**55.** $y = \csc^{-1}(x^2+1)$, $x > 0$

**56.** $y = \csc^{-1}\frac{x}{2}$

**57.** $y = \sec^{-1}\frac{1}{t}$, $0 < t < 1$ **58.** $y = \sin^{-1}\frac{3}{t^2}$

**59.** $y = \cot^{-1}\sqrt{t}$ **60.** $y = \cot^{-1}\sqrt{t-1}$

**61.** $y = \ln(\tan^{-1}x)$ **62.** $y = \tan^{-1}(\ln x)$

**63.** $y = \csc^{-1}(e^t)$ **64.** $y = \cos^{-1}(e^{-t})$

**65.** $y = s\sqrt{1-s^2} + \cos^{-1}s$ **66.** $y = \sqrt{s^2-1} - \sec^{-1}s$

**67.** $y = \tan^{-1}\sqrt{x^2-1} + \csc^{-1}x$, $x > 1$

**68.** $y = \cot^{-1}\frac{1}{x} - \tan^{-1}x$ **69.** $y = x\sin^{-1}x + \sqrt{1-x^2}$

**70.** $y = \ln(x^2+4) - x\tan^{-1}\left(\frac{x}{2}\right)$

## Evaluating Integrals

Evaluate the integrals in Exercises 71–94.

**71.** $\int \frac{dx}{\sqrt{9-x^2}}$ **72.** $\int \frac{dx}{\sqrt{1-4x^2}}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**73.** $\displaystyle\int \frac{dx}{17 + x^2}$ **74.** $\displaystyle\int \frac{dx}{9 + 3x^2}$

**75.** $\displaystyle\int \frac{dx}{x\sqrt{25x^2 - 2}}$ **76.** $\displaystyle\int \frac{dx}{x\sqrt{5x^2 - 4}}$

**77.** $\displaystyle\int_0^1 \frac{4\,ds}{\sqrt{4 - s^2}}$ **78.** $\displaystyle\int_0^{3\sqrt{2}/4} \frac{ds}{\sqrt{9 - 4s^2}}$

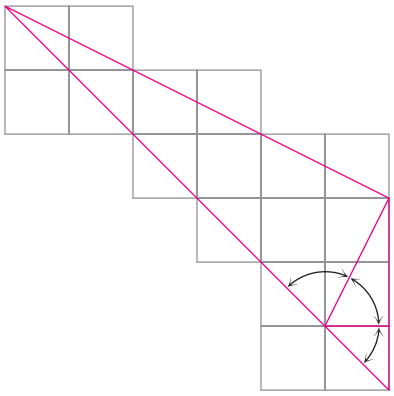
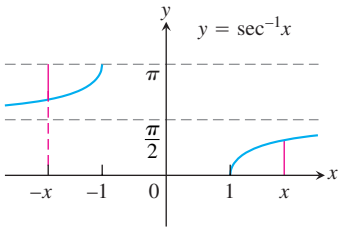
**126.** The region between the curve $y = \sec^{-1} x$ and the $x$-axis from $x = 1$ to $x = 2$ (shown here) is revolved about the $y$-axis to generate a solid. Find the volume of the solid.



**127.** The slant height of the cone shown here is 3 m. How large should the indicated angle be to maximize the cone's volume?

**128.** Find the angle $\alpha$.



**129.** Here is an informal proof that $\tan^{-1} 1 + \tan^{-1} 2 + \tan^{-1} 3 = \pi$. Explain what is going on.

**130. Two derivations of the identity $\sec^{-1}(-x) = \pi - \sec^{-1} x$**

**a.** (*Geometric*) Here is a pictorial proof that $\sec^{-1}(-x) = \pi - \sec^{-1} x$. See if you can tell what is going on.

**b.** (*Algebraic*) Derive the identity $\sec^{-1}(-x) = \pi - \sec^{-1} x$ by combining the following two equations from the text:

$$\cos^{-1}(-x) = \pi - \cos^{-1} x \qquad \text{Eq. (3)}$$

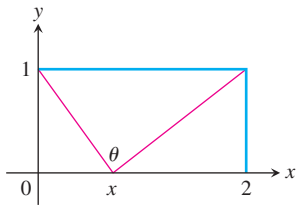
$$\sec^{-1} x = \cos^{-1}(1/x) \qquad \text{Eq. (5)}$$

**131. The identity $\sin^{-1} x + \cos^{-1} x = \pi/2$** Figure 7.21 establishes the identity for $0 < x < 1$. To establish it for the rest of $[-1, 1]$, verify by direct calculation that it holds for $x = 1$, 0, and $-1$. Then, for values of $x$ in $(-1, 0)$, let $x = -a$, $a > 0$, and apply Eqs. (1) and (3) to the sum $\sin^{-1}(-a) + \cos^{-1}(-a)$.

**132.** Show that the sum $\tan^{-1} x + \tan^{-1}(1/x)$ is constant.

Which of the expressions in Exercises 133–136 are defined, and which are not? Give reasons for your answers.

**133. a.** $\tan^{-1} 2$ **b.** $\cos^{-1} 2$



**134. a.** $\csc^{-1}(1/2)$ **b.** $\csc^{-1} 2$

**135. a.** $\sec^{-1} 0$ **b.** $\sin^{-1}\sqrt{2}$

**136. a.** $\cot^{-1}(-1/2)$ **b.** $\cos^{-1}(-5)$

**137.** (*Continuation of Exercise 125.*) You want to position your chair along the wall to maximize your viewing angle $\alpha$. How far from the front of the room should you sit?

**138.** What value of $x$ maximizes the angle $\theta$ shown here? How large is $\theta$ at that point? Begin by showing that $\theta = \pi - \cot^{-1} x - \cot^{-1}(2 - x)$.

**139.** Can the integrations in (a) and (b) both be correct? Explain.

**a.** $\displaystyle\int \frac{dx}{\sqrt{1-x^2}} = \sin^{-1} x + C$

**b.** $\displaystyle\int \frac{dx}{\sqrt{1-x^2}} = -\int -\frac{dx}{\sqrt{1-x^2}} = -\cos^{-1} x + C$

**140.** Can the integrations in (a) and (b) both be correct? Explain.

**a.** $\displaystyle\int \frac{dx}{\sqrt{1-x^2}} = -\int -\frac{dx}{\sqrt{1-x^2}} = -\cos^{-1} x + C$

# 7.8 Hyperbolic Functions

The hyperbolic functions are formed by taking combinations of the two exponential functions $e^x$ and $e^{-x}$. The hyperbolic functions simplify many mathematical expressions and they are important in applications. For instance, they are used in problems such as computing the tension in a cable suspended by its two ends, as in an electric transmission line. They also play an important role in finding solutions to differential equations. In this section, we give a brief introduction to hyperbolic functions, their graphs, how their derivatives are calculated, and why they appear as important antiderivatives.

## Even and Odd Parts of the Exponential Function

Recall the definitions of even and odd functions from Section 1.4, and the symmetries of their graphs. An even function $f$ satisfies $f(-x) = f(x)$, while an odd function satisfies $f(-x) = -f(x)$. Every function $f$ that is defined on an interval centered at the origin can be written in a unique way as the sum of one even function and one odd function. The decomposition is

$$f(x) = \underbrace{\frac{f(x) + f(-x)}{2}}_{\text{even part}} + \underbrace{\frac{f(x) - f(-x)}{2}}_{\text{odd part}}.$$

If we write $e^x$ this way, we get

$$e^x = \underbrace{\frac{e^x + e^{-x}}{2}}_{\text{even part}} + \underbrace{\frac{e^x - e^{-x}}{2}}_{\text{odd part}}.$$

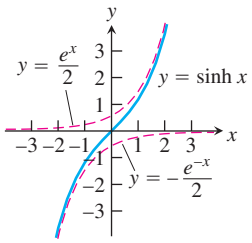
The even and odd parts of $e^x$, called the hyperbolic cosine and hyperbolic sine of $x$, respectively, are useful in their own right. They describe the motions of waves in elastic solids and the temperature distributions in metal cooling fins. The centerline of the Gateway Arch to the West in St. Louis is a weighted hyperbolic cosine curve.

## Definitions and Identities

The hyperbolic cosine and hyperbolic sine functions are defined by the first two equations in Table 7.5. The table also lists the definitions of the hyperbolic tangent, cotangent, secant, and cosecant. As we will see, the hyperbolic functions bear a number of similarities to the trigonometric functions after which they are named. (See Exercise 84 as well.)

The notation $\cosh x$ is often read "kosh $x$," rhyming with "gosh $x$," and $\sinh x$ is pronounced as if spelled "cinch $x$," rhyming with "pinch $x$."

Hyperbolic functions satisfy the identities in Table 7.6. Except for differences in sign, these resemble identities we already know for trigonometric functions.



The second equation is obtained as follows:

$$\begin{aligned} 2 \sinh x \cosh x &= 2\left(\frac{e^x - e^{-x}}{2}\right)\left(\frac{e^x + e^{-x}}{2}\right) \\ &= \frac{e^{2x} - e^{-2x}}{2} \\ &= \sinh 2x. \end{aligned}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

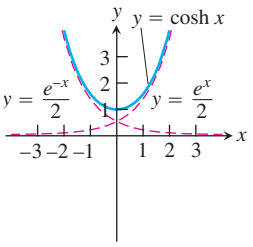


**TABLE 7.5** The six basic hyperbolic functions **FIGURE 7.31**

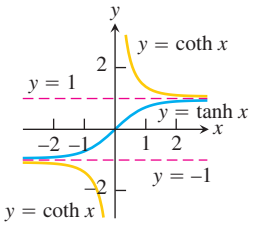
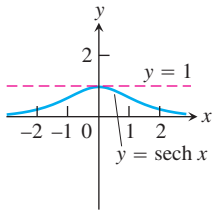
Hyperbolic sine of $x$: $\sinh x = \dfrac{e^x - e^{-x}}{2}$

(a)



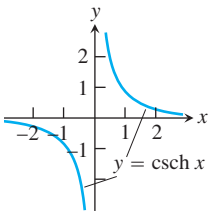
Hyperbolic cosine of $x$: $\cosh x = \dfrac{e^x + e^{-x}}{2}$

(b)



Hyperbolic tangent: $\tanh x = \dfrac{\sinh x}{\cosh x} = \dfrac{e^x - e^{-x}}{e^x + e^{-x}}$

Hyperbolic cotangent: $\coth x = \dfrac{\cosh x}{\sinh x} = \dfrac{e^x + e^{-x}}{e^x - e^{-x}}$



(c)

Hyperbolic secant: $\operatorname{sech} x = \dfrac{1}{\cosh x} = \dfrac{2}{e^x + e^{-x}}$

(d)

Hyperbolic cosecant: $\operatorname{csch} x = \dfrac{1}{\sinh x} = \dfrac{2}{e^x - e^{-x}}$

(e)

**TABLE 7.6** Identities for hyperbolic functions

$\cosh^2 x - \sinh^2 x = 1$

$\sinh 2x = 2 \sinh x \cosh x$

$\cosh 2x = \cosh^2 x + \sinh^2 x$

$\cosh^2 x = \dfrac{\cosh 2x + 1}{2}$

$\sinh^2 x = \dfrac{\cosh 2x - 1}{2}$

$\tanh^2 x = 1 - \operatorname{sech}^2 x$

$\coth^2 x = 1 + \operatorname{csch}^2 x$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The other identities are obtained similarly, by substituting in the definitions of the hyperbolic functions and using algebra. Like many standard functions, hyperbolic functions and their inverses are easily evaluated with calculators, which have special keys or keystroke sequences for that purpose.

## Derivatives and Integrals

The six hyperbolic functions, being rational combinations of the differentiable functions $e^x$ and $e^{-x}$, have derivatives at every point at which they are defined (Table 7.7). Again, there are similarities with trigonometric functions. The derivative formulas in Table 7.7 lead to the integral formulas in Table 8.

**TABLE 7.7** Derivatives of hyperbolic functions

$$\frac{d}{dx}(\sinh u) = \cosh u \frac{du}{dx}$$

$$\frac{d}{dx}(\cosh u) = \sinh u \frac{du}{dx}$$

$$\frac{d}{dx}(\tanh u) = \operatorname{sech}^2 u \frac{du}{dx}$$

$$\frac{d}{dx}(\coth u) = -\operatorname{csch}^2 u \frac{du}{dx}$$

$$\frac{d}{dx}(\operatorname{sech} u) = -\operatorname{sech} u \tanh u \frac{du}{dx}$$

$$\frac{d}{dx}(\operatorname{csch} u) = -\operatorname{csch} u \coth u \frac{du}{dx}$$

**TABLE 7.8** Integral formulas for hyperbolic functions

$$\int \sinh u\, du = \cosh u + C$$

$$\int \cosh u\, du = \sinh u + C$$

$$\int \operatorname{sech}^2 u\, du = \tanh u + C$$

$$\int \operatorname{csch}^2 u\, du = -\coth u + C$$

$$\int \operatorname{sech} u \tanh u\, du = -\operatorname{sech} u + C$$

$$\int \operatorname{csch} u \coth u\, du = -\operatorname{csch} u + C$$

The derivative formulas are derived from the derivative of $e^u$:

$$\begin{aligned}
\frac{d}{dx}(\sinh u) &= \frac{d}{dx}\left(\frac{e^u - e^{-u}}{2}\right) && \text{Definition of sinh } u \\
&= \frac{e^u\, du/dx + e^{-u}\, du/dx}{2} && \text{Derivative of } e^u \\
&= \cosh u \frac{du}{dx} && \text{Definition of cosh } u
\end{aligned}$$

This gives the first derivative formula. The calculation

$$\begin{aligned}
\frac{d}{dx}(\operatorname{csch} u) &= \frac{d}{dx}\left(\frac{1}{\sinh u}\right) && \text{Definition of csch } u \\
&= -\frac{\cosh u}{\sinh^2 u}\frac{du}{dx} && \text{Quotient Rule} \\
&= -\frac{1}{\sinh u}\frac{\cosh u}{\sinh u}\frac{du}{dx} && \text{Rearrange terms.} \\
&= -\operatorname{csch} u \coth u \frac{du}{dx} && \text{Definitions of csch } u \text{ and coth } u
\end{aligned}$$

gives the last formula. The others are obtained similarly.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 1** Finding Derivatives and Integrals

**(a)** $\dfrac{d}{dt}\left(\tanh\sqrt{1+t^2}\right) = \operatorname{sech}^2\sqrt{1+t^2}\cdot\dfrac{d}{dt}\left(\sqrt{1+t^2}\right)$

$$= \frac{t}{\sqrt{1+t^2}}\operatorname{sech}^2\sqrt{1+t^2}$$

**(b)** $\displaystyle\int \coth 5x\,dx = \int \frac{\cosh 5x}{\sinh 5x}\,dx = \frac{1}{5}\int \frac{du}{u}$ $\quad u = \sinh 5x,\ du = 5\cosh 5x\,dx$

$$= \frac{1}{5}\ln|u| + C = \frac{1}{5}\ln|\sinh 5x| + C$$

**(c)** $\displaystyle\int_0^1 \sinh^2 x\,dx = \int_0^1 \frac{\cosh 2x - 1}{2}\,dx$ Table 7.6

$$= \frac{1}{2}\int_0^1 (\cosh 2x - 1)\,dx = \frac{1}{2}\left[\frac{\sinh 2x}{2} - x\right]_0^1$$

$$= \frac{\sinh 2}{4} - \frac{1}{2} \approx 0.40672$$ Evaluate with a calculator

**(d)** $\displaystyle\int_0^{\ln 2} 4e^x \sinh x\,dx = \int_0^{\ln 2} 4e^x\,\frac{e^x - e^{-x}}{2}\,dx = \int_0^{\ln 2} (2e^{2x} - 2)\,dx$

$$= \left[e^{2x} - 2x\right]_0^{\ln 2} = (e^{2\ln 2} - 2\ln 2) - (1 - 0)$$

$$= 4 - 2\ln 2 - 1$$

$$\approx 1.6137$$ ■

## Inverse Hyperbolic Functions

The inverses of the six basic hyperbolic functions are very useful in integration. Since $d(\sinh x)/dx = \cosh x > 0$, the hyperbolic sine is an increasing function of $x$. We denote its inverse by

$$y = \sinh^{-1} x.$$

For every value of $x$ in the interval $-\infty < x < \infty$, the value of $y = \sinh^{-1} x$ is the number whose hyperbolic sine is $x$. The graphs of $y = \sinh x$ and $y = \sinh^{-1} x$ are shown in Figure 7.32a.

The function $y = \cosh x$ is not one-to-one, as we can see from the graph in Figure 7.31b. The restricted function $y = \cosh x, x \geq 0$, however, is one-to-one and therefore has an inverse, denoted by

$$y = \cosh^{-1} x.$$

For every value of $x \geq 1$, $y = \cosh^{-1} x$ is the number in the interval $0 \leq y < \infty$ whose hyperbolic cosine is $x$. The graphs of $y = \cosh x, x \geq 0$, and $y = \cosh^{-1} x$ are shown in Figure 7.32b.

Like $y = \cosh x$, the function $y = \operatorname{sech} x = 1/\cosh x$ fails to be one-to-one, but its restriction to nonnegative values of $x$ does have an inverse, denoted by

$$y = \operatorname{sech}^{-1} x.$$

For every value of $x$ in the interval $(0, 1]$, $y = \operatorname{sech}^{-1} x$ is the nonnegative number whose hyperbolic secant is $x$. The graphs of $y = \operatorname{sech} x, x \geq 0$, and $y = \operatorname{sech}^{-1} x$ are shown in Figure 7.32c.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

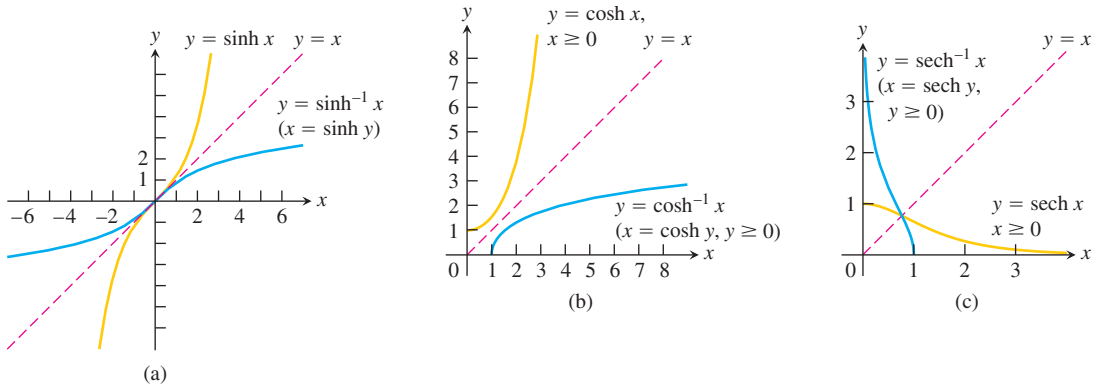


**FIGURE 7.32** The graphs of the inverse hyperbolic sine, cosine, and secant of $x$. Notice the symmetries about the line $y = x$.

The hyperbolic tangent, cotangent, and cosecant are one-to-one on their domains and therefore have inverses, denoted by

$$y = \tanh^{-1} x, \qquad y = \coth^{-1} x, \qquad y = \operatorname{csch}^{-1} x.$$

These functions are graphed in Figure 7.33.

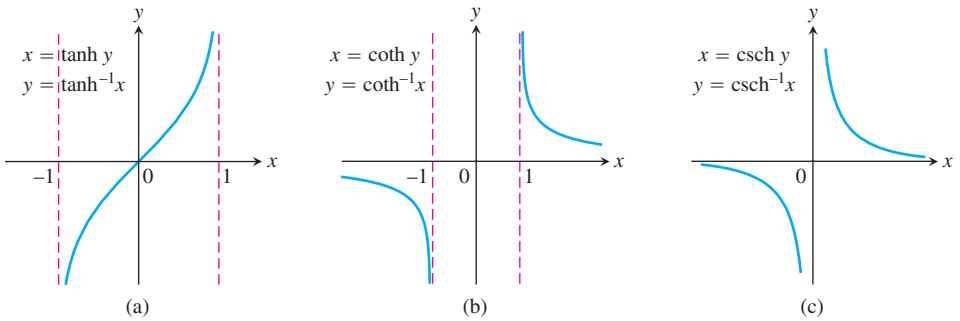

**FIGURE 7.33** The graphs of the inverse hyperbolic tangent, cotangent, and cosecant of $x$.

**TABLE 7.9** Identities for inverse hyperbolic functions

$$\operatorname{sech}^{-1} x = \cosh^{-1} \frac{1}{x}$$

$$\operatorname{csch}^{-1} x = \sinh^{-1} \frac{1}{x}$$

$$\coth^{-1} x = \tanh^{-1} \frac{1}{x}$$

## Useful Identities

We use the identities in Table 7.9 to calculate the values of $\operatorname{sech}^{-1} x$, $\operatorname{csch}^{-1} x$, and $\coth^{-1} x$ on calculators that give only $\cosh^{-1} x$, $\sinh^{-1} x$, and $\tanh^{-1} x$. These identities are direct consequences of the definitions. For example, if $0 < x \leq 1$, then

$$\operatorname{sech}\left(\cosh^{-1}\left(\frac{1}{x}\right)\right) = \frac{1}{\cosh\left(\cosh^{-1}\left(\frac{1}{x}\right)\right)} = \frac{1}{\left(\frac{1}{x}\right)} = x$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

so

$$\cosh^{-1}\left(\frac{1}{x}\right) = \operatorname{sech}^{-1} x$$

since the hyperbolic secant is one-to-one on $(0, 1]$.

## Derivatives and Integrals

The chief use of inverse hyperbolic functions lies in integrations that reverse the derivative formulas in Table 7.10.

**TABLE 7.10** Derivatives of inverse hyperbolic functions

$$\frac{d(\sinh^{-1} u)}{dx} = \frac{1}{\sqrt{1+u^2}}\frac{du}{dx}$$

$$\frac{d(\cosh^{-1} u)}{dx} = \frac{1}{\sqrt{u^2-1}}\frac{du}{dx}, \qquad u > 1$$

$$\frac{d(\tanh^{-1} u)}{dx} = \frac{1}{1-u^2}\frac{du}{dx}, \qquad |u| < 1$$

$$\frac{d(\coth^{-1} u)}{dx} = \frac{1}{1-u^2}\frac{du}{dx}, \qquad |u| > 1$$

$$\frac{d(\operatorname{sech}^{-1} u)}{dx} = \frac{-du/dx}{u\sqrt{1-u^2}}, \qquad 0 < u < 1$$

$$\frac{d(\operatorname{csch}^{-1} u)}{dx} = \frac{-du/dx}{|u|\sqrt{1+u^2}}, \qquad u \neq 0$$

The restrictions $|u| < 1$ and $|u| > 1$ on the derivative formulas for $\tanh^{-1} u$ and $\coth^{-1} u$ come from the natural restrictions on the values of these functions. (See Figure 7.33a and b.) The distinction between $|u| < 1$ and $|u| > 1$ becomes important when we convert the derivative formulas into integral formulas. If $|u| < 1$, the integral of $1/(1-u^2)$ is $\tanh^{-1} u + C$. If $|u| > 1$, the integral is $\coth^{-1} u + C$.

We illustrate how the derivatives of the inverse hyperbolic functions are found in Example 2, where we calculate $d(\cosh^{-1} u)/dx$. The other derivatives are obtained by similar calculations.

(1850–1891)

**EXAMPLE 2** Derivative of the Inverse Hyperbolic Cosine

Show that if $u$ is a differentiable function of $x$ whose values are greater than 1, then

$$\frac{d}{dx}(\cosh^{-1} u) = \frac{1}{\sqrt{u^2-1}}\frac{du}{dx}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** First we find the derivative of $y = \cosh^{-1} x$ for $x > 1$ by applying Theorem 1 with $f(x) = \cosh x$ and $f^{-1}(x) = \cosh^{-1} x$. Theorem 1 can be applied because the derivative of $\cosh x$ is positive for $0 < x$.

$$(f^{-1})'(x) = \frac{1}{f'(f^{-1}(x))} \qquad \text{Theorem 1}$$

$$= \frac{1}{\sinh(\cosh^{-1} x)} \qquad f'(u) = \sinh u$$

$$= \frac{1}{\sqrt{\cosh^2(\cosh^{-1} x) - 1}} \qquad \cosh^2 u - \sinh^2 u = 1,\ \sinh u = \sqrt{\cosh^2 u - 1}$$

$$= \frac{1}{\sqrt{x^2 - 1}} \qquad \cosh(\cosh^{-1} x) = x$$

In short,

$$\frac{d}{dx}(\cosh^{-1} x) = \frac{1}{\sqrt{x^2 - 1}}.$$

The Chain Rule gives the final result:

$$\frac{d}{dx}(\cosh^{-1} u) = \frac{1}{\sqrt{u^2 - 1}}\frac{du}{dx}.$$

■

Instead of applying Theorem 1 directly, as in Example 2, we could also find the derivative of $y = \cosh^{-1} x, x > 1$, using implicit differentiation and the Chain Rule:

$$y = \cosh^{-1} x$$

$$x = \cosh y \qquad \text{Equivalent equation}$$

$$1 = \sinh y \frac{dy}{dx} \qquad \text{Implicit differentiation with respect to } x, \text{ and the Chain Rule}$$

$$\frac{dy}{dx} = \frac{1}{\sinh y} = \frac{1}{\sqrt{\cosh^2 y - 1}} \qquad \text{Since } x > 1, y > 0 \text{ and } \sinh y > 0$$

$$= \frac{1}{\sqrt{x^2 - 1}}. \qquad \cosh y = x$$

With appropriate substitutions, the derivative formulas in Table 7.10 lead to the integration formulas in Table 7.11. Each of the formulas in Table 7.11 can be verified by differentiating the expression on the right-hand side.

**EXAMPLE 3** Using Table 7.11

Evaluate

$$\int_0^1 \frac{2\,dx}{\sqrt{3 + 4x^2}}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**TABLE 7.11** Integrals leading to inverse hyperbolic functions

1. $\displaystyle\int \frac{du}{\sqrt{a^2 + u^2}} = \sinh^{-1}\left(\frac{u}{a}\right) + C, \qquad a > 0$

2. $\displaystyle\int \frac{du}{\sqrt{u^2 - a^2}} = \cosh^{-1}\left(\frac{u}{a}\right) + C, \qquad u > a > 0$

3. $\displaystyle\int \frac{du}{a^2 - u^2} = \begin{cases} \frac{1}{a}\tanh^{-1}\left(\frac{u}{a}\right) + C & \text{if } u^2 < a^2 \\ \frac{1}{a}\coth^{-1}\left(\frac{u}{a}\right) + C, & \text{if } u^2 > a^2 \end{cases}$

4. $\displaystyle\int \frac{du}{u\sqrt{a^2 - u^2}} = -\frac{1}{a}\operatorname{sech}^{-1}\left(\frac{u}{a}\right) + C, \qquad 0 < u < a$

5. $\displaystyle\int \frac{du}{u\sqrt{a^2 + u^2}} = -\frac{1}{a}\operatorname{csch}^{-1}\left|\frac{u}{a}\right| + C, \qquad u \neq 0 \text{ and } a > 0$

**Solution** The indefinite integral is

$$\int \frac{2\,dx}{\sqrt{3 + 4x^2}} = \int \frac{du}{\sqrt{a^2 + u^2}} \qquad u = 2x, \quad du = 2\,dx, \quad a = \sqrt{3}$$

$$= \sinh^{-1}\left(\frac{u}{a}\right) + C \qquad \text{Formula from Table 7.11}$$

$$= \sinh^{-1}\left(\frac{2x}{\sqrt{3}}\right) + C.$$

Therefore,

$$\int_0^1 \frac{2\,dx}{\sqrt{3 + 4x^2}} = \sinh^{-1}\left(\frac{2x}{\sqrt{3}}\right)\Big]_0^1 = \sinh^{-1}\left(\frac{2}{\sqrt{3}}\right) - \sinh^{-1}(0)$$

$$= \sinh^{-1}\left(\frac{2}{\sqrt{3}}\right) - 0 \approx 0.98665.$$

# EXERCISES 7.8

## Hyperbolic Function Values and Identities

Each of Exercises 1–4 gives a value of $\sinh x$ or $\cosh x$. Use the definitions and the identity $\cosh^2 x - \sinh^2 x = 1$ to find the values of the remaining five hyperbolic functions.

**1.** $\sinh x = -\frac{3}{4}$

**2.** $\sinh x = \frac{4}{3}$

**3.** $\cosh x = \frac{17}{15}, \quad x > 0$

**4.** $\cosh x = \frac{13}{5}, \quad x > 0$

Rewrite the expressions in Exercises 5–10 in terms of exponentials and simplify the results as much as you can.

**5.** $2 \cosh (\ln x)$

**6.** $\sinh (2 \ln x)$

**7.** $\cosh 5x + \sinh 5x$

**8.** $\cosh 3x - \sinh 3x$

**9.** $(\sinh x + \cosh x)^4$

**10.** $\ln (\cosh x + \sinh x) + \ln (\cosh x - \sinh x)$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**11.** Use the identities

$$\sinh(x + y) = \sinh x \cosh y + \cosh x \sinh y$$
$$\cosh(x + y) = \cosh x \cosh y + \sinh x \sinh y$$

to show that

**a.** $\sinh 2x = 2 \sinh x \cosh x$

**b.** $\cosh 2x = \cosh^2 x + \sinh^2 x$.

**12.** Use the definitions of $\cosh x$ and $\sinh x$ to show that

$$\cosh^2 x - \sinh^2 x = 1.$$

## Derivatives

In Exercises 13–24, find the derivative of $y$ with respect to the appropriate variable.

**13.** $y = 6 \sinh \frac{x}{3}$

**14.** $y = \frac{1}{2} \sinh(2x + 1)$

**15.** $y = 2\sqrt{t} \tanh \sqrt{t}$

**16.** $y = t^2 \tanh \frac{1}{t}$

**17.** $y = \ln(\sinh z)$

**18.** $y = \ln(\cosh z)$

**19.** $y = \operatorname{sech} \theta(1 - \ln \operatorname{sech} \theta)$

**20.** $y = \operatorname{csch} \theta(1 - \ln \operatorname{csch} \theta)$

**21.** $y = \ln \cosh v - \frac{1}{2} \tanh^2 v$

**22.** $y = \ln \sinh v - \frac{1}{2} \coth^2 v$

**23.** $y = (x^2 + 1) \operatorname{sech}(\ln x)$

(*Hint:* Before differentiating, express in terms of exponentials and simplify.)

**24.** $y = (4x^2 - 1) \operatorname{csch}(\ln 2x)$

In Exercises 25–36, find the derivative of $y$ with respect to the appropriate variable.

**25.** $y = \sinh^{-1} \sqrt{x}$

**26.** $y = \cosh^{-1} 2\sqrt{x + 1}$

**27.** $y = (1 - \theta) \tanh^{-1} \theta$

**28.** $y = (\theta^2 + 2\theta) \tanh^{-1}(\theta + 1)$

**29.** $y = (1 - t) \coth^{-1} \sqrt{t}$

**30.** $y = (1 - t^2) \coth^{-1} t$

**31.** $y = \cos^{-1} x - x \operatorname{sech}^{-1} x$

**32.** $y = \ln x + \sqrt{1 - x^2} \operatorname{sech}^{-1} x$

**33.** $y = \operatorname{csch}^{-1} \left(\frac{1}{2}\right)^{\theta}$

**34.** $y = \operatorname{csch}^{-1} 2^{\theta}$

**35.** $y = \sinh^{-1}(\tan x)$

**36.** $y = \cosh^{-1}(\sec x), \quad 0 < x < \pi/2$

## Integration Formulas

Verify the integration formulas in Exercises 37–40.

**37. a.** $\int \operatorname{sech} x \, dx = \tan^{-1}(\sinh x) + C$

**b.** $\int \operatorname{sech} x \, dx = \sin^{-1}(\tanh x) + C$

**38.** $\int x \operatorname{sech}^{-1} x \, dx = \frac{x^2}{2} \operatorname{sech}^{-1} x - \frac{1}{2}\sqrt{1 - x^2} + C$

**39.** $\int x \coth^{-1} x \, dx = \frac{x^2 - 1}{2} \coth^{-1} x + \frac{x}{2} + C$

**40.** $\int \tanh^{-1} x \, dx = x \tanh^{-1} x + \frac{1}{2} \ln(1 - x^2) + C$

## Indefinite Integrals

Evaluate the integrals in Exercises 41–50.

**41.** $\int \sinh 2x \, dx$

**42.** $\int \sinh \frac{x}{5} \, dx$

**43.** $\int 6 \cosh\left(\frac{x}{2} - \ln 3\right) dx$

**44.** $\int 4 \cosh(3x - \ln 2) \, dx$

**45.** $\int \tanh \frac{x}{7} \, dx$

**46.** $\int \coth \frac{\theta}{\sqrt{3}} \, d\theta$

**47.** $\int \operatorname{sech}^2\left(x - \frac{1}{2}\right) dx$

**48.** $\int \operatorname{csch}^2(5 - x) \, dx$

**49.** $\int \frac{\operatorname{sech} \sqrt{t} \tanh \sqrt{t} \, dt}{\sqrt{t}}$

**50.** $\int \frac{\operatorname{csch}(\ln t) \coth(\ln t) \, dt}{t}$

## Definite Integrals

Evaluate the integrals in Exercises 51–60.

**51.** $\int_{\ln 2}^{\ln 4} \coth x \, dx$

**52.** $\int_{0}^{\ln 2} \tanh 2x \, dx$

**53.** $\int_{-\ln 4}^{-\ln 2} 2e^{\theta} \cosh \theta \, d\theta$

**54.** $\int_{0}^{\ln 2} 4e^{-\theta} \sinh \theta \, d\theta$

**55.** $\int_{-\pi/4}^{\pi/4} \cosh(\tan \theta) \sec^2 \theta \, d\theta$

**56.** $\int_{0}^{\pi/2} 2 \sinh(\sin \theta) \cos \theta \, d\theta$

**57.** $\int_{1}^{2} \frac{\cosh(\ln t)}{t} \, dt$

**58.** $\int_{1}^{4} \frac{8 \cosh \sqrt{x}}{\sqrt{x}} \, dx$

**59.** $\int_{-\ln 2}^{0} \cosh^2\left(\frac{x}{2}\right) dx$

**60.** $\int_{0}^{\ln 10} 4 \sinh^2\left(\frac{x}{2}\right) dx$

## Evaluating Inverse Hyperbolic Functions and Related Integrals

When hyperbolic function keys are not available on a calculator, it is still possible to evaluate the inverse hyperbolic functions by expressing them as logarithms, as shown here.

$$\sinh^{-1} x = \ln\left(x + \sqrt{x^2 + 1}\right), \qquad -\infty < x < \infty$$
$$\cosh^{-1} x = \ln\left(x + \sqrt{x^2 + 1}\right), \qquad x \geq 1$$
$$\tanh^{-1} x = \frac{1}{2} \ln \frac{1 + x}{1 - x}, \qquad |x| < 1$$
$$\operatorname{sech}^{-1} x = \ln\left(\frac{1 + \sqrt{1 - x^2}}{x}\right), \qquad 0 < x \leq 1$$
$$\operatorname{csch}^{-1} x = \ln\left(\frac{1}{x} + \frac{\sqrt{1 + x^2}}{|x|}\right), \qquad x \neq 0$$
$$\coth^{-1} x = \frac{1}{2} \ln \frac{x + 1}{x - 1}, \qquad |x| > 1$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Use the formulas in the box here to express the numbers in Exercises 61–66 in terms of natural logarithms.

Exercises

**61.** $\sinh^{-1}(-5/12)$ **62.** $\cosh^{-1}(5/3)$

**63.** $\tanh^{-1}(-1/2)$ **64.** $\coth^{-1}(5/4)$

**65.** $\operatorname{sech}^{-1}(3/5)$ **66.** $\operatorname{csch}^{-1}(-1/\sqrt{3})$

Evaluate the integrals in Exercises 67–74 in terms of

**a.** inverse hyperbolic functions.

**b.** natural logarithms.

Exercises

**67.** $\displaystyle\int_0^{2\sqrt{3}} \frac{dx}{\sqrt{4+x^2}}$ **68.** $\displaystyle\int_0^{1/3} \frac{6\,dx}{\sqrt{1+9x^2}}$

**69.** $\displaystyle\int_{5/4}^{2} \frac{dx}{1-x^2}$ **70.** $\displaystyle\int_0^{1/2} \frac{dx}{1-x^2}$

**71.** $\displaystyle\int_{1/5}^{3/13} \frac{dx}{x\sqrt{1-16x^2}}$ **72.** $\displaystyle\int_1^2 \frac{dx}{x\sqrt{4+x^2}}$

**73.** $\displaystyle\int_0^{\pi} \frac{\cos x\,dx}{\sqrt{1+\sin^2 x}}$ **74.** $\displaystyle\int_1^e \frac{dx}{x\sqrt{1+(\ln x)^2}}$

## Applications and Theory

**75. a.** Show that if a function $f$ is defined on an interval symmetric about the origin (so that $f$ is defined at $-x$ whenever it is defined at $x$), then

$$f(x) = \frac{f(x)+f(-x)}{2} + \frac{f(x)-f(-x)}{2}. \qquad (1)$$

Then show that $(f(x)+f(-x))/2$ is even and that $(f(x)-f(-x))/2$ is odd.

**b.** Equation (1) simplifies considerably if $f$ itself is (i) even or (ii) odd. What are the new equations? Give reasons for your answers.

**76.** Derive the formula $\sinh^{-1} x = \ln\left(x+\sqrt{x^2+1}\right)$, $-\infty < x < \infty$. Explain in your derivation why the plus sign is used with the square root instead of the minus sign.

**77. Skydiving** If a body of mass $m$ falling from rest under the action of gravity encounters an air resistance proportional to the square of the velocity, then the body's velocity $t$ sec into the fall satisfies the differential equation

$$m\frac{dv}{dt} = mg - kv^2,$$

where $k$ is a constant that depends on the body's aerodynamic properties and the density of the air. (We assume that the fall is short enough so that the variation in the air's density will not affect the outcome significantly.)

**a.** Show that

$$v = \sqrt{\frac{mg}{k}}\tanh\left(\sqrt{\frac{gk}{m}}\,t\right)$$

satisfies the differential equation and the initial condition that $v = 0$ when $t = 0$.

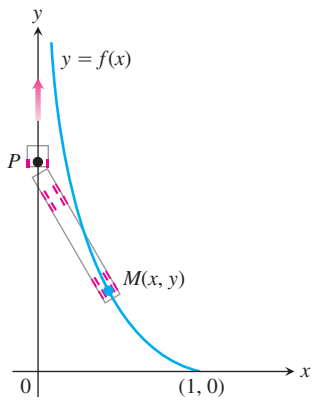
**b.** Find the body's *limiting velocity*, $\lim_{t\to\infty} v$.

**c.** For a 160-lb skydiver ($mg = 160$), with time in seconds and distance in feet, a typical value for $k$ is 0.005. What is the diver's limiting velocity?

**78. Accelerations whose magnitudes are proportional to displacement** Suppose that the position of a body moving along a coordinate line at time $t$ is

**a.** $s = a\cos kt + b\sin kt$

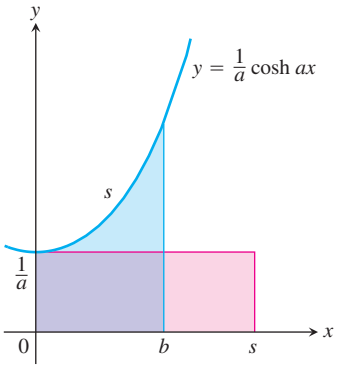
**b.** $s = a\cosh kt + b\sinh kt$.



Show in both cases that the acceleration $d^2s/dt^2$ is proportional to $s$ but that in the first case it is directed toward the origin, whereas in the second case it is directed away from the origin.

**79. Tractor trailers and the tractrix** When a tractor trailer turns into a cross street or driveway, its rear wheels follow a curve like the one shown here. (This is why the rear wheels sometimes ride up over the curb.) We can find an equation for the curve if we picture the rear wheels as a mass $M$ at the point $(1, 0)$ on the $x$-axis attached by a rod of unit length to a point $P$ representing the cab at the origin. As the point $P$ moves up the $y$-axis, it drags $M$ along behind it. The curve traced by $M$—called a *tractrix* from the Latin word *tractum*, for "drag"—can be shown to be the graph of the function $y = f(x)$ that solves the initial value problem

Differential equation: $\dfrac{dy}{dx} = -\dfrac{1}{x\sqrt{1-x^2}} + \dfrac{x}{\sqrt{1-x^2}}$

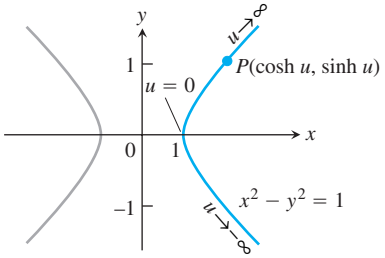


Initial condition: $y = 0$ when $x = 1$.

Solve the initial value problem to find an equation for the curve. (You need an inverse hyperbolic function.)

**80. Area** Show that the area of the region in the first quadrant enclosed by the curve $y = (1/a)\cosh ax$, the coordinate axes, and the line $x = b$ is the same as the area of a rectangle of height $1/a$ and length $s$, where $s$ is the length of the curve from $x = 0$ to $x = b$. (See accompanying figure.)

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



**81. Volume** A region in the first quadrant is bounded above by the curve $y = \cosh x$, below by the curve $y = \sinh x$, and on the left and right by the $y$-axis and the line $x = 2$, respectively. Find the volume of the solid generated by revolving the region about the $x$-axis.

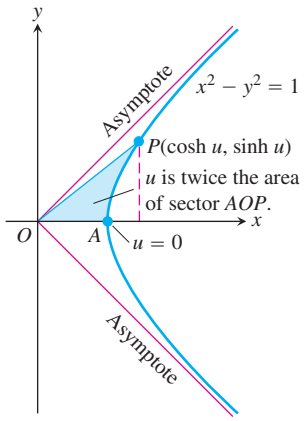
**82. Volume** The region enclosed by the curve $y = \operatorname{sech} x$, the $x$-axis, and the lines $x = \pm \ln \sqrt{3}$ is revolved about the $x$-axis to generate a solid. Find the volume of the solid.

**83. Arc length** Find the length of the segment of the curve $y = (1/2)\cosh 2x$ from $x = 0$ to $x = \ln \sqrt{5}$.

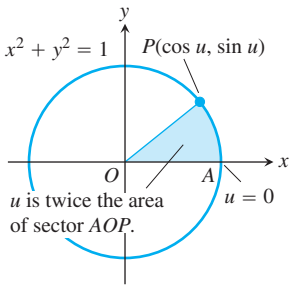
**84. The hyperbolic in hyperbolic functions** In case you are wondering where the name *hyperbolic* comes from, here is the answer: Just as $x = \cos u$ and $y = \sin u$ are identified with points $(x, y)$ on the unit circle, the functions $x = \cosh u$ and $y = \sinh u$ are identified with points $(x, y)$ on the right-hand branch of the unit hyperbola, $x^2 - y^2 = 1$.

Since $\cosh^2 u - \sinh^2 u = 1$, the point $(\cosh u, \sinh u)$ lies on the right-hand branch of the hyperbola $x^2 - y^2 = 1$ for every value of $u$ (Exercise 84).

Another analogy between hyperbolic and circular functions is that the variable $u$ in the coordinates $(\cosh u, \sinh u)$ for the points of the right-hand branch of the hyperbola $x^2 - y^2 = 1$ is twice the area of the sector $AOP$ pictured in the accompanying figure. To see why this is so, carry out the following steps.



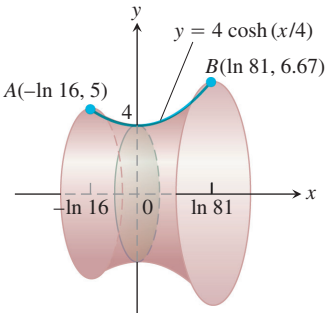
**a.** Show that the area $A(u)$ of sector $AOP$ is



$$A(u) = \frac{1}{2}\cosh u \sinh u - \int_1^{\cosh u} \sqrt{x^2 - 1}\, dx.$$

**b.** Differentiate both sides of the equation in part (a) with respect to $u$ to show that

$$A'(u) = \frac{1}{2}.$$



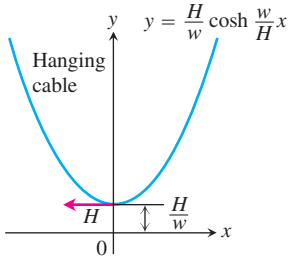
**c.** Solve this last equation for $A(u)$. What is the value of $A(0)$? What is the value of the constant of integration $C$ in your solution? With $C$ determined, what does your solution say about the relationship of $u$ to $A(u)$?

One of the analogies between hyperbolic and circular functions is revealed by these two diagrams (Exercise 84).

**85. A minimal surface** Find the area of the surface swept out by revolving about the $x$-axis the curve $y = 4\cosh(x/4)$, $-\ln 16 \le x \le \ln 81$.

It can be shown that, of all continuously differentiable curves joining points $A$ and $B$ in the figure, the curve $y = 4\cosh(x/4)$ generates the surface of least area. If you made a rigid wire frame of the end-circles through $A$ and $B$ and dipped them in a soap-film solution, the surface spanning the circles would be the one generated by the curve.

**T 86. a.** Find the centroid of the curve $y = \cosh x$, $-\ln 2 \le x \le \ln 2$.



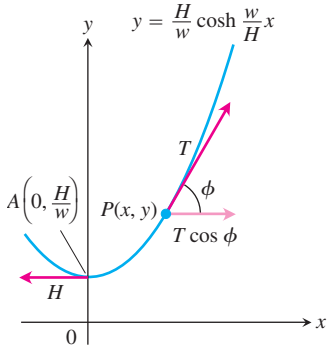
**b.** Evaluate the coordinates to two decimal places. Then sketch the curve and plot the centroid to show its relation to the curve.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Hanging Cables

**87.** Imagine a cable, like a telephone line or TV cable, strung from one support to another and hanging freely. The cable's weight per unit length is $w$ and the horizontal tension at its lowest point is a vector of length $H$. If we choose a coordinate system for the plane of the cable in which the $x$-axis is horizontal, the force of gravity is straight down, the positive $y$-axis points straight up, and the lowest point of the cable lies at the point $y = H/w$ on the $y$-axis (see accompanying figure), then it can be shown that the cable lies along the graph of the hyperbolic cosine

$$y = \frac{H}{w}\cosh\frac{w}{H}x.$$



Such a curve is sometimes called a **chain curve** or a **catenary**, the latter deriving from the Latin *catena*, meaning "chain."

**a.** Let $P(x, y)$ denote an arbitrary point on the cable. The next accompanying figure displays the tension at $P$ as a vector of length (magnitude) $T$, as well as the tension $H$ at the lowest point $A$. Show that the cable's slope at $P$ is

$$\tan\phi = \frac{dy}{dx} = \sinh\frac{w}{H}x.$$

**b.** Using the result from part (a) and the fact that the horizontal tension at $P$ must equal $H$ (the cable is not moving), show that $T = wy$. Hence, the magnitude of the tension at $P(x, y)$ is exactly equal to the weight of $y$ units of cable.

**88.** (*Continuation of Exercise 87.*) The length of arc $AP$ in the Exercise 87 figure is $s = (1/a)\sinh ax$, where $a = w/H$. Show that the coordinates of $P$ may be expressed in terms of $s$ as

$$x = \frac{1}{a}\sinh^{-1} as, \qquad y = \sqrt{s^2 + \frac{1}{a^2}}.$$

**89. The sag and horizontal tension in a cable** The ends of a cable 32 ft long and weighing 2 lb/ft are fastened at the same level to posts 30 ft apart.

**a.** Model the cable with the equation

$$y = \frac{1}{a}\cosh ax, \quad -15 \le x \le 15.$$

Use information from Exercise 88 to show that $a$ satisfies the equation

$$16a = \sinh 15a. \tag{2}$$

**T b.** Solve Equation (2) graphically by estimating the coordinates of the points where the graphs of the equations $y = 16a$ and $y = \sinh 15a$ intersect in the $ay$-plane.

**T c.** Solve Equation (2) for $a$ numerically. Compare your solution with the value you found in part (b).

**d.** Estimate the horizontal tension in the cable at the cable's lowest point.

**T e.** Using the value found for $a$ in part (c), graph the catenary

$$y = \frac{1}{a}\cosh ax$$

over the interval $-15 \le x \le 15$. Estimate the sag in the cable at its center.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# Chapter 7 Additional and Advanced Exercises

## Limits

Find the limits in Exercises 1–6.

**1.** $\lim_{b\to 1^-} \int_0^b \frac{dx}{\sqrt{1-x^2}}$

**2.** $\lim_{x\to\infty} \frac{1}{x}\int_0^x \tan^{-1} t\, dt$

**3.** $\lim_{x\to 0^+} (\cos\sqrt{x})^{1/x}$

**4.** $\lim_{x\to\infty} (x + e^x)^{2/x}$

**5.** $\lim_{n\to\infty} \left(\frac{1}{n+1} + \frac{1}{n+2} + \cdots + \frac{1}{2n}\right)$

**6.** $\lim_{n\to\infty} \frac{1}{n}\left(e^{1/n} + e^{2/n} + \cdots + e^{(n-1)/n} + e^{n/n}\right)$

**7.** Let $A(t)$ be the area of the region in the first quadrant enclosed by the coordinate axes, the curve $y = e^{-x}$, and the vertical line $x = t$, $t > 0$. Let $V(t)$ be the volume of the solid generated by revolving the region about the $x$-axis. Find the following limits.

**a.** $\lim_{t\to\infty} A(t)$ **b.** $\lim_{t\to\infty} V(t)/A(t)$ **c.** $\lim_{t\to 0^+} V(t)/A(t)$

**8. Varying a logarithm's base**

**a.** Find $\lim \log_a 2$ as $a \to 0^+, 1^-, 1^+$, and $\infty$.

T **b.** Graph $y = \log_a 2$ as a function of $a$ over the interval $0 < a \le 4$.

## Theory and Examples

**9.** Find the areas between the curves $y = 2(\log_2 x)/x$ and $y = 2(\log_4 x)/x$ and the $x$-axis from $x = 1$ to $x = e$. What is the ratio of the larger area to the smaller?

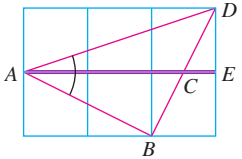
T **10.** Graph $f(x) = \tan^{-1} x + \tan^{-1}(1/x)$ for $-5 \le x \le 5$. Then use calculus to explain what you see. How would you expect $f$ to behave beyond the interval $[-5, 5]$? Give reasons for your answer.

**11.** For what $x > 0$ does $x^{(x^x)} = (x^x)^x$? Give reasons for your answer.

T **12.** Graph $f(x) = (\sin x)^{\sin x}$ over $[0, 3\pi]$. Explain what you see.

**13.** Find $f'(2)$ if $f(x) = e^{g(x)}$ and $g(x) = \int_2^x \frac{t}{1+t^4}\, dt$.

**14.** **a.** Find $df/dx$ if



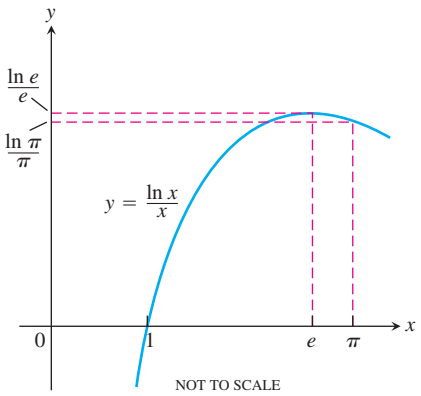
$$f(x) = \int_1^{e^x} \frac{2\ln t}{t}\, dt.$$

**b.** Find $f(0)$.

**c.** What can you conclude about the graph of $f$? Give reasons for your answer.

**15.** The figure here shows an informal proof that

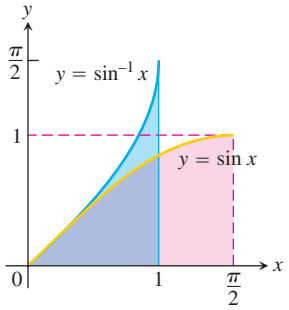
$$\tan^{-1}\frac{1}{2} + \tan^{-1}\frac{1}{3} = \frac{\pi}{4}.$$



How does the argument go? (*Source*: "Behold! Sums of Arctan," by Edward M. Harris, *College Mathematics Journal*, Vol. 18, No. 2, Mar. 1987, p. 141.)

**16.** $\pi^e < e^\pi$

**a.** Why does the accompanying figure "prove" that $\pi^e < e^\pi$? (*Source:* "Proof Without Words," by Fouad Nakhil, *Mathematics Magazine*, Vol. 60, No. 3, June 1987, p. 165.)

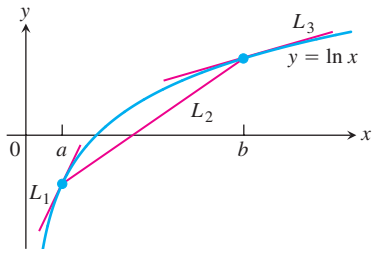


**b.** The accompanying figure assumes that $f(x) = (\ln x)/x$ has an absolute maximum value at $x = e$. How do you know it does?

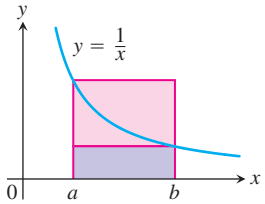
Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**17.** Use the accompanying figure to show that

$$\int_0^{\pi/2} \sin x\, dx = \frac{\pi}{2} - \int_0^1 \sin^{-1} x\, dx.$$



**18. Napier's inequality** Here are two pictorial proofs that



$$b > a > 0 \quad \Rightarrow \quad \frac{1}{b} < \frac{\ln b - \ln a}{b - a} < \frac{1}{a}.$$

Explain what is going on in each case.

**a.**

**b.**

(*Source:* Roger B. Nelson, *College Mathematics Journal*, Vol. 24, No. 2, March 1993, p. 165.)

**19. Even-odd decompositions**

**a.** Suppose that $g$ is an even function of $x$ and $h$ is an odd function of $x$. Show that if $g(x) + h(x) = 0$ for all $x$ then $g(x) = 0$ for all $x$ and $h(x) = 0$ for all $x$.

**b.** Use the result in part (a) to show that if $f(x) = f_E(x) + f_O(x)$ is the sum of an even function $f_E(x)$ and an odd function $f_O(x)$, then

$$f_E(x) = (f(x) + f(-x))/2 \quad \text{and} \quad f_O(x) = (f(x) - f(-x))/2.$$

**c.** What is the significance of the result in part (b)?

**20.** Let $g$ be a function that is differentiable throughout an open interval containing the origin. Suppose $g$ has the following properties:

**i.** $g(x + y) = \dfrac{g(x) + g(y)}{1 - g(x)g(y)}$ for all real numbers $x$, $y$, and $x + y$ in the domain of $g$.

**ii.** $\lim_{h \to 0} g(h) = 0$

**iii.** $\lim_{h \to 0} \dfrac{g(h)}{h} = 1$

**a.** Show that $g(0) = 0$.

**b.** Show that $g'(x) = 1 + [g(x)]^2$.

**c.** Find $g(x)$ by solving the differential equation in part (b).

## Applications

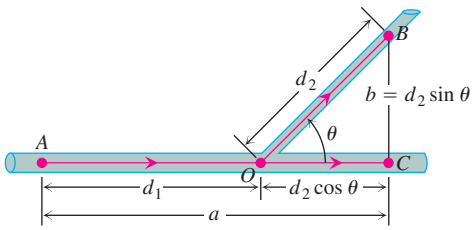
**21. Center of mass** Find the center of mass of a thin plate of constant density covering the region in the first and fourth quadrants enclosed by the curves $y = 1/(1 + x^2)$ and $y = -1/(1 + x^2)$ and by the lines $x = 0$ and $x = 1$.

**22. Solid of revolution** The region between the curve $y = 1/(2\sqrt{x})$ and the $x$-axis from $x = 1/4$ to $x = 4$ is revolved about the $x$-axis to generate a solid.

**a.** Find the volume of the solid.

**b.** Find the centroid of the region.

**23. The Rule of 70** If you use the approximation $\ln 2 \approx 0.70$ (in place of $0.69314\ldots$), you can derive a rule of thumb that says, "To estimate how many years it will take an amount of money to double when invested at $r$ percent compounded continuously, divide $r$ into 70." For instance, an amount of money invested at 5% will double in about $70/5 = 14$ years. If you want it to double in 10 years instead, you have to invest it at $70/10 = 7\%$. Show how the Rule of 70 is derived. (A similar "Rule of 72" uses 72 instead of 70, because 72 has more integer factors.)



**24. Free fall in the fourteenth century** In the middle of the fourteenth century, Albert of Saxony (1316–1390) proposed a model of free fall that assumed that the velocity of a falling body was proportional to the distance fallen. It seemed reasonable to think that a body that had fallen 20 ft might be moving twice as fast as a body that had fallen 10 ft. And besides, none of the instruments in use at the time were accurate enough to prove otherwise. Today we can see just how far off Albert of Saxony's model was by

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

solving the initial value problem implicit in his model. Solve the problem and compare your solution graphically with the equation $s = 16t^2$. You will see that it describes a motion that starts too slowly at first and then becomes too fast too soon to be realistic.

**25. The best branching angles for blood vessels and pipes** When a smaller pipe branches off from a larger one in a flow system, we may want it to run off at an angle that is best from some energy-saving point of view. We might require, for instance, that energy loss due to friction be minimized along the section $AOB$ shown in the accompanying figure. In this diagram, $B$ is a given point to be reached by the smaller pipe, $A$ is a point in the larger pipe upstream from $B$, and $O$ is the point where the branching occurs. A law due to Poiseuille states that the loss of energy due to friction in nonturbulent flow is proportional to the length of the path and inversely proportional to the fourth power of the radius. Thus, the loss along $AO$ is $(kd_1)/R^4$ and along $OB$ is $(kd_2)/r^4$, where $k$ is a constant, $d_1$ is the length of $AO$, $d_2$ is the length of $OB$, $R$ is the radius of the larger pipe, and $r$ is the radius of the smaller pipe. The angle $\theta$ is to be chosen to minimize the sum of these two losses:

$$L = k\frac{d_1}{R^4} + k\frac{d_2}{r^4}.$$

In our model, we assume that $AC = a$ and $BC = b$ are fixed. Thus we have the relations

$$d_1 + d_2\cos\theta = a \quad d_2\sin\theta = b,$$

so that

$$d_2 = b\csc\theta,$$
$$d_1 = a - d_2\cos\theta = a - b\cot\theta.$$

We can express the total loss $L$ as a function of $\theta$:

$$L = k\left(\frac{a - b\cot\theta}{R^4} + \frac{b\csc\theta}{r^4}\right).$$

**a.** Show that the critical value of $\theta$ for which $dL/d\theta$ equals zero is

$$\theta_c = \cos^{-1}\frac{r^4}{R^4}.$$

**b.** If the ratio of the pipe radii is $r/R = 5/6$, estimate to the nearest degree the optimal branching angle given in part (a).

The mathematical analysis described here is also used to explain the angles at which arteries branch in an animal's body. (See *Introduction to Mathematics for Life Scientists*, Second Edition, by E. Batschelet [New York: Springer-Verlag, 1976].)

**T 26. Group blood testing** During World War II it was necessary to administer blood tests to large numbers of recruits. There are two standard ways to administer a blood test to $N$ people. In method 1, each person is tested separately. In method 2, the blood samples of $x$ people are pooled and tested as one large sample. If the test is negative, this one test is enough for all $x$ people. If the test is positive, then each of the $x$ people is tested separately, requiring a total of $x + 1$ tests. Using the second method and some probability theory it can be shown that, on the average, the total number of tests $y$ will be

$$y = N\left(1 - q^x + \frac{1}{x}\right).$$

With $q = 0.99$ and $N = 1000$, find the integer value of $x$ that minimizes $y$. Also find the integer value of $x$ that maximizes $y$. (This second result is not important to the real-life situation.) The group testing method was used in World War II with a savings of 80% over the individual testing method, but not with the given value of $q$.

# Chapter 7 Practice Exercises

## Differentiation

In Exercises 1–24, find the derivative of $y$ with respect to the appropriate variable.

**1.** $y = 10e^{-x/5}$

**2.** $y = \sqrt{2}e^{\sqrt{2}x}$

**3.** $y = \frac{1}{4}xe^{4x} - \frac{1}{16}e^{4x}$

**4.** $y = x^2e^{-2/x}$

**5.** $y = \ln(\sin^2\theta)$

**6.** $y = \ln(\sec^2\theta)$

**7.** $y = \log_2(x^2/2)$

**8.** $y = \log_5(3x - 7)$

**9.** $y = 8^{-t}$

**10.** $y = 9^{2t}$

**11.** $y = 5x^{3.6}$

**12.** $y = \sqrt{2}x^{-\sqrt{2}}$

**13.** $y = (x + 2)^{x+2}$

**14.** $y = 2(\ln x)^{x/2}$

**15.** $y = \sin^{-1}\sqrt{1 - u^2}, \quad 0 < u < 1$

**16.** $y = \sin^{-1}\left(\frac{1}{\sqrt{v}}\right), \quad v > 1$

**17.** $y = \ln\cos^{-1}x$

**18.** $y = z\cos^{-1}z - \sqrt{1 - z^2}$

**19.** $y = t\tan^{-1}t - \frac{1}{2}\ln t$

**20.** $y = (1 + t^2)\cot^{-1}2t$

**21.** $y = z\sec^{-1}z - \sqrt{z^2 - 1}, \quad z > 1$

**22.** $y = 2\sqrt{x - 1}\ \sec^{-1}\sqrt{x}$

**23.** $y = \csc^{-1}(\sec\theta), \quad 0 < \theta < \pi/2$

**24.** $y = (1 + x^2)e^{\tan^{-1}x}$

## Logarithmic Differentiation

In Exercises 25–30, use logarithmic differentiation to find the derivative of $y$ with respect to the appropriate variable.

**25.** $y = \frac{2(x^2 + 1)}{\sqrt{\cos 2x}}$

**26.** $y = \sqrt[10]{\frac{3x + 4}{2x - 4}}$

**27.** $y = \left(\frac{(t + 1)(t - 1)}{(t - 2)(t + 3)}\right)^5, \quad t > 2$

**28.** $y = \frac{2u2^u}{\sqrt{u^2 + 1}}$

**29.** $y = (\sin\theta)^{\sqrt{\theta}}$

**30.** $y = (\ln x)^{1/(\ln x)}$

## Integration

Evaluate the integrals in Exercises 31–78.

**31.** $\int e^x \sin(e^x)\,dx$

**32.** $\int e^t \cos(3e^t - 2)\,dt$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**33.** $\int e^x \sec^2(e^x - 7)\,dx$

**34.** $\int e^y \csc(e^y + 1)\cot(e^y + 1)\,dy$

**35.** $\int \sec^2(x)e^{\tan x}\,dx$

**36.** $\int \csc^2 x\, e^{\cot x}\,dx$

**37.** $\int_{-1}^{1} \frac{dx}{3x - 4}$

**38.** $\int_{1}^{e} \frac{\sqrt{\ln x}}{x}\,dx$

**39.** $\int_{0}^{\pi} \tan\frac{x}{3}\,dx$

**40.** $\int_{1/6}^{1/4} 2\cot \pi x\,dx$

**41.** $\int_{0}^{4} \frac{2t}{t^2 - 25}\,dt$

**42.** $\int_{-\pi/2}^{\pi/6} \frac{\cos t}{1 - \sin t}\,dt$

**43.** $\int \frac{\tan(\ln v)}{v}\,dv$

**44.** $\int \frac{dv}{v \ln v}$

**45.** $\int \frac{(\ln x)^{-3}}{x}\,dx$

**46.** $\int \frac{\ln(x - 5)}{x - 5}\,dx$

**47.** $\int \frac{1}{r}\csc^2(1 + \ln r)\,dr$

**48.** $\int \frac{\cos(1 - \ln v)}{v}\,dv$

**49.** $\int x3^{x^2}\,dx$

**50.** $\int 2^{\tan x}\sec^2 x\,dx$

**51.** $\int_{1}^{7} \frac{3}{x}\,dx$

**52.** $\int_{1}^{32} \frac{1}{5x}\,dx$

**53.** $\int_{1}^{4} \left(\frac{x}{8} + \frac{1}{2x}\right)dx$

**54.** $\int_{1}^{8} \left(\frac{2}{3x} - \frac{8}{x^2}\right)dx$

**55.** $\int_{-2}^{-1} e^{-(x+1)}\,dx$

**56.** $\int_{-\ln 2}^{0} e^{2w}\,dw$

**57.** $\int_{0}^{\ln 5} e^r(3e^r + 1)^{-3/2}\,dr$

**58.** $\int_{0}^{\ln 9} e^{\theta}(e^{\theta} - 1)^{1/2}\,d\theta$

**59.** $\int_{1}^{e} \frac{1}{x}(1 + 7\ln x)^{-1/3}\,dx$

**60.** $\int_{e}^{e^2} \frac{1}{x\sqrt{\ln x}}\,dx$

**61.** $\int_{1}^{3} \frac{(\ln(v + 1))^2}{v + 1}\,dv$

**62.** $\int_{2}^{4} (1 + \ln t)t \ln t\,dt$

**63.** $\int_{1}^{8} \frac{\log_4 \theta}{\theta}\,d\theta$

**64.** $\int_{1}^{e} \frac{8 \ln 3 \log_3 \theta}{\theta}\,d\theta$

**65.** $\int_{-3/4}^{3/4} \frac{6\,dx}{\sqrt{9 - 4x^2}}$

**66.** $\int_{-1/5}^{1/5} \frac{6\,dx}{\sqrt{4 - 25x^2}}$

**67.** $\int_{-2}^{2} \frac{3\,dt}{4 + 3t^2}$

**68.** $\int_{\sqrt{3}}^{3} \frac{dt}{3 + t^2}$

**69.** $\int \frac{dy}{y\sqrt{4y^2 - 1}}$

**70.** $\int \frac{24\,dy}{y\sqrt{y^2 - 16}}$

**71.** $\int_{\sqrt{2}/3}^{2/3} \frac{dy}{|y|\sqrt{9y^2 - 1}}$

**72.** $\int_{-2/\sqrt{5}}^{-\sqrt{6}/\sqrt{5}} \frac{dy}{|y|\sqrt{5y^2 - 3}}$

**73.** $\int \frac{dx}{\sqrt{-2x - x^2}}$

**74.** $\int \frac{dx}{\sqrt{-x^2 + 4x - 1}}$

**75.** $\int_{-2}^{-1} \frac{2\,dv}{v^2 + 4v + 5}$

**76.** $\int_{-1}^{1} \frac{3\,dv}{4v^2 + 4v + 4}$

**77.** $\int \frac{dt}{(t + 1)\sqrt{t^2 + 2t - 8}}$

**78.** $\int \frac{dt}{(3t + 1)\sqrt{9t^2 + 6t}}$

## Solving Equations with Logarithmic or Exponential Terms

In Exercises 79–84, solve for $y$.

**79.** $3^y = 2^{y+1}$

**80.** $4^{-y} = 3^{y+2}$

**81.** $9e^{2y} = x^2$

**82.** $3^y = 3\ln x$

**83.** $\ln(y - 1) = x + \ln y$

**84.** $\ln(10 \ln y) = \ln 5x$

## Evaluating Limits

Find the limits in Exercises 85–96.

**85.** $\lim_{x\to 0} \frac{10^x - 1}{x}$

**86.** $\lim_{\theta\to 0} \frac{3^{\theta} - 1}{\theta}$

**87.** $\lim_{x\to 0} \frac{2^{\sin x} - 1}{e^x - 1}$

**88.** $\lim_{x\to 0} \frac{2^{-\sin x} - 1}{e^x - 1}$

**89.** $\lim_{x\to 0} \frac{5 - 5\cos x}{e^x - x - 1}$

**90.** $\lim_{x\to 0} \frac{4 - 4e^x}{xe^x}$

**91.** $\lim_{t\to 0^+} \frac{t - \ln(1 + 2t)}{t^2}$

**92.** $\lim_{x\to 4} \frac{\sin^2(\pi x)}{e^{x-4} + 3 - x}$

**93.** $\lim_{t\to 0^+} \left(\frac{e^t}{t} - \frac{1}{t}\right)$

**94.** $\lim_{y\to 0^+} e^{-1/y}\ln y$

**95.** $\lim_{x\to\infty} \left(1 + \frac{3}{x}\right)^x$

**96.** $\lim_{x\to 0^+} \left(1 + \frac{3}{x}\right)^x$

## Comparing Growth Rates of Functions

**97.** Does $f$ grow faster, slower, or at the same rate as $g$ as $x \to \infty$? Give reasons for your answers.

**a.** $f(x) = \log_2 x, \quad g(x) = \log_3 x$

**b.** $f(x) = x, \quad g(x) = x + \frac{1}{x}$

**c.** $f(x) = x/100, \quad g(x) = xe^{-x}$

**d.** $f(x) = x, \quad g(x) = \tan^{-1} x$

**e.** $f(x) = \csc^{-1} x, \quad g(x) = 1/x$

**f.** $f(x) = \sinh x, \quad g(x) = e^x$

**98.** Does $f$ grow faster, slower, or at the same rate as $g$ as $x \to \infty$? Give reasons for your answers.

**a.** $f(x) = 3^{-x}, \quad g(x) = 2^{-x}$

**b.** $f(x) = \ln 2x, \quad g(x) = \ln x^2$

**c.** $f(x) = 10x^3 + 2x^2, \quad g(x) = e^x$

**d.** $f(x) = \tan^{-1}(1/x), \quad g(x) = 1/x$

**e.** $f(x) = \sin^{-1}(1/x), \quad g(x) = 1/x^2$

**f.** $f(x) = \operatorname{sech} x, \quad g(x) = e^{-x}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**99.** True, or false? Give reasons for your answers.

**a.** $\frac{1}{x^2} + \frac{1}{x^4} = O\left(\frac{1}{x^2}\right)$ **b.** $\frac{1}{x^2} + \frac{1}{x^4} = O\left(\frac{1}{x^4}\right)$

**c.** $x = o(x + \ln x)$ **d.** $\ln(\ln x) = o(\ln x)$

**e.** $\tan^{-1} x = O(1)$ **f.** $\cosh x = O(e^x)$

**100.** True, or false? Give reasons for your answers.

**a.** $\frac{1}{x^4} = O\left(\frac{1}{x^2} + \frac{1}{x^4}\right)$ **b.** $\frac{1}{x^4} = o\left(\frac{1}{x^2} + \frac{1}{x^4}\right)$

**c.** $\ln x = o(x + 1)$ **d.** $\ln 2x = O(\ln x)$

**e.** $\sec^{-1} x = O(1)$ **f.** $\sinh x = O(e^x)$

## Theory and Applications

**101.** The function $f(x) = e^x + x$, being differentiable and one-to-one, has a differentiable inverse $f^{-1}(x)$. Find the value of $df^{-1}/dx$ at the point $f(\ln 2)$.

**102.** Find the inverse of the function $f(x) = 1 + (1/x), x \neq 0$. Then show that $f^{-1}(f(x)) = f(f^{-1}(x)) = x$ and that

$$\left.\frac{df^{-1}}{dx}\right|_{f(x)} = \frac{1}{f'(x)}.$$

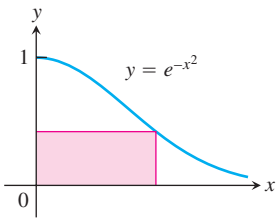
In Exercises 103 and 104, find the absolute maximum and minimum values of each function on the given interval.

**103.** $y = x \ln 2x - x, \quad \left[\frac{1}{2e}, \frac{e}{2}\right]$

**104.** $y = 10x(2 - \ln x), \quad (0, e^2]$

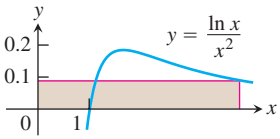
**105. Area** Find the area between the curve $y = 2(\ln x)/x$ and the $x$-axis from $x = 1$ to $x = e$.

**106. Area**



**a.** Show that the area between the curve $y = 1/x$ and the $x$-axis from $x = 10$ to $x = 20$ is the same as the area between the curve and the $x$-axis from $x = 1$ to $x = 2$.

**b.** Show that the area between the curve $y = 1/x$ and the $x$-axis from $ka$ to $kb$ is the same as the area between the curve and the $x$-axis from $x = a$ to $x = b$ $(0 < a < b, k > 0)$.



**107.** A particle is traveling upward and to the right along the curve $y = \ln x$. Its $x$-coordinate is increasing at the rate $(dx/dt) = \sqrt{x}$ m/sec. At what rate is the $y$-coordinate changing at the point $(e^2, 2)$?

**108.** A girl is sliding down a slide shaped like the curve $y = 9e^{-x/3}$. Her $y$-coordinate is changing at the rate $dy/dt = (-1/4)\sqrt{9 - y}$ ft/sec. At approximately what rate is her $x$-coordinate changing when she reaches the bottom of the slide at $x = 9$ ft? (Take $e^3$ to be 20 and round your answer to the nearest ft/sec.)

**109.** The rectangle shown here has one side on the positive $y$-axis, one side on the positive $x$-axis, and its upper right-hand vertex on the curve $y = e^{-x^2}$. What dimensions give the rectangle its largest area, and what is that area?

**110.** The rectangle shown here has one side on the positive $y$-axis, one side on the positive $x$-axis, and its upper right-hand vertex on the curve $y = (\ln x)/x^2$. What dimensions give the rectangle its largest area, and what is that area?

**111.** The functions $f(x) = \ln 5x$ and $g(x) = \ln 3x$ differ by a constant. What constant? Give reasons for your answer.

**112.** **a.** If $(\ln x)/x = (\ln 2)/2$, must $x = 2$?

**b.** If $(\ln x)/x = -2 \ln 2$, must $x = 1/2$?

Give reasons for your answers.

**113.** The quotient $(\log_4 x)/(\log_2 x)$ has a constant value. What value? Give reasons for your answer.

T **114. $\log_x(2)$ vs. $\log_2(x)$** How does $f(x) = \log_x(2)$ compare with $g(x) = \log_2(x)$? Here is one way to find out.

**a.** Use the equation $\log_a b = (\ln b)/(\ln a)$ to express $f(x)$ and $g(x)$ in terms of natural logarithms.

**b.** Graph $f$ and $g$ together. Comment on the behavior of $f$ in relation to the signs and values of $g$.

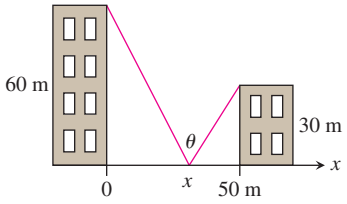
T **115.** Graph the following functions and use what you see to locate and estimate the extreme values, identify the coordinates of the inflection points, and identify the intervals on which the graphs are concave up and concave down. Then confirm your estimates by working with the functions' derivatives.

**a.** $y = (\ln x)/\sqrt{x}$ **b.** $y = e^{-x^2}$ **c.** $y = (1 + x)e^{-x}$

T **116.** Graph $f(x) = x \ln x$. Does the function appear to have an absolute minimum value? Confirm your answer with calculus.

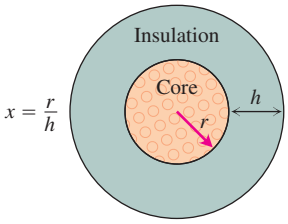
**117.** What is the age of a sample of charcoal in which 90% of the carbon-14 originally present has decayed?

**118. Cooling a pie** A deep-dish apple pie, whose internal temperature was 220°F when removed from the oven, was set out on a breezy 40°F porch to cool. Fifteen minutes later, the pie's internal temperature was 180°F. How long did it take the pie to cool from there to 70°F?



**119. Locating a solar station** You are under contract to build a solar station at ground level on the east–west line between the two buildings shown here. How far from the taller building should you place the station to maximize the number of hours it will be

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



in the sun on a day when the sun passes directly overhead? Begin by observing that

$$\theta = \pi - \cot^{-1}\frac{x}{60} - \cot^{-1}\frac{50 - x}{30}.$$

Then find the value of $x$ that maximizes $\theta$.

**120.** A round underwater transmission cable consists of a core of copper wires surrounded by nonconducting insulation. If $x$ denotes the ratio of the radius of the core to the thickness of the insulation, it is known that the speed of the transmission signal is given by the equation $v = x^2 \ln(1/x)$. If the radius of the core is 1 cm, what insulation thickness $h$ will allow the greatest transmission speed?

# Chapter 7 Questions to Guide Your Review

1. What functions have inverses? How do you know if two functions $f$ and $g$ are inverses of one another? Give examples of functions that are (are not) inverses of one another.
2. How are the domains, ranges, and graphs of functions and their inverses related? Give an example.
3. How can you sometimes express the inverse of a function of $x$ as a function of $x$?
4. Under what circumstances can you be sure that the inverse of a function $f$ is differentiable? How are the derivatives of $f$ and $f^{-1}$ related?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

5. What is the natural logarithm function? What are its domain, range, and derivative? What arithmetic properties does it have? Comment on its graph.
6. What is logarithmic differentiation? Give an example.
7. What integrals lead to logarithms? Give examples. What are the integrals of $\tan x$ and $\cot x$?
8. How is the exponential function $e^x$ defined? What are its domain, range, and derivative? What laws of exponents does it obey? Comment on its graph.
9. How are the functions $a^x$ and $\log_a x$ defined? Are there any restrictions on $a$? How is the graph of $\log_a x$ related to the graph of $\ln x$? What truth is there in the statement that there is really only one exponential function and one logarithmic function?
10. Describe some of the applications of base 10 logarithms.
11. What is the law of exponential change? How can it be derived from an initial value problem? What are some of the applications of the law?
12. How do you compare the growth rates of positive functions as $x \to \infty$?
13. What roles do the functions $e^x$ and $\ln x$ play in growth comparisons?
14. Describe big-oh and little-oh notation. Give examples.
15. Which is more efficient—a sequential search or a binary search? Explain.
16. How are the inverse trigonometric functions defined? How can you sometimes use right triangles to find values of these functions? Give examples.
17. What are the derivatives of the inverse trigonometric functions? How do the domains of the derivatives compare with the domains of the functions?
18. What integrals lead to inverse trigonometric functions? How do substitution and completing the square broaden the application of these integrals?
19. What are the six basic hyperbolic functions? Comment on their domains, ranges, and graphs. What are some of the identities relating them?
20. What are the derivatives of the six basic hyperbolic functions? What are the corresponding integral formulas? What similarities do you see here with the six basic trigonometric functions?
21. How are the inverse hyperbolic functions defined? Comment on their domains, ranges, and graphs. How can you find values of $\operatorname{sech}^{-1} x$, $\operatorname{csch}^{-1} x$, and $\coth^{-1} x$ using a calculator's keys for $\cosh^{-1} x$, $\sinh^{-1} x$, and $\tanh^{-1} x$?
22. What integrals lead naturally to inverse hyperbolic functions?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Chapter

# 8 TECHNIQUES OF INTEGRATION

**OVERVIEW** The Fundamental Theorem connects antiderivatives and the definite integral. Evaluating the indefinite integral

$$\int f(x)\,dx$$

is equivalent to finding a function $F$ such that $F'(x) = f(x)$, and then adding an arbitrary constant $C$:

$$\int f(x)\,dx = F(x) + C.$$

In this chapter we study a number of important techniques for finding indefinite integrals of more complicated functions than those seen before. The goal of this chapter is to show how to change unfamiliar integrals into integrals we can recognize, find in a table, or evaluate with a computer. We also extend the idea of the definite integral to *improper integrals* for which the integrand may be unbounded over the interval of integration, or the interval itself may no longer be finite.

## 8.1 Basic Integration Formulas

To help us in the search for finding indefinite integrals, it is useful to build up a table of integral formulas by inverting formulas for derivatives, as we have done in previous chapters. Then we try to match any integral that confronts us against one of the standard types. This usually involves a certain amount of algebraic manipulation as well as use of the Substitution Rule.

Recall the Substitution Rule from Section 5.5:

$$\int f(g(x))g'(x)\,dx = \int f(u)\,du$$

where $u = g(x)$ is a differentiable function whose range is an interval $I$ and $f$ is continuous on $I$. Success in integration often hinges on the ability to spot what part of the integrand should be called $u$ in order that one will also have $du$, so that a known formula can be applied. This means that the first requirement for skill in integration is a thorough mastery of the formulas for differentiation.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Table 8.1 shows the basic forms of integrals we have evaluated so far. In this section we present several algebraic or substitution methods to help us use this table. There is a more extensive table at the back of the book; we discuss its use in Section 8.6.

**TABLE 8.1** Basic integration formulas

1. $\int du = u + C$
2. $\int k\,du = ku + C \qquad$ (any number $k$)
3. $\int (du + dv) = \int du + \int dv$
4. $\int u^n\,du = \dfrac{u^{n+1}}{n+1} + C \qquad (n \neq -1)$
5. $\int \dfrac{du}{u} = \ln|u| + C$
6. $\int \sin u\,du = -\cos u + C$
7. $\int \cos u\,du = \sin u + C$
8. $\int \sec^2 u\,du = \tan u + C$
9. $\int \csc^2 u\,du = -\cot u + C$
10. $\int \sec u \tan u\,du = \sec u + C$
11. $\int \csc u \cot u\,du = -\csc u + C$
12. $\int \tan u\,du = -\ln|\cos u| + C = \ln|\sec u| + C$
13. $\int \cot u\,du = \ln|\sin u| + C = -\ln|\csc u| + C$
14. $\int e^u\,du = e^u + C$
15. $\int a^u\,du = \dfrac{a^u}{\ln a} + C \qquad (a > 0, a \neq 1)$
16. $\int \sinh u\,du = \cosh u + C$
17. $\int \cosh u\,du = \sinh u + C$
18. $\int \dfrac{du}{\sqrt{a^2 - u^2}} = \sin^{-1}\left(\dfrac{u}{a}\right) + C$
19. $\int \dfrac{du}{a^2 + u^2} = \dfrac{1}{a}\tan^{-1}\left(\dfrac{u}{a}\right) + C$
20. $\int \dfrac{du}{u\sqrt{u^2 - a^2}} = \dfrac{1}{a}\sec^{-1}\left|\dfrac{u}{a}\right| + C$
21. $\int \dfrac{du}{\sqrt{a^2 + u^2}} = \sinh^{-1}\left(\dfrac{u}{a}\right) + C \qquad (a > 0)$
22. $\int \dfrac{du}{\sqrt{u^2 - a^2}} = \cosh^{-1}\left(\dfrac{u}{a}\right) + C \qquad (u > a > 0)$

We often have to rewrite an integral to match it to a standard formula.

**EXAMPLE 1** Making a Simplifying Substitution

Evaluate

$$\int \frac{2x - 9}{\sqrt{x^2 - 9x + 1}}\,dx.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution**

$$\int \frac{2x-9}{\sqrt{x^2-9x+1}}\,dx = \int \frac{du}{\sqrt{u}} \qquad u = x^2 - 9x + 1,\ du = (2x-9)\,dx.$$

$$= \int u^{-1/2}\,du$$

$$= \frac{u^{(-1/2)+1}}{(-1/2)+1} + C \qquad \text{Table 8.1 Formula 4, with } n = -1/2$$

$$= 2u^{1/2} + C$$

$$= 2\sqrt{x^2-9x+1} + C \quad \blacksquare$$

**EXAMPLE 2** Completing the Square

Evaluate

$$\int \frac{dx}{\sqrt{8x-x^2}}.$$

**Solution** We complete the square to simplify the denominator:

$$8x - x^2 = -(x^2 - 8x) = -(x^2 - 8x + 16 - 16)$$

$$= -(x^2 - 8x + 16) + 16 = 16 - (x-4)^2.$$

Then

$$\int \frac{dx}{\sqrt{8x-x^2}} = \int \frac{dx}{\sqrt{16-(x-4)^2}}$$

$$= \int \frac{du}{\sqrt{a^2-u^2}} \qquad a = 4,\ u = (x-4),\ du = dx$$

$$= \sin^{-1}\left(\frac{u}{a}\right) + C \qquad \text{Table 8.1, Formula 18}$$

$$= \sin^{-1}\left(\frac{x-4}{4}\right) + C. \quad \blacksquare$$

**EXAMPLE 3** Expanding a Power and Using a Trigonometric Identity

Evaluate

$$\int (\sec x + \tan x)^2\,dx.$$

**Solution** We expand the integrand and get

$$(\sec x + \tan x)^2 = \sec^2 x + 2\sec x \tan x + \tan^2 x.$$

The first two terms on the right-hand side of this equation are familiar; we can integrate them at once. How about $\tan^2 x$? There is an identity that connects it with $\sec^2 x$:

$$\tan^2 x + 1 = \sec^2 x, \qquad \tan^2 x = \sec^2 x - 1.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We replace $\tan^2 x$ by $\sec^2 x - 1$ and get

$$\int (\sec x + \tan x)^2\,dx = \int (\sec^2 x + 2\sec x \tan x + \sec^2 x - 1)\,dx$$
$$= 2\int \sec^2 x\,dx + 2\int \sec x \tan x\,dx - \int 1\,dx$$
$$= 2\tan x + 2\sec x - x + C.$$

**EXAMPLE 4** Eliminating a Square Root

Evaluate

$$\int_0^{\pi/4} \sqrt{1 + \cos 4x}\,dx.$$

**Solution** We use the identity

$$\cos^2\theta = \frac{1 + \cos 2\theta}{2}, \qquad \text{or} \qquad 1 + \cos 2\theta = 2\cos^2\theta.$$

With $\theta = 2x$, this identity becomes

$$1 + \cos 4x = 2\cos^2 2x.$$

Hence,

$$\int_0^{\pi/4} \sqrt{1 + \cos 4x}\,dx = \int_0^{\pi/4} \sqrt{2}\sqrt{\cos^2 2x}\,dx$$
$$= \sqrt{2}\int_0^{\pi/4} |\cos 2x|\,dx \qquad \sqrt{u^2} = |u|$$
$$= \sqrt{2}\int_0^{\pi/4} \cos 2x\,dx \qquad \text{On } [0, \pi/4],\ \cos 2x \geq 0,\ \text{so } |\cos 2x| = \cos 2x.$$
$$= \sqrt{2}\left[\frac{\sin 2x}{2}\right]_0^{\pi/4} \qquad \text{Table 8.1, Formula 7, with } u = 2x \text{ and } du = 2\,dx$$
$$= \sqrt{2}\left[\frac{1}{2} - 0\right] = \frac{\sqrt{2}}{2}.$$

**EXAMPLE 5** Reducing an Improper Fraction

Evaluate

$$\int \frac{3x^2 - 7x}{3x + 2}\,dx.$$

**Solution** The integrand is an improper fraction (degree of numerator greater than or equal to degree of denominator). To integrate it, we divide first, getting a quotient plus a remainder that is a proper fraction:

$$\begin{array}{r} x - 3 \\ 3x + 2\overline{)\,3x^2 - 7x} \\ \underline{3x^2 + 2x} \\ -9x \\ \underline{-9x - 6} \\ +6 \end{array}$$

$$\frac{3x^2 - 7x}{3x + 2} = x - 3 + \frac{6}{3x + 2}.$$

Therefore,

$$\int \frac{3x^2 - 7x}{3x + 2}\,dx = \int \left(x - 3 + \frac{6}{3x + 2}\right)dx = \frac{x^2}{2} - 3x + 2\ln|3x + 2| + C.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Reducing an improper fraction by long division (Example 5) does not always lead to an expression we can integrate directly. We see what to do about that in Section 8.5.

**EXAMPLE 6** Separating a Fraction

Evaluate

$$\int \frac{3x + 2}{\sqrt{1 - x^2}}\,dx.$$

**Solution** We first separate the integrand to get

$$\int \frac{3x + 2}{\sqrt{1 - x^2}}\,dx = 3\int \frac{x\,dx}{\sqrt{1 - x^2}} + 2\int \frac{dx}{\sqrt{1 - x^2}}.$$

In the first of these new integrals, we substitute

$$u = 1 - x^2, \qquad du = -2x\,dx, \qquad \text{and} \qquad x\,dx = -\frac{1}{2}\,du.$$

$$3\int \frac{x\,dx}{\sqrt{1 - x^2}} = 3\int \frac{(-1/2)\,du}{\sqrt{u}} = -\frac{3}{2}\int u^{-1/2}\,du$$

$$= -\frac{3}{2}\cdot\frac{u^{1/2}}{1/2} + C_1 = -3\sqrt{1 - x^2} + C_1$$

The second of the new integrals is a standard form,

$$2\int \frac{dx}{\sqrt{1 - x^2}} = 2\sin^{-1}x + C_2.$$

Combining these results and renaming $C_1 + C_2$ as $C$ gives

$$\int \frac{3x + 2}{\sqrt{1 - x^2}}\,dx = -3\sqrt{1 - x^2} + 2\sin^{-1}x + C.$$ ■

The final example of this section calculates an important integral by the algebraic technique of multiplying the integrand by a form of 1 to change the integrand into one we can integrate.

HISTORICAL BIOGRAPHY

George David Birkhoff (1884–1944)

**EXAMPLE 7** Integral of $y = \sec x$—Multiplying by a Form of 1

Evaluate

$$\int \sec x\,dx.$$

**Solution**

$$\int \sec x\,dx = \int (\sec x)(1)\,dx = \int \sec x\cdot\frac{\sec x + \tan x}{\sec x + \tan x}\,dx$$

$$= \int \frac{\sec^2 x + \sec x\tan x}{\sec x + \tan x}\,dx$$

$$= \int \frac{du}{u} \qquad u = \tan x + \sec x,\ du = (\sec^2 x + \sec x\tan x)\,dx$$

$$= \ln|u| + C = \ln|\sec x + \tan x| + C.$$ ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

With cosecants and cotangents in place of secants and tangents, the method of Example 7 leads to a companion formula for the integral of the cosecant (see Exercise 95).

**TABLE 8.2** The secant and cosecant integrals

1. $\int \sec u\, du = \ln|\sec u + \tan u| + C$
2. $\int \csc u\, du = -\ln|\csc u + \cot u| + C$

## Procedures for Matching Integrals to Basic Formulas

| PROCEDURE | EXAMPLE |
|---|---|
| Making a simplifying substitution | $\dfrac{2x-9}{\sqrt{x^2-9x+1}}\,dx = \dfrac{du}{\sqrt{u}}$ |
| Completing the square | $\sqrt{8x-x^2} = \sqrt{16-(x-4)^2}$ |
| Using a trigonometric identity | $(\sec x + \tan x)^2 = \sec^2 x + 2\sec x\tan x + \tan^2 x$<br>$= \sec^2 x + 2\sec x\tan x + (\sec^2 x - 1)$<br>$= 2\sec^2 x + 2\sec x\tan x - 1$ |
| Eliminating a square root | $\sqrt{1+\cos 4x} = \sqrt{2\cos^2 2x} = \sqrt{2}\,\lvert\cos 2x\rvert$ |
| Reducing an improper fraction | $\dfrac{3x^2-7x}{3x+2} = x - 3 + \dfrac{6}{3x+2}$ |
| Separating a fraction | $\dfrac{3x+2}{\sqrt{1-x^2}} = \dfrac{3x}{\sqrt{1-x^2}} + \dfrac{2}{\sqrt{1-x^2}}$ |
| Multiplying by a form of 1 | $\sec x = \sec x \cdot \dfrac{\sec x + \tan x}{\sec x + \tan x}$<br>$= \dfrac{\sec^2 x + \sec x\tan x}{\sec x + \tan x}$ |

# EXERCISES 8.1

## Basic Substitutions

Evaluate each integral in Exercises 1–36 by using a substitution to reduce it to standard form.

**1.** $\displaystyle\int \frac{16x\,dx}{\sqrt{8x^2 + 1}}$

**2.** $\displaystyle\int \frac{3\cos x\,dx}{\sqrt{1 + 3\sin x}}$

**3.** $\displaystyle\int 3\sqrt{\sin v}\cos v\,dv$

**4.** $\displaystyle\int \cot^3 y \csc^2 y\,dy$

**5.** $\displaystyle\int_0^1 \frac{16x\,dx}{8x^2 + 2}$

**6.** $\displaystyle\int_{\pi/4}^{\pi/3} \frac{\sec^2 z}{\tan z}\,dz$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

7. $\int \frac{dx}{\sqrt{x}(\sqrt{x}+1)}$

8. $\int \frac{dx}{x-\sqrt{x}}$

9. $\int \cot(3-7x)\,dx$

10. $\int \csc(\pi x-1)\,dx$

11. $\int e^{\theta}\csc(e^{\theta}+1)\,d\theta$

12. $\int \frac{\cot(3+\ln x)}{x}\,dx$

13. $\int \sec\frac{t}{3}\,dt$

14. $\int x\sec(x^2-5)\,dx$

15. $\int \csc(s-\pi)\,ds$

16. $\int \frac{1}{\theta^2}\csc\frac{1}{\theta}\,d\theta$

17. $\int_0^{\sqrt{\ln 2}} 2x\,e^{x^2}\,dx$

18. $\int_{\pi/2}^{\pi} (\sin y)e^{\cos y}\,dy$

19. $\int e^{\tan v}\sec^2 v\,dv$

20. $\int \frac{e^{\sqrt{t}}\,dt}{\sqrt{t}}$

21. $\int 3^{x+1}\,dx$

22. $\int \frac{2^{\ln x}}{x}\,dx$

23. $\int \frac{2^{\sqrt{w}}\,dw}{2\sqrt{w}}$

24. $\int 10^{2\theta}\,d\theta$

25. $\int \frac{9\,du}{1+9u^2}$

26. $\int \frac{4\,dx}{1+(2x+1)^2}$

27. $\int_0^{1/6} \frac{dx}{\sqrt{1-9x^2}}$

28. $\int_0^{1} \frac{dt}{\sqrt{4-t^2}}$

29. $\int \frac{2s\,ds}{\sqrt{1-s^4}}$

30. $\int \frac{2\,dx}{x\sqrt{1-4\ln^2 x}}$

31. $\int \frac{6\,dx}{x\sqrt{25x^2-1}}$

32. $\int \frac{dr}{r\sqrt{r^2-9}}$

33. $\int \frac{dx}{e^x+e^{-x}}$

34. $\int \frac{dy}{\sqrt{e^{2y}-1}}$

35. $\int_1^{e^{\pi/3}} \frac{dx}{x\cos(\ln x)}$

36. $\int \frac{\ln x\,dx}{x+4x\ln^2 x}$

## Completing the Square

Evaluate each integral in Exercises 37–42 by completing the square and using a substitution to reduce it to standard form.

Exercises

37. $\int_1^2 \frac{8\,dx}{x^2-2x+2}$

38. $\int_2^4 \frac{2\,dx}{x^2-6x+10}$

39. $\int \frac{dt}{\sqrt{-t^2+4t-3}}$

40. $\int \frac{d\theta}{\sqrt{2\theta-\theta^2}}$

41. $\int \frac{dx}{(x+1)\sqrt{x^2+2x}}$

42. $\int \frac{dx}{(x-2)\sqrt{x^2-4x+3}}$

## Trigonometric Identities

Evaluate each integral in Exercises 43–46 by using trigonometric identities and substitutions to reduce it to standard form.

Exercises

43. $\int (\sec x+\cot x)^2\,dx$

44. $\int (\csc x-\tan x)^2\,dx$

45. $\int \csc x\sin 3x\,dx$

46. $\int (\sin 3x\cos 2x-\cos 3x\sin 2x)\,dx$

## Improper Fractions

Evaluate each integral in Exercises 47–52 by reducing the improper fraction and using a substitution (if necessary) to reduce it to standard form.

Exercises

47. $\int \frac{x}{x+1}\,dx$

48. $\int \frac{x^2}{x^2+1}\,dx$

49. $\int_{\sqrt{2}}^{3} \frac{2x^3}{x^2-1}\,dx$

50. $\int_{-1}^{3} \frac{4x^2-7}{2x+3}\,dx$

51. $\int \frac{4t^3-t^2+16t}{t^2+4}\,dt$

52. $\int \frac{2\theta^3-7\theta^2+7\theta}{2\theta-5}\,d\theta$

## Separating Fractions

Evaluate each integral in Exercises 53–56 by separating the fraction and using a substitution (if necessary) to reduce it to standard form.

Exercises

53. $\int \frac{1-x}{\sqrt{1-x^2}}\,dx$

54. $\int \frac{x+2\sqrt{x-1}}{2x\sqrt{x-1}}\,dx$

55. $\int_0^{\pi/4} \frac{1+\sin x}{\cos^2 x}\,dx$

56. $\int_0^{1/2} \frac{2-8x}{1+4x^2}\,dx$

## Multiplying by a Form of 1

Evaluate each integral in Exercises 57–62 by multiplying by a form of 1 and using a substitution (if necessary) to reduce it to standard form.

Exercises

57. $\int \frac{1}{1+\sin x}\,dx$

58. $\int \frac{1}{1+\cos x}\,dx$

59. $\int \frac{1}{\sec\theta+\tan\theta}\,d\theta$

60. $\int \frac{1}{\csc\theta+\cot\theta}\,d\theta$

61. $\int \frac{1}{1-\sec x}\,dx$

62. $\int \frac{1}{1-\csc x}\,dx$

## Eliminating Square Roots

Evaluate each integral in Exercises 63–70 by eliminating the square root.

Exercises

63. $\int_0^{2\pi} \sqrt{\frac{1-\cos x}{2}}\,dx$

64. $\int_0^{\pi} \sqrt{1-\cos 2x}\,dx$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**65.** $\int_{\pi/2}^{\pi} \sqrt{1 + \cos 2t}\, dt$ **66.** $\int_{-\pi}^{0} \sqrt{1 + \cos t}\, dt$

**67.** $\int_{-\pi}^{0} \sqrt{1 - \cos^2 \theta}\, d\theta$ **68.** $\int_{\pi/2}^{\pi} \sqrt{1 - \sin^2 \theta}\, d\theta$

**69.** $\int_{-\pi/4}^{\pi/4} \sqrt{1 + \tan^2 y}\, dy$ **70.** $\int_{-\pi/4}^{0} \sqrt{\sec^2 y - 1}\, dy$

## Assorted Integrations

Evaluate each integral in Exercises 71–82 by using any technique you think is appropriate.

**71.** $\int_{\pi/4}^{3\pi/4} (\csc x - \cot x)^2\, dx$ **72.** $\int_{0}^{\pi/4} (\sec x + 4 \cos x)^2\, dx$

**73.** $\int \cos\theta \csc(\sin\theta)\, d\theta$ **74.** $\int \left(1 + \frac{1}{x}\right) \cot(x + \ln x)\, dx$

**75.** $\int (\csc x - \sec x)(\sin x + \cos x)\, dx$

**76.** $\int 3 \sinh\left(\frac{x}{2} + \ln 5\right) dx$

**77.** $\int \frac{6\, dy}{\sqrt{y}(1 + y)}$ **78.** $\int \frac{dx}{x\sqrt{4x^2 - 1}}$

**79.** $\int \frac{7\, dx}{(x - 1)\sqrt{x^2 - 2x - 48}}$ **80.** $\int \frac{dx}{(2x + 1)\sqrt{4x^2 + 4x}}$

**81.** $\int \sec^2 t \tan(\tan t)\, dt$ **82.** $\int \frac{dx}{x\sqrt{3 + x^2}}$

## Trigonometric Powers

**83. a.** Evaluate $\int \cos^3\theta\, d\theta$. (*Hint:* $\cos^2\theta = 1 - \sin^2\theta$.)

**b.** Evaluate $\int \cos^5\theta\, d\theta$.

**c.** Without actually evaluating the integral, explain how you would evaluate $\int \cos^9\theta\, d\theta$.

**84. a.** Evaluate $\int \sin^3\theta\, d\theta$. (*Hint:* $\sin^2\theta = 1 - \cos^2\theta$.)

**b.** Evaluate $\int \sin^5\theta\, d\theta$.

**c.** Evaluate $\int \sin^7\theta\, d\theta$.

**d.** Without actually evaluating the integral, explain how you would evaluate $\int \sin^{13}\theta\, d\theta$.

**85. a.** Express $\int \tan^3\theta\, d\theta$ in terms of $\int \tan\theta\, d\theta$. Then evaluate $\int \tan^3\theta\, d\theta$. (*Hint:* $\tan^2\theta = \sec^2\theta - 1$.)

**b.** Express $\int \tan^5\theta\, d\theta$ in terms of $\int \tan^3\theta\, d\theta$.

**c.** Express $\int \tan^7\theta\, d\theta$ in terms of $\int \tan^5\theta\, d\theta$.

**d.** Express $\int \tan^{2k+1}\theta\, d\theta$, where $k$ is a positive integer, in terms of $\int \tan^{2k-1}\theta\, d\theta$.

**86. a.** Express $\int \cot^3\theta\, d\theta$ in terms of $\int \cot\theta\, d\theta$. Then evaluate $\int \cot^3\theta\, d\theta$. (*Hint:* $\cot^2\theta = \csc^2\theta - 1$.)

**b.** Express $\int \cot^5\theta\, d\theta$ in terms of $\int \cot^3\theta\, d\theta$.

**c.** Express $\int \cot^7\theta\, d\theta$ in terms of $\int \cot^5\theta\, d\theta$.

**d.** Express $\int \cot^{2k+1}\theta\, d\theta$, where $k$ is a positive integer, in terms of $\int \cot^{2k-1}\theta\, d\theta$.

## Theory and Examples

**87. Area** Find the area of the region bounded above by $y = 2\cos x$ and below by $y = \sec x$, $-\pi/4 \le x \le \pi/4$.

**88. Area** Find the area of the "triangular" region that is bounded from above and below by the curves $y = \csc x$ and $y = \sin x$, $\pi/6 \le x \le \pi/2$, and on the left by the line $x = \pi/6$.

**89. Volume** Find the volume of the solid generated by revolving the region in Exercise 87 about the $x$-axis.

**90. Volume** Find the volume of the solid generated by revolving the region in Exercise 88 about the $x$-axis.

**91. Arc length** Find the length of the curve $y = \ln(\cos x)$, $0 \le x \le \pi/3$.

**92. Arc length** Find the length of the curve $y = \ln(\sec x)$, $0 \le x \le \pi/4$.

**93. Centroid** Find the centroid of the region bounded by the $x$-axis, the curve $y = \sec x$, and the lines $x = -\pi/4$, $x = \pi/4$.

**94. Centroid** Find the centroid of the region that is bounded by the $x$-axis, the curve $y = \csc x$, and the lines $x = \pi/6$, $x = 5\pi/6$.

**95. The integral of csc *x*** Repeat the derivation in Example 7, using cofunctions, to show that

$$\int \csc x\, dx = -\ln|\csc x + \cot x| + C.$$

**96. Using different substitutions** Show that the integral

$$\int ((x^2 - 1)(x + 1))^{-2/3}\, dx$$

can be evaluated with any of the following substitutions.

**a.** $u = 1/(x + 1)$

**b.** $u = ((x - 1)/(x + 1))^k$ for $k = 1, 1/2, 1/3, -1/3, -2/3$, and $-1$

**c.** $u = \tan^{-1} x$

**d.** $u = \tan^{-1}\sqrt{x}$ **e.** $u = \tan^{-1}((x - 1)/2)$

**f.** $u = \cos^{-1} x$ **g.** $u = \cosh^{-1} x$

What is the value of the integral? (*Source:* "Problems and Solutions," *College Mathematics Journal*, Vol. 21, No. 5 (Nov. 1990), pp. 425–426.)

# 8.2 Integration by Parts

Since

$$\int x\,dx = \frac{1}{2}x^2 + C$$

and

$$\int x^2\,dx = \frac{1}{3}x^3 + C,$$

it is apparent that

$$\int x \cdot x\,dx \neq \int x\,dx \cdot \int x\,dx.$$

In other words, the integral of a product is generally *not* the product of the individual-integrals:

$$\int f(x)g(x)\,dx \text{ is not equal to } \int f(x)\,dx \cdot \int g(x)\,dx.$$

Integration by parts is a technique for simplifying integrals of the form

$$\int f(x)g(x)\,dx.$$

It is useful when $f$ can be differentiated repeatedly and $g$ can be integrated repeatedly without difficulty. The integral

$$\int xe^x\,dx$$

is such an integral because $f(x) = x$ can be differentiated twice to become zero and $g(x) = e^x$ can be integrated repeatedly without difficulty. Integration by parts also applies to integrals like

$$\int e^x \sin x\,dx$$

in which each part of the integrand appears again after repeated differentiation or integration.

In this section, we describe integration by parts and show how to apply it.

## Product Rule in Integral Form

If $f$ and $g$ are differentiable functions of $x$, the Product Rule says

$$\frac{d}{dx}[f(x)g(x)] = f'(x)g(x) + f(x)g'(x).$$

In terms of indefinite integrals, this equation becomes

$$\int \frac{d}{dx}[f(x)g(x)]\,dx = \int [f'(x)g(x) + f(x)g'(x)]\,dx$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

or

$$\int \frac{d}{dx}[f(x)g(x)]\,dx = \int f'(x)g(x)\,dx + \int f(x)g'(x)\,dx.$$

Rearranging the terms of this last equation, we get

$$\int f(x)g'(x)\,dx = \int \frac{d}{dx}[f(x)g(x)]\,dx - \int f'(x)g(x)\,dx$$

leading to the **integration by parts** formula

$$\int f(x)g'(x)\,dx = f(x)g(x) - \int f'(x)g(x)\,dx \qquad (1)$$

Sometimes it is easier to remember the formula if we write it in differential form. Let $u = f(x)$ and $v = g(x)$. Then $du = f'(x)\,dx$ and $dv = g'(x)\,dx$. Using the Substitution Rule, the integration by parts formula becomes

**Integration by Parts Formula**

$$\int u\,dv = uv - \int v\,du \qquad (2)$$

This formula expresses one integral, $\int u\,dv$, in terms of a second integral, $\int v\,du$. With a proper choice of $u$ and $v$, the second integral may be easier to evaluate than the first. In using the formula, various choices may be available for $u$ and $dv$. The next examples illustrate the technique.

**EXAMPLE 1** Using Integration by Parts

Find

$$\int x\cos x\,dx.$$

**Solution** We use the formula $\int u\,dv = uv - \int v\,du$ with

$$u = x, \qquad dv = \cos x\,dx,$$
$$du = dx, \qquad v = \sin x. \qquad \text{Simplest antiderivative of } \cos x$$

Then

$$\int x\cos x\,dx = x\sin x - \int \sin x\,dx = x\sin x + \cos x + C. \quad \blacksquare$$

Let us examine the choices available for $u$ and $dv$ in Example 1.

**EXAMPLE 2** Example 1 Revisited

To apply integration by parts to

$$\int x\cos x\,dx = \int u\,dv$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

we have four possible choices:

**1.** Let $u = 1$ and $dv = x \cos x\, dx$.
**2.** Let $u = x$ and $dv = \cos x\, dx$.
**3.** Let $u = x \cos x$ and $dv = dx$.
**4.** Let $u = \cos x$ and $dv = x\, dx$.

Let's examine these one at a time.

Choice 1 won't do because we don't know how to integrate $dv = x \cos x\, dx$ to get $v$.

Choice 2 works well, as we saw in Example 1.

Choice 3 leads to

$$u = x \cos x, \qquad dv = dx,$$
$$du = (\cos x - x \sin x)\, dx, \qquad v = x,$$

and the new integral

$$\int v\, du = \int (x \cos x - x^2 \sin x)\, dx.$$

This is worse than the integral we started with.

Choice 4 leads to

$$u = \cos x, \qquad dv = x\, dx,$$
$$du = -\sin x\, dx, \qquad v = x^2/2,$$

so the new integral is

$$\int v\, du = -\int \frac{x^2}{2} \sin x\, dx.$$

This, too, is worse. ■

The goal of integration by parts is to go from an integral $\int u\, dv$ that we don't see how to evaluate to an integral $\int v\, du$ that we can evaluate. Generally, you choose $dv$ first to be as much of the integrand, including $dx$, as you can readily integrate; $u$ is the leftover part. Keep in mind that integration by parts does not always work.

## EXAMPLE 3 Integral of the Natural Logarithm

Find

$$\int \ln x\, dx.$$

**Solution** Since $\int \ln x\, dx$ can be written as $\int \ln x \cdot 1\, dx$, we use the formula $\int u\, dv = uv - \int v\, du$ with

$u = \ln x$ Simplifies when differentiated $\qquad dv = dx$ Easy to integrate

$du = \frac{1}{x}\, dx,$ $\qquad v = x.$ Simplest antiderivative

Then

$$\int \ln x\, dx = x \ln x - \int x \cdot \frac{1}{x}\, dx = x \ln x - \int dx = x \ln x - x + C.$$ ■

Sometimes we have to use integration by parts more than once.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 4** Repeated Use of Integration by Parts

Evaluate

$$\int x^2 e^x \, dx.$$

**Solution** With $u = x^2$, $dv = e^x \, dx$, $du = 2x \, dx$, and $v = e^x$, we have

$$\int x^2 e^x \, dx = x^2 e^x - 2\int x e^x \, dx.$$

The new integral is less complicated than the original because the exponent on $x$ is reduced by one. To evaluate the integral on the right, we integrate by parts again with $u = x$, $dv = e^x \, dx$. Then $du = dx$, $v = e^x$, and

$$\int x e^x \, dx = x e^x - \int e^x \, dx = x e^x - e^x + C.$$

Hence,

$$\begin{aligned}\int x^2 e^x \, dx &= x^2 e^x - 2\int x e^x \, dx \\ &= x^2 e^x - 2x e^x + 2e^x + C.\end{aligned}$$

■

The technique of Example 4 works for any integral $\int x^n e^x \, dx$ in which $n$ is a positive integer, because differentiating $x^n$ will eventually lead to zero and integrating $e^x$ is easy. We say more about this later in this section when we discuss *tabular integration.*

Integrals like the one in the next example occur in electrical engineering. Their evaluation requires two integrations by parts, followed by solving for the unknown integral.

**EXAMPLE 5** Solving for the Unknown Integral

Evaluate

$$\int e^x \cos x \, dx.$$

**Solution** Let $u = e^x$ and $dv = \cos x \, dx$. Then $du = e^x \, dx$, $v = \sin x$, and

$$\int e^x \cos x \, dx = e^x \sin x - \int e^x \sin x \, dx.$$

The second integral is like the first except that it has $\sin x$ in place of $\cos x$. To evaluate it, we use integration by parts with

$$u = e^x, \qquad dv = \sin x \, dx, \qquad v = -\cos x, \qquad du = e^x \, dx.$$

Then

$$\begin{aligned}\int e^x \cos x \, dx &= e^x \sin x - \left(-e^x \cos x - \int (-\cos x)(e^x \, dx)\right) \\ &= e^x \sin x + e^x \cos x - \int e^x \cos x \, dx.\end{aligned}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The unknown integral now appears on both sides of the equation. Adding the integral to both sides and adding the constant of integration gives

$$2\int e^x \cos x\, dx = e^x \sin x + e^x \cos x + C_1.$$

Dividing by 2 and renaming the constant of integration gives

$$\int e^x \cos x\, dx = \frac{e^x \sin x + e^x \cos x}{2} + C.$$

## Evaluating Definite Integrals by Parts

The integration by parts formula in Equation (1) can be combined with Part 2 of the Fundamental Theorem in order to evaluate definite integrals by parts. Assuming that both $f'$ and $g'$ are continuous over the interval $[a, b]$, Part 2 of the Fundamental Theorem gives

**Integration by Parts Formula for Definite Integrals**

$$\int_a^b f(x)g'(x)\, dx = f(x)g(x)\Big]_a^b - \int_a^b f'(x)g(x)\, dx \tag{3}$$

In applying Equation (3), we normally use the $u$ and $v$ notation from Equation (2) because it is easier to remember. Here is an example.

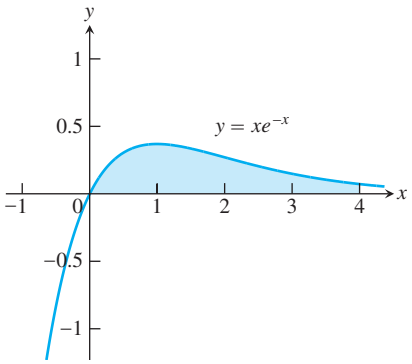

**FIGURE 8.1** The region in Example 6.

### EXAMPLE 6 Finding Area

Find the area of the region bounded by the curve $y = xe^{-x}$ and the $x$-axis from $x = 0$ to $x = 4$.

**Solution** The region is shaded in Figure 8.1. Its area is

$$\int_0^4 xe^{-x}\, dx.$$

Let $u = x$, $dv = e^{-x}\, dx$, $v = -e^{-x}$, and $du = dx$. Then,

$$\begin{aligned}\int_0^4 xe^{-x}\, dx &= -xe^{-x}\Big]_0^4 - \int_0^4 (-e^{-x})\, dx \\ &= [-4e^{-4} - (0)] + \int_0^4 e^{-x}\, dx \\ &= -4e^{-4} - e^{-x}\Big]_0^4 \\ &= -4e^{-4} - e^{-4} - (-e^0) = 1 - 5e^{-4} \approx 0.91.\end{aligned}$$

## Tabular Integration

We have seen that integrals of the form $\int f(x)g(x)\, dx$, in which $f$ can be differentiated repeatedly to become zero and $g$ can be integrated repeatedly without difficulty, are natural candidates for integration by parts. However, if many repetitions are required, the calculations can be cumbersome. In situations like this, there is a way to organize

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

the calculations that saves a great deal of work. It is called **tabular integration** and is illustrated in the following examples.

**EXAMPLE 7** Using Tabular Integration

Evaluate

$$\int x^2 e^x \, dx.$$

**Solution** With $f(x) = x^2$ and $g(x) = e^x$, we list:

| $f(x)$ and its derivatives | | $g(x)$ and its integrals |
|---|---|---|
| $x^2$ | $(+)$ | $e^x$ |
| $2x$ | $(-)$ | $e^x$ |
| $2$ | $(+)$ | $e^x$ |
| $0$ | | $e^x$ |

We combine the products of the functions connected by the arrows according to the operation signs above the arrows to obtain

$$\int x^2 e^x \, dx = x^2 e^x - 2xe^x + 2e^x + C.$$

Compare this with the result in Example 4. ■

**EXAMPLE 8** Using Tabular Integration

Evaluate

$$\int x^3 \sin x \, dx.$$

**Solution** With $f(x) = x^3$ and $g(x) = \sin x$, we list:

| $f(x)$ and its derivatives | | $g(x)$ and its integrals |
|---|---|---|
| $x^3$ | $(+)$ | $\sin x$ |
| $3x^2$ | $(-)$ | $-\cos x$ |
| $6x$ | $(+)$ | $-\sin x$ |
| $6$ | $(-)$ | $\cos x$ |
| $0$ | | $\sin x$ |

Again we combine the products of the functions connected by the arrows according to the operation signs above the arrows to obtain

$$\int x^3 \sin x \, dx = -x^3 \cos x + 3x^2 \sin x + 6x \cos x - 6 \sin x + C.$$ ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The Additional Exercises at the end of this chapter show how tabular integration can be used when neither function $f$ nor $g$ can be differentiated repeatedly to become zero.

## Summary

When substitution doesn't work, try integration by parts. Start with an integral in which the integrand is the product of two functions,

$$\int f(x)g(x)\,dx.$$

(Remember that $g$ may be the constant function 1, as in Example 3.) Match the integral with the form

$$\int u\,dv$$

by choosing $dv$ to be part of the integrand including $dx$ and either $f(x)$ or $g(x)$. Remember that we must be able to readily integrate $dv$ to get $v$ in order to obtain the right side of the formula

$$\int u\,dv = uv - \int v\,du.$$

If the new integral on the right side is more complex than the original one, try a different choice for $u$ and $dv$.

### EXAMPLE 9 A Reduction Formula

Obtain a "reduction" formula that expresses the integral

$$\int \cos^n x\,dx$$

in terms of an integral of a lower power of $\cos x$.

**Solution** We may think of $\cos^n x$ as $\cos^{n-1} x \cdot \cos x$. Then we let

$$u = \cos^{n-1} x \qquad \text{and} \qquad dv = \cos x\,dx,$$

so that

$$du = (n-1)\cos^{n-2} x\,(-\sin x\,dx) \qquad \text{and} \qquad v = \sin x.$$

Hence

$$\begin{aligned}\int \cos^n x\,dx &= \cos^{n-1} x \sin x + (n-1)\int \sin^2 x \cos^{n-2} x\,dx \\ &= \cos^{n-1} x \sin x + (n-1)\int (1-\cos^2 x)\cos^{n-2} x\,dx, \\ &= \cos^{n-1} x \sin x + (n-1)\int \cos^{n-2} x\,dx - (n-1)\int \cos^n x\,dx.\end{aligned}$$

If we add

$$(n-1)\int \cos^n x\,dx$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

to both sides of this equation, we obtain

$$n\int \cos^n x\,dx = \cos^{n-1} x \sin x + (n-1)\int \cos^{n-2} x\,dx.$$

We then divide through by $n$, and the final result is

$$\int \cos^n x\,dx = \frac{\cos^{n-1} x \sin x}{n} + \frac{n-1}{n}\int \cos^{n-2} x\,dx.$$

This allows us to reduce the exponent on $\cos x$ by 2 and is a very useful formula. When $n$ is a positive integer, we may apply the formula repeatedly until the remaining integral is either

$$\int \cos x\,dx = \sin x + C \qquad \text{or} \qquad \int \cos^0 x\,dx = \int dx = x + C.$$ ■

**EXAMPLE 10** Using a Reduction Formula

Evaluate

$$\int \cos^3 x\,dx.$$

**Solution** From the result in Example 9,

$$\int \cos^3 x\,dx = \frac{\cos^2 x \sin x}{3} + \frac{2}{3}\int \cos x\,dx$$

$$= \frac{1}{3}\cos^2 x \sin x + \frac{2}{3}\sin x + C.$$ ■

# EXERCISES 8.2

## Integration by Parts

Evaluate the integrals in Exercises 1–24.

1. $\int x \sin \frac{x}{2}\, dx$
2. $\int \theta \cos \pi\theta\, d\theta$
3. $\int t^2 \cos t\, dt$
4. $\int x^2 \sin x\, dx$
5. $\int_1^2 x \ln x\, dx$
6. $\int_1^e x^3 \ln x\, dx$
7. $\int \tan^{-1} y\, dy$
8. $\int \sin^{-1} y\, dy$
9. $\int x \sec^2 x\, dx$
10. $\int 4x \sec^2 2x\, dx$
11. $\int x^3 e^x\, dx$
12. $\int p^4 e^{-p}\, dp$
13. $\int (x^2 - 5x)e^x\, dx$
14. $\int (r^2 + r + 1)e^r\, dr$
15. $\int x^5 e^x\, dx$
16. $\int t^2 e^{4t}\, dt$
17. $\int_0^{\pi/2} \theta^2 \sin 2\theta\, d\theta$
18. $\int_0^{\pi/2} x^3 \cos 2x\, dx$
19. $\int_{2/\sqrt{3}}^2 t \sec^{-1} t\, dt$
20. $\int_0^{1/\sqrt{2}} 2x \sin^{-1}(x^2)\, dx$
21. $\int e^\theta \sin\theta\, d\theta$
22. $\int e^{-y} \cos y\, dy$
23. $\int e^{2x} \cos 3x\, dx$
24. $\int e^{-2x} \sin 2x\, dx$

## Substitution and Integration by Parts

Evaluate the integrals in Exercises 25–30 by using a substitution prior to integration by parts.

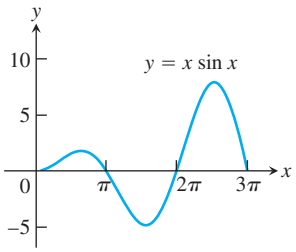
**25.** $\int e^{\sqrt{3s+9}}\,ds$

**26.** $\int_0^1 x\sqrt{1-x}\,dx$

**27.** $\int_0^{\pi/3} x\tan^2 x\,dx$

**28.** $\int \ln(x+x^2)\,dx$

**29.** $\int \sin(\ln x)\,dx$



**30.** $\int z(\ln z)^2\,dz$

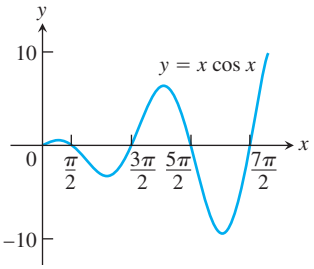
## Theory and Examples

**31. Finding area** Find the area of the region enclosed by the curve $y = x\sin x$ and the $x$-axis (see the accompanying figure) for

**a.** $0 \le x \le \pi$ **b.** $\pi \le x \le 2\pi$ **c.** $2\pi \le x \le 3\pi$.

**d.** What pattern do you see here? What is the area between the curve and the $x$-axis for $n\pi \le x \le (n+1)\pi$, $n$ an arbitrary nonnegative integer? Give reasons for your answer.

**32. Finding area** Find the area of the region enclosed by the curve $y = x\cos x$ and the $x$-axis (see the accompanying figure) for



**a.** $\pi/2 \le x \le 3\pi/2$ **b.** $3\pi/2 \le x \le 5\pi/2$

**c.** $5\pi/2 \le x \le 7\pi/2$.

**d.** What pattern do you see? What is the area between the curve and the $x$-axis for

$$\left(\frac{2n-1}{2}\right)\pi \le x \le \left(\frac{2n+1}{2}\right)\pi,$$

$n$ an arbitrary positive integer? Give reasons for your answer.

**33. Finding volume** Find the volume of the solid generated by revolving the region in the first quadrant bounded by the coordinate axes, the curve $y = e^x$, and the line $x = \ln 2$ about the line $x = \ln 2$.

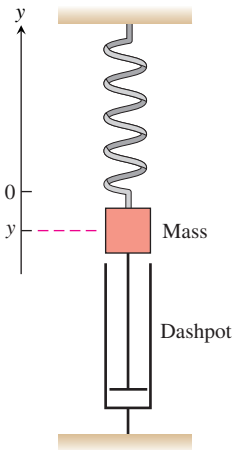
**34. Finding volume** Find the volume of the solid generated by revolving the region in the first quadrant bounded by the coordinate axes, the curve $y = e^{-x}$, and the line $x = 1$

**a.** about the $y$-axis. **b.** about the line $x = 1$.

**35. Finding volume** Find the volume of the solid generated by revolving the region in the first quadrant bounded by the coordinate axes and the curve $y = \cos x$, $0 \le x \le \pi/2$, about

**a.** the $y$-axis. **b.** the line $x = \pi/2$.

**36. Finding volume** Find the volume of the solid generated by revolving the region bounded by the $x$-axis and the curve $y = x\sin x$, $0 \le x \le \pi$, about



**a.** the $y$-axis. **b.** the line $x = \pi$.

(See Exercise 31 for a graph.)

**37. Average value** A retarding force, symbolized by the dashpot in the figure, slows the motion of the weighted spring so that the mass's position at time $t$ is

$$y = 2e^{-t}\cos t, \qquad t \ge 0.$$

Find the average value of $y$ over the interval $0 \le t \le 2\pi$.

**38. Average value** In a mass-spring-dashpot system like the one in Exercise 37, the mass's position at time $t$ is

$$y = 4e^{-t}(\sin t - \cos t), \qquad t \ge 0.$$

Find the average value of $y$ over the interval $0 \le t \le 2\pi$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Reduction Formulas

In Exercises 39–42, use integration by parts to establish the *reduction formula*.

**39.** $\displaystyle\int x^n \cos x\,dx = x^n \sin x - n\int x^{n-1}\sin x\,dx$

**40.** $\displaystyle\int x^n \sin x\,dx = -x^n \cos x + n\int x^{n-1}\cos x\,dx$

**41.** $\displaystyle\int x^n e^{ax}\,dx = \frac{x^n e^{ax}}{a} - \frac{n}{a}\int x^{n-1}e^{ax}\,dx, \quad a \neq 0$

**42.** $\displaystyle\int (\ln x)^n\,dx = x(\ln x)^n - n\int (\ln x)^{n-1}\,dx$

## Integrating Inverses of Functions

Integration by parts leads to a rule for integrating inverses that usually gives good results:

$$\int f^{-1}(x)\,dx = \int yf'(y)\,dy \qquad y = f^{-1}(x),\quad x = f(y),\quad dx = f'(y)\,dy$$

$$= yf(y) - \int f(y)\,dy \qquad \text{Integration by parts with } u = y,\ dv = f'(y)\,dy$$

$$= xf^{-1}(x) - \int f(y)\,dy$$

The idea is to take the most complicated part of the integral, in this case $f^{-1}(x)$, and simplify it first. For the integral of $\ln x$, we get

$$\int \ln x\,dx = \int ye^y\,dy \qquad y = \ln x,\quad x = e^y,\quad dx = e^y\,dy$$

$$= ye^y - e^y + C$$

$$= x\ln x - x + C.$$

For the integral of $\cos^{-1} x$ we get

$$\int \cos^{-1} x\,dx = x\cos^{-1} x - \int \cos y\,dy \qquad y = \cos^{-1} x$$

$$= x\cos^{-1} x - \sin y + C$$

$$= x\cos^{-1} x - \sin(\cos^{-1} x) + C.$$

Use the formula

$$\int f^{-1}(x)\,dx = xf^{-1}(x) - \int f(y)\,dy \qquad y = f^{-1}(x) \qquad (4)$$

to evaluate the integrals in Exercises 43–46. Express your answers in terms of $x$.

**43.** $\displaystyle\int \sin^{-1} x\,dx$ **44.** $\displaystyle\int \tan^{-1} x\,dx$

**45.** $\displaystyle\int \sec^{-1} x\,dx$ **46.** $\displaystyle\int \log_2 x\,dx$

Another way to integrate $f^{-1}(x)$ (when $f^{-1}$ is integrable, of course) is to use integration by parts with $u = f^{-1}(x)$ and $dv = dx$ to rewrite the integral of $f^{-1}$ as

$$\int f^{-1}(x)\,dx = xf^{-1}(x) - \int x\left(\frac{d}{dx}f^{-1}(x)\right)dx. \qquad (5)$$

Exercises 47 and 48 compare the results of using Equations (4) and (5).

**47.** Equations (4) and (5) give different formulas for the integral of $\cos^{-1} x$:

**a.** $\displaystyle\int \cos^{-1} x\,dx = x\cos^{-1} x - \sin(\cos^{-1} x) + C$ Eq. (4)

**b.** $\displaystyle\int \cos^{-1} x\,dx = x\cos^{-1} x - \sqrt{1 - x^2} + C$ Eq. (5)

Can both integrations be correct? Explain.

**48.** Equations (4) and (5) lead to different formulas for the integral of $\tan^{-1} x$:

**a.** $\displaystyle\int \tan^{-1} x\,dx = x\tan^{-1} x - \ln\sec(\tan^{-1} x) + C$ Eq. (4)

**b.** $\displaystyle\int \tan^{-1} x\,dx = x\tan^{-1} x - \ln\sqrt{1 + x^2} + C$ Eq. (5)

Can both integrations be correct? Explain.

Evaluate the integrals in Exercises 49 and 50 with **(a)** Eq. (4) and **(b)** Eq. (5). In each case, check your work by differentiating your answer with respect to $x$.

**49.** $\displaystyle\int \sinh^{-1} x\,dx$ **50.** $\displaystyle\int \tanh^{-1} x\,dx$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# 8.3 Integration of Rational Functions by Partial Fractions

This section shows how to express a rational function (a quotient of polynomials) as a sum of simpler fractions, called *partial fractions*, which are easily integrated. For instance, the rational function $(5x - 3)/(x^2 - 2x - 3)$ can be rewritten as

$$\frac{5x - 3}{x^2 - 2x - 3} = \frac{2}{x + 1} + \frac{3}{x - 3},$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

which can be verified algebraically by placing the fractions on the right side over a common denominator $(x + 1)(x - 3)$. The skill acquired in writing rational functions as such a sum is useful in other settings as well (for instance, when using certain transform methods to solve differential equations). To integrate the rational function $(5x - 3)/(x + 1)(x - 3)$ on the left side of our previous expression, we simply sum the integrals of the fractions on the right side:

$$\int \frac{5x - 3}{(x + 1)(x - 3)}\,dx = \int \frac{2}{x + 1}\,dx + \int \frac{3}{x - 3}\,dx$$

$$= 2 \ln |x + 1| + 3 \ln |x - 3| + C.$$

The method for rewriting rational functions as a sum of simpler fractions is called **the method of partial fractions**. In the case of the above example, it consists of finding constants $A$ and $B$ such that

$$\frac{5x - 3}{x^2 - 2x - 3} = \frac{A}{x + 1} + \frac{B}{x - 3}. \tag{1}$$

(Pretend for a moment that we do not know that $A = 2$ and $B = 3$ will work.) We call the fractions $A/(x + 1)$ and $B/(x - 3)$ **partial fractions** because their denominators are only part of the original denominator $x^2 - 2x - 3$. We call $A$ and $B$ **undetermined coefficients** until proper values for them have been found.

To find $A$ and $B$, we first clear Equation (1) of fractions, obtaining

$$5x - 3 = A(x - 3) + B(x + 1) = (A + B)x - 3A + B.$$

This will be an identity in $x$ if and only if the coefficients of like powers of $x$ on the two sides are equal:

$$A + B = 5, \qquad -3A + B = -3.$$

Solving these equations simultaneously gives $A = 2$ and $B = 3$.

## General Description of the Method

Success in writing a rational function $f(x)/g(x)$ as a sum of partial fractions depends on two things:

- *The degree of $f(x)$ must be less than the degree of $g(x)$.* That is, the fraction must be proper. If it isn't, divide $f(x)$ by $g(x)$ and work with the remainder term. See Example 3 of this section.
- *We must know the factors of $g(x)$.* In theory, any polynomial with real coefficients can be written as a product of real linear factors and real quadratic factors. In practice, the factors may be hard to find.

Here is how we find the partial fractions of a proper fraction $f(x)/g(x)$ when the factors of $g$ are known.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Method of Partial Fractions ($f(x)/g(x)$ Proper)**

1. Let $x - r$ be a linear factor of $g(x)$. Suppose that $(x - r)^m$ is the highest power of $x - r$ that divides $g(x)$. Then, to this factor, assign the sum of the $m$ partial fractions:
$$\frac{A_1}{x - r} + \frac{A_2}{(x - r)^2} + \cdots + \frac{A_m}{(x - r)^m}.$$
Do this for each distinct linear factor of $g(x)$.
2. Let $x^2 + px + q$ be a quadratic factor of $g(x)$. Suppose that $(x^2 + px + q)^n$ is the highest power of this factor that divides $g(x)$. Then, to this factor, assign the sum of the $n$ partial fractions:
$$\frac{B_1x + C_1}{x^2 + px + q} + \frac{B_2x + C_2}{(x^2 + px + q)^2} + \cdots + \frac{B_nx + C_n}{(x^2 + px + q)^n}.$$
Do this for each distinct quadratic factor of $g(x)$ that cannot be factored into linear factors with real coefficients.
3. Set the original fraction $f(x)/g(x)$ equal to the sum of all these partial fractions. Clear the resulting equation of fractions and arrange the terms in decreasing powers of $x$.
4. Equate the coefficients of corresponding powers of $x$ and solve the resulting equations for the undetermined coefficients.

**EXAMPLE 1** Distinct Linear Factors

Evaluate
$$\int \frac{x^2 + 4x + 1}{(x - 1)(x + 1)(x + 3)}\,dx$$
using partial fractions.

**Solution** The partial fraction decomposition has the form
$$\frac{x^2 + 4x + 1}{(x - 1)(x + 1)(x + 3)} = \frac{A}{x - 1} + \frac{B}{x + 1} + \frac{C}{x + 3}.$$
To find the values of the undetermined coefficients $A$, $B$, and $C$ we clear fractions and get
$$\begin{aligned} x^2 + 4x + 1 &= A(x + 1)(x + 3) + B(x - 1)(x + 3) + C(x - 1)(x + 1) \\ &= (A + B + C)x^2 + (4A + 2B)x + (3A - 3B - C). \end{aligned}$$
The polynomials on both sides of the above equation are identical, so we equate coefficients of like powers of $x$ obtaining
$$\begin{aligned} \text{Coefficient of } x^2\text{:} \quad & A + B + C = 1 \\ \text{Coefficient of } x^1\text{:} \quad & 4A + 2B = 4 \\ \text{Coefficient of } x^0\text{:} \quad & 3A - 3B - C = 1 \end{aligned}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

There are several ways for solving such a system of linear equations for the unknowns $A$, $B$, and $C$, including elimination of variables, or the use of a calculator or computer. Whatever method is used, the solution is $A = 3/4$, $B = 1/2$, and $C = -1/4$. Hence we have

$$\int \frac{x^2 + 4x + 1}{(x-1)(x+1)(x+3)}\,dx = \int \left[\frac{3}{4}\frac{1}{x-1} + \frac{1}{2}\frac{1}{x+1} - \frac{1}{4}\frac{1}{x+3}\right]dx$$

$$= \frac{3}{4}\ln|x-1| + \frac{1}{2}\ln|x+1| - \frac{1}{4}\ln|x+3| + K,$$

where $K$ is the arbitrary constant of integration (to avoid confusion with the undetermined coefficient we labeled as $C$). ■

**EXAMPLE 2** A Repeated Linear Factor

Evaluate

$$\int \frac{6x+7}{(x+2)^2}\,dx.$$

**Solution** First we express the integrand as a sum of partial fractions with undetermined coefficients.

$$\frac{6x+7}{(x+2)^2} = \frac{A}{x+2} + \frac{B}{(x+2)^2}$$

$$6x + 7 = A(x+2) + B \qquad \text{Multiply both sides by } (x+2)^2.$$

$$= Ax + (2A + B)$$

Equating coefficients of corresponding powers of $x$ gives

$$A = 6 \quad \text{and} \quad 2A + B = 12 + B = 7, \quad \text{or} \quad A = 6 \quad \text{and} \quad B = -5.$$

Therefore,

$$\int \frac{6x+7}{(x+2)^2}\,dx = \int \left(\frac{6}{x+2} - \frac{5}{(x+2)^2}\right)dx$$

$$= 6\int \frac{dx}{x+2} - 5\int (x+2)^{-2}\,dx$$

$$= 6\ln|x+2| + 5(x+2)^{-1} + C$$ ■

**EXAMPLE 3** Integrating an Improper Fraction

Evaluate

$$\int \frac{2x^3 - 4x^2 - x - 3}{x^2 - 2x - 3}\,dx.$$

**Solution** First we divide the denominator into the numerator to get a polynomial plus a proper fraction.

$$\begin{array}{r} 2x \\ x^2 - 2x - 3\overline{)\,2x^3 - 4x^2 - x - 3} \\ \underline{2x^3 - 4x^2 - 6x} \\ 5x - 3 \end{array}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Then we write the improper fraction as a polynomial plus a proper fraction.

$$\frac{2x^3 - 4x^2 - x - 3}{x^2 - 2x - 3} = 2x + \frac{5x - 3}{x^2 - 2x - 3}$$

We found the partial fraction decomposition of the fraction on the right in the opening example, so

$$\begin{aligned}\int \frac{2x^3 - 4x^2 - x - 3}{x^2 - 2x - 3}\,dx &= \int 2x\,dx + \int \frac{5x - 3}{x^2 - 2x - 3}\,dx \\ &= \int 2x\,dx + \int \frac{2}{x + 1}\,dx + \int \frac{3}{x - 3}\,dx \\ &= x^2 + 2\ln|x + 1| + 3\ln|x - 3| + C. \quad \blacksquare\end{aligned}$$

A quadratic polynomial is **irreducible** if it cannot be written as the product of two linear factors with real coefficients.

**EXAMPLE 4** Integrating with an Irreducible Quadratic Factor in the Denominator

Evaluate

$$\int \frac{-2x + 4}{(x^2 + 1)(x - 1)^2}\,dx$$

using partial fractions.

**Solution** The denominator has an irreducible quadratic factor as well as a repeated linear factor, so we write

$$\frac{-2x + 4}{(x^2 + 1)(x - 1)^2} = \frac{Ax + B}{x^2 + 1} + \frac{C}{x - 1} + \frac{D}{(x - 1)^2}. \tag{2}$$

Clearing the equation of fractions gives

$$\begin{aligned}-2x + 4 &= (Ax + B)(x - 1)^2 + C(x - 1)(x^2 + 1) + D(x^2 + 1) \\ &= (A + C)x^3 + (-2A + B - C + D)x^2 \\ &\quad + (A - 2B + C)x + (B - C + D).\end{aligned}$$

Equating coefficients of like terms gives

$$\begin{aligned}&\text{Coefficients of } x^3: && 0 = A + C \\ &\text{Coefficients of } x^2: && 0 = -2A + B - C + D \\ &\text{Coefficients of } x^1: && -2 = A - 2B + C \\ &\text{Coefficients of } x^0: && 4 = B - C + D\end{aligned}$$

We solve these equations simultaneously to find the values of $A$, $B$, $C$, and $D$:

$$\begin{aligned}-4 = -2A, \quad A = 2 &\qquad \text{Subtract fourth equation from second.} \\ C = -A = -2 &\qquad \text{From the first equation} \\ B = 1 &\qquad A = 2 \text{ and } C = -2 \text{ in third equation.} \\ D = 4 - B + C = 1. &\qquad \text{From the fourth equation}\end{aligned}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We substitute these values into Equation (2), obtaining

$$\frac{-2x+4}{(x^2+1)(x-1)^2} = \frac{2x+1}{x^2+1} - \frac{2}{x-1} + \frac{1}{(x-1)^2}.$$

Finally, using the expansion above we can integrate:

$$\begin{aligned}\int \frac{-2x+4}{(x^2+1)(x-1)^2}\,dx &= \int \left(\frac{2x+1}{x^2+1} - \frac{2}{x-1} + \frac{1}{(x-1)^2}\right)dx \\ &= \int \left(\frac{2x}{x^2+1} + \frac{1}{x^2+1} - \frac{2}{x-1} + \frac{1}{(x-1)^2}\right)dx \\ &= \ln(x^2+1) + \tan^{-1}x - 2\ln|x-1| - \frac{1}{x-1} + C. \quad \blacksquare\end{aligned}$$

**EXAMPLE 5** A Repeated Irreducible Quadratic Factor

Evaluate

$$\int \frac{dx}{x(x^2+1)^2}.$$

**Solution** The form of the partial fraction decomposition is

$$\frac{1}{x(x^2+1)^2} = \frac{A}{x} + \frac{Bx+C}{x^2+1} + \frac{Dx+E}{(x^2+1)^2}$$

Multiplying by $x(x^2+1)^2$, we have

$$\begin{aligned}1 &= A(x^2+1)^2 + (Bx+C)x(x^2+1) + (Dx+E)x \\ &= A(x^4+2x^2+1) + B(x^4+x^2) + C(x^3+x) + Dx^2 + Ex \\ &= (A+B)x^4 + Cx^3 + (2A+B+D)x^2 + (C+E)x + A\end{aligned}$$

If we equate coefficients, we get the system

$$A+B=0, \qquad C=0, \qquad 2A+B+D=0, \qquad C+E=0, \qquad A=1.$$

Solving this system gives $A=1$, $B=-1$, $C=0$, $D=-1$, and $E=0$. Thus,

$$\begin{aligned}\int \frac{dx}{x(x^2+1)^2} &= \int \left[\frac{1}{x} + \frac{-x}{x^2+1} + \frac{-x}{(x^2+1)^2}\right]dx \\ &= \int \frac{dx}{x} - \int \frac{x\,dx}{x^2+1} - \int \frac{x\,dx}{(x^2+1)^2} \\ &= \int \frac{dx}{x} - \frac{1}{2}\int \frac{du}{u} - \frac{1}{2}\int \frac{du}{u^2} \qquad u = x^2+1,\ du = 2x\,dx \\ &= \ln|x| - \frac{1}{2}\ln|u| + \frac{1}{2u} + K \\ &= \ln|x| - \frac{1}{2}\ln(x^2+1) + \frac{1}{2(x^2+1)} + K \\ &= \ln\frac{|x|}{\sqrt{x^2+1}} + \frac{1}{2(x^2+1)} + K. \quad \blacksquare\end{aligned}$$

HISTORICAL BIOGRAPHY

Oliver Heaviside
(1850–1925)

## The Heaviside "Cover-up" Method for Linear Factors

When the degree of the polynomial $f(x)$ is less than the degree of $g(x)$ and

$$g(x) = (x - r_1)(x - r_2)\cdots(x - r_n)$$

is a product of $n$ distinct linear factors, each raised to the first power, there is a quick way to expand $f(x)/g(x)$ by partial fractions.

### EXAMPLE 6 Using the Heaviside Method

Find $A$, $B$, and $C$ in the partial-fraction expansion

$$\frac{x^2 + 1}{(x - 1)(x - 2)(x - 3)} = \frac{A}{x - 1} + \frac{B}{x - 2} + \frac{C}{x - 3}. \tag{3}$$

**Solution** If we multiply both sides of Equation (3) by $(x - 1)$ to get

$$\frac{x^2 + 1}{(x - 2)(x - 3)} = A + \frac{B(x - 1)}{x - 2} + \frac{C(x - 1)}{x - 3}$$

and set $x = 1$, the resulting equation gives the value of $A$:

$$\frac{(1)^2 + 1}{(1 - 2)(1 - 3)} = A + 0 + 0,$$

$$A = 1.$$

Thus, the value of $A$ is the number we would have obtained if we had covered the factor $(x - 1)$ in the denominator of the original fraction

$$\frac{x^2 + 1}{(x - 1)(x - 2)(x - 3)} \tag{4}$$

and evaluated the rest at $x = 1$:

$$A = \frac{(1)^2 + 1}{\boxed{(x - 1)}\,(1 - 2)(1 - 3)} = \frac{2}{(-1)(-2)} = 1.$$

$\Uparrow$ Cover

Similarly, we find the value of $B$ in Equation (3) by covering the factor $(x - 2)$ in Equation (4) and evaluating the rest at $x = 2$:

$$B = \frac{(2)^2 + 1}{(2 - 1)\,\boxed{(x - 2)}\,(2 - 3)} = \frac{5}{(1)(-1)} = -5.$$

$\Uparrow$ Cover

Finally, $C$ is found by covering the $(x - 3)$ in Equation (4) and evaluating the rest at $x = 3$:

$$C = \frac{(3)^2 + 1}{(3 - 1)(3 - 2)\,\boxed{(x - 3)}} = \frac{10}{(2)(1)} = 5.$$

$\Uparrow$ Cover

■

**Heaviside Method**

**1.** *Write the quotient with $g(x)$ factored:*

$$\frac{f(x)}{g(x)} = \frac{f(x)}{(x - r_1)(x - r_2)\cdots(x - r_n)}.$$

**2.** *Cover the factors $(x - r_i)$ of $g(x)$ one at a time*, each time replacing all the uncovered $x$'s by the number $r_i$. This gives a number $A_i$ for each root $r_i$:

$$A_1 = \frac{f(r_1)}{(r_1 - r_2)\cdots(r_1 - r_n)}$$

$$A_2 = \frac{f(r_2)}{(r_2 - r_1)(r_2 - r_3)\cdots(r_2 - r_n)}$$

$$\vdots$$

$$A_n = \frac{f(r_n)}{(r_n - r_1)(r_n - r_2)\cdots(r_n - r_{n-1})}.$$

**3.** *Write the partial-fraction expansion of $f(x)/g(x)$* as

$$\frac{f(x)}{g(x)} = \frac{A_1}{(x - r_1)} + \frac{A_2}{(x - r_2)} + \cdots + \frac{A_n}{(x - r_n)}.$$

## EXAMPLE 7 Integrating with the Heaviside Method

Evaluate

$$\int \frac{x + 4}{x^3 + 3x^2 - 10x}\,dx.$$

**Solution** The degree of $f(x) = x + 4$ is less than the degree of $g(x) = x^3 + 3x^2 - 10x$, and, with $g(x)$ factored,

$$\frac{x + 4}{x^3 + 3x^2 - 10x} = \frac{x + 4}{x(x - 2)(x + 5)}.$$

The roots of $g(x)$ are $r_1 = 0$, $r_2 = 2$, and $r_3 = -5$. We find

$$A_1 = \frac{0 + 4}{\boxed{x}\,(0 - 2)(0 + 5)} = \frac{4}{(-2)(5)} = -\frac{2}{5}$$

Cover

$$A_2 = \frac{2 + 4}{2\,\boxed{(x - 2)}\,(2 + 5)} = \frac{6}{(2)(7)} = \frac{3}{7}$$

Cover

$$A_3 = \frac{-5 + 4}{(-5)(-5 - 2)\,\boxed{(x + 5)}} = \frac{-1}{(-5)(-7)} = -\frac{1}{35}.$$

Cover

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Therefore,

$$\frac{x+4}{x(x-2)(x+5)} = -\frac{2}{5x} + \frac{3}{7(x-2)} - \frac{1}{35(x+5)},$$

and

$$\int \frac{x+4}{x(x-2)(x+5)}\,dx = -\frac{2}{5}\ln|x| + \frac{3}{7}\ln|x-2| - \frac{1}{35}\ln|x+5| + C. \quad \blacksquare$$

## Other Ways to Determine the Coefficients

Another way to determine the constants that appear in partial fractions is to differentiate, as in the next example. Still another is to assign selected numerical values to $x$.

### EXAMPLE 8 Using Differentiation

Find $A$, $B$, and $C$ in the equation

$$\frac{x-1}{(x+1)^3} = \frac{A}{x+1} + \frac{B}{(x+1)^2} + \frac{C}{(x+1)^3}.$$

**Solution** We first clear fractions:

$$x - 1 = A(x+1)^2 + B(x+1) + C.$$

Substituting $x = -1$ shows $C = -2$. We then differentiate both sides with respect to $x$, obtaining

$$1 = 2A(x+1) + B.$$

Substituting $x = -1$ shows $B = 1$. We differentiate again to get $0 = 2A$, which shows $A = 0$. Hence,

$$\frac{x-1}{(x+1)^3} = \frac{1}{(x+1)^2} - \frac{2}{(x+1)^3}. \quad \blacksquare$$

In some problems, assigning small values to $x$ such as $x = 0, \pm 1, \pm 2$, to get equations in $A$, $B$, and $C$ provides a fast alternative to other methods.

### EXAMPLE 9 Assigning Numerical Values to $x$

Find $A$, $B$, and $C$ in

$$\frac{x^2+1}{(x-1)(x-2)(x-3)} = \frac{A}{x-1} + \frac{B}{x-2} + \frac{C}{x-3}.$$

**Solution** Clear fractions to get

$$x^2 + 1 = A(x-2)(x-3) + B(x-1)(x-3) + C(x-1)(x-2).$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Then let $x = 1, 2, 3$ successively to find $A$, $B$, and $C$:

$$\begin{aligned}
x = 1: \quad (1)^2 + 1 &= A(-1)(-2) + B(0) + C(0) \\
2 &= 2A \\
A &= 1 \\
x = 2: \quad (2)^2 + 1 &= A(0) + B(1)(-1) + C(0) \\
5 &= -B \\
B &= -5 \\
x = 3: \quad (3)^2 + 1 &= A(0) + B(0) + C(2)(1) \\
10 &= 2C \\
C &= 5.
\end{aligned}$$

Conclusion:

$$\frac{x^2 + 1}{(x - 1)(x - 2)(x - 3)} = \frac{1}{x - 1} - \frac{5}{x - 2} + \frac{5}{x - 3}.$$

# EXERCISES 8.3

## Expanding Quotients into Partial Fractions

Expand the quotients in Exercises 1–8 by partial fractions.

1. $\dfrac{5x - 13}{(x - 3)(x - 2)}$
2. $\dfrac{5x - 7}{x^2 - 3x + 2}$
3. $\dfrac{x + 4}{(x + 1)^2}$
4. $\dfrac{2x + 2}{x^2 - 2x + 1}$
5. $\dfrac{z + 1}{z^2(z - 1)}$
6. $\dfrac{z}{z^3 - z^2 - 6z}$
7. $\dfrac{t^2 + 8}{t^2 - 5t + 6}$
8. $\dfrac{t^4 + 9}{t^4 + 9t^2}$

## Nonrepeated Linear Factors

In Exercises 9–16, express the integrands as a sum of partial fractions and evaluate the integrals.

9. $\displaystyle\int \frac{dx}{1 - x^2}$
10. $\displaystyle\int \frac{dx}{x^2 + 2x}$
11. $\displaystyle\int \frac{x + 4}{x^2 + 5x - 6}\,dx$
12. $\displaystyle\int \frac{2x + 1}{x^2 - 7x + 12}\,dx$
13. $\displaystyle\int_4^8 \frac{y\,dy}{y^2 - 2y - 3}$
14. $\displaystyle\int_{1/2}^1 \frac{y + 4}{y^2 + y}\,dy$
15. $\displaystyle\int \frac{dt}{t^3 + t^2 - 2t}$
16. $\displaystyle\int \frac{x + 3}{2x^3 - 8x}\,dx$

## Repeated Linear Factors

In Exercises 17–20, express the integrands as a sum of partial fractions and evaluate the integrals.

17. $\displaystyle\int_0^1 \frac{x^3\,dx}{x^2 + 2x + 1}$
18. $\displaystyle\int_{-1}^0 \frac{x^3\,dx}{x^2 - 2x + 1}$
19. $\displaystyle\int \frac{dx}{(x^2 - 1)^2}$
20. $\displaystyle\int \frac{x^2\,dx}{(x - 1)(x^2 + 2x + 1)}$

## Irreducible Quadratic Factors

In Exercises 21–28, express the integrands as a sum of partial fractions and evaluate the integrals.

21. $\displaystyle\int_0^1 \frac{dx}{(x + 1)(x^2 + 1)}$
22. $\displaystyle\int_1^{\sqrt{3}} \frac{3t^2 + t + 4}{t^3 + t}\,dt$
23. $\displaystyle\int \frac{y^2 + 2y + 1}{(y^2 + 1)^2}\,dy$
24. $\displaystyle\int \frac{8x^2 + 8x + 2}{(4x^2 + 1)^2}\,dx$
25. $\displaystyle\int \frac{2s + 2}{(s^2 + 1)(s - 1)^3}\,ds$
26. $\displaystyle\int \frac{s^4 + 81}{s(s^2 + 9)^2}\,ds$
27. $\displaystyle\int \frac{2\theta^3 + 5\theta^2 + 8\theta + 4}{(\theta^2 + 2\theta + 2)^2}\,d\theta$
28. $\displaystyle\int \frac{\theta^4 - 4\theta^3 + 2\theta^2 - 3\theta + 1}{(\theta^2 + 1)^3}\,d\theta$

## Improper Fractions

In Exercises 29–34, perform long division on the integrand, write the proper fraction as a sum of partial fractions, and then evaluate the integral.

29. $\displaystyle\int \frac{2x^3 - 2x^2 + 1}{x^2 - x}\,dx$
30. $\displaystyle\int \frac{x^4}{x^2 - 1}\,dx$
31. $\displaystyle\int \frac{9x^3 - 3x + 1}{x^3 - x^2}\,dx$
32. $\displaystyle\int \frac{16x^3}{4x^2 - 4x + 1}\,dx$
33. $\displaystyle\int \frac{y^4 + y^2 - 1}{y^3 + y}\,dy$
34. $\displaystyle\int \frac{2y^4}{y^3 - y^2 + y - 1}\,dy$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Evaluating Integrals

Evaluate the integrals in Exercises 35–40.

**35.** $\displaystyle\int \frac{e^t\,dt}{e^{2t} + 3e^t + 2}$

**36.** $\displaystyle\int \frac{e^{4t} + 2e^{2t} - e^t}{e^{2t} + 1}\,dt$

**37.** $\displaystyle\int \frac{\cos y\,dy}{\sin^2 y + \sin y - 6}$

**38.** $\displaystyle\int \frac{\sin\theta\,d\theta}{\cos^2\theta + \cos\theta - 2}$

**39.** $\displaystyle\int \frac{(x-2)^2\tan^{-1}(2x) - 12x^3 - 3x}{(4x^2+1)(x-2)^2}\,dx$

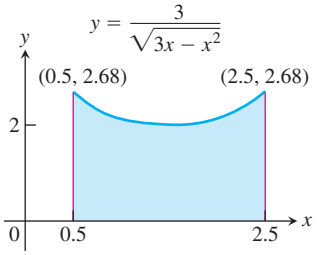
**40.** $\displaystyle\int \frac{(x+1)^2\tan^{-1}(3x) + 9x^3 + x}{(9x^2+1)(x+1)^2}\,dx$

## Initial Value Problems

Solve the initial value problems in Exercises 41–44 for $x$ as a function of $t$.

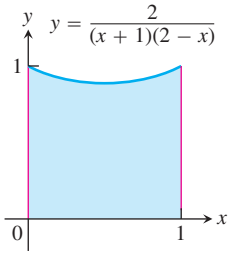
**41.** $(t^2 - 3t + 2)\dfrac{dx}{dt} = 1 \quad (t > 2), \quad x(3) = 0$

**42.** $(3t^4 + 4t^2 + 1)\dfrac{dx}{dt} = 2\sqrt{3}, \quad x(1) = -\pi\sqrt{3}/4$



**43.** $(t^2 + 2t)\dfrac{dx}{dt} = 2x + 2 \quad (t, x > 0), \quad x(1) = 1$

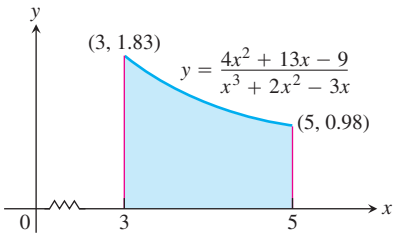
**44.** $(t+1)\dfrac{dx}{dt} = x^2 + 1 \quad (t > -1), \quad x(0) = \pi/4$



## Applications and Examples

In Exercises 45 and 46, find the volume of the solid generated by revolving the shaded region about the indicated axis.

**45.** The $x$-axis



**46.** The $y$-axis

**47.** Find, to two decimal places, the $x$-coordinate of the centroid of the region in the first quadrant bounded by the $x$-axis, the curve $y = \tan^{-1}x$, and the line $x = \sqrt{3}$.

**48.** Find the $x$-coordinate of the centroid of this region to two decimal places.

**49. Social diffusion** Sociologists sometimes use the phrase "social diffusion" to describe the way information spreads through a population. The information might be a rumor, a cultural fad, or news about a technical innovation. In a sufficiently large population, the number of people $x$ who have the information is treated as a differentiable function of time $t$, and the rate of diffusion, $dx/dt$, is assumed to be proportional to the number of people who have the information times the number of people who do not. This leads to the equation

$$\frac{dx}{dt} = kx(N - x),$$

where $N$ is the number of people in the population.

Suppose $t$ is in days, $k = 1/250$, and two people start a rumor at time $t = 0$ in a population of $N = 1000$ people.

**a.** Find $x$ as a function of $t$.

**b.** When will half the population have heard the rumor? (This is when the rumor will be spreading the fastest.)

**50. Second-order chemical reactions** Many chemical reactions are the result of the interaction of two molecules that undergo a change to produce a new product. The rate of the reaction typically depends on the concentrations of the two kinds of molecules. If $a$ is the amount of substance $A$ and $b$ is the amount of substance $B$ at time $t = 0$, and if $x$ is the amount of product at time $t$, then the rate of formation of $x$ may be given by the differential equation

$$\frac{dx}{dt} = k(a - x)(b - x),$$

or

$$\frac{1}{(a-x)(b-x)}\frac{dx}{dt} = k,$$

where $k$ is a constant for the reaction. Integrate both sides of this equation to obtain a relation between $x$ and $t$ **(a)** if $a = b$, and **(b)** if $a \neq b$. Assume in each case that $x = 0$ when $t = 0$.

**51. An integral connecting $\pi$ to the approximation 22/7**

**a.** Evaluate $\displaystyle\int_0^1 \frac{x^4(x-1)^4}{x^2+1}\,dx$.

**b.** How good is the approximation $\pi \approx 22/7$? Find out by expressing $\left(\dfrac{22}{7} - \pi\right)$ as a percentage of $\pi$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**c.** Graph the function $y = \dfrac{x^4(x-1)^4}{x^2+1}$ for $0 \le x \le 1$. Experiment with the range on the $y$-axis set between 0 and 1, then between 0 and 0.5, and then decreasing the range until the graph can be seen. What do you conclude about the area under the curve?

**52.** Find the second-degree polynomial $P(x)$ such that $P(0) = 1$, $P'(0) = 0$, and

$$\int \frac{P(x)}{x^3(x-1)^2}\,dx$$

is a rational function.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# 8.4 Trigonometric Integrals

Trigonometric integrals involve algebraic combinations of the six basic trigonometric functions. In principle, we can always express such integrals in terms of sines and cosines, but it is often simpler to work with other functions, as in the integral

$$\int \sec^2 x\,dx = \tan x + C.$$

The general idea is to use identities to transform the integrals we have to find into integrals that are easier to work with.

## Products of Powers of Sines and Cosines

We begin with integrals of the form:

$$\int \sin^m x \cos^n x\,dx,$$

where $m$ and $n$ are nonnegative integers (positive or zero). We can divide the work into three cases.

**Case 1** If $m$ is odd, we write $m$ as $2k + 1$ and use the identity $\sin^2 x = 1 - \cos^2 x$ to obtain

$$\sin^m x = \sin^{2k+1} x = (\sin^2 x)^k \sin x = (1 - \cos^2 x)^k \sin x. \tag{1}$$

Then we combine the single $\sin x$ with $dx$ in the integral and set $\sin x\,dx$ equal to $-d(\cos x)$.

**Case 2** If $m$ is even and $n$ is odd in $\int \sin^m x \cos^n x\,dx$, we write $n$ as $2k + 1$ and use the identity $\cos^2 x = 1 - \sin^2 x$ to obtain

$$\cos^n x = \cos^{2k+1} x = (\cos^2 x)^k \cos x = (1 - \sin^2 x)^k \cos x.$$

We then combine the single $\cos x$ with $dx$ and set $\cos x\,dx$ equal to $d(\sin x)$.

**Case 3** If both $m$ and $n$ are even in $\int \sin^m x \cos^n x\,dx$, we substitute

$$\sin^2 x = \frac{1 - \cos 2x}{2}, \qquad \cos^2 x = \frac{1 + \cos 2x}{2} \tag{2}$$

to reduce the integrand to one in lower powers of $\cos 2x$.

Here are some examples illustrating each case.

**EXAMPLE 1** *m* is Odd

Evaluate

$$\int \sin^3 x \cos^2 x\,dx.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution**

$$\begin{aligned}\int \sin^3 x \cos^2 x\, dx &= \int \sin^2 x \cos^2 x \sin x\, dx \\ &= \int (1 - \cos^2 x)\cos^2 x\,(-d(\cos x)) \\ &= \int (1 - u^2)(u^2)(-du) \qquad u = \cos x \\ &= \int (u^4 - u^2)\, du \\ &= \frac{u^5}{5} - \frac{u^3}{3} + C \\ &= \frac{\cos^5 x}{5} - \frac{\cos^3 x}{3} + C.\end{aligned}$$

■

**EXAMPLE 2** *m* is Even and *n* is Odd

Evaluate

$$\int \cos^5 x\, dx.$$

**Solution**

$$\begin{aligned}\int \cos^5 x\, dx &= \int \cos^4 x \cos x\, dx = \int (1 - \sin^2 x)^2\, d(\sin x) \qquad m = 0 \\ &= \int (1 - u^2)^2\, du \qquad u = \sin x \\ &= \int (1 - 2u^2 + u^4)\, du \\ &= u - \frac{2}{3}u^3 + \frac{1}{5}u^5 + C = \sin x - \frac{2}{3}\sin^3 x + \frac{1}{5}\sin^5 x + C.\end{aligned}$$

■

**EXAMPLE 3** *m* and *n* are Both Even

Evaluate

$$\int \sin^2 x \cos^4 x\, dx.$$

**Solution**

$$\begin{aligned}\int \sin^2 x \cos^4 x\, dx &= \int \left(\frac{1 - \cos 2x}{2}\right)\left(\frac{1 + \cos 2x}{2}\right)^2 dx \\ &= \frac{1}{8}\int (1 - \cos 2x)(1 + 2\cos 2x + \cos^2 2x)\, dx \\ &= \frac{1}{8}\int (1 + \cos 2x - \cos^2 2x - \cos^3 2x)\, dx \\ &= \frac{1}{8}\left[x + \frac{1}{2}\sin 2x - \int (\cos^2 2x + \cos^3 2x)\, dx\right].\end{aligned}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

For the term involving $\cos^2 2x$ we use

$$\int \cos^2 2x\,dx = \frac{1}{2}\int (1 + \cos 4x)\,dx$$

$$= \frac{1}{2}\left(x + \frac{1}{4}\sin 4x\right).$$

Omitting the constant of integration until the final result

For the $\cos^3 2x$ term we have

$$\int \cos^3 2x\,dx = \int (1 - \sin^2 2x)\cos 2x\,dx$$

$u = \sin 2x$, $du = 2\cos 2x\,dx$

$$= \frac{1}{2}\int (1 - u^2)\,du = \frac{1}{2}\left(\sin 2x - \frac{1}{3}\sin^3 2x\right).$$

Again omitting $C$

Combining everything and simplifying we get

$$\int \sin^2 x \cos^4 x\,dx = \frac{1}{16}\left(x - \frac{1}{4}\sin 4x + \frac{1}{3}\sin^3 2x\right) + C.$$

■

## Eliminating Square Roots

In the next example, we use the identity $\cos^2\theta = (1 + \cos 2\theta)/2$ to eliminate a square root.

**EXAMPLE 4** Evaluate

$$\int_0^{\pi/4} \sqrt{1 + \cos 4x}\,dx.$$

**Solution** To eliminate the square root we use the identity

$$\cos^2\theta = \frac{1 + \cos 2\theta}{2}, \quad \text{or} \quad 1 + \cos 2\theta = 2\cos^2\theta.$$

With $\theta = 2x$, this becomes

$$1 + \cos 4x = 2\cos^2 2x.$$

Therefore,

$$\int_0^{\pi/4} \sqrt{1 + \cos 4x}\,dx = \int_0^{\pi/4} \sqrt{2\cos^2 2x}\,dx = \int_0^{\pi/4} \sqrt{2}\sqrt{\cos^2 2x}\,dx$$

$$= \sqrt{2}\int_0^{\pi/4} |\cos 2x|\,dx = \sqrt{2}\int_0^{\pi/4} \cos 2x\,dx$$

$\cos 2x \geq 0$ on $[0, \pi/4]$

$$= \sqrt{2}\left[\frac{\sin 2x}{2}\right]_0^{\pi/4} = \frac{\sqrt{2}}{2}[1 - 0] = \frac{\sqrt{2}}{2}.$$

■

## Integrals of Powers of tan *x* and sec *x*

We know how to integrate the tangent and secant and their squares. To integrate higher powers we use the identities $\tan^2 x = \sec^2 x - 1$ and $\sec^2 x = \tan^2 x + 1$, and integrate by parts when necessary to reduce the higher powers to lower powers.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 5** Evaluate

$$\int \tan^4 x\,dx.$$

**Solution**

$$\begin{aligned}\int \tan^4 x\,dx &= \int \tan^2 x \cdot \tan^2 x\,dx = \int \tan^2 x \cdot (\sec^2 x - 1)\,dx \\ &= \int \tan^2 x \sec^2 x\,dx - \int \tan^2 x\,dx \\ &= \int \tan^2 x \sec^2 x\,dx - \int (\sec^2 x - 1)\,dx \\ &= \int \tan^2 x \sec^2 x\,dx - \int \sec^2 x\,dx + \int dx.\end{aligned}$$

In the first integral, we let

$$u = \tan x, \qquad du = \sec^2 x\,dx$$

and have

$$\int u^2\,du = \frac{1}{3}u^3 + C_1.$$

The remaining integrals are standard forms, so

$$\int \tan^4 x\,dx = \frac{1}{3}\tan^3 x - \tan x + x + C.$$ ■

**EXAMPLE 6** Evaluate

$$\int \sec^3 x\,dx.$$

**Solution** We integrate by parts, using

$$u = \sec x, \qquad dv = \sec^2 x\,dx, \qquad v = \tan x, \qquad du = \sec x \tan x\,dx.$$

Then

$$\begin{aligned}\int \sec^3 x\,dx &= \sec x \tan x - \int (\tan x)(\sec x \tan x\,dx) \\ &= \sec x \tan x - \int (\sec^2 x - 1)\sec x\,dx \qquad \tan^2 x = \sec^2 x - 1 \\ &= \sec x \tan x + \int \sec x\,dx - \int \sec^3 x\,dx.\end{aligned}$$

Combining the two secant-cubed integrals gives

$$2\int \sec^3 x\,dx = \sec x \tan x + \int \sec x\,dx$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

and

$$\int \sec^3 x\,dx = \frac{1}{2}\sec x \tan x + \frac{1}{2}\ln|\sec x + \tan x| + C.$$

## Products of Sines and Cosines

The integrals

$$\int \sin mx \sin nx\,dx, \qquad \int \sin mx \cos nx\,dx, \qquad \text{and} \qquad \int \cos mx \cos nx\,dx$$

arise in many places where trigonometric functions are applied to problems in mathematics and science. We can evaluate these integrals through integration by parts, but two such integrations are required in each case. It is simpler to use the identities

$$\sin mx \sin nx = \frac{1}{2}[\cos(m-n)x - \cos(m+n)x], \tag{3}$$

$$\sin mx \cos nx = \frac{1}{2}[\sin(m-n)x + \sin(m+n)x], \tag{4}$$

$$\cos mx \cos nx = \frac{1}{2}[\cos(m-n)x + \cos(m+n)x]. \tag{5}$$

These come from the angle sum formulas for the sine and cosine functions (Section 1.6). They give functions whose antiderivatives are easily found.

**EXAMPLE 7** Evaluate

$$\int \sin 3x \cos 5x\,dx.$$

**Solution** From Equation (4) with $m = 3$ and $n = 5$ we get

$$\begin{aligned}\int \sin 3x \cos 5x\,dx &= \frac{1}{2}\int [\sin(-2x) + \sin 8x]\,dx \\ &= \frac{1}{2}\int (\sin 8x - \sin 2x)\,dx \\ &= -\frac{\cos 8x}{16} + \frac{\cos 2x}{4} + C.\end{aligned}$$

## Theory and Examples

**39. Surface area** Find the area of the surface generated by revolving the arc

$$x = t^{2/3}, \quad y = t^2/2, \quad 0 \le t \le 2,$$

about the $x$-axis.

**40. Arc length** Find the length of the curve

$$y = \ln(\cos x), \quad 0 \le x \le \pi/3.$$

**41. Arc length** Find the length of the curve

$$y = \ln(\sec x), \quad 0 \le x \le \pi/4.$$

**42. Center of gravity** Find the center of gravity of the region bounded by the $x$-axis, the curve $y = \sec x$, and the lines $x = -\pi/4$, $x = \pi/4$.

**43. Volume** Find the volume generated by revolving one arch of the curve $y = \sin x$ about the $x$-axis.

**44. Area** Find the area between the $x$-axis and the curve $y = \sqrt{1 + \cos 4x}$, $0 \le x \le \pi$.

**45. Orthogonal functions** Two functions $f$ and $g$ are said to be **orthogonal** on an interval $a \le x \le b$ if $\int_a^b f(x)g(x) \, dx = 0$.

**a.** Prove that $\sin mx$ and $\sin nx$ are orthogonal on any interval of length $2\pi$ provided $m$ and $n$ are integers such that $m^2 \ne n^2$.

**b.** Prove the same for $\cos mx$ and $\cos nx$.

**c.** Prove the same for $\sin mx$ and $\cos nx$ even if $m = n$.

**46. Fourier series** A finite Fourier series is given by the sum

$$f(x) = \sum_{n=1}^{N} a_n \sin nx$$
$$= a_1 \sin x + a_2 \sin 2x + \cdots + a_N \sin Nx$$

Show that the $m$th coefficient $a_m$ is given by the formula

$$a_m = \frac{1}{\pi} \int_{-\pi}^{\pi} f(x) \sin mx \, dx.$$

## 8.5 Trigonometric Substitutions

Trigonometric substitutions can be effective in transforming integrals involving $\sqrt{a^2 - x^2}$, $\sqrt{a^2 + x^2}$, and $\sqrt{x^2 - a^2}$ into integrals we can evaluate directly.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Three Basic Substitutions

The most common substitutions are $x = a\tan\theta$, $x = a\sin\theta$, and $x = a\sec\theta$. They come from the reference right triangles in Figure 8.2.

With $x = a\tan\theta$,

$$a^2 + x^2 = a^2 + a^2\tan^2\theta = a^2(1 + \tan^2\theta) = a^2\sec^2\theta.$$

With $x = a\sin\theta$,

$$a^2 - x^2 = a^2 - a^2\sin^2\theta = a^2(1 - \sin^2\theta) = a^2\cos^2\theta.$$

With $x = a\sec\theta$,

$$x^2 - a^2 = a^2\sec^2\theta - a^2 = a^2(\sec^2\theta - 1) = a^2\tan^2\theta.$$

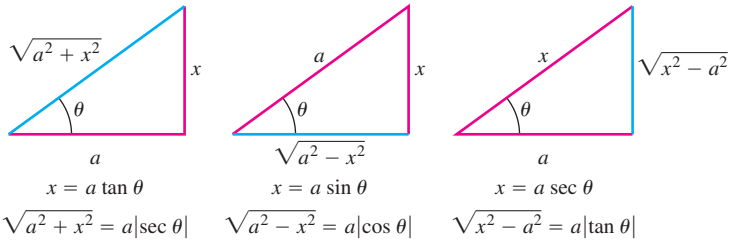

**FIGURE 8.2** Reference triangles for the three basic substitutions identifying the sides labeled $x$ and $a$ for each substitution.

We want any substitution we use in an integration to be reversible so that we can change back to the original variable afterward. For example, if $x = a\tan\theta$, we want to be able to set $\theta = \tan^{-1}(x/a)$ after the integration takes place. If $x = a\sin\theta$, we want to be able to set $\theta = \sin^{-1}(x/a)$ when we're done, and similarly for $x = a\sec\theta$.

As we know from Section 7.7, the functions in these substitutions have inverses only for selected values of $\theta$ (Figure 8.3). For reversibility,

$$x = a\tan\theta \quad \text{requires} \quad \theta = \tan^{-1}\left(\frac{x}{a}\right) \quad \text{with} \quad -\frac{\pi}{2} < \theta < \frac{\pi}{2},$$

$$x = a\sin\theta \quad \text{requires} \quad \theta = \sin^{-1}\left(\frac{x}{a}\right) \quad \text{with} \quad -\frac{\pi}{2} \le \theta \le \frac{\pi}{2},$$

$$x = a\sec\theta \quad \text{requires} \quad \theta = \sec^{-1}\left(\frac{x}{a}\right) \quad \text{with} \quad \begin{cases} 0 \le \theta < \dfrac{\pi}{2} & \text{if } \dfrac{x}{a} \ge 1, \\ \dfrac{\pi}{2} < \theta \le \pi & \text{if } \dfrac{x}{a} \le -1. \end{cases}$$

To simplify calculations with the substitution $x = a\sec\theta$, we will restrict its use to integrals in which $x/a \ge 1$. This will place $\theta$ in $[0, \pi/2)$ and make $\tan\theta \ge 0$. We will then have $\sqrt{x^2 - a^2} = \sqrt{a^2\tan^2\theta} = |a\tan\theta| = a\tan\theta$, free of absolute values, provided $a > 0$.

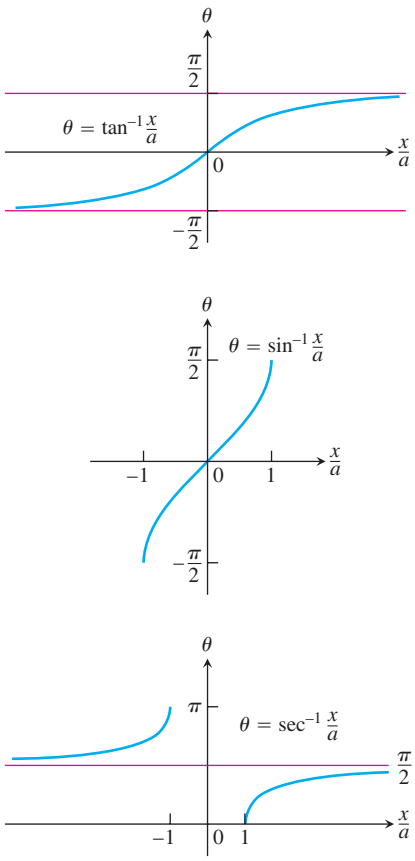

**FIGURE 8.3** The arctangent, arcsine, and arcsecant of $x/a$, graphed as functions of $x/a$.

**EXAMPLE 1** Using the Substitution $x = a\tan\theta$

Evaluate

$$\int \frac{dx}{\sqrt{4 + x^2}}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** We set

$$x = 2\tan\theta, \qquad dx = 2\sec^2\theta\, d\theta, \qquad -\frac{\pi}{2} < \theta < \frac{\pi}{2},$$
$$4 + x^2 = 4 + 4\tan^2\theta = 4(1 + \tan^2\theta) = 4\sec^2\theta.$$

Then

$$\int \frac{dx}{\sqrt{4+x^2}} = \int \frac{2\sec^2\theta\, d\theta}{\sqrt{4\sec^2\theta}} = \int \frac{\sec^2\theta\, d\theta}{|\sec\theta|} \qquad \sqrt{\sec^2\theta} = |\sec\theta|$$
$$= \int \sec\theta\, d\theta \qquad \sec\theta > 0 \text{ for } -\frac{\pi}{2} < \theta < \frac{\pi}{2}$$
$$= \ln|\sec\theta + \tan\theta| + C$$
$$= \ln\left|\frac{\sqrt{4+x^2}}{2} + \frac{x}{2}\right| + C \qquad \text{From Fig. 8.4}$$
$$= \ln|\sqrt{4+x^2} + x| + C'. \qquad \text{Taking } C' = C - \ln 2$$

Notice how we expressed $\ln|\sec\theta + \tan\theta|$ in terms of $x$: We drew a reference triangle for the original substitution $x = 2\tan\theta$ (Figure 8.4) and read the ratios from the triangle. ■

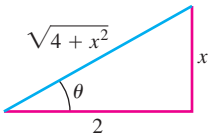

**FIGURE 8.4** Reference triangle for $x = 2\tan\theta$ (Example 1):

$$\tan\theta = \frac{x}{2}$$

and

$$\sec\theta = \frac{\sqrt{4+x^2}}{2}.$$

**EXAMPLE 2** Using the Substitution $x = a\sin\theta$

Evaluate

$$\int \frac{x^2\, dx}{\sqrt{9-x^2}}.$$

**Solution** We set

$$x = 3\sin\theta, \qquad dx = 3\cos\theta\, d\theta, \qquad -\frac{\pi}{2} < \theta < \frac{\pi}{2}$$
$$9 - x^2 = 9 - 9\sin^2\theta = 9(1 - \sin^2\theta) = 9\cos^2\theta.$$

Then

$$\int \frac{x^2\, dx}{\sqrt{9-x^2}} = \int \frac{9\sin^2\theta \cdot 3\cos\theta\, d\theta}{|3\cos\theta|}$$
$$= 9\int \sin^2\theta\, d\theta \qquad \cos\theta > 0 \text{ for } -\frac{\pi}{2} < \theta < \frac{\pi}{2}$$
$$= 9\int \frac{1 - \cos 2\theta}{2}\, d\theta$$
$$= \frac{9}{2}\left(\theta - \frac{\sin 2\theta}{2}\right) + C$$
$$= \frac{9}{2}(\theta - \sin\theta\cos\theta) + C \qquad \sin 2\theta = 2\sin\theta\cos\theta$$
$$= \frac{9}{2}\left(\sin^{-1}\frac{x}{3} - \frac{x}{3}\cdot\frac{\sqrt{9-x^2}}{3}\right) + C \qquad \text{Fig. 8.5}$$
$$= \frac{9}{2}\sin^{-1}\frac{x}{3} - \frac{x}{2}\sqrt{9-x^2} + C.$$ ■

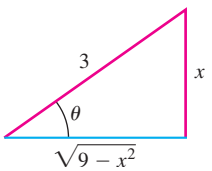

**FIGURE 8.5** Reference triangle for $x = 3\sin\theta$ (Example 2):

$$\sin\theta = \frac{x}{3}$$

and

$$\cos\theta = \frac{\sqrt{9-x^2}}{3}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 3** Using the Substitution $x = a \sec\theta$

Evaluate

$$\int \frac{dx}{\sqrt{25x^2 - 4}}, \qquad x > \frac{2}{5}.$$

**Solution** We first rewrite the radical as

$$\sqrt{25x^2 - 4} = \sqrt{25\left(x^2 - \frac{4}{25}\right)}$$
$$= 5\sqrt{x^2 - \left(\frac{2}{5}\right)^2}$$

to put the radicand in the form $x^2 - a^2$. We then substitute

$$x = \frac{2}{5}\sec\theta, \qquad dx = \frac{2}{5}\sec\theta\tan\theta\, d\theta, \qquad 0 < \theta < \frac{\pi}{2}$$

$$x^2 - \left(\frac{2}{5}\right)^2 = \frac{4}{25}\sec^2\theta - \frac{4}{25}$$
$$= \frac{4}{25}(\sec^2\theta - 1) = \frac{4}{25}\tan^2\theta$$

$$\sqrt{x^2 - \left(\frac{2}{5}\right)^2} = \frac{2}{5}|\tan\theta| = \frac{2}{5}\tan\theta. \qquad \tan\theta > 0 \text{ for } 0 < \theta < \pi/2$$

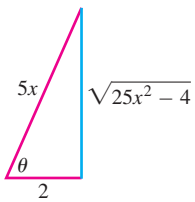

**FIGURE 8.6** If $x = (2/5)\sec\theta$, $0 < \theta < \pi/2$, then $\theta = \sec^{-1}(5x/2)$, and we can read the values of the other trigonometric functions of $\theta$ from this right triangle (Example 3).

With these substitutions, we have

$$\int \frac{dx}{\sqrt{25x^2 - 4}} = \int \frac{dx}{5\sqrt{x^2 - (4/25)}} = \int \frac{(2/5)\sec\theta\tan\theta\, d\theta}{5\cdot(2/5)\tan\theta}$$
$$= \frac{1}{5}\int \sec\theta\, d\theta = \frac{1}{5}\ln|\sec\theta + \tan\theta| + C$$
$$= \frac{1}{5}\ln\left|\frac{5x}{2} + \frac{\sqrt{25x^2 - 4}}{2}\right| + C. \qquad \text{Fig. 8.6}$$

■

A trigonometric substitution can sometimes help us to evaluate an integral containing an integer power of a quadratic binomial, as in the next example.

**EXAMPLE 4** Finding the Volume of a Solid of Revolution

Find the volume of the solid generated by revolving about the $x$-axis the region bounded by the curve $y = 4/(x^2 + 4)$, the $x$-axis, and the lines $x = 0$ and $x = 2$.

**Solution** We sketch the region (Figure 8.7) and use the disk method:

$$V = \int_0^2 \pi[R(x)]^2\, dx = 16\pi\int_0^2 \frac{dx}{(x^2 + 4)^2}. \qquad R(x) = \frac{4}{x^2 + 4}$$

To evaluate the integral, we set

$$x = 2\tan\theta, \qquad dx = 2\sec^2\theta\, d\theta, \qquad \theta = \tan^{-1}\frac{x}{2},$$
$$x^2 + 4 = 4\tan^2\theta + 4 = 4(\tan^2\theta + 1) = 4\sec^2\theta$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

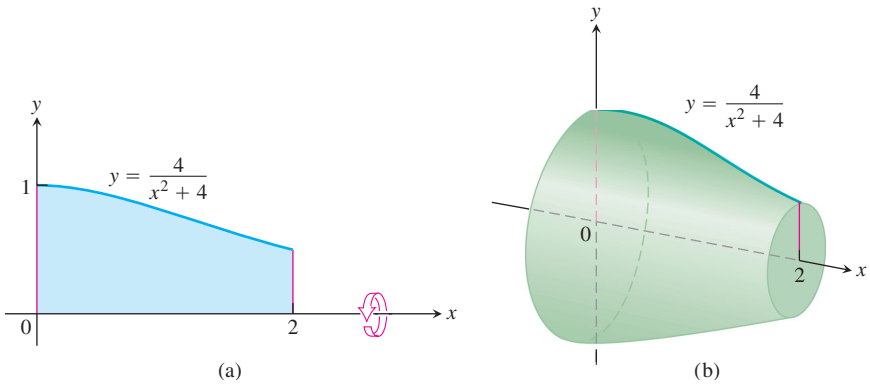

**FIGURE 8.7** The region (a) and solid (b) in Example 4.

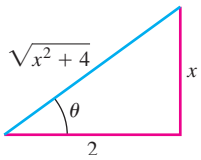

**FIGURE 8.8** Reference triangle for $x = 2 \tan \theta$ (Example 4).

(Figure 8.8). With these substitutions,

$$V = 16\pi \int_0^2 \frac{dx}{(x^2 + 4)^2}$$

$$= 16\pi \int_0^{\pi/4} \frac{2 \sec^2 \theta \, d\theta}{(4 \sec^2 \theta)^2} \qquad \theta = 0 \text{ when } x = 0;\ \theta = \pi/4 \text{ when } x = 2$$

$$= 16\pi \int_0^{\pi/4} \frac{2 \sec^2 \theta \, d\theta}{16 \sec^4 \theta} = \pi \int_0^{\pi/4} 2 \cos^2 \theta \, d\theta$$

$$= \pi \int_0^{\pi/4} (1 + \cos 2\theta) \, d\theta = \pi \left[ \theta + \frac{\sin 2\theta}{2} \right]_0^{\pi/4} \qquad 2 \cos^2 \theta = 1 + \cos 2\theta$$

$$= \pi \left[ \frac{\pi}{4} + \frac{1}{2} \right] \approx 4.04. \quad \blacksquare$$

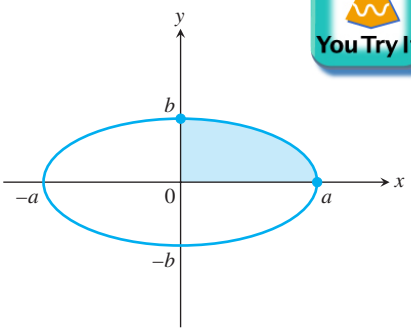

**FIGURE 8.9** The ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ in Example 5.

**EXAMPLE 5** Finding the Area of an Ellipse

Find the area enclosed by the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$$

**Solution** Because the ellipse is symmetric with respect to both axes, the total area $A$ is four times the area in the first quadrant (Figure 8.9). Solving the equation of the ellipse for $y \geq 0$, we get

$$\frac{y^2}{b^2} = 1 - \frac{x^2}{a^2} = \frac{a^2 - x^2}{a^2},$$

or

$$y = \frac{b}{a} \sqrt{a^2 - x^2} \qquad 0 \leq x \leq a$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The area of the ellipse is

$$
\begin{aligned}
A &= 4\int_0^a \frac{b}{a}\sqrt{a^2 - x^2}\,dx \\
&= 4\frac{b}{a}\int_0^{\pi/2} a\cos\theta \cdot a\cos\theta\,d\theta && x = a\sin\theta,\ dx = a\cos\theta\,d\theta,\ \theta = 0 \text{ when } x = 0;\ \theta = \pi/2 \text{ when } x = a \\
&= 4ab\int_0^{\pi/2} \cos^2\theta\,d\theta \\
&= 4ab\int_0^{\pi/2} \frac{1 + \cos 2\theta}{2}\,d\theta \\
&= 2ab\left[\theta + \frac{\sin 2\theta}{2}\right]_0^{\pi/2} \\
&= 2ab\left[\frac{\pi}{2} + 0 - 0\right] = \pi ab.
\end{aligned}
$$

If $a = b = r$ we get that the area of a circle with radius $r$ is $\pi r^2$. ■

# EXERCISES 8.5

## Basic Trigonometric Substitutions

Evaluate the integrals in Exercises 1–28.

1. $\displaystyle\int \frac{dy}{\sqrt{9+y^2}}$
2. $\displaystyle\int \frac{3\,dy}{\sqrt{1+9y^2}}$
3. $\displaystyle\int_{-2}^{2} \frac{dx}{4+x^2}$
4. $\displaystyle\int_{0}^{2} \frac{dx}{8+2x^2}$
5. $\displaystyle\int_{0}^{3/2} \frac{dx}{\sqrt{9-x^2}}$
6. $\displaystyle\int_{0}^{1/2\sqrt{2}} \frac{2\,dx}{\sqrt{1-4x^2}}$
7. $\displaystyle\int \sqrt{25-t^2}\,dt$
8. $\displaystyle\int \sqrt{1-9t^2}\,dt$
9. $\displaystyle\int \frac{dx}{\sqrt{4x^2-49}}, \quad x > \frac{7}{2}$
10. $\displaystyle\int \frac{5\,dx}{\sqrt{25x^2-9}}, \quad x > \frac{3}{5}$
11. $\displaystyle\int \frac{\sqrt{y^2-49}}{y}\,dy, \quad y > 7$
12. $\displaystyle\int \frac{\sqrt{y^2-25}}{y^3}\,dy, \quad y > 5$
13. $\displaystyle\int \frac{dx}{x^2\sqrt{x^2-1}}, \quad x > 1$
14. $\displaystyle\int \frac{2\,dx}{x^3\sqrt{x^2-1}}, \quad x > 1$
15. $\displaystyle\int \frac{x^3\,dx}{\sqrt{x^2+4}}$
16. $\displaystyle\int \frac{dx}{x^2\sqrt{x^2+1}}$
17. $\displaystyle\int \frac{8\,dw}{w^2\sqrt{4-w^2}}$
18. $\displaystyle\int \frac{\sqrt{9-w^2}}{w^2}\,dw$
19. $\displaystyle\int_{0}^{\sqrt{3}/2} \frac{4x^2\,dx}{(1-x^2)^{3/2}}$
20. $\displaystyle\int_{0}^{1} \frac{dx}{(4-x^2)^{3/2}}$
21. $\displaystyle\int \frac{dx}{(x^2-1)^{3/2}}, \quad x > 1$
22. $\displaystyle\int \frac{x^2\,dx}{(x^2-1)^{5/2}}, \quad x > 1$
23. $\displaystyle\int \frac{(1-x^2)^{3/2}}{x^6}\,dx$
24. $\displaystyle\int \frac{(1-x^2)^{1/2}}{x^4}\,dx$
25. $\displaystyle\int \frac{8\,dx}{(4x^2+1)^2}$
26. $\displaystyle\int \frac{6\,dt}{(9t^2+1)^2}$
27. $\displaystyle\int \frac{v^2\,dv}{(1-v^2)^{5/2}}$
28. $\displaystyle\int \frac{(1-r^2)^{5/2}}{r^8}\,dr$

In Exercises 29–36, use an appropriate substitution and then a trigonometric substitution to evaluate the integrals.

29. $\displaystyle\int_{0}^{\ln 4} \frac{e^t\,dt}{\sqrt{e^{2t}+9}}$
30. $\displaystyle\int_{\ln(3/4)}^{\ln(4/3)} \frac{e^t\,dt}{(1+e^{2t})^{3/2}}$
31. $\displaystyle\int_{1/12}^{1/4} \frac{2\,dt}{\sqrt{t}+4t\sqrt{t}}$
32. $\displaystyle\int_{1}^{e} \frac{dy}{y\sqrt{1+(\ln y)^2}}$
33. $\displaystyle\int \frac{dx}{x\sqrt{x^2-1}}$
34. $\displaystyle\int \frac{dx}{1+x^2}$
35. $\displaystyle\int \frac{x\,dx}{\sqrt{x^2-1}}$
36. $\displaystyle\int \frac{dx}{\sqrt{1-x^2}}$

## Initial Value Problems

Solve the initial value problems in Exercises 37–40 for $y$ as a function of $x$.

37. $x\dfrac{dy}{dx} = \sqrt{x^2-4}, \quad x \geq 2, \quad y(2) = 0$
38. $\sqrt{x^2-9}\dfrac{dy}{dx} = 1, \quad x > 3, \quad y(5) = \ln 3$
39. $(x^2+4)\dfrac{dy}{dx} = 3, \quad y(2) = 0$
40. $(x^2+1)^2\dfrac{dy}{dx} = \sqrt{x^2+1}, \quad y(0) = 1$

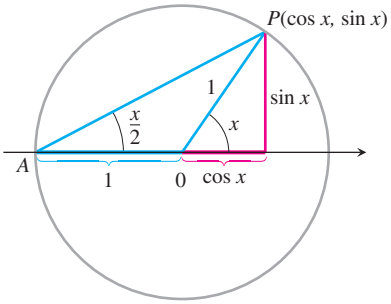
## Applications

Exercises

**41.** Find the area of the region in the first quadrant that is enclosed by the coordinate axes and the curve $y = \sqrt{9 - x^2}/3$.

**42.** Find the volume of the solid generated by revolving about the $x$-axis the region in the first quadrant enclosed by the coordinate axes, the curve $y = 2/(1 + x^2)$, and the line $x = 1$.



## The Substitution $z = \tan(x/2)$

The substitution

$$z = \tan\frac{x}{2} \tag{1}$$

reduces the problem of integrating a rational expression in $\sin x$ and $\cos x$ to a problem of integrating a rational function of $z$. This in turn can be integrated by partial fractions.

From the accompanying figure

we can read the relation

$$\tan\frac{x}{2} = \frac{\sin x}{1 + \cos x}.$$

To see the effect of the substitution, we calculate

$$\cos x = 2\cos^2\left(\frac{x}{2}\right) - 1 = \frac{2}{\sec^2(x/2)} - 1$$

$$= \frac{2}{1 + \tan^2(x/2)} - 1 = \frac{2}{1 + z^2} - 1$$

$$\cos x = \frac{1 - z^2}{1 + z^2}, \tag{2}$$

and

$$\sin x = 2\sin\frac{x}{2}\cos\frac{x}{2} = 2\frac{\sin(x/2)}{\cos(x/2)}\cdot\cos^2\left(\frac{x}{2}\right)$$

$$= 2\tan\frac{x}{2}\cdot\frac{1}{\sec^2(x/2)} = \frac{2\tan(x/2)}{1 + \tan^2(x/2)}$$

$$\sin x = \frac{2z}{1 + z^2}. \tag{3}$$

Finally, $x = 2\tan^{-1} z$, so

$$dx = \frac{2\,dz}{1 + z^2}. \tag{4}$$

## Examples

**a.** $$\int \frac{1}{1 + \cos x}\,dx = \int \frac{1 + z^2}{2}\frac{2\,dz}{1 + z^2}$$

$$= \int dz = z + C$$

$$= \tan\left(\frac{x}{2}\right) + C$$

**b.** $$\int \frac{1}{2 + \sin x}\,dx = \int \frac{1 + z^2}{2 + 2z + 2z^2}\frac{2\,dz}{1 + z^2}$$

$$= \int \frac{dz}{z^2 + z + 1} = \int \frac{dz}{(z + (1/2))^2 + 3/4}$$

$$= \int \frac{du}{u^2 + a^2}$$

$$= \frac{1}{a}\tan^{-1}\left(\frac{u}{a}\right) + C$$

$$= \frac{2}{\sqrt{3}}\tan^{-1}\frac{2z + 1}{\sqrt{3}} + C$$

$$= \frac{2}{\sqrt{3}}\tan^{-1}\frac{1 + 2\tan(x/2)}{\sqrt{3}} + C$$

Use the substitutions in Equations (1)–(4) to evaluate the integrals in Exercises 43–50. Integrals like these arise in calculating the average angular velocity of the output shaft of a universal joint when the input and output shafts are not aligned.

**43.** $\displaystyle\int \frac{dx}{1 - \sin x}$

**44.** $\displaystyle\int \frac{dx}{1 + \sin x + \cos x}$

**45.** $\displaystyle\int_0^{\pi/2} \frac{dx}{1 + \sin x}$

**46.** $\displaystyle\int_{\pi/3}^{\pi/2} \frac{dx}{1 - \cos x}$

**47.** $\displaystyle\int_0^{\pi/2} \frac{d\theta}{2 + \cos\theta}$

**48.** $\displaystyle\int_{\pi/2}^{2\pi/3} \frac{\cos\theta\,d\theta}{\sin\theta\cos\theta + \sin\theta}$

**49.** $\displaystyle\int \frac{dt}{\sin t - \cos t}$

**50.** $\displaystyle\int \frac{\cos t\,dt}{1 - \cos t}$

Use the substitution $z = \tan(\theta/2)$ to evaluate the integrals in Exercises 51 and 52.

**51.** $\displaystyle\int \sec\theta\,d\theta$

**52.** $\displaystyle\int \csc\theta\,d\theta$

# 8.6 Integral Tables and Computer Algebra Systems

As we have studied, the basic techniques of integration are substitution and integration by parts. We apply these techniques to transform unfamiliar integrals into integrals whose forms we recognize or can find in a table. But where do the integrals in the tables come from? They come from applying substitutions and integration by parts, or by differentiating important functions that arise in practice or applications and tabling the results (as we did in creating Table 8.1). When an integral matches an integral in the table or can be changed into one of the tabulated integrals with some appropriate combination of algebra, trigonometry, substitution, and calculus, the matched result can be used to solve the integration problem at hand.

Computer Algebra Systems (CAS) can also be used to evaluate an integral, if such a system is available. However, beware that there are many relatively simple functions, like $\sin(x^2)$ or $1/\ln x$ for which even the most powerful computer algebra systems cannot find explicit antiderivative formulas because no such formulas exist.

In this section we discuss how to use tables and computer algebra systems to evaluate integrals.

## Integral Tables

A Brief Table of Integrals is provided at the back of the book, after the index. (More extensive tables appear in compilations such as *CRC Mathematical Tables*, which contain thousands of integrals.) The integration formulas are stated in terms of constants $a$, $b$, $c$, $m$, $n$, and so on. These constants can usually assume any real value and need not be integers. Occasional limitations on their values are stated with the formulas. Formula 5 requires $n \neq -1$, for example, and Formula 11 requires $n \neq 2$.

The formulas also assume that the constants do not take on values that require dividing by zero or taking even roots of negative numbers. For example, Formula 8 assumes that $a \neq 0$, and Formulas 13(a) and (b) cannot be used unless $b$ is positive.

The integrals in Examples 1–5 of this section can be evaluated using algebraic manipulation, substitution, or integration by parts. Here we illustrate how the integrals are found using the Brief Table of Integrals.

**EXAMPLE 1** Find

$$\int x(2x + 5)^{-1}\,dx.$$

**Solution** We use Formula 8 (not 7, which requires $n \neq -1$):

$$\int x(ax + b)^{-1}\,dx = \frac{x}{a} - \frac{b}{a^2}\ln|ax + b| + C.$$

With $a = 2$ and $b = 5$, we have

$$\int x(2x + 5)^{-1}\,dx = \frac{x}{2} - \frac{5}{4}\ln|2x + 5| + C.$$ ■

**EXAMPLE 2** Find

$$\int \frac{dx}{x\sqrt{2x + 4}}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** We use Formula 13(b):

$$\int \frac{dx}{x\sqrt{ax+b}} = \frac{1}{\sqrt{b}} \ln \left| \frac{\sqrt{ax+b} - \sqrt{b}}{\sqrt{ax+b} + \sqrt{b}} \right| + C, \qquad \text{if } b > 0.$$

With $a = 2$ and $b = 4$, we have

$$\int \frac{dx}{x\sqrt{2x+4}} = \frac{1}{\sqrt{4}} \ln \left| \frac{\sqrt{2x+4} - \sqrt{4}}{\sqrt{2x+4} + \sqrt{4}} \right| + C$$

$$= \frac{1}{2} \ln \left| \frac{\sqrt{2x+4} - 2}{\sqrt{2x+4} + 2} \right| + C. \quad \blacksquare$$

Formula 13(a), which would require $b < 0$ here, is not appropriate in Example 2. It *is* appropriate, however, in the next example.

**EXAMPLE 3** Find

$$\int \frac{dx}{x\sqrt{2x-4}}.$$

**Solution** We use Formula 13(a):

$$\int \frac{dx}{x\sqrt{ax-b}} = \frac{2}{\sqrt{b}} \tan^{-1} \sqrt{\frac{ax-b}{b}} + C.$$

With $a = 2$ and $b = 4$, we have

$$\int \frac{dx}{x\sqrt{2x-4}} = \frac{2}{\sqrt{4}} \tan^{-1} \sqrt{\frac{2x-4}{4}} + C = \tan^{-1} \sqrt{\frac{x-2}{2}} + C. \quad \blacksquare$$

**EXAMPLE 4** Find

$$\int \frac{dx}{x^2\sqrt{2x-4}}.$$

**Solution** We begin with Formula 15:

$$\int \frac{dx}{x^2\sqrt{ax+b}} = -\frac{\sqrt{ax+b}}{bx} - \frac{a}{2b} \int \frac{dx}{x\sqrt{ax+b}} + C.$$

With $a = 2$ and $b = -4$, we have

$$\int \frac{dx}{x^2\sqrt{2x-4}} = -\frac{\sqrt{2x-4}}{-4x} + \frac{2}{2 \cdot 4} \int \frac{dx}{x\sqrt{2x-4}} + C.$$

We then use Formula 13(a) to evaluate the integral on the right (Example 3) to obtain

$$\int \frac{dx}{x^2\sqrt{2x-4}} = \frac{\sqrt{2x-4}}{4x} + \frac{1}{4} \tan^{-1} \sqrt{\frac{x-2}{2}} + C. \quad \blacksquare$$

**EXAMPLE 5** Find

$$\int x \sin^{-1} x \, dx.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** We use Formula 99:

$$\int x^n \sin^{-1} ax\, dx = \frac{x^{n+1}}{n+1}\sin^{-1} ax - \frac{a}{n+1}\int \frac{x^{n+1}\, dx}{\sqrt{1-a^2x^2}}, \qquad n \neq -1.$$

With $n = 1$ and $a = 1$, we have

$$\int x \sin^{-1} x\, dx = \frac{x^2}{2}\sin^{-1} x - \frac{1}{2}\int \frac{x^2\, dx}{\sqrt{1-x^2}}.$$

The integral on the right is found in the table as Formula 33:

$$\int \frac{x^2}{\sqrt{a^2-x^2}}\, dx = \frac{a^2}{2}\sin^{-1}\left(\frac{x}{a}\right) - \frac{1}{2}x\sqrt{a^2-x^2} + C.$$

With $a = 1$,

$$\int \frac{x^2\, dx}{\sqrt{1-x^2}} = \frac{1}{2}\sin^{-1} x - \frac{1}{2}x\sqrt{1-x^2} + C.$$

The combined result is

$$\begin{aligned}\int x \sin^{-1} x\, dx &= \frac{x^2}{2}\sin^{-1} x - \frac{1}{2}\left(\frac{1}{2}\sin^{-1} x - \frac{1}{2}x\sqrt{1-x^2} + C\right)\\ &= \left(\frac{x^2}{2} - \frac{1}{4}\right)\sin^{-1} x + \frac{1}{4}x\sqrt{1-x^2} + C'.\end{aligned}$$

■

## Reduction Formulas

The time required for repeated integrations by parts can sometimes be shortened by applying formulas like

$$\int \tan^n x\, dx = \frac{1}{n-1}\tan^{n-1} x - \int \tan^{n-2} x\, dx \tag{1}$$

$$\int (\ln x)^n\, dx = x(\ln x)^n - n\int (\ln x)^{n-1}\, dx \tag{2}$$

$$\int \sin^n x \cos^m x\, dx = -\frac{\sin^{n-1} x \cos^{m+1} x}{m+n} + \frac{n-1}{m+n}\int \sin^{n-2} x \cos^m x\, dx \qquad (n \neq -m). \tag{3}$$

Formulas like these are called **reduction formulas** because they replace an integral containing some power of a function with an integral of the same form with the power reduced. By applying such a formula repeatedly, we can eventually express the original integral in terms of a power low enough to be evaluated directly.

**EXAMPLE 6** Using a Reduction Formula

Find

$$\int \tan^5 x\, dx.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** We apply Equation (1) with $n = 5$ to get

$$\int \tan^5 x\,dx = \frac{1}{4}\tan^4 x - \int \tan^3 x\,dx.$$

We then apply Equation (1) again, with $n = 3$, to evaluate the remaining integral:

$$\int \tan^3 x\,dx = \frac{1}{2}\tan^2 x - \int \tan x\,dx = \frac{1}{2}\tan^2 x + \ln|\cos x| + C.$$

The combined result is

$$\int \tan^5 x\,dx = \frac{1}{4}\tan^4 x - \frac{1}{2}\tan^2 x - \ln|\cos x| + C'. \quad \blacksquare$$

As their form suggests, reduction formulas are derived by integration by parts.

**EXAMPLE 7** Deriving a Reduction Formula

Show that for any positive integer $n$,

$$\int (\ln x)^n\,dx = x(\ln x)^n - n\int (\ln x)^{n-1}\,dx.$$

**Solution** We use the integration by parts formula

$$\int u\,dv = uv - \int v\,du$$

with

$$u = (\ln x)^n, \qquad du = n(\ln x)^{n-1}\frac{dx}{x}, \qquad dv = dx, \qquad v = x,$$

to obtain

$$\int (\ln x)^n\,dx = x(\ln x)^n - n\int (\ln x)^{n-1}\,dx. \quad \blacksquare$$

Sometimes two reduction formulas come into play.

**EXAMPLE 8** Find

$$\int \sin^2 x \cos^3 x\,dx.$$

**Solution 1** We apply Equation (3) with $n = 2$ and $m = 3$ to get

$$\int \sin^2 x \cos^3 x\,dx = -\frac{\sin x \cos^4 x}{2+3} + \frac{1}{2+3}\int \sin^0 x \cos^3 x\,dx$$

$$= -\frac{\sin x \cos^4 x}{5} + \frac{1}{5}\int \cos^3 x\,dx.$$

We can evaluate the remaining integral with Formula 61 (another reduction formula):

$$\int \cos^n ax\,dx = \frac{\cos^{n-1} ax \sin ax}{na} + \frac{n-1}{n}\int \cos^{n-2} ax\,dx.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

With $n = 3$ and $a = 1$, we have

$$\int \cos^3 x\, dx = \frac{\cos^2 x \sin x}{3} + \frac{2}{3}\int \cos x\, dx$$
$$= \frac{\cos^2 x \sin x}{3} + \frac{2}{3}\sin x + C.$$

The combined result is

$$\int \sin^2 x \cos^3 x\, dx = -\frac{\sin x \cos^4 x}{5} + \frac{1}{5}\left(\frac{\cos^2 x \sin x}{3} + \frac{2}{3}\sin x + C\right)$$
$$= -\frac{\sin x \cos^4 x}{5} + \frac{\cos^2 x \sin x}{15} + \frac{2}{15}\sin x + C'.$$

**Solution 2** Equation (3) corresponds to Formula 68 in the table, but there is another formula we might use, namely Formula 69. With $a = 1$, Formula 69 gives

$$\int \sin^n x \cos^m x\, dx = \frac{\sin^{n+1} x \cos^{m-1} x}{m + n} + \frac{m - 1}{m + n}\int \sin^n x \cos^{m-2} x\, dx.$$

In our case, $n = 2$ and $m = 3$, so that

$$\int \sin^2 x \cos^3 x\, dx = \frac{\sin^3 x \cos^2 x}{5} + \frac{2}{5}\int \sin^2 x \cos x\, dx$$
$$= \frac{\sin^3 x \cos^2 x}{5} + \frac{2}{5}\left(\frac{\sin^3 x}{3}\right) + C$$
$$= \frac{\sin^3 x \cos^2 x}{5} + \frac{2}{15}\sin^3 x + C.$$

As you can see, it is faster to use Formula 69, but we often cannot tell beforehand how things will work out. Do not spend a lot of time looking for the "best" formula. Just find one that will work and forge ahead.

Notice also that Formulas 68 (Solution 1) and 69 (Solution 2) lead to different-looking answers. That is often the case with trigonometric integrals and is no cause for concern. The results are equivalent, and we may use whichever one we please. ■

## Nonelementary Integrals

The development of computers and calculators that find antiderivatives by symbolic manipulation has led to a renewed interest in determining which antiderivatives can be expressed as finite combinations of elementary functions (the functions we have been studying) and which cannot. Integrals of functions that do not have elementary antiderivatives are called **nonelementary** integrals. They require infinite series (Chapter 11) or numerical methods for their evaluation. Examples of the latter include the error function (which measures the probability of random errors)

$$\operatorname{erf}(x) = \frac{2}{\sqrt{\pi}}\int_0^x e^{-t^2}\, dt$$

and integrals such as

$$\int \sin x^2\, dx \qquad \text{and} \qquad \int \sqrt{1 + x^4}\, dx$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

that arise in engineering and physics. These and a number of others, such as

$$\int \frac{e^x}{x}\,dx, \qquad \int e^{(e^x)}\,dx, \qquad \int \frac{1}{\ln x}\,dx, \qquad \int \ln(\ln x)\,dx, \qquad \int \frac{\sin x}{x}\,dx,$$

$$\int \sqrt{1 - k^2 \sin^2 x}\,dx, \qquad 0 < k < 1,$$

look so easy they tempt us to try them just to see how they turn out. It can be proved, however, that there is no way to express these integrals as finite combinations of elementary functions. The same applies to integrals that can be changed into these by substitution. The integrands all have antiderivatives, as a consequence of the Fundamental Theorem of the Calculus, Part 1, because they are continuous. However, none of the antiderivatives is elementary.

None of the integrals you are asked to evaluate in the present chapter falls into this category, but you may encounter nonelementary integrals in your other work.

## Integration with a CAS

A powerful capability of computer algebra systems is their ability to integrate symbolically. This is performed with the **integrate command** specified by the particular system (for example, **int** in Maple, **Integrate** in Mathematica).

### EXAMPLE 9 Using a CAS with a Named Function

Suppose that you want to evaluate the indefinite integral of the function

$$f(x) = x^2\sqrt{a^2 + x^2}.$$

Using Maple, you first define or name the function:

$$> f := x\text{^}2 * \text{sqrt}(a\text{^}2 + x\text{^}2);$$

Then you use the integrate command on $f$, identifying the variable of integration:

$$> \text{int}(f, x);$$

Maple returns the answer

$$\frac{1}{4}x(a^2 + x^2)^{3/2} - \frac{1}{8}a^2x\sqrt{a^2 + x^2} - \frac{1}{8}a^4 \ln\left(x + \sqrt{a^2 + x^2}\right).$$

If you want to see if the answer can be simplified, enter

$$> \text{simplify}(\%);$$

Maple returns

$$\frac{1}{8}a^2x\sqrt{a^2 + x^2} + \frac{1}{4}x^3\sqrt{a^2 + x^2} - \frac{1}{8}a^4 \ln\left(x + \sqrt{a^2 + x^2}\right).$$

If you want the definite integral for $0 \le x \le \pi/2$, you can use the format

$$> \text{int}(f, x = 0..\text{Pi}/2);$$

Maple (Version 5.1) will return the expression

$$\frac{1}{64}\pi(4a^2 + \pi^2)^{(3/2)} - \frac{1}{32}a^2\pi\sqrt{4a^2 + \pi^2} + \frac{1}{8}a^4 \ln(2) - \frac{1}{8}a^4 \ln\left(\pi + \sqrt{4a^2 + \pi^2}\right) + \frac{1}{16}a^4 \ln(a^2).$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

You can also find the definite integral for a particular value of the constant $a$:

$$> a:= 1;$$
$$> \text{int}(f, x = 0..1);$$

Maple returns the numerical answer

$$\frac{3}{8}\sqrt{2} + \frac{1}{8}\ln\left(\sqrt{2} - 1\right).$$

■

**EXAMPLE 10** Using a CAS Without Naming the Function

Use a CAS to find

$$\int \sin^2 x \cos^3 x \, dx.$$

**Solution** With Maple, we have the entry

$$> \text{int}((\sin\text{^}2)(x) * (\cos\text{^}3)(x), x);$$

with the immediate return

$$-\frac{1}{5}\sin(x)\cos(x)^4 + \frac{1}{15}\cos(x)^2\sin(x) + \frac{2}{15}\sin(x).$$

■

**EXAMPLE 11** A CAS May Not Return a Closed Form Solution

Use a CAS to find

$$\int (\cos^{-1} ax)^2 \, dx.$$

**Solution** Using Maple, we enter

$$> \text{int}((\arccos(a * x))\text{^}2, x);$$

and Maple returns the expression

$$\int \arccos(ax)^2 \, dx,$$

indicating that it does not have a closed form solution known by Maple. In Chapter 11, you will see how series expansion may help to evaluate such an integral. ■

Computer algebra systems vary in how they process integrations. We used Maple 5.1 in Examples 9–11. Mathematica 4 would have returned somewhat different results:

**1.** In Example 9, given

*In [1]*:= Integrate [$x$^2 * Sqrt [$a$^2 + $x$^2], $x$]

Mathematica returns

$$\textit{Out [1]}= \sqrt{a^2 + x^2}\left(\frac{a^2 x}{8} + \frac{x^3}{4}\right) - \frac{1}{8}a^4 \,\text{Log}\left[x + \sqrt{a^2 + x^2}\right]$$

without having to simplify an intermediate result. The answer is close to Formula 22 in the integral tables.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**2.** The Mathematica answer to the integral

$$In\ [2]:= \text{Integrate}\ [\text{Sin}\ [x]\hat{}2 * \text{Cos}\ [x]\hat{}3, x]$$

in Example 10 is

$$Out\ [2]= \frac{\text{Sin}\ [x]}{8} - \frac{1}{48}\text{Sin}\ [3\,x] - \frac{1}{80}\text{Sin}\ [5\,x]$$

differing from both the Maple answer and the answers in Example 8.

**3.** Mathematica does give a result for the integration

$$In\ [3]:= \text{Integrate}\ [\text{ArcCos}\ [a * x]\hat{}2, x]$$

in Example 11, provided $a \neq 0$:

$$Out\ [3]= -2x - \frac{2\sqrt{1 - a^2 x^2}\,\text{ArcCos}\ [a\,x]}{a} + x\,\text{ArcCos}\ [a\,x]^2$$

Although a CAS is very powerful and can aid us in solving difficult problems, each CAS has its own limitations. There are even situations where a CAS may further complicate a problem (in the sense of producing an answer that is extremely difficult to use or interpret). Note, too, that neither Maple nor Mathematica return an arbitrary constant $+C$. On the other hand, a little mathematical thinking on your part may reduce the problem to one that is quite easy to handle. We provide an example in Exercise 111.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# EXERCISES 8.6

## Using Integral Tables

Use the table of integrals at the back of the book to evaluate the integrals in Exercises 1–38.

1. $\displaystyle\int \frac{dx}{x\sqrt{x-3}}$
2. $\displaystyle\int \frac{dx}{x\sqrt{x+4}}$
3. $\displaystyle\int \frac{x\,dx}{\sqrt{x-2}}$
4. $\displaystyle\int \frac{x\,dx}{(2x+3)^{3/2}}$
5. $\displaystyle\int x\sqrt{2x-3}\,dx$
6. $\displaystyle\int x(7x+5)^{3/2}\,dx$
7. $\displaystyle\int \frac{\sqrt{9-4x}}{x^2}\,dx$
8. $\displaystyle\int \frac{dx}{x^2\sqrt{4x-9}}$
9. $\displaystyle\int x\sqrt{4x-x^2}\,dx$
10. $\displaystyle\int \frac{\sqrt{x-x^2}}{x}\,dx$
11. $\displaystyle\int \frac{dx}{x\sqrt{7+x^2}}$
12. $\displaystyle\int \frac{dx}{x\sqrt{7-x^2}}$
13. $\displaystyle\int \frac{\sqrt{4-x^2}}{x}\,dx$
14. $\displaystyle\int \frac{\sqrt{x^2-4}}{x}\,dx$
15. $\displaystyle\int \sqrt{25-p^2}\,dp$
16. $\displaystyle\int q^2\sqrt{25-q^2}\,dq$
17. $\displaystyle\int \frac{r^2}{\sqrt{4-r^2}}\,dr$
18. $\displaystyle\int \frac{ds}{\sqrt{s^2-2}}$
19. $\displaystyle\int \frac{d\theta}{5+4\sin 2\theta}$
20. $\displaystyle\int \frac{d\theta}{4+5\sin 2\theta}$
21. $\displaystyle\int e^{2t}\cos 3t\,dt$
22. $\displaystyle\int e^{-3t}\sin 4t\,dt$
23. $\displaystyle\int x\cos^{-1}x\,dx$
24. $\displaystyle\int x\tan^{-1}x\,dx$
25. $\displaystyle\int \frac{ds}{(9-s^2)^2}$
26. $\displaystyle\int \frac{d\theta}{(2-\theta^2)^2}$
27. $\displaystyle\int \frac{\sqrt{4x+9}}{x^2}\,dx$
28. $\displaystyle\int \frac{\sqrt{9x-4}}{x^2}\,dx$
29. $\displaystyle\int \frac{\sqrt{3t-4}}{t}\,dt$
30. $\displaystyle\int \frac{\sqrt{3t+9}}{t}\,dt$
31. $\displaystyle\int x^2\tan^{-1}x\,dx$
32. $\displaystyle\int \frac{\tan^{-1}x}{x^2}\,dx$
33. $\displaystyle\int \sin 3x\cos 2x\,dx$
34. $\displaystyle\int \sin 2x\cos 3x\,dx$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**35.** $\int 8 \sin 4t \sin \frac{t}{2}\, dt$

**36.** $\int \sin \frac{t}{3} \sin \frac{t}{6}\, dt$

**37.** $\int \cos \frac{\theta}{3} \cos \frac{\theta}{4}\, d\theta$

**38.** $\int \cos \frac{\theta}{2} \cos 7\theta\, d\theta$

## Substitution and Integral Tables

In Exercises 39–52, use a substitution to change the integral into one you can find in the table. Then evaluate the integral.

**39.** $\int \frac{x^3 + x + 1}{(x^2 + 1)^2}\, dx$

**40.** $\int \frac{x^2 + 6x}{(x^2 + 3)^2}\, dx$

**41.** $\int \sin^{-1} \sqrt{x}\, dx$

**42.** $\int \frac{\cos^{-1} \sqrt{x}}{\sqrt{x}}\, dx$

**43.** $\int \frac{\sqrt{x}}{\sqrt{1 - x}}\, dx$

**44.** $\int \frac{\sqrt{2 - x}}{\sqrt{x}}\, dx$

**45.** $\int \cot t \sqrt{1 - \sin^2 t}\, dt, \quad 0 < t < \pi/2$

**46.** $\int \frac{dt}{\tan t \sqrt{4 - \sin^2 t}}$

**47.** $\int \frac{dy}{y\sqrt{3 + (\ln y)^2}}$

**48.** $\int \frac{\cos \theta\, d\theta}{\sqrt{5 + \sin^2 \theta}}$

**49.** $\int \frac{3\, dr}{\sqrt{9r^2 - 1}}$

**50.** $\int \frac{3\, dy}{\sqrt{1 + 9y^2}}$

**51.** $\int \cos^{-1} \sqrt{x}\, dx$

**52.** $\int \tan^{-1} \sqrt{y}\, dy$

## Using Reduction Formulas

Use reduction formulas to evaluate the integrals in Exercises 53–72.

**53.** $\int \sin^5 2x\, dx$

**54.** $\int \sin^5 \frac{\theta}{2}\, d\theta$

**55.** $\int 8 \cos^4 2\pi t\, dt$

**56.** $\int 3 \cos^5 3y\, dy$

**57.** $\int \sin^2 2\theta \cos^3 2\theta\, d\theta$

**58.** $\int 9 \sin^3 \theta \cos^{3/2} \theta\, d\theta$

**59.** $\int 2 \sin^2 t \sec^4 t\, dt$

**60.** $\int \csc^2 y \cos^5 y\, dy$

**61.** $\int 4 \tan^3 2x\, dx$

**62.** $\int \tan^4 \left(\frac{x}{2}\right) dx$

**63.** $\int 8 \cot^4 t\, dt$

**64.** $\int 4 \cot^3 2t\, dt$

**65.** $\int 2 \sec^3 \pi x\, dx$

**66.** $\int \frac{1}{2} \csc^3 \frac{x}{2}\, dx$

**67.** $\int 3 \sec^4 3x\, dx$

**68.** $\int \csc^4 \frac{\theta}{3}\, d\theta$

**69.** $\int \csc^5 x\, dx$

**70.** $\int \sec^5 x\, dx$

**71.** $\int 16x^3 (\ln x)^2\, dx$

**72.** $\int (\ln x)^3\, dx$

## Powers of $x$ Times Exponentials

Evaluate the integrals in Exercises 73–80 using table Formulas 103–106. These integrals can also be evaluated using tabular integration (Section 8.2).

**73.** $\int xe^{3x}\, dx$

**74.** $\int xe^{-2x}\, dx$

**75.** $\int x^3 e^{x/2}\, dx$

**76.** $\int x^2 e^{\pi x}\, dx$

**77.** $\int x^2\, 2^x\, dx$

**78.** $\int x^2\, 2^{-x}\, dx$

**79.** $\int x\pi^x\, dx$

**80.** $\int x 2^{\sqrt{2}x}\, dx$

## Substitutions with Reduction Formulas

Evaluate the integrals in Exercises 81–86 by making a substitution (possibly trigonometric) and then applying a reduction formula.

**81.** $\int e^t \sec^3 (e^t - 1)\, dt$

**82.** $\int \frac{\csc^3 \sqrt{\theta}}{\sqrt{\theta}}\, d\theta$

**83.** $\int_0^1 2\sqrt{x^2 + 1}\, dx$

**84.** $\int_0^{\sqrt{3}/2} \frac{dy}{(1 - y^2)^{5/2}}$

**85.** $\int_1^2 \frac{(r^2 - 1)^{3/2}}{r}\, dr$

**86.** $\int_0^{1/\sqrt{3}} \frac{dt}{(t^2 + 1)^{7/2}}$

## Hyperbolic Functions

Use the integral tables to evaluate the integrals in Exercises 87–92.

**87.** $\int \frac{1}{8} \sinh^5 3x\, dx$

**88.** $\int \frac{\cosh^4 \sqrt{x}}{\sqrt{x}}\, dx$

**89.** $\int x^2 \cosh 3x\, dx$

**90.** $\int x \sinh 5x\, dx$

**91.** $\int \operatorname{sech}^7 x \tanh x\, dx$

**92.** $\int \operatorname{csch}^3 2x \coth 2x\, dx$

## Theory and Examples

Exercises 93–100 refer to formulas in the table of integrals at the back of the book.

**93.** Derive Formula 9 by using the substitution $u = ax + b$ to evaluate

$$\int \frac{x}{(ax + b)^2}\, dx.$$

**94.** Derive Formula 17 by using a trigonometric substitution to evaluate

$$\int \frac{dx}{(a^2 + x^2)^2}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**95.** Derive Formula 29 by using a trigonometric substitution to evaluate

$$\int \sqrt{a^2 - x^2}\, dx.$$

**96.** Derive Formula 46 by using a trigonometric substitution to evaluate

$$\int \frac{dx}{x^2\sqrt{x^2 - a^2}}.$$

**97.** Derive Formula 80 by evaluating

$$\int x^n \sin ax\, dx$$

by integration by parts.

**98.** Derive Formula 110 by evaluating

$$\int x^n (\ln ax)^m\, dx$$

by integration by parts.

**99.** Derive Formula 99 by evaluating

$$\int x^n \sin^{-1} ax\, dx$$

by integration by parts.

**100.** Derive Formula 101 by evaluating

$$\int x^n \tan^{-1} ax\, dx$$

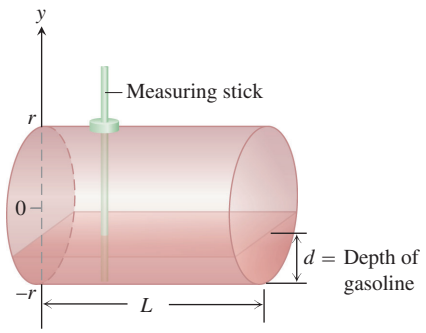
by integration by parts.

**101. Surface area** Find the area of the surface generated by revolving the curve $y = \sqrt{x^2 + 2}$, $0 \le x \le \sqrt{2}$, about the $x$-axis.

**102. Arc length** Find the length of the curve $y = x^2$, $0 \le x \le \sqrt{3}/2$.

**103. Centroid** Find the centroid of the region cut from the first quadrant by the curve $y = 1/\sqrt{x + 1}$ and the line $x = 3$.

**104. Moment about $y$-axis** A thin plate of constant density $\delta = 1$ occupies the region enclosed by the curve $y = 36/(2x + 3)$ and the line $x = 3$ in the first quadrant. Find the moment of the plate about the $y$-axis.



T **105.** Use the integral table and a calculator to find to two decimal places the area of the surface generated by revolving the curve $y = x^2$, $-1 \le x \le 1$, about the $x$-axis.

**106. Volume** The head of your firm's accounting department has asked you to find a formula she can use in a computer program to calculate the year-end inventory of gasoline in the company's tanks. A typical tank is shaped like a right circular cylinder of radius $r$ and length $L$, mounted horizontally, as shown here. The data come to the accounting office as depth measurements taken with a vertical measuring stick marked in centimeters.

**a.** Show, in the notation of the figure here, that the volume of gasoline that fills the tank to a depth $d$ is

$$V = 2L\int_{-r}^{-r+d} \sqrt{r^2 - y^2}\, dy.$$

**b.** Evaluate the integral.

**107.** What is the largest value

$$\int_a^b \sqrt{x - x^2}\, dx$$

can have for any $a$ and $b$? Give reasons for your answer.

**108.** What is the largest value

$$\int_a^b x\sqrt{2x - x^2}\, dx$$

can have for any $a$ and $b$? Give reasons for your answer.

## COMPUTER EXPLORATIONS

In Exercises 109 and 110, use a CAS to perform the integrations.

**109.** Evaluate the integrals

**a.** $\int x \ln x\, dx$ **b.** $\int x^2 \ln x\, dx$ **c.** $\int x^3 \ln x\, dx$.

**d.** What pattern do you see? Predict the formula for $\int x^4 \ln x\, dx$ and then see if you are correct by evaluating it with a CAS.

**e.** What is the formula for $\int x^n \ln x\, dx$, $n \ge 1$? Check your answer using a CAS.

**110.** Evaluate the integrals

**a.** $\int \frac{\ln x}{x^2}\, dx$ **b.** $\int \frac{\ln x}{x^3}\, dx$ **c.** $\int \frac{\ln x}{x^4}\, dx$.

**d.** What pattern do you see? Predict the formula for

$$\int \frac{\ln x}{x^5}\, dx$$

and then see if you are correct by evaluating it with a CAS.

**e.** What is the formula for

$$\int \frac{\ln x}{x^n}\, dx, \quad n \ge 2?$$

Check your answer using a CAS.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**111. a.** Use a CAS to evaluate

$$\int_0^{\pi/2} \frac{\sin^n x}{\sin^n x + \cos^n x}\, dx$$

where $n$ is an arbitrary positive integer. Does your CAS find the result?

**b.** In succession, find the integral when $n = 1, 2, 3, 5, 7$. Comment on the complexity of the results.

**c.** Now substitute $x = (\pi/2) - u$ and add the new and old integrals. What is the value of

$$\int_0^{\pi/2} \frac{\sin^n x}{\sin^n x + \cos^n x}\, dx?$$

This exercise illustrates how a little mathematical ingenuity solves a problem not immediately amenable to solution by a CAS.

# 8.7 Numerical Integration

As we have seen, the ideal way to evaluate a definite integral $\int_a^b f(x)\,dx$ is to find a formula $F(x)$ for one of the antiderivatives of $f(x)$ and calculate the number $F(b) - F(a)$. But some antiderivatives require considerable work to find, and still others, like the antiderivatives of $\sin(x^2)$, $1/\ln x$, and $\sqrt{1 + x^4}$, have no elementary formulas.

Another situation arises when a function is defined by a table whose entries were obtained experimentally through instrument readings. In this case a formula for the function may not even exist.

Whatever the reason, when we cannot evaluate a definite integral with an antiderivative, we turn to numerical methods such as the *Trapezoidal Rule* and *Simpson's Rule* developed in this section. These rules usually require far fewer subdivisions of the integration interval to get accurate results compared to the various rectangle rules presented in Sections 5.1 and 5.2. We also estimate the error obtained when using these approximation methods.

## Trapezoidal Approximations

When we cannot find a workable antiderivative for a function $f$ that we have to integrate, we partition the interval of integration, replace $f$ by a closely fitting polynomial on each subinterval, integrate the polynomials, and add the results to approximate the integral of $f$. In our presentation we assume that $f$ is positive, but the only requirement is for $f$ to be continuous over the interval of integration $[a, b]$.

The Trapezoidal Rule for the value of a definite integral is based on approximating the region between a curve and the $x$-axis with trapezoids instead of rectangles, as in Figure 8.10. It is not necessary for the subdivision points $x_0, x_1, x_2, \ldots, x_n$ in the figure to be evenly spaced, but the resulting formula is simpler if they are. We therefore assume that the length of each subinterval is

$$\Delta x = \frac{b - a}{n}.$$

The length $\Delta x = (b - a)/n$ is called the **step size** or **mesh size**. The area of the trapezoid that lies above the $i$th subinterval is

$$\Delta x\left(\frac{y_{i-1} + y_i}{2}\right) = \frac{\Delta x}{2}(y_{i-1} + y_i),$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

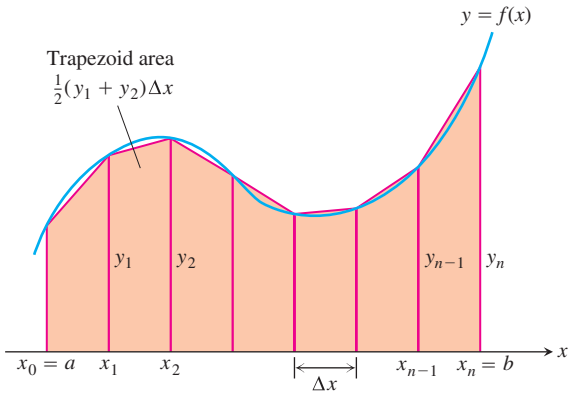

**FIGURE 8.10** The Trapezoidal Rule approximates short stretches of the curve $y = f(x)$ with line segments. To approximate the integral of $f$ from $a$ to $b$, we add the areas of the trapezoids made by joining the ends of the segments to the $x$-axis.

where $y_{i-1} = f(x_{i-1})$ and $y_i = f(x_i)$. This area is the length $\Delta x$ of the trapezoid's horizontal "altitude" times the average of its two vertical "bases." (See Figure 8.10.) The area below the curve $y = f(x)$ and above the $x$-axis is then approximated by adding the areas of all the trapezoids:

$$\begin{aligned} T &= \frac{1}{2}(y_0 + y_1)\Delta x + \frac{1}{2}(y_1 + y_2)\Delta x + \cdots \\ &\quad + \frac{1}{2}(y_{n-2} + y_{n-1})\Delta x + \frac{1}{2}(y_{n-1} + y_n)\Delta x \\ &= \Delta x\left(\frac{1}{2}y_0 + y_1 + y_2 + \cdots + y_{n-1} + \frac{1}{2}y_n\right) \\ &= \frac{\Delta x}{2}(y_0 + 2y_1 + 2y_2 + \cdots + 2y_{n-1} + y_n), \end{aligned}$$

where

$$y_0 = f(a), \qquad y_1 = f(x_1), \qquad \ldots, \qquad y_{n-1} = f(x_{n-1}), \qquad y_n = f(b).$$

The Trapezoidal Rule says: Use $T$ to estimate the integral of $f$ from $a$ to $b$.

**The Trapezoidal Rule**

To approximate $\int_a^b f(x)\,dx$, use

$$T = \frac{\Delta x}{2}\left(y_0 + 2y_1 + 2y_2 + \cdots + 2y_{n-1} + y_n\right).$$

The $y$'s are the values of $f$ at the partition points

$$x_0 = a, x_1 = a + \Delta x, x_2 = a + 2\Delta x, \ldots, x_{n-1} = a + (n-1)\Delta x, x_n = b,$$

where $\Delta x = (b - a)/n$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

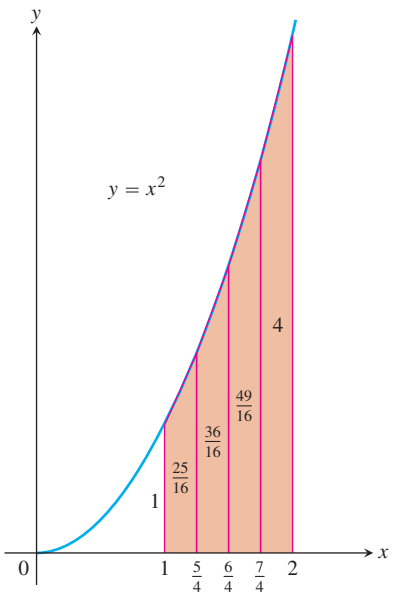

**FIGURE 8.11** The trapezoidal approximation of the area under the graph of $y = x^2$ from $x = 1$ to $x = 2$ is a slight overestimate (Example 1).

**TABLE 8.3**

| $x$ | $y = x^2$ |
|---|---|
| 1 | 1 |
| $\frac{5}{4}$ | $\frac{25}{16}$ |
| $\frac{6}{4}$ | $\frac{36}{16}$ |
| $\frac{7}{4}$ | $\frac{49}{16}$ |
| 2 | 4 |

## EXAMPLE 1 Applying the Trapezoidal Rule

Use the Trapezoidal Rule with $n = 4$ to estimate $\int_1^2 x^2\,dx$. Compare the estimate with the exact value.

**Solution** Partition $[1, 2]$ into four subintervals of equal length (Figure 8.11). Then evaluate $y = x^2$ at each partition point (Table 8.3).

Using these $y$ values, $n = 4$, and $\Delta x = (2 - 1)/4 = 1/4$ in the Trapezoidal Rule, we have

$$T = \frac{\Delta x}{2}\left(y_0 + 2y_1 + 2y_2 + 2y_3 + y_4\right)$$
$$= \frac{1}{8}\left(1 + 2\left(\frac{25}{16}\right) + 2\left(\frac{36}{16}\right) + 2\left(\frac{49}{16}\right) + 4\right)$$
$$= \frac{75}{32} = 2.34375.$$

The exact value of the integral is

$$\int_1^2 x^2\,dx = \frac{x^3}{3}\Big]_1^2 = \frac{8}{3} - \frac{1}{3} = \frac{7}{3}.$$

The $T$ approximation overestimates the integral by about half a percent of its true value of $7/3$. The percentage error is $(2.34375 - 7/3)/(7/3) \approx 0.00446$, or 0.446%. ■

We could have predicted that the Trapezoidal Rule would overestimate the integral in Example 1 by considering the geometry of the graph in Figure 8.11. Since the parabola is concave *up*, the approximating segments lie above the curve, giving each trapezoid slightly more area than the corresponding strip under the curve. In Figure 8.10, we see that the straight segments lie *under* the curve on those intervals where the curve is concave *down*, causing the Trapezoidal Rule to *underestimate* the integral on those intervals.

## EXAMPLE 2 Averaging Temperatures

An observer measures the outside temperature every hour from noon until midnight, recording the temperatures in the following table.

| Time | N | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | M |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Temp | 63 | 65 | 66 | 68 | 70 | 69 | 68 | 68 | 65 | 64 | 62 | 58 | 55 |

What was the average temperature for the 12-hour period?

**Solution** We are looking for the average value of a continuous function (temperature) for which we know values at discrete times that are one unit apart. We need to find

$$\text{av}(f) = \frac{1}{b - a}\int_a^b f(x)\,dx,$$

without having a formula for $f(x)$. The integral, however, can be approximated by the Trapezoidal Rule, using the temperatures in the table as function values at the points of a 12-subinterval partition of the 12-hour interval (making $\Delta x = 1$).

$$T = \frac{\Delta x}{2}\left(y_0 + 2y_1 + 2y_2 + \cdots + 2y_{11} + y_{12}\right)$$
$$= \frac{1}{2}\left(63 + 2\cdot 65 + 2\cdot 66 + \cdots + 2\cdot 58 + 55\right)$$
$$= 782$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Using $T$ to approximate $\int_a^b f(x)\,dx$, we have

$$\text{av}(f) \approx \frac{1}{b-a} \cdot T = \frac{1}{12} \cdot 782 \approx 65.17.$$

Rounding to the accuracy of the given data, we estimate the average temperature as 65 degrees. ■

## Error Estimates for the Trapezoidal Rule

As $n$ increases and the step size $\Delta x = (b-a)/n$ approaches zero, $T$ approaches the exact value of $\int_a^b f(x)\,dx$. To see why, write

$$\begin{aligned} T &= \Delta x \left( \frac{1}{2} y_0 + y_1 + y_2 + \cdots + y_{n-1} + \frac{1}{2} y_n \right) \\ &= (y_1 + y_2 + \cdots + y_n)\Delta x + \frac{1}{2}(y_0 - y_n)\,\Delta x \\ &= \sum_{k=1}^{n} f(x_k)\Delta x + \frac{1}{2}[f(a) - f(b)]\,\Delta x. \end{aligned}$$

As $n \to \infty$ and $\Delta x \to 0$,

$$\sum_{k=1}^{n} f(x_k)\Delta x \to \int_a^b f(x)\,dx \qquad \text{and} \qquad \frac{1}{2}[f(a) - f(b)]\Delta x \to 0.$$

Therefore,

$$\lim_{n\to\infty} T = \int_a^b f(x)\,dx + 0 = \int_a^b f(x)\,dx.$$

This means that in theory we can make the difference between $T$ and the integral as small as we want by taking $n$ large enough, assuming only that $f$ is integrable. In practice, though, how do we tell how large $n$ should be for a given tolerance?

We answer this question with a result from advanced calculus, which says that if $f''$ is continuous on $[a, b]$, then

$$\int_a^b f(x)\,dx = T - \frac{b-a}{12} \cdot f''(c)(\Delta x)^2$$

for some number $c$ between $a$ and $b$. Thus, as $\Delta x$ approaches zero, the error defined by

$$E_T = -\frac{b-a}{12} \cdot f''(c)(\Delta x)^2$$

approaches zero as the *square* of $\Delta x$.

The inequality

$$|E_T| \le \frac{b-a}{12} \max|f''(x)|(\Delta x)^2,$$

where max refers to the interval $[a, b]$, gives an upper bound for the magnitude of the error. In practice, we usually cannot find the exact value of $\max|f''(x)|$ and have to estimate an upper bound or "worst case" value for it instead. If $M$ is any upper bound for the values of $|f''(x)|$ on $[a, b]$, so that $|f''(x)| \le M$ on $[a, b]$, then

$$|E_T| \le \frac{b-a}{12} M(\Delta x)^2.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

If we substitute $(b - a)/n$ for $\Delta x$, we get

$$|E_T| \le \frac{M(b - a)^3}{12n^2}.$$

This is the inequality we normally use in estimating $|E_T|$. We find the best $M$ we can and go on to estimate $|E_T|$ from there. This may sound careless, but it works. To make $|E_T|$ small for a given $M$, we just make $n$ large.

**The Error Estimate for the Trapezoidal Rule**

If $f''$ is continuous and $M$ is any upper bound for the values of $|f''|$ on $[a, b]$, then the error $E_T$ in the trapezoidal approximation of the integral of $f$ from $a$ to $b$ for $n$ steps satisfies the inequality

$$|E_T| \le \frac{M(b - a)^3}{12n^2}.$$

**EXAMPLE 3** Bounding the Trapezoidal Rule Error

Find an upper bound for the error incurred in estimating

$$\int_0^{\pi} x \sin x \, dx$$

with the Trapezoidal Rule with $n = 10$ steps (Figure 8.12).

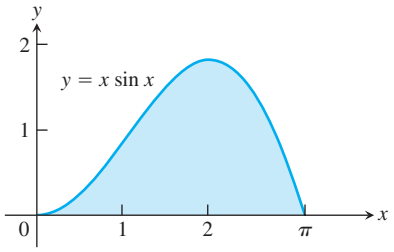

**FIGURE 8.12** Graph of the integrand in Example 3.

**Solution** With $a = 0$, $b = \pi$, and $n = 10$, the error estimate gives

$$|E_T| \le \frac{M(b - a)^3}{12n^2} = \frac{\pi^3}{1200} M.$$

The number $M$ can be any upper bound for the magnitude of the second derivative of $f(x) = x \sin x$ on $[0, \pi]$. A routine calculation gives

$$f''(x) = 2 \cos x - x \sin x,$$

so

$$\begin{aligned} |f''(x)| &= |2 \cos x - x \sin x| \\ &\le 2|\cos x| + |x||\sin x| \\ &\le 2 \cdot 1 + \pi \cdot 1 = 2 + \pi. \end{aligned}$$

$|\cos x|$ and $|\sin x|$ never exceed 1, and $0 \le x \le \pi$.

We can safely take $M = 2 + \pi$. Therefore,

$$|E_T| \le \frac{\pi^3}{1200} M = \frac{\pi^3(2 + \pi)}{1200} < 0.133.$$

Rounded up to be safe

The absolute error is no greater than 0.133.

For greater accuracy, we would not try to improve $M$ but would take more steps. With $n = 100$ steps, for example, we get

$$|E_T| \le \frac{(2 + \pi)\pi^3}{120{,}000} < 0.00133 = 1.33 \times 10^{-3}.$$

■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

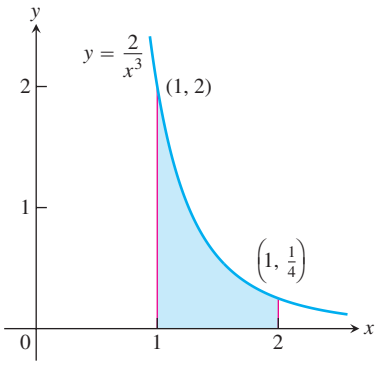

**FIGURE 8.13** The continuous function $y = 2/x^3$ has its maximum value on $[1, 2]$ at $x = 1$.

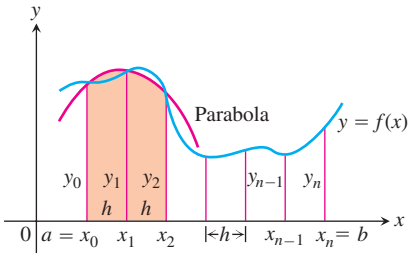

**FIGURE 8.14** Simpson's Rule approximates short stretches of the curve with parabolas.

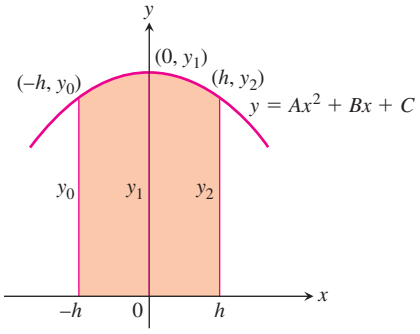

**FIGURE 8.15** By integrating from $-h$ to $h$, we find the shaded area to be

$$\frac{h}{3}(y_0 + 4y_1 + y_2).$$

**EXAMPLE 4** Finding How Many Steps Are Needed for a Specific Accuracy

How many subdivisions should be used in the Trapezoidal Rule to approximate

$$\ln 2 = \int_1^2 \frac{1}{x}\,dx$$

with an error whose absolute value is less than $10^{-4}$?

**Solution** With $a = 1$ and $b = 2$, the error estimate is

$$|E_T| \le \frac{M(2-1)^3}{12n^2} = \frac{M}{12n^2}.$$

This is one of the rare cases in which we actually can find $\max|f''|$ rather than having to settle for an upper bound $M$. With $f(x) = 1/x$, we find

$$f''(x) = \frac{d^2}{dx^2}(x^{-1}) = 2x^{-3} = \frac{2}{x^3}.$$

On $[1, 2]$, $y = 2/x^3$ decreases steadily from a maximum of $y = 2$ to a minimum of $y = 1/4$ (Figure 8.13). Therefore, $M = 2$ and

$$|E_T| \le \frac{2}{12n^2} = \frac{1}{6n^2}.$$

The error's absolute value will therefore be less than $10^{-4}$ if

$$\frac{1}{6n^2} < 10^{-4}, \qquad \frac{10^4}{6} < n^2, \qquad \frac{100}{\sqrt{6}} < n, \qquad \text{or} \qquad 40.83 < n.$$

The first integer beyond 40.83 is $n = 41$. With $n = 41$ subdivisions we can guarantee calculating $\ln 2$ with an error of magnitude less than $10^{-4}$. Any larger $n$ will work, too. ■

## Simpson's Rule: Approximations Using Parabolas

Riemann sums and the Trapezoidal Rule both give reasonable approximations to the integral of a continuous function over a closed interval. The Trapezoidal Rule is more efficient, giving a better approximation for small values of $n$, which makes it a faster algorithm for numerical integration.

Another rule for approximating the definite integral of a continuous function results from using parabolas instead of the straight line segments which produced trapezoids. As before, we partition the interval $[a, b]$ into $n$ subintervals of equal length $h = \Delta x = (b - a)/n$, but this time we require that $n$ be an *even* number. On each consecutive pair of intervals we approximate the curve $y = f(x) \ge 0$ by a parabola, as shown in Figure 8.14. A typical parabola passes through three consecutive points $(x_{i-1}, y_{i-1})$, $(x_i, y_i)$, and $(x_{i+1}, y_{i+1})$ on the curve.

Let's calculate the shaded area beneath a parabola passing through three consecutive points. To simplify our calculations, we first take the case where $x_0 = -h$, $x_1 = 0$, and $x_2 = h$ (Figure 8.15), where $h = \Delta x = (b - a)/n$. The area under the parabola will be the same if we shift the $y$-axis to the left or right. The parabola has an equation of the form

$$y = Ax^2 + Bx + C,$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

so the area under it from $x = -h$ to $x = h$ is

$$A_p = \int_{-h}^{h} (Ax^2 + Bx + C)\,dx$$

$$= \frac{Ax^3}{3} + \frac{Bx^2}{2} + Cx \Big]_{-h}^{h}$$

$$= \frac{2Ah^3}{3} + 2Ch = \frac{h}{3}(2Ah^2 + 6C).$$

Since the curve passes through the three points $(-h, y_0)$, $(0, y_1)$, and $(h, y_2)$, we also have

$$y_0 = Ah^2 - Bh + C, \qquad y_1 = C, \qquad y_2 = Ah^2 + Bh + C,$$

from which we obtain

$$C = y_1,$$

$$Ah^2 - Bh = y_0 - y_1,$$

$$Ah^2 + Bh = y_2 - y_1,$$

$$2Ah^2 = y_0 + y_2 - 2y_1.$$

Hence, expressing the area $A_p$ in terms of the ordinates $y_0$, $y_1$, and $y_2$, we have

$$A_p = \frac{h}{3}(2Ah^2 + 6C) = \frac{h}{3}((y_0 + y_2 - 2y_1) + 6y_1) = \frac{h}{3}(y_0 + 4y_1 + y_2).$$

Now shifting the parabola horizontally to its shaded position in Figure 8.14 does not change the area under it. Thus the area under the parabola through $(x_0, y_0)$, $(x_1, y_1)$, and $(x_2, y_2)$ in Figure 8.14 is still

$$\frac{h}{3}(y_0 + 4y_1 + y_2).$$

Similarly, the area under the parabola through the points $(x_2, y_2)$, $(x_3, y_3)$, and $(x_4, y_4)$ is

$$\frac{h}{3}(y_2 + 4y_3 + y_4).$$

Computing the areas under all the parabolas and adding the results gives the approximation

$$\int_a^b f(x)\,dx \approx \frac{h}{3}(y_0 + 4y_1 + y_2) + \frac{h}{3}(y_2 + 4y_3 + y_4) + \cdots$$

$$+ \frac{h}{3}(y_{n-2} + 4y_{n-1} + y_n)$$

$$= \frac{h}{3}(y_0 + 4y_1 + 2y_2 + 4y_3 + 2y_4 + \cdots + 2y_{n-2} + 4y_{n-1} + y_n).$$

HISTORICAL BIOGRAPHY

Thomas Simpson
(1720–1761)

The result is known as Simpson's Rule, and it is again valid for any continuous function $y = f(x)$ (Exercise 38). The function need not be positive, as in our derivation. The number $n$ of subintervals must be even to apply the rule because each parabolic arc uses two subintervals.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Simpson's Rule**

To approximate $\int_a^b f(x)\,dx$, use

$$S = \frac{\Delta x}{3}(y_0 + 4y_1 + 2y_2 + 4y_3 + \cdots + 2y_{n-2} + 4y_{n-1} + y_n).$$

The $y$'s are the values of $f$ at the partition points

$$x_0 = a, x_1 = a + \Delta x, x_2 = a + 2\Delta x, \ldots, x_{n-1} = a + (n-1)\Delta x, x_n = b.$$

The number $n$ is even, and $\Delta x = (b - a)/n$.

Note the pattern of the coefficients in the above rule: 1, 4, 2, 4, 2, 4, 2, . . . , 4, 2, 1.

**TABLE 8.4**

| $x$ | $y = 5x^4$ |
|---|---|
| 0 | 0 |
| $\frac{1}{2}$ | $\frac{5}{16}$ |
| 1 | 5 |
| $\frac{3}{2}$ | $\frac{405}{16}$ |
| 2 | 80 |

**EXAMPLE 5** Applying Simpson's Rule

Use Simpson's Rule with $n = 4$ to approximate $\int_0^2 5x^4\,dx$.

**Solution** Partition [0, 2] into four subintervals and evaluate $y = 5x^4$ at the partition points (Table 8.4). Then apply Simpson's Rule with $n = 4$ and $\Delta x = 1/2$:

$$\begin{aligned} S &= \frac{\Delta x}{3}\left(y_0 + 4y_1 + 2y_2 + 4y_3 + y_4\right) \\ &= \frac{1}{6}\left(0 + 4\left(\frac{5}{16}\right) + 2(5) + 4\left(\frac{405}{16}\right) + 80\right) \\ &= 32\frac{1}{12}. \end{aligned}$$

This estimate differs from the exact value (32) by only 1/12, a percentage error of less than three-tenths of one percent, and this was with just four subintervals. ■

## Error Estimates for Simpson's Rule

To estimate the error in Simpson's rule, we start with a result from advanced calculus that says that if the fourth derivative $f^{(4)}$ is continuous, then

$$\int_a^b f(x)\,dx = S - \frac{b-a}{180} \cdot f^{(4)}(c)(\Delta x)^4$$

for some point $c$ between $a$ and $b$. Thus, as $\Delta x$ approaches zero, the error,

$$E_S = -\frac{b-a}{180} \cdot f^{(4)}(c)(\Delta x)^4,$$

approaches zero as the *fourth power* of $\Delta x$ (This helps to explain why Simpson's Rule is likely to give better results than the Trapezoidal Rule.)

The inequality

$$|E_S| \le \frac{b-a}{180} \max|f^{(4)}(x)|\,(\Delta x)^4$$

where max refers to the interval $[a, b]$, gives an upper bound for the magnitude of the error. As with $\max|f''|$ in the error formula for the Trapezoidal Rule, we usually cannot

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

find the exact value of $\max|f^{(4)}(x)|$ and have to replace it with an upper bound. If $M$ is any upper bound for the values of $|f^{(4)}|$ on $[a, b]$, then

$$|E_S| \le \frac{b-a}{180} M(\Delta x)^4.$$

Substituting $(b-a)/n$ for $\Delta x$ in this last expression gives

$$|E_S| \le \frac{M(b-a)^5}{180n^4}.$$

This is the formula we usually use in estimating the error in Simpson's Rule. We find a reasonable value for $M$ and go on to estimate $|E_S|$ from there.

**The Error Estimate for Simpson's Rule**

If $f^{(4)}$ is continuous and $M$ is any upper bound for the values of $|f^{(4)}|$ on $[a, b]$, then the error $E_S$ in the Simpson's Rule approximation of the integral of $f$ from $a$ to $b$ for $n$ steps satisfies the inequality

$$|E_S| \le \frac{M(b-a)^5}{180n^4}.$$

As with the Trapezoidal Rule, we often cannot find the smallest possible value of $M$. We just find the best value we can and go on from there.

### EXAMPLE 6 Bounding the Error in Simpson's Rule

Find an upper bound for the error in estimating $\int_0^2 5x^4\,dx$ using Simpson's Rule with $n = 4$ (Example 5).

**Solution** To estimate the error, we first find an upper bound $M$ for the magnitude of the fourth derivative of $f(x) = 5x^4$ on the interval $0 \le x \le 2$. Since the fourth derivative has the constant value $f^{(4)}(x) = 120$, we take $M = 120$. With $b - a = 2$ and $n = 4$, the error estimate for Simpson's Rule gives

$$|E_S| \le \frac{M(b-a)^5}{180n^4} = \frac{120(2)^5}{180 \cdot 4^4} = \frac{1}{12}.$$

■

### EXAMPLE 7 Comparing the Trapezoidal Rule and Simpson's Rule Approximations

As we saw in Chapter 7, the value of ln 2 can be calculated from the integral

$$\ln 2 = \int_1^2 \frac{1}{x}\,dx.$$

Table 8.5 shows $T$ and $S$ values for approximations of $\int_1^2 (1/x)\,dx$ using various values of $n$. Notice how Simpson's Rule dramatically improves over the Trapezoidal Rule. In particular, notice that when we double the value of $n$ (thereby halving the value of $h = \Delta x$), the $T$ error is divided by 2 *squared*, whereas the $S$ error is divided by 2 *to the fourth*.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**TABLE 8.5** Trapezoidal Rule approximations ($T_n$) and Simpson's Rule approximations ($S_n$) of $\ln 2 = \int_1^2 (1/x)\,dx$

| $n$ | $T_n$ | \|Error\| less than . . . | $S_n$ | \|Error\| less than . . . |
|---|---|---|---|---|
| 10 | 0.6937714032 | 0.0006242227 | 0.6931502307 | 0.0000030502 |
| 20 | 0.6933033818 | 0.0001562013 | 0.6931473747 | 0.0000001942 |
| 30 | 0.6932166154 | 0.0000694349 | 0.6931472190 | 0.0000000385 |
| 40 | 0.6931862400 | 0.0000390595 | 0.6931471927 | 0.0000000122 |
| 50 | 0.6931721793 | 0.0000249988 | 0.6931471856 | 0.0000000050 |
| 100 | 0.6931534305 | 0.0000062500 | 0.6931471809 | 0.0000000004 |

This has a dramatic effect as $\Delta x = (2 - 1)/n$ gets very small. The Simpson approximation for $n = 50$ rounds accurately to seven places and for $n = 100$ agrees to nine decimal places (billionths)! ■

If $f(x)$ is a polynomial of degree less than four, then its fourth derivative is zero, and

$$E_S = -\frac{b-a}{180} f^{(4)}(c)(\Delta x)^4 = -\frac{b-a}{180}(0)(\Delta x)^4 = 0.$$

Thus, there will be no error in the Simpson approximation of any integral of $f$. In other words, if $f$ is a constant, a linear function, or a quadratic or cubic polynomial, Simpson's Rule will give the value of any integral of $f$ exactly, whatever the number of subdivisions. Similarly, if $f$ is a constant or a linear function, then its second derivative is zero and

$$E_T = -\frac{b-a}{12} f''(c)(\Delta x)^2 = -\frac{b-a}{12}(0)(\Delta x)^2 = 0.$$

The Trapezoidal Rule will therefore give the exact value of any integral of $f$. This is no surprise, for the trapezoids fit the graph perfectly. Although decreasing the step size $\Delta x$ reduces the error in the Simpson and Trapezoidal approximations in theory, it may fail to do so in practice.

When $\Delta x$ is very small, say $\Delta x = 10^{-5}$, computer or calculator round-off errors in the arithmetic required to evaluate $S$ and $T$ may accumulate to such an extent that the error formulas no longer describe what is going on. Shrinking $\Delta x$ below a certain size can actually make things worse. Although this is not an issue in this book, you should consult a text on numerical analysis for alternative methods if you are having problems with round-off.

**EXAMPLE 8** Estimate

$$\int_0^2 x^3\,dx$$

with Simpson's Rule.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** The fourth derivative of $f(x) = x^3$ is zero, so we expect Simpson's Rule to give the integral's exact value with any (even) number of steps. Indeed, with $n = 2$ and $\Delta x = (2 - 0)/2 = 1$,

$$S = \frac{\Delta x}{3}(y_0 + 4y_1 + y_2)$$
$$= \frac{1}{3}((0)^3 + 4(1)^3 + (2)^3) = \frac{12}{3} = 4,$$

while

$$\int_0^2 x^3\,dx = \frac{x^4}{4}\Big]_0^2 = \frac{16}{4} - 0 = 4.$$

■

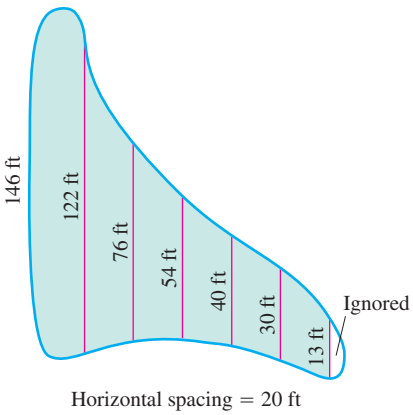

**FIGURE 8.16** The dimensions of the swamp in Example 9.

## EXAMPLE 9 Draining a Swamp

A town wants to drain and fill a small polluted swamp (Figure 8.16). The swamp averages 5 ft deep. About how many cubic yards of dirt will it take to fill the area after the swamp is drained?

**Solution** To calculate the volume of the swamp, we estimate the surface area and multiply by 5. To estimate the area, we use Simpson's Rule with $\Delta x = 20$ ft and the $y$'s equal to the distances measured across the swamp, as shown in Figure 8.16.

$$S = \frac{\Delta x}{3}(y_0 + 4y_1 + 2y_2 + 4y_3 + 2y_4 + 4y_5 + y_6)$$
$$= \frac{20}{3}(146 + 488 + 152 + 216 + 80 + 120 + 13) = 8100$$

The volume is about $(8100)(5) = 40{,}500$ ft$^3$ or $1500$ yd$^3$.

# EXERCISES 8.7

## Estimating Integrals

The instructions for the integrals in Exercises 1–10 have two parts, one for the Trapezoidal Rule and one for Simpson's Rule.

**I. Using the Trapezoidal Rule**

**a.** Estimate the integral with $n = 4$ steps and find an upper bound for $|E_T|$.

**b.** Evaluate the integral directly and find $|E_T|$.

**c.** Use the formula $(|E_T|/(\text{true value})) \times 100$ to express $|E_T|$ as a percentage of the integral's true value.

**II. Using Simpson's Rule**

**a.** Estimate the integral with $n = 4$ steps and find an upper bound for $|E_S|$.

**b.** Evaluate the integral directly and find $|E_S|$.

**c.** Use the formula $(|E_S|/(\text{true value})) \times 100$ to express $|E_S|$ as a percentage of the integral's true value.

**1.** $\displaystyle\int_1^2 x\,dx$

**2.** $\displaystyle\int_1^3 (2x - 1)\,dx$

**3.** $\displaystyle\int_{-1}^1 (x^2 + 1)\,dx$

**4.** $\displaystyle\int_{-2}^0 (x^2 - 1)\,dx$

**5.** $\displaystyle\int_0^2 (t^3 + t)\,dt$

**6.** $\displaystyle\int_{-1}^1 (t^3 + 1)\,dt$

**7.** $\displaystyle\int_1^2 \frac{1}{s^2}\,ds$

**8.** $\displaystyle\int_2^4 \frac{1}{(s-1)^2}\,ds$

**9.** $\displaystyle\int_0^\pi \sin t\,dt$

**10.** $\displaystyle\int_0^1 \sin \pi t\,dt$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

In Exercises 11–14, use the tabulated values of the integrand to estimate the integral with **(a)** the Trapezoidal Rule and **(b)** Simpson's Rule with $n = 8$ steps. Round your answers to five decimal places. Then **(c)** find the integral's exact value and the approximation error $E_T$ or $E_S$, as appropriate.

**11.** $\displaystyle\int_0^1 x\sqrt{1-x^2}\,dx$

| $x$ | $x\sqrt{1-x^2}$ |

## The Minimum Number of Subintervals

In Exercises 15–26, estimate the minimum number of subintervals needed to approximate the integrals with an error of magnitude less than $10^{-4}$ by **(a)** the Trapezoidal Rule and **(b)** Simpson's Rule. (The integrals in Exercises 15–22 are the integrals from Exercises 1–8.)

**15.** $\displaystyle\int_1^2 x\,dx$

**16.** $\displaystyle\int_1^3 (2x-1)\,dx$

**17.** $\displaystyle\int_{-1}^1 (x^2+1)\,dx$

**18.** $\displaystyle\int_{-2}^0 (x^2-1)\,dx$

**19.** $\displaystyle\int_0^2 (t^3+t)\,dt$

**20.** $\displaystyle\int_{-1}^1 (t^3+1)\,dt$

**21.** $\displaystyle\int_1^2 \frac{1}{s^2}\,ds$

**22.** $\displaystyle\int_2^4 \frac{1}{(s-1)^2}\,ds$

**23.** $\displaystyle\int_0^3 \sqrt{x+1}\,dx$

**24.** $\displaystyle\int_0^3 \frac{1}{\sqrt{x+1}}\,dx$

**25.** $\displaystyle\int_0^2 \sin(x+1)\,dx$

**26.** $\displaystyle\int_{-1}^1 \cos(x+\pi)\,dx$

## Applications

**27. Volume of water in a swimming pool** A rectangular swimming pool is 30 ft wide and 50 ft long. The table shows the depth $h(x)$ of the water at 5-ft intervals from one end of the pool to the other. Estimate the volume of water in the pool using the Trapezoidal Rule with $n = 10$, applied to the integral

$$V = \int_0^{50} 30 \cdot h(x)\,dx.$$

| Position (ft) $x$ | Depth (ft) $h(x)$ | Position (ft) $x$ | Depth (ft) $h(x)$ |
|---|---|---|---|
| 0 | 6.0 | 30 | 11.5 |
| 5 | 8.2 | 35 | 11.9 |
| 10 | 9.1 | 40 | 12.3 |
| 15 | 9.9 | 45 | 12.7 |

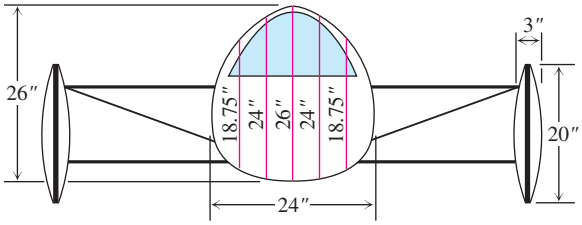
Exercises

**28. Stocking a fish pond** As the fish and game warden of your township, you are responsible for stocking the town pond with fish before the fishing season. The average depth of the pond is 20 ft. Using a scaled map, you measure distances across the pond at 200-ft intervals, as shown in the accompanying diagram.

**a.** Use the Trapezoidal Rule to estimate the volume of the pond.

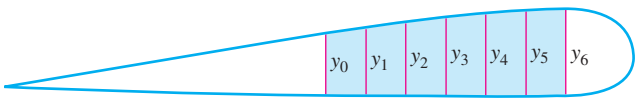
**b.** You plan to start the season with one fish per 1000 cubic feet. You intend to have at least 25% of the opening day's fish population left at the end of the season. What is the maximum number of licenses the town can sell if the average seasonal catch is 20 fish per license?



Vertical spacing = 200 ft

**29. Ford® Mustang Cobra™** The accompanying table shows time-to-speed data for a 1994 Ford Mustang Cobra accelerating from rest to 130 mph. How far had the Mustang traveled by the time it reached this speed? (Use trapezoids to estimate the area under the velocity curve, but be careful: The time intervals vary in length.)

| Speed change | Time (sec) |
|---|---|
| Zero to 30 mph | 2.2 |
| 40 mph | 3.2 |
| 50 mph | 4.5 |
| 60 mph | 5.9 |
| 70 mph | 7.8 |
| 80 mph | 10.2 |
| 90 mph | 12.7 |
| 100 mph | 16.0 |
| 110 mph | 20.6 |
| 120 mph | 26.2 |
| 130 mph | 37.1 |



*Source: Car and Driver*, April 1994.

**30. Aerodynamic drag** A vehicle's aerodynamic drag is determined in part by its cross-sectional area, so, all other things being equal, engineers try to make this area as small as possible. Use Simpson's Rule to estimate the cross-sectional area of the body of James Worden's solar-powered Solectria® automobile at MIT from the diagram.

**31. Wing design** The design of a new airplane requires a gasoline tank of constant cross-sectional area in each wing. A scale drawing of a cross-section is shown here. The tank must hold 5000 lb of gasoline, which has a density of 42 lb/ft$^3$. Estimate the length of the tank.

$y_0 = 1.5$ ft, $y_1 = 1.6$ ft, $y_2 = 1.8$ ft, $y_3 = 1.9$ ft,
$y_4 = 2.0$ ft, $y_5 = y_6 = 2.1$ ft Horizontal spacing = 1 ft

**32. Oil consumption on Pathfinder Island** A diesel generator runs continuously, consuming oil at a gradually increasing rate until it must be temporarily shut down to have the filters replaced.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

Use the Trapezoidal Rule to estimate the amount of oil consumed by the generator during that week.

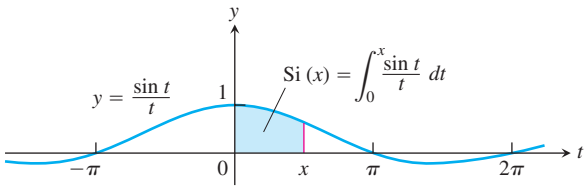
## Theory and Examples

**33. Usable values of the sine-integral function** *The sine-integral function,*



$$\text{Si}(x) = \int_0^x \frac{\sin t}{t}\,dt, \qquad \text{"Sine integral of } x\text{"}$$

is one of the many functions in engineering whose formulas cannot be simplified. There is no elementary formula for the antiderivative of $(\sin t)/t$. The values of $\text{Si}(x)$, however, are readily estimated by numerical integration.

Although the notation does not show it explicitly, the function being integrated is

$$f(t) = \begin{cases} \dfrac{\sin t}{t}, & t \neq 0 \\ 1, & t = 0, \end{cases}$$

the continuous extension of $(\sin t)/t$ to the interval $[0, x]$. The function has derivatives of all orders at every point of its domain. Its graph is smooth, and you can expect good results from Simpson's Rule.

**a.** Use the fact that $|f^{(4)}| \le 1$ on $[0, \pi/2]$ to give an upper bound for the error that will occur if

$$\text{Si}\left(\frac{\pi}{2}\right) = \int_0^{\pi/2} \frac{\sin t}{t}\,dt$$

is estimated by Simpson's Rule with $n = 4$.

**b.** Estimate $\text{Si}(\pi/2)$ by Simpson's Rule with $n = 4$.

**c.** Express the error bound you found in part (a) as a percentage of the value you found in part (b).

**34. The error function** *The error function,*

$$\text{erf}\,(x) = \frac{2}{\sqrt{\pi}} \int_0^x e^{-t^2}\,dt,$$

important in probability and in the theories of heat flow and signal transmission, must be evaluated numerically because there is no elementary expression for the antiderivative of $e^{-t^2}$.

**a.** Use Simpson's Rule with $n = 10$ to estimate $\text{erf}\,(1)$.

**b.** In $[0, 1]$,

$$\left|\frac{d^4}{dt^4}\left(e^{-t^2}\right)\right| \le 12.$$

Give an upper bound for the magnitude of the error of the estimate in part (a).

**35.** (*Continuation of Example 3.*) The error bounds for $E_T$ and $E_S$ are "worst case" estimates, and the Trapezoidal and Simpson Rules are often more accurate than the bounds suggest. The Trapezoidal Rule estimate of

$$\int_0^\pi x \sin x\,dx$$

in Example 3 is a case in point.

| $x$ | $x \sin x$ |
|---|---|
| 0 | 0 |
| $(0.1)\pi$ | 0.09708 |
| $(0.2)\pi$ | 0.36932 |
| $(0.3)\pi$ | 0.76248 |
| $(0.4)\pi$ | 1.19513 |
| $(0.5)\pi$ | 1.57080 |
| $(0.6)\pi$ | 1.79270 |
| $(0.7)\pi$ | 1.77912 |
| $(0.8)\pi$ | 1.47727 |
| $(0.9)\pi$ | 0.87372 |
| $\pi$ | 0 |

**a.** Use the Trapezoidal Rule with $n = 10$ to approximate the value of the integral. The table to the right gives the necessary $y$-values.

**b.** Find the magnitude of the difference between $\pi$, the integral's value, and your approximation in part (a). You will find the difference to be considerably less than the upper bound of 0.133 calculated with $n = 10$ in Example 3.

T **c.** The upper bound of 0.133 for $|E_T|$ in Example 3 could have been improved somewhat by having a better bound for

$$|f''(x)| = |2\cos x - x \sin x|$$

on $[0, \pi]$. The upper bound we used was $2 + \pi$. Graph $f''$ over $[0, \pi]$ and use Trace or Zoom to improve this upper bound.

Use the improved upper bound as $M$ to make an improved estimate of $|E_T|$. Notice that the Trapezoidal Rule approximation in part (a) is also better than this improved estimate would suggest.

T **36.** (*Continuation of Exercise 35.*)

**a.** Show that the fourth derivative of $f(x) = x \sin x$ is

$$f^{(4)}(x) = -4\cos x + x \sin x.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Use Trace or Zoom to find an upper bound $M$ for the values of $|f^{(4)}|$ on $[0, \pi]$.

**b.** Use the value of $M$ from part (a) to obtain an upper bound for the magnitude of the error in estimating the value of

$$\int_0^{\pi} x \sin x \, dx$$

with Simpson's Rule with $n = 10$ steps.

**c.** Use the data in the table in Exercise 35 to estimate $\int_0^{\pi} x \sin x \, dx$ with Simpson's Rule with $n = 10$ steps.

**d.** To six decimal places, find the magnitude of the difference between your estimate in part (c) and the integral's true value, $\pi$. You will find the error estimate obtained in part (b) to be quite good.

**37.** Prove that the sum $T$ in the Trapezoidal Rule for $\int_a^b f(x)\,dx$ is a Riemann sum for $f$ continuous on $[a, b]$. (*Hint:* Use the Intermediate Value Theorem to show the existence of $c_k$ in the subinterval $[x_{k-1}, x_k]$ satisfying $f(c_k) = (f(x_{k-1}) + f(x_k))/2$.)

**38.** Prove that the sum $S$ in Simpson's Rule for $\int_a^b f(x)\,dx$ is a Riemann sum for $f$ continuous on $[a, b]$. (See Exercise 37.)

## T Numerical Integration

As we mentioned at the beginning of the section, the definite integrals of many continuous functions cannot be evaluated with the Fundamental Theorem of Calculus because their antiderivatives lack elementary formulas. Numerical integration offers a practical way to estimate the values of these so-called *nonelementary integrals*. If your calculator or computer has a numerical integration routine, try it on the integrals in Exercises 39–42.

**39.** $\displaystyle\int_0^1 \sqrt{1 + x^4}\,dx$ — A nonelementary integral that came up in Newton's research

**40.** $\displaystyle\int_0^{\pi/2} \frac{\sin x}{x}\,dx$ — The integral from Exercise 33. To avoid division by zero, you may have to start the integration at a small positive number like $10^{-6}$ instead of 0.

**41.** $\displaystyle\int_0^{\pi/2} \sin(x^2)\,dx$ — An integral associated with the diffraction of light

**42.** $\displaystyle\int_0^{\pi/2} 40\sqrt{1 - 0.64\cos^2 t}\,dt$ — The length of the ellipse $(x^2/25) + (y^2/9) = 1$

**T 43.** Consider the integral $\int_0^{\pi} \sin x\,dx$.

**a.** Find the Trapezoidal Rule approximations for $n = 10, 100$, and 1000.

**b.** Record the errors with as many decimal places of accuracy as you can.

**c.** What pattern do you see?

**d.** Explain how the error bound for $E_T$ accounts for the pattern.

**T 44.** (*Continuation of Exercise 43.*) Repeat Exercise 43 with Simpson's Rule and $E_S$.

**45.** Consider the integral $\int_{-1}^{1} \sin(x^2)\,dx$.

**a.** Find $f''$ for $f(x) = \sin(x^2)$.

**b.** Graph $y = f''(x)$ in the viewing window $[-1, 1]$ by $[-3, 3]$.

**c.** Explain why the graph in part (b) suggests that $|f''(x)| \le 3$ for $-1 \le x \le 1$.

**d.** Show that the error estimate for the Trapezoidal Rule in this case becomes

$$|E_T| \le \frac{(\Delta x)^2}{2}.$$

**e.** Show that the Trapezoidal Rule error will be less than or equal to 0.01 in magnitude if $\Delta x \le 0.1$.

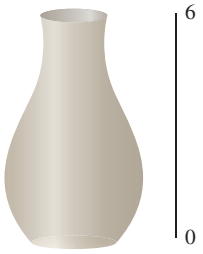
**f.** How large must $n$ be for $\Delta x \le 0.1$?

**46.** Consider the integral $\int_{-1}^{1} \sin(x^2)\,dx$.

**a.** Find $f^{(4)}$ for $f(x) = \sin(x^2)$. (You may want to check your work with a CAS if you have one available.)

**b.** Graph $y = f^{(4)}(x)$ in the viewing window $[-1, 1]$ by $[-30, 10]$.

**c.** Explain why the graph in part (b) suggests that $|f^{(4)}(x)| \le 30$ for $-1 \le x \le 1$.



**d.** Show that the error estimate for Simpson's Rule in this case becomes

$$|E_S| \le \frac{(\Delta x)^4}{3}.$$

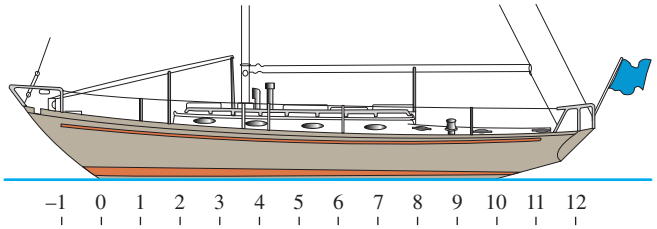
**e.** Show that the Simpson's Rule error will be less than or equal to 0.01 in magnitude if $\Delta x \le 0.4$.

**f.** How large must $n$ be for $\Delta x \le 0.4$?

**T 47. A vase** We wish to estimate the volume of a flower vase using only a calculator, a string, and a ruler. We measure the height of the vase to be 6 in. We then use the string and the ruler to find circumferences of the vase (in inches) at half-inch intervals. (We list them from the top down to correspond with the picture of the vase.)

| Circumferences | |
|---|---|
| 5.4 | 10.8 |
| 4.5 | 11.6 |
| 4.4 | 11.6 |
| 5.1 | 10.8 |
| 6.3 | 9.0 |
| 7.8 | 6.3 |
| 9.4 | |

**a.** Find the areas of the cross-sections that correspond to the given circumferences.



**b.** Express the volume of the vase as an integral with respect to $y$ over the interval $[0, 6]$.

**c.** Approximate the integral using the Trapezoidal Rule with $n = 12$.

**d.** Approximate the integral using Simpson's Rule with $n = 12$. Which result do you think is more accurate? Give reasons for your answer.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**T** **48. A sailboat's displacement** To find the volume of water displaced by a sailboat, the common practice is to partition the waterline into 10 subintervals of equal length, measure the cross-sectional area $A(x)$ of the submerged portion of the hull at each partition point, and then use Simpson's Rule to estimate the integral of $A(x)$ from one end of the waterline to the other. The table here lists the area measurements at "Stations" 0 through 10, as the partition points are called, for the cruising sloop *Pipedream*, shown here. The common subinterval length (distance between consecutive stations) is $\Delta x = 2.54$ ft (about 2 ft 6-1/2 in., chosen for the convenience of the builder).

**a.** Estimate *Pipedream*'s displacement volume to the nearest cubic foot.

| Station | Submerged area ($ft^2$) |
|---|---|
| 0 | 0 |
| 1 | 1.07 |
| 2 | 3.84 |
| 3 | 7.82 |
| 4 | 12.20 |
| 5 | 15.18 |
| 6 | 16.14 |
| 7 | 14.00 |
| 8 | 9.21 |
| 9 | 3.24 |
| 10 | 0 |

**b.** The figures in the table are for seawater, which weighs 64 $lb/ft^3$. How many pounds of water does *Pipedream* displace? (Displacement is given in pounds for small craft and in long tons (1 long ton = 2240 lb) for larger vessels.) (Data from *Skene's Elements of Yacht Design* by Francis S. Kinney (Dodd, Mead, 1962.)

**c. Prismatic coefficients** A boat's prismatic coefficient is the ratio of the displacement volume to the volume of a prism whose height equals the boat's waterline length and whose base equals the area of the boat's largest submerged cross-section. The best sailboats have prismatic coefficients between 0.51 and 0.54. Find *Pipedream*'s prismatic coefficient, given a waterline length of 25.4 ft and a largest submerged cross-sectional area of 16.14 $ft^2$ (at Station 6).

**T** **49. Elliptic integrals** The length of the ellipse

$$x = a\cos t, \quad y = b\sin t, \quad 0 \le t \le 2\pi$$

turns out to be

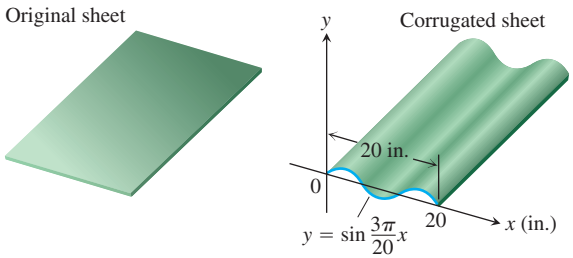
$$\text{Length} = 4a\int_0^{\pi/2} \sqrt{1 - e^2\cos^2 t}\, dt,$$

where $e$ is the ellipse's eccentricity. The integral in this formula, called an *elliptic integral*, is nonelementary except when $e = 0$ or 1.

**a.** Use the Trapezoidal Rule with $n = 10$ to estimate the length of the ellipse when $a = 1$ and $e = 1/2$.

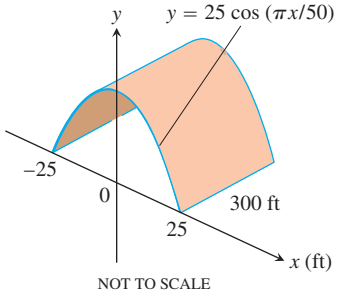
**b.** Use the fact that the absolute value of the second derivative of $f(t) = \sqrt{1 - e^2\cos^2 t}$ is less than 1 to find an upper bound for the error in the estimate you obtained in part (a).

**T** **50.** The length of one arch of the curve $y = \sin x$ is given by



$$L = \int_0^{\pi} \sqrt{1 + \cos^2 x}\, dx.$$

Estimate $L$ by Simpson's Rule with $n = 8$.



**T** **51.** Your metal fabrication company is bidding for a contract to make sheets of corrugated iron roofing like the one shown here. The cross-sections of the corrugated sheets are to conform to the curve

$$y = \sin\frac{3\pi}{20}x, \quad 0 \le x \le 20 \text{ in.}$$

If the roofing is to be stamped from flat sheets by a process that does not stretch the material, how wide should the original material be? To find out, use numerical integration to approximate the length of the sine curve to two decimal places.

**T** **52.** Your engineering firm is bidding for the contract to construct the tunnel shown here. The tunnel is 300 ft long and 50 ft wide at the base. The cross-section is shaped like one arch of the curve $y = 25\cos(\pi x/50)$. Upon completion, the tunnel's inside surface (excluding the roadway) will be treated with a waterproof sealer that costs $1.75 per square foot to apply. How much will it cost to apply the sealer? (*Hint:* Use numerical integration to find the length of the cosine curve.)

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Surface Area

Find, to two decimal places, the areas of the surfaces generated by revolving the curves in Exercises 53–56 about the $x$-axis.

**53.** $y = \sin x, \quad 0 \le x \le \pi$

**54.** $y = x^2/4, \quad 0 \le x \le 2$

**55.** $y = x + \sin 2x, \quad -2\pi/3 \le x \le 2\pi/3$ (the curve in Section 4.4, Exercise 5)

**56.** $y = \frac{x}{12}\sqrt{36 - x^2}, 0 \le x \le 6$ (the surface of the plumb bob in Section 6.1, Exercise 56)

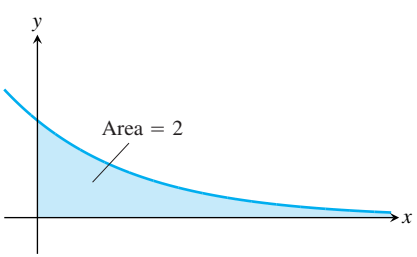
## Estimating Function Values

**57.** Use numerical integration to estimate the value of

$$\sin^{-1} 0.6 = \int_0^{0.6} \frac{dx}{\sqrt{1 - x^2}}.$$

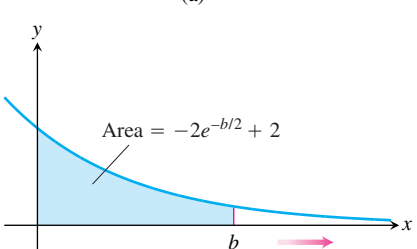
For reference, $\sin^{-1} 0.6 = 0.64350$ to five decimal places.

**58.** Use numerical integration to estimate the value of



$$\pi = 4\int_0^1 \frac{1}{1 + x^2}\, dx.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



# 8.8 Improper Integrals

Up to now, definite integrals have been required to have two properties. First, that the domain of integration $[a, b]$ be finite. Second, that the range of the integrand be finite on this domain. In practice, we may encounter problems that fail to meet one or both of these conditions. The integral for the area under the curve $y = (\ln x)/x^2$ from $x = 1$ to $x = \infty$ is an example for which the domain is infinite (Figure 8.17a). The integral for the area under the curve of $y = 1/\sqrt{x}$ between $x = 0$ and $x = 1$ is an example for which the range of the integrand is infinite (Figure 8.17b). In either case, the integrals are said to be *improper* and are calculated as limits. We will see that improper integrals play an important role when investigating the convergence of certain infinite series in Chapter 11.

(a)

(b)

**FIGURE 8.18** (a) The area in the first quadrant under the curve $y = e^{-x/2}$ is (b) an improper integral of the first type.

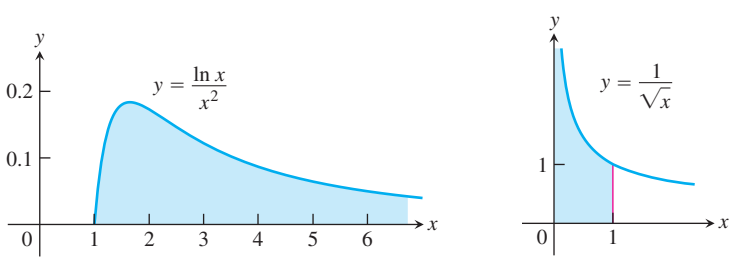


**FIGURE 8.17** Are the areas under these infinite curves finite?

## Infinite Limits of Integration

Consider the infinite region that lies under the curve $y = e^{-x/2}$ in the first quadrant (Figure 8.18a). You might think this region has infinite area, but we will see that the natural value to assign is finite. Here is how to assign a value to the area. First find the area $A(b)$ of the portion of the region that is bounded on the right by $x = b$ (Figure 8.18b).

$$A(b) = \int_0^b e^{-x/2}\,dx = -2e^{-x/2}\Big]_0^b = -2e^{-b/2} + 2$$

Then find the limit of $A(b)$ as $b \to \infty$

$$\lim_{b\to\infty} A(b) = \lim_{b\to\infty} (-2e^{-b/2} + 2) = 2.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The value we assign to the area under the curve from 0 to $\infty$ is

$$\int_0^\infty e^{-x/2}\,dx = \lim_{b\to\infty}\int_0^b e^{-x/2}\,dx = 2.$$

**DEFINITION Type I Improper Integrals**

Integrals with infinite limits of integration are **improper integrals of Type I**.

**1.** If $f(x)$ is continuous on $[a, \infty)$, then

$$\int_a^\infty f(x)\,dx = \lim_{b\to\infty}\int_a^b f(x)\,dx.$$

**2.** If $f(x)$ is continuous on $(-\infty, b]$, then

$$\int_{-\infty}^b f(x)\,dx = \lim_{a\to-\infty}\int_a^b f(x)\,dx.$$

**3.** If $f(x)$ is continuous on $(-\infty, \infty)$, then

$$\int_{-\infty}^\infty f(x)\,dx = \int_{-\infty}^c f(x)\,dx + \int_c^\infty f(x)\,dx,$$

where $c$ is any real number.

In each case, if the limit is finite we say that the improper integral **converges** and that the limit is the **value** of the improper integral. If the limit fails to exist, the improper integral **diverges**.

It can be shown that the choice of $c$ in Part 3 of the definition is unimportant. We can evaluate or determine the convergence or divergence of $\int_{-\infty}^\infty f(x)\,dx$ with any convenient choice.

Any of the integrals in the above definition can be interpreted as an area if $f \geq 0$ on the interval of integration. For instance, we interpreted the improper integral in Figure 8.18 as an area. In that case, the area has the finite value 2. If $f \geq 0$ and the improper integral diverges, we say the area under the curve is **infinite**.

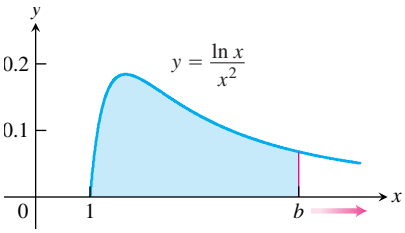

**FIGURE 8.19** The area under this curve is an improper integral (Example 1).

**EXAMPLE 1** Evaluating an Improper Integral on $[1, \infty)$

Is the area under the curve $y = (\ln x)/x^2$ from $x = 1$ to $x = \infty$ finite? If so, what is it?

**Solution** We find the area under the curve from $x = 1$ to $x = b$ and examine the limit as $b \to \infty$. If the limit is finite, we take it to be the area under the curve (Figure 8.19). The area from 1 to $b$ is

$$\int_1^b \frac{\ln x}{x^2}\,dx = \left[(\ln x)\left(-\frac{1}{x}\right)\right]_1^b - \int_1^b \left(-\frac{1}{x}\right)\left(\frac{1}{x}\right)dx$$

Integration by parts with $u = \ln x$, $dv = dx/x^2$, $du = dx/x$, $v = -1/x$.

$$= -\frac{\ln b}{b} - \left[\frac{1}{x}\right]_1^b$$

$$= -\frac{\ln b}{b} - \frac{1}{b} + 1.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The limit of the area as $b \to \infty$ is

$$\int_1^\infty \frac{\ln x}{x^2}\,dx = \lim_{b\to\infty}\int_1^b \frac{\ln x}{x^2}\,dx$$

$$= \lim_{b\to\infty}\left[-\frac{\ln b}{b} - \frac{1}{b} + 1\right]$$

$$= -\left[\lim_{b\to\infty}\frac{\ln b}{b}\right] - 0 + 1$$

$$= -\left[\lim_{b\to\infty}\frac{1/b}{1}\right] + 1 = 0 + 1 = 1. \qquad \text{l'Hôpital's Rule}$$

Thus, the improper integral converges and the area has finite value 1. ■

**EXAMPLE 2** Evaluating an Integral on $(-\infty, \infty)$

Evaluate

$$\int_{-\infty}^\infty \frac{dx}{1+x^2}.$$

**Solution** According to the definition (Part 3), we can write

$$\int_{-\infty}^\infty \frac{dx}{1+x^2} = \int_{-\infty}^0 \frac{dx}{1+x^2} + \int_0^\infty \frac{dx}{1+x^2}.$$

HISTORICAL BIOGRAPHY

Lejeune Dirichlet
(1805–1859)

Next we evaluate each improper integral on the right side of the equation above.

$$\int_{-\infty}^0 \frac{dx}{1+x^2} = \lim_{a\to-\infty}\int_a^0 \frac{dx}{1+x^2}$$

$$= \lim_{a\to-\infty}\tan^{-1}x\Big]_a^0$$

$$= \lim_{a\to-\infty}(\tan^{-1}0 - \tan^{-1}a) = 0 - \left(-\frac{\pi}{2}\right) = \frac{\pi}{2}$$

$$\int_0^\infty \frac{dx}{1+x^2} = \lim_{b\to\infty}\int_0^b \frac{dx}{1+x^2}$$

$$= \lim_{b\to\infty}\tan^{-1}x\Big]_0^b$$

$$= \lim_{b\to\infty}(\tan^{-1}b - \tan^{-1}0) = \frac{\pi}{2} - 0 = \frac{\pi}{2}$$

Thus,

$$\int_{-\infty}^\infty \frac{dx}{1+x^2} = \frac{\pi}{2} + \frac{\pi}{2} = \pi.$$

Since $1/(1+x^2) > 0$, the improper integral can be interpreted as the (finite) area beneath the curve and above the $x$-axis (Figure 8.20). ■

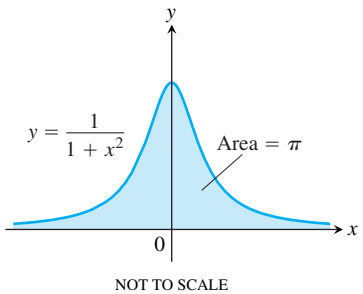

**FIGURE 8.20** The area under this curve is finite (Example 2).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## The Integral $\int_1^\infty \frac{dx}{x^p}$

The function $y = 1/x$ is the boundary between the convergent and divergent improper integrals with integrands of the form $y = 1/x^p$. As the next example shows, the improper integral converges if $p > 1$ and diverges if $p \le 1$.

### EXAMPLE 3 Determining Convergence

For what values of $p$ does the integral $\int_1^\infty dx/x^p$ converge? When the integral does converge, what is its value?

**Solution** If $p \neq 1$,

$$\int_1^b \frac{dx}{x^p} = \frac{x^{-p+1}}{-p+1}\Big]_1^b = \frac{1}{1-p}(b^{-p+1} - 1) = \frac{1}{1-p}\left(\frac{1}{b^{p-1}} - 1\right).$$

Thus,

$$\int_1^\infty \frac{dx}{x^p} = \lim_{b\to\infty}\int_1^b \frac{dx}{x^p}$$

$$= \lim_{b\to\infty}\left[\frac{1}{1-p}\left(\frac{1}{b^{p-1}} - 1\right)\right] = \begin{cases} \dfrac{1}{p-1}, & p > 1 \\ \infty, & p < 1 \end{cases}$$

because

$$\lim_{b\to\infty}\frac{1}{b^{p-1}} = \begin{cases} 0, & p > 1 \\ \infty, & p < 1. \end{cases}$$

Therefore, the integral converges to the value $1/(p-1)$ if $p > 1$ and it diverges if $p < 1$.

If $p = 1$, the integral also diverges:

$$\int_1^\infty \frac{dx}{x^p} = \int_1^\infty \frac{dx}{x}$$

$$= \lim_{b\to\infty}\int_1^b \frac{dx}{x}$$

$$= \lim_{b\to\infty} \ln x\Big]_1^b$$

$$= \lim_{b\to\infty}(\ln b - \ln 1) = \infty.$$

■

## Integrands with Vertical Asymptotes

Another type of improper integral arises when the integrand has a vertical asymptote—an infinite discontinuity—at a limit of integration or at some point between the limits of integration. If the integrand $f$ is positive over the interval of integration, we can again interpret the improper integral as the area under the graph of $f$ and above the $x$-axis between the limits of integration.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

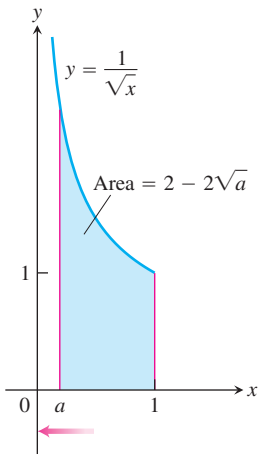

**FIGURE 8.21** The area under this curve is

$$\lim_{a\to 0^+} \int_a^1 \left(\frac{1}{\sqrt{x}}\right) dx = 2,$$

an improper integral of the second kind.

Consider the region in the first quadrant that lies under the curve $y = 1/\sqrt{x}$ from $x = 0$ to $x = 1$ (Figure 8.17b). First we find the area of the portion from $a$ to 1 (Figure 8.21).

$$\int_a^1 \frac{dx}{\sqrt{x}} = 2\sqrt{x}\Big]_a^1 = 2 - 2\sqrt{a}$$

Then we find the limit of this area as $a \to 0^+$:

$$\lim_{a\to 0^+} \int_a^1 \frac{dx}{\sqrt{x}} = \lim_{a\to 0^+} \left(2 - 2\sqrt{a}\right) = 2.$$

The area under the curve from 0 to 1 is finite and equals

$$\int_0^1 \frac{dx}{\sqrt{x}} = \lim_{a\to 0^+} \int_a^1 \frac{dx}{\sqrt{x}} = 2.$$

**DEFINITION Type II Improper Integrals**

Integrals of functions that become infinite at a point within the interval of integration are **improper integrals of Type II**.

**1.** If $f(x)$ is continuous on $(a, b]$ and is discontinuous at $a$ then

$$\int_a^b f(x)\,dx = \lim_{c\to a^+} \int_c^b f(x)\,dx.$$

**2.** If $f(x)$ is continuous on $[a, b)$ and is discontinuous at $b$, then

$$\int_a^b f(x)\,dx = \lim_{c\to b^-} \int_a^c f(x)\,dx.$$

**3.** If $f(x)$ is discontinuous at $c$, where $a < c < b$, and continuous on $[a, c) \cup (c, b]$, then

$$\int_a^b f(x)\,dx = \int_a^c f(x)\,dx + \int_c^b f(x)\,dx.$$

In each case, if the limit is finite we say the improper integral **converges** and that the limit is the **value** of the improper integral. If the limit does not exist, the integral **diverges**.

In Part 3 of the definition, the integral on the left side of the equation converges if *both* integrals on the right side converge; otherwise it diverges.

**EXAMPLE 4** A Divergent Improper Integral

Investigate the convergence of

$$\int_0^1 \frac{1}{1-x}\,dx.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

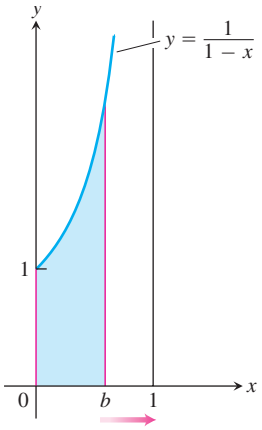

**FIGURE 8.22** The limit does not exist:

$$\int_0^1 \left(\frac{1}{1-x}\right) dx = \lim_{b\to 1^-} \int_0^b \frac{1}{1-x}\,dx = \infty.$$

The area beneath the curve and above the $x$-axis for $[0, 1)$ is not a real number (Example 4).

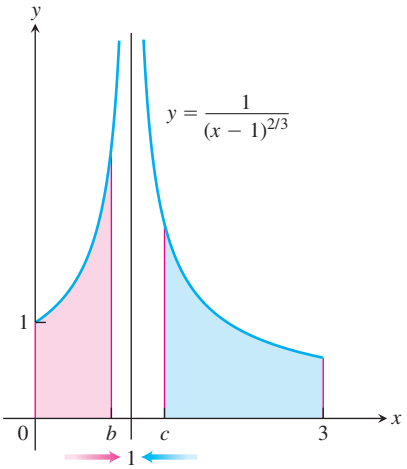

**FIGURE 8.23** Example 5 shows the convergence of

$$\int_0^3 \frac{1}{(x-1)^{2/3}}\,dx = 3 + 3\sqrt[3]{2},$$

so the area under the curve exists (so it is a real number).

**Solution** The integrand $f(x) = 1/(1-x)$ is continuous on $[0, 1)$ but is discontinuous at $x = 1$ and becomes infinite as $x \to 1^-$ (Figure 8.22). We evaluate the integral as

$$\lim_{b\to 1^-} \int_0^b \frac{1}{1-x}\,dx = \lim_{b\to 1^-} \Big[-\ln|1-x|\Big]_0^b$$

$$= \lim_{b\to 1^-} [-\ln(1-b) + 0] = \infty.$$

The limit is infinite, so the integral diverges. ■

## EXAMPLE 5 Vertical Asympote at an Interior Point

Evaluate

$$\int_0^3 \frac{dx}{(x-1)^{2/3}}.$$

**Solution** The integrand has a vertical asymptote at $x = 1$ and is continuous on $[0, 1)$ and $(1, 3]$ (Figure 8.23). Thus, by Part 3 of the definition above,

$$\int_0^3 \frac{dx}{(x-1)^{2/3}} = \int_0^1 \frac{dx}{(x-1)^{2/3}} + \int_1^3 \frac{dx}{(x-1)^{2/3}}.$$

Next, we evaluate each improper integral on the right-hand side of this equation.

$$\int_0^1 \frac{dx}{(x-1)^{2/3}} = \lim_{b\to 1^-} \int_0^b \frac{dx}{(x-1)^{2/3}}$$

$$= \lim_{b\to 1^-} 3(x-1)^{1/3}\Big]_0^b$$

$$= \lim_{b\to 1^-} [3(b-1)^{1/3} + 3] = 3$$

$$\int_1^3 \frac{dx}{(x-1)^{2/3}} = \lim_{c\to 1^+} \int_c^3 \frac{dx}{(x-1)^{2/3}}$$

$$= \lim_{c\to 1^+} 3(x-1)^{1/3}\Big]_c^3$$

$$= \lim_{c\to 1^+} \left[3(3-1)^{1/3} - 3(c-1)^{1/3}\right] = 3\sqrt[3]{2}$$

We conclude that

$$\int_0^3 \frac{dx}{(x-1)^{2/3}} = 3 + 3\sqrt[3]{2}.$$ ■

## EXAMPLE 6 A Convergent Improper Integral

Evaluate

$$\int_2^\infty \frac{x+3}{(x-1)(x^2+1)}\,dx.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution**

$$\int_2^\infty \frac{x+3}{(x-1)(x^2+1)}\,dx = \lim_{b\to\infty}\int_2^b \frac{x+3}{(x-1)(x^2+1)}\,dx$$

$$= \lim_{b\to\infty}\int_2^b \left(\frac{2}{x-1} - \frac{2x+1}{x^2+1}\right)dx \qquad \text{Partial fractions}$$

$$= \lim_{b\to\infty}\left[2\ln(x-1) - \ln(x^2+1) - \tan^{-1}x\right]_2^b$$

$$= \lim_{b\to\infty}\left[\ln\frac{(x-1)^2}{x^2+1} - \tan^{-1}x\right]_2^b \qquad \text{Combine the logarithms.}$$

$$= \lim_{b\to\infty}\left[\ln\left(\frac{(b-1)^2}{b^2+1}\right) - \tan^{-1}b\right] - \ln\left(\frac{1}{5}\right) + \tan^{-1}2$$

$$= 0 - \frac{\pi}{2} + \ln 5 + \tan^{-1}2 \approx 1.1458$$

Notice that we combined the logarithms in the antiderivative *before* we calculated the limit as $b \to \infty$. Had we not done so, we would have encountered the indeterminate form

$$\lim_{b\to\infty}(2\ln(b-1) - \ln(b^2+1)) = \infty - \infty.$$

The way to evaluate the indeterminate form, of course, is to combine the logarithms, so we would have arrived at the same answer in the end. ■

Computer algebra systems can evaluate many convergent improper integrals. To evaluate the integral in Example 6 using Maple, enter

$$> f:=(x+3)/((x-1)*(x\text{^}2+1));$$

Then use the integration command

$$> \text{int}(f, x = 2..\text{infinity});$$

Maple returns the answer

$$-\frac{1}{2}\pi + \ln(5) + \arctan(2).$$

To obtain a numerical result, use the evaluation command **evalf** and specify the number of digits, as follows:

$$> \text{evalf}(\%, 6);$$

The symbol % instructs the computer to evaluate the last expression on the screen, in this case $(-1/2)\pi + \ln(5) + \arctan(2)$. Maple returns 1.14579.

Using Mathematica, entering

$$In\ [1]:= \text{Integrate}\,[(x+3)/((x-1)(x\text{^}2+1)), \{x, 2, \text{Infinity}\}]$$

returns

$$Out\ [1]= \frac{-\text{Pi}}{2} + \text{ArcTan}\,[2] + \text{Log}\,[5].$$

To obtain a numerical result with six digits, use the command "N[%, 6]"; it also yields 1.14579.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

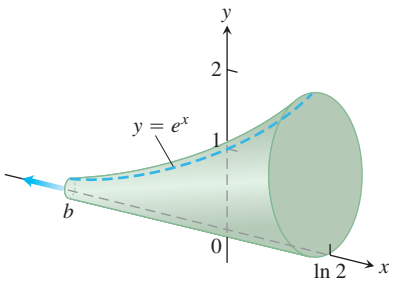

**FIGURE 8.24** The calculation in Example 7 shows that this infinite horn has a finite volume.

## EXAMPLE 7 Finding the Volume of an Infinite Solid

The cross-sections of the solid horn in Figure 8.24 perpendicular to the $x$-axis are circular disks with diameters reaching from the $x$-axis to the curve $y = e^x$, $-\infty < x \leq \ln 2$. Find the volume of the horn.

**Solution** The area of a typical cross-section is

$$A(x) = \pi(\text{radius})^2 = \pi\left(\frac{1}{2}y\right)^2 = \frac{\pi}{4}e^{2x}.$$

We define the volume of the horn to be the limit as $b \to -\infty$ of the volume of the portion from $b$ to $\ln 2$. As in Section 6.1 (the method of slicing), the volume of this portion is

$$V = \int_b^{\ln 2} A(x)\,dx = \int_b^{\ln 2} \frac{\pi}{4}e^{2x}\,dx = \frac{\pi}{8}e^{2x}\Big]_b^{\ln 2}$$

$$= \frac{\pi}{8}(e^{\ln 4} - e^{2b}) = \frac{\pi}{8}(4 - e^{2b}).$$

As $b \to -\infty$, $e^{2b} \to 0$ and $V \to (\pi/8)(4 - 0) = \pi/2$. The volume of the horn is $\pi/2$. ■

## EXAMPLE 8 An Incorrect Calculation

Evaluate

$$\int_0^3 \frac{dx}{x-1}.$$

**Solution** Suppose we fail to notice the discontinuity of the integrand at $x = 1$, interior to the interval of integration. If we evaluate the integral as an ordinary integral we get

$$\int_0^3 \frac{dx}{x-1} = \ln|x-1|\Big]_0^3 = \ln 2 - \ln 1 = \ln 2.$$

This result is *wrong* because the integral is improper. The correct evaluation uses limits:

$$\int_0^3 \frac{dx}{x-1} = \int_0^1 \frac{dx}{x-1} + \int_1^3 \frac{dx}{x-1}$$

where

$$\int_0^1 \frac{dx}{x-1} = \lim_{b\to 1^-}\int_0^b \frac{dx}{x-1} = \lim_{b\to 1^-} \ln|x-1|\Big]_0^b$$

$$= \lim_{b\to 1^-}(\ln|b-1| - \ln|-1|)$$

$$= \lim_{b\to 1^-}\ln(1-b) = -\infty. \qquad 1 - b \to 0^+ \text{ as } b \to 1^-$$

Since $\int_0^1 dx/(x-1)$ is divergent, the original integral $\int_0^3 dx/(x-1)$ is divergent. ■

Example 8 illustrates what can go wrong if you mistake an improper integral for an ordinary integral. Whenever you encounter an integral $\int_a^b f(x)\,dx$ you must examine the function $f$ on $[a, b]$ and then decide if the integral is improper. If $f$ is continuous on $[a, b]$, it will be proper, an ordinary integral.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

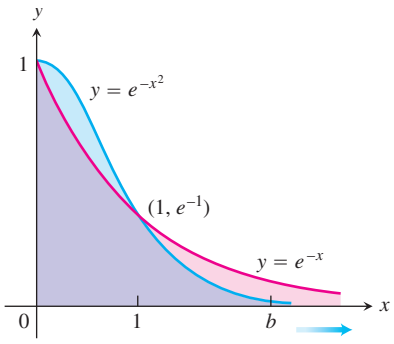

**FIGURE 8.25** The graph of $e^{-x^2}$ lies below the graph of $e^{-x}$ for $x > 1$ (Example 9).

## Tests for Convergence and Divergence

When we cannot evaluate an improper integral directly, we try to determine whether it converges or diverges. If the integral diverges, that's the end of the story. If it converges, we can use numerical methods to approximate its value. The principal tests for convergence or divergence are the Direct Comparison Test and the Limit Comparison Test.

### EXAMPLE 9 Investigating Convergence

Does the integral $\int_1^\infty e^{-x^2}\,dx$ converge?

**Solution** By definition,

$$\int_1^\infty e^{-x^2}\,dx = \lim_{b\to\infty}\int_1^b e^{-x^2}\,dx.$$

We cannot evaluate the latter integral directly because it is nonelementary. But we *can* show that its limit as $b \to \infty$ is finite. We know that $\int_1^b e^{-x^2}\,dx$ is an increasing function of $b$. Therefore either it becomes infinite as $b \to \infty$ or it has a finite limit as $b \to \infty$. It does not become infinite: For every value of $x \geq 1$ we have $e^{-x^2} \leq e^{-x}$ (Figure 8.25), so that

$$\int_1^b e^{-x^2}\,dx \leq \int_1^b e^{-x}\,dx = -e^{-b} + e^{-1} < e^{-1} \approx 0.36788.$$

Hence

$$\int_1^\infty e^{-x^2}\,dx = \lim_{b\to\infty}\int_1^b e^{-x^2}\,dx$$

converges to some definite finite value. We do not know exactly what the value is except that it is something positive and less than 0.37. Here we are relying on the completeness property of the real numbers, discussed in Appendix 4. ■

The comparison of $e^{-x^2}$ and $e^{-x}$ in Example 9 is a special case of the following test.

HISTORICAL BIOGRAPHY

Karl Weierstrass
(1815–1897)

**THEOREM 1 Direct Comparison Test**

Let $f$ and $g$ be continuous on $[a, \infty)$ with $0 \leq f(x) \leq g(x)$ for all $x \geq a$. Then

1. $\int_a^\infty f(x)\,dx$ converges if $\int_a^\infty g(x)\,dx$ converges
2. $\int_a^\infty g(x)\,dx$ diverges if $\int_a^\infty f(x)\,dx$ diverges.

The reasoning behind the argument establishing Theorem 1 is similar to that in Example 9.

If $0 \leq f(x) \leq g(x)$ for $x \geq a$, then

$$\int_a^b f(x)\,dx \leq \int_a^b g(x)\,dx, \qquad b > a.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

From this it can be argued, as in Example 9, that

$$\int_a^\infty f(x)\,dx \text{ converges if } \int_a^\infty g(x)\,dx \text{ converges.}$$

Turning this around says that

$$\int_a^\infty g(x)\,dx \text{ diverges if } \int_a^\infty f(x)\,dx \text{ diverges.}$$

**EXAMPLE 10** Using the Direct Comparison Test

**(a)** $\displaystyle\int_1^\infty \frac{\sin^2 x}{x^2}\,dx$ converges because

$$0 \le \frac{\sin^2 x}{x^2} \le \frac{1}{x^2} \quad \text{on} \quad [1, \infty) \quad \text{and} \quad \int_1^\infty \frac{1}{x^2}\,dx \text{ converges.}$$ Example 3

**(b)** $\displaystyle\int_1^\infty \frac{1}{\sqrt{x^2 - 0.1}}\,dx$ diverges because

$$\frac{1}{\sqrt{x^2 - 0.1}} \ge \frac{1}{x} \quad \text{on} \quad [1, \infty) \quad \text{and} \quad \int_1^\infty \frac{1}{x}\,dx \text{ diverges.}$$ Example 3

■

**THEOREM 2 Limit Comparison Test**

If the positive functions $f$ and $g$ are continuous on $[a, \infty)$ and if

$$\lim_{x\to\infty} \frac{f(x)}{g(x)} = L, \qquad 0 < L < \infty,$$

then

$$\int_a^\infty f(x)\,dx \quad \text{and} \quad \int_a^\infty g(x)\,dx$$

both converge or both diverge.

A proof of Theorem 2 is given in advanced calculus.

Although the improper integrals of two functions from $a$ to $\infty$ may both converge, this does not mean that their integrals necessarily have the same value, as the next example shows.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 11** Using the Limit Comparison Test

Show that

$$\int_1^\infty \frac{dx}{1+x^2}$$

converges by comparison with $\int_1^\infty (1/x^2)\,dx$. Find and compare the two integral values.

**Solution** The functions $f(x) = 1/x^2$ and $g(x) = 1/(1+x^2)$ are positive and continuous on $[1, \infty)$. Also,

$$\lim_{x\to\infty} \frac{f(x)}{g(x)} = \lim_{x\to\infty} \frac{1/x^2}{1/(1+x^2)} = \lim_{x\to\infty} \frac{1+x^2}{x^2}$$

$$= \lim_{x\to\infty} \left(\frac{1}{x^2} + 1\right) = 0 + 1 = 1,$$

a positive finite limit (Figure 8.26). Therefore, $\int_1^\infty \frac{dx}{1+x^2}$ converges because $\int_1^\infty \frac{dx}{x^2}$ converges.

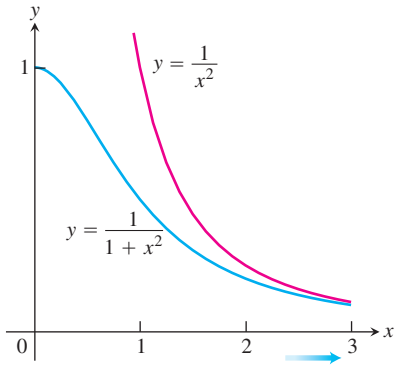

**FIGURE 8.26** The functions in Example 11.

The integrals converge to different values, however.

$$\int_1^\infty \frac{dx}{x^2} = \frac{1}{2-1} = 1 \qquad \text{Example 3}$$

and

$$\int_1^\infty \frac{dx}{1+x^2} = \lim_{b\to\infty} \int_1^b \frac{dx}{1+x^2}$$

$$= \lim_{b\to\infty} [\tan^{-1} b - \tan^{-1} 1] = \frac{\pi}{2} - \frac{\pi}{4} = \frac{\pi}{4}$$ ■

**EXAMPLE 12** Using the Limit Comparison Test

Show that

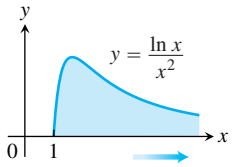
$$\int_1^\infty \frac{3}{e^x + 5}\,dx$$

converges.

**Solution** From Example 9, it is easy to see that $\int_1^\infty e^{-x}\,dx = \int_1^\infty (1/e^x)\,dx$ converges. Moreover, we have

$$\lim_{x\to\infty} \frac{1/e^x}{3/(e^x+5)} = \lim_{x\to\infty} \frac{e^x+5}{3e^x} = \lim_{x\to\infty} \left(\frac{1}{3} + \frac{5}{3e^x}\right) = \frac{1}{3},$$

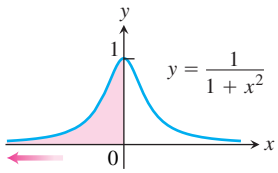
a positive finite limit. As far as the convergence of the improper integral is concerned, $3/(e^x+5)$ behaves like $1/e^x$. ■



Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

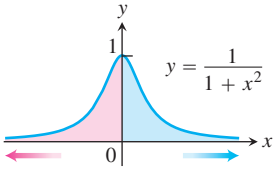
## Types of Improper Integrals Discussed in This Section

INFINITE LIMITS OF INTEGRATION: TYPE I



**1.** Upper limit

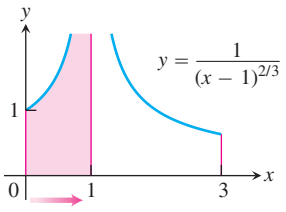
$$\int_1^\infty \frac{\ln x}{x^2}\,dx = \lim_{b\to\infty}\int_1^b \frac{\ln x}{x^2}\,dx$$



**2.** Lower limit

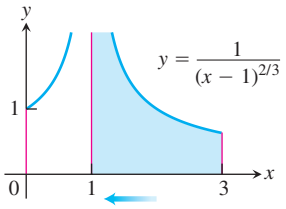
$$\int_{-\infty}^0 \frac{dx}{1+x^2} = \lim_{a\to-\infty}\int_a^0 \frac{dx}{1+x^2}$$

**3.** Both limits



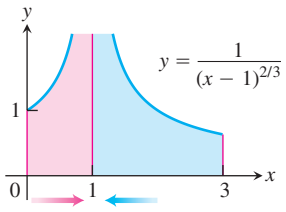
$$\int_{-\infty}^\infty \frac{dx}{1+x^2} = \lim_{b\to-\infty}\int_b^0 \frac{dx}{1+x^2} + \lim_{c\to\infty}\int_0^c \frac{dx}{1+x^2}$$

INTEGRAND BECOMES INFINITE: TYPE II



**4.** Upper endpoint

$$\int_0^1 \frac{dx}{(x-1)^{2/3}} = \lim_{b\to1^-}\int_0^b \frac{dx}{(x-1)^{2/3}}$$



**5.** Lower endpoint

$$\int_1^3 \frac{dx}{(x-1)^{2/3}} = \lim_{d\to1^+}\int_d^3 \frac{dx}{(x-1)^{2/3}}$$

**6.** Interior point

$$\int_0^3 \frac{dx}{(x-1)^{2/3}} = \int_0^1 \frac{dx}{(x-1)^{2/3}} + \int_1^3 \frac{dx}{(x-1)^{2/3}}$$

# EXERCISES 8.8

## Evaluating Improper Integrals

Evaluate the integrals in Exercises 1–34 without using tables.

1. $\int_0^\infty \frac{dx}{x^2+1}$
2. $\int_1^\infty \frac{dx}{x^{1.001}}$
3. $\int_0^1 \frac{dx}{\sqrt{x}}$
4. $\int_0^4 \frac{dx}{\sqrt{4-x}}$
5. $\int_{-1}^1 \frac{dx}{x^{2/3}}$
6. $\int_{-8}^1 \frac{dx}{x^{1/3}}$
7. $\int_0^1 \frac{dx}{\sqrt{1-x^2}}$
8. $\int_0^1 \frac{dr}{r^{0.999}}$
9. $\int_{-\infty}^{-2} \frac{2\,dx}{x^2-1}$
10. $\int_{-\infty}^{2} \frac{2\,dx}{x^2+4}$
11. $\int_2^\infty \frac{2}{v^2-v}\,dv$
12. $\int_2^\infty \frac{2\,dt}{t^2-1}$
13. $\int_{-\infty}^{\infty} \frac{2x\,dx}{(x^2+1)^2}$
14. $\int_{-\infty}^{\infty} \frac{x\,dx}{(x^2+4)^{3/2}}$
15. $\int_0^1 \frac{\theta+1}{\sqrt{\theta^2+2\theta}}\,d\theta$
16. $\int_0^2 \frac{s+1}{\sqrt{4-s^2}}\,ds$
17. $\int_0^\infty \frac{dx}{(1+x)\sqrt{x}}$
18. $\int_1^\infty \frac{1}{x\sqrt{x^2-1}}\,dx$
19. $\int_0^\infty \frac{dv}{(1+v^2)(1+\tan^{-1}v)}$
20. $\int_0^\infty \frac{16\tan^{-1}x}{1+x^2}\,dx$
21. $\int_{-\infty}^0 \theta e^\theta\,d\theta$
22. $\int_0^\infty 2e^{-\theta}\sin\theta\,d\theta$
23. $\int_{-\infty}^0 e^{-|x|}\,dx$
24. $\int_{-\infty}^\infty 2xe^{-x^2}\,dx$
25. $\int_0^1 x\ln x\,dx$
26. $\int_0^1 (-\ln x)\,dx$
27. $\int_0^2 \frac{ds}{\sqrt{4-s^2}}$
28. $\int_0^1 \frac{4r\,dr}{\sqrt{1-r^4}}$
29. $\int_1^2 \frac{ds}{s\sqrt{s^2-1}}$
30. $\int_2^4 \frac{dt}{t\sqrt{t^2-4}}$
31. $\int_{-1}^4 \frac{dx}{\sqrt{|x|}}$
32. $\int_0^2 \frac{dx}{\sqrt{|x-1|}}$
33. $\int_{-1}^\infty \frac{d\theta}{\theta^2+5\theta+6}$
34. $\int_0^\infty \frac{dx}{(x+1)(x^2+1)}$

## Testing for Convergence

In Exercises 35–64, use integration, the Direct Comparison Test, or the Limit Comparison Test to test the integrals for convergence. If more than one method applies, use whatever method you prefer.

35. $\int_0^{\pi/2} \tan\theta\,d\theta$
36. $\int_0^{\pi/2} \cot\theta\,d\theta$
37. $\int_0^\pi \frac{\sin\theta\,d\theta}{\sqrt{\pi-\theta}}$
38. $\int_{-\pi/2}^{\pi/2} \frac{\cos\theta\,d\theta}{(\pi-2\theta)^{1/3}}$
39. $\int_0^{\ln 2} x^{-2}e^{-1/x}\,dx$
40. $\int_0^1 \frac{e^{-\sqrt{x}}}{\sqrt{x}}\,dx$
41. $\int_0^\pi \frac{dt}{\sqrt{t}+\sin t}$
42. $\int_0^1 \frac{dt}{t-\sin t}$ (*Hint:* $t \ge \sin t$ for $t \ge 0$)
43. $\int_0^2 \frac{dx}{1-x^2}$
44. $\int_0^2 \frac{dx}{1-x}$
45. $\int_{-1}^1 \ln|x|\,dx$
46. $\int_{-1}^1 -x\ln|x|\,dx$
47. $\int_1^\infty \frac{dx}{x^3+1}$
48. $\int_4^\infty \frac{dx}{\sqrt{x}-1}$
49. $\int_2^\infty \frac{dv}{\sqrt{v-1}}$
50. $\int_0^\infty \frac{d\theta}{1+e^\theta}$
51. $\int_0^\infty \frac{dx}{\sqrt{x^6+1}}$
52. $\int_2^\infty \frac{dx}{\sqrt{x^2-1}}$
53. $\int_1^\infty \frac{\sqrt{x+1}}{x^2}\,dx$
54. $\int_2^\infty \frac{x\,dx}{\sqrt{x^4-1}}$
55. $\int_\pi^\infty \frac{2+\cos x}{x}\,dx$
56. $\int_\pi^\infty \frac{1+\sin x}{x^2}\,dx$
57. $\int_4^\infty \frac{2\,dt}{t^{3/2}-1}$
58. $\int_2^\infty \frac{1}{\ln x}\,dx$
59. $\int_1^\infty \frac{e^x}{x}\,dx$
60. $\int_{e^e}^\infty \ln(\ln x)\,dx$
61. $\int_1^\infty \frac{1}{\sqrt{e^x-x}}\,dx$
62. $\int_1^\infty \frac{1}{e^x-2^x}\,dx$
63. $\int_{-\infty}^\infty \frac{dx}{\sqrt{x^4+1}}$
64. $\int_{-\infty}^\infty \frac{dx}{e^x+e^{-x}}$

## Theory and Examples

65. Find the values of $p$ for which each integral converges.

    **a.** $\int_1^2 \frac{dx}{x(\ln x)^p}$ **b.** $\int_2^\infty \frac{dx}{x(\ln x)^p}$

66. **$\int_{-\infty}^{\infty} f(x)\,dx$ may not equal $\lim_{b\to\infty}\int_{-b}^{b} f(x)\,dx$** Show that

$$\int_0^\infty \frac{2x\,dx}{x^2+1}$$

diverges and hence that

$$\int_{-\infty}^\infty \frac{2x\,dx}{x^2+1}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

diverges. Then show that

$$\lim_{b\to\infty}\int_{-b}^{b}\frac{2x\,dx}{x^2+1}=0.$$

Exercises 67–70 are about the infinite region in the first quadrant between the curve $y=e^{-x}$ and the $x$-axis.

**67.** Find the area of the region.

**68.** Find the centroid of the region.

**69.** Find the volume of the solid generated by revolving the region about the $y$-axis.

**70.** Find the volume of the solid generated by revolving the region about the $x$-axis.

**71.** Find the area of the region that lies between the curves $y=\sec x$ and $y=\tan x$ from $x=0$ to $x=\pi/2$.

**72.** The region in Exercise 71 is revolved about the $x$-axis to generate a solid.

**a.** Find the volume of the solid.

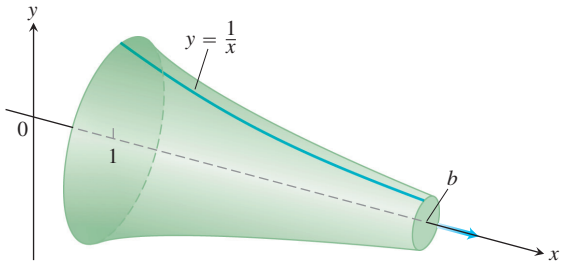
**b.** Show that the inner and outer surfaces of the solid have infinite area.

**73. Estimating the value of a convergent improper integral whose domain is infinite**

**a.** Show that

$$\int_3^\infty e^{-3x}\,dx=\frac{1}{3}e^{-9}<0.000042,$$

and hence that $\int_3^\infty e^{-x^2}\,dx<0.000042$. Explain why this means that $\int_0^\infty e^{-x^2}\,dx$ can be replaced by $\int_0^3 e^{-x^2}\,dx$ without introducing an error of magnitude greater than 0.000042.



T **b.** Evaluate $\int_0^3 e^{-x^2}\,dx$ numerically.

**74. The infinite paint can or Gabriel's horn** As Example 3 shows, the integral $\int_1^\infty (dx/x)$ diverges. This means that the integral

$$\int_1^\infty 2\pi\frac{1}{x}\sqrt{1+\frac{1}{x^4}}\,dx,$$

which measures the *surface area* of the solid of revolution traced out by revolving the curve $y=1/x$, $1\le x$, about the $x$-axis, diverges also. By comparing the two integrals, we see that, for every finite value $b>1$,

$$\int_1^b 2\pi\frac{1}{x}\sqrt{1+\frac{1}{x^4}}\,dx>2\pi\int_1^b\frac{1}{x}\,dx.$$

However, the integral

$$\int_1^\infty \pi\left(\frac{1}{x}\right)^2 dx$$

for the *volume* of the solid converges. **(a)** Calculate it. **(b)** This solid of revolution is sometimes described as a can that does not hold enough paint to cover its own interior. Think about that for a moment. It is common sense that a finite amount of paint cannot cover an infinite surface. But if we fill the horn with paint (a finite amount), then we *will* have covered an infinite surface. Explain the apparent contradiction.

**75. Sine-integral function** The integral

$$\text{Si}\,(x)=\int_0^x\frac{\sin t}{t}\,dt,$$

called the *sine-integral function,* has important applications in optics.

T **a.** Plot the integrand $(\sin t)/t$ for $t>0$. Is the Si function everywhere increasing or decreasing? Do you think $\text{Si}\,(x)=0$ for $x>0$? Check your answers by graphing the function $\text{Si}\,(x)$ for $0\le x\le 25$.

**b.** Explore the convergence of

$$\int_0^\infty\frac{\sin t}{t}\,dt.$$

If it converges, what is its value?

**76. Error function** The function

$$\text{erf}\,(x)=\int_0^x\frac{2e^{-t^2}}{\sqrt{\pi}}\,dt,$$

called the *error function*, has important applications in probability and statistics.

T **a.** Plot the error function for $0\le x\le 25$.

**b.** Explore the convergence of

$$\int_0^\infty\frac{2e^{-t^2}}{\sqrt{\pi}}\,dt.$$

If it converges, what appears to be its value? You will see how to confirm your estimate in Section 15.3, Exercise 37.

**77. Normal probability distribution function** The function

$$f(x)=\frac{1}{\sigma\sqrt{2\pi}}e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2}$$

is called the *normal probability density function* with mean $\mu$ and standard deviation $\sigma$. The number $\mu$ tells where the distribution is centered, and $\sigma$ measures the "scatter" around the mean.

From the theory of probability, it is known that

$$\int_{-\infty}^\infty f(x)\,dx=1.$$

In what follows, let $\mu=0$ and $\sigma=1$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**T** **a.** Draw the graph of $f$. Find the intervals on which $f$ is increasing, the intervals on which $f$ is decreasing, and any local extreme values and where they occur.

**b.** Evaluate

$$\int_{-n}^{n} f(x)\,dx$$

for $n = 1, 2, 3$.

**c.** Give a convincing argument that

$$\int_{-\infty}^{\infty} f(x)\,dx = 1.$$

(*Hint:* Show that $0 < f(x) < e^{-x/2}$ for $x > 1$, and for $b > 1$,

$$\int_{b}^{\infty} e^{-x/2}\,dx \to 0 \quad \text{as} \quad b \to \infty.)$$

**78.** Here is an argument that ln 3 equals $\infty - \infty$. Where does the argument go wrong? Give reasons for your answer.

$$\begin{aligned}
\ln 3 &= \ln 1 + \ln 3 = \ln 1 - \ln \frac{1}{3} \\
&= \lim_{b\to\infty} \ln\left(\frac{b-2}{b}\right) - \ln\frac{1}{3} \\
&= \lim_{b\to\infty} \left[\ln\frac{x-2}{x}\right]_3^b \\
&= \lim_{b\to\infty} \left[\ln(x-2) - \ln x\right]_3^b \\
&= \lim_{b\to\infty} \int_3^b \left(\frac{1}{x-2} - \frac{1}{x}\right) dx \\
&= \int_3^{\infty} \left(\frac{1}{x-2} - \frac{1}{x}\right) dx \\
&= \int_3^{\infty} \frac{1}{x-2}\,dx - \int_3^{\infty} \frac{1}{x}\,dx \\
&= \lim_{b\to\infty} \left[\ln(x-2)\right]_3^b - \lim_{b\to\infty} \left[\ln x\right]_3^b \\
&= \infty - \infty.
\end{aligned}$$

**79.** Show that if $f(x)$ is integrable on every interval of real numbers and $a$ and $b$ are real numbers with $a < b$, then

**a.** $\int_{-\infty}^{a} f(x)\,dx$ and $\int_{a}^{\infty} f(x)\,dx$ both converge if and only if $\int_{-\infty}^{b} f(x)\,dx$ and $\int_{b}^{\infty} f(x)\,dx$ both converge.

**b.** $\int_{-\infty}^{a} f(x)\,dx + \int_{a}^{\infty} f(x)\,dx = \int_{-\infty}^{b} f(x)\,dx + \int_{b}^{\infty} f(x)\,dx$ when the integrals involved converge.

**80.** **a.** Show that if $f$ is even and the necessary integrals exist, then

$$\int_{-\infty}^{\infty} f(x)\,dx = 2\int_{0}^{\infty} f(x)\,dx.$$

**b.** Show that if $f$ is odd and the necessary integrals exist, then

$$\int_{-\infty}^{\infty} f(x)\,dx = 0.$$

Use direct evaluation, the comparison tests, and the results in Exercise 80, as appropriate, to determine the convergence or divergence of the integrals in Exercises 81–88. If more than one method applies, use whatever method you prefer.

**81.** $\displaystyle\int_{-\infty}^{\infty} \frac{dx}{\sqrt{x^2+1}}$

**82.** $\displaystyle\int_{-\infty}^{\infty} \frac{dx}{\sqrt{x^6+1}}$

**83.** $\displaystyle\int_{-\infty}^{\infty} \frac{dx}{e^x + e^{-x}}$

**84.** $\displaystyle\int_{-\infty}^{\infty} \frac{e^{-x}\,dx}{x^2+1}$

**85.** $\displaystyle\int_{-\infty}^{\infty} e^{-|x|}\,dx$

**86.** $\displaystyle\int_{-\infty}^{\infty} \frac{dx}{(x+1)^2}$

**87.** $\displaystyle\int_{-\infty}^{\infty} \frac{|\sin x| + |\cos x|}{|x|+1}\,dx$

(*Hint:* $|\sin\theta| + |\cos\theta| \geq \sin^2\theta + \cos^2\theta$.)

**88.** $\displaystyle\int_{-\infty}^{\infty} \frac{x\,dx}{(x^2+1)(x^2+2)}$

## COMPUTER EXPLORATIONS

### Exploring Integrals of $x^p \ln x$

In Exercises 89–92, use a CAS to explore the integrals for various values of $p$ (include noninteger values). For what values of $p$ does the integral converge? What is the value of the integral when it does converge? Plot the integrand for various values of $p$.

**89.** $\displaystyle\int_{0}^{e} x^p \ln x\,dx$

**90.** $\displaystyle\int_{e}^{\infty} x^p \ln x\,dx$

**91.** $\displaystyle\int_{0}^{\infty} x^p \ln x\,dx$

**92.** $\displaystyle\int_{-\infty}^{\infty} x^p \ln|x|\,dx$

# Chapter 8 Additional and Advanced Exercises

## Challenging Integrals

Evaluate the integrals in Exercises 1–10.

1. $\int (\sin^{-1} x)^2\, dx$

2. $\int \dfrac{dx}{x(x+1)(x+2)\cdots(x+m)}$

3. $\int x \sin^{-1} x\, dx$

4. $\int \sin^{-1} \sqrt{y}\, dy$

5. $\int \dfrac{d\theta}{1-\tan^2\theta}$

6. $\int \ln\left(\sqrt{x} + \sqrt{1+x}\right) dx$

7. $\int \dfrac{dt}{t - \sqrt{1-t^2}}$

8. $\int \dfrac{(2e^{2x} - e^x)\, dx}{\sqrt{3e^{2x} - 6e^x - 1}}$

9. $\int \dfrac{dx}{x^4 + 4}$

10. $\int \dfrac{dx}{x^6 - 1}$

## Limits

Evaluate the limits in Exercises 11 and 12.

11. $\lim_{x\to\infty} \int_{-x}^{x} \sin t\, dt$

12. $\lim_{x\to 0^+} x \int_{x}^{1} \dfrac{\cos t}{t^2}\, dt$

Evaluate the limits in Exercises 13 and 14 by identifying them with definite integrals and evaluating the integrals.

13. $\lim_{n\to\infty} \sum_{k=1}^{n} \ln \sqrt[n]{1 + \dfrac{k}{n}}$

14. $\lim_{n\to\infty} \sum_{k=0}^{n-1} \dfrac{1}{\sqrt{n^2 - k^2}}$

## Theory and Applications

15. **Finding arc length** Find the length of the curve

$$y = \int_0^x \sqrt{\cos 2t}\, dt, \quad 0 \le x \le \pi/4.$$

16. **Finding arc length** Find the length of the curve $y = \ln(1 - x^2)$, $0 \le x \le 1/2$.

17. **Finding volume** The region in the first quadrant that is enclosed by the $x$-axis and the curve $y = 3x\sqrt{1-x}$ is revolved about the $y$-axis to generate a solid. Find the volume of the solid.

18. **Finding volume** The region in the first quadrant that is enclosed by the $x$-axis, the curve $y = 5/\left(x\sqrt{5-x}\right)$, and the lines $x = 1$ and $x = 4$ is revolved about the $x$-axis to generate a solid. Find the volume of the solid.

19. **Finding volume** The region in the first quadrant enclosed by the coordinate axes, the curve $y = e^x$, and the line $x = 1$ is revolved about the $y$-axis to generate a solid. Find the volume of the solid.

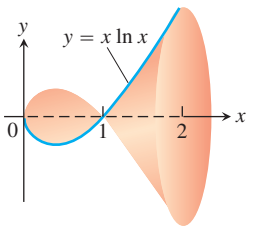
20. **Finding volume** The region in the first quadrant that is bounded above by the curve $y = e^x - 1$, below by the $x$-axis, and on the right by the line $x = \ln 2$ is revolved about the line $x = \ln 2$ to generate a solid. Find the volume of the solid.

21. **Finding volume** Let $R$ be the "triangular" region in the first quadrant that is bounded above by the line $y = 1$, below by the curve $y = \ln x$, and on the left by the line $x = 1$. Find the volume of the solid generated by revolving $R$ about

**a.** the $x$-axis. **b.** the line $y = 1$.

22. **Finding volume** (*Continuation of Exercise 21.*) Find the volume of the solid generated by revolving the region $R$ about

**a.** the $y$-axis. **b.** the line $x = 1$.



23. **Finding volume** The region between the $x$-axis and the curve

$$y = f(x) = \begin{cases} 0, & x = 0 \\ x \ln x, & 0 < x \le 2 \end{cases}$$

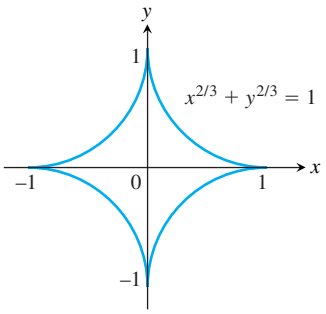
is revolved about the $x$-axis to generate the solid shown here.

**a.** Show that $f$ is continuous at $x = 0$.

**b.** Find the volume of the solid.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**24. Finding volume** The infinite region bounded by the coordinate axes and the curve $y = -\ln x$ in the first quadrant is revolved about the $x$-axis to generate a solid. Find the volume of the solid.



**25. Centroid of a region** Find the centroid of the region in the first quadrant that is bounded below by the $x$-axis, above by the curve $y = \ln x$, and on the right by the line $x = e$.

**26. Centroid of a region** Find the centroid of the region in the plane enclosed by the curves $y = \pm(1 - x^2)^{-1/2}$ and the lines $x = 0$ and $x = 1$.

**27. Length of a curve** Find the length of the curve $y = \ln x$ from $x = 1$ to $x = e$.

**28. Finding surface area** Find the area of the surface generated by revolving the curve in Exercise 27 about the $y$-axis.

**29. The length of an astroid** The graph of the equation $x^{2/3} + y^{2/3} = 1$ is one of a family of curves called *astroids* (not "asteroids") because of their starlike appearance (see accompanying figure). Find the length of this particular astroid.

**30. The surface generated by an astroid** Find the area of the surface generated by revolving the curve in Exercise 29 about the $x$-axis.

**31.** Find a curve through the origin whose length is

$$\int_0^4 \sqrt{1 + \frac{1}{4x}}\, dx.$$

**32.** Without evaluating either integral, explain why

$$2\int_{-1}^{1} \sqrt{1 - x^2}\, dx = \int_{-1}^{1} \frac{dx}{\sqrt{1 - x^2}}.$$

**T** **33. a.** Graph the function $f(x) = e^{(x - e^x)}$, $-5 \le x \le 3$.

**b.** Show that $\int_{-\infty}^{\infty} f(x)\, dx$ converges and find its value.

**34.** Find $\lim_{n\to\infty} \int_0^1 \frac{ny^{n-1}}{1 + y}\, dy$.

**35.** Derive the integral formula

$$\int x\left(\sqrt{x^2 - a^2}\right)^n dx = \frac{\left(\sqrt{x^2 - a^2}\right)^{n+2}}{n + 2} + C, \quad n \ne -2.$$

**36.** Prove that

$$\frac{\pi}{6} < \int_0^1 \frac{dx}{\sqrt{4 - x^2 - x^3}} < \frac{\pi\sqrt{2}}{8}.$$

(*Hint:* Observe that for $0 < x < 1$, we have $4 - x^2 > 4 - x^2 - x^3 > 4 - 2x^2$, with the left-hand side becoming an equality for $x = 0$ and the right-hand side becoming an equality for $x = 1$.)

**37.** For what value or values of $a$ does

$$\int_1^{\infty} \left(\frac{ax}{x^2 + 1} - \frac{1}{2x}\right) dx$$

converge? Evaluate the corresponding integral(s).

**38.** For each $x > 0$, let $G(x) = \int_0^{\infty} e^{-xt}\, dt$. Prove that $xG(x) = 1$ for each $x > 0$.

**39. Infinite area and finite volume** What values of $p$ have the following property: The area of the region between the curve $y = x^{-p}$, $1 \le x < \infty$, and the $x$-axis is infinite but the volume of the solid generated by revolving the region about the $x$-axis is finite.

**40. Infinite area and finite volume** What values of $p$ have the following property: The area of the region in the first quadrant enclosed by the curve $y = x^{-p}$, the $y$-axis, the line $x = 1$, and the interval $[0, 1]$ on the $x$-axis is infinite but the volume of the solid generated by revolving the region about one of the coordinate axes is finite.

## Tabular Integration

The technique of tabular integration also applies to integrals of the form $\int f(x)g(x)\, dx$ when neither function can be differentiated repeatedly to become zero. For example, to evaluate

$$\int e^{2x} \cos x\, dx$$

we begin as before with a table listing successive derivatives of $e^{2x}$ and integrals of $\cos x$:

| $e^{2x}$ and its derivatives | | $\cos x$ and its integrals |
|---|---|---|
| $e^{2x}$ | (+) | $\cos x$ |
| $2e^{2x}$ | (−) | $\sin x$ |
| $4e^{2x}$ | (+) | $-\cos x$ ← *Stop here:* Row is same as first row except for multiplicative constants (4 on the left, −1 on the right) |

We stop differentiating and integrating as soon as we reach a row that is the same as the first row except for multiplicative constants. We interpret the table as saying

$$\int e^{2x} \cos x\, dx = +(e^{2x} \sin x) - (2e^{2x}(-\cos x)) + \int (4e^{2x})(-\cos x)\, dx.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We take signed products from the diagonal arrows and a signed integral for the last horizontal arrow. Transposing the integral on the right-hand side over to the left-hand side now gives

$$5\int e^{2x}\cos x\,dx = e^{2x}\sin x + 2e^{2x}\cos x$$

or

$$\int e^{2x}\cos x\,dx = \frac{e^{2x}\sin x + 2e^{2x}\cos x}{5} + C,$$

after dividing by 5 and adding the constant of integration.

Use tabular integration to evaluate the integrals in Exercises 41–48.

**41.** $\int e^{2x}\cos 3x\,dx$

**42.** $\int e^{3x}\sin 4x\,dx$

**43.** $\int \sin 3x \sin x\,dx$

**44.** $\int \cos 5x \sin 4x\,dx$

**45.** $\int e^{ax}\sin bx\,dx$

**46.** $\int e^{ax}\cos bx\,dx$

**47.** $\int \ln(ax)\,dx$

**48.** $\int x^2 \ln(ax)\,dx$

## The Gamma Function and Stirling's Formula

Euler's gamma function $\Gamma(x)$ ("gamma of $x$"; $\Gamma$ is a Greek capital $g$) uses an integral to extend the factorial function from the nonnegative integers to other real values. The formula is

$$\Gamma(x) = \int_0^\infty t^{x-1}e^{-t}\,dt, \quad x > 0.$$

For each positive $x$, the number $\Gamma(x)$ is the integral of $t^{x-1}e^{-t}$ with respect to $t$ from 0 to $\infty$. Figure 8.27 shows the graph of $\Gamma$ near the origin. You will see how to calculate $\Gamma(1/2)$ if you do Additional Exercise 31 in Chapter 15.

**49. If $n$ is a nonnegative integer, $\Gamma(n+1) = n!$**

**a.** Show that $\Gamma(1) = 1$.

**b.** Then apply integration by parts to the integral for $\Gamma(x+1)$ to show that $\Gamma(x+1) = x\Gamma(x)$. This gives

$$\begin{aligned}\Gamma(2) &= 1\Gamma(1) = 1\\ \Gamma(3) &= 2\Gamma(2) = 2\\ \Gamma(4) &= 3\Gamma(3) = 6\\ &\vdots\\ \Gamma(n+1) &= n\,\Gamma(n) = n! \end{aligned} \qquad (1)$$

**c.** Use mathematical induction to verify Equation (1) for every nonnegative integer $n$.

**50. Stirling's formula** Scottish mathematician James Stirling (1692–1770) showed that

$$\lim_{x\to\infty}\left(\frac{e}{x}\right)^x\sqrt{\frac{x}{2\pi}}\,\Gamma(x) = 1,$$

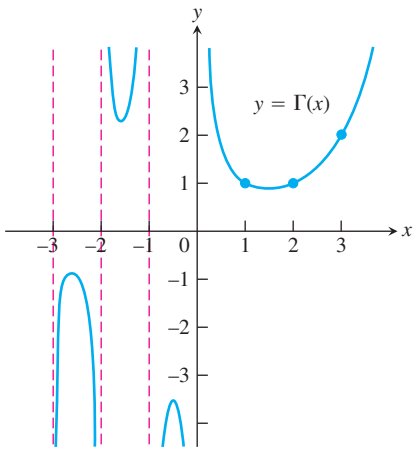


**FIGURE 8.27** Euler's gamma function $\Gamma(x)$ is a continuous function of $x$ whose value at each positive integer $n+1$ is $n!$. The defining integral formula for $\Gamma$ is valid only for $x > 0$, but we can extend $\Gamma$ to negative noninteger values of $x$ with the formula $\Gamma(x) = (\Gamma(x+1))/x$, which is the subject of Exercise 49.

so for large $x$,

$$\Gamma(x) = \left(\frac{x}{e}\right)^x\sqrt{\frac{2\pi}{x}}\,(1+\epsilon(x)), \qquad \epsilon(x)\to 0 \text{ as } x\to\infty. \qquad (2)$$

Dropping $\epsilon(x)$ leads to the approximation

$$\Gamma(x) \approx \left(\frac{x}{e}\right)^x\sqrt{\frac{2\pi}{x}} \qquad \textbf{(Stirling's formula)}. \qquad (3)$$

**a. Stirling's approximation for $n!$** Use Equation (3) and the fact that $n! = n\Gamma(n)$ to show that

$$n! \approx \left(\frac{n}{e}\right)^n\sqrt{2n\pi} \qquad \textbf{(Stirling's approximation)}. \qquad (4)$$

As you will see if you do Exercise 64 in Section 11.1, Equation (4) leads to the approximation

$$\sqrt[n]{n!} \approx \frac{n}{e}. \qquad (5)$$

T **b.** Compare your calculator's value for $n!$ with the value given by Stirling's approximation for $n = 10, 20, 30, \ldots$, as far as your calculator can go.

T **c.** A refinement of Equation (2) gives

$$\Gamma(x) = \left(\frac{x}{e}\right)^x\sqrt{\frac{2\pi}{x}}\,e^{1/(12x)}(1+\epsilon(x)),$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

or

$$\Gamma(x) \approx \left(\frac{x}{e}\right)^x \sqrt{\frac{2\pi}{x}}\, e^{1/(12x)}$$

which tells us that

$$n! \approx \left(\frac{n}{e}\right)^n \sqrt{2n\pi}\, e^{1/(12n)}. \tag{6}$$

Compare the values given for 10! by your calculator, Stirling's approximation, and Equation (6).

# Chapter 8 Practice Exercises

## Integration Using Substitutions

Evaluate the integrals in Exercises 1–82. To transform each integral into a recognizable basic form, it may be necessary to use one or more of the techniques of algebraic substitution, completing the square, separating fractions, long division, or trigonometric substitution.

**1.** $\int x\sqrt{4x^2 - 9}\,dx$

**2.** $\int 6x\sqrt{3x^2 + 5}\,dx$

**3.** $\int x(2x + 1)^{1/2}\,dx$

**4.** $\int x(1 - x)^{-1/2}\,dx$

**5.** $\int \frac{x\,dx}{\sqrt{8x^2 + 1}}$

**6.** $\int \frac{x\,dx}{\sqrt{9 - 4x^2}}$

**7.** $\int \frac{y\,dy}{25 + y^2}$

**8.** $\int \frac{y^3\,dy}{4 + y^4}$

**9.** $\int \frac{t^3\,dt}{\sqrt{9 - 4t^4}}$

**10.** $\int \frac{2t\,dt}{t^4 + 1}$

**11.** $\int z^{2/3}(z^{5/3} + 1)^{2/3}\,dz$

**12.** $\int z^{-1/5}(1 + z^{4/5})^{-1/2}\,dz$

**13.** $\int \frac{\sin 2\theta\,d\theta}{(1 - \cos 2\theta)^2}$

**14.** $\int \frac{\cos\theta\,d\theta}{(1 + \sin\theta)^{1/2}}$

**15.** $\int \frac{\sin t}{3 + 4\cos t}\,dt$

**16.** $\int \frac{\cos 2t}{1 + \sin 2t}\,dt$

**17.** $\int \sin 2x\, e^{\cos 2x}\,dx$

**18.** $\int \sec x \tan x\, e^{\sec x}\,dx$

**19.** $\int e^\theta \sin(e^\theta)\cos^2(e^\theta)\,d\theta$

**20.** $\int e^\theta \sec^2(e^\theta)\,d\theta$

**21.** $\int 2^{x-1}\,dx$

**22.** $\int 5^{x\sqrt{2}}\,dx$

**23.** $\int \frac{dv}{v \ln v}$

**24.** $\int \frac{dv}{v(2 + \ln v)}$

**25.** $\int \frac{dx}{(x^2 + 1)(2 + \tan^{-1} x)}$

**26.** $\int \frac{\sin^{-1} x}{\sqrt{1 - x^2}}\,dx$

**27.** $\int \frac{2\,dx}{\sqrt{1 - 4x^2}}$

**28.** $\int \frac{dx}{\sqrt{49 - x^2}}$

**29.** $\int \frac{dt}{\sqrt{16 - 9t^2}}$

**30.** $\int \frac{dt}{\sqrt{9 - 4t^2}}$

**31.** $\int \frac{dt}{9 + t^2}$

**32.** $\int \frac{dt}{1 + 25t^2}$

**33.** $\int \frac{4\,dx}{5x\sqrt{25x^2 - 16}}$

**34.** $\int \frac{6\,dx}{x\sqrt{4x^2 - 9}}$

**35.** $\int \frac{dx}{\sqrt{4x - x^2}}$

**36.** $\int \frac{dx}{\sqrt{4x - x^2 - 3}}$

**37.** $\int \frac{dy}{y^2 - 4y + 8}$

**38.** $\int \frac{dt}{t^2 + 4t + 5}$

**39.** $\int \frac{dx}{(x - 1)\sqrt{x^2 - 2x}}$

**40.** $\int \frac{dv}{(v + 1)\sqrt{v^2 + 2v}}$

**41.** $\int \sin^2 x\,dx$

**42.** $\int \cos^2 3x\,dx$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**43.** $\int \sin^3 \frac{\theta}{2}\, d\theta$

**44.** $\int \sin^3 \theta \cos^2 \theta\, d\theta$

**45.** $\int \tan^3 2t\, dt$

**46.** $\int 6 \sec^4 t\, dt$

**47.** $\int \frac{dx}{2 \sin x \cos x}$

**48.** $\int \frac{2\, dx}{\cos^2 x - \sin^2 x}$

**49.** $\int_{\pi/4}^{\pi/2} \sqrt{\csc^2 y - 1}\, dy$

**50.** $\int_{\pi/4}^{3\pi/4} \sqrt{\cot^2 t + 1}\, dt$

**51.** $\int_0^{\pi} \sqrt{1 - \cos^2 2x}\, dx$

**52.** $\int_0^{2\pi} \sqrt{1 - \sin^2 \frac{x}{2}}\, dx$

**53.** $\int_{-\pi/2}^{\pi/2} \sqrt{1 - \cos 2t}\, dt$

**54.** $\int_{\pi}^{2\pi} \sqrt{1 + \cos 2t}\, dt$

**55.** $\int \frac{x^2}{x^2 + 4}\, dx$

**56.** $\int \frac{x^3}{9 + x^2}\, dx$

**57.** $\int \frac{4x^2 + 3}{2x - 1}\, dx$

**58.** $\int \frac{2x}{x - 4}\, dx$

**59.** $\int \frac{2y - 1}{y^2 + 4}\, dy$

**60.** $\int \frac{y + 4}{y^2 + 1}\, dy$

**61.** $\int \frac{t + 2}{\sqrt{4 - t^2}}\, dt$

**62.** $\int \frac{2t^2 + \sqrt{1 - t^2}}{t\sqrt{1 - t^2}}\, dt$

**63.** $\int \frac{\tan x\, dx}{\tan x + \sec x}$

**64.** $\int \frac{\cot x}{\cot x + \csc x}\, dx$

**65.** $\int \sec(5 - 3x)\, dx$

**66.** $\int x \csc(x^2 + 3)\, dx$

**67.** $\int \cot\left(\frac{x}{4}\right) dx$

**68.** $\int \tan(2x - 7)\, dx$

**69.** $\int x\sqrt{1 - x}\, dx$

**70.** $\int 3x\sqrt{2x + 1}\, dx$

**71.** $\int \sqrt{z^2 + 1}\, dz$

**72.** $\int (16 + z^2)^{-3/2}\, dz$

**73.** $\int \frac{dy}{\sqrt{25 + y^2}}$

**74.** $\int \frac{dy}{\sqrt{25 + 9y^2}}$

**75.** $\int \frac{dx}{x^2\sqrt{1 - x^2}}$

**76.** $\int \frac{x^3\, dx}{\sqrt{1 - x^2}}$

**77.** $\int \frac{x^2\, dx}{\sqrt{1 - x^2}}$

**78.** $\int \sqrt{4 - x^2}\, dx$

**79.** $\int \frac{dx}{\sqrt{x^2 - 9}}$

**80.** $\int \frac{12\, dx}{(x^2 - 1)^{3/2}}$

**81.** $\int \frac{\sqrt{w^2 - 1}}{w}\, dw$

**82.** $\int \frac{\sqrt{z^2 - 16}}{z}\, dz$

## Integration by Parts

Evaluate the integrals in Exercises 83–90 using integration by parts.

**83.** $\int \ln(x + 1)\, dx$

**84.** $\int x^2 \ln x\, dx$

**85.** $\int \tan^{-1} 3x\, dx$

**86.** $\int \cos^{-1}\left(\frac{x}{2}\right) dx$

**87.** $\int (x + 1)^2 e^x\, dx$

**88.** $\int x^2 \sin(1 - x)\, dx$

**89.** $\int e^x \cos 2x\, dx$

**90.** $\int e^{-2x} \sin 3x\, dx$

## Partial Fractions

Evaluate the integrals in Exercises 91–110. It may be necessary to use a substitution first.

**91.** $\int \frac{x\, dx}{x^2 - 3x + 2}$

**92.** $\int \frac{x\, dx}{x^2 + 4x + 3}$

**93.** $\int \frac{dx}{x(x + 1)^2}$

**94.** $\int \frac{x + 1}{x^2(x - 1)}\, dx$

**95.** $\int \frac{\sin\theta\, d\theta}{\cos^2\theta + \cos\theta - 2}$

**96.** $\int \frac{\cos\theta\, d\theta}{\sin^2\theta + \sin\theta - 6}$

**97.** $\int \frac{3x^2 + 4x + 4}{x^3 + x}\, dx$

**98.** $\int \frac{4x\, dx}{x^3 + 4x}$

**99.** $\int \frac{v + 3}{2v^3 - 8v}\, dv$

**100.** $\int \frac{(3v - 7)\, dv}{(v - 1)(v - 2)(v - 3)}$

**101.** $\int \frac{dt}{t^4 + 4t^2 + 3}$

**102.** $\int \frac{t\, dt}{t^4 - t^2 - 2}$

**103.** $\int \frac{x^3 + x^2}{x^2 + x - 2}\, dx$

**104.** $\int \frac{x^3 + 1}{x^3 - x}\, dx$

**105.** $\int \frac{x^3 + 4x^2}{x^2 + 4x + 3}\, dx$

**106.** $\int \frac{2x^3 + x^2 - 21x + 24}{x^2 + 2x - 8}\, dx$

**107.** $\int \frac{dx}{x\left(3\sqrt{x + 1}\right)}$

**108.** $\int \frac{dx}{x\left(1 + \sqrt[3]{x}\right)}$

**109.** $\int \frac{ds}{e^s - 1}$

**110.** $\int \frac{ds}{\sqrt{e^s + 1}}$

## Trigonometric Substitutions

Evaluate the integrals in Exercises 111–114 **(a)** without using a trigonometric substitution, **(b)** using a trigonometric substitution.

**111.** $\int \frac{y\, dy}{\sqrt{16 - y^2}}$

**112.** $\int \frac{x\, dx}{\sqrt{4 + x^2}}$

**113.** $\int \frac{x\, dx}{4 - x^2}$

**114.** $\int \frac{t\, dt}{\sqrt{4t^2 - 1}}$

## Quadratic Terms

Evaluate the integrals in Exercises 115–118.

**115.** $\int \frac{x\, dx}{9 - x^2}$

**116.** $\int \frac{dx}{x(9 - x^2)}$

**117.** $\int \frac{dx}{9 - x^2}$

**118.** $\int \frac{dx}{\sqrt{9 - x^2}}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Trigonometric Integrals

Evaluate the integrals in Exercises 119–126.

**119.** $\int \sin^3 x \cos^4 x \, dx$

**120.** $\int \cos^5 x \sin^5 x \, dx$

**121.** $\int \tan^4 x \sec^2 x \, dx$

**122.** $\int \tan^3 x \sec^3 x \, dx$

**123.** $\int \sin 5\theta \cos 6\theta \, d\theta$

**124.** $\int \cos 3\theta \cos 3\theta \, d\theta$

**125.** $\int \sqrt{1 + \cos(t/2)}\, dt$

**126.** $\int e^t \sqrt{\tan^2 e^t + 1}\, dt$

## Numerical Integration

**127.** According to the error-bound formula for Simpson's Rule, how many subintervals should you use to be sure of estimating the value of

$$\ln 3 = \int_1^3 \frac{1}{x}\, dx$$

by Simpson's Rule with an error of no more than $10^{-4}$ in absolute value? (Remember that for Simpson's Rule, the number of subintervals has to be even.)

**128.** A brief calculation shows that if $0 \le x \le 1$, then the second derivative of $f(x) = \sqrt{1 + x^4}$ lies between 0 and 8. Based on this, about how many subdivisions would you need to estimate the integral of $f$ from 0 to 1 with an error no greater than $10^{-3}$ in absolute value using the Trapezoidal Rule?

**129.** A direct calculation shows that

$$\int_0^{\pi} 2 \sin^2 x \, dx = \pi.$$

How close do you come to this value by using the Trapezoidal Rule with $n = 6$? Simpson's Rule with $n = 6$? Try them and find out.

**130.** You are planning to use Simpson's Rule to estimate the value of the integral

$$\int_1^2 f(x)\, dx$$

with an error magnitude less than $10^{-5}$. You have determined that $|f^{(4)}(x)| \le 3$ throughout the interval of integration. How many subintervals should you use to assure the required accuracy? (Remember that for Simpson's Rule the number has to be even.)

**131. Mean temperature** Compute the average value of the temperature function

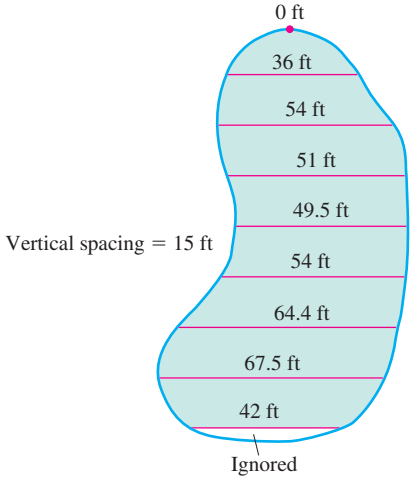
$$f(x) = 37 \sin\left(\frac{2\pi}{365}(x - 101)\right) + 25$$

for a 365-day year. This is one way to estimate the annual mean air temperature in Fairbanks, Alaska. The National Weather Service's official figure, a numerical average of the daily normal mean air temperatures for the year, is 25.7°F, which is slightly higher than the average value of $f(x)$.

**132. Heat capacity of a gas** Heat capacity $C_v$ is the amount of heat required to raise the temperature of a given mass of gas with constant volume by 1°C, measured in units of cal/deg-mol (calories per degree gram molecular weight). The heat capacity of oxygen depends on its temperature $T$ and satisfies the formula

$$C_v = 8.27 + 10^{-5}(26T - 1.87T^2).$$

Find the average value of $C_v$ for $20° \le T \le 675°$C and the temperature at which it is attained.



**133. Fuel efficiency** An automobile computer gives a digital readout of fuel consumption in gallons per hour. During a trip, a passenger recorded the fuel consumption every 5 min for a full hour of travel.

| Time | Gal/h | Time | Gal/h |
|---|---|---|---|
| 0 | 2.5 | 35 | 2.5 |
| 5 | 2.4 | 40 | 2.4 |
| 10 | 2.3 | 45 | 2.3 |
| 15 | 2.4 | 50 | 2.4 |
| 20 | 2.4 | 55 | 2.4 |
| 25 | 2.5 | 60 | 2.3 |
| 30 | 2.6 | | |

**a.** Use the Trapezoidal Rule to approximate the total fuel consumption during the hour.

**b.** If the automobile covered 60 mi in the hour, what was its fuel efficiency (in miles per gallon) for that portion of the trip?

**134. A new parking lot** To meet the demand for parking, your town has allocated the area shown here. As the town engineer, you have been asked by the town council to find out if the lot can be built for $11,000. The cost to clear the land will be $0.10 a square foot, and the lot will cost $2.00 a square foot to pave. Use Simpson's Rule to find out if the job can be done for $11,000.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Improper Integrals

Evaluate the improper integrals in Exercises 135–144.

**135.** $\int_0^3 \frac{dx}{\sqrt{9-x^2}}$

**136.** $\int_0^1 \ln x\, dx$

**137.** $\int_{-1}^1 \frac{dy}{y^{2/3}}$

**138.** $\int_{-2}^0 \frac{d\theta}{(\theta+1)^{3/5}}$

**139.** $\int_3^\infty \frac{2\,du}{u^2-2u}$

**140.** $\int_1^\infty \frac{3v-1}{4v^3-v^2}\,dv$

**141.** $\int_0^\infty x^2 e^{-x}\,dx$

**142.** $\int_{-\infty}^0 xe^{3x}\,dx$

**143.** $\int_{-\infty}^\infty \frac{dx}{4x^2+9}$

**144.** $\int_{-\infty}^\infty \frac{4dx}{x^2+16}$

## Convergence or Divergence

Which of the improper integrals in Exercises 145–150 converge and which diverge?

**145.** $\int_6^\infty \frac{d\theta}{\sqrt{\theta^2+1}}$

**146.** $\int_0^\infty e^{-u}\cos u\, du$

**147.** $\int_1^\infty \frac{\ln z}{z}\,dz$

**148.** $\int_1^\infty \frac{e^{-t}}{\sqrt{t}}\,dt$

**149.** $\int_{-\infty}^\infty \frac{2\,dx}{e^x+e^{-x}}$

**150.** $\int_{-\infty}^\infty \frac{dx}{x^2(1+e^x)}$

## Assorted Integrations

Evaluate the integrals in Exercises 151–218. The integrals are listed in random order.

**151.** $\int \frac{x\,dx}{1+\sqrt{x}}$

**152.** $\int \frac{x^3+2}{4-x^2}\,dx$

**153.** $\int \frac{dx}{x(x^2+1)^2}$

**154.** $\int \frac{\cos\sqrt{x}}{\sqrt{x}}\,dx$

**155.** $\int \frac{dx}{\sqrt{-2x-x^2}}$

**156.** $\int \frac{(t-1)\,dt}{\sqrt{t^2-2t}}$

**157.** $\int \frac{du}{\sqrt{1+u^2}}$

**158.** $\int e^t \cos e^t\,dt$

**159.** $\int \frac{2-\cos x+\sin x}{\sin^2 x}\,dx$

**160.** $\int \frac{\sin^2\theta}{\cos^2\theta}\,d\theta$

**161.** $\int \frac{9\,dv}{81-v^4}$

**162.** $\int \frac{\cos x\,dx}{1+\sin^2 x}$

**163.** $\int \theta\cos(2\theta+1)\,d\theta$

**164.** $\int_2^\infty \frac{dx}{(x-1)^2}$

**165.** $\int \frac{x^3\,dx}{x^2-2x+1}$

**166.** $\int \frac{d\theta}{\sqrt{1+\sqrt{\theta}}}$

**167.** $\int \frac{2\sin\sqrt{x}\,dx}{\sqrt{x}\sec\sqrt{x}}$

**168.** $\int \frac{x^5\,dx}{x^4-16}$

**169.** $\int \frac{dy}{\sin y\cos y}$

**170.** $\int \frac{d\theta}{\theta^2-2\theta+4}$

**171.** $\int \frac{\tan x}{\cos^2 x}\,dx$

**172.** $\int \frac{dr}{(r+1)\sqrt{r^2+2r}}$

**173.** $\int \frac{(r+2)\,dr}{\sqrt{-r^2-4r}}$

**174.** $\int \frac{y\,dy}{4+y^4}$

**175.** $\int \frac{\sin 2\theta\,d\theta}{(1+\cos 2\theta)^2}$

**176.** $\int \frac{dx}{(x^2-1)^2}$

**177.** $\int_{\pi/4}^{\pi/2} \sqrt{1+\cos 4x}\,dx$

**178.** $\int (15)^{2x+1}\,dx$

**179.** $\int \frac{x\,dx}{\sqrt{2-x}}$

**180.** $\int \frac{\sqrt{1-v^2}}{v^2}\,dv$

**181.** $\int \frac{dy}{y^2-2y+2}$

**182.** $\int \ln\sqrt{x-1}\,dx$

**183.** $\int \theta^2\tan(\theta^3)\,d\theta$

**184.** $\int \frac{x\,dx}{\sqrt{8-2x^2-x^4}}$

**185.** $\int \frac{z+1}{z^2(z^2+4)}\,dz$

**186.** $\int x^3 e^{(x^2)}\,dx$

**187.** $\int \frac{t\,dt}{\sqrt{9-4t^2}}$

**188.** $\int_0^{\pi/10} \sqrt{1+\cos 5\theta}\,d\theta$

**189.** $\int \frac{\cot\theta\,d\theta}{1+\sin^2\theta}$

**190.** $\int \frac{\tan^{-1}x}{x^2}\,dx$

**191.** $\int \frac{\tan\sqrt{y}}{2\sqrt{y}}\,dy$

**192.** $\int \frac{e^t\,dt}{e^{2t}+3e^t+2}$

**193.** $\int \frac{\theta^2 d\theta}{4-\theta^2}$

**194.** $\int \frac{1-\cos 2x}{1+\cos 2x}\,dx$

**195.** $\int \frac{\cos(\sin^{-1}x)}{\sqrt{1-x^2}}\,dx$

**196.** $\int \frac{\cos x\,dx}{\sin^3 x-\sin x}$

**197.** $\int \sin\frac{x}{2}\cos\frac{x}{2}\,dx$

**198.** $\int \frac{x^2-x+2}{(x^2+2)^2}\,dx$

**199.** $\int \frac{e^t\,dt}{1+e^t}$

**200.** $\int \tan^3 t\,dt$

**201.** $\int_1^\infty \frac{\ln y}{y^3}\,dy$

**202.** $\int \frac{3+\sec^2 x+\sin x}{\tan x}\,dx$

**203.** $\int \frac{\cot v\,dv}{\ln\sin v}$

**204.** $\int \frac{dx}{(2x-1)\sqrt{x^2-x}}$

**205.** $\int e^{\ln\sqrt{x}}\,dx$

**206.** $\int e^\theta\sqrt{3+4e^\theta}\,d\theta$

**207.** $\int \frac{\sin 5t\,dt}{1+(\cos 5t)^2}$

**208.** $\int \frac{dv}{\sqrt{e^{2v}-1}}$

**209.** $\int (27)^{3\theta+1}d\theta$

**210.** $\int x^5\sin x\,dx$

**211.** $\int \frac{dr}{1+\sqrt{r}}$

**212.** $\int \frac{4x^3-20x}{x^4-10x^2+9}\,dx$

**213.** $\int \frac{8\,dy}{y^3(y+2)}$

**214.** $\int \frac{(t+1)\,dt}{(t^2+2t)^{2/3}}$

**215.** $\int \frac{8\,dm}{m\sqrt{49m^2-4}}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**216.** $\displaystyle\int \frac{dt}{t(1+\ln t)\sqrt{(\ln t)(2+\ln t)}}$

**217.** $\displaystyle\int_0^1 3(x-1)^2\left(\int_0^x \sqrt{1+(t-1)^4}\,dt\right)dx$

**218.** $\displaystyle\int_2^\infty \frac{4v^3+v-1}{v^2(v-1)(v^2+1)}\,dv$

**219.** Suppose for a certain function $f$ it is known that

$$f'(x)=\frac{\cos x}{x},\quad f(\pi\ 2)=a,\quad \text{and}\quad f(3\pi\ 2)=b.$$

Use integration by parts to evaluate

$$\int_{\pi/2}^{3\pi/2} f(x)\,dx.$$

**220.** Find a positive number $a$ satisfying

$$\int_0^a \frac{dx}{1+x^2}=\int_a^\infty \frac{dx}{1+x^2}.$$

# Chapter 8 Questions to Guide Your Review

1. What basic integration formulas do you know?
2. What procedures do you know for matching integrals to basic formulas?
3. What is the formula for integration by parts? Where does it come from? Why might you want to use it?
4. When applying the formula for integration by parts, how do you choose the $u$ and $dv$? How can you apply integration by parts to an integral of the form $\int f(x)\,dx$?
5. What is tabular integration? Give an example.
6. What is the goal of the method of partial fractions?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**7.** When the degree of a polynomial $f(x)$ is less than the degree of a polynomial $g(x)$, how do you write $f(x)/g(x)$ as a sum of partial fractions if $g(x)$

**a.** is a product of distinct linear factors?

**b.** consists of a repeated linear factor?

**c.** contains an irreducible quadratic factor?

What do you do if the degree of $f$ is *not* less than the degree of $g$?

**8.** If an integrand is a product of the form $\sin^n x \cos^m x$, where $m$ and $n$ are nonnegative integers, how do you evaluate the integral? Give a specific example of each case.

**9.** What substitutions are made to evaluate integrals of $\sin mx \sin nx$, $\sin mx \cos nx$, and $\cos mx \cos nx$? Give an example of each case.

**10.** What substitutions are sometimes used to transform integrals involving $\sqrt{a^2 - x^2}$, $\sqrt{a^2 + x^2}$, and $\sqrt{x^2 - a^2}$ into integrals that can be evaluated directly? Give an example of each case.

**11.** What restrictions can you place on the variables involved in the three basic trigonometric substitutions to make sure the substitutions are reversible (have inverses)?

**12.** How are integral tables typically used? What do you do if a particular integral you want to evaluate is not listed in the table?

**13.** What is a reduction formula? How are reduction formulas typically derived? How are reduction formulas used? Give an example.

**14.** You are collaborating to produce a short "how-to" manual for numerical integration, and you are writing about the Trapezoidal Rule. **(a)** What would you say about the rule itself and how to use it? How to achieve accuracy? **(b)** What would you say if you were writing about Simpson's Rule instead?

**15.** How would you compare the relative merits of Simpson's Rule and the Trapezoidal Rule?

**16.** What is an improper integral of Type I? Type II? How are the values of various types of improper integrals defined? Give examples.

**17.** What tests are available for determining the convergence and divergence of improper integrals that cannot be evaluated directly? Give examples of their use.

Chapter

# 9 Further Applications of Integration

Historical Biography

Carl Friedrich Gauss
(1777–1855)

**OVERVIEW** In Section 4.8 we introduced differential equations of the form $dy/dx = f(x)$, where $y$ is an unknown function being differentiated. For a continuous function $f$, we found the general solution $y(x)$ by integration: $y(x) = \int f(x)\,dx$. (Remember that the indefinite integral represents *all* the antiderivatives of $f$, so it contains an arbitrary constant $+C$ which must be shown once an antiderivative is found.) Many applications in the sciences, engineering, and economics involve a model formulated by even more general differential equations. In Section 7.5, for example, we found that exponential growth and decay is modeled by a differential equation of the form $dy/dx = ky$, for some constant $k \neq 0$. We have not yet considered differential equations such as $dy/dx = y - x$, yet such equations arise frequently in applications. In this chapter, we study several differential equations having the form $dy/dx = f(x, y)$, where $f$ is a function of *both* the independent and dependent variables. We use the theory of indefinite integration to solve these differential equations, and investigate analytic, graphical, and numerical solution methods.

## 9.1 Slope Fields and Separable Differential Equations

Historical Biography

Jules Henri Poincaré
(1854–1912)

In calculating derivatives by implicit differentiation (Section 3.6), we found that the expression for the derivative $dy/dx$ often contained both variables $x$ and $y$, not just the independent variable $x$. We begin this section by considering the general differential equation $dy/dx = f(x, y)$ and what is meant by a solution to it. Then we investigate equations having a special form for which the function $f$ can be expressed as a product of a function of $x$ and a function of $y$.

### General First-Order Differential Equations and Solutions

A **first-order differential equation** is an equation

$$\frac{dy}{dx} = f(x, y) \tag{1}$$

in which $f(x, y)$ is a function of two variables defined on a region in the $xy$-plane. The equation is of *first-order* because it involves only the first derivative $dy/dx$ (and not higher-order derivatives). We point out that the equations

$$y' = f(x, y) \quad \text{and} \quad \frac{d}{dx}y = f(x, y),$$

are equivalent to Equation (1) and all three forms will be used interchangeably in the text.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

A **solution** of Equation (1) is a differentiable function $y = y(x)$ defined on an interval $I$ of $x$-values (perhaps infinite) such that

$$\frac{d}{dx}y(x) = f(x, y(x))$$

on that interval. That is, when $y(x)$ and its derivative $y'(x)$ are substituted into Equation (1), the resulting equation is true for all $x$ over the interval $I$. The **general solution** to a first-order differential equation is a solution that contains all possible solutions. The general solution always contains an arbitrary constant, but having this property doesn't mean a solution is the general solution. That is, a solution may contain an arbitrary constant without being the general solution. Establishing that a solution *is* the general solution may require deeper results from the theory of differential equations and is best studied in a more advanced course.

**EXAMPLE 1** Verifying Solution Functions

Show that every member of the family of functions

$$y = \frac{C}{x} + 2$$

is a solution of the first-order differential equation

$$\frac{dy}{dx} = \frac{1}{x}(2 - y)$$

on the interval $(0, \infty)$, where $C$ is any constant.

**Solution** Differentiating $y = C/x + 2$ gives

$$\frac{dy}{dx} = C\frac{d}{dx}\left(\frac{1}{x}\right) + 0 = -\frac{C}{x^2}.$$

Thus we need only verify that for all $x \in (0, \infty)$,

$$-\frac{C}{x^2} = \frac{1}{x}\left[2 - \left(\frac{C}{x} + 2\right)\right].$$

This last equation follows immediately by expanding the expression on the right side:

$$\frac{1}{x}\left[2 - \left(\frac{C}{x} + 2\right)\right] = \frac{1}{x}\left(-\frac{C}{x}\right) = -\frac{C}{x^2}.$$

Therefore, for every value of $C$, the function $y = C/x + 2$ is a solution of the differential equation. ■

As was the case in finding antiderivatives, we often need a *particular* rather than the general solution to a first-order differential equation $y' = f(x, y)$. The **particular solution** satisfying the initial condition $y(x_0) = y_0$ is the solution $y = y(x)$ whose value is $y_0$ when $x = x_0$. Thus the graph of the particular solution passes through the point $(x_0, y_0)$ in the $xy$-plane. A **first-order initial value problem** is a differential equation $y' = f(x, y)$ whose solution must satisfy an initial condition $y(x_0) = y_0$.

**EXAMPLE 2** Verifying That a Function Is a Particular Solution

Show that the function

$$y = (x + 1) - \frac{1}{3}e^x$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

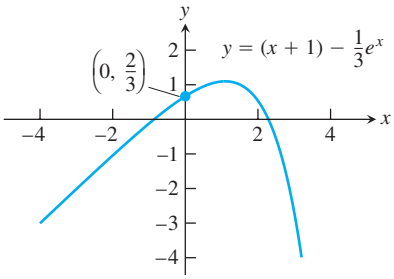

**FIGURE 9.1** Graph of the solution $y = (x + 1) - \frac{1}{3}e^x$ to the differential equation $dy/dx = y - x$, with initial condition $y(0) = \frac{2}{3}$ (Example 2).

is a solution to the first-order initial value problem

$$\frac{dy}{dx} = y - x, \qquad y(0) = \frac{2}{3}.$$

**Solution** The equation

$$\frac{dy}{dx} = y - x$$

is a first-order differential equation with $f(x, y) = y - x$.

*On the left:*

$$\frac{dy}{dx} = \frac{d}{dx}\left(x + 1 - \frac{1}{3}e^x\right) = 1 - \frac{1}{3}e^x.$$

*On the right:*

$$y - x = (x + 1) - \frac{1}{3}e^x - x = 1 - \frac{1}{3}e^x.$$

The function satisfies the initial condition because

$$y(0) = \left[(x + 1) - \frac{1}{3}e^x\right]_{x=0} = 1 - \frac{1}{3} = \frac{2}{3}.$$

The graph of the function is shown in Figure 9.1. ■

## Slope Fields: Viewing Solution Curves

Each time we specify an initial condition $y(x_0) = y_0$ for the solution of a differential equation $y' = f(x, y)$, the **solution curve** (graph of the solution) is required to pass through the point $(x_0, y_0)$ and to have slope $f(x_0, y_0)$ there. We can picture these slopes graphically by drawing short line segments of slope $f(x, y)$ at selected points $(x, y)$ in the region of the $xy$-plane that constitutes the domain of $f$. Each segment has the same slope as the solution curve through $(x, y)$ and so is tangent to the curve there. The resulting picture is called a **slope field** (or **direction field**) and gives a visualization of the general shape of the solution curves. Figure 9.2a shows a slope field, with a particular solution sketched into it in Figure 9.2b. We see how these line segments indicate the direction the solution curve takes at each point it passes through.

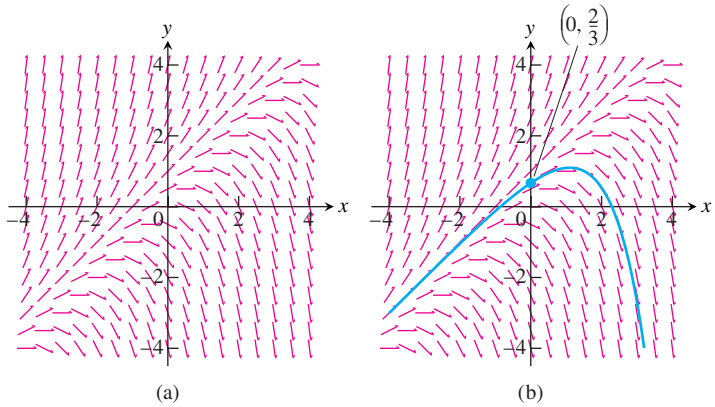

**FIGURE 9.2** (a) Slope field for $\frac{dy}{dx} = y - x$. (b) The particular solution curve through the point $\left(0, \frac{2}{3}\right)$ (Example 2).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Figure 9.3 shows three slope fields and we see how the solution curves behave by following the tangent line segments in these fields.

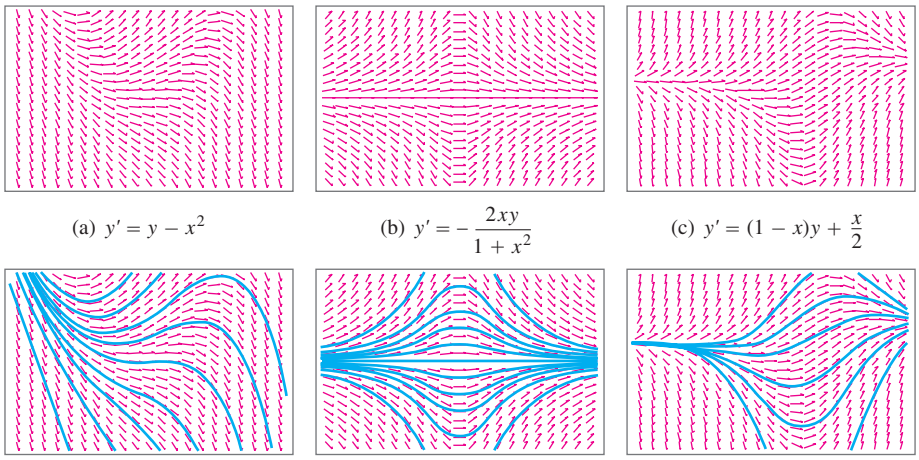

**FIGURE 9.3** Slope fields (top row) and selected solution curves (bottom row). In computer renditions, slope segments are sometimes portrayed with arrows, as they are here. This is not to be taken as an indication that slopes have directions, however, for they do not.

Constructing a slope field with pencil and paper can be quite tedious. All our examples were generated by a computer.

While general differential equations are difficult to solve, many important equations that arise in science and applications have special forms that make them solvable by special techniques. One such class is the separable equations.

## Separable Equations

The equation $y' = f(x, y)$ is **separable** if $f$ can be expressed as a product of a function of $x$ and a function of $y$. The differential equation then has the form

$$\frac{dy}{dx} = g(x)H(y).$$

When we rewrite this equation in the form

$$\frac{dy}{dx} = \frac{g(x)}{h(y)}, \qquad H(y) = \frac{1}{h(y)}$$

its differential form allows us to collect all $y$ terms with $dy$ and all $x$ terms with $dx$:

$$h(y)\,dy = g(x)\,dx.$$

Now we simply integrate both sides of this equation:

$$\int h(y)\,dy = \int g(x)\,dx. \tag{2}$$

After completing the integrations we obtain the solution $y$ defined implicitly as a function of $x$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The justification that we can simply integrate both sides in Equation (2) is based on the Substitution Rule (Section 5.5):

$$\begin{aligned}\int h(y)\,dy &= \int h(y(x))\frac{dy}{dx}\,dx \\ &= \int h(y(x))\frac{g(x)}{h(y(x))}\,dx \qquad \frac{dy}{dx} = \frac{g(x)}{h(y)} \\ &= \int g(x)\,dx.\end{aligned}$$

**EXAMPLE 3** Solving a Separable Equation

Solve the differential equation

$$\frac{dy}{dx} = (1 + y^2)e^x.$$

**Solution** Since $1 + y^2$ is never zero, we can solve the equation by separating the variables.

$$\begin{aligned}\frac{dy}{dx} &= (1 + y^2)e^x \\ dy &= (1 + y^2)e^x\,dx \qquad \text{Treat } dy/dx \text{ as a quotient of differentials and multiply both sides by } dx. \\ \frac{dy}{1 + y^2} &= e^x\,dx \qquad \text{Divide by } (1 + y^2). \\ \int \frac{dy}{1 + y^2} &= \int e^x\,dx \qquad \text{Integrate both sides.} \\ \tan^{-1} y &= e^x + C \qquad C \text{ represents the combined constants of integration.}\end{aligned}$$

The equation $\tan^{-1} y = e^x + C$ gives $y$ as an implicit function of $x$. When $-\pi/2 < e^x + C < \pi/2$, we can solve for $y$ as an explicit function of $x$ by taking the tangent of both sides:

$$\begin{aligned}\tan(\tan^{-1} y) &= \tan(e^x + C) \\ y &= \tan(e^x + C).\end{aligned}$$

■

**EXAMPLE 4** Solve the equation

$$(x + 1)\frac{dy}{dx} = x(y^2 + 1).$$

**Solution** We change to differential form, separate the variables, and integrate:

$$\begin{aligned}(x + 1)\,dy &= x(y^2 + 1)\,dx \\ \frac{dy}{y^2 + 1} &= \frac{x\,dx}{x + 1} \qquad x \neq -1 \\ \int \frac{dy}{1 + y^2} &= \int \left(1 - \frac{1}{x + 1}\right)dx \\ \tan^{-1} y &= x - \ln|x + 1| + C.\end{aligned}$$

■

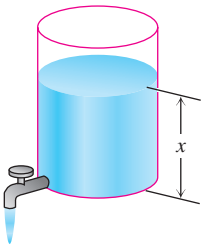

**FIGURE 9.4** The rate at which water runs out is $k\sqrt{x}$, where $k$ is a positive constant. In Example 5, $k = 1/2$ and $x$ is measured in feet.

The initial value problem

$$\frac{dy}{dt} = ky, \qquad y(0) = y_0$$

involves a separable differential equation, and the solution $y = y_0 e^{kt}$ gives the Law of Exponential Change (Section 7.5). We found this initial value problem to be a model for such phenomena as population growth, radioactive decay, and heat transfer. We now present an application involving a different separable first-order equation.

## Torricelli's Law

Torricelli's Law says that if you drain a tank like the one in Figure 9.4, the rate at which the water runs out is a constant times the square root of the water's depth $x$. The constant depends on the size of the drainage hole. In Example 5, we assume that the constant is $1/2$.

### EXAMPLE 5 Draining a Tank

A right circular cylindrical tank with radius 5 ft and height 16 ft that was initially full of water is being drained at the rate of $0.5\sqrt{x}$ ft$^3$/min. Find a formula for the depth and the amount of water in the tank at any time $t$. How long will it take to empty the tank?

HISTORICAL BIOGRAPHY

Evangelista Torricelli
(1608–1647)

**Solution** The volume of a right circular cylinder with radius $r$ and height $h$ is $V = \pi r^2 h$, so the volume of water in the tank (Figure 9.4) is

$$V = \pi r^2 h = \pi(5)^2 x = 25\pi x.$$

Diffentiation leads to

$$\frac{dV}{dt} = 25\pi \frac{dx}{dt} \qquad \text{Negative because } V \text{ is decreasing and } dx/dt < 0$$

$$-0.5\sqrt{x} = 25\pi \frac{dx}{dt} \qquad \text{Torricelli's Law}$$

Thus we have the initial value problem

$$\frac{dx}{dt} = -\frac{\sqrt{x}}{50\pi},$$

$$x(0) = 16 \qquad \text{The water is 16 ft deep when } t = 0.$$

We solve the differential equation by separating the variables.

$$x^{-1/2}\,dx = -\frac{1}{50\pi}\,dt$$

$$\int x^{-1/2}\,dx = -\int \frac{1}{50\pi}\,dt \qquad \text{Integrate both sides.}$$

$$2x^{1/2} = -\frac{1}{50\pi}\,t + C \qquad \text{Constants combined}$$

The initial condition $x(0) = 16$ determines the value of $C$.

$$2(16)^{1/2} = -\frac{1}{50\pi}(0) + C$$

$$C = 8$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

With $C = 8$, we have

$$2x^{1/2} = -\frac{1}{50\pi}t + 8 \qquad \text{or} \qquad x^{1/2} = 4 - \frac{t}{100\pi}.$$

The formulas we seek are

$$x = \left(4 - \frac{t}{100\pi}\right)^2 \qquad \text{and} \qquad V = 25\pi x = 25\pi\left(4 - \frac{t}{100\pi}\right)^2.$$

At any time $t$, the water in the tank is $(4 - t/(100\pi))^2$ ft deep and the amount of water is $25\pi(4 - t/(100\pi))^2$ ft$^3$. At $t = 0$, we have $x = 16$ ft and $V = 400\pi$ ft$^3$, as required. The tank will empty $(V = 0)$ in $t = 400\pi$ minutes, which is about 21 hours. ■

# EXERCISES 9.1

## Verifying Solutions

In Exercises 1 and 2, show that each function $y = f(x)$ is a solution of the accompanying differential equation.

**1.** $2y' + 3y = e^{-x}$

**a.** $y = e^{-x}$ **b.** $y = e^{-x} + e^{-(3/2)x}$

**c.** $y = e^{-x} + Ce^{-(3/2)x}$

**2.** $y' = y^2$

**a.** $y = -\dfrac{1}{x}$ **b.** $y = -\dfrac{1}{x+3}$ **c.** $y = -\dfrac{1}{x+C}$

In Exercises 3 and 4, show that the function $y = f(x)$ is a solution of the given differential equation.

**3.** $y = \dfrac{1}{x}\displaystyle\int_1^x \frac{e^t}{t}\,dt, \quad x^2y' + xy = e^x$

**4.** $y = \dfrac{1}{\sqrt{1+x^4}}\displaystyle\int_1^x \sqrt{1+t^4}\,dt, \quad y' + \dfrac{2x^3}{1+x^4}y = 1$

In Exercises 5–8, show that each function is a solution of the given initial value problem.

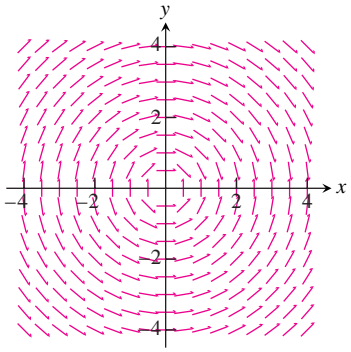
| Differential equation | Initial condition | Solution candidate |
|---|---|---|
| **5.** $y' + y = \dfrac{2}{1+4e^{2x}}$ | $y(-\ln 2) = \dfrac{\pi}{2}$ | $y = e^{-x}\tan^{-1}(2e^x)$ |
| **6.** $y' = e^{-x^2} - 2xy$ | $y(2) = 0$ | $y = (x-2)e^{-x^2}$ |
| **7.** $xy' + y = -\sin x$, $x > 0$ | $y\left(\dfrac{\pi}{2}\right) = 0$ | $y = \dfrac{\cos x}{x}$ |
| **8.** $x^2y' = xy - y^2$, $x > 1$ | $y(e) = e$ | $y = \dfrac{x}{\ln x}$ |

## Separable Equations

Solve the differential equation in Exercises 9–18.

**9.** $2\sqrt{xy}\,\dfrac{dy}{dx} = 1, \quad x, y > 0$ **10.** $\dfrac{dy}{dx} = x^2\sqrt{y}, \quad y > 0$

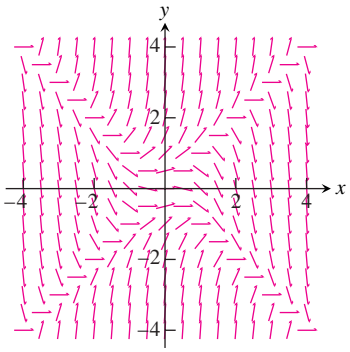
**11.** $\dfrac{dy}{dx} = e^{x-y}$ **12.** $\dfrac{dy}{dx} = 3x^2\,e^{-y}$



**13.** $\dfrac{dy}{dx} = \sqrt{y}\cos^2\sqrt{y}$ **14.** $\sqrt{2xy}\,\dfrac{dy}{dx} = 1$

**15.** $\sqrt{x}\,\dfrac{dy}{dx} = e^{y+\sqrt{x}}, \quad x > 0$ **16.** $(\sec x)\,\dfrac{dy}{dx} = e^{y+\sin x}$

**17.** $\dfrac{dy}{dx} = 2x\sqrt{1-y^2}, \quad -1 < y < 1$



**18.** $\dfrac{dy}{dx} = \dfrac{e^{2x-y}}{e^{x+y}}$

In Exercises 19–22, match the differential equations with their slope fields, graphed here.

In Exercises 31 and 32, obtain a slope field and graph the particular solution over the specified interval. Use your CAS DE solver to find the general solution of the differential equation.

**31. A logistic equation** $y' = y(2 - y), \quad y(0) = 1/2; \quad 0 \le x \le 4, \quad 0 \le y \le 3$

**32.** $y' = (\sin x)(\sin y), \quad y(0) = 2; \quad -6 \le x \le 6, \quad -6 \le y \le 6$

Exercises 33 and 34 have no explicit solution in terms of elementary functions. Use a CAS to explore graphically each of the differential equations.

**33.** $y' = \cos(2x - y), \quad y(0) = 2; \quad 0 \le x \le 5, \quad 0 \le y \le 5;$ $y(2)$

**34. A Gompertz equation** $y' = y(1/2 - \ln y), \quad y(0) = 1/3; \quad 0 \le x \le 4, \quad 0 \le y \le 3; \quad y(3)$

**35.** Use a CAS to find the solutions of $y' + y = f(x)$ subject to the initial condition $y(0) = 0$, if $f(x)$ is

**a.** $2x$ **b.** $\sin 2x$ **c.** $3e^{x/2}$ **d.** $2e^{-x/2}\cos 2x$.

Graph all four solutions over the interval $-2 \le x \le 6$ to compare the results.

**36. a.** Use a CAS to plot the slope field of the differential equation

$$y' = \frac{3x^2 + 4x + 2}{2(y - 1)}$$

over the region $-3 \le x \le 3$ and $-3 \le y \le 3$.

**b.** Separate the variables and use a CAS integrator to find the general solution in implicit form.

**c.** Using a CAS implicit function grapher, plot solution curves for the arbitrary constant values $C = -6, -4, -2, 0, 2, 4, 6$.

**d.** Find and graph the solution that satisfies the initial condition $y(0) = -1$.

# 9.2 First-Order Linear Differential Equations

The exponential growth/decay equation $dy/dx = ky$ (Section 7.5) is a separable differential equation. It is also a special case of a differential equation having a *linear form*. Linear differential equations model a number of real-world phenomena, including electrical circuits and chemical mixture problems.

A first-order **linear** differential equation is one that can be written in the form

$$\frac{dy}{dx} + P(x)y = Q(x), \tag{1}$$

where $P$ and $Q$ are continuous functions of $x$. Equation (1) is the linear equation's **standard form**.

Since the exponential growth/decay equation can be put in the standard form

$$\frac{dy}{dx} - ky = 0,$$

we see it is a linear equation with $P(x) = -k$ and $Q(x) = 0$. Equation (1) is *linear* (in $y$) because $y$ and its derivative $dy/dx$ occur only to the first power, are not multiplied together, nor do they appear as the argument of a function (such as $\sin y$, $e^y$, or $\sqrt{dy/dx}$).

**EXAMPLE 1** Finding the Standard Form

Put the following equation in standard form:

$$x\frac{dy}{dx} = x^2 + 3y, \qquad x > 0.$$

**Solution**

$$x\frac{dy}{dx} = x^2 + 3y$$

$$\frac{dy}{dx} = x + \frac{3}{x}y \qquad \text{Divide by } x$$

$$\frac{dy}{dx} - \frac{3}{x}y = x \qquad \text{Standard form with } P(x) = -3/x \text{ and } Q(x) = x$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Notice that $P(x)$ is $-3/x$, not $+3/x$. The standard form is $y' + P(x)y = Q(x)$, so the minus sign is part of the formula for $P(x)$. ■

## Solving Linear Equations

We solve the equation

$$\frac{dy}{dx} + P(x)y = Q(x) \tag{2}$$

by multiplying both sides by a *positive* function $v(x)$ that transforms the left side into the derivative of the product $v(x) \cdot y$. We will show how to find $v$ in a moment, but first we want to show how, once found, it provides the solution we seek.

Here is why multiplying by $v(x)$ works:

$$\frac{dy}{dx} + P(x)y = Q(x) \qquad \text{Original equation is in standard form.}$$

$$v(x)\frac{dy}{dx} + P(x)v(x)y = v(x)Q(x) \qquad \text{Multiply by positive } v(x).$$

$$\frac{d}{dx}(v(x) \cdot y) = v(x)Q(x) \qquad v(x) \text{ is chosen to make } v\frac{dy}{dx} + Pvy = \frac{d}{dx}(v \cdot y).$$

$$v(x) \cdot y = \int v(x)Q(x)\,dx \qquad \text{Integrate with respect to } x.$$

$$y = \frac{1}{v(x)}\int v(x)Q(x)\,dx \tag{3}$$

Equation (3) expresses the solution of Equation (2) in terms of the function $v(x)$ and $Q(x)$. We call $v(x)$ an **integrating factor** for Equation (2) because its presence makes the equation integrable.

Why doesn't the formula for $P(x)$ appear in the solution as well? It does, but indirectly, in the construction of the positive function $v(x)$. We have

$$\frac{d}{dx}(vy) = v\frac{dy}{dx} + Pvy \qquad \text{Condition imposed on } v$$

$$v\frac{dy}{dx} + y\frac{dv}{dx} = v\frac{dy}{dx} + Pvy \qquad \text{Product Rule for derivatives}$$

$$y\frac{dv}{dx} = Pvy \qquad \text{The terms } v\frac{dy}{dx} \text{ cancel.}$$

This last equation will hold if

$$\frac{dv}{dx} = Pv$$

$$\frac{dv}{v} = P\,dx \qquad \text{Variables separated, } v > 0$$

$$\int \frac{dv}{v} = \int P\,dx \qquad \text{Integrate both sides.}$$

$$\ln v = \int P\,dx \qquad \text{Since } v > 0, \text{ we do not need absolute value signs in } \ln v.$$

$$e^{\ln v} = e^{\int P\,dx} \qquad \text{Exponentiate both sides to solve for } v.$$

$$v = e^{\int P\,dx} \tag{4}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Thus a formula for the general solution to Equation (1) is given by Equation (3), where $v(x)$ is given by Equation (4). However, rather than memorizing the formula, just remember how to find the integrating factor once you have the standard form so $P(x)$ is correctly identified.

> To solve the linear equation $y' + P(x)y = Q(x)$, multiply both sides by the integrating factor $v(x) = e^{\int P(x)\,dx}$ and integrate both sides.

When you integrate the left-side product in this procedure, you always obtain the product $v(x)y$ of the integrating factor and solution function $y$ because of the way $v$ is defined.

**EXAMPLE 2** Solving a First-Order Linear Differential Equation

Solve the equation

$$x\frac{dy}{dx} = x^2 + 3y, \qquad x > 0.$$

HISTORICAL BIOGRAPHY

Adrien Marie Legendre
(1752–1833)

**Solution** First we put the equation in standard form (Example 1):

$$\frac{dy}{dx} - \frac{3}{x}y = x,$$

so $P(x) = -3/x$ is identified.

The integrating factor is

$$\begin{aligned} v(x) = e^{\int P(x)\,dx} &= e^{\int(-3/x)\,dx} \\ &= e^{-3\ln|x|} \\ &= e^{-3\ln x} \\ &= e^{\ln x^{-3}} = \frac{1}{x^3}. \end{aligned}$$

Constant of integration is 0, so $v$ is as simple as possible. $x > 0$

Next we multiply both sides of the standard form by $v(x)$ and integrate:

$$\begin{aligned} \frac{1}{x^3}\cdot\left(\frac{dy}{dx} - \frac{3}{x}y\right) &= \frac{1}{x^3}\cdot x \\ \frac{1}{x^3}\frac{dy}{dx} - \frac{3}{x^4}y &= \frac{1}{x^2} \\ \frac{d}{dx}\left(\frac{1}{x^3}y\right) &= \frac{1}{x^2} \qquad \text{Left side is } \tfrac{d}{dx}(v\cdot y). \\ \frac{1}{x^3}y &= \int \frac{1}{x^2}\,dx \qquad \text{Integrate both sides.} \\ \frac{1}{x^3}y &= -\frac{1}{x} + C. \end{aligned}$$

Solving this last equation for $y$ gives the general solution:

$$y = x^3\left(-\frac{1}{x} + C\right) = -x^2 + Cx^3, \qquad x > 0. \quad \blacksquare$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 3** Solving a First-Order Linear Initial Value Problem

Solve the equation

$$xy' = x^2 + 3y, \qquad x > 0,$$

given the initial condition $y(1) = 2$.

**Solution** We first solve the differential equation (Example 2), obtaining

$$y = -x^2 + Cx^3, \qquad x > 0.$$

We then use the initial condition to find $C$:

$$\begin{aligned} y &= -x^2 + Cx^3 \\ 2 &= -(1)^2 + C(1)^3 \qquad y = 2 \text{ when } x = 1 \\ C &= 2 + (1)^2 = 3. \end{aligned}$$

The solution of the initial value problem is the function $y = -x^2 + 3x^3$. ■

**EXAMPLE 4** Find the particular solution of

$$3xy' - y = \ln x + 1, \qquad x > 0,$$

satisfying $y(1) = -2$.

**Solution** With $x > 0$, we write the equation in standard form:

$$y' - \frac{1}{3x}y = \frac{\ln x + 1}{3x}.$$

Then the integrating factor is given by

$$v = e^{\int -dx/3x} = e^{(-1/3)\ln x} = x^{-1/3}. \qquad x > 0$$

Thus

$$x^{-1/3}y = \frac{1}{3}\int (\ln x + 1)x^{-4/3}\,dx. \qquad \text{Left side is } vy.$$

Integration by parts of the right side gives

$$x^{-1/3}y = -x^{-1/3}(\ln x + 1) + \int x^{-4/3}\,dx + C.$$

Therefore

$$x^{-1/3}y = -x^{-1/3}(\ln x + 1) - 3x^{-1/3} + C$$

or, solving for $y$,

$$y = -(\ln x + 4) + Cx^{1/3}.$$

When $x = 1$ and $y = -2$ this last equation becomes

$$-2 = -(0 + 4) + C,$$

so

$$C = 2.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Substitution into the equation for $y$ gives the particular solution

$$y = 2x^{1/3} - \ln x - 4.$$

■

In solving the linear equation in Example 2, we integrated both sides of the equation after multiplying each side by the integrating factor. However, we can shorten the amount of work, as in Example 4, by remembering that the left side *always* integrates into the product $v(x) \cdot y$ of the integrating factor times the solution function. From Equation (3) this means that

$$v(x)y = \int v(x)Q(x)\,dx.$$

We need only integrate the product of the integrating factor $v(x)$ with the right side $Q(x)$ of Equation (1) and then equate the result with $v(x)y$ to obtain the general solution. Nevertheless, to emphasize the role of $v(x)$ in the solution process, we sometimes follow the complete procedure as illustrated in Example 2.

Observe that if the function $Q(x)$ is identically zero in the standard form given by Equation (1), the linear equation is separable:

$$\frac{dy}{dx} + P(x)y = Q(x)$$

$$\frac{dy}{dx} + P(x)y = 0 \qquad Q(x) \equiv 0$$

$$dy = -P(x)\,dx \qquad \text{Separating the variables}$$

We now present two applied problems modeled by a first-order linear differential equation.

## *RL* Circuits

The diagram in Figure 9.5 represents an electrical circuit whose total resistance is a constant $R$ ohms and whose self-inductance, shown as a coil, is $L$ henries, also a constant. There is a switch whose terminals at $a$ and $b$ can be closed to connect a constant electrical source of $V$ volts.

Ohm's Law, $V = RI$, has to be modified for such a circuit. The modified form is

$$L\frac{di}{dt} + Ri = V, \tag{5}$$

where $i$ is the intensity of the current in amperes and $t$ is the time in seconds. By solving this equation, we can predict how the current will flow after the switch is closed.

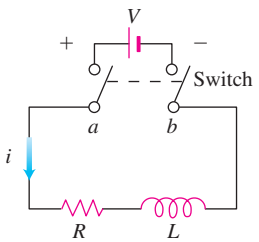

**FIGURE 9.5** The *RL* circuit in Example 5.

### EXAMPLE 5 Electric Current Flow

The switch in the *RL* circuit in Figure 9.5 is closed at time $t = 0$. How will the current flow as a function of time?

**Solution** Equation (5) is a first-order linear differential equation for $i$ as a function of $t$. Its standard form is

$$\frac{di}{dt} + \frac{R}{L}i = \frac{V}{L}, \tag{6}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

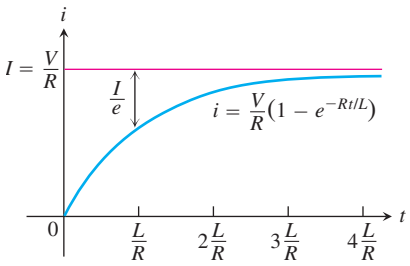

**FIGURE 9.6** The growth of the current in the $RL$ circuit in Example 5. $I$ is the current's steady-state value. The number $t = L/R$ is the time constant of the circuit. The current gets to within 5% of its steady-state value in 3 time constants (Exercise 31).

and the corresponding solution, given that $i = 0$ when $t = 0$, is

$$i = \frac{V}{R} - \frac{V}{R}e^{-(R/L)t} \tag{7}$$

(Exercise 32). Since $R$ and $L$ are positive, $-(R/L)$ is negative and $e^{-(R/L)t} \to 0$ as $t \to \infty$. Thus,

$$\lim_{t\to\infty} i = \lim_{t\to\infty}\left(\frac{V}{R} - \frac{V}{R}e^{-(R/L)t}\right) = \frac{V}{R} - \frac{V}{R}\cdot 0 = \frac{V}{R}.$$

At any given time, the current is theoretically less than $V/R$, but as time passes, the current approaches the **steady-state value** $V/R$. According to the equation

$$L\frac{di}{dt} + Ri = V,$$

$I = V/R$ is the current that will flow in the circuit if either $L = 0$ (no inductance) or $di/dt = 0$ (steady current, $i =$ constant) (Figure 9.6).

Equation (7) expresses the solution of Equation (6) as the sum of two terms: a **steady-state solution** $V/R$ and a **transient solution** $-(V/R)e^{-(R/L)t}$ that tends to zero as $t \to \infty$. ■

## Mixture Problems

A chemical in a liquid solution (or dispersed in a gas) runs into a container holding the liquid (or the gas) with, possibly, a specified amount of the chemical dissolved as well. The mixture is kept uniform by stirring and flows out of the container at a known rate. In this process, it is often important to know the concentration of the chemical in the container at any given time. The differential equation describing the process is based on the formula

$$\begin{pmatrix}\text{Rate of change}\\ \text{of amount}\\ \text{in container}\end{pmatrix} = \begin{pmatrix}\text{rate at which}\\ \text{chemical}\\ \text{arrives}\end{pmatrix} - \begin{pmatrix}\text{rate at which}\\ \text{chemical}\\ \text{departs.}\end{pmatrix} \tag{8}$$

If $y(t)$ is the amount of chemical in the container at time $t$ and $V(t)$ is the total volume of liquid in the container at time $t$, then the departure rate of the chemical at time $t$ is

$$\begin{aligned}\text{Departure rate} &= \frac{y(t)}{V(t)}\cdot(\text{outflow rate})\\ &= \begin{pmatrix}\text{concentration in}\\ \text{container at time } t\end{pmatrix}\cdot(\text{outflow rate}).\end{aligned} \tag{9}$$

Accordingly, Equation (8) becomes

$$\frac{dy}{dt} = (\text{chemical's arrival rate}) - \frac{y(t)}{V(t)}\cdot(\text{outflow rate}). \tag{10}$$

If, say, $y$ is measured in pounds, $V$ in gallons, and $t$ in minutes, the units in Equation (10) are

$$\frac{\text{pounds}}{\text{minutes}} = \frac{\text{pounds}}{\text{minutes}} - \frac{\text{pounds}}{\text{gallons}}\cdot\frac{\text{gallons}}{\text{minutes}}.$$

**EXAMPLE 6** Oil Refinery Storage Tank

In an oil refinery, a storage tank contains 2000 gal of gasoline that initially has 100 lb of an additive dissolved in it. In preparation for winter weather, gasoline containing 2 lb of

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

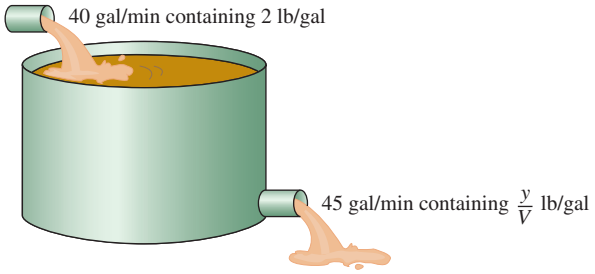

**FIGURE 9.7** The storage tank in Example 6 mixes input liquid with stored liquid to produce an output liquid.

additive per gallon is pumped into the tank at a rate of 40 gal/min. The well-mixed solution is pumped out at a rate of 45 gal/min. How much of the additive is in the tank 20 min after the pumping process begins (Figure 9.7)?

**Solution** Let $y$ be the amount (in pounds) of additive in the tank at time $t$. We know that $y = 100$ when $t = 0$. The number of gallons of gasoline and additive in solution in the tank at any time $t$ is

$$\begin{aligned} V(t) &= 2000 \text{ gal} + \left(40\frac{\text{gal}}{\text{min}} - 45\frac{\text{gal}}{\text{min}}\right)(t \text{ min}) \\ &= (2000 - 5t) \text{ gal}. \end{aligned}$$

Therefore,

$$\begin{aligned} \text{Rate out} &= \frac{y(t)}{V(t)} \cdot \text{outflow rate} && \text{Eq. (9)} \\ &= \left(\frac{y}{2000 - 5t}\right) 45 && \text{Outflow rate is 45 gal/min. and } v = 2000 - 5t. \\ &= \frac{45y}{2000 - 5t}\frac{\text{lb}}{\text{min}}. \end{aligned}$$

Also,

$$\begin{aligned} \text{Rate in} &= \left(2\frac{\text{lb}}{\text{gal}}\right)\left(40\frac{\text{gal}}{\text{min}}\right) \\ &= 80\frac{\text{lb}}{\text{min}}. && \text{Eq. (10)} \end{aligned}$$

The differential equation modeling the mixture process is

$$\frac{dy}{dt} = 80 - \frac{45y}{2000 - 5t}$$

in pounds per minute.

To solve this differential equation, we first write it in standard form:

$$\frac{dy}{dt} + \frac{45}{2000 - 5t}y = 80.$$

Thus, $P(t) = 45/(2000 - 5t)$ and $Q(t) = 80$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The integrating factor is

$$\begin{aligned} v(t) = e^{\int P\,dt} &= e^{\int \frac{45}{2000-5t}\,dt} \\ &= e^{-9\ln(2000-5t)} \qquad 2000 - 5t > 0 \\ &= (2000 - 5t)^{-9}. \end{aligned}$$

Multiplying both sides of the standard equation by $v(t)$ and integrating both sides gives,

$$(2000 - 5t)^{-9} \cdot \left(\frac{dy}{dt} + \frac{45}{2000 - 5t}\, y\right) = 80(2000 - 5t)^{-9}$$

$$(2000 - 5t)^{-9}\,\frac{dy}{dt} + 45(2000 - 5t)^{-10}\, y = 80(2000 - 5t)^{-9}$$

$$\frac{d}{dt}\left[(2000 - 5t)^{-9} y\right] = 80(2000 - 5t)^{-9}$$

$$(2000 - 5t)^{-9} y = \int 80(2000 - 5t)^{-9}\,dt$$

$$(2000 - 5t)^{-9} y = 80 \cdot \frac{(2000 - 5t)^{-8}}{(-8)(-5)} + C.$$

The general solution is

$$y = 2(2000 - 5t) + C(2000 - 5t)^9.$$

Because $y = 100$ when $t = 0$, we can determine the value of $C$:

$$100 = 2(2000 - 0) + C(2000 - 0)^9$$

$$C = -\frac{3900}{(2000)^9}.$$

The particular solution of the initial value problem is

$$y = 2(2000 - 5t) - \frac{3900}{(2000)^9}(2000 - 5t)^9.$$

The amount of additive 20 min after the pumping begins is

$$y(20) = 2[2000 - 5(20)] - \frac{3900}{(2000)^9}[2000 - 5(20)]^9 \approx 1342 \text{ lb}.$$

# EXERCISES 9.2

## First-Order Linear Equations

Solve the differential equations in Exercises 1–14.

**1.** $x\dfrac{dy}{dx} + y = e^x, \quad x > 0$

**2.** $e^x\dfrac{dy}{dx} + 2e^x y = 1$

**3.** $xy' + 3y = \dfrac{\sin x}{x^2}, \quad x > 0$

**4.** $y' + (\tan x)y = \cos^2 x, \quad -\pi/2 < x < \pi/2$

**5.** $x\dfrac{dy}{dx} + 2y = 1 - \dfrac{1}{x}, \quad x > 0$

**6.** $(1 + x)y' + y = \sqrt{x}$

**7.** $2y' = e^{x/2} + y$

**8.** $e^{2x}y' + 2e^{2x}y = 2x$

**9.** $xy' - y = 2x \ln x$

**10.** $x\dfrac{dy}{dx} = \dfrac{\cos x}{x} - 2y, \quad x > 0$

**11.** $(t - 1)^3\dfrac{ds}{dt} + 4(t - 1)^2 s = t + 1, \quad t > 1$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

**12.** $(t+1)\dfrac{ds}{dt} + 2s = 3(t+1) + \dfrac{1}{(t+1)^2}, \quad t > -1$

**13.** $\sin\theta\dfrac{dr}{d\theta} + (\cos\theta)r = \tan\theta, \quad 0 < \theta < \pi/2$

**14.** $\tan\theta\dfrac{dr}{d\theta} + r = \sin^2\theta, \quad 0 < \theta < \pi/2$

## Solving Initial Value Problems

Solve the initial value problems in Exercises 15–20.

Exercises

**15.** $\dfrac{dy}{dt} + 2y = 3, \quad y(0) = 1$

**16.** $t\dfrac{dy}{dt} + 2y = t^3, \quad t > 0, \quad y(2) = 1$

**17.** $\theta\dfrac{dy}{d\theta} + y = \sin\theta, \quad \theta > 0, \quad y(\pi/2) = 1$

**18.** $\theta\dfrac{dy}{d\theta} - 2y = \theta^3\sec\theta\tan\theta, \quad \theta > 0, \quad y(\pi/3) = 2$

**19.** $(x+1)\dfrac{dy}{dx} - 2(x^2+x)y = \dfrac{e^{x^2}}{x+1}, \quad x > -1, \quad y(0) = 5$

**20.** $\dfrac{dy}{dx} + xy = x, \quad y(0) = -6$

**21.** Solve the exponential growth/decay initial value problem for $y$ as a function of $t$ thinking of the differential equation as a first-order linear equation with $P(x) = -k$ and $Q(x) = 0$:

$$\frac{dy}{dt} = ky \quad (k \text{ constant}), \quad y(0) = y_0$$

**22.** Solve the following initial value problem for $u$ as a function of $t$:

$$\frac{du}{dt} + \frac{k}{m}u = 0 \quad (k \text{ and } m \text{ positive constants}), \quad u(0) = u_0$$

**a.** as a first-order linear equation.

**b.** as a separable equation.

## Theory and Examples

**23.** Is either of the following equations correct? Give reasons for your answers.

**a.** $x\displaystyle\int \frac{1}{x}\,dx = x\ln|x| + C$ **b.** $x\displaystyle\int \frac{1}{x}\,dx = x\ln|x| + Cx$

**24.** Is either of the following equations correct? Give reasons for your answers.

**a.** $\dfrac{1}{\cos x}\displaystyle\int \cos x\,dx = \tan x + C$

**b.** $\dfrac{1}{\cos x}\displaystyle\int \cos x\,dx = \tan x + \frac{C}{\cos x}$

**25. Salt mixture** A tank initially contains 100 gal of brine in which 50 lb of salt are dissolved. A brine containing 2 lb/gal of salt runs into the tank at the rate of 5 gal/min. The mixture is kept uniform by stirring and flows out of the tank at the rate of 4 gal/min.

**a.** At what rate (pounds per minute) does salt enter the tank at time $t$?

**b.** What is the volume of brine in the tank at time $t$?

**c.** At what rate (pounds per minute) does salt leave the tank at time $t$?

**d.** Write down and solve the initial value problem describing the mixing process.

**e.** Find the concentration of salt in the tank 25 min after the process starts.

**26. Mixture problem** A 200-gal tank is half full of distilled water. At time $t = 0$, a solution containing 0.5 lb/gal of concentrate enters the tank at the rate of 5 gal/min, and the well-stirred mixture is withdrawn at the rate of 3 gal/min.

**a.** At what time will the tank be full?

**b.** At the time the tank is full, how many pounds of concentrate will it contain?

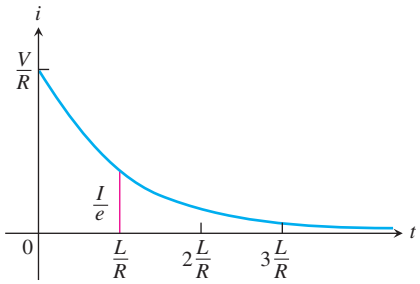
**27. Fertilizer mixture** A tank contains 100 gal of fresh water. A solution containing 1 lb/gal of soluble lawn fertilizer runs into the tank at the rate of 1 gal/min, and the mixture is pumped out of the tank at the rate of 3 gal/min. Find the maximum amount of fertilizer in the tank and the time required to reach the maximum.

**28. Carbon monoxide pollution** An executive conference room of a corporation contains 4500 $ft^3$ of air initially free of carbon monoxide. Starting at time $t = 0$, cigarette smoke containing 4% carbon monoxide is blown into the room at the rate of 0.3 $ft^3$/min. A ceiling fan keeps the air in the room well circulated and the air leaves the room at the same rate of 0.3 $ft^3$/min. Find the time when the concentration of carbon monoxide in the room reaches 0.01%.

**29. Current in a closed *RL* circuit** How many seconds after the switch in an $RL$ circuit is closed will it take the current $i$ to reach half of its steady state value? Notice that the time depends on $R$ and $L$ and not on how much voltage is applied.

**30. Current in an open *RL* circuit** If the switch is thrown open after the current in an $RL$ circuit has built up to its steady-state value $I = V/R$, the decaying current (graphed here) obeys the equation

$$L\frac{di}{dt} + Ri = 0,$$



which is Equation (5) with $V = 0$.

**a.** Solve the equation to express $i$ as a function of $t$.

**b.** How long after the switch is thrown will it take the current to fall to half its original value?

**c.** Show that the value of the current when $t = L/R$ is $I/e$. (The significance of this time is explained in the next exercise.)

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**31. Time constants** Engineers call the number $L/R$ the *time constant* of the $RL$ circuit in Figure 9.6. The significance of the time constant is that the current will reach 95% of its final value within 3 time constants of the time the switch is closed (Figure 9.6). Thus, the time constant gives a built-in measure of how rapidly an individual circuit will reach equilibrium.

**a.** Find the value of $i$ in Equation (7) that corresponds to $t = 3L/R$ and show that it is about 95% of the steady-state value $I = V/R$.

**b.** Approximately what percentage of the steady-state current will be flowing in the circuit 2 time constants after the switch is closed (i.e., when $t = 2L/R$)?

**32. Derivation of Equation (7) in Example 5**

**a.** Show that the solution of the equation

$$\frac{di}{dt} + \frac{R}{L}i = \frac{V}{L}$$

is

$$i = \frac{V}{R} + Ce^{-(R/L)t}.$$

**b.** Then use the initial condition $i(0) = 0$ to determine the value of $C$. This will complete the derivation of Equation (7).

**c.** Show that $i = V/R$ is a solution of Equation (6) and that $i = Ce^{-(R/L)t}$ satisfies the equation

$$\frac{di}{dt} + \frac{R}{L}i = 0.$$

HISTORICAL BIOGRAPHY

James Bernoulli
(1654–1705)

A **Bernoulli differential equation** is of the form

$$\frac{dy}{dx} + P(x)y = Q(x)y^n.$$

Observe that, if $n = 0$ or 1, the Bernoulli equation is linear. For other values of $n$, the substitution $u = y^{1-n}$ transforms the Bernoulli equation into the linear equation

$$\frac{du}{dx} + (1 - n)P(x)u = (1 - n)Q(x).$$

For example, in the equation

$$\frac{dy}{dx} - y = e^{-x}y^2$$

we have $n = 2$, so that $u = y^{1-2} = y^{-1}$ and $du/dx = -y^{-2}\,dy/dx$. Then $dy/dx = -y^2\,du/dx = -u^{-2}\,du/dx$. Substitution into the original equation gives

$$-u^{-2}\frac{du}{dx} - u^{-1} = e^{-x}u^{-2}$$

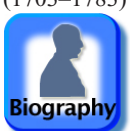
or, equivalently,

$$\frac{du}{dx} + u = -e^{-x}.$$

This last equation is linear in the (unknown) dependent variable $u$.

Solve the differential equations in Exercises 33–36.

**33.** $y' - y = -y^2$ **34.** $y' - y = xy^2$



**35.** $xy' + y = y^{-2}$ **36.** $x^2y' + 2xy = y^3$

# 9.3 Euler's Method

HISTORICAL BIOGRAPHY

Leonhard Euler
(1703–1783)

If we do not require or cannot immediately find an *exact* solution for an initial value problem $y' = f(x, y), y(x_0) = y_0$ we can often use a computer to generate a table of approximate numerical values of $y$ for values of $x$ in an appropriate interval. Such a table is called a **numerical solution** of the problem, and the method by which we generate the table is called a **numerical method**. Numerical methods are generally fast and accurate, and they are often the methods of choice when exact formulas are unnecessary, unavailable, or overly complicated. In this section, we study one such method, called Euler's method, upon which many other numerical methods are based.

## Euler's Method

Given a differential equation $dy/dx = f(x, y)$ and an initial condition $y(x_0) = y_0$, we can approximate the solution $y = y(x)$ by its linearization

$$L(x) = y(x_0) + y'(x_0)(x - x_0) \qquad \text{or} \qquad L(x) = y_0 + f(x_0, y_0)(x - x_0).$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

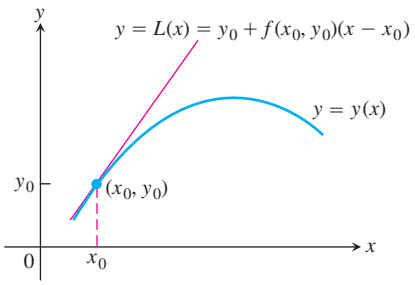

**FIGURE 9.8** The linearization $L(x)$ of $y = y(x)$ at $x = x_0$.

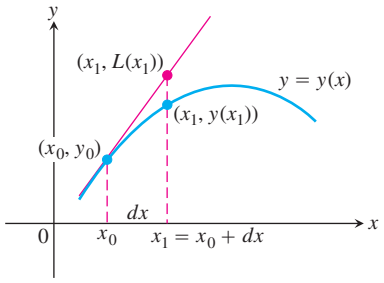

**FIGURE 9.9** The first Euler step approximates $y(x_1)$ with $y_1 = L(x_1)$.

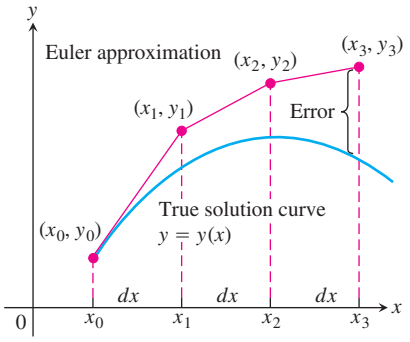

**FIGURE 9.10** Three steps in the Euler approximation to the solution of the initial value problem $y' = f(x, y), y(x_0) = y_0$. As we take more steps, the errors involved usually accumulate, but not in the exaggerated way shown here.

The function $L(x)$ gives a good approximation to the solution $y(x)$ in a short interval about $x_0$ (Figure 9.8). The basis of Euler's method is to patch together a string of linearizations to approximate the curve over a longer stretch. Here is how the method works.

We know the point $(x_0, y_0)$ lies on the solution curve. Suppose that we specify a new value for the independent variable to be $x_1 = x_0 + dx$. (Recall that $dx = \Delta x$ in the definition of differentials.) If the increment $dx$ is small, then

$$y_1 = L(x_1) = y_0 + f(x_0, y_0)\, dx$$

is a good approximation to the exact solution value $y = y(x_1)$. So from the point $(x_0, y_0)$, which lies *exactly* on the solution curve, we have obtained the point $(x_1, y_1)$, which lies very close to the point $(x_1, y(x_1))$ on the solution curve (Figure 9.9).

Using the point $(x_1, y_1)$ and the slope $f(x_1, y_1)$ of the solution curve through $(x_1, y_1)$, we take a second step. Setting $x_2 = x_1 + dx$, we use the linearization of the solution curve through $(x_1, y_1)$ to calculate

$$y_2 = y_1 + f(x_1, y_1)\, dx.$$

This gives the next approximation $(x_2, y_2)$ to values along the solution curve $y = y(x)$ (Figure 9.10). Continuing in this fashion, we take a third step from the point $(x_2, y_2)$ with slope $f(x_2, y_2)$ to obtain the third approximation

$$y_3 = y_2 + f(x_2, y_2)\, dx,$$

and so on. We are literally building an approximation to one of the solutions by following the direction of the slope field of the differential equation.

The steps in Figure 9.10 are drawn large to illustrate the construction process, so the approximation looks crude. In practice, $dx$ would be small enough to make the red curve hug the blue one and give a good approximation throughout.

## EXAMPLE 1 Using Euler's Method

Find the first three approximations $y_1, y_2, y_3$ using Euler's method for the initial value problem

$$y' = 1 + y, \qquad y(0) = 1,$$

starting at $x_0 = 0$ with $dx = 0.1$.

**Solution** We have $x_0 = 0, y_0 = 1, x_1 = x_0 + dx = 0.1, x_2 = x_0 + 2dx = 0.2$, and $x_3 = x_0 + 3dx = 0.3$.

$$\begin{aligned}
\textit{First:}\quad y_1 &= y_0 + f(x_0, y_0)\, dx \\
&= y_0 + (1 + y_0)\, dx \\
&= 1 + (1 + 1)(0.1) = 1.2 \\
\textit{Second:}\quad y_2 &= y_1 + f(x_1, y_1)\, dx \\
&= y_1 + (1 + y_1)\, dx \\
&= 1.2 + (1 + 1.2)(0.1) = 1.42 \\
\textit{Third:}\quad y_3 &= y_2 + f(x_2, y_2)\, dx \\
&= y_2 + (1 + y_2)\, dx \\
&= 1.42 + (1 + 1.42)(0.1) = 1.662
\end{aligned}$$

■

The step-by-step process used in Example 1 can be continued easily. Using equally spaced values for the independent variable in the table and generating $n$ of them, set

$$\begin{aligned}
x_1 &= x_0 + dx \\
x_2 &= x_1 + dx \\
&\vdots \\
x_n &= x_{n-1} + dx.
\end{aligned}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Then calculate the approximations to the solution,

$$y_1 = y_0 + f(x_0, y_0)\,dx$$
$$y_2 = y_1 + f(x_1, y_1)\,dx$$
$$\vdots$$
$$y_n = y_{n-1} + f(x_{n-1}, y_{n-1})\,dx.$$

The number of steps $n$ can be as large as we like, but errors can accumulate if $n$ is too large.

Euler's method is easy to implement on a computer or calculator. A computer program generates a table of numerical solutions to an initial value problem, allowing us to input $x_0$ and $y_0$, the number of steps $n$, and the step size $dx$. It then calculates the approximate solution values $y_1, y_2, \ldots, y_n$ in iterative fashion, as just described.

Solving the separable equation in Example 1, we find that the exact solution to the initial value problem is $y = 2e^x - 1$. We use this information in Example 2.

**EXAMPLE 2** Investigating the Accuracy of Euler's Method

Use Euler's method to solve

$$y' = 1 + y, \qquad y(0) = 1,$$

on the interval $0 \le x \le 1$, starting at $x_0 = 0$ and taking

**(a)** $dx = 0.1$

**(b)** $dx = 0.05$.

Compare the approximations with the values of the exact solution $y = 2e^x - 1$.

**Solution**

**(a)** We used a computer to generate the approximate values in Table 9.1. The "error" column is obtained by subtracting the unrounded Euler values from the unrounded values found using the exact solution. All entries are then rounded to four decimal places.

**TABLE 9.1** Euler solution of $y' = 1 + y$, $y(0) = 1$, step size $dx = 0.1$

| $x$ | $y$ (Euler) | $y$ (exact) | Error |
|---|---|---|---|
| 0 | 1 | 1 | 0 |
| 0.1 | 1.2 | 1.2103 | 0.0103 |
| 0.2 | 1.42 | 1.4428 | 0.0228 |
| 0.3 | 1.662 | 1.6997 | 0.0377 |

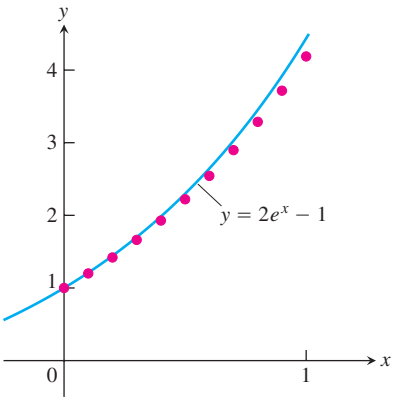

**FIGURE 9.11** The graph of $y = 2e^x - 1$ superimposed on a scatterplot of the Euler approximations shown in Table 9.1 (Example 2).

By the time we reach $x = 1$ (after 10 steps), the error is about 5.6% of the exact solution. A plot of the exact solution curve with the scatterplot of Euler solution points from Table 9.1 is shown in Figure 9.11.

**(b)** One way to try to reduce the error is to decrease the step size. Table 9.2 shows the results and their comparisons with the exact solutions when we decrease the step size to 0.05, doubling the number of steps to 20. As in Table 9.1, all computations are performed before rounding. This time when we reach $x = 1$, the relative error is only about 2.9%.

**TABLE 9.2** Euler solution of $y' = 1 + y$, $y(0) = 1$, step size $dx = 0.05$

| $x$ | $y$ (Euler) | $y$ (exact) | Error |

| 0 | 1 | 1 | 0 |
| 0.05 | 1.1 | 1.1025 | 0.0025 |
| 0.10 | 1.205 | 1.2103 | 0.0053 |
| 0.15 | 1.3153 | 1.3237 | 0.0084 |
| 0.20 | 1.4310 | 1.4428 | 0.0118 |
| 0.25 | 1.5526 | 1.5681 | 0.0155 |
| 0.30 | 1.6802 | 1.6997 | 0.0195 |
| 0.35 | 1.8142 | 1.8381 | 0.0239 |
| 0.40 | 1.9549 | 1.9836 | 0.0287 |
| 0.45 | 2.1027 | 2.1366 | 0.0340 |
| 0.50 | 2.2578 | 2.2974 | 0.0397 |
| 0.55 | 2.4207 | 2.4665 | 0.0458 |
| 0.60 | 2.5917 | 2.6442 | 0.0525 |
| 0.65 | 2.7713 | 2.8311 | 0.0598 |
| 0.70 | 2.9599 | 3.0275 | 0.0676 |
| 0.75 | 3.1579 | 3.2340 | 0.0761 |
| 0.80 | 3.3657 | 3.4511 | 0.0853 |
| 0.85 | 3.5840 | 3.6793 | 0.0953 |
| 0.90 | 3.8132 | 3.9192 | 0.1060 |
| 0.95 | 4.0539 | 4.1714 | 0.1175 |
| 1.00 | 4.3066 | 4.4366 | 0.1300 |

■

It might be tempting to reduce the step size even further in Example 2 to obtain greater accuracy. Each additional calculation, however, not only requires additional computer time but more importantly adds to the buildup of round-off errors due to the approximate representations of numbers inside the computer.

The analysis of error and the investigation of methods to reduce it when making numerical calculations are important but are appropriate for a more advanced course. There are numerical methods more accurate than Euler's method, as you can see in a further study of differential equations. We study one improvement here.

HISTORICAL BIOGRAPHY

Carl Runge
(1856–1927)

## Improved Euler's Method

We can improve on Euler's method by taking an average of two slopes. We first estimate $y_n$ as in the original Euler method, but denote it by $z_n$. We then take the average of $f(x_{n-1}, y_{n-1})$ and $f(x_n, z_n)$ in place of $f(x_{n-1}, y_{n-1})$ in the next step. Thus, we calculate the next approximation $y_n$ using

$$z_n = y_{n-1} + f(x_{n-1}, y_{n-1})\,dx$$

$$y_n = y_{n-1} + \left[\frac{f(x_{n-1}, y_{n-1}) + f(x_n, z_n)}{2}\right] dx.$$

**EXAMPLE 3** Investigating the Accuracy of the Improved Euler's Method

Use the improved Euler's method to solve

$$y' = 1 + y, \qquad y(0) = 1,$$

on the interval $0 \le x \le 1$, starting at $x_0 = 0$ and taking $dx = 0.1$. Compare the approximations with the values of the exact solution $y = 2e^x - 1$.

**Solution** We used a computer to generate the approximate values in Table 9.3. The "error" column is obtained by subtracting the unrounded improved Euler values from the unrounded values found using the exact solution. All entries are then rounded to four decimal places.

**TABLE 9.3** Improved Euler solution of $y' = 1 + y$, $y(0) = 1$, step size $dx = 0.1$

| $x$ | $y$ (improved Euler) | $y$ (exact) | Error |
|---|---|---|---|
| 0 | 1 | 1 | 0 |
| 0.1 | 1.21 | 1.2103 | 0.0003 |
| 0.2 | 1.4421 | 1.4428 | 0.0008 |
| 0.3 | 1.6985 | 1.6997 | 0.0013 |
| 0.4 | 1.9818 | 1.9836 | 0.0018 |
| 0.5 | 2.2949 | 2.2974 | 0.0025 |
| 0.6 | 2.6409 | 2.6442 | 0.0034 |
| 0.7 | 3.0231 | 3.0275 | 0.0044 |
| 0.8 | 3.4456 | 3.4511 | 0.0055 |
| 0.9 | 3.9124 | 3.9192 | 0.0068 |
| 1.0 | 4.4282 | 4.4366 | 0.0084 |

By the time we reach $x = 1$ (after 10 steps), the relative error is about 0.19%. ■

By comparing Tables 9.1 and 9.3, we see that the improved Euler's method is considerably more accurate than the regular Euler's method, at least for the initial value problem $y' = 1 + y$, $y(0) = 1$.

**EXAMPLE 4** Oil Refinery Storage Tank Revisited

In Example 6, Section 9.2, we looked at a problem involving an additive mixture entering a 2000-gallon gasoline tank that was simultaneously being pumped. The analysis gave the initial value problem

$$\frac{dy}{dt} = 80 - \frac{45y}{2000 - 5t}, \qquad y(0) = 100$$

where $y(t)$ is the amount of additive in the tank at time $t$. The question was to find $y(20)$. Using Euler's method with an increment of $dt = 0.2$ (or 100 steps) gives the approximations

$$y(0.2) \approx 115.55, \qquad y(0.4) \approx 131.0298, \ldots$$

ending with $y(20) \approx 1344.3616$. The relative error from the exact solution $y(20) = 1342$ is about 0.18%. ■

# EXERCISES 9.3

## Calculating Euler Approximations

In Exercises 1–6, use Euler's method to calculate the first three approximations to the given initial value problem for the specified increment size. Calculate the exact solution and investigate the accuracy of your approximations. Round your results to four decimal places.

**1.** $y' = 1 - \dfrac{y}{x}, \quad y(2) = -1, \quad dx = 0.5$

**2.** $y' = x(1 - y), \quad y(1) = 0, \quad dx = 0.2$

**3.** $y' = 2xy + 2y, \quad y(0) = 3, \quad dx = 0.2$

**4.** $y' = y^2(1 + 2x), \quad y(-1) = 1, \quad dx = 0.5$

T **5.** $y' = 2xe^{x^2}, \quad y(0) = 2, \quad dx = 0.1$

T **6.** $y' = y + e^x - 2, \quad y(0) = 2, \quad dx = 0.5$

**7.** Use the Euler method with $dx = 0.2$ to estimate $y(1)$ if $y' = y$ and $y(0) = 1$. What is the exact value of $y(1)$?

**8.** Use the Euler method with $dx = 0.2$ to estimate $y(2)$ if $y' = y/x$ and $y(1) = 2$. What is the exact value of $y(2)$?

T **9.** Use the Euler method with $dx = 0.5$ to estimate $y(5)$ if $y' = y^2/\sqrt{x}$ and $y(1) = -1$. What is the exact value of $y(5)$?

T **10.** Use the Euler method with $dx = 1/3$ to estimate $y(2)$ if $y' = y - e^{2x}$ and $y(0) = 1$. What is the exact value of $y(2)$?

## Improved Euler's Method

In Exercises 11 and 12, use the improved Euler's method to calculate the first three approximations to the given initial value problem. Compare the approximations with the values of the exact solution.

**11.** $y' = 2y(x + 1), \quad y(0) = 3, \quad dx = 0.2$

(See Exercise 3 for the exact solution.)

**12.** $y' = x(1 - y), \quad y(1) = 0, \quad dx = 0.2$

(See Exercise 2 for the exact solution.)

COMPUTER EXPLORATIONS

## Euler's Method

In Exercises 13–16, use Euler's method with the specified step size to estimate the value of the solution at the given point $x^*$. Find the value of the exact solution at $x^*$.

**13.** $y' = 2xe^{x^2}, \quad y(0) = 2, \quad dx = 0.1, \quad x^* = 1$

**14.** $y' = y + e^x - 2, \quad y(0) = 2, \quad dx = 0.5, \quad x^* = 2$

**15.** $y' = \sqrt{x}/y, \quad y > 0, \quad y(0) = 1, \quad dx = 0.1, \quad x^* = 1$

**16.** $y' = 1 + y^2, \quad y(0) = 0, \quad dx = 0.1, \quad x^* = 1$

In Exercises 17 and 18, **(a)** find the exact solution of the initial value problem. Then compare the accuracy of the approximation with $y(x^*)$ using Euler's method starting at $x_0$ with step size **(b)** 0.2, **(c)** 0.1, and **(d)** 0.05.

**17.** $y' = 2y^2(x - 1), \quad y(2) = -1/2, \quad x_0 = 2, \quad x^* = 3$

**18.** $y' = y - 1, \quad y(0) = 3, \quad x_0 = 0, \quad x^* = 1$

## Improved Euler's Method

In Exercises 19 and 20, compare the accuracy of the approximation with $y(x^*)$ using the improved Euler's method starting at $x_0$ with step size

**a.** 0.2 **b.** 0.1 **c.** 0.05

**d.** Describe what happens to the error as the step size decreases.

**19.** $y' = 2y^2(x - 1), \quad y(2) = -1/2, \quad x_0 = 2, \quad x^* = 3$

(See Exercise 17 for the exact solution.)

**20.** $y' = y - 1, \quad y(0) = 3, \quad x_0 = 0, \quad x^* = 1$

(See Exercise 18 for the exact solution.)

## Exploring Differential Equations Graphically

Use a CAS to explore graphically each of the differential equations in Exercises 21–24. Perform the following steps to help with your explorations.

**a.** Plot a slope field for the differential equation in the given $xy$-window.

**b.** Find the general solution of the differential equation using your CAS DE solver.

**c.** Graph the solutions for the values of the arbitrary constant $C = -2, -1, 0, 1, 2$ superimposed on your slope field plot.

**d.** Find and graph the solution that satisfies the specified initial condition over the interval $[0, b]$.

**e.** Find the Euler numerical approximation to the solution of the initial value problem with 4 subintervals of the $x$-interval and plot the Euler approximation superimposed on the graph produced in part (d).

**f.** Repeat part (e) for 8, 16, and 32 subintervals. Plot these three Euler approximations superimposed on the graph from part (e).

**g.** Find the error $(y(\text{exact}) - y(\text{Euler}))$ at the specified point $x = b$ for each of your four Euler approximations. Discuss the improvement in the percentage error.

**21.** $y' = x + y, \quad y(0) = -7/10; \quad -4 \le x \le 4, \quad -4 \le y \le 4; \quad b = 1$

**22.** $y' = -x/y, \quad y(0) = 2; \quad -3 \le x \le 3, \quad -3 \le y \le 3; \quad b = 2$

**23.** **A logistic equation** $y' = y(2 - y), \quad y(0) = 1/2; \quad 0 \le x \le 4, \quad 0 \le y \le 3; \quad b = 3$

**24.** $y' = (\sin x)(\sin y), \quad y(0) = 2; \quad -6 \le x \le 6, \quad -6 \le y \le 6; \quad b = 3\pi/2$

# 9.4 Graphical Solutions of Autonomous Differential Equations

In Chapter 4 we learned that the sign of the first derivative tells where the graph of a function is increasing and where it is decreasing. The sign of the second derivative tells the concavity of the graph. We can build on our knowledge of how derivatives determine the shape of a graph to solve differential equations graphically. The starting ideas for doing so are the notions of *phase line* and *equilibrium value*. We arrive at these notions by investigating what happens when the derivative of a differentiable function is zero from a point of view different from that studied in Chapter 4.

## Equilibrium Values and Phase Lines

When we differentiate implicitly the equation

$$\frac{1}{5}\ln(5y - 15) = x + 1$$

we obtain

$$\frac{1}{5}\left(\frac{5}{5y - 15}\right)\frac{dy}{dx} = 1.$$

Solving for $y' = dy/dx$ we find $y' = 5y - 15 = 5(y - 3)$. In this case the derivative $y'$ is a function of $y$ only (the dependent variable) and is zero when $y = 3$.

A differential equation for which $dy/dx$ is a function of $y$ only is called an **autonomous** differential equation. Let's investigate what happens when the derivative in an autonomous equation equals zero.

**DEFINITION Equilibrium Values**

If $dy/dx = g(y)$ is an autonomous differential equation, then the values of $y$ for which $dy/dx = 0$ are called **equilibrium values** or **rest points**.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Thus, equilibrium values are those at which no change occurs in the dependent variable, so $y$ is at *rest*. The emphasis is on the value of $y$ where $dy/dx = 0$, not the value of $x$, as we studied in Chapter 4.

### EXAMPLE 1 Finding Equilibrium Values

The equilibrium values for the autonomous differential equation

$$\frac{dy}{dx} = (y + 1)(y - 2)$$

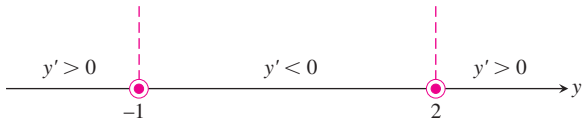
are $y = -1$ and $y = 2$. ■

To construct a graphical solution to an autonomous differential equation like the one in Example 1, we first make a **phase line** for the equation, a plot on the $y$-axis that shows the equation's equilibrium values along with the intervals where $dy/dx$ and $d^2y/dx^2$ are positive and negative. Then we know where the solutions are increasing and decreasing, and the concavity of the solution curves. These are the essential features we found in Section 4.4, so we can determine the shapes of the solution curves without having to find formulas for them.

### EXAMPLE 2 Drawing a Phase Line and Sketching Solution Curves

Draw a phase line for the equation

$$\frac{dy}{dx} = (y + 1)(y - 2)$$



and use it to sketch solutions to the equation.

**Solution**

1. *Draw a number line for y and mark the equilibrium values* $y = -1$ *and* $y = 2$, *where* $dy/dx = 0$.

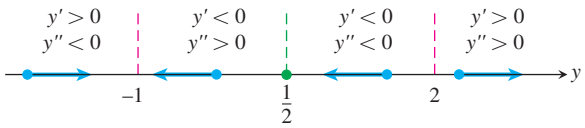
2. *Identify and label the intervals where* $y' > 0$ *and* $y' < 0$. This step resembles what we did in Section 4.3, only now we are marking the $y$-axis instead of the $x$-axis.

We can encapsulate the information about the sign of $y'$ on the phase line itself. Since $y' > 0$ on the interval to the left of $y = -1$, a solution of the differential equation with a $y$-value less than $-1$ will increase from there toward $y = -1$. We display this information by drawing an arrow on the interval pointing to $-1$.

Similarly, $y' < 0$ between $y = -1$ and $y = 2$, so any solution with a value in this interval will decrease toward $y = -1$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

For $y > 2$, we have $y' > 0$, so a solution with a $y$-value greater than 2 will increase from there without bound.



In short, solution curves below the horizontal line $y = -1$ in the $xy$-plane rise toward $y = -1$. Solution curves between the lines $y = -1$ and $y = 2$ fall away from $y = 2$ toward $y = -1$. Solution curves above $y = 2$ rise away from $y = 2$ and keep going up.

**3.** *Calculate $y''$ and mark the intervals where $y'' > 0$ and $y'' < 0$.* To find $y''$, we differentiate $y'$ *with respect to* $x$, using implicit differentiation.

$$y' = (y + 1)(y - 2) = y^2 - y - 2 \qquad \text{Formula for } y' \ldots .$$

$$\begin{aligned} y'' &= \frac{d}{dx}(y') = \frac{d}{dx}(y^2 - y - 2) \\ &= 2yy' - y' \qquad \text{differentiated implicitly with respect to } x. \\ &= (2y - 1)y' \\ &= (2y - 1)(y + 1)(y - 2). \end{aligned}$$

From this formula, we see that $y''$ changes sign at $y = -1, y = 1/2$, and $y = 2$. We add the sign information to the phase line.

**4.** *Sketch an assortment of solution curves in the $xy$-plane.* The horizontal lines $y = -1, y = 1/2$, and $y = 2$ partition the plane into horizontal bands in which we know the signs of $y'$ and $y''$. In each band, this information tells us whether the solution curves rise or fall and how they bend as $x$ increases (Figure 9.12).

The "equilibrium lines" $y = -1$ and $y = 2$ are also solution curves. (The constant functions $y = -1$ and $y = 2$ satisfy the differential equation.) Solution curves that cross the line $y = 1/2$ have an inflection point there. The concavity changes from concave down (above the line) to concave up (below the line).

As predicted in Step 2, solutions in the middle and lower bands approach the equilibrium value $y = -1$ as $x$ increases. Solutions in the upper band rise steadily away from the value $y = 2$. ■

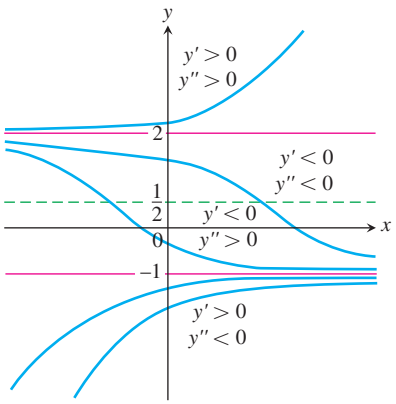


**FIGURE 9.12** Graphical solutions from Example 2 include the horizontal lines $y = -1$ and $y = 2$ through the equilibrium values.

## Stable and Unstable Equilibria

Look at Figure 9.12 once more, in particular at the behavior of the solution curves near the equilibrium values. Once a solution curve has a value near $y = -1$, it tends steadily toward that value; $y = -1$ is a **stable equilibrium**. The behavior near $y = 2$ is just the opposite: all solutions except the equilibrium solution $y = 2$ itself move *away* from it as $x$ increases. We call $y = 2$ an **unstable equilibrium**. If the solution is *at* that value, it stays, but if it is off by any amount, no matter how small, it moves away. (Sometimes an equilibrium value is unstable because a solution moves away from it only on one side of the point.)

Now that we know what to look for, we can already see this behavior on the initial phase line. The arrows lead away from $y = 2$ and, once to the left of $y = 2$, toward $y = -1$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We now present several applied examples for which we can sketch a family of solution curves to the differential equation models using the method in Example 2.

In Section 7.5 we solved analytically the differential equation

$$\frac{dH}{dt} = -k(H - H_S), \qquad k > 0$$

modeling Newton's law of cooling. Here $H$ is the temperature (amount of heat) of an object at time $t$ and $H_S$ is the constant temperature of the surrounding medium. Our first example uses a phase line analysis to understand the graphical behavior of this temperature model over time.

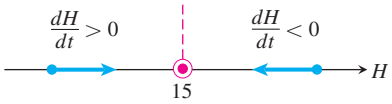

**FIGURE 9.13** First step in constructing the phase line for Newton's law of cooling in Example 3. The temperature tends towards the equilibrium (surrounding-medium) value in the long run.

## EXAMPLE 3 Cooling Soup

What happens to the temperature of the soup when a cup of hot soup is placed on a table in a room? We know the soup cools down, but what does a typical temperature curve look like as a function of time?

**Solution** Suppose that the surrounding medium has a constant Celsius temperature of 15°C. We can then express the difference in temperature as $H(t) - 15$. Assuming $H$ is a differentiable function of time $t$, by Newton's law of cooling, there is a constant of proportionality $k > 0$ such that

$$\frac{dH}{dt} = -k(H - 15) \tag{1}$$

(*minus k* to give a negative derivative when $H > 15$).

Since $dH/dt = 0$ at $H = 15$, the temperature 15°C is an equilibrium value. If $H > 15$, Equation (1) tells us that $(H - 15) > 0$ and $dH/dt < 0$. If the object is hotter than the room, it will get cooler. Similarly, if $H < 15$, then $(H - 15) < 0$ and $dH/dt > 0$. An object cooler than the room will warm up. Thus, the behavior described by Equation (1) agrees with our intuition of how temperature should behave. These observations are captured in the initial phase line diagram in Figure 9.13. The value $H = 15$ is a stable equilibrium.

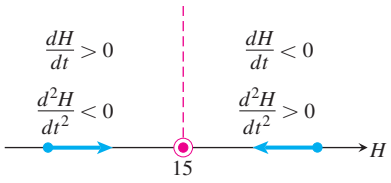

**FIGURE 9.14** The complete phase line for Newton's law of cooling (Example 3).

We determine the concavity of the solution curves by differentiating both sides of Equation (1) with respect to $t$:

$$\frac{d}{dt}\left(\frac{dH}{dt}\right) = \frac{d}{dt}(-k(H - 15))$$

$$\frac{d^2H}{dt^2} = -k\frac{dH}{dt}.$$

Since $-k$ is negative, we see that $d^2H/dt^2$ is positive when $dH/dt < 0$ and negative when $dH/dt > 0$. Figure 9.14 adds this information to the phase line.

The completed phase line shows that if the temperature of the object is above the equilibrium value of 15°C, the graph of $H(t)$ will be decreasing and concave upward. If the temperature is below 15°C (the temperature of the surrounding medium), the graph of $H(t)$ will be increasing and concave downward. We use this information to sketch typical solution curves (Figure 9.15).

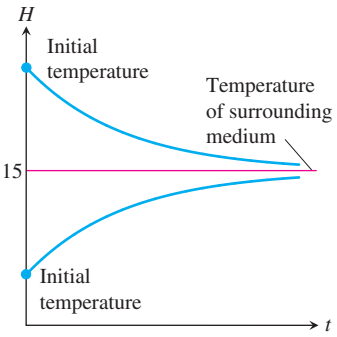

**FIGURE 9.15** Temperature versus time. Regardless of initial temperature, the object's temperature $H(t)$ tends toward 15°C, the temperature of the surrounding medium.

From the upper solution curve in Figure 9.15, we see that as the object cools down, the rate at which it cools slows down because $dH/dt$ approaches zero. This observation is implicit in Newton's law of cooling and contained in the differential equation, but the flattening of the graph as time advances gives an immediate visual representation of the phenomenon. The ability to discern physical behavior from graphs is a powerful tool in understanding real-world systems. ■

**EXAMPLE 4** Analyzing the Fall of a Body Encountering a Resistive Force

Galileo and Newton both observed that the rate of change in momentum encountered by a moving object is equal to the net force applied to it. In mathematical terms,

$$F = \frac{d}{dt}(mv) \tag{2}$$

where $F$ is the force and $m$ and $v$ the object's mass and velocity. If $m$ varies with time, as it will if the object is a rocket burning fuel, the right-hand side of Equation (2) expands to

$$m\frac{dv}{dt} + v\frac{dm}{dt}$$

using the Product Rule. In many situations, however, $m$ is constant, $dm/dt = 0$, and Equation (2) takes the simpler form

$$F = m\frac{dv}{dt} \quad \text{or} \quad F = ma, \tag{3}$$

known as *Newton's second law of motion*.

In free fall, the constant acceleration due to gravity is denoted by $g$ and the one force acting downward on the falling body is

$$F_p = mg,$$

the propulsion due to gravity. If, however, we think of a real body falling through the air—say, a penny from a great height or a parachutist from an even greater height—we know that at some point air resistance is a factor in the speed of the fall. A more realistic model of free fall would include air resistance, shown as a force $F_r$ in the schematic diagram in Figure 9.16.

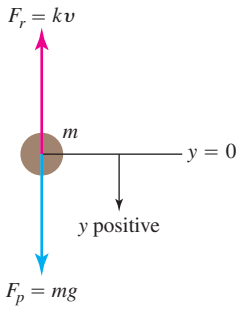

**FIGURE 9.16** An object falling under the influence of gravity with a resistive force assumed to be proportional to the velocity.

For low speeds well below the speed of sound, physical experiments have shown that $F_r$ is approximately proportional to the body's velocity. The net force on the falling body is therefore

$$F = F_p - F_r,$$

giving

$$m\frac{dv}{dt} = mg - kv$$

$$\frac{dv}{dt} = g - \frac{k}{m}v. \tag{4}$$

We can use a phase line to analyze the velocity functions that solve this differential equation.

The equilibrium point, obtained by setting the right-hand side of Equation (4) equal to zero, is

$$v = \frac{mg}{k}.$$

If the body is initially moving faster than this, $dv/dt$ is negative and the body slows down. If the body is moving at a velocity below $mg/k$, then $dv/dt > 0$ and the body speeds up. These observations are captured in the initial phase line diagram in Figure 9.17.

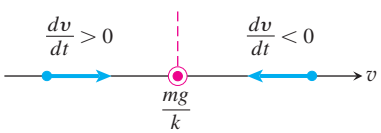

**FIGURE 9.17** Initial phase line for Example 4.

We determine the concavity of the solution curves by differentiating both sides of Equation (4) with respect to $t$:

$$\frac{d^2v}{dt^2} = \frac{d}{dt}\left(g - \frac{k}{m}v\right) = -\frac{k}{m}\frac{dv}{dt}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

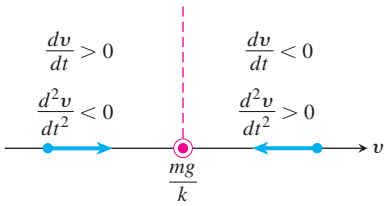

**FIGURE 9.18** The completed phase line for Example 4.

We see that $d^2v/dt^2 < 0$ when $v < mg/k$ and $d^2v/dt^2 > 0$ when $v > mg/k$. Figure 9.18 adds this information to the phase line. Notice the similarity to the phase line for Newton's law of cooling (Figure 9.14). The solution curves are similar as well (Figure 9.19).

Figure 9.19 shows two typical solution curves. Regardless of the initial velocity, we see the body's velocity tending toward the limiting value $v = mg/k$. This value, a stable equilibrium point, is called the body's **terminal velocity**. Skydivers can vary their terminal velocity from 95 mph to 180 mph by changing the amount of body area opposing the fall. ■

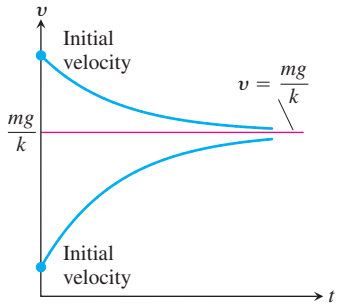

**FIGURE 9.19** Typical velocity curves in Example 4. The value $v = mg/k$ is the terminal velocity.

## EXAMPLE 5 Analyzing Population Growth in a Limiting Environment

In Section 7.5 we examined population growth using the model of exponential change. That is, if $P$ represents the number of individuals and we neglect departures and arrivals, then

$$\frac{dP}{dt} = kP, \tag{5}$$

where $k > 0$ is the birthrate minus the death rate per individual per unit time.

Because the natural environment has only a limited number of resources to sustain life, it is reasonable to assume that only a maximum population $M$ can be accommodated. As the population approaches this **limiting population** or **carrying capacity**, resources become less abundant and the growth rate $k$ decreases. A simple relationship exhibiting this behavior is

$$k = r(M - P),$$

where $r > 0$ is a constant. Notice that $k$ decreases as $P$ increases toward $M$ and that $k$ is negative if $P$ is greater than $M$. Substituting $r(M - P)$ for $k$ in Equation (5) gives the differential equation

$$\frac{dP}{dt} = r(M - P)P = rMP - rP^2. \tag{6}$$

The model given by Equation (6) is referred to as **logistic growth**.

We can forecast the behavior of the population over time by analyzing the phase line for Equation (6). The equilibrium values are $P = M$ and $P = 0$, and we can see that $dP/dt > 0$ if $0 < P < M$ and $dP/dt < 0$ if $P > M$. These observations are recorded on the phase line in Figure 9.20.

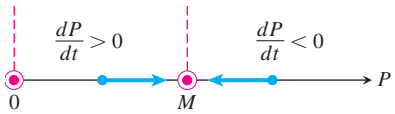

**FIGURE 9.20** The initial phase line for Equation 6.

We determine the concavity of the population curves by differentiating both sides of Equation (6) with respect to $t$:

$$\begin{aligned}\frac{d^2P}{dt^2} &= \frac{d}{dt}(rMP - rP^2)\\ &= rM\frac{dP}{dt} - 2rP\frac{dP}{dt}\\ &= r(M - 2P)\frac{dP}{dt}.\end{aligned} \tag{7}$$

If $P = M/2$, then $d^2P/dt^2 = 0$. If $P < M/2$, then $(M - 2P)$ and $dP/dt$ are positive and $d^2P/dt^2 > 0$. If $M/2 < P < M$, then $(M - 2P) < 0$, $dP/dt > 0$, and $d^2P/dt^2 < 0$. If $P > M$, then $(M - 2P)$ and $dP/dt$ are both negative and $d^2P/dt^2 > 0$. We add this information to the phase line (Figure 9.21).

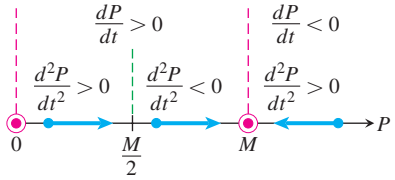

**FIGURE 9.21** The completed phase line for logistic growth (Equation 6).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The lines $P = M/2$ and $P = M$ divide the first quadrant of the $tP$-plane into horizontal bands in which we know the signs of both $dP/dt$ and $d^2P/dt^2$. In each band, we know how the solution curves rise and fall, and how they bend as time passes. The equilibrium lines $P = 0$ and $P = M$ are both population curves. Population curves crossing the line $P = M/2$ have an inflection point there, giving them a **sigmoid** shape (curved in two directions like a letter S). Figure 9.22 displays typical population curves. ■

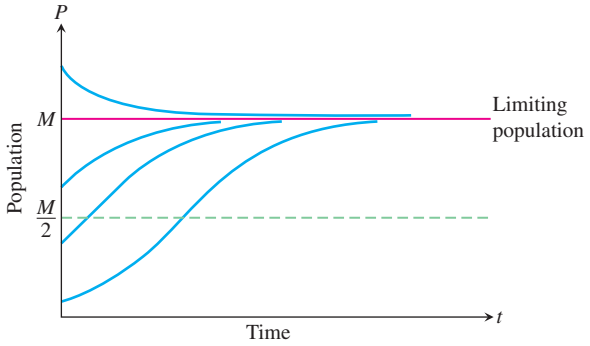

**FIGURE 9.22** Population curves in Example 5.

# EXERCISES 9.4

## Phase Lines and Solution Curves

In Exercises 1–8,

**a.** Identify the equilibrium values. Which are stable and which are unstable?

**b.** Construct a phase line. Identify the signs of $y'$ and $y''$.

**c.** Sketch several solution curves.

**1.** $\dfrac{dy}{dx} = (y + 2)(y - 3)$

**2.** $\dfrac{dy}{dx} = y^2 - 4$

**3.** $\dfrac{dy}{dx} = y^3 - y$

**4.** $\dfrac{dy}{dx} = y^2 - 2y$

**5.** $y' = \sqrt{y}, \quad y > 0$

**6.** $y' = y - \sqrt{y}, \quad y > 0$

**7.** $y' = (y - 1)(y - 2)(y - 3)$

**8.** $y' = y^3 - y^2$

## Models of Population Growth

The autonomous differential equations in Exercises 9–12 represent models for population growth. For each exercise, use a phase line analysis to sketch solution curves for $P(t)$, selecting different starting values $P(0)$ (as in Example 5). Which equilibria are stable, and which are unstable?

**9.** $\dfrac{dP}{dt} = 1 - 2P$

**10.** $\dfrac{dP}{dt} = P(1 - 2P)$

**11.** $\dfrac{dP}{dt} = 2P(P - 3)$

**12.** $\dfrac{dP}{dt} = 3P(1 - P)\left(P - \dfrac{1}{2}\right)$

**13. Catastrophic continuation of Example 5** Suppose that a healthy population of some species is growing in a limited environment and that the current population $P_0$ is fairly close to the carrying capacity $M_0$. You might imagine a population of fish living in a freshwater lake in a wilderness area. Suddenly a catastrophe such as the Mount St. Helens volcanic eruption contaminates the lake and destroys a significant part of the food and oxygen on which the fish depend. The result is a new environment with a carrying capacity $M_1$ considerably less than $M_0$ and, in fact, less than the current population $P_0$. Starting at some time before the catastrophe, sketch a "before-and-after" curve that shows how the fish population responds to the change in environment.

**14. Controlling a population** The fish and game department in a certain state is planning to issue hunting permits to control the deer population (one deer per permit). It is known that if the deer population falls below a certain level $m$, the deer will become extinct. It is also known that if the deer population rises above the carrying capacity $M$, the population will decrease back to $M$ through disease and malnutrition.

**a.** Discuss the reasonableness of the following model for the growth rate of the deer population as a function of time:

$$\frac{dP}{dt} = rP(M - P)(P - m),$$

where $P$ is the population of the deer and $r$ is a positive constant of proportionality. Include a phase line.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**b.** Explain how this model differs from the logistic model $dP/dt = rP(M - P)$. Is it better or worse than the logistic model?

**c.** Show that if $P > M$ for all $t$, then $\lim_{t\to\infty} P(t) = M$.

**d.** What happens if $P < m$ for all $t$?

**e.** Discuss the solutions to the differential equation. What are the equilibrium points of the model? Explain the dependence of the steady-state value of $P$ on the initial values of $P$. About how many permits should be issued?

## Applications and Examples

**15. Skydiving** If a body of mass $m$ falling from rest under the action of gravity encounters an air resistance proportional to the square of velocity, then the body's velocity $t$ seconds into the fall satisfies the equation.

$$m\frac{dv}{dt} = mg - kv^2, \qquad k > 0$$

where $k$ is a constant that depends on the body's aerodynamic properties and the density of the air. (We assume that the fall is too short to be affected by changes in the air's density.)

**a.** Draw a phase line for the equation.

**b.** Sketch a typical velocity curve.

**c.** For a 160-lb skydiver ($mg = 160$) and with time in seconds and distance in feet, a typical value of $k$ is 0.005. What is the diver's terminal velocity?

**16. Resistance proportional to $\sqrt{v}$** A body of mass $m$ is projected vertically downward with initial velocity $v_0$. Assume that the resisting force is proportional to the square root of the velocity and find the terminal velocity from a graphical analysis.

**17. Sailing** A sailboat is running along a straight course with the wind providing a constant forward force of 50 lb. The only other force acting on the boat is resistance as the boat moves through the water. The resisting force is numerically equal to five times the boat's speed, and the initial velocity is 1 ft/sec. What is the maximum velocity in feet per second of the boat under this wind?

**18. The spread of information** Sociologists recognize a phenomenon called *social diffusion,* which is the spreading of a piece of information, technological innovation, or cultural fad among a population. The members of the population can be divided into two classes: those who have the information and those who do not. In a fixed population whose size is known, it is reasonable to assume that the rate of diffusion is proportional to the number who have the information times the number yet to receive it. If $X$ denotes the number of individuals who have the information in a population of $N$ people, then a mathematical model for social diffusion is given by

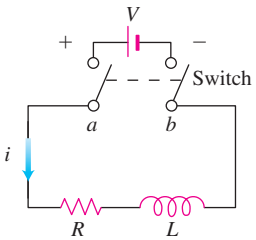
$$\frac{dX}{dt} = kX(N - X),$$

where $t$ represents time in days and $k$ is a positive constant.

**a.** Discuss the reasonableness of the model.

**b.** Construct a phase line identifying the signs of $X'$ and $X''$.

**c.** Sketch representative solution curves.



**d.** Predict the value of $X$ for which the information is spreading most rapidly. How many people eventually receive the information?

**19. Current in an *RL*-circuit** The accompanying diagram represents an electrical circuit whose total resistance is a constant $R$ ohms and whose self-inductance, shown as a coil, is $L$ henries, also a constant. There is a switch whose terminals at $a$ and $b$ can be closed to connect a constant electrical source of $V$ volts.

Ohm's Law, $V = Ri$, has to be modified for such a circuit. The modified form is

$$L\frac{di}{dt} + Ri = V,$$

where $i$ is the intensity of the current in amperes and $t$ is the time in seconds. By solving this equation, we can predict how the current will flow after the switch is closed.

Use a phase line analysis to sketch the solution curve assuming that the switch in the *RL*-circuit is closed at time $t = 0$. What happens to the current as $t \to \infty$? This value is called the *steady-state solution.*

**20. A pearl in shampoo** Suppose that a pearl is sinking in a thick fluid, like shampoo, subject to a frictional force opposing its fall and proportional to its velocity. Suppose that there is also a resistive buoyant force exerted by the shampoo. According to *Archimedes' principle,* the buoyant force equals the weight of the fluid displaced by the pearl. Using $m$ for the mass of the pearl and $P$ for the mass of the shampoo displaced by the pearl as it descends, complete the following steps.

**a.** Draw a schematic diagram showing the forces acting on the pearl as it sinks, as in Figure 9.16.

**b.** Using $v(t)$ for the pearl's velocity as a function of time $t$, write a differential equation modeling the velocity of the pearl as a falling body.

**c.** Construct a phase line displaying the signs of $v'$ and $v''$.

**d.** Sketch typical solution curves.

**e.** What is the terminal velocity of the pearl?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# 9.5 Applications of First-Order Differential Equations

We now look at three applications of the differential equations we have been studying. The first application analyzes an object moving along a straight line while subject to a force opposing its motion. The second is a model of population growth which takes into account factors in the environment placing limits on growth, such as the availability of food or other vital resources. The last application considers a curve or curves intersecting each curve in a second family of curves *orthogonally* (that is, at right angles).

## Resistance Proportional to Velocity

In some cases it is reasonable to assume that the resistance encountered by a moving object, such as a car coasting to a stop, is proportional to the object's velocity. The faster the object moves, the more its forward progress is resisted by the air through which it passes. To describe this in mathematical terms, we picture the object as a mass $m$ moving along a coordinate line with position function $s$ and velocity $v$ at time $t$. From Newton's second law of motion, the resisting force opposing the motion is

$$\text{Force} = \text{mass} \times \text{acceleration} = m\frac{dv}{dt}.$$

We can express the assumption that the resisting force is proportional to velocity by writing

$$m\frac{dv}{dt} = -kv \qquad \text{or} \qquad \frac{dv}{dt} = -\frac{k}{m}v \qquad (k > 0).$$

This is a separable differential equation representing exponential change. The solution to the equation with initial condition $v = v_0$ at $t = 0$ is (Section 7.5)

$$v = v_0 e^{-(k/m)t}. \tag{1}$$

What can we learn from Equation (1)? For one thing, we can see that if $m$ is something large, like the mass of a 20,000-ton ore boat in Lake Erie, it will take a long time for the velocity to approach zero (because $t$ must be large in the exponent of the equation in order to make $kt/m$ large enough for $v$ to be small). We can learn even more if we integrate Equation (1) to find the position $s$ as a function of time $t$.

Suppose that a body is coasting to a stop and the only force acting on it is a resistance proportional to its speed. How far will it coast? To find out, we start with Equation (1) and solve the initial value problem

$$\frac{ds}{dt} = v_0 e^{-(k/m)t}, \qquad s(0) = 0.$$

Integrating with respect to $t$ gives

$$s = -\frac{v_0 m}{k}e^{-(k/m)t} + C.$$

Substituting $s = 0$ when $t = 0$ gives

$$0 = -\frac{v_0 m}{k} + C \qquad \text{and} \qquad C = \frac{v_0 m}{k}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The body's position at time $t$ is therefore

$$s(t) = -\frac{v_0 m}{k} e^{-(k/m)t} + \frac{v_0 m}{k} = \frac{v_0 m}{k}(1 - e^{-(k/m)t}). \tag{2}$$

To find how far the body will coast, we find the limit of $s(t)$ as $t \to \infty$. Since $-(k/m) < 0$, we know that $e^{-(k/m)t} \to 0$ as $t \to \infty$, so that

$$\lim_{t\to\infty} s(t) = \lim_{t\to\infty} \frac{v_0 m}{k}(1 - e^{-(k/m)t})$$
$$= \frac{v_0 m}{k}(1 - 0) = \frac{v_0 m}{k}.$$

Thus,

$$\text{Distance coasted} = \frac{v_0 m}{k}. \tag{3}$$

This is an ideal figure, of course. Only in mathematics can time stretch to infinity. The number $v_0 m/k$ is only an upper bound (albeit a useful one). It is true to life in one respect, at least: if $m$ is large, it will take a lot of energy to stop the body. That is why ocean liners have to be docked by tugboats. Any liner of conventional design entering a slip with enough speed to steer would smash into the pier before it could stop.

In the English system, where weight is measured in pounds, mass is measured in **slugs**. Thus,

$$\text{Pounds} = \text{slugs} \times 32,$$

assuming the gravitational constant is 32 ft/sec$^2$.

### EXAMPLE 1 A Coasting Ice Skater

For a 192-lb ice skater, the $k$ in Equation (1) is about 1/3 slug/sec and $m = 192/32 = 6$ slugs. How long will it take the skater to coast from 11 ft/sec (7.5 mph) to 1 ft/sec? How far will the skater coast before coming to a complete stop?

**Solution** We answer the first question by solving Equation (1) for $t$:

$$11e^{-t/18} = 1 \qquad \text{Eq. (1) with } k = 1/3,\ m = 6,\ v_0 = 11,\ v = 1$$
$$e^{-t/18} = 1/11$$
$$-t/18 = \ln(1/11) = -\ln 11$$
$$t = 18 \ln 11 \approx 43 \text{ sec}.$$

We answer the second question with Equation (3):

$$\text{Distance coasted} = \frac{v_0 m}{k} = \frac{11 \cdot 6}{1/3}$$
$$= 198 \text{ ft}.$$

■

## Modeling Population Growth

In Section 7.5 we modeled population growth with the Law of Exponential Change:

$$\frac{dP}{dt} = kP, \qquad P(0) = P_0$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

where $P$ is the population at time $t$, $k > 0$ is a constant growth rate, and $P_0$ is the size of the population at time $t = 0$. In Section 7.5 we found the solution $P = P_0 e^{kt}$ to this model. However, an issue to be addressed is "how good is the model?"

To begin an assessment of the model, notice that the exponential growth differential equation says that

$$\frac{dP/dt}{P} = k \tag{4}$$

is constant. This rate is called the **relative growth rate**. Now, Table 9.4 gives the world population at midyear for the years 1980 to 1989. Taking $dt = 1$ and $dP \approx \Delta P$, we see from the table that the relative growth rate in Equation (4) is approximately the constant 0.017. Thus, based on the tabled data with $t = 0$ representing 1980, $t = 1$ representing 1981, and so forth, the world population could be modeled by

$$\text{Differential equation:} \quad \frac{dP}{dt} = 0.017P$$
$$\text{Initial condition:} \quad P(0) = 4454.$$

**TABLE 9.4** World population (midyear)

| Year | Population (millions) | $\Delta P/P$ |
|---|---|---|
| 1980 | 4454 | $76/4454 \approx 0.0171$ |

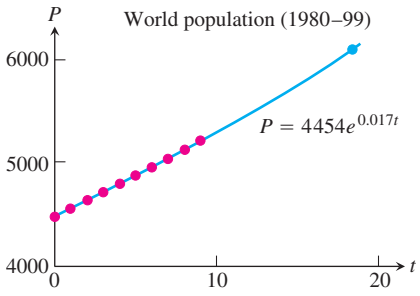

**FIGURE 9.23** Notice that the value of the solution $P = 4454e^{0.017t}$ is 6152.16 when $t = 19$, which is slightly higher than the actual population in 1999.

The solution to this initial value problem gives the population function $P = 4454e^{0.017t}$. In year 1999 (so $t = 19$), the solution predicts the world population in midyear to be about 6152 million, or 6.15 billion (Figure 9.23), which is more than the actual population of 6001 million given by the U.S. Bureau of the Census (Table 9.5). Let's examine more recent data to see if there is a change in the growth rate.

Table 9.5 shows the world population for the years 1990 to 2002. From the table we see that the relative growth rate is positive but decreases as the population increases due to

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

environmental, economic, and other factors. On average, the growth rate decreases by about 0.0003 per year over the years 1990 to 2002. That is, the graph of $k$ in Equation (4) is closer to being a line with a negative slope $-r = -0.0003$. In Example 5 of Section 9.4 we proposed the more realistic **logistic growth model**

$$\frac{dP}{dt} = r(M - P)P, \tag{5}$$

where $M$ is the maximum population, or **carrying capacity**, that the environment is capable of sustaining in the long run. Comparing Equation (5) with the exponential model, we see that $k = r(M - P)$ is a linearly decreasing function of the population rather than a constant. The graphical solution curves to the logistic model of Equation (5) were obtained in Section 9.4 and are displayed (again) in Figure 9.24. Notice from the graphs that if $P < M$, the population grows toward $M$; if $P > M$, the growth rate will be negative (as $r > 0, M > 0$) and the population decreasing.

**TABLE 9.5** Recent world population

| Year | Population (millions) | $\Delta P/P$ |
|---|---|---|
| 1990 | 5275 | $84/5275 \approx 0.0159$ |
| 1991 | 5359 | $84/5359 \approx 0.0157$ |
| 1992 | 5443 | $81/5443 \approx 0.0149$ |
| 1993 | 5524 | $81/5524 \approx 0.0147$ |

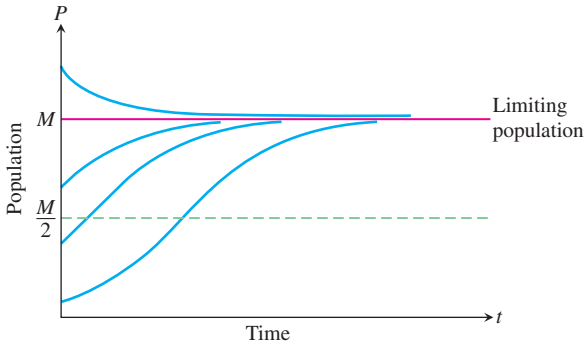

**FIGURE 9.24** Solution curves to the logistic population model $dP/dt = r(M - P)P$.

**EXAMPLE 2** Modeling a Bear Population

A national park is known to be capable of supporting 100 grizzly bears, but no more. Ten bears are in the park at present. We model the population with a logistic differential equation with $r = 0.001$ (although the model may not give reliable results for very small population levels).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

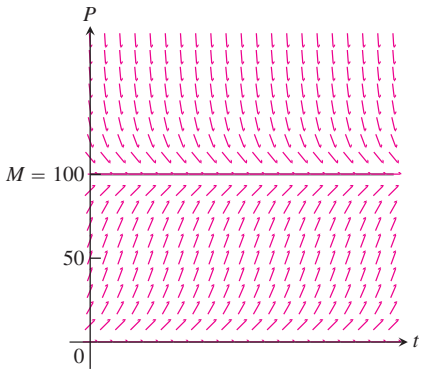

**FIGURE 9.25** A slope field for the logistic differential equation $dP/dt = 0.001(100 - P)P$ (Example 2).

**(a)** Draw and describe a slope field for the differential equation.

**(b)** Use Euler's method with step size $dt = 1$ to estimate the population size in 20 years.

**(c)** Find a logistic growth analytic solution $P(t)$ for the population and draw its graph.

**(d)** When will the bear population reach 50?

**Solution**

**(a)** *Slope field*. The carrying capacity is 100, so $M = 100$. The solution we seek is a solution to the following differential equation.

$$\frac{dP}{dt} = 0.001(100 - P)P$$

Figure 9.25 shows a slope field for this differential equation. There appears to be a horizontal asymptote at $P = 100$. The solution curves fall toward this level from above and rise toward it from below.

**(b)** *Euler's method*. With step size $dt = 1$, $t_0 = 0$, $P(0) = 10$, and

$$\frac{dP}{dt} = f(t, P) = 0.001(100 - P)P,$$

we obtain the approximations in Table 9.6, using the iteration formula

$$P_n = P_{n-1} + 0.001(100 - P_{n-1})P_{n-1}.$$

**TABLE 9.6** Euler solution of $dP/dt = 0.001(100 - P)P$, $P(0) = 10$, step size $dt = 1$

| $t$ | $P$ (Euler) | $t$ | $P$ (Euler) |
|---|---|---|---|
| 0 | 10 | | |
| 1 | 10.9 | 11 | 24.3629 |
| 2 | 11.8712 | 12 | 26.2056 |
| 3 | 12.9174 | 13 | 28.1395 |
| 4 | 14.0423 | 14 | 30.1616 |
| 5 | 15.2493 | 15 | 32.2680 |
| 6 | 16.5417 | 16 | 34.4536 |
| 7 | 17.9222 | 17 | 36.7119 |
| 8 | 19.3933 | 18 | 39.0353 |
| 9 | 20.9565 | 19 | 41.4151 |
| 10 | 22.6130 | 20 | 43.8414 |

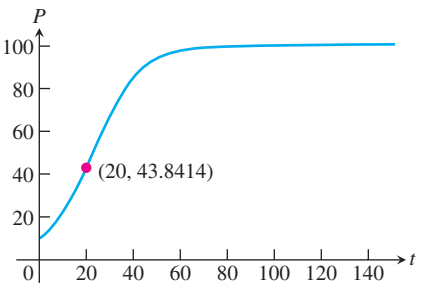

**FIGURE 9.26** Euler approximations of the solution to $dP/dt = 0.001(100 - P)P$, $P(0) = 10$, step size $dt = 1$.

There are approximately 44 grizzly bears after 20 years. Figure 9.26 shows a graph of the Euler approximation over the interval $0 \le t \le 150$ with step size $dt = 1$. It looks like the lower curves we sketched in Figure 9.24.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**(c)** *Analytic solution*. We can assume that $t = 0$ when the bear population is 10, so $P(0) = 10$. The logistic growth model we seek is the solution to the following initial value problem.

$$\text{Differential equation:} \quad \frac{dP}{dt} = 0.001(100 - P)P$$

$$\text{Initial condition:} \quad P(0) = 10$$

To prepare for integration, we rewrite the differential equation in the form

$$\frac{1}{P(100 - P)}\frac{dP}{dt} = 0.001.$$

Using partial fraction decomposition on the left-hand side and multiplying both sides by 100, we get

$$\left(\frac{1}{P} + \frac{1}{100 - P}\right)\frac{dP}{dt} = 0.1$$

$$\ln|P| - \ln|100 - P| = 0.1t + C \qquad \text{Integrate with respect to } t.$$

$$\ln\left|\frac{P}{100 - P}\right| = 0.1t + C$$

$$\ln\left|\frac{100 - P}{P}\right| = -0.1t - C \qquad \ln\frac{a}{b} = -\ln\frac{b}{a}$$

$$\left|\frac{100 - P}{P}\right| = e^{-0.1t - C} \qquad \text{Exponentiate.}$$

$$\frac{100 - P}{P} = (\pm e^{-C})e^{-0.1t}$$

$$\frac{100}{P} - 1 = Ae^{-0.1t} \qquad \text{Let } A = \pm e^{-c}.$$

$$P = \frac{100}{1 + Ae^{-0.1t}}. \qquad \text{Solve for } P.$$

This is the general solution to the differential equation. When $t = 0$, $P = 10$, and we obtain

$$10 = \frac{100}{1 + Ae^0}$$

$$1 + A = 10$$

$$A = 9.$$

Thus, the logistic growth model is

$$P = \frac{100}{1 + 9e^{-0.1t}}.$$

Its graph (Figure 9.27) is superimposed on the slope field from Figure 9.25.

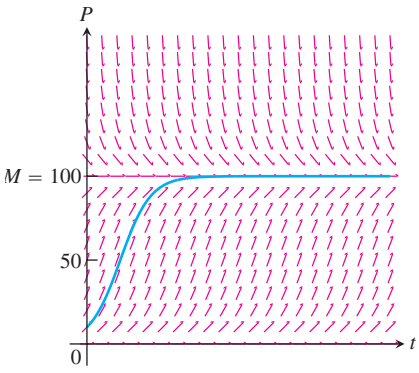

**FIGURE 9.27** The graph of

$$P = \frac{100}{1 + 9e^{-0.1t}}$$

superimposed on the slope field in Figure 9.25 (Example 2).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**(d)** When will the bear population reach 50? For this model,

$$\begin{aligned} 50 &= \frac{100}{1 + 9e^{-0.1t}} \\ 1 + 9e^{-0.1t} &= 2 \\ e^{-0.1t} &= \frac{1}{9} \\ e^{0.1t} &= 9 \\ t &= \frac{\ln 9}{0.1} \approx 22 \text{ years}. \end{aligned}$$

■

The solution of the general logistic differential equation

$$\frac{dP}{dt} = r(M - P)P$$

can be obtained as in Example 2. In Exercise 10, we ask you to show that the solution is

$$P = \frac{M}{1 + Ae^{-rMt}}.$$

The value of $A$ is determined by an appropriate initial condition.

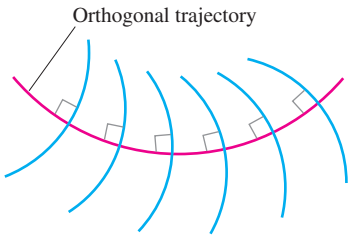

**FIGURE 9.28** An orthogonal trajectory intersects the family of curves at right angles, or orthogonally.

## Orthogonal Trajectories

An **orthogonal trajectory** of a family of curves is a curve that intersects each curve of the family at right angles, or *orthogonally* (Figure 9.28). For instance, each straight line through the origin is an orthogonal trajectory of the family of circles $x^2 + y^2 = a^2$, centered at the origin (Figure 9.29). Such mutually orthogonal systems of curves are of particular importance in physical problems related to electrical potential, where the curves in one family correspond to flow of electric current and those in the other family correspond to curves of constant potential. They also occur in hydrodynamics and heat-flow problems.

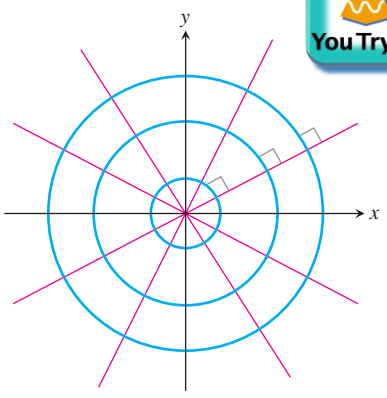

**FIGURE 9.29** Every straight line through the origin is orthogonal to the family of circles centered at the origin.

### EXAMPLE 3 Finding Orthogonal Trajectories

Find the orthogonal trajectories of the family of curves $xy = a$, where $a \neq 0$ is an arbitrary constant.

**Solution** The curves $xy = a$ form a family of hyperbolas with asymptotes $y = \pm x$. First we find the slopes of each curve in this family, or their $dy/dx$ values. Differentiating $xy = a$ implicitly gives

$$x\frac{dy}{dx} + y = 0 \qquad \text{or} \qquad \frac{dy}{dx} = -\frac{y}{x}.$$

Thus the slope of the tangent line at any point $(x, y)$ on one of the hyperbolas $xy = a$ is $y' = -y/x$. On an orthogonal trajectory the slope of the tangent line at this same point must be the negative reciprocal, or $x/y$. Therefore, the orthogonal trajectories must satisfy the differential equation

$$\frac{dy}{dx} = \frac{x}{y}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

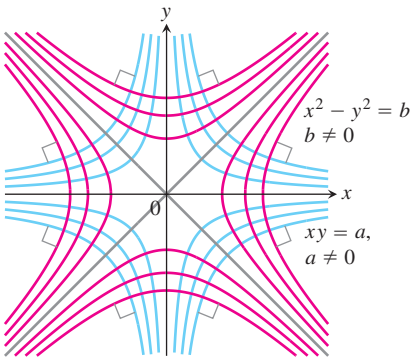

**FIGURE 9.30** Each curve is orthogonal to every curve it meets in the other family (Example 3).

This differential equation is separable and we solve it as in Section 9.1:

$$y\,dy = x\,dx \qquad \text{Separate variables.}$$

$$\int y\,dy = \int x\,dx \qquad \text{Integrate both sides.}$$

$$\frac{1}{2}y^2 = \frac{1}{2}x^2 + C$$

$$y^2 - x^2 = b, \tag{6}$$

where $b = 2C$ is an arbitrary constant. The orthogonal trajectories are the family of hyperbolas given by Equation (6) and sketched in Figure 9.30. ■

## EXERCISES 9.5

1. **Coasting bicycle** A 66-kg cyclist on a 7-kg bicycle starts coasting on level ground at 9 m/sec. The $k$ in Equation (1) is about 3.9 kg/sec.
   **a.** About how far will the cyclist coast before reaching a complete stop?
   **b.** How long will it take the cyclist's speed to drop to 1 m/sec?
2. **Coasting battleship** Suppose that an Iowa class battleship has mass around 51,000 metric tons (51,000,000 kg) and a $k$ value in Equation (1) of about 59,000 kg/sec. Assume that the ship loses power when it is moving at a speed of 9 m/sec.
   **a.** About how far will the ship coast before it is dead in the water?
   **b.** About how long will it take the ship's speed to drop to 1 m/sec?
3. The data in Table 9.7 were collected with a motion detector and a CBL™ by Valerie Sharritts, a mathematics teacher at St. Francis DeSales High School in Columbus, Ohio. The table shows the distance $s$ (meters) coasted on in-line skates in $t$ sec by her daughter Ashley when she was 10 years old. Find a model for Ashley's position given by the data in Table 9.7 in the form of Equation (2). Her initial velocity was $v_0 = 2.75$ m/sec, her mass $m = 39.92$ kg (she weighed 88 lb), and her total coasting distance was 4.91 m.
4. **Coasting to a stop** Table 9.8 shows the distance $s$ (meters) coasted on in-line skates in terms of time $t$ (seconds) by Kelly Schmitzer. Find a model for her position in the form of Equation (2). Her initial velocity was $v_0 = 0.80$ m/sec, her mass $m = 49.90$ kg (110 lb), and her total coasting distance was 1.32 m.

5. **Guppy population** A 2000-gal tank can support no more than 150 guppies. Six guppies are introduced into the tank. Assume that the rate of growth of the population is

$$\frac{dP}{dt} = 0.0015(150 - P)P,$$

where time $t$ is in weeks.

**TABLE 9.7** Ashley Sharritts skating data

| $t$ (sec) | $s$ (m) | $t$ (sec) | $s$ (m) | $t$ (sec) | $s$ (m) |

| 1.92 | 2.73 | 4.16 | 4.63 | 6.40 | 4.91 |
| 2.08 | 2.89 | 4.32 | 4.69 | 6.56 | 4.91 |

   **a.** Find a formula for the guppy population in terms of $t$.
   **b.** How long will it take for the guppy population to be 100? 125?
6. **Gorilla population** A certain wild animal preserve can support no more than 250 lowland gorillas. Twenty-eight gorillas were known to be in the preserve in 1970. Assume that the rate of growth of the population is

$$\frac{dP}{dt} = 0.0004(250 - P)P,$$

where time $t$ is in years.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**TABLE 9.8** Kelly Schmitzer skating data

| $t$ (sec) | $s$ (m) | $t$ (sec) | $s$ (m) | $t$ (sec) | $s$ (m) |
|---|---|---|---|---|---|
| 0 | 0 | 1.5 | 0.89 | 3.1 | 1.30 |
| 0.1 | 0.07 | 1.7 | 0.97 | 3.3 | 1.31 |

| 1.3 | 0.81 | 2.9 | 1.28 | 4.5 | 1.32 |

**a.** Find a formula for the gorilla population in terms of $t$.

**b.** How long will it take for the gorilla population to reach the carrying capacity of the preserve?

**7. Pacific halibut fishery** The Pacific halibut fishery has been modeled by the logistic equation

$$\frac{dy}{dt} = r(M - y)y$$

where $y(t)$ is the total weight of the halibut population in kilograms at time $t$ (measured in years), the carrying capacity is estimated to be $M = 8 \times 10^7$ kg, and $r = 0.08875 \times 10^{-7}$ per year.

**a.** If $y(0) = 1.6 \times 10^7$ kg, what is the total weight of the halibut population after 1 year?

**b.** When will the total weight in the halibut fishery reach $4 \times 10^7$ kg?

**8. Modified logistic model** Suppose that the logistic differential equation in Example 2 is modified to

$$\frac{dP}{dt} = 0.001(100 - P)P - c$$

for some constant $c$.

**a.** Explain the meaning of the constant $c$. What values for $c$ might be realistic for the grizzly bear population?

T **b.** Draw a direction field for the differential equation when $c = 1$. What are the equilibrium solutions (Section 9.4)?

**c.** Sketch several solution curves in your direction field from part (a). Describe what happens to the grizzly bear population for various initial populations.

**9. Exact solutions** Find the exact solutions to the following initial value problems.

**a.** $y' = 1 + y, \quad y(0) = 1$

**b.** $y' = 0.5(400 - y)y, \quad y(0) = 2$

**10. Logistic differential equation** Show that the solution of the differential equation

$$\frac{dP}{dt} = r(M - P)P$$

is

$$P = \frac{M}{1 + Ae^{-rMt}},$$

where $A$ is an arbitrary constant.

**11. Catastrophic solution** Let $k$ and $P_0$ be positive constants.

**a.** Solve the initial value problem?

$$\frac{dP}{dt} = kP^2, \quad P(0) = P_0$$

T **b.** Show that the graph of the solution in part (a) has a vertical asymptote at a positive value of $t$. What is that value of $t$?

**12. Extinct populations** Consider the population model

$$\frac{dP}{dt} = r(M - P)(P - m),$$

where $r > 0$, $M$ is the maximum sustainable population, and $m$ is the minimum population below which the species becomes extinct.

**a.** Let $m = 100$, and $M = 1200$, and assume that $m < P < M$. Show that the differential equation can be rewritten in the form

$$\left[\frac{1}{1200 - P} + \frac{1}{P - 100}\right]\frac{dP}{dt} = 1100r$$

and solve this separable equation.

**b.** Find the solution to part (a) that satisfies $P(0) = 300$.

**c.** Solve the differential equation with the restriction $m < P < M$.

## Orthogonal Trajectories

In Exercises 13–18, find the orthogonal trajectories of the family of curves. Sketch several members of each family.

**13.** $y = mx$ **14.** $y = cx^2$

**15.** $kx^2 + y^2 = 1$ **16.** $2x^2 + y^2 = c^2$

**17.** $y = ce^{-x}$ **18.** $y = e^{kx}$

**19.** Show that the curves $2x^2 + 3y^2 = 5$ and $y^2 = x^3$ are orthogonal.

**20.** Find the family of solutions of the given differential equation and the family of orthogonal trajectories. Sketch both families.

**a.** $x\,dx + y\,dy = 0$ **b.** $x\,dy - 2y\,dx = 0$

**21.** Suppose $a$ and $b$ are positive numbers. Sketch the parabolas

$$y^2 = 4a^2 - 4ax \quad \text{and} \quad y^2 = 4b^2 + 4bx$$

in the same diagram. Show that they intersect at $\left(a - b, \pm 2\sqrt{ab}\right)$, and that each "$a$-parabola" is orthogonal to every "$b$-parabola."

# Chapter 9 Additional and Advanced Exercises

## Theory and Applications

1. **Transport through a cell membrane** Under some conditions, the result of the movement of a dissolved substance across a cell's membrane is described by the equation

$$\frac{dy}{dt} = k\frac{A}{V}(c - y).$$

In this equation, $y$ is the concentration of the substance inside the cell and $dy/dt$ is the rate at which $y$ changes over time. The letters

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$k$, $A$, $V$, and $c$ stand for constants, $k$ being the *permeability coefficient* (a property of the membrane), $A$ the surface area of the membrane, $V$ the cell's volume, and $c$ the concentration of the substance outside the cell. The equation says that the rate at which the concentration changes within the cell is proportional to the difference between it and the outside concentration.

**a.** Solve the equation for $y(t)$, using $y_0$ to denote $y(0)$.

**b.** Find the steady-state concentration, $\lim_{t\to\infty} y(t)$. (Based on *Some Mathematical Models in Biology*, edited by R. M. Thrall, J. A. Mortimer, K. R. Rebman, and R. F. Baum, rev. ed., Dec. 1967, PB-202 364, pp. 101–103; distributed by N.T.I.S., U.S. Department of Commerce.)

**2. Oxygen flow mixture** Oxygen flows through one tube into a liter flask filled with air, and the mixture of oxygen and air (considered well stirred) escapes through another tube. Assuming that air contains 21% oxygen, what percentage of oxygen will the flask contain after 5 L have passed through the intake tube?

**3. Carbon dioxide in a classroom** If the average person breathes 20 times per minute, exhaling each time 100 $in^3$ of air containing 4% carbon dioxide, find the percentage of carbon dioxide in the air of a 10,000 $ft^3$ closed room 1 hour after a class of 30 students enters. Assume that the air is fresh at the start, that the ventilators admit 1000 $ft^3$ of fresh air per minute, and that the fresh air contains 0.04% carbon dioxide.

**4. Height of a rocket** If an external force $F$ acts upon a system whose mass varies with time, Newton's law of motion is

$$\frac{d(mv)}{dt} = F + (v + u)\frac{dm}{dt}.$$

In this equation, $m$ is the mass of the system at time $t$, $v$ its velocity, and $v + u$ is the velocity of the mass that is entering (or leaving) the system at the rate $dm/dt$. Suppose that a rocket of initial mass $m_0$ starts from rest, but is driven upward by firing some of its mass directly backward at the constant rate of $dm/dt = -b$ units per second and at constant speed relative to the rocket $u = -c$. The only external force acting on the rocket is $F = -mg$ due to gravity. Under these assumptions, show that the height of the rocket above the ground at the end of $t$ seconds ($t$ small compared to $m_0/b$) is

$$y = c\left[t + \frac{m_0 - bt}{b}\ln\frac{m_0 - bt}{m_0}\right] - \frac{1}{2}gt^2.$$

**5. a.** Assume that $P(x)$ and $Q(x)$ are continuous over the interval $[a, b]$. Use the Fundamental Theorem of Calculus, Part 1 to show that any function $y$ satisfying the equation

$$v(x)y = \int v(x)Q(x)\,dx + C$$

for $v(x) = e^{\int P(x)\,dx}$ is a solution to the first-order linear equation

$$\frac{dy}{dx} + P(x)y = Q(x).$$

**b.** If $C = y_0 v(x_0) - \int_{x_0}^{x} v(t)Q(t)\,dt$, then show that any solution $y$ in part (a) satisfies the initial condition $y(x_0) = y_0$.

**6.** (*Continuation of Exercise 5.*) Assume the hypotheses of Exercise 5, and assume that $y_1(x)$ and $y_2(x)$ are both solutions to the first-order linear equation satisfying the initial condition $y(x_0) = y_0$.

**a.** Verify that $y(x) = y_1(x) - y_2(x)$ satisfies the initial value problem

$$y' + P(x)y = 0, \quad y(x_0) = 0.$$

**b.** For the integrating factor $v(x) = e^{\int P(x)\,dx}$, show that

$$\frac{d}{dx}(v(x)[y_1(x) - y_2(x)]) = 0.$$

Conclude that $v(x)[y_1(x) - y_2(x)] \equiv$ constant.

**c.** From part (a), we have $y_1(x_0) - y_2(x_0) = 0$. Since $v(x) > 0$ for $a < x < b$, use part (b) to establish that $y_1(x) - y_2(x) \equiv 0$ on the interval $(a, b)$. Thus $y_1(x) = y_2(x)$ for all $a < x < b$.

# Chapter 9 Practice Exercises

In Exercises 1–20 solve the differential equation.

**1.** $\dfrac{dy}{dx} = \sqrt{y}\cos^2\sqrt{y}$

**2.** $y' = \dfrac{3y(x+1)^2}{y-1}$

**3.** $yy' = \sec y^2 \sec^2 x$

**4.** $y\cos^2 x\,dy + \sin x\,dx = 0$

**5.** $y' = xe^y\sqrt{x-2}$

**6.** $y' = xye^{x^2}$

**7.** $\sec x\,dy + x\cos^2 y\,dx = 0$

**8.** $2x^2\,dx - 3\sqrt{y}\csc x\,dy = 0$

**9.** $y' = \dfrac{e^y}{xy}$

**10.** $y' = xe^{x-y}\csc y$

**11.** $x(x-1)\,dy - y\,dx = 0$

**12.** $y' = (y^2-1)x^{-1}$

**13.** $2y' - y = xe^{x/2}$

**14.** $\dfrac{y'}{2} + y = e^{-x}\sin x$

**15.** $xy' + 2y = 1 - x^{-1}$

**16.** $xy' - y = 2x\ln x$

**17.** $(1+e^x)\,dy + (ye^x + e^{-x})\,dx = 0$

**18.** $e^{-x}\,dy + (e^{-x}y - 4x)\,dx = 0$

**19.** $(x + 3y^2)\,dy + y\,dx = 0$ (*Hint:* $d(xy) = y\,dx + x\,dy$)

**20.** $x\,dy + (3y - x^{-2}\cos x)\,dx = 0, \quad x > 0$

## Initial Value Problems

In Exercises 21–30 solve the initial value problem.

**21.** $\dfrac{dy}{dx} = e^{-x-y-2}, \quad y(0) = -2$

**22.** $\dfrac{dy}{dx} = \dfrac{y\ln y}{1+x^2}, \quad y(0) = e^2$

**23.** $(x+1)\dfrac{dy}{dx} + 2y = x, \quad x > -1, \quad y(0) = 1$

**24.** $x\dfrac{dy}{dx} + 2y = x^2 + 1, \quad x > 0, \quad y(1) = 1$

**25.** $\dfrac{dy}{dx} + 3x^2y = x^2, \quad y(0) = -1$

**26.** $x\,dy + (y - \cos x)\,dx = 0, \quad y\left(\dfrac{\pi}{2}\right) = 0$

**27.** $x\,dy - \left(y + \sqrt{y}\right)dx = 0, \quad y(1) = 1$

**28.** $y^{-2}\dfrac{dx}{dy} = \dfrac{e^x}{e^{2x}+1}, \quad y(0) = 1$

**29.** $xy' + (x-2)y = 3x^3e^{-x}, \quad y(1) = 0$

**30.** $y\,dx + (3x - xy + 2)\,dy = 0, \quad y(2) = -1, \quad y < 0$

## Euler's Method

In Exercises 31 and 32, use the stated method to solve the initial value problem on the given interval starting at $x_0$ with $dx = 0.1$.

T **31. Euler:** $y' = y + \cos x, \quad y(0) = 0; \quad 0 \le x \le 2; \quad x_0 = 0$

T **32. Improved Euler:** $y' = (2-y)(2x+3), \quad y(-3) = 1;$ $-3 \le x \le -1; \quad x_0 = -3$

In Exercises 33 and 34, use the stated method with $dx = 0.05$ to estimate $y(c)$ where $y$ is the solution to the given initial value problem.

T **33. Improved Euler:**

$$c = 3; \quad \frac{dy}{dx} = \frac{x-2y}{x+1}, \quad y(0) = 1$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**T** **34. Euler:**

$$c = 4; \quad \frac{dy}{dx} = \frac{x^2 - 2y + 1}{x}, \quad y(1) = 1$$

In Exercises 35 and 36, use the stated method to solve the initial value problem graphically, starting at $x_0 = 0$ with

**a.** $dx = 0.1$. **b.** $dx = -0.1$.

**T** **35. Euler:**

$$\frac{dy}{dx} = \frac{1}{e^{x+y+2}}, \quad y(0) = -2$$

**T** **36. Improved Euler:**

$$\frac{dy}{dx} = -\frac{x^2 + y}{e^y + x}, \quad y(0) = 0$$

## Slope Fields

In Exercises 37–40, sketch part of the equation's slope field. Then add to your sketch the solution curve that passes through the point $P(1, -1)$. Use Euler's method with $x_0 = 1$ and $dx = 0.2$ to estimate $y(2)$. Round your answers to four decimal places. Find the exact value of $y(2)$ for comparison.

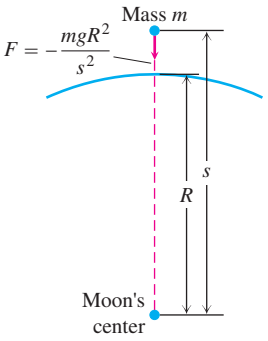
**37.** $y' = x$ **38.** $y' = 1/x$

**39.** $y' = xy$ **40.** $y' = 1/y$

## Autonomous Differential Equations and Phase Lines

In Exercises 41 and 42.

**a.** Identify the equilibrium values. Which are stable and which are unstable?



**b.** Construct a phase line. Identify the signs of $y'$ and $y''$.

**c.** Sketch a representative selection of solution curves.

**41.** $\frac{dy}{dx} = y^2 - 1$ **42.** $\frac{dy}{dx} = y - y^2$

## Applications

**43. Escape velocity** The gravitational attraction $F$ exerted by an airless moon on a body of mass $m$ at a distance $s$ from the moon's center is given by the equation $F = -mgR^2s^{-2}$, where $g$ is the acceleration of gravity at the moon's surface and $R$ is the moon's radius (see accompanying figure). The force $F$ is negative because it acts in the direction of decreasing $s$.

**a.** If the body is projected vertically upward from the moon's surface with an initial velocity $v_0$ at time $t = 0$, use Newton's second law, $F = ma$, to show that the body's velocity at position $s$ is given by the equation

$$v^2 = \frac{2gR^2}{s} + v_0^2 - 2gR.$$

Thus, the velocity remains positive as long as $v_0 \geq \sqrt{2gR}$. The velocity $v_0 = \sqrt{2gR}$ is the moon's **escape velocity**. A body projected upward with this velocity or a greater one will escape from the moon's gravitational pull.

**b.** Show that if $v_0 = \sqrt{2gR}$, then

$$s = R\left(1 + \frac{3v_0}{2R}t\right)^{2/3}.$$

**44. Coasting to a stop** Table 9.9 shows the distance $s$ (meters) coasted on in-line skates in $t$ sec by Johnathon Krueger. Find a model for his position in the form of Equation (2) of Section 9.5. His initial velocity was $v_0 = 0.86$ m/sec, his mass $m = 30.84$ kg (he weighed 68 lb), and his total coasting distance 0.97 m.

**TABLE 9.9** Johnathon Krueger skating data

| $t$ (sec) | $s$ (m) | $t$ (sec) | $s$ (m) | $t$ (sec) | $s$ (m) |
|---|---|---|---|---|---|
| 0 | 0 | 0.93 | 0.61 | 1.86 | 0.93 |
| 0.13 | 0.08 | 1.06 | 0.68 | 2.00 | 0.94 |
| 0.27 | 0.19 | 1.20 | 0.74 | 2.13 | 0.95 |
| 0.40 | 0.28 | 1.33 | 0.79 | 2.26 | 0.96 |
| 0.53 | 0.36 | 1.46 | 0.83 | 2.39 | 0.96 |
| 0.67 | 0.45 | 1.60 | 0.87 | 2.53 | 0.97 |
| 0.80 | 0.53 | 1.73 | 0.90 | 2.66 | 0.97 |

# Chapter 9 Questions to Guide Your Review

1. What is a first-order differential equation? When is a function a solution of such an equation?
2. How do you solve separable first-order differential equations?
3. What is the law of exponential change? How can it be derived from an initial value problem? What are some of the applications of the law?
4. What is the slope field of a differential equation $y' = f(x, y)$? What can we learn from such fields?
5. How do you solve linear first-order differential equations?
6. Describe Euler's method for solving the initial value problem $y' = f(x, y), y(x_0) = y_0$ numerically. Give an example. Comment on the method's accuracy. Why might you want to solve an initial value problem numerically?
7. Describe the improved Euler's method for solving the initial value problem $y' = f(x, y), y(x_0) = y_0$ numerically. How does it compare with Euler's method?
8. What is an autonomous differential equation? What are its equilibrium values? How do they differ from critical points? What is a stable equilibrium value? Unstable?
9. How do you construct the phase line for an autonomous differential equation? How does the phase line help you produce a graph which qualitatively depicts a solution to the differential equation?
10. Why is the exponential model unrealistic for predicting long-term population growth? How does the logistic model correct for the deficiency in the exponential model for population growth? What is the logistic differential equation? What is the form of its solution? Describe the graph of the logistic solution.

Chapter

# 10 Conic Sections and Polar Coordinates

Biography

**OVERVIEW** In this chapter we give geometric definitions of parabolas, ellipses, and hyperbolas and derive their standard equations. These curves are called *conic sections*, or *conics*, and model the paths traveled by planets, satellites, and other bodies whose motions are driven by inverse square forces. In Chapter 13 we will see that once the path of a moving body is known to be a conic, we immediately have information about the body's velocity and the force that drives it. Planetary motion is best described with the help of polar coordinates, so we also investigate curves, derivatives, and integrals in this new coordinate system.

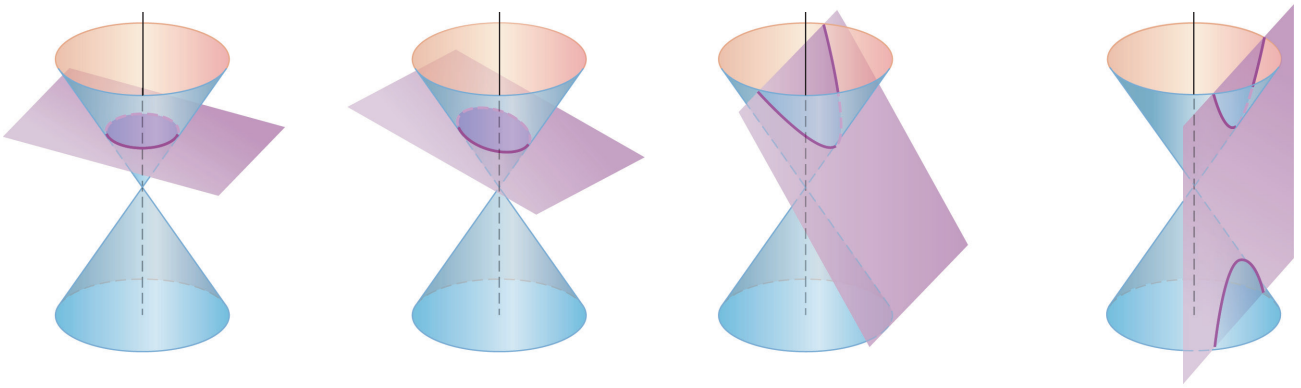
## 10.1 Conic Sections and Quadratic Equations

In Chapter 1 we defined a **circle** as the set of points in a plane whose distance from some fixed center point is a constant radius value. If the center is $(h, k)$ and the radius is $a$, the standard equation for the circle is $(x - h)^2 + (y - k)^2 = a^2$. It is an example of a conic section, which are the curves formed by cutting a double cone with a plane (Figure 10.1); hence the name *conic section.*

We now describe parabolas, ellipses, and hyperbolas as the graphs of quadratic equations in the coordinate plane.

### Parabolas

**DEFINITIONS** **Parabola, Focus, Directrix**

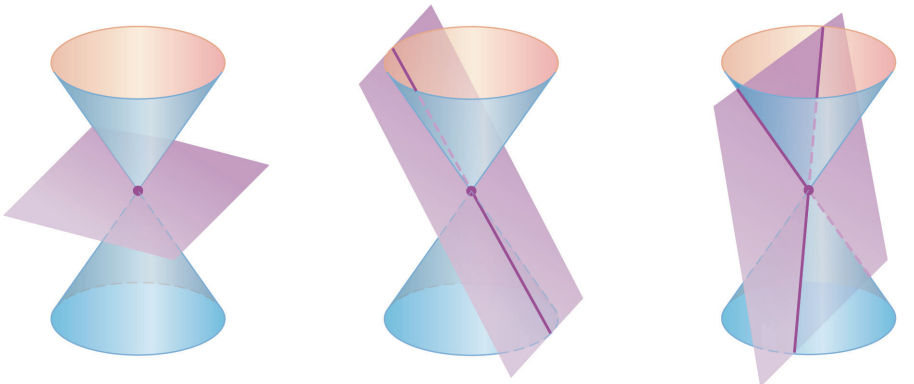


A set that consists of all the points in a plane equidistant from a given fixed point and a given fixed line in the plane is a **parabola**. The fixed point is the **focus** of the parabola. The fixed line is the **directrix**.

If the focus $F$ lies on the directrix $L$, the parabola is the line through $F$ perpendicular to $L$. We consider this to be a degenerate case and assume henceforth that $F$ does not lie on $L$.

A parabola has its simplest equation when its focus and directrix straddle one of the coordinate axes. For example, suppose that the focus lies at the point $F(0, p)$ on the positive $y$-axis and that the directrix is the line $y = -p$ (Figure 10.2). In the notation of the figure,

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



Circle: plane perpendicular to cone axis

Ellipse: plane oblique to cone axis

Parabola: plane parallel to side of cone

Hyperbola: plane cuts both halves of cone

(a)

Point: plane through cone vertex only

Single line: plane tangent to cone

Pair of intersecting lines

(b)

**FIGURE 10.1** The standard conic sections (a) are the curves in which a plane cuts a double cone. Hyperbolas come in two parts, called *branches*. The point and lines obtained by passing the plane through the cone's vertex (b) are *degenerate* conic sections.

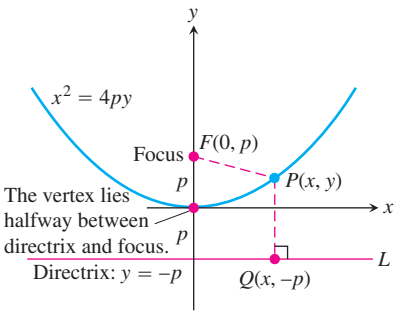


**FIGURE 10.2** The standard form of the parabola $x^2 = 4py, p > 0$.

a point $P(x, y)$ lies on the parabola if and only if $PF = PQ$. From the distance formula,

$$PF = \sqrt{(x - 0)^2 + (y - p)^2} = \sqrt{x^2 + (y - p)^2}$$

$$PQ = \sqrt{(x - x)^2 + (y - (-p))^2} = \sqrt{(y + p)^2}.$$

When we equate these expressions, square, and simplify, we get

$$y = \frac{x^2}{4p} \quad \text{or} \quad x^2 = 4py. \qquad \text{Standard form} \qquad (1)$$

These equations reveal the parabola's symmetry about the $y$-axis. We call the $y$-axis the **axis** of the parabola (short for "axis of symmetry").

The point where a parabola crosses its axis is the **vertex**. The vertex of the parabola $x^2 = 4py$ lies at the origin (Figure 10.2). The positive number $p$ is the parabola's **focal length**.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

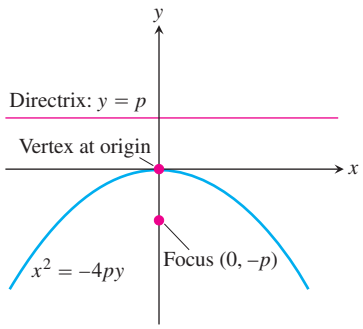

**FIGURE 10.3** The parabola $x^2 = -4py$, $p > 0$.

If the parabola opens downward, with its focus at $(0, -p)$ and its directrix the line $y = p$, then Equations (1) become

$$y = -\frac{x^2}{4p} \qquad \text{and} \qquad x^2 = -4py$$

(Figure 10.3). We obtain similar equations for parabolas opening to the right or to the left (Figure 10.4 and Table 10.1).

**TABLE 10.1** Standard-form equations for parabolas with vertices at the origin ($p > 0$)

| Equation | Focus | Directrix | Axis | Opens |
|---|---|---|---|---|
| $x^2 = 4py$ | $(0, p)$ | $y = -p$ | $y$-axis | Up |
| $x^2 = -4py$ | $(0, -p)$ | $y = p$ | $y$-axis | Down |
| $y^2 = 4px$ | $(p, 0)$ | $x = -p$ | $x$-axis | To the right |
| $y^2 = -4px$ | $(-p, 0)$ | $x = p$ | $x$-axis | To the left |

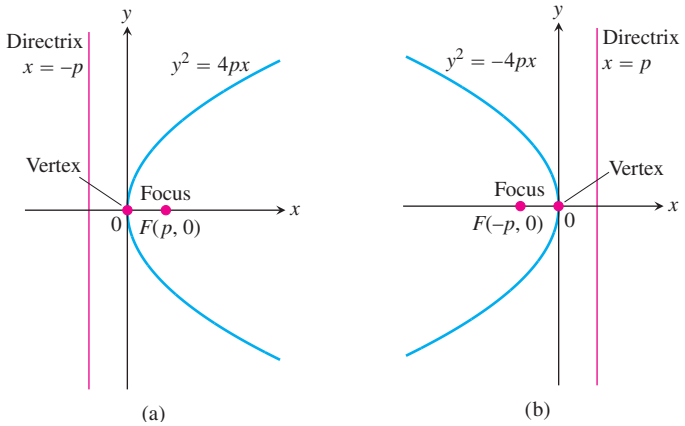

**FIGURE 10.4** (a) The parabola $y^2 = 4px$. (b) The parabola $y^2 = -4px$.

**EXAMPLE 1** Find the focus and directrix of the parabola $y^2 = 10x$.

**Solution** We find the value of $p$ in the standard equation $y^2 = 4px$:

$$4p = 10, \qquad \text{so} \qquad p = \frac{10}{4} = \frac{5}{2}.$$

Then we find the focus and directrix for this value of $p$:

$$\text{Focus:} \qquad (p, 0) = \left(\frac{5}{2}, 0\right)$$

$$\text{Directrix:} \qquad x = -p \qquad \text{or} \qquad x = -\frac{5}{2}.$$

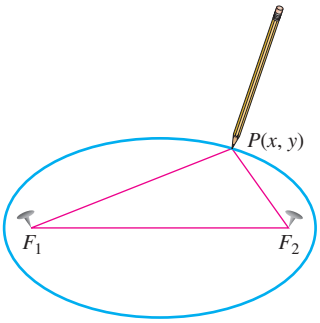

**FIGURE 10.5** One way to draw an ellipse uses two tacks and a loop of string to guide the pencil.

The horizontal and vertical shift formulas in Section 1.5, can be applied to the equations in Table 10.1 to give equations for a variety of parabolas in other locations (see Exercises 39, 40, and 45–48).

## Ellipses

**DEFINITIONS Ellipse, Foci**

An **ellipse** is the set of points in a plane whose distances from two fixed points in the plane have a constant sum. The two fixed points are the **foci** of the ellipse.

The quickest way to construct an ellipse uses the definition. Put a loop of string around two tacks $F_1$ and $F_2$, pull the string taut with a pencil point $P$, and move the pencil around to trace a closed curve (Figure 10.5). The curve is an ellipse because the sum $PF_1 + PF_2$, being the length of the loop minus the distance between the tacks, remains constant. The ellipse's foci lie at $F_1$ and $F_2$.

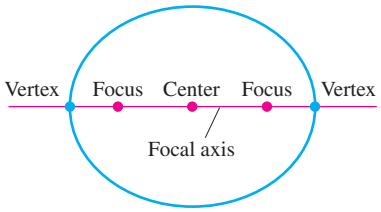

**FIGURE 10.6** Points on the focal axis of an ellipse.

**DEFINITIONS Focal Axis, Center, Vertices**

The line through the foci of an ellipse is the ellipse's **focal axis**. The point on the axis halfway between the foci is the **center**. The points where the focal axis and ellipse cross are the ellipse's **vertices** (Figure 10.6).

If the foci are $F_1(-c, 0)$ and $F_2(c, 0)$ (Figure 10.7), and $PF_1 + PF_2$ is denoted by $2a$, then the coordinates of a point $P$ on the ellipse satisfy the equation

$$\sqrt{(x + c)^2 + y^2} + \sqrt{(x - c)^2 + y^2} = 2a.$$

To simplify this equation, we move the second radical to the right-hand side, square, isolate the remaining radical, and square again, obtaining

$$\frac{x^2}{a^2} + \frac{y^2}{a^2 - c^2} = 1. \tag{2}$$

Since $PF_1 + PF_2$ is greater than the length $F_1F_2$ (triangle inequality for triangle $PF_1F_2$), the number $2a$ is greater than $2c$. Accordingly, $a > c$ and the number $a^2 - c^2$ in Equation (2) is positive.

The algebraic steps leading to Equation (2) can be reversed to show that every point $P$ whose coordinates satisfy an equation of this form with $0 < c < a$ also satisfies the equation $PF_1 + PF_2 = 2a$. A point therefore lies on the ellipse if and only if its coordinates satisfy Equation (2).

If

$$b = \sqrt{a^2 - c^2}, \tag{3}$$

then $a^2 - c^2 = b^2$ and Equation (2) takes the form

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1. \tag{4}$$

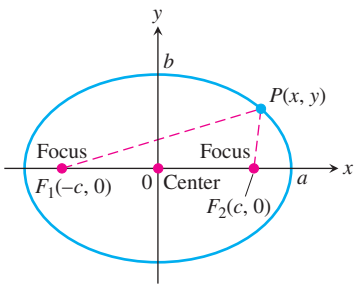

**FIGURE 10.7** The ellipse defined by the equation $PF_1 + PF_2 = 2a$ is the graph of the equation $(x^2/a^2) + (y^2/b^2) = 1$, where $b^2 = a^2 - c^2$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Equation (4) reveals that this ellipse is symmetric with respect to the origin and both coordinate axes. It lies inside the rectangle bounded by the lines $x = \pm a$ and $y = \pm b$. It crosses the axes at the points $(\pm a, 0)$ and $(0, \pm b)$. The tangents at these points are perpendicular to the axes because

$$\frac{dy}{dx} = -\frac{b^2 x}{a^2 y}$$ Obtained from Equation (4) by implicit differentiation

is zero if $x = 0$ and infinite if $y = 0$.

The **major axis** of the ellipse in Equation (4) is the line segment of length $2a$ joining the points $(\pm a, 0)$. The **minor axis** is the line segment of length $2b$ joining the points $(0, \pm b)$. The number $a$ itself is the **semimajor axis**, the number $b$ the **semiminor axis**. The number $c$, found from Equation (3) as

$$c = \sqrt{a^2 - b^2},$$

is the **center-to-focus distance** of the ellipse.

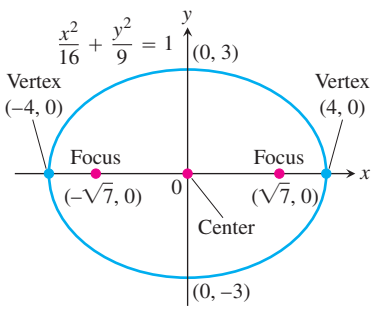

**FIGURE 10.8** An ellipse with its major axis horizontal (Example 2).

## EXAMPLE 2 Major Axis Horizontal

The ellipse

$$\frac{x^2}{16} + \frac{y^2}{9} = 1 \tag{5}$$

(Figure 10.8) has

Semimajor axis: $a = \sqrt{16} = 4$, Semiminor axis: $b = \sqrt{9} = 3$

Center-to-focus distance: $c = \sqrt{16 - 9} = \sqrt{7}$

Foci: $(\pm c, 0) = \left(\pm\sqrt{7}, 0\right)$

Vertices: $(\pm a, 0) = (\pm 4, 0)$

Center: $(0, 0)$. ■

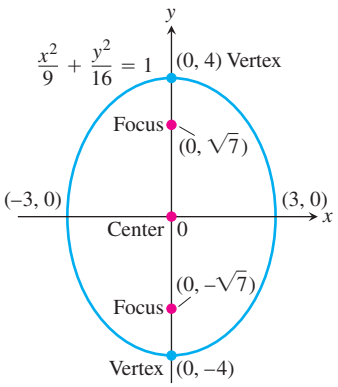

**FIGURE 10.9** An ellipse with its major axis vertical (Example 3).

## EXAMPLE 3 Major Axis Vertical

The ellipse

$$\frac{x^2}{9} + \frac{y^2}{16} = 1, \tag{6}$$

obtained by interchanging $x$ and $y$ in Equation (5), has its major axis vertical instead of horizontal (Figure 10.9). With $a^2$ still equal to 16 and $b^2$ equal to 9, we have

Semimajor axis: $a = \sqrt{16} = 4$, Semiminor axis: $b = \sqrt{9} = 3$

Center-to-focus distance: $c = \sqrt{16 - 9} = \sqrt{7}$

Foci: $(0, \pm c) = \left(0, \pm\sqrt{7}\right)$

Vertices: $(0, \pm a) = (0, \pm 4)$

Center: $(0, 0)$. ■

There is never any cause for confusion in analyzing Equations (5) and (6). We simply find the intercepts on the coordinate axes; then we know which way the major axis runs because it is the longer of the two axes. The center always lies at the origin and the foci and vertices lie on the major axis.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Standard-Form Equations for Ellipses Centered at the Origin**

*Foci on the x-axis*: $\dfrac{x^2}{a^2} + \dfrac{y^2}{b^2} = 1 \quad (a > b)$

Center-to-focus distance: $c = \sqrt{a^2 - b^2}$

Foci: $(\pm c, 0)$

Vertices: $(\pm a, 0)$

*Foci on the y-axis*: $\dfrac{x^2}{b^2} + \dfrac{y^2}{a^2} = 1 \quad (a > b)$

Center-to-focus distance: $c = \sqrt{a^2 - b^2}$

Foci: $(0, \pm c)$

Vertices: $(0, \pm a)$

In each case, $a$ is the semimajor axis and $b$ is the semiminor axis.

## Hyperbolas

**DEFINITIONS Hyperbola, Foci**

A **hyperbola** is the set of points in a plane whose distances from two fixed points in the plane have a constant difference. The two fixed points are the **foci** of the hyperbola.

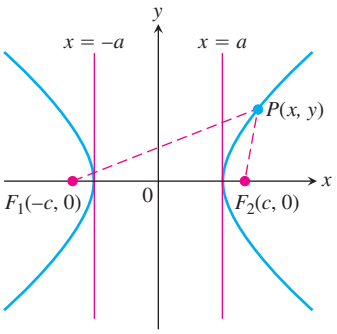

**FIGURE 10.10** Hyperbolas have two branches. For points on the right-hand branch of the hyperbola shown here, $PF_1 - PF_2 = 2a$. For points on the left-hand branch, $PF_2 - PF_1 = 2a$. We then let $b = \sqrt{c^2 - a^2}$.

If the foci are $F_1(-c, 0)$ and $F_2(c, 0)$ (Figure 10.10) and the constant difference is $2a$, then a point $(x, y)$ lies on the hyperbola if and only if

$$\sqrt{(x + c)^2 + y^2} - \sqrt{(x - c)^2 + y^2} = \pm 2a. \tag{7}$$

To simplify this equation, we move the second radical to the right-hand side, square, isolate the remaining radical, and square again, obtaining

$$\frac{x^2}{a^2} + \frac{y^2}{a^2 - c^2} = 1. \tag{8}$$

So far, this looks just like the equation for an ellipse. But now $a^2 - c^2$ is negative because $2a$, being the difference of two sides of triangle $PF_1F_2$, is less than $2c$, the third side.

The algebraic steps leading to Equation (8) can be reversed to show that every point $P$ whose coordinates satisfy an equation of this form with $0 < a < c$ also satisfies Equation (7). A point therefore lies on the hyperbola if and only if its coordinates satisfy Equation (8).

If we let $b$ denote the positive square root of $c^2 - a^2$,

$$b = \sqrt{c^2 - a^2}, \tag{9}$$

then $a^2 - c^2 = -b^2$ and Equation (8) takes the more compact form

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1. \tag{10}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The differences between Equation (10) and the equation for an ellipse (Equation 4) are the minus sign and the new relation

$$c^2 = a^2 + b^2. \qquad \text{From Equation (9)}$$

Like the ellipse, the hyperbola is symmetric with respect to the origin and coordinate axes. It crosses the $x$-axis at the points $(\pm a, 0)$. The tangents at these points are vertical because

$$\frac{dy}{dx} = \frac{b^2 x}{a^2 y} \qquad \text{Obtained from Equation (10) by implicit differentiation}$$

is infinite when $y = 0$. The hyperbola has no $y$-intercepts; in fact, no part of the curve lies between the lines $x = -a$ and $x = a$.

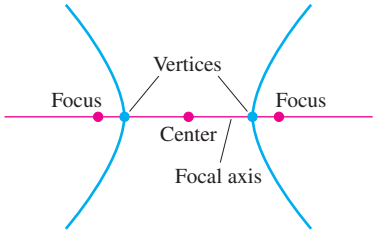

**FIGURE 10.11** Points on the focal axis of a hyperbola.

**DEFINITIONS Focal Axis, Center, Vertices**

The line through the foci of a hyperbola is the **focal axis**. The point on the axis halfway between the foci is the hyperbola's **center**. The points where the focal axis and hyperbola cross are the **vertices** (Figure 10.11).

## Asymptotes of Hyperbolas and Graphing

If we solve Equation (10) for $y$ we obtain

$$y^2 = b^2\left(\frac{x^2}{a^2} - 1\right)$$

$$= \frac{b^2}{a^2}x^2\left(1 - \frac{a^2}{x^2}\right)$$

or, taking square roots,

$$y = \pm\frac{b}{a}x\sqrt{1 - \frac{a^2}{x^2}}.$$

As $x \to \pm\infty$, the factor $\sqrt{1 - a^2/x^2}$ approaches 1, and the factor $\pm(b/a)x$ is dominant. Thus the lines

$$y = \pm\frac{b}{a}x$$

are the two **asymptotes** of the hyperbola defined by Equation (10). The asymptotes give the guidance we need to graph hyperbolas quickly. The fastest way to find the equations of the asymptotes is to replace the 1 in Equation (10) by 0 and solve the new equation for $y$:

$$\underbrace{\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1}_{\text{hyperbola}} \to \underbrace{\frac{x^2}{a^2} - \frac{y^2}{b^2} = 0}_{\text{0 for 1}} \to \underbrace{y = \pm\frac{b}{a}x.}_{\text{asymptotes}}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Standard-Form Equations for Hyperbolas Centered at the Origin**

*Foci on the x-axis*: $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 1$

Center-to-focus distance: $c = \sqrt{a^2 + b^2}$

Foci: $(\pm c, 0)$

Vertices: $(\pm a, 0)$

Asymptotes: $\dfrac{x^2}{a^2} - \dfrac{y^2}{b^2} = 0$ or $y = \pm\dfrac{b}{a}x$

*Foci on the y-axis*: $\dfrac{y^2}{a^2} - \dfrac{x^2}{b^2} = 1$

Center-to-focus distance: $c = \sqrt{a^2 + b^2}$

Foci: $(0, \pm c)$

Vertices: $(0, \pm a)$

Asymptotes: $\dfrac{y^2}{a^2} - \dfrac{x^2}{b^2} = 0$ or $y = \pm\dfrac{a}{b}x$

Notice the difference in the asymptote equations ($b/a$ in the first, $a/b$ in the second).

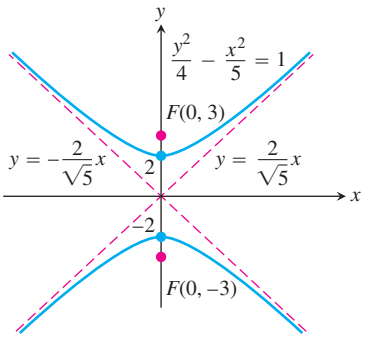

**FIGURE 10.13** The hyperbola and its asymptotes in Example 5.

**EXAMPLE 4** Foci on the *x*-axis

The equation

$$\frac{x^2}{4} - \frac{y^2}{5} = 1 \tag{11}$$

is Equation (10) with $a^2 = 4$ and $b^2 = 5$ (Figure 10.12). We have

Center-to-focus distance: $c = \sqrt{a^2 + b^2} = \sqrt{4 + 5} = 3$

Foci: $(\pm c, 0) = (\pm 3, 0)$, Vertices: $(\pm a, 0) = (\pm 2, 0)$

Center: $(0, 0)$

Asymptotes: $\dfrac{x^2}{4} - \dfrac{y^2}{5} = 0$ or $y = \pm\dfrac{\sqrt{5}}{2}x$. ■

**EXAMPLE 5** Foci on the *y*-axis

The hyperbola

$$\frac{y^2}{4} - \frac{x^2}{5} = 1,$$

obtained by interchanging $x$ and $y$ in Equation (11), has its vertices on the $y$-axis instead of the $x$-axis (Figure 10.13). With $a^2$ still equal to 4 and $b^2$ equal to 5, we have

Center-to-focus distance: $c = \sqrt{a^2 + b^2} = \sqrt{4 + 5} = 3$

Foci: $(0, \pm c) = (0, \pm 3)$, Vertices: $(0, \pm a) = (0, \pm 2)$

Center: $(0, 0)$

Asymptotes: $\dfrac{y^2}{4} - \dfrac{x^2}{5} = 0$ or $y = \pm\dfrac{2}{\sqrt{5}}x$. ■

## Reflective Properties

The chief applications of parabolas involve their use as reflectors of light and radio waves. Rays originating at a parabola's focus are reflected out of the parabola parallel to the parabola's axis (Figure 10.14 and Exercise 90). Moreover, the time any ray takes from the focus to a line parallel to the parabola's directrix (thus perpendicular to its axis) is the same for each of the rays. These properties are used by flashlight, headlight, and spotlight reflectors and by microwave broadcast antennas.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

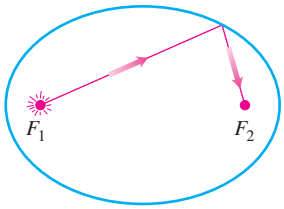

**FIGURE 10.15** An elliptical mirror (shown here in profile) reflects light from one focus to the other.

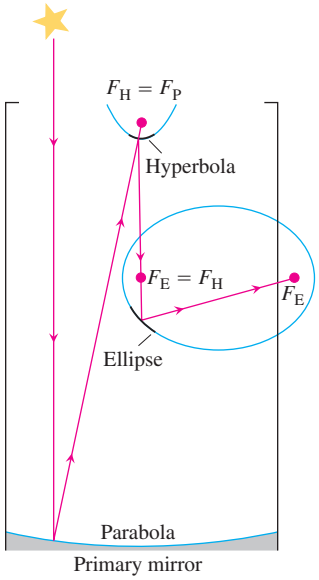

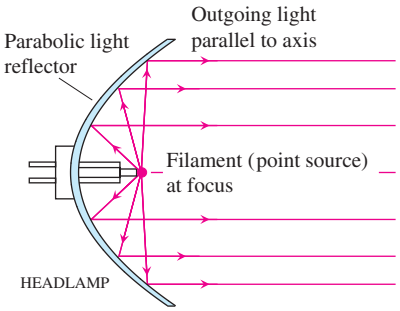

**FIGURE 10.16** Schematic drawing of a reflecting telescope.

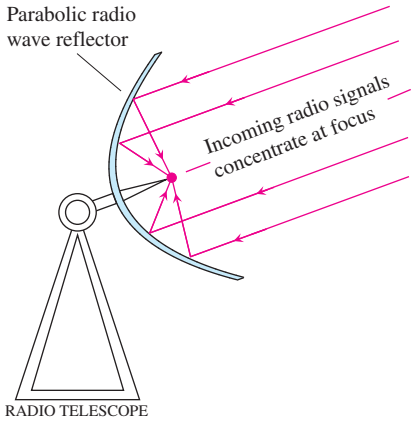

**FIGURE 10.14** Parabolic reflectors can generate a beam of light parallel to the parabola's axis from a source at the focus; or they can receive rays parallel to the axis and concentrate them at the focus.

If an ellipse is revolved about its major axis to generate a surface (the surface is called an *ellipsoid*) and the interior is silvered to produce a mirror, light from one focus will be reflected to the other focus (Figure 10.15). Ellipsoids reflect sound the same way, and this property is used to construct *whispering galleries*, rooms in which a person standing at one focus can hear a whisper from the other focus. (Statuary Hall in the U.S. Capitol building is a whispering gallery.)

Light directed toward one focus of a hyperbolic mirror is reflected toward the other focus. This property of hyperbolas is combined with the reflective properties of parabolas and ellipses in designing some modern telescopes. In Figure 10.16 starlight reflects off a primary parabolic mirror toward the mirror's focus $F_P$. It is then reflected by a small hyperbolic mirror, whose focus is $F_H = F_P$, toward the second focus of the hyperbola, $F_E = F_H$. Since this focus is shared by an ellipse, the light is reflected by the elliptical mirror to the ellipse's second focus to be seen by an observer.

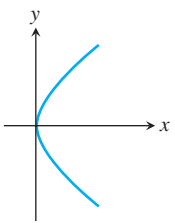
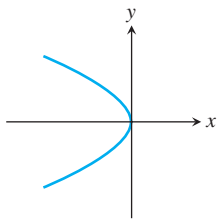
# EXERCISES 10.1



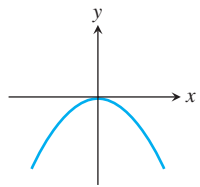
## Identifying Graphs

Match the parabolas in Exercises 1–4 with the following equations:

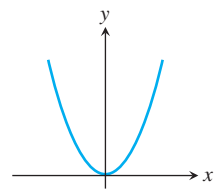


$$x^2 = 2y, \quad x^2 = -6y, \quad y^2 = 8x, \quad y^2 = -4x.$$

Then find the parabola's focus and directrix.



**1.**

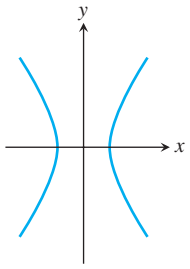


**2.**

**3.**

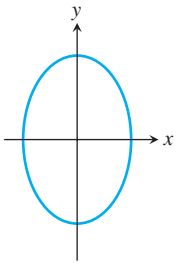
**4.**

Match each conic section in Exercises 5–8 with one of these equations:



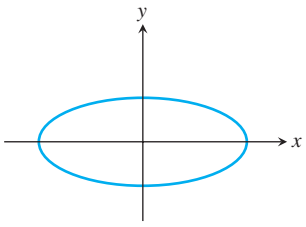
$$\frac{x^2}{4} + \frac{y^2}{9} = 1, \qquad \frac{x^2}{2} + y^2 = 1,$$

$$\frac{y^2}{4} - x^2 = 1, \qquad \frac{x^2}{4} - \frac{y^2}{9} = 1.$$

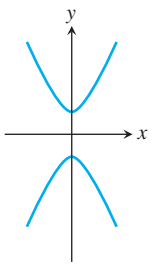


Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Then find the conic section's foci and vertices. If the conic section is a hyperbola, find its asymptotes as well.



**5.**



**6.**

**7.**

**8.**

## Parabolas

Exercises 9–16 give equations of parabolas. Find each parabola's focus and directrix. Then sketch the parabola. Include the focus and directrix in your sketch.

**9.** $y^2 = 12x$ **10.** $x^2 = 6y$ **11.** $x^2 = -8y$

**12.** $y^2 = -2x$ **13.** $y = 4x^2$ **14.** $y = -8x^2$

**15.** $x = -3y^2$ **16.** $x = 2y^2$

## Ellipses

Exercises 17–24 give equations for ellipses. Put each equation in standard form. Then sketch the ellipse. Include the foci in your sketch.

**17.** $16x^2 + 25y^2 = 400$ **18.** $7x^2 + 16y^2 = 112$

**19.** $2x^2 + y^2 = 2$ **20.** $2x^2 + y^2 = 4$

**21.** $3x^2 + 2y^2 = 6$ **22.** $9x^2 + 10y^2 = 90$

**23.** $6x^2 + 9y^2 = 54$ **24.** $169x^2 + 25y^2 = 4225$

Exercises 25 and 26 give information about the foci and vertices of ellipses centered at the origin of the $xy$-plane. In each case, find the ellipse's standard-form equation from the given information.

**25.** Foci: $\left(\pm\sqrt{2}, 0\right)$
Vertices: $(\pm 2, 0)$

**26.** Foci: $(0, \pm 4)$
Vertices: $(0, \pm 5)$

## Hyperbolas

Exercises 27–34 give equations for hyperbolas. Put each equation in standard form and find the hyperbola's asymptotes. Then sketch the hyperbola. Include the asymptotes and foci in your sketch.

**27.** $x^2 - y^2 = 1$ **28.** $9x^2 - 16y^2 = 144$

**29.** $y^2 - x^2 = 8$ **30.** $y^2 - x^2 = 4$

**31.** $8x^2 - 2y^2 = 16$ **32.** $y^2 - 3x^2 = 3$

**33.** $8y^2 - 2x^2 = 16$ **34.** $64x^2 - 36y^2 = 2304$

Exercises 35–38 give information about the foci, vertices, and asymptotes of hyperbolas centered at the origin of the $xy$-plane. In each case, find the hyperbola's standard-form equation from the information given.

**35.** Foci: $\left(0, \pm\sqrt{2}\right)$
Asymptotes: $y = \pm x$

**36.** Foci: $(\pm 2, 0)$
Asymptotes: $y = \pm\dfrac{1}{\sqrt{3}}x$

**37.** Vertices: $(\pm 3, 0)$
Asymptotes: $y = \pm\dfrac{4}{3}x$

**38.** Vertices: $(0, \pm 2)$
Asymptotes: $y = \pm\dfrac{1}{2}x$

## Shifting Conic Sections

**39.** The parabola $y^2 = 8x$ is shifted down 2 units and right 1 unit to generate the parabola $(y + 2)^2 = 8(x - 1)$.

**a.** Find the new parabola's vertex, focus, and directrix.

**b.** Plot the new vertex, focus, and directrix, and sketch in the parabola.

**40.** The parabola $x^2 = -4y$ is shifted left 1 unit and up 3 units to generate the parabola $(x + 1)^2 = -4(y - 3)$.

**a.** Find the new parabola's vertex, focus, and directrix.

**b.** Plot the new vertex, focus, and directrix, and sketch in the parabola.

**41.** The ellipse $(x^2/16) + (y^2/9) = 1$ is shifted 4 units to the right and 3 units up to generate the ellipse

$$\frac{(x-4)^2}{16} + \frac{(y-3)^2}{9} = 1.$$

**a.** Find the foci, vertices, and center of the new ellipse.

**b.** Plot the new foci, vertices, and center, and sketch in the new ellipse.

**42.** The ellipse $(x^2/9) + (y^2/25) = 1$ is shifted 3 units to the left and 2 units down to generate the ellipse

$$\frac{(x+3)^2}{9} + \frac{(y+2)^2}{25} = 1.$$

**a.** Find the foci, vertices, and center of the new ellipse.

**b.** Plot the new foci, vertices, and center, and sketch in the new ellipse.

**43.** The hyperbola $(x^2/16) - (y^2/9) = 1$ is shifted 2 units to the right to generate the hyperbola

$$\frac{(x-2)^2}{16} - \frac{y^2}{9} = 1.$$

**a.** Find the center, foci, vertices, and asymptotes of the new hyperbola.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**b.** Plot the new center, foci, vertices, and asymptotes, and sketch in the hyperbola.

**44.** The hyperbola $(y^2/4) - (x^2/5) = 1$ is shifted 2 units down to generate the hyperbola

$$\frac{(y+2)^2}{4} - \frac{x^2}{5} = 1.$$

**a.** Find the center, foci, vertices, and asymptotes of the new hyperbola.

**b.** Plot the new center, foci, vertices, and asymptotes, and sketch in the hyperbola.

Exercises 45–48 give equations for parabolas and tell how many units up or down and to the right or left each parabola is to be shifted. Find an equation for the new parabola, and find the new vertex, focus, and directrix.

**45.** $y^2 = 4x$, left 2, down 3 **46.** $y^2 = -12x$, right 4, up 3

**47.** $x^2 = 8y$, right 1, down 7 **48.** $x^2 = 6y$, left 3, down 2

Exercises 49–52 give equations for ellipses and tell how many units up or down and to the right or left each ellipse is to be shifted. Find an equation for the new ellipse, and find the new foci, vertices, and center.

**49.** $\frac{x^2}{6} + \frac{y^2}{9} = 1$, left 2, down 1

**50.** $\frac{x^2}{2} + y^2 = 1$, right 3, up 4

**51.** $\frac{x^2}{3} + \frac{y^2}{2} = 1$, right 2, up 3

**52.** $\frac{x^2}{16} + \frac{y^2}{25} = 1$, left 4, down 5

Exercises 53–56 give equations for hyperbolas and tell how many units up or down and to the right or left each hyperbola is to be shifted. Find an equation for the new hyperbola, and find the new center, foci, vertices, and asymptotes.

**53.** $\frac{x^2}{4} - \frac{y^2}{5} = 1$, right 2, up 2

**54.** $\frac{x^2}{16} - \frac{y^2}{9} = 1$, left 2, down 1

**55.** $y^2 - x^2 = 1$, left 1, down 1

**56.** $\frac{y^2}{3} - x^2 = 1$, right 1, up 3

Find the center, foci, vertices, asymptotes, and radius, as appropriate, of the conic sections in Exercises 57–68.

**57.** $x^2 + 4x + y^2 = 12$

**58.** $2x^2 + 2y^2 - 28x + 12y + 114 = 0$

**59.** $x^2 + 2x + 4y - 3 = 0$ **60.** $y^2 - 4y - 8x - 12 = 0$

**61.** $x^2 + 5y^2 + 4x = 1$ **62.** $9x^2 + 6y^2 + 36y = 0$

**63.** $x^2 + 2y^2 - 2x - 4y = -1$

**64.** $4x^2 + y^2 + 8x - 2y = -1$

**65.** $x^2 - y^2 - 2x + 4y = 4$ **66.** $x^2 - y^2 + 4x - 6y = 6$

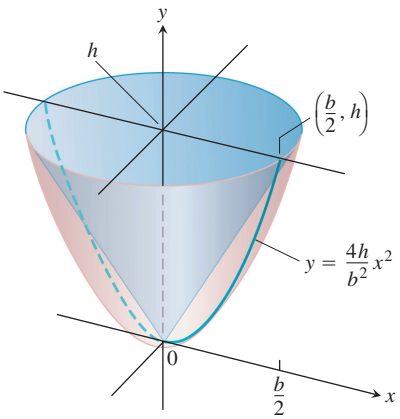
**67.** $2x^2 - y^2 + 6y = 3$ **68.** $y^2 - 4x^2 + 16x = 24$

## Inequalities

Sketch the regions in the $xy$-plane whose coordinates satisfy the inequalities or pairs of inequalities in Exercises 69–74.

**69.** $9x^2 + 16y^2 \le 144$

**70.** $x^2 + y^2 \ge 1$ and $4x^2 + y^2 \le 4$

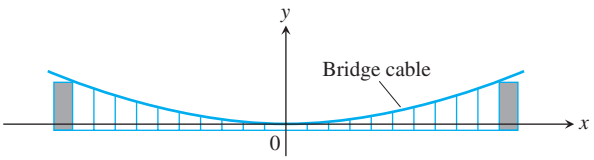


**71.** $x^2 + 4y^2 \ge 4$ and $4x^2 + 9y^2 \le 36$

**72.** $(x^2 + y^2 - 4)(x^2 + 9y^2 - 9) \le 0$

**73.** $4y^2 - x^2 \ge 4$ **74.** $|x^2 - y^2| \le 1$

## Theory and Examples



**75. Archimedes' formula for the volume of a parabolic solid** The region enclosed by the parabola $y = (4h/b^2)x^2$ and the line $y = h$ is revolved about the $y$-axis to generate the solid shown here. Show that the volume of the solid is $3/2$ the volume of the corresponding cone.

**76. Suspension bridge cables hang in parabolas** The suspension bridge cable shown here supports a uniform load of $w$ pounds per horizontal foot. It can be shown that if $H$ is the horizontal tension of the cable at the origin, then the curve of the cable satisfies the equation

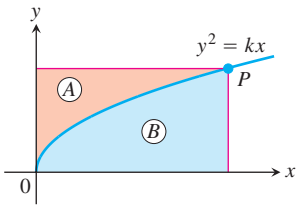
$$\frac{dy}{dx} = \frac{w}{H}x.$$

Show that the cable hangs in a parabola by solving this differential equation subject to the initial condition that $y = 0$ when $x = 0$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**77.** Find an equation for the circle through the points (1, 0), (0, 1), and (2, 2).

**78.** Find an equation for the circle through the points (2, 3), (3, 2), and $(-4, 3)$.



**79.** Find an equation for the circle centered at $(-2, 1)$ that passes through the point (1, 3). Is the point (1.1, 2.8) inside, outside, or on the circle?

**80.** Find equations for the tangents to the circle $(x - 2)^2 + (y - 1)^2 = 5$ at the points where the circle crosses the coordinate axes. (*Hint:* Use implicit differentiation.)

**81.** If lines are drawn parallel to the coordinate axes through a point $P$ on the parabola $y^2 = kx$, $k > 0$, the parabola partitions the rectangular region bounded by these lines and the coordinate axes into two smaller regions, $A$ and $B$.

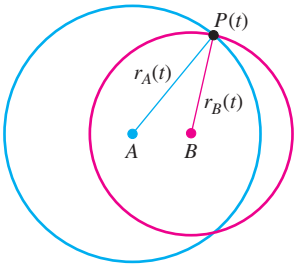
**a.** If the two smaller regions are revolved about the $y$-axis, show that they generate solids whose volumes have the ratio 4:1.

**b.** What is the ratio of the volumes generated by revolving the regions about the $x$-axis?

**82.** Show that the tangents to the curve $y^2 = 4px$ from any point on the line $x = -p$ are perpendicular.

**83.** Find the dimensions of the rectangle of largest area that can be inscribed in the ellipse $x^2 + 4y^2 = 4$ with its sides parallel to the coordinate axes. What is the area of the rectangle?

**84.** Find the volume of the solid generated by revolving the region enclosed by the ellipse $9x^2 + 4y^2 = 36$ about the **(a)** $x$-axis, **(b)** $y$-axis.

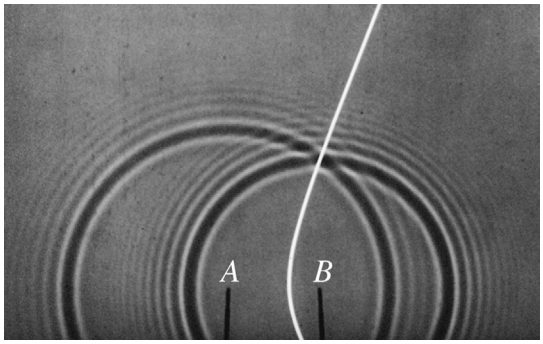


**85.** The "triangular" region in the first quadrant bounded by the $x$-axis, the line $x = 4$, and the hyperbola $9x^2 - 4y^2 = 36$ is revolved about the $x$-axis to generate a solid. Find the volume of the solid.

**86.** The region bounded on the left by the $y$-axis, on the right by the hyperbola $x^2 - y^2 = 1$, and above and below by the lines $y = \pm 3$ is revolved about the $y$-axis to generate a solid. Find the volume of the solid.

**87.** Find the centroid of the region that is bounded below by the $x$-axis and above by the ellipse $(x^2/9) + (y^2/16) = 1$.

**88.** The curve $y = \sqrt{x^2 + 1}, 0 \le x \le \sqrt{2}$, which is part of the upper branch of the hyperbola $y^2 - x^2 = 1$, is revolved about the $x$-axis to generate a surface. Find the area of the surface.



**89.** The circular waves in the photograph here were made by touching the surface of a ripple tank, first at $A$ and then at $B$. As the waves expanded, their point of intersection appeared to trace a hyperbola. Did it really do that? To find out, we can model the waves with circles centered at $A$ and $B$.

At time $t$, the point $P$ is $r_A(t)$ units from $A$ and $r_B(t)$ units from $B$. Since the radii of the circles increase at a constant rate, the rate at which the waves are traveling is

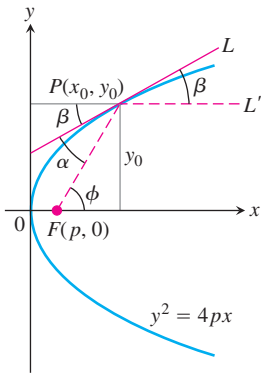
$$\frac{dr_A}{dt} = \frac{dr_B}{dt}.$$

Conclude from this equation that $r_A - r_B$ has a constant value, so that $P$ must lie on a hyperbola with foci at $A$ and $B$.

**90. The reflective property of parabolas** The figure here shows a typical point $P(x_0, y_0)$ on the parabola $y^2 = 4px$. The line $L$ is tangent to the parabola at $P$. The parabola's focus lies at $F(p, 0)$. The ray $L'$ extending from $P$ to the right is parallel to the $x$-axis. We show that light from $F$ to $P$ will be reflected out along $L'$ by showing that $\beta$ equals $\alpha$. Establish this equality by taking the following steps.

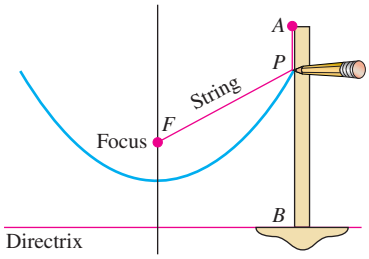
**a.** Show that $\tan \beta = 2p/y_0$.

**b.** Show that $\tan \phi = y_0/(x_0 - p)$.



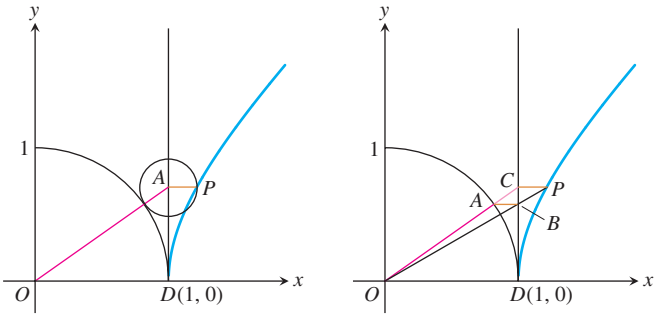
**c.** Use the identity

$$\tan \alpha = \frac{\tan \phi - \tan \beta}{1 + \tan \phi \tan \beta}$$



to show that $\tan \alpha = 2p/y_0$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



Since $\alpha$ and $\beta$ are both acute, $\tan\beta = \tan\alpha$ implies $\beta = \alpha$.

**91. How the astronomer Kepler used string to draw parabolas** Kepler's method for drawing a parabola (with more modern tools) requires a string the length of a T square and a table whose edge can serve as the parabola's directrix. Pin one end of the string to the point where you want the focus to be and the other end to the upper end of the T square. Then, holding the string taut against the T square with a pencil, slide the T square along the table's edge. As the T square moves, the pencil will trace a parabola. Why?

**92. Construction of a hyperbola** The following diagrams appeared (unlabeled) in Ernest J. Eckert, "Constructions Without Words," *Mathematics Magazine*, Vol. 66, No. 2, Apr. 1993, p. 113. Explain the constructions by finding the coordinates of the point $P$.

**93. The width of a parabola at the focus** Show that the number $4p$ is the *width* of the parabola $x^2 = 4py$ $(p > 0)$ at the focus by showing that the line $y = p$ cuts the parabola at points that are $4p$ units apart.

**94. The asymptotes of $(x^2/a^2) - (y^2/b^2) = 1$** Show that the vertical distance between the line $y = (b/a)x$ and the upper half of the right-hand branch $y = (b/a)\sqrt{x^2 - a^2}$ of the hyperbola $(x^2/a^2) - (y^2/b^2) = 1$ approaches 0 by showing that

$$\lim_{x\to\infty}\left(\frac{b}{a}x - \frac{b}{a}\sqrt{x^2 - a^2}\right) = \frac{b}{a}\lim_{x\to\infty}\left(x - \sqrt{x^2 - a^2}\right) = 0.$$

Similar results hold for the remaining portions of the hyperbola and the lines $y = \pm(b/a)x$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# 10.2 Classifying Conic Sections by Eccentricity

We now show how to associate with each conic section a number called the conic section's *eccentricity*. The eccentricity reveals the conic section's type (circle, ellipse, parabola, or hyperbola) and, in the case of ellipses and hyperbolas, describes the conic section's general proportions.

## Eccentricity

Although the center-to-focus distance $c$ does not appear in the equation

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1, \qquad (a > b)$$

for an ellipse, we can still determine $c$ from the equation $c = \sqrt{a^2 - b^2}$. If we fix $a$ and vary $c$ over the interval $0 \le c \le a$, the resulting ellipses will vary in shape (Figure 10.17). They are circles if $c = 0$ (so that $a = b$) and flatten as $c$ increases. If $c = a$, the foci and vertices overlap and the ellipse degenerates into a line segment.

We use the ratio of $c$ to $a$ to describe the various shapes the ellipse can take. We call this ratio the ellipse's eccentricity.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

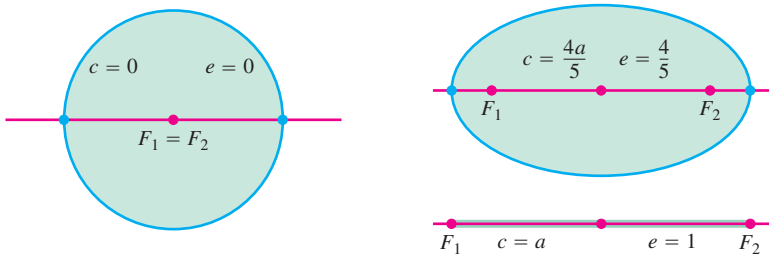


**FIGURE 10.17** The ellipse changes from a circle to a line segment as $c$ increases from 0 to $a$.

**DEFINITION Eccentricity of an Ellipse**

The **eccentricity** of the ellipse $(x^2/a^2) + (y^2/b^2) = 1$ $(a > b)$ is

$$e = \frac{c}{a} = \frac{\sqrt{a^2 - b^2}}{a}.$$

**TABLE 10.2** Eccentricities of planetary orbits

| | | | |
|---|---|---|---|
| Mercury | 0.21 | Saturn | 0.06 |
| Venus | 0.01 | Uranus | 0.05 |
| Earth | 0.02 | Neptune | 0.01 |
| Mars | 0.09 | Pluto | 0.25 |
| Jupiter | 0.05 | | |

The planets in the solar system revolve around the sun in (approximate) elliptical orbits with the sun at one focus. Most of the orbits are nearly circular, as can be seen from the eccentricities in Table 10.2. Pluto has a fairly eccentric orbit, with $e = 0.25$, as does Mercury, with $e = 0.21$. Other members of the solar system have orbits that are even more eccentric. Icarus, an asteroid about 1 mile wide that revolves around the sun every 409 Earth days, has an orbital eccentricity of 0.83 (Figure 10.18).

**EXAMPLE 1** Halley's Comet

The orbit of Halley's comet is an ellipse 36.18 astronomical units long by 9.12 astronomical units wide. (One *astronomical unit* [AU] is 149,597,870 km, the semimajor axis of Earth's orbit.) Its eccentricity is

$$e = \frac{\sqrt{a^2 - b^2}}{a} = \frac{\sqrt{(36.18/2)^2 - (9.12/2)^2}}{(1/2)(36.18)} = \frac{\sqrt{(18.09)^2 - (4.56)^2}}{18.09} \approx 0.97. \quad \blacksquare$$

HISTORICAL BIOGRAPHY

Edmund Halley (1656–1742)

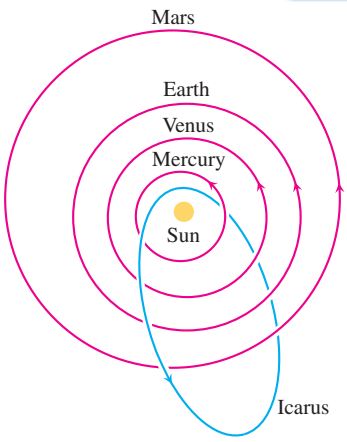

**FIGURE 10.18** The orbit of the asteroid Icarus is highly eccentric. Earth's orbit is so nearly circular that its foci lie inside the sun.

Whereas a parabola has one focus and one directrix, each **ellipse** has two foci and two **directrices**. These are the lines perpendicular to the major axis at distances $\pm a/e$ from the center. The parabola has the property that

$$PF = 1 \cdot PD \tag{1}$$

for any point $P$ on it, where $F$ is the focus and $D$ is the point nearest $P$ on the directrix. For an ellipse, it can be shown that the equations that replace Equation (1) are

$$PF_1 = e \cdot PD_1, \qquad PF_2 = e \cdot PD_2. \tag{2}$$

Here, $e$ is the eccentricity, $P$ is any point on the ellipse, $F_1$ and $F_2$ are the foci, and $D_1$ and $D_2$ are the points on the directrices nearest $P$ (Figure 10.19).

In both Equations (2) the directrix and focus must correspond; that is, if we use the distance from $P$ to $F_1$, we must also use the distance from $P$ to the directrix at the same end of the ellipse. The directrix $x = -a/e$ corresponds to $F_1(-c, 0)$, and the directrix $x = a/e$ corresponds to $F_2(c, 0)$.

The eccentricity of a hyperbola is also $e = c/a$, only in this case $c$ equals $\sqrt{a^2 + b^2}$ instead of $\sqrt{a^2 - b^2}$. In contrast to the eccentricity of an ellipse, the eccentricity of a hyperbola is always greater than 1.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

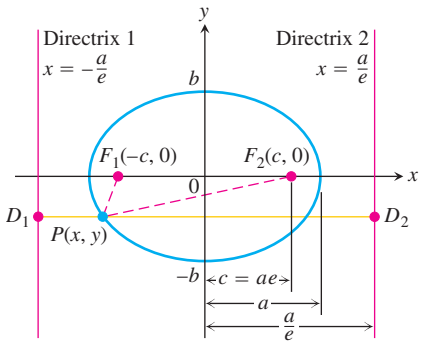

**FIGURE 10.19** The foci and directrices of the ellipse $(x^2/a^2) + (y^2/b^2) = 1$. Directrix 1 corresponds to focus $F_1$, and directrix 2 to focus $F_2$.

**DEFINITION Eccentricity of a Hyperbola**

The **eccentricity** of the hyperbola $(x^2/a^2) - (y^2/b^2) = 1$ is

$$e = \frac{c}{a} = \frac{\sqrt{a^2 + b^2}}{a}.$$

In both ellipse and hyperbola, the eccentricity is the ratio of the distance between the foci to the distance between the vertices (because $c/a = 2c/2a$).

$$\text{Eccentricity} = \frac{\text{distance between foci}}{\text{distance between vertices}}$$

In an ellipse, the foci are closer together than the vertices and the ratio is less than 1. In a hyperbola, the foci are farther apart than the vertices and the ratio is greater than 1.

## EXAMPLE 2 Finding the Vertices of an Ellipse

Locate the vertices of an ellipse of eccentricity 0.8 whose foci lie at the points $(0, \pm 7)$.

**Solution** Since $e = c/a$, the vertices are the points $(0, \pm a)$ where

$$a = \frac{c}{e} = \frac{7}{0.8} = 8.75,$$

or $(0, \pm 8.75)$. ■

## EXAMPLE 3 Eccentricity of a Hyperbola

Find the eccentricity of the hyperbola $9x^2 - 16y^2 = 144$.

**Solution** We divide both sides of the hyperbola's equation by 144 to put it in standard form, obtaining

$$\frac{9x^2}{144} - \frac{16y^2}{144} = 1 \quad \text{and} \quad \frac{x^2}{16} - \frac{y^2}{9} = 1.$$

With $a^2 = 16$ and $b^2 = 9$, we find that $c = \sqrt{a^2 + b^2} = \sqrt{16 + 9} = 5$, so

$$e = \frac{c}{a} = \frac{5}{4}.$$ ■

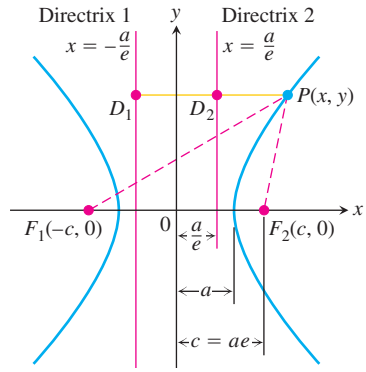

**FIGURE 10.20** The foci and directrices of the hyperbola $(x^2/a^2) - (y^2/b^2) = 1$. No matter where $P$ lies on the hyperbola, $PF_1 = e \cdot PD_1$ and $PF_2 = e \cdot PD_2$.

As with the ellipse, it can be shown that the lines $x = \pm a/e$ act as **directrices** for the **hyperbola** and that

$$PF_1 = e \cdot PD_1 \quad \text{and} \quad PF_2 = e \cdot PD_2. \tag{3}$$

Here $P$ is any point on the hyperbola, $F_1$ and $F_2$ are the foci, and $D_1$ and $D_2$ are the points nearest $P$ on the directrices (Figure 10.20).

To complete the picture, we define the eccentricity of a parabola to be $e = 1$. Equations (1) to (3) then have the common form $PF = e \cdot PD$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**DEFINITION** **Eccentricity of a Parabola**

The **eccentricity** of a parabola is $e = 1$.

The "focus–directrix" equation $PF = e \cdot PD$ unites the parabola, ellipse, and hyperbola in the following way. Suppose that the distance $PF$ of a point $P$ from a fixed point $F$ (the focus) is a constant multiple of its distance from a fixed line (the directrix). That is, suppose

$$PF = e \cdot PD, \tag{4}$$

where $e$ is the constant of proportionality. Then the path traced by $P$ is

**(a)** a *parabola* if $e = 1$,

**(b)** an *ellipse* of eccentricity $e$ if $e < 1$, and

**(c)** a *hyperbola* of eccentricity $e$ if $e > 1$.

There are no coordinates in Equation (4) and when we try to translate it into coordinate form it translates in different ways, depending on the size of $e$. At least, that is what happens in Cartesian coordinates. However, in polar coordinates, as we will see in Section 10.8, the equation $PF = e \cdot PD$ translates into a single equation regardless of the value of $e$, an equation so simple that it has been the equation of choice of astronomers and space scientists for nearly 300 years.

Given the focus and corresponding directrix of a hyperbola centered at the origin and with foci on the $x$-axis, we can use the dimensions shown in Figure 10.20 to find $e$. Knowing $e$, we can derive a Cartesian equation for the hyperbola from the equation $PF = e \cdot PD$, as in the next example. We can find equations for ellipses centered at the origin and with foci on the $x$-axis in a similar way, using the dimensions shown in Figure 10.19.

**EXAMPLE 4** Cartesian Equation for a Hyperbola

Find a Cartesian equation for the hyperbola centered at the origin that has a focus at (3, 0) and the line $x = 1$ as the corresponding directrix.

**Solution** We first use the dimensions shown in Figure 10.20 to find the hyperbola's eccentricity. The focus is

$$(c, 0) = (3, 0) \qquad \text{so} \qquad c = 3.$$

The directrix is the line

$$x = \frac{a}{e} = 1, \qquad \text{so} \qquad a = e.$$

When combined with the equation $e = c/a$ that defines eccentricity, these results give

$$e = \frac{c}{a} = \frac{3}{e}, \qquad \text{so} \qquad e^2 = 3 \quad \text{and} \quad e = \sqrt{3}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

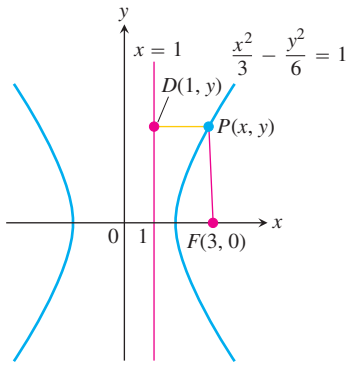

**FIGURE 10.21** The hyperbola and directrix in Example 4.

Knowing $e$, we can now derive the equation we want from the equation $PF = e \cdot PD$. In the notation of Figure 10.21, we have

$$PF = e \cdot PD \qquad \text{Equation (4)}$$

$$\sqrt{(x-3)^2 + (y-0)^2} = \sqrt{3}\,|x-1| \qquad e = \sqrt{3}$$

$$x^2 - 6x + 9 + y^2 = 3(x^2 - 2x + 1)$$

$$2x^2 - y^2 = 6$$

$$\frac{x^2}{3} - \frac{y^2}{6} = 1.$$

# EXERCISES 10.2

## Ellipses

In Exercises 1–8, find the eccentricity of the ellipse. Then find and graph the ellipse's foci and directrices.

**1.** $16x^2 + 25y^2 = 400$ **2.** $7x^2 + 16y^2 = 112$

**3.** $2x^2 + y^2 = 2$ **4.** $2x^2 + y^2 = 4$

**5.** $3x^2 + 2y^2 = 6$ **6.** $9x^2 + 10y^2 = 90$

**7.** $6x^2 + 9y^2 = 54$ **8.** $169x^2 + 25y^2 = 4225$

Exercises 9–12 give the foci or vertices and the eccentricities of ellipses centered at the origin of the $xy$-plane. In each case, find the ellipse's standard-form equation.

**9.** Foci: $(0, \pm 3)$
Eccentricity: 0.5

**10.** Foci: $(\pm 8, 0)$
Eccentricity: 0.2

**11.** Vertices: $(0, \pm 70)$
Eccentricity: 0.1

**12.** Vertices: $(\pm 10, 0)$
Eccentricity: 0.24

Exercises 13–16 give foci and corresponding directrices of ellipses centered at the origin of the $xy$-plane. In each case, use the dimensions in Figure 10.19 to find the eccentricity of the ellipse. Then find the ellipse's standard-form equation.

**13.** Focus: $\left(\sqrt{5}, 0\right)$
Directrix: $x = \dfrac{9}{\sqrt{5}}$

**14.** Focus: $(4, 0)$
Directrix: $x = \dfrac{16}{3}$

**15.** Focus: $(-4, 0)$
Directrix: $x = -16$

**16.** Focus: $\left(-\sqrt{2}, 0\right)$
Directrix: $x = -2\sqrt{2}$

**17.** Draw an ellipse of eccentricity $4/5$. Explain your procedure.

**18.** Draw the orbit of Pluto (eccentricity 0.25) to scale. Explain your procedure.

**19.** The endpoints of the major and minor axes of an ellipse are $(1, 1)$, $(3, 4)$, $(1, 7)$, and $(-1, 4)$. Sketch the ellipse, give its equation in standard form, and find its foci, eccentricity, and directrices.

**20.** Find an equation for the ellipse of eccentricity $2/3$ that has the line $x = 9$ as a directrix and the point $(4, 0)$ as the corresponding focus.

**21.** What values of the constants $a$, $b$, and $c$ make the ellipse

$$4x^2 + y^2 + ax + by + c = 0$$

lie tangent to the $x$-axis at the origin and pass through the point $(-1, 2)$? What is the eccentricity of the ellipse?

**22.** **The reflective property of ellipses** An ellipse is revolved about its major axis to generate an ellipsoid. The inner surface of the ellipsoid is silvered to make a mirror. Show that a ray of light emanating from one focus will be reflected to the other focus. Sound waves also follow such paths, and this property is used in constructing "whispering galleries." (*Hint:* Place the ellipse in standard position in the $xy$-plane and show that the lines from a point $P$ on the ellipse to the two foci make congruent angles with the tangent to the ellipse at $P$.)

## Hyperbolas

In Exercises 23–30, find the eccentricity of the hyperbola. Then find and graph the hyperbola's foci and directrices.

**23.** $x^2 - y^2 = 1$ **24.** $9x^2 - 16y^2 = 144$

**25.** $y^2 - x^2 = 8$ **26.** $y^2 - x^2 = 4$

**27.** $8x^2 - 2y^2 = 16$ **28.** $y^2 - 3x^2 = 3$

**29.** $8y^2 - 2x^2 = 16$ **30.** $64x^2 - 36y^2 = 2304$

Exercises 31–34 give the eccentricities and the vertices or foci of hyperbolas centered at the origin of the $xy$-plane. In each case, find the hyperbola's standard-form equation.

**31.** Eccentricity: 3
Vertices: $(0, \pm 1)$

**32.** Eccentricity: 2
Vertices: $(\pm 2, 0)$

**33.** Eccentricity: 3
Foci: $(\pm 3, 0)$

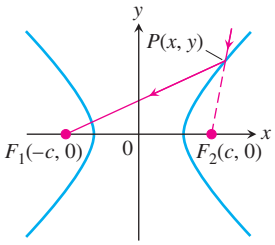
**34.** Eccentricity: 1.25
Foci: $(0, \pm 5)$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises 35–38 give foci and corresponding directrices of hyperbolas centered at the origin of the $xy$-plane. In each case, find the hyperbola's eccentricity. Then find the hyperbola's standard-form equation.

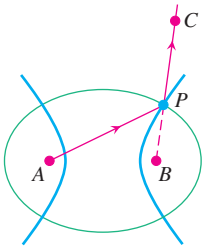
**35.** Focus: $(4, 0)$
Directrix: $x = 2$

**36.** Focus: $\left(\sqrt{10}, 0\right)$
Directrix: $x = \sqrt{2}$



**37.** Focus: $(-2, 0)$
Directrix: $x = -\frac{1}{2}$

**38.** Focus: $(-6, 0)$
Directrix: $x = -2$



**39.** A hyperbola of eccentricity $3/2$ has one focus at $(1, -3)$. The corresponding directrix is the line $y = 2$. Find an equation for the hyperbola.

T **40. The effect of eccentricity on a hyperbola's shape** What happens to the graph of a hyperbola as its eccentricity increases? To find out, rewrite the equation $(x^2/a^2) - (y^2/b^2) = 1$ in terms of $a$ and $e$ instead of $a$ and $b$. Graph the hyperbola for various values of $e$ and describe what you find.

**41. The reflective property of hyperbolas** Show that a ray of light directed toward one focus of a hyperbolic mirror, as in the accompanying figure, is reflected toward the other focus. (*Hint:* Show that the tangent to the hyperbola at $P$ bisects the angle made by segments $PF_1$ and $PF_2$.)

**42. A confocal ellipse and hyperbola** Show that an ellipse and a hyperbola that have the same foci $A$ and $B$, as in the accompanying figure, cross at right angles at their point of intersection. (*Hint:* A ray of light from focus $A$ that met the hyperbola at $P$ would be reflected from the hyperbola as if it came directly from $B$ (Exercise 41). The same ray would be reflected off the ellipse to pass through $B$ (Exercise 22).)

# 10.3 Quadratic Equations and Rotations

In this section, we examine the Cartesian graph of any equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0, \tag{1}$$

in which $A$, $B$, and $C$ are not all zero, and show that it is nearly always a conic section. The exceptions are the cases in which there is no graph at all or the graph consists of two parallel lines. It is conventional to call all graphs of Equation (1), curved or not, **quadratic curves**.

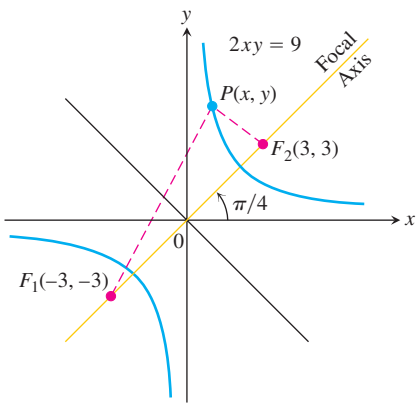

**FIGURE 10.22** The focal axis of the hyperbola $2xy = 9$ makes an angle of $\pi/4$ radians with the positive $x$-axis.

## The Cross Product Term

You may have noticed that the term $Bxy$ did not appear in the equations for the conic sections in Section 10.1. This happened because the axes of the conic sections ran parallel to (in fact, coincided with) the coordinate axes.

To see what happens when the parallelism is absent, let us write an equation for a hyperbola with $a = 3$ and foci at $F_1(-3, -3)$ and $F_2(3, 3)$ (Figure 10.22). The equation $|PF_1 - PF_2| = 2a$ becomes $|PF_1 - PF_2| = 2(3) = 6$ and

$$\sqrt{(x+3)^2 + (y+3)^2} - \sqrt{(x-3)^2 + (y-3)^2} = \pm 6.$$

When we transpose one radical, square, solve for the radical that still appears, and square again, the equation reduces to

$$2xy = 9, \tag{2}$$

a case of Equation (1) in which the cross product term is present. The asymptotes of the hyperbola in Equation (2) are the $x$- and $y$-axes, and the focal axis makes an angle of $\pi/4$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

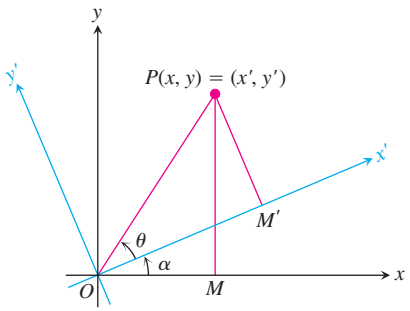

**FIGURE 10.23** A counterclockwise rotation through angle $\alpha$ about the origin.

radians with the positive $x$-axis. As in this example, the cross product term is present in Equation (1) only when the axes of the conic are tilted.

To eliminate the $xy$-term from the equation of a conic, we rotate the coordinate axes to eliminate the "tilt" in the axes of the conic. The equations for the rotations we use are derived in the following way. In the notation of Figure 10.23, which shows a counterclockwise rotation about the origin through an angle $\alpha$,

$$\begin{aligned} x &= OM = OP\cos(\theta + \alpha) = OP\cos\theta\cos\alpha - OP\sin\theta\sin\alpha \\ y &= MP = OP\sin(\theta + \alpha) = OP\cos\theta\sin\alpha + OP\sin\theta\cos\alpha. \end{aligned} \tag{3}$$

Since

$$OP\cos\theta = OM' = x'$$

and

$$OP\sin\theta = M'P = y',$$

Equations (3) reduce to the following.

**Equations for Rotating Coordinate Axes**

$$\begin{aligned} x &= x'\cos\alpha - y'\sin\alpha \\ y &= x'\sin\alpha + y'\cos\alpha \end{aligned} \tag{4}$$

**EXAMPLE 1** Finding an Equation for a Hyperbola

The $x$- and $y$-axes are rotated through an angle of $\pi/4$ radians about the origin. Find an equation for the hyperbola $2xy = 9$ in the new coordinates.

**Solution** Since $\cos\pi/4 = \sin\pi/4 = 1/\sqrt{2}$, we substitute

$$x = \frac{x' - y'}{\sqrt{2}}, \qquad y = \frac{x' + y'}{\sqrt{2}}$$

from Equations (4) into the equation $2xy = 9$ and obtain

$$\begin{aligned} 2\left(\frac{x' - y'}{\sqrt{2}}\right)\left(\frac{x' + y'}{\sqrt{2}}\right) &= 9 \\ x'^2 - y'^2 &= 9 \\ \frac{x'^2}{9} - \frac{y'^2}{9} &= 1. \end{aligned}$$

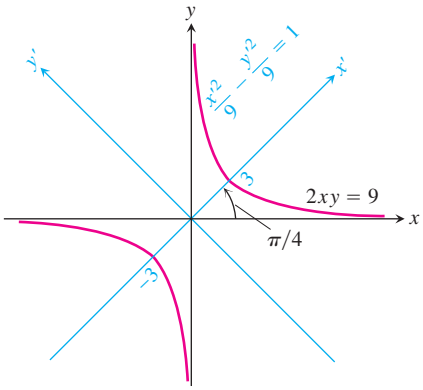

**FIGURE 10.24** The hyperbola in Example 1 ($x'$ and $y'$ are the coordinates).

See Figure 10.24. ■

If we apply Equations (4) to the quadratic equation (1), we obtain a new quadratic equation

$$A'x'^2 + B'x'y' + C'y'^2 + D'x' + E'y' + F' = 0. \tag{5}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The new and old coefficients are related by the equations

$$\begin{aligned} A' &= A\cos^2\alpha + B\cos\alpha\sin\alpha + C\sin^2\alpha \\ B' &= B\cos 2\alpha + (C - A)\sin 2\alpha \\ C' &= A\sin^2\alpha - B\sin\alpha\cos\alpha + C\cos^2\alpha \\ D' &= D\cos\alpha + E\sin\alpha \\ E' &= -D\sin\alpha + E\cos\alpha \\ F' &= F. \end{aligned} \tag{6}$$

These equations show, among other things, that if we start with an equation for a curve in which the cross product term is present ($B \neq 0$), we can find a rotation angle $\alpha$ that produces an equation in which no cross product term appears ($B' = 0$). To find $\alpha$, we set $B' = 0$ in the second equation in (6) and solve the resulting equation,

$$B\cos 2\alpha + (C - A)\sin 2\alpha = 0,$$

for $\alpha$. In practice, this means determining $\alpha$ from one of the two equations

**Angle of Rotation**

$$\cot 2\alpha = \frac{A - C}{B} \qquad \text{or} \qquad \tan 2\alpha = \frac{B}{A - C}. \tag{7}$$

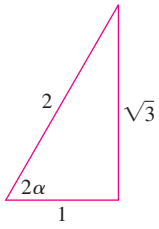

**FIGURE 10.25** This triangle identifies $2\alpha = \cot^{-1}(1/\sqrt{3})$ as $\pi/3$ (Example 2).

## EXAMPLE 2 Finding the Angle of Rotation

The coordinate axes are to be rotated through an angle $\alpha$ to produce an equation for the curve

$$2x^2 + \sqrt{3}\,xy + y^2 - 10 = 0$$

that has no cross product term. Find $\alpha$ and the new equation. Identify the curve.

**Solution** The equation $2x^2 + \sqrt{3}\,xy + y^2 - 10 = 0$ has $A = 2, B = \sqrt{3}$, and $C = 1$. We substitute these values into Equation (7) to find $\alpha$:

$$\cot 2\alpha = \frac{A - C}{B} = \frac{2 - 1}{\sqrt{3}} = \frac{1}{\sqrt{3}}.$$

From the right triangle in Figure 10.25, we see that one appropriate choice of angle is $2\alpha = \pi/3$, so we take $\alpha = \pi/6$. Substituting $\alpha = \pi/6$, $A = 2$, $B = \sqrt{3}$, $C = 1$, $D = E = 0$, and $F = -10$ into Equations (6) gives

$$A' = \frac{5}{2}, \qquad B' = 0, \qquad C' = \frac{1}{2}, \qquad D' = E' = 0, \qquad F' = -10.$$

Equation (5) then gives

$$\frac{5}{2}x'^2 + \frac{1}{2}y'^2 - 10 = 0, \qquad \text{or} \qquad \frac{x'^2}{4} + \frac{y'^2}{20} = 1.$$

The curve is an ellipse with foci on the new $y'$-axis (Figure 10.26). ■

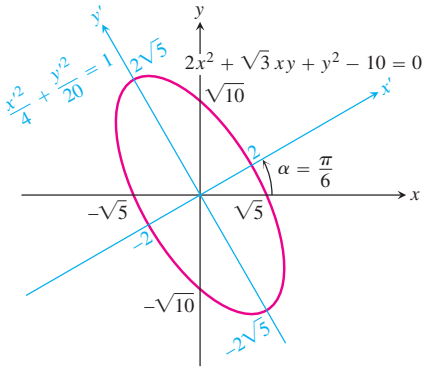

**FIGURE 10.26** The conic section in Example 2.

## Possible Graphs of Quadratic Equations

We now return to the graph of the general quadratic equation.

Since axes can always be rotated to eliminate the cross product term, there is no loss of generality in assuming that this has been done and that our equation has the form

$$Ax^2 + Cy^2 + Dx + Ey + F = 0. \tag{8}$$

Equation (8) represents

**(a)** a *circle* if $A = C \neq 0$ (special cases: the graph is a point or there is no graph at all);

**(b)** a *parabola* if Equation (8) is quadratic in one variable and linear in the other;

**(c)** an *ellipse* if $A$ and $C$ are both positive or both negative (special cases: circles, a single point, or no graph at all);

**(d)** a *hyperbola* if $A$ and $C$ have opposite signs (special case: a pair of intersecting lines);

**(e)** a *straight line* if $A$ and $C$ are zero and at least one of $D$ and $E$ is different from zero;

**(f)** *one or two straight lines* if the left-hand side of Equation (8) can be factored into the product of two linear factors.

See Table 10.3 for examples.

**TABLE 10.3** Examples of quadratic curves $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$

| | $A$ | $B$ | $C$ | $D$ | $E$ | $F$ | Equation | Remarks |
|---|---|---|---|---|---|---|---|---|
| Circle | 1 | | 1 | | | $-4$ | $x^2 + y^2 = 4$ | $A = C; F < 0$ |
| Parabola | | | 1 | $-9$ | | | $y^2 = 9x$ | Quadratic in $y$, linear in $x$ |
| Ellipse | 4 | | 9 | | | $-36$ | $4x^2 + 9y^2 = 36$ | $A$, $C$ have same sign, $A \neq C; F < 0$ |
| Hyperbola | 1 | | $-1$ | | | $-1$ | $x^2 - y^2 = 1$ | $A$, $C$ have opposite signs |
| One line (still a conic section) | 1 | | | | | | $x^2 = 0$ | $y$-axis |
| Intersecting lines (still a conic section) | | 1 | | 1 | $-1$ | $-1$ | $xy + x - y - 1 = 0$ | Factors to $(x - 1)(y + 1) = 0$, so $x = 1, y = -1$ |
| Parallel lines (not a conic section) | 1 | | | $-3$ | | 2 | $x^2 - 3x + 2 = 0$ | Factors to $(x - 1)(x - 2) = 0$, so $x = 1, x = 2$ |
| Point | 1 | | 1 | | | | $x^2 + y^2 = 0$ | The origin |
| No graph | 1 | | | | | 1 | $x^2 = -1$ | No graph |

## The Discriminant Test

We do not need to eliminate the $xy$-term from the equation

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0 \tag{9}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

to tell what kind of conic section the equation represents. If this is the only information we want, we can apply the following test instead.

As we have seen, if $B \neq 0$, then rotating the coordinate axes through an angle $\alpha$ that satisfies the equation

$$\cot 2\alpha = \frac{A - C}{B} \tag{10}$$

will change Equation (9) into an equivalent form

$$A'x'^2 + C'y'^2 + D'x' + E'y' + F' = 0 \tag{11}$$

without a cross product term.

Now, the graph of Equation (11) is a (real or degenerate)

**(a)** *parabola* if $A'$ or $C' = 0$; that is, if $A'C' = 0$;

**(b)** *ellipse* if $A'$ and $C'$ have the same sign; that is, if $A'C' > 0$;

**(c)** *hyperbola* if $A'$ and $C'$ have opposite signs; that is, if $A'C' < 0$.

It can also be verified from Equations (6) that for any rotation of axes,

$$B^2 - 4AC = B'^2 - 4A'C'. \tag{12}$$

This means that the quantity $B^2 - 4AC$ is not changed by a rotation. But when we rotate through the angle $\alpha$ given by Equation (10), $B'$ becomes zero, so

$$B^2 - 4AC = -4A'C'.$$

Since the curve is a parabola if $A'C' = 0$, an ellipse if $A'C' > 0$, and a hyperbola if $A'C' < 0$, the curve must be a parabola if $B^2 - 4AC = 0$, an ellipse if $B^2 - 4AC < 0$, and a hyperbola if $B^2 - 4AC > 0$. The number $B^2 - 4AC$ is called the **discriminant** of Equation (9).

**The Discriminant Test**

With the understanding that occasional degenerate cases may arise, the quadratic curve $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$ is

**(a)** a **parabola** if $B^2 - 4AC = 0$,
**(b)** an **ellipse** if $B^2 - 4AC < 0$,
**(c)** a **hyperbola** if $B^2 - 4AC > 0$.

**EXAMPLE 3** Applying the Discriminant Test

**(a)** $3x^2 - 6xy + 3y^2 + 2x - 7 = 0$ represents a parabola because

$$B^2 - 4AC = (-6)^2 - 4 \cdot 3 \cdot 3 = 36 - 36 = 0.$$

**(b)** $x^2 + xy + y^2 - 1 = 0$ represents an ellipse because

$$B^2 - 4AC = (1)^2 - 4 \cdot 1 \cdot 1 = -3 < 0.$$

**(c)** $xy - y^2 - 5y + 1 = 0$ represents a hyperbola because

$$B^2 - 4AC = (1)^2 - 4(0)(-1) = 1 > 0.$$

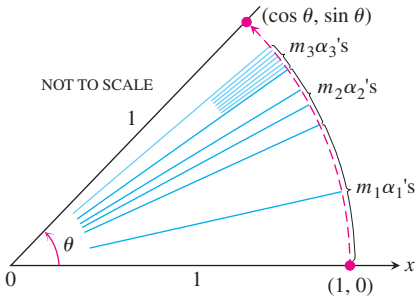

**FIGURE 10.27** To calculate the sine and cosine of an angle $\theta$ between 0 and $2\pi$, the calculator rotates the point (1, 0) to an appropriate location on the unit circle and displays the resulting coordinates.

## USING TECHNOLOGY How Calculators Use Rotations to Evaluate Sines and Cosines

Some calculators use rotations to calculate sines and cosines of arbitrary angles. The procedure goes something like this: The calculator has, stored,

**1.** ten angles or so, say

$$\alpha_1 = \sin^{-1}(10^{-1}), \qquad \alpha_2 = \sin^{-1}(10^{-2}), \qquad \ldots, \qquad \alpha_{10} = \sin^{-1}(10^{-10}),$$

and

**2.** twenty numbers, the sines and cosines of the angles $\alpha_1, \alpha_2, \ldots, \alpha_{10}$.

To calculate the sine and cosine of an arbitrary angle $\theta$, we enter $\theta$ (in radians) into the calculator. The calculator subtracts or adds multiples of $2\pi$ to $\theta$ to replace $\theta$ by the angle between 0 and $2\pi$ that has the same sine and cosine as $\theta$ (we continue to call the angle $\theta$). The calculator then "writes" $\theta$ as a sum of multiples of $\alpha_1$ (as many as possible without overshooting) plus multiples of $\alpha_2$ (again, as many as possible), and so on, working its way to $\alpha_{10}$. This gives

$$\theta \approx m_1\alpha_1 + m_2\alpha_2 + \cdots + m_{10}\alpha_{10}.$$

The calculator then rotates the point (1, 0) through $m_1$ copies of $\alpha_1$ (through $\alpha_1$, $m_1$ times in succession), plus $m_2$ copies of $\alpha_2$, and so on, finishing off with $m_{10}$ copies of $\alpha_{10}$ (Figure 10.27). The coordinates of the final position of (1, 0) on the unit circle are the values the calculator gives for $(\cos\theta, \sin\theta)$.

# EXERCISES 10.3

## Using the Discriminant

Use the discriminant $B^2 - 4AC$ to decide whether the equations in Exercises 1–16 represent parabolas, ellipses, or hyperbolas.

**1.** $x^2 - 3xy + y^2 - x = 0$

**2.** $3x^2 - 18xy + 27y^2 - 5x + 7y = -4$

**3.** $3x^2 - 7xy + \sqrt{17}\,y^2 = 1$

**4.** $2x^2 - \sqrt{15}\,xy + 2y^2 + x + y = 0$

**5.** $x^2 + 2xy + y^2 + 2x - y + 2 = 0$

**6.** $2x^2 - y^2 + 4xy - 2x + 3y = 6$

**7.** $x^2 + 4xy + 4y^2 - 3x = 6$

**8.** $x^2 + y^2 + 3x - 2y = 10$

**9.** $xy + y^2 - 3x = 5$

**10.** $3x^2 + 6xy + 3y^2 - 4x + 5y = 12$

**11.** $3x^2 - 5xy + 2y^2 - 7x - 14y = -1$

**12.** $2x^2 - 4.9xy + 3y^2 - 4x = 7$

**13.** $x^2 - 3xy + 3y^2 + 6y = 7$

**14.** $25x^2 + 21xy + 4y^2 - 350x = 0$

**15.** $6x^2 + 3xy + 2y^2 + 17y + 2 = 0$

**16.** $3x^2 + 12xy + 12y^2 + 435x - 9y + 72 = 0$

## Rotating Coordinate Axes

In Exercises 17–26, rotate the coordinate axes to change the given equation into an equation that has no cross product ($xy$) term. Then identify the graph of the equation. (The new equations will vary with the size and direction of the rotation you use.)

**17.** $xy = 2$

**18.** $x^2 + xy + y^2 = 1$

**19.** $3x^2 + 2\sqrt{3}\,xy + y^2 - 8x + 8\sqrt{3}\,y = 0$

**20.** $x^2 - \sqrt{3}\,xy + 2y^2 = 1$

**21.** $x^2 - 2xy + y^2 = 2$

**22.** $3x^2 - 2\sqrt{3}\,xy + y^2 = 1$

**23.** $\sqrt{2}\,x^2 + 2\sqrt{2}\,xy + \sqrt{2}\,y^2 - 8x + 8y = 0$

**24.** $xy - y - x + 1 = 0$

**25.** $3x^2 + 2xy + 3y^2 = 19$

**26.** $3x^2 + 4\sqrt{3}\,xy - y^2 = 7$

**27.** Find the sine and cosine of an angle in Quadrant I through which the coordinate axes can be rotated to eliminate the cross product term from the equation

$$14x^2 + 16xy + 2y^2 - 10x + 26{,}370y - 17 = 0.$$

Do not carry out the rotation.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**28.** Find the sine and cosine of an angle in Quadrant II through which the coordinate axes can be rotated to eliminate the cross product term from the equation

$$4x^2 - 4xy + y^2 - 8\sqrt{5}\,x - 16\sqrt{5}\,y = 0.$$

Do not carry out the rotation.

T The conic sections in Exercises 17–26 were chosen to have rotation angles that were "nice" in the sense that once we knew $\cot 2\alpha$ or $\tan 2\alpha$ we could identify $2\alpha$ and find $\sin\alpha$ and $\cos\alpha$ from familiar triangles.

In Exercises 29–34, use a calculator to find an angle $\alpha$ through which the coordinate axes can be rotated to change the given equation into a quadratic equation that has no cross product term. Then find $\sin\alpha$ and $\cos\alpha$ to two decimal places and use Equations (6) to find the coefficients of the new equation to the nearest decimal place. In each case, say whether the conic section is an ellipse, a hyperbola, or a parabola.

**29.** $x^2 - xy + 3y^2 + x - y - 3 = 0$

**30.** $2x^2 + xy - 3y^2 + 3x - 7 = 0$

**31.** $x^2 - 4xy + 4y^2 - 5 = 0$

**32.** $2x^2 - 12xy + 18y^2 - 49 = 0$

**33.** $3x^2 + 5xy + 2y^2 - 8y - 1 = 0$

**34.** $2x^2 + 7xy + 9y^2 + 20x - 86 = 0$

## Theory and Examples

**35.** What effect does a 90° rotation about the origin have on the equations of the following conic sections? Give the new equation in each case.

**a.** The ellipse $(x^2/a^2) + (y^2/b^2) = 1 \quad (a > b)$

**b.** The hyperbola $(x^2/a^2) = (y^2/b^2) = 1$

**c.** The circle $x^2 + y^2 = a^2$

**d.** The line $y = mx$ **e.** The line $y = mx + b$

**36.** What effect does a 180° rotation about the origin have on the equations of the following conic sections? Give the new equation in each case.

**a.** The ellipse $(x^2/a^2) + (y^2/b^2) = 1 \quad (a > b)$

**b.** The hyperbola $(x^2/a^2) = (y^2/b^2) = 1$

**c.** The circle $x^2 + y^2 = a^2$

**d.** The line $y = mx$ **e.** The line $y = mx + b$

**37. The Hyperbola $xy = a$** The hyperbola $xy = 1$ is one of many hyperbolas of the form $xy = a$ that appear in science and mathematics.

**a.** Rotate the coordinate axes through an angle of 45° to change the equation $xy = 1$ into an equation with no $xy$-term. What is the new equation?

**b.** Do the same for the equation $xy = a$.

**38.** Find the eccentricity of the hyperbola $xy = 2$.

**39.** Can anything be said about the graph of the equation $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$ if $AC < 0$? Give reasons for your answer.

**40. Degenerate conics** Does any nondegenerate conic section $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$ have all of the following properties?

**a.** It is symmetric with respect to the origin.

**b.** It passes through the point $(1, 0)$.

**c.** It is tangent to the line $y = 1$ at the point $(-2, 1)$.

Give reasons for your answer.

**41.** Show that the equation $x^2 + y^2 = a^2$ becomes $x'^2 + y'^2 = a^2$ for every choice of the angle $\alpha$ in the rotation equations (4).

**42.** Show that rotating the axes through an angle of $\pi/4$ radians will eliminate the $xy$-term from Equation (1) whenever $A = C$.

**43.** **a.** Decide whether the equation

$$x^2 + 4xy + 4y^2 + 6x + 12y + 9 = 0$$

represents an ellipse, a parabola, or a hyperbola.

**b.** Show that the graph of the equation in part (a) is the line $2y = -x - 3$.

**44.** **a.** Decide whether the conic section with equation

$$9x^2 + 6xy + y^2 - 12x - 4y + 4 = 0$$

represents a parabola, an ellipse, or a hyperbola.

**b.** Show that the graph of the equation in part (a) is the line $y = -3x + 2$.

**45.** **a.** What kind of conic section is the curve $xy + 2x - y = 0$?

**b.** Solve the equation $xy + 2x - y = 0$ for $y$ and sketch the curve as the graph of a rational function of $x$.

**c.** Find equations for the lines parallel to the line $y = -2x$ that are normal to the curve. Add the lines to your sketch.

**46.** Prove or find counterexamples to the following statements about the graph of $Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$.

**a.** If $AC > 0$, the graph is an ellipse.

**b.** If $AC > 0$, the graph is a hyperbola.

**c.** If $AC < 0$, the graph is a hyperbola.

**47. A nice area formula for ellipses** When $B^2 - 4AC$ is negative, the equation

$$Ax^2 + Bxy + Cy^2 = 1$$

represents an ellipse. If the ellipse's semi-axes are $a$ and $b$, its area is $\pi ab$ (a standard formula). Show that the area is also given by the formula $2\pi/\sqrt{4AC - B^2}$. (*Hint:* Rotate the coordinate axes to eliminate the $xy$-term and apply Equation (12) to the new equation.)

**48. Other invariants** We describe the fact that $B'^2 - 4A'C'$ equals $B^2 - 4AC$ after a rotation about the origin by saying that the discriminant of a quadratic equation is an *invariant* of the equation.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Use Equations (6) to show that the numbers **(a)** $A + C$ and **(b)** $D^2 + E^2$ are also invariants, in the sense that

$$A' + C' = A + C \quad \text{and} \quad D'^2 + E'^2 = D^2 + E^2.$$

We can use these equalities to check against numerical errors when we rotate axes.

**49. A proof that $B'^2 - 4A'C' = B^2 - 4AC$** Use Equations (6) to show that $B'^2 - 4A'C' = B^2 - 4AC$ for any rotation of axes about the origin.

# 10.4 Conics and Parametric Equations; The Cycloid

Curves in the Cartesian plane defined by parametric equations, and the calculation of their derivatives, were introduced in Section 3.5. There we studied parametrizations of lines, circles, and ellipses. In this section we discuss parametrization of parabolas, hyperbolas, cycloids, brachistocrones, and tautocrones.

## Parabolas and Hyperbolas

In Section 3.5 we used the parametrization

$$x = \sqrt{t}, \qquad y = t, \qquad t > 0$$

to describe the motion of a particle moving along the right branch of the parabola $y = x^2$. In the following example we obtain a parametrization of the entire parabola, not just its right branch.

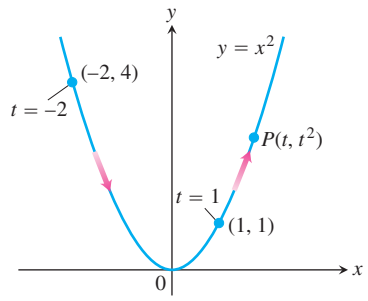

**FIGURE 10.28** The path defined by $x = t, y = t^2, -\infty < t < \infty$ is the entire parabola $y = x^2$ (Example 1).

**EXAMPLE 1** An Entire Parabola

The position $P(x, y)$ of a particle moving in the $xy$-plane is given by the equations and parameter interval

$$x = t, \qquad y = t^2, \qquad -\infty < t < \infty.$$

Identify the particle's path and describe the motion.

**Solution** We identify the path by eliminating $t$ between the equations $x = t$ and $y = t^2$, obtaining

$$y = (t)^2 = x^2.$$

The particle's position coordinates satisfy the equation $y = x^2$, so the particle moves along this curve.

In contrast to Example 10 in Section 3.5, the particle now traverses the entire parabola. As $t$ increases from $-\infty$ to $\infty$, the particle comes down the left-hand side, passes through the origin, and moves up the right-hand side (Figure 10.28). ■

As Example 1 illustrates, any curve $y = f(x)$ has the parametrization $x = t$, $y = f(t)$. This is so simple we usually do not use it, but the point of view is occasionally helpful.

**EXAMPLE 2** A Parametrization of the Right-hand Branch of the Hyperbola $x^2 - y^2 = 1$

Describe the motion of the particle whose position $P(x, y)$ at time $t$ is given by

$$x = \sec t, \qquad y = \tan t, \qquad -\frac{\pi}{2} < t < \frac{\pi}{2}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

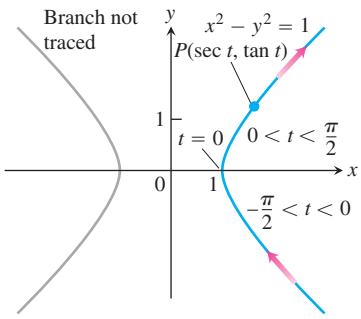

**FIGURE 10.29** The equations $x = \sec t, y = \tan t$ and interval $-\pi/2 < t < \pi/2$ describe the right-hand branch of the hyperbola $x^2 - y^2 = 1$ (Example 2).

HISTORICAL BIOGRAPHY

Christiaan Huygens (1629–1695)

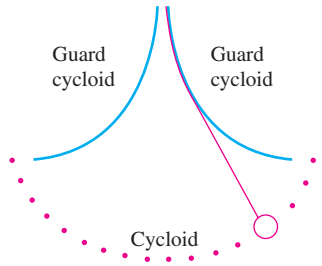

**FIGURE 10.30** In Huygens' pendulum clock, the bob swings in a cycloid, so the frequency is independent of the amplitude.

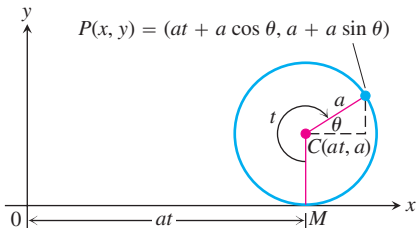

**FIGURE 10.31** The position of $P(x, y)$ on the rolling wheel at angle $t$ (Example 3).

**Solution** We find a Cartesian equation for the coordinates of $P$ by eliminating $t$ between the equations

$$\sec t = x, \qquad \tan t = y.$$

We accomplish this with the identity $\sec^2 t - \tan^2 t = 1$, which yields

$$x^2 - y^2 = 1.$$

Since the particle's coordinates $(x, y)$ satisfy the equation $x^2 - y^2 = 1$, the motion takes place somewhere on this hyperbola. As $t$ runs between $-\pi/2$ and $\pi/2$, $x = \sec t$ remains positive and $y = \tan t$ runs between $-\infty$ and $\infty$, so $P$ traverses the hyperbola's right-hand branch. It comes in along the branch's lower half as $t \to 0^-$, reaches $(1, 0)$ at $t = 0$, and moves out into the first quadrant as $t$ increases toward $\pi/2$ (Figure 10.29). ■

## Cycloids

The problem with a pendulum clock whose bob swings in a circular arc is that the frequency of the swing depends on the amplitude of the swing. The wider the swing, the longer it takes the bob to return to center (its lowest position).

This does not happen if the bob can be made to swing in a *cycloid*. In 1673, Christiaan Huygens designed a pendulum clock whose bob would swing in a cycloid, a curve we define in Example 3. He hung the bob from a fine wire constrained by guards that caused it to draw up as it swung away from center (Figure 10.30).

### EXAMPLE 3 Parametrizing a Cycloid

A wheel of radius $a$ rolls along a horizontal straight line. Find parametric equations for the path traced by a point $P$ on the wheel's circumference. The path is called a **cycloid**.

**Solution** We take the line to be the $x$-axis, mark a point $P$ on the wheel, start the wheel with $P$ at the origin, and roll the wheel to the right. As parameter, we use the angle $t$ through which the wheel turns, measured in radians. Figure 10.31 shows the wheel a short while later, when its base lies $at$ units from the origin. The wheel's center $C$ lies at $(at, a)$ and the coordinates of $P$ are

$$x = at + a\cos\theta, \qquad y = a + a\sin\theta.$$

To express $\theta$ in terms of $t$, we observe that $t + \theta = 3\pi/2$ in the figure, so that

$$\theta = \frac{3\pi}{2} - t.$$

This makes

$$\cos\theta = \cos\left(\frac{3\pi}{2} - t\right) = -\sin t, \qquad \sin\theta = \sin\left(\frac{3\pi}{2} - t\right) = -\cos t.$$

The equations we seek are

$$x = at - a\sin t, \qquad y = a - a\cos t.$$

These are usually written with the $a$ factored out:

$$x = a(t - \sin t), \qquad y = a(1 - \cos t). \tag{1}$$

Figure 10.32 shows the first arch of the cycloid and part of the next. ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

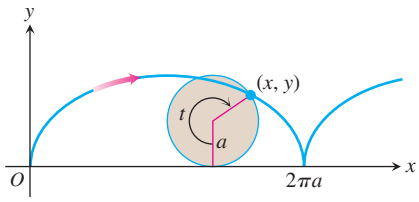

**FIGURE 10.32** The cycloid $x = a(t - \sin t), y = a(1 - \cos t)$, for $t \geq 0$.

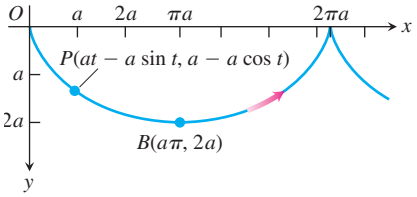

**FIGURE 10.33** To study motion along an upside-down cycloid under the influence of gravity, we turn Figure 10.32 upside down. This points the $y$-axis in the direction of the gravitational force and makes the downward $y$-coordinates positive. The equations and parameter interval for the cycloid are still

$$x = a(t - \sin t),$$
$$y = a(1 - \cos t), \quad t \geq 0.$$

The arrow shows the direction of increasing $t$.

## Brachistochrones and Tautochrones

If we turn Figure 10.32 upside down, Equations (1) still apply and the resulting curve (Figure 10.33) has two interesting physical properties. The first relates to the origin $O$ and the point $B$ at the bottom of the first arch. Among all smooth curves joining these points, the cycloid is the curve along which a frictionless bead, subject only to the force of gravity, will slide from $O$ to $B$ the fastest. This makes the cycloid a **brachistochrone** ("brah-*kiss*-toe-krone"), or shortest time curve for these points. The second property is that even if you start the bead partway down the curve toward $B$, it will still take the bead the same amount of time to reach $B$. This makes the cycloid a **tautochrone** ("*taw*-toe-krone"), or same-time curve for $O$ and $B$.

Are there any other brachistochrones joining $O$ and $B$, or is the cycloid the only one? We can formulate this as a mathematical question in the following way. At the start, the kinetic energy of the bead is zero, since its velocity is zero. The work done by gravity in moving the bead from (0, 0) to any other point $(x, y)$ in the plane is $mgy$, and this must equal the change in kinetic energy. That is,

$$mgy = \frac{1}{2}mv^2 - \frac{1}{2}m(0)^2.$$

Thus, the velocity of the bead when it reaches $(x, y)$ has to be

$$v = \sqrt{2gy}.$$

That is,

$$\frac{ds}{dt} = \sqrt{2gy}$$

$ds$ is the arc length differential along the bead's path.

or

$$dt = \frac{ds}{\sqrt{2gy}} = \frac{\sqrt{1 + (dy/dx)^2}\,dx}{\sqrt{2gy}}.$$

The time $T_f$ it takes the bead to slide along a particular path $y = f(x)$ from $O$ to $B(a\pi, 2a)$ is

$$T_f = \int_{x=0}^{x=a\pi} \sqrt{\frac{1 + (dy/dx)^2}{2gy}}\,dx. \tag{2}$$

What curves $y = f(x)$, if any, minimize the value of this integral?

At first sight, we might guess that the straight line joining $O$ and $B$ would give the shortest time, but perhaps not. There might be some advantage in having the bead fall vertically at first to build up its velocity faster. With a higher velocity, the bead could travel a longer path and still reach $B$ first. Indeed, this is the right idea. The solution, from a branch of mathematics known as the *calculus of variations,* is that the original cycloid from $O$ to $B$ is the one and only brachistochrone for $O$ and $B$.

While the solution of the brachistrochrone problem is beyond our present reach, we can still show why the cycloid is a tautochrone. For the cycloid, Equation (2) takes the form

$$T_{\text{cycloid}} = \int_{x=0}^{x=a\pi} \sqrt{\frac{dx^2 + dy^2}{2gy}}$$
$$= \int_{t=0}^{t=\pi} \sqrt{\frac{a^2(2 - 2\cos t)}{2ga(1 - \cos t)}}\,dt$$
$$= \int_0^{\pi} \sqrt{\frac{a}{g}}\,dt = \pi\sqrt{\frac{a}{g}}.$$

From Equations (1), $dx = a(1 - \cos t)\,dt$, $dy = a\sin t\,dt$, and $y = a(1 - \cos t)$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Thus, the amount of time it takes the frictionless bead to slide down the cycloid to $B$ after it is released from rest at $O$ is $\pi\sqrt{a/g}$.

Suppose that instead of starting the bead at $O$ we start it at some lower point on the cycloid, a point $(x_0, y_0)$ corresponding to the parameter value $t_0 > 0$. The bead's velocity at any later point $(x, y)$ on the cycloid is

$$v = \sqrt{2g(y - y_0)} = \sqrt{2ga(\cos t_0 - \cos t)}. \qquad y = a(1 - \cos t)$$

Accordingly, the time required for the bead to slide from $(x_0, y_0)$ down to $B$ is

$$T = \int_{t_0}^{\pi} \sqrt{\frac{a^2(2 - 2\cos t)}{2ga(\cos t_0 - \cos t)}}\, dt = \sqrt{\frac{a}{g}} \int_{t_0}^{\pi} \sqrt{\frac{1 - \cos t}{\cos t_0 - \cos t}}\, dt$$

$$= \sqrt{\frac{a}{g}} \int_{t_0}^{\pi} \sqrt{\frac{2\sin^2(t/2)}{(2\cos^2(t_0/2) - 1) - (2\cos^2(t/2) - 1)}}\, dt$$

$$= \sqrt{\frac{a}{g}} \int_{t_0}^{\pi} \frac{\sin(t/2)\, dt}{\sqrt{\cos^2(t_0/2) - \cos^2(t/2)}}$$

$$= \sqrt{\frac{a}{g}} \int_{t=t_0}^{t=\pi} \frac{-2\, du}{\sqrt{a^2 - u^2}} \qquad \begin{aligned} u &= \cos(t/2) \\ -2\, du &= \sin(t/2)\, dt \\ c &= \cos(t_0/2) \end{aligned}$$

$$= 2\sqrt{\frac{a}{g}} \left[ -\sin^{-1} \frac{u}{c} \right]_{t=t_0}^{t=\pi}$$

$$= 2\sqrt{\frac{a}{g}} \left[ -\sin^{-1} \frac{\cos(t/2)}{\cos(t_0/2)} \right]_{t_0}^{\pi}$$

$$= 2\sqrt{\frac{a}{g}} (-\sin^{-1} 0 + \sin^{-1} 1) = \pi\sqrt{\frac{a}{g}}.$$

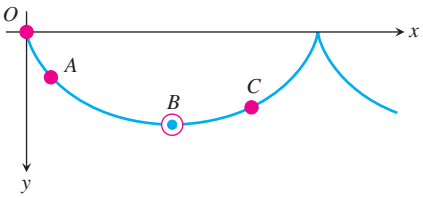

**FIGURE 10.34** Beads released simultaneously on the cycloid at $O$, $A$, and $C$ will reach $B$ at the same time.

This is precisely the time it takes the bead to slide to $B$ from $O$. It takes the bead the same amount of time to reach $B$ no matter where it starts. Beads starting simultaneously from $O$, $A$, and $C$ in Figure 10.34, for instance, will all reach $B$ at the same time. This is the reason that Huygens' pendulum clock is independent of the amplitude of the swing.

# EXERCISES 10.4

## Parametric Equations for Conics

Exercises 1–12 give parametric equations and parameter intervals for the motion of a particle in the $xy$-plane. Identify the particle's path by finding a Cartesian equation for it. Graph the Cartesian equation. (The graphs will vary with the equation used.) Indicate the portion of the graph traced by the particle and the direction of motion.

**1.** $x = \cos t, \quad y = \sin t, \quad 0 \le t \le \pi$

**2.** $x = \sin(2\pi(1 - t)), \quad y = \cos(2\pi(1 - t)); \quad 0 \le t \le 1$

**3.** $x = 4\cos t, \quad y = 5\sin t; \quad 0 \le t \le \pi$

**4.** $x = 4\sin t, \quad y = 5\cos t; \quad 0 \le t \le 2\pi$

**5.** $x = t, \quad y = \sqrt{t}; \quad t \ge 0$

**6.** $x = \sec^2 t - 1, \quad y = \tan t; \quad -\pi/2 < t < \pi/2$

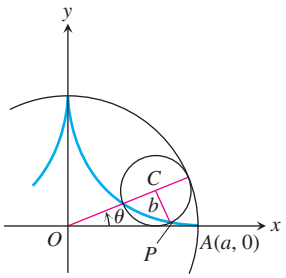
**7.** $x = -\sec t, \quad y = \tan t; \quad -\pi/2 < t < \pi/2$

**8.** $x = \csc t, \quad y = \cot t; \quad 0 < t < \pi$

**9.** $x = t, \quad y = \sqrt{4 - t^2}; \quad 0 \le t \le 2$

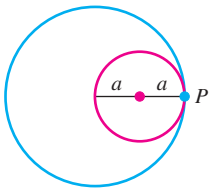
**10.** $x = t^2, \quad y = \sqrt{t^4 + 1}; \quad t \ge 0$

**11.** $x = -\cosh t, \quad y = \sinh t; \quad -\infty < t < \infty$



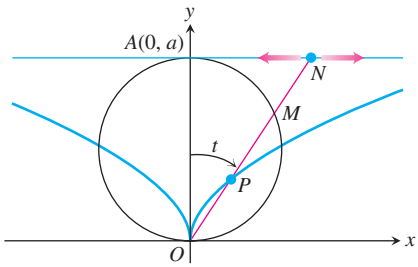
**12.** $x = 2\sinh t, \quad y = 2\cosh t; \quad -\infty < t < \infty$

**13. Hypocycloids** When a circle rolls on the inside of a fixed circle, any point $P$ on the circumference of the rolling circle describes a *hypocycloid*. Let the fixed circle be $x^2 + y^2 = a^2$, let the radius of the rolling circle be $b$, and let the initial position of the tracing point $P$ be $A(a, 0)$. Find parametric equations for the hypocycloid, using as the parameter the angle $\theta$ from the positive $x$-axis to the line joining the circles' centers. In particular, if



Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$b = a/4$, as in the accompanying figure, show that the hypocycloid is the astroid



$$x = a\cos^3\theta, \quad y = a\sin^3\theta.$$

**14. More about hypocycloids** The accompanying figure shows a circle of radius $a$ tangent to the inside of a circle of radius $2a$. The point $P$, shown as the point of tangency in the figure, is attached to the smaller circle. What path does $P$ trace as the smaller circle rolls around the inside of the larger circle?

**15.** As the point $N$ moves along the line $y = a$ in the accompanying figure, $P$ moves in such a way that $OP = MN$. Find parametric equations for the coordinates of $P$ as functions of the angle $t$ that the line $ON$ makes with the positive $y$-axis.

**16. Trochoids** A wheel of radius $a$ rolls along a horizontal straight line without slipping. Find parametric equations for the curve traced out by a point $P$ on a spoke of the wheel $b$ units from its center. As parameter, use the angle $\theta$ through which the wheel turns. The curve is called a *trochoid*, which is a cycloid when $b = a$.

## Distance Using Parametric Equations

**17.** Find the point on the parabola $x = t, y = t^2, -\infty < t < \infty$, closest to the point $(2, 1/2)$. (*Hint:* Minimize the square of the distance as a function of $t$.)

**18.** Find the point on the ellipse $x = 2\cos t, y = \sin t, 0 \le t \le 2\pi$ closest to the point $(3/4, 0)$. (*Hint:* Minimize the square of the distance as a function of $t$.)

## T GRAPHER EXPLORATIONS

If you have a parametric equation grapher, graph the following equations over the given intervals.

**19. Ellipse** $x = 4\cos t, \quad y = 2\sin t, \quad$ over

**a.** $0 \le t \le 2\pi$ **b.** $0 \le t \le \pi$

**c.** $-\pi/2 \le t \le \pi/2$.

**20. Hyperbola branch** $x = \sec t$ (enter as $1/\cos(t)$), $y = \tan t$ (enter as $\sin(t)/\cos(t)$), over

**a.** $-1.5 \le t \le 1.5$ **b.** $-0.5 \le t \le 0.5$

**c.** $-0.1 \le t \le 0.1$.

**21. Parabola** $x = 2t + 3, \quad y = t^2 - 1, \quad -2 \le t \le 2$

**22. Cycloid** $x = t - \sin t, \quad y = 1 - \cos t, \quad$ over

**a.** $0 \le t \le 2\pi$ **b.** $0 \le t \le 4\pi$

**c.** $\pi \le t \le 3\pi$.

**23. A nice curve (a deltoid)**

$$x = 2\cos t + \cos 2t, \quad y = 2\sin t - \sin 2t; \quad 0 \le t \le 2\pi$$

What happens if you replace 2 with $-2$ in the equations for $x$ and $y$? Graph the new equations and find out.

**24. An even nicer curve**

$$x = 3\cos t + \cos 3t, \quad y = 3\sin t - \sin 3t; \quad 0 \le t \le 2\pi$$

What happens if you replace 3 with $-3$ in the equations for $x$ and $y$? Graph the new equations and find out.

**25. Three beautiful curves**

**a.** *Epicycloid:*

$$x = 9\cos t - \cos 9t, \quad y = 9\sin t - \sin 9t; \quad 0 \le t \le 2\pi$$

**b.** *Hypocycloid:*

$$x = 8\cos t + 2\cos 4t, \quad y = 8\sin t - 2\sin 4t; \quad 0 \le t \le 2\pi$$

**c.** *Hypotrochoid:*

$$x = \cos t + 5\cos 3t, \quad y = 6\cos t - 5\sin 3t; \quad 0 \le t \le 2\pi$$

**26. More beautiful curves**

**a.** $x = 6\cos t + 5\cos 3t, \quad y = 6\sin t - 5\sin 3t;$
$0 \le t \le 2\pi$

**b.** $x = 6\cos 2t + 5\cos 6t, \quad y = 6\sin 2t - 5\sin 6t;$
$0 \le t \le \pi$

**c.** $x = 6\cos t + 5\cos 3t, \quad y = 6\sin 2t - 5\sin 3t;$
$0 \le t \le 2\pi$

**d.** $x = 6\cos 2t + 5\cos 6t, \quad y = 6\sin 4t - 5\sin 6t;$
$0 \le t \le \pi$

# 10.5 Polar Coordinates

In this section, we study polar coordinates and their relation to Cartesian coordinates. While a point in the plane has just one pair of Cartesian coordinates, it has infinitely many pairs of polar coordinates. This has interesting consequences for graphing, as we will see in the next section.

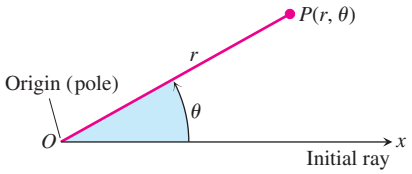

**FIGURE 10.35** To define polar coordinates for the plane, we start with an origin, called the pole, and an initial ray.

## Definition of Polar Coordinates

To define polar coordinates, we first fix an **origin** $O$ (called the **pole**) and an **initial ray** from $O$ (Figure 10.35). Then each point $P$ can be located by assigning to it a **polar coordinate pair** $(r, \theta)$ in which $r$ gives the directed distance from $O$ to $P$ and $\theta$ gives the directed angle from the initial ray to ray $OP$.

**Polar Coordinates**

$P(r, \theta)$

Directed distance from $O$ to $P$ — Directed angle from initial ray to $OP$

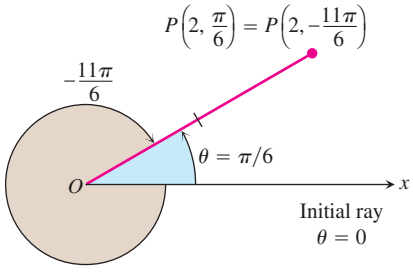

**FIGURE 10.36** Polar coordinates are not unique.

As in trigonometry, $\theta$ is positive when measured counterclockwise and negative when measured clockwise. The angle associated with a given point is not unique. For instance, the point 2 units from the origin along the ray $\theta = \pi/6$ has polar coordinates $r = 2$, $\theta = \pi/6$. It also has coordinates $r = 2, \theta = -11\pi/6$ (Figure 10.36). There are occasions when we wish to allow $r$ to be negative. That is why we use directed distance in defining $P(r, \theta)$. The point $P(2, 7\pi/6)$ can be reached by turning $7\pi/6$ radians counterclockwise from the initial ray and going forward 2 units (Figure 10.37). It can also be reached by turning $\pi/6$ radians counterclockwise from the initial ray and going *backward* 2 units. So the point also has polar coordinates $r = -2, \theta = \pi/6$.

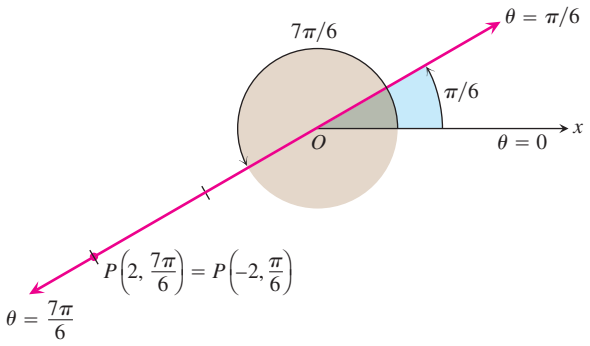

**FIGURE 10.37** Polar coordinates can have negative $r$-values.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 1** Finding Polar Coordinates

Find all the polar coordinates of the point $P(2, \pi/6)$.

**Solution** We sketch the initial ray of the coordinate system, draw the ray from the origin that makes an angle of $\pi/6$ radians with the initial ray, and mark the point $(2, \pi/6)$ (Figure 10.38). We then find the angles for the other coordinate pairs of $P$ in which $r = 2$ and $r = -2$.

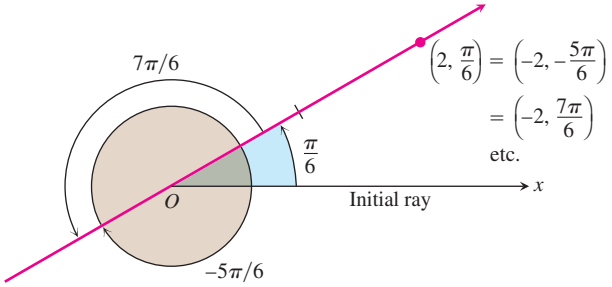

**FIGURE 10.38** The point $P(2, \pi/6)$ has infinitely many polar coordinate pairs (Example 1).

For $r = 2$, the complete list of angles is

$$\frac{\pi}{6}, \quad \frac{\pi}{6} \pm 2\pi, \quad \frac{\pi}{6} \pm 4\pi, \quad \frac{\pi}{6} \pm 6\pi, \quad \ldots.$$

For $r = -2$, the angles are

$$-\frac{5\pi}{6}, \quad -\frac{5\pi}{6} \pm 2\pi, \quad -\frac{5\pi}{6} \pm 4\pi, \quad -\frac{5\pi}{6} \pm 6\pi, \quad \ldots.$$

The corresponding coordinate pairs of $P$ are

$$\left(2, \frac{\pi}{6} + 2n\pi\right), \qquad n = 0, \pm 1, \pm 2, \ldots$$

and

$$\left(-2, -\frac{5\pi}{6} + 2n\pi\right), \qquad n = 0, \pm 1, \pm 2, \ldots.$$

When $n = 0$, the formulas give $(2, \pi/6)$ and $(-2, -5\pi/6)$. When $n = 1$, they give $(2, 13\pi/6)$ and $(-2, 7\pi/6)$, and so on. ■

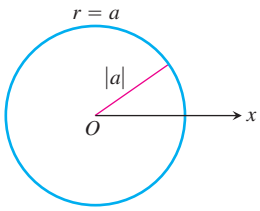

**FIGURE 10.39** The polar equation for a circle is $r = a$.

## Polar Equations and Graphs

If we hold $r$ fixed at a constant value $r = a \neq 0$, the point $P(r, \theta)$ will lie $|a|$ units from the origin $O$. As $\theta$ varies over any interval of length $2\pi$, $P$ then traces a circle of radius $|a|$ centered at $O$ (Figure 10.39).

If we hold $\theta$ fixed at a constant value $\theta = \theta_0$ and let $r$ vary between $-\infty$ and $\infty$, the point $P(r, \theta)$ traces the line through $O$ that makes an angle of measure $\theta_0$ with the initial ray.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

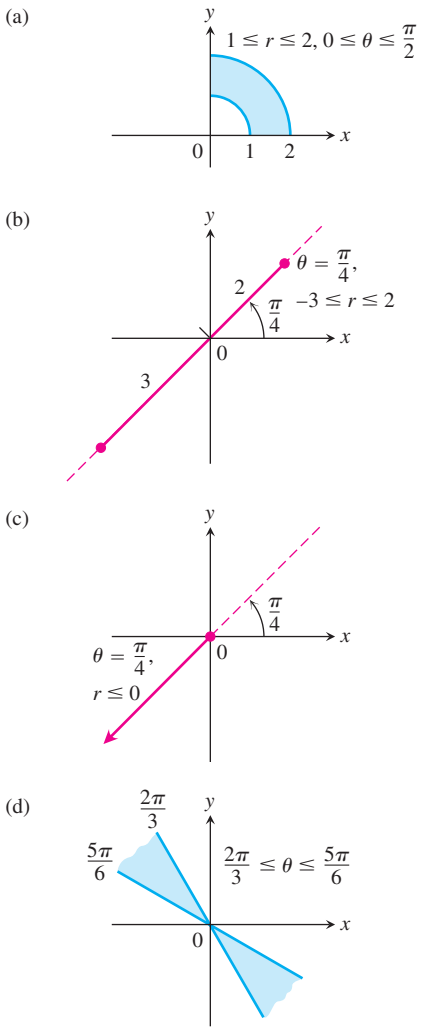

**FIGURE 10.40** The graphs of typical inequalities in $r$ and $\theta$ (Example 3).

| Equation | Graph |
|---|---|
| $r = a$ | Circle radius $\lvert a \rvert$ centered at $O$ |
| $\theta = \theta_0$ | Line through $O$ making an angle $\theta_0$ with the initial ray |

## EXAMPLE 2 Finding Polar Equations for Graphs

**(a)** $r = 1$ and $r = -1$ are equations for the circle of radius 1 centered at $O$.

**(b)** $\theta = \pi/6$, $\theta = 7\pi/6$, and $\theta = -5\pi/6$ are equations for the line in Figure 10.38. ■

Equations of the form $r = a$ and $\theta = \theta_0$ can be combined to define regions, segments, and rays.

## EXAMPLE 3 Identifying Graphs

Graph the sets of points whose polar coordinates satisfy the following conditions.

**(a)** $1 \le r \le 2$ and $0 \le \theta \le \frac{\pi}{2}$

**(b)** $-3 \le r \le 2$ and $\theta = \frac{\pi}{4}$

**(c)** $r \le 0$ and $\theta = \frac{\pi}{4}$

**(d)** $\frac{2\pi}{3} \le \theta \le \frac{5\pi}{6}$ (no restriction on $r$)

**Solution** The graphs are shown in Figure 10.40. ■

## Relating Polar and Cartesian Coordinates

When we use both polar and Cartesian coordinates in a plane, we place the two origins together and take the initial polar ray as the positive $x$-axis. The ray $\theta = \pi/2, r > 0$, becomes the positive $y$-axis (Figure 10.41). The two coordinate systems are then related by the following equations.

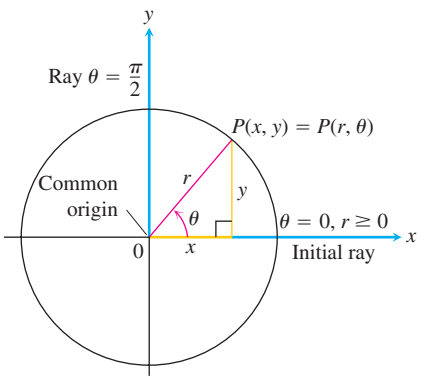

**FIGURE 10.41** The usual way to relate polar and Cartesian coordinates.

**Equations Relating Polar and Cartesian Coordinates**

$$x = r\cos\theta, \qquad y = r\sin\theta, \qquad x^2 + y^2 = r^2$$

The first two of these equations uniquely determine the Cartesian coordinates $x$ and $y$ given the polar coordinates $r$ and $\theta$. On the other hand, if $x$ and $y$ are given, the third equation gives two possible choices for $r$ (a positive and a negative value). For each selection, there is a unique $\theta \in [0, 2\pi)$ satisfying the first two equations, each then giving a polar coordinate representation of the Cartesian point $(x, y)$. The other polar coordinate representations for the point can be determined from these two, as in Example 1.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## EXAMPLE 4 Equivalent Equations

| Polar equation | Cartesian equivalent |
|---|---|
| $r\cos\theta = 2$ | $x = 2$ |
| $r^2\cos\theta\sin\theta = 4$ | $xy = 4$ |
| $r^2\cos^2\theta - r^2\sin^2\theta = 1$ | $x^2 - y^2 = 1$ |
| $r = 1 + 2r\cos\theta$ | $y^2 - 3x^2 - 4x - 1 = 0$ |
| $r = 1 - \cos\theta$ | $x^4 + y^4 + 2x^2y^2 + 2x^3 + 2xy^2 - y^2 = 0$ |

With some curves, we are better off with polar coordinates; with others, we aren't. ■

## EXAMPLE 5 Converting Cartesian to Polar

Find a polar equation for the circle $x^2 + (y - 3)^2 = 9$ (Figure 10.42).

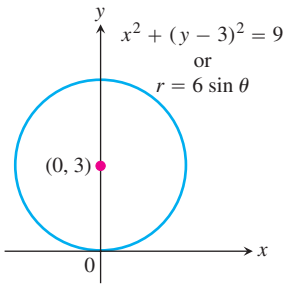

FIGURE 10.42 The circle in Example 5.

**Solution**

$$x^2 + y^2 - 6y + 9 = 9 \qquad \text{Expand } (y - 3)^2.$$
$$x^2 + y^2 - 6y = 0 \qquad \text{The 9's cancel.}$$
$$r^2 - 6r\sin\theta = 0 \qquad x^2 + y^2 = r^2$$
$$r = 0 \quad \text{or} \quad r - 6\sin\theta = 0$$
$$r = 6\sin\theta \qquad \text{Includes both possibilities}$$

We will say more about polar equations of conic sections in Section 10.8. ■

## EXAMPLE 6 Converting Polar to Cartesian

Replace the following polar equations by equivalent Cartesian equations, and identify their graphs.

**(a)** $r\cos\theta = -4$

**(b)** $r^2 = 4r\cos\theta$

**(c)** $r = \dfrac{4}{2\cos\theta - \sin\theta}$

**Solution** We use the substitutions $r\cos\theta = x$, $r\sin\theta = y$, $r^2 = x^2 + y^2$.

**(a)** $r\cos\theta = -4$

The Cartesian equation: $r\cos\theta = -4$

$x = -4$

The graph: Vertical line through $x = -4$ on the $x$-axis

**(b)** $r^2 = 4r\cos\theta$

The Cartesian equation: $r^2 = 4r\cos\theta$

$x^2 + y^2 = 4x$

$x^2 - 4x + y^2 = 0$

$x^2 - 4x + 4 + y^2 = 4$ Completing the square

$(x - 2)^2 + y^2 = 4$

The graph: Circle, radius 2, center $(h, k) = (2, 0)$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**(c)** $r = \dfrac{4}{2\cos\theta - \sin\theta}$

The Cartesian equation:
$$r(2\cos\theta - \sin\theta) = 4$$
$$2r\cos\theta - r\sin\theta = 4$$
$$2x - y = 4$$
$$y = 2x - 4$$

The graph: Line, slope $m = 2$, $y$-intercept $b = -4$ ■

# EXERCISES 10.5

## Polar Coordinate Pairs

**1.** Which polar coordinate pairs label the same point?

**a.** $(3, 0)$ **b.** $(-3, 0)$ **c.** $(2, 2\pi/3)$
**d.** $(2, 7\pi/3)$ **e.** $(-3, \pi)$ **f.** $(2, \pi/3)$
**g.** $(-3, 2\pi)$ **h.** $(-2, -\pi/3)$

**2.** Which polar coordinate pairs label the same point?

**a.** $(-2, \pi/3)$ **b.** $(2, -\pi/3)$ **c.** $(r, \theta)$
**d.** $(r, \theta + \pi)$ **e.** $(-r, \theta)$ **f.** $(2, -2\pi/3)$
**g.** $(-r, \theta + \pi)$ **h.** $(-2, 2\pi/3)$

**3.** Plot the following points (given in polar coordinates). Then find all the polar coordinates of each point.

**a.** $(2, \pi/2)$ **b.** $(2, 0)$
**c.** $(-2, \pi/2)$ **d.** $(-2, 0)$

**4.** Plot the following points (given in polar coordinates). Then find all the polar coordinates of each point.

**a.** $(3, \pi/4)$ **b.** $(-3, \pi/4)$
**c.** $(3, -\pi/4)$ **d.** $(-3, -\pi/4)$

## Polar to Cartesian Coordinates

**5.** Find the Cartesian coordinates of the points in Exercise 1.

**6.** Find the Cartesian coordinates of the following points (given in polar coordinates).

**a.** $\left(\sqrt{2}, \pi/4\right)$ **b.** $(1, 0)$
**c.** $(0, \pi/2)$ **d.** $\left(-\sqrt{2}, \pi/4\right)$
**e.** $(-3, 5\pi/6)$ **f.** $(5, \tan^{-1}(4/3))$
**g.** $(-1, 7\pi)$ **h.** $\left(2\sqrt{3}, 2\pi/3\right)$

## Graphing Polar Equations and Inequalities

Graph the sets of points whose polar coordinates satisfy the equations and inequalities in Exercises 7–22.

**7.** $r = 2$ **8.** $0 \le r \le 2$
**9.** $r \ge 1$ **10.** $1 \le r \le 2$
**11.** $0 \le \theta \le \pi/6, \quad r \ge 0$ **12.** $\theta = 2\pi/3, \quad r \le -2$
**13.** $\theta = \pi/3, \quad -1 \le r \le 3$ **14.** $\theta = 11\pi/4, \quad r \ge -1$
**15.** $\theta = \pi/2, \quad r \ge 0$ **16.** $\theta = \pi/2, \quad r \le 0$
**17.** $0 \le \theta \le \pi, \quad r = 1$ **18.** $0 \le \theta \le \pi, \quad r = -1$
**19.** $\pi/4 \le \theta \le 3\pi/4, \quad 0 \le r \le 1$
**20.** $-\pi/4 \le \theta \le \pi/4, \quad -1 \le r \le 1$
**21.** $-\pi/2 \le \theta \le \pi/2, \quad 1 \le r \le 2$
**22.** $0 \le \theta \le \pi/2, \quad 1 \le |r| \le 2$

## Polar to Cartesian Equations

Replace the polar equations in Exercises 23–48 by equivalent Cartesian equations. Then describe or identify the graph.

**23.** $r \cos\theta = 2$ **24.** $r \sin\theta = -1$
**25.** $r \sin\theta = 0$ **26.** $r \cos\theta = 0$
**27.** $r = 4 \csc\theta$ **28.** $r = -3 \sec\theta$
**29.** $r \cos\theta + r \sin\theta = 1$ **30.** $r \sin\theta = r \cos\theta$
**31.** $r^2 = 1$ **32.** $r^2 = 4r \sin\theta$
**33.** $r = \dfrac{5}{\sin\theta - 2\cos\theta}$ **34.** $r^2 \sin 2\theta = 2$
**35.** $r = \cot\theta \csc\theta$ **36.** $r = 4 \tan\theta \sec\theta$
**37.** $r = \csc\theta\, e^{r\cos\theta}$ **38.** $r \sin\theta = \ln r + \ln\cos\theta$
**39.** $r^2 + 2r^2 \cos\theta \sin\theta = 1$ **40.** $\cos^2\theta = \sin^2\theta$
**41.** $r^2 = -4r \cos\theta$ **42.** $r^2 = -6r \sin\theta$
**43.** $r = 8 \sin\theta$ **44.** $r = 3 \cos\theta$
**45.** $r = 2\cos\theta + 2\sin\theta$ **46.** $r = 2\cos\theta - \sin\theta$
**47.** $r \sin\left(\theta + \dfrac{\pi}{6}\right) = 2$ **48.** $r \sin\left(\dfrac{2\pi}{3} - \theta\right) = 5$

## Cartesian to Polar Equations

Replace the Cartesian equations in Exercises 49–62 by equivalent polar equations.

**49.** $x = 7$ **50.** $y = 1$ **51.** $x = y$
**52.** $x - y = 3$ **53.** $x^2 + y^2 = 4$ **54.** $x^2 - y^2 = 1$
**55.** $\dfrac{x^2}{9} + \dfrac{y^2}{4} = 1$ **56.** $xy = 2$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**57.** $y^2 = 4x$

**58.** $x^2 + xy + y^2 = 1$

**59.** $x^2 + (y - 2)^2 = 4$

**60.** $(x - 5)^2 + y^2 = 25$

**61.** $(x - 3)^2 + (y + 1)^2 = 4$

**62.** $(x + 2)^2 + (y - 5)^2 = 16$

## Theory and Examples

**63.** Find all polar coordinates of the origin.

**64. Vertical and horizontal lines**

**a.** Show that every vertical line in the $xy$-plane has a polar equation of the form $r = a \sec\theta$.

**b.** Find the analogous polar equation for horizontal lines in the $xy$-plane.

# 10.6 Graphing in Polar Coordinates

This section describes techniques for graphing equations in polar coordinates.

## Symmetry

Figure 10.43 illustrates the standard polar coordinate tests for symmetry.

(a) About the $x$-axis (b) About the $y$-axis (c) About the origin

**FIGURE 10.43** Three tests for symmetry in polar coordinates.

### Symmetry Tests for Polar Graphs

1. *Symmetry about the x-axis:* If the point $(r, \theta)$ lies on the graph, the point $(r, -\theta)$ or $(-r, \pi - \theta)$ lies on the graph (Figure 10.43a).
2. *Symmetry about the y-axis:* If the point $(r, \theta)$ lies on the graph, the point $(r, \pi - \theta)$ or $(-r, -\theta)$ lies on the graph (Figure 10.43b).
3. *Symmetry about the origin:* If the point $(r, \theta)$ lies on the graph, the point $(-r, \theta)$ or $(r, \theta + \pi)$ lies on the graph (Figure 10.43c).

## Slope

The slope of a polar curve $r = f(\theta)$ is given by $dy/dx$, not by $r' = df/d\theta$. To see why, think of the graph of $f$ as the graph of the parametric equations

$$x = r\cos\theta = f(\theta)\cos\theta, \qquad y = r\sin\theta = f(\theta)\sin\theta.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

If $f$ is a differentiable function of $\theta$, then so are $x$ and $y$ and, when $dx/d\theta \neq 0$, we can calculate $dy/dx$ from the parametric formula

$$\frac{dy}{dx} = \frac{dy/d\theta}{dx/d\theta} \qquad \text{Section 3.5, Equation (2) with } t = \theta$$

$$= \frac{\frac{d}{d\theta}(f(\theta)\cdot \sin\theta)}{\frac{d}{d\theta}(f(\theta)\cdot \cos\theta)}$$

$$= \frac{\frac{df}{d\theta}\sin\theta + f(\theta)\cos\theta}{\frac{df}{d\theta}\cos\theta - f(\theta)\sin\theta} \qquad \text{Product Rule for derivatives}$$

**Slope of the Curve $r = f(\theta)$**

$$\left.\frac{dy}{dx}\right|_{(r,\,\theta)} = \frac{f'(\theta)\sin\theta + f(\theta)\cos\theta}{f'(\theta)\cos\theta - f(\theta)\sin\theta},$$

provided $dx/d\theta \neq 0$ at $(r, \theta)$.

If the curve $r = f(\theta)$ passes through the origin at $\theta = \theta_0$, then $f(\theta_0) = 0$, and the slope equation gives

$$\left.\frac{dy}{dx}\right|_{(0,\,\theta_0)} = \frac{f'(\theta_0)\sin\theta_0}{f'(\theta_0)\cos\theta_0} = \tan\theta_0.$$

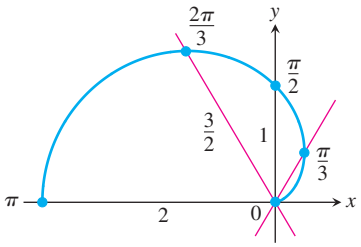
If the graph of $r = f(\theta)$ passes through the origin at the value $\theta = \theta_0$, the slope of the curve there is $\tan\theta_0$. The reason we say "slope at $(0, \theta_0)$" and not just "slope at the origin" is that a polar curve may pass through the origin (or any point) more than once, with different slopes at different $\theta$-values. This is not the case in our first example, however.

## EXAMPLE 1 A Cardioid

Graph the curve $r = 1 - \cos\theta$.

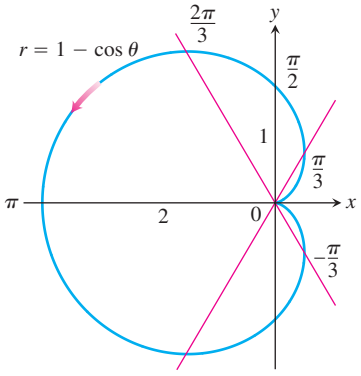
**Solution** The curve is symmetric about the $x$-axis because

$$(r, \theta) \text{ on the graph} \Rightarrow r = 1 - \cos\theta$$
$$\Rightarrow r = 1 - \cos(-\theta) \qquad \cos\theta = \cos(-\theta)$$
$$\Rightarrow (r, -\theta) \text{ on the graph}.$$



As $\theta$ increases from 0 to $\pi$, $\cos\theta$ decreases from 1 to $-1$, and $r = 1 - \cos\theta$ increases from a minimum value of 0 to a maximum value of 2. As $\theta$ continues on from $\pi$ to $2\pi$, $\cos\theta$ increases from $-1$ back to 1 and $r$ decreases from 2 back to 0. The curve starts to repeat when $\theta = 2\pi$ because the cosine has period $2\pi$.

The curve leaves the origin with slope $\tan(0) = 0$ and returns to the origin with slope $\tan(2\pi) = 0$.



We make a table of values from $\theta = 0$ to $\theta = \pi$, plot the points, draw a smooth curve through them with a horizontal tangent at the origin, and reflect the curve across the $x$-axis to complete the graph (Figure 10.44). The curve is called a *cardioid* because of its heart shape. Cardioid shapes appear in the cams that direct the even layering of thread on bobbins and reels, and in the signal-strength pattern of certain radio antennas. ■

| $\theta$ | $r = 1 - \cos\theta$ |
|---|---|
| 0 | 0 |
| $\frac{\pi}{3}$ | $\frac{1}{2}$ |
| $\frac{\pi}{2}$ | 1 |
| $\frac{2\pi}{3}$ | $\frac{3}{2}$ |
| $\pi$ | 2 |

(a)

(b)

(c)

**FIGURE 10.44** The steps in graphing the cardioid $r = 1 - \cos\theta$ (Example 1). The arrow shows the direction of increasing $\theta$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 2** Graph the Curve $r^2 = 4\cos\theta$.

**Solution** The equation $r^2 = 4\cos\theta$ requires $\cos\theta \geq 0$, so we get the entire graph by running $\theta$ from $-\pi/2$ to $\pi/2$. The curve is symmetric about the $x$-axis because

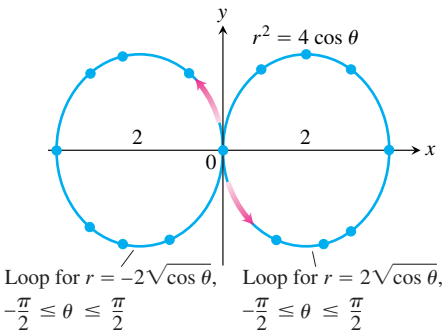
$$\begin{aligned}(r, \theta) \text{ on the graph} &\Rightarrow r^2 = 4\cos\theta \\ &\Rightarrow r^2 = 4\cos(-\theta) \qquad \cos\theta = \cos(-\theta) \\ &\Rightarrow (r, -\theta) \text{ on the graph.}\end{aligned}$$

The curve is also symmetric about the origin because

$$\begin{aligned}(r, \theta) \text{ on the graph} &\Rightarrow r^2 = 4\cos\theta \\ &\Rightarrow (-r)^2 = 4\cos\theta \\ &\Rightarrow (-r, \theta) \text{ on the graph.}\end{aligned}$$

Together, these two symmetries imply symmetry about the $y$-axis.

The curve passes through the origin when $\theta = -\pi/2$ and $\theta = \pi/2$. It has a vertical tangent both times because $\tan\theta$ is infinite.



For each value of $\theta$ in the interval between $-\pi/2$ and $\pi/2$, the formula $r^2 = 4\cos\theta$ gives two values of $r$:

$$r = \pm 2\sqrt{\cos\theta}.$$

We make a short table of values, plot the corresponding points, and use information about symmetry and tangents to guide us in connecting the points with a smooth curve (Figure 10.45). ■

| $\theta$ | $\cos\theta$ | $r = \pm 2\sqrt{\cos\theta}$ |
|---|---|---|
| 0 | 1 | $\pm 2$ |
| $\pm\frac{\pi}{6}$ | $\frac{\sqrt{3}}{2}$ | $\approx \pm 1.9$ |
| $\pm\frac{\pi}{4}$ | $\frac{1}{\sqrt{2}}$ | $\approx \pm 1.7$ |
| $\pm\frac{\pi}{3}$ | $\frac{1}{2}$ | $\approx \pm 1.4$ |
| $\pm\frac{\pi}{2}$ | 0 | 0 |

(a)

(b)

**FIGURE 10.45** The graph of $r^2 = 4\cos\theta$. The arrows show the direction of increasing $\theta$. The values of $r$ in the table are rounded (Example 2).

## A Technique for Graphing

One way to graph a polar equation $r = f(\theta)$ is to make a table of $(r, \theta)$-values, plot the corresponding points, and connect them in order of increasing $\theta$. This can work well if enough points have been plotted to reveal all the loops and dimples in the graph. Another method of graphing that is usually quicker and more reliable is to

1. first graph $r = f(\theta)$ in the *Cartesian* $r\theta$-plane,
2. then use the Cartesian graph as a "table" and guide to sketch the *polar* coordinate graph.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

This method is better than simple point plotting because the first Cartesian graph, even when hastily drawn, shows at a glance where $r$ is positive, negative, and nonexistent, as well as where $r$ is increasing and decreasing. Here's an example.

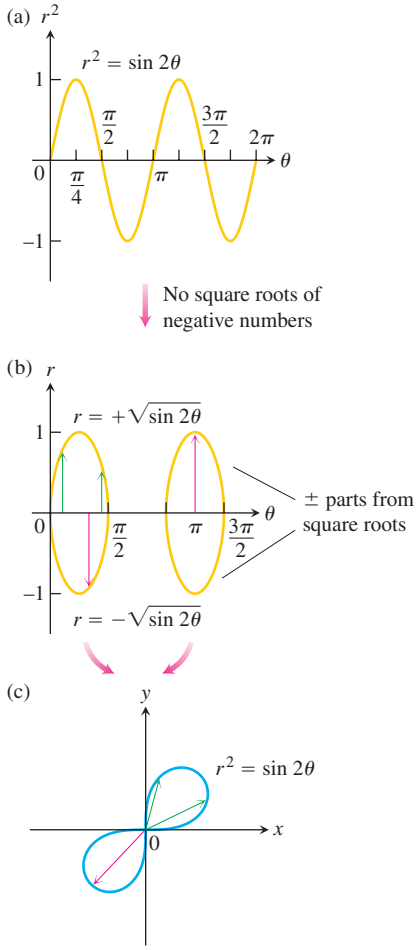


**FIGURE 10.46** To plot $r = f(\theta)$ in the Cartesian $r\theta$-plane in (b), we first plot $r^2 = \sin 2\theta$ in the $r^2\theta$-plane in (a) and then ignore the values of $\theta$ for which $\sin 2\theta$ is negative. The radii from the sketch in (b) cover the polar graph of the lemniscate in (c) twice (Example 3).

### EXAMPLE 3 A Lemniscate

Graph the curve

$$r^2 = \sin 2\theta.$$

**Solution** Here we begin by plotting $r^2$ (not $r$) as a function of $\theta$ in the Cartesian $r^2\theta$-plane. See Figure 10.46a. We pass from there to the graph of $r = \pm\sqrt{\sin 2\theta}$ in the $r\theta$-plane (Figure 10.46b), and then draw the polar graph (Figure 10.46c). The graph in Figure 10.46b "covers" the final polar graph in Figure 10.46c twice. We could have managed with either loop alone, with the two upper halves, or with the two lower halves. The double covering does no harm, however, and we actually learn a little more about the behavior of the function this way. ■

## Finding Points Where Polar Graphs Intersect

The fact that we can represent a point in different ways in polar coordinates makes extra care necessary in deciding when a point lies on the graph of a polar equation and in determining the points in which polar graphs intersect. The problem is that a point of intersection may satisfy the equation of one curve with polar coordinates that are different from the ones with which it satisfies the equation of another curve. Thus, solving the equations of two curves simultaneously may not identify all their points of intersection. One sure way to identify all the points of intersection is to graph the equations.

### EXAMPLE 4 Deceptive Polar Coordinates

Show that the point $(2, \pi/2)$ lies on the curve $r = 2\cos 2\theta$.

**Solution** It may seem at first that the point $(2, \pi/2)$ does not lie on the curve because substituting the given coordinates into the equation gives

$$2 = 2\cos 2\left(\frac{\pi}{2}\right) = 2\cos \pi = -2,$$

which is not a true equality. The magnitude is right, but the sign is wrong. This suggests looking for a pair of coordinates for the same given point in which $r$ is negative, for example, $(-2, -(\pi/2))$. If we try these in the equation $r = 2\cos 2\theta$, we find

$$-2 = 2\cos 2\left(-\frac{\pi}{2}\right) = 2(-1) = -2,$$

and the equation is satisfied. The point $(2, \pi/2)$ does lie on the curve. ■

### EXAMPLE 5 Elusive Intersection Points

Find the points of intersection of the curves

$$r^2 = 4\cos\theta \quad \text{and} \quad r = 1 - \cos\theta.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

HISTORICAL BIOGRAPHY

Johannes Kepler
(1571–1630)

**Solution** In Cartesian coordinates, we can always find the points where two curves cross by solving their equations simultaneously. In polar coordinates, the story is different. Simultaneous solution may reveal some intersection points without revealing others. In this example, simultaneous solution reveals only two of the four intersection points. The others are found by graphing. (Also, see Exercise 49.)

If we substitute $\cos\theta = r^2/4$ in the equation $r = 1 - \cos\theta$, we get

$$r = 1 - \cos\theta = 1 - \frac{r^2}{4}$$

$$4r = 4 - r^2$$

$$r^2 + 4r - 4 = 0$$

$$r = -2 \pm 2\sqrt{2}. \qquad \text{Quadratic formula}$$

The value $r = -2 - 2\sqrt{2}$ has too large an absolute value to belong to either curve. The values of $\theta$ corresponding to $r = -2 + 2\sqrt{2}$ are

$$\theta = \cos^{-1}(1 - r) \qquad \text{From } r = 1 - \cos\theta$$

$$= \cos^{-1}\left(1 - \left(2\sqrt{2} - 2\right)\right) \qquad \text{Set } r = 2\sqrt{2} - 2.$$

$$= \cos^{-1}\left(3 - 2\sqrt{2}\right)$$

$$= \pm 80°. \qquad \text{Rounded to the nearest degree}$$

We have thus identified two intersection points: $(r, \theta) = (2\sqrt{2} - 2, \pm 80°)$.

If we graph the equations $r^2 = 4\cos\theta$ and $r = 1 - \cos\theta$ together (Figure 10.47), as we can now do by combining the graphs in Figures 10.44 and 10.45, we see that the curves also intersect at the point $(2, \pi)$ and the origin. Why weren't the $r$-values of these points revealed by the simultaneous solution? The answer is that the points $(0, 0)$ and $(2, \pi)$ are not on the curves "simultaneously." They are not reached at the same value of $\theta$. On the curve $r = 1 - \cos\theta$, the point $(2, \pi)$ is reached when $\theta = \pi$. On the curve $r^2 = 4\cos\theta$, it is reached when $\theta = 0$, where it is identified not by the coordinates $(2, \pi)$, which do not satisfy the equation, but by the coordinates $(-2, 0)$, which do. Similarly, the cardioid reaches the origin when $\theta = 0$, but the curve $r^2 = 4\cos\theta$ reaches the origin when $\theta = \pi/2$. ■

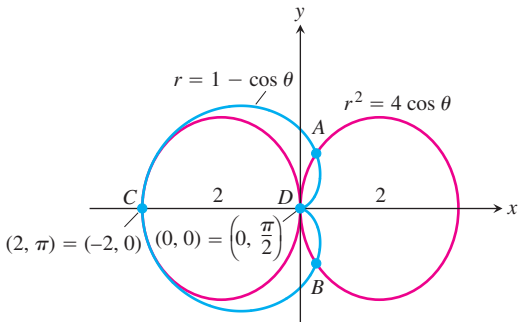

**FIGURE 10.47** The four points of intersection of the curves $r = 1 - \cos\theta$ and $r^2 = 4\cos\theta$ (Example 5). Only $A$ and $B$ were found by simultaneous solution. The other two were disclosed by graphing.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**USING TECHNOLOGY** **Graphing Polar Curves Parametrically**

For complicated polar curves we may need to use a graphing calculator or computer to graph the curve. If the device does not plot polar graphs directly, we can convert $r = f(\theta)$ into parametric form using the equations

$$x = r\cos\theta = f(\theta)\cos\theta, \qquad y = r\sin\theta = f(\theta)\sin\theta.$$

Then we use the device to draw a parametrized curve in the Cartesian $xy$-plane. It may be required to use the parameter $t$ rather than $\theta$ for the graphing device.

# EXERCISES 10.6

## Symmetries and Polar Graphs

Identify the symmetries of the curves in Exercises 1–12. Then sketch the curves.

**1.** $r = 1 + \cos\theta$ **2.** $r = 2 - 2\cos\theta$

**3.** $r = 1 - \sin\theta$ **4.** $r = 1 + \sin\theta$

**5.** $r = 2 + \sin\theta$ **6.** $r = 1 + 2\sin\theta$

**7.** $r = \sin(\theta/2)$ **8.** $r = \cos(\theta/2)$

**9.** $r^2 = \cos\theta$ **10.** $r^2 = \sin\theta$

**11.** $r^2 = -\sin\theta$ **12.** $r^2 = -\cos\theta$

Graph the lemniscates in Exercises 13–16. What symmetries do these curves have?

**13.** $r^2 = 4\cos 2\theta$ **14.** $r^2 = 4\sin 2\theta$

**15.** $r^2 = -\sin 2\theta$ **16.** $r^2 = -\cos 2\theta$

## Slopes of Polar Curves

Find the slopes of the curves in Exercises 17–20 at the given points. Sketch the curves along with their tangents at these points.

**17. Cardioid** $r = -1 + \cos\theta$; $\theta = \pm\pi/2$

**18. Cardioid** $r = -1 + \sin\theta$; $\theta = 0, \pi$

**19. Four-leaved rose** $r = \sin 2\theta$; $\theta = \pm\pi/4, \pm 3\pi/4$

**20. Four-leaved rose** $r = \cos 2\theta$; $\theta = 0, \pm\pi/2, \pi$

## Limaçons

Graph the limaçons in Exercises 21–24. Limaçon ("*lee*-ma-sahn") is Old French for "snail." You will understand the name when you graph the limaçons in Exercise 21. Equations for limaçons have the form $r = a \pm b\cos\theta$ or $r = a \pm b\sin\theta$. There are four basic shapes.

**21. Limaçons with an inner loop**

**a.** $r = \frac{1}{2} + \cos\theta$ **b.** $r = \frac{1}{2} + \sin\theta$

**22. Cardioids**

**a.** $r = 1 - \cos\theta$ **b.** $r = -1 + \sin\theta$

**23. Dimpled limaçons**

**a.** $r = \frac{3}{2} + \cos\theta$ **b.** $r = \frac{3}{2} - \sin\theta$

**24. Oval limaçons**

**a.** $r = 2 + \cos\theta$ **b.** $r = -2 + \sin\theta$

## Graphing Polar Inequalities

**25.** Sketch the region defined by the inequalities $-1 \le r \le 2$ and $-\pi/2 \le \theta \le \pi/2$.

**26.** Sketch the region defined by the inequalities $0 \le r \le 2\sec\theta$ and $-\pi/4 \le \theta \le \pi/4$.

In Exercises 27 and 28, sketch the region defined by the inequality.

**27.** $0 \le r \le 2 - 2\cos\theta$ **28.** $0 \le r^2 \le \cos\theta$

## Intersections

**29.** Show that the point $(2, 3\pi/4)$ lies on the curve $r = 2\sin 2\theta$.

**30.** Show that $(1/2, 3\pi/2)$ lies on the curve $r = -\sin(\theta/3)$.

Find the points of intersection of the pairs of curves in Exercises 31–38.

**31.** $r = 1 + \cos\theta$, $r = 1 - \cos\theta$

**32.** $r = 1 + \sin\theta$, $r = 1 - \sin\theta$

**33.** $r = 2\sin\theta$, $r = 2\sin 2\theta$

**34.** $r = \cos\theta$, $r = 1 - \cos\theta$

**35.** $r = \sqrt{2}$, $r^2 = 4\sin\theta$

**36.** $r^2 = \sqrt{2}\sin\theta$, $r^2 = \sqrt{2}\cos\theta$

**37.** $r = 1$, $r^2 = 2\sin 2\theta$

**38.** $r^2 = \sqrt{2}\cos 2\theta$, $r^2 = \sqrt{2}\sin 2\theta$

T Find the points of intersection of the pairs of curves in Exercises 39–42.

**39.** $r^2 = \sin 2\theta$, $r^2 = \cos 2\theta$

**40.** $r = 1 + \cos\frac{\theta}{2}$, $r = 1 - \sin\frac{\theta}{2}$

**41.** $r = 1$, $r = 2\sin 2\theta$ **42.** $r = 1$, $r^2 = 2\sin 2\theta$

## T Grapher Explorations

**43.** Which of the following has the same graph as $r = 1 - \cos\theta$?

**a.** $r = -1 - \cos\theta$ **b.** $r = 1 + \cos\theta$

Confirm your answer with algebra.

**44.** Which of the following has the same graph as $r = \cos 2\theta$?

**a.** $r = -\sin(2\theta + \pi/2)$ **b.** $r = -\cos(\theta/2)$

Confirm your answer with algebra.

**45. A rose within a rose** Graph the equation $r = 1 - 2\sin 3\theta$.

**46. The nephroid of Freeth** Graph the nephroid of Freeth:

$$r = 1 + 2\sin\frac{\theta}{2}.$$

**47. Roses** Graph the roses $r = \cos m\theta$ for $m = 1/3, 2, 3$, and 7.

**48. Spirals** Polar coordinates are just the thing for defining spirals. Graph the following spirals.

**a.** $r = \theta$ **b.** $r = -\theta$

**c.** *A logarithmic spiral:* $r = e^{\theta/10}$

**d.** *A hyperbolic spiral:* $r = 8/\theta$

**e.** *An equilateral hyperbola:* $r = \pm 10/\sqrt{\theta}$

(Use different colors for the two branches.)

## Theory and Examples

**49.** (*Continuation of Example 5.*) The simultaneous solution of the equations

$$r^2 = 4\cos\theta \quad (1)$$

$$r = 1 - \cos\theta \quad (2)$$

in the text did not reveal the points $(0, 0)$ and $(2, \pi)$ in which their graphs intersected.

**a.** We could have found the point $(2, \pi)$, however, by replacing the $(r, \theta)$ in Equation (1) by the equivalent $(-r, \theta + \pi)$ to obtain

$$\begin{aligned} r^2 &= 4\cos\theta \\ (-r)^2 &= 4\cos(\theta + \pi) \\ r^2 &= -4\cos\theta. \end{aligned} \quad (3)$$

Solve Equations (2) and (3) simultaneously to show that $(2, \pi)$ is a common solution. (This will still not reveal that the graphs intersect at $(0, 0)$.)

**b.** The origin is still a special case. (It often is.) Here is one way to handle it: Set $r = 0$ in Equations (1) and (2) and solve each equation for a corresponding value of $\theta$. Since $(0, \theta)$ is the origin for *any* $\theta$, this will show that both curves pass through the origin even if they do so for different $\theta$-values.

**50.** If a curve has any two of the symmetries listed at the beginning of the section, can anything be said about its having or not having the third symmetry? Give reasons for your answer.

***51.** Find the maximum width of the petal of the four-leaved rose $r = \cos 2\theta$, which lies along the $x$-axis.

***52.** Find the maximum height above the $x$-axis of the cardioid $r = 2(1 + \cos\theta)$.

# 10.7 Areas and Lengths in Polar Coordinates

This section shows how to calculate areas of plane regions, lengths of curves, and areas of surfaces of revolution in polar coordinates.

## Area in the Plane

The region $OTS$ in Figure 10.48 is bounded by the rays $\theta = \alpha$ and $\theta = \beta$ and the curve $r = f(\theta)$. We approximate the region with $n$ nonoverlapping fan-shaped circular sectors based on a partition $P$ of angle $TOS$. The typical sector has radius $r_k = f(\theta_k)$ and central angle of radian measure $\Delta\theta_k$. Its area is $\Delta\theta_k/2\pi$ times the area of a circle of radius $r_k$, or

$$A_k = \frac{1}{2} r_k^2 \, \Delta\theta_k = \frac{1}{2} \big(f(\theta_k)\big)^2 \, \Delta\theta_k .$$

The area of region $OTS$ is approximately

$$\sum_{k=1}^{n} A_k = \sum_{k=1}^{n} \frac{1}{2} \big(f(\theta_k)\big)^2 \, \Delta\theta_k .$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

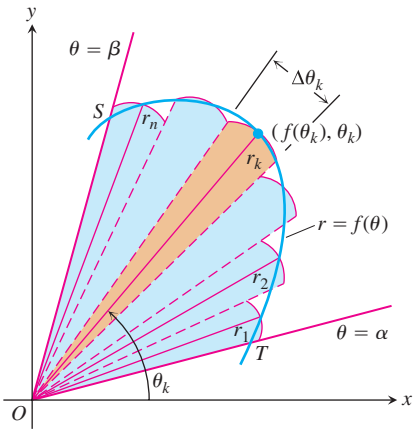

**FIGURE 10.48** To derive a formula for the area of region $OTS$, we approximate the region with fan-shaped circular sectors.

If $f$ is continuous, we expect the approximations to improve as the norm of the partition $\|P\| \to 0$, and we are led to the following formula for the region's area:

$$A = \lim_{\|P\|\to 0} \sum_{k=1}^{n} \frac{1}{2}\big(f(\theta_k)\big)^2\,\Delta\theta_k = \int_{\alpha}^{\beta} \frac{1}{2}\big(f(\theta)\big)^2\,d\theta.$$

**Area of the Fan-Shaped Region Between the Origin and the Curve $r = f(\theta)$, $\alpha \le \theta \le \beta$**

$$A = \int_{\alpha}^{\beta} \frac{1}{2} r^2\,d\theta.$$

This is the integral of the **area differential** (Figure 10.49)

$$dA = \frac{1}{2} r^2\,d\theta = \frac{1}{2}(f(\theta))^2\,d\theta.$$

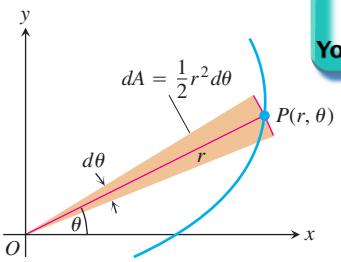

**FIGURE 10.49** The area differential $dA$ for the curve $n = f(\theta)$.

## EXAMPLE 1 Finding Area

Find the area of the region in the plane enclosed by the cardioid $r = 2(1 + \cos\theta)$.

**Solution** We graph the cardioid (Figure 10.50) and determine that the radius $OP$ sweeps out the region exactly once as $\theta$ runs from 0 to $2\pi$. The area is therefore

$$\begin{aligned}\int_{\theta=0}^{\theta=2\pi} \frac{1}{2} r^2\,d\theta &= \int_0^{2\pi} \frac{1}{2}\cdot 4(1+\cos\theta)^2\,d\theta \\ &= \int_0^{2\pi} 2(1 + 2\cos\theta + \cos^2\theta)\,d\theta \\ &= \int_0^{2\pi} \left(2 + 4\cos\theta + 2\,\frac{1+\cos 2\theta}{2}\right) d\theta \\ &= \int_0^{2\pi} (3 + 4\cos\theta + \cos 2\theta)\,d\theta \\ &= \left[3\theta + 4\sin\theta + \frac{\sin 2\theta}{2}\right]_0^{2\pi} = 6\pi - 0 = 6\pi.\end{aligned}$$

■

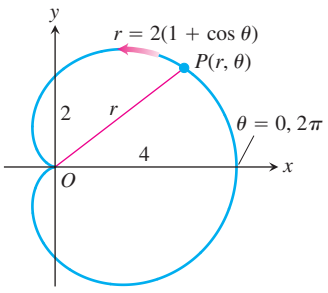

**FIGURE 10.50** The cardioid in Example 1.

## EXAMPLE 2 Finding Area

Find the area inside the smaller loop of the limaçon

$$r = 2\cos\theta + 1.$$

**Solution** After sketching the curve (Figure 10.51), we see that the smaller loop is traced out by the point $(r, \theta)$ as $\theta$ increases from $\theta = 2\pi/3$ to $\theta = 4\pi/3$. Since the curve is symmetric about the $x$-axis (the equation is unaltered when we replace $\theta$ by $-\theta$), we may calculate the area of the shaded half of the inner loop by integrating from $\theta = 2\pi/3$ to $\theta = \pi$. The area we seek will be twice the resulting integral:

$$A = 2\int_{2\pi/3}^{\pi} \frac{1}{2} r^2\,d\theta = \int_{2\pi/3}^{\pi} r^2\,d\theta.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

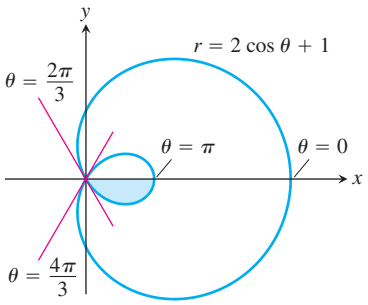

**FIGURE 10.51** The limaçon in Example 2. Limaçon (pronounced LEE-ma-sahn) is an old French word for *snail*.

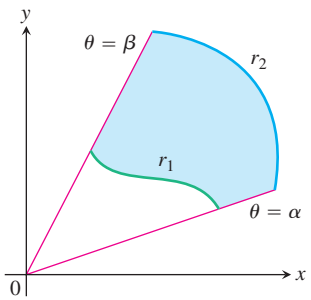

**FIGURE 10.52** The area of the shaded region is calculated by subtracting the area of the region between $r_1$ and the origin from the area of the region between $r_2$ and the origin.

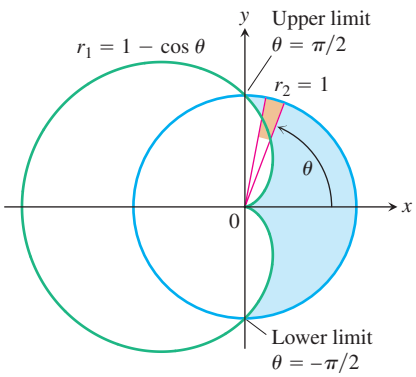

**FIGURE 10.53** The region and limits of integration in Example 3.

Since

$$\begin{aligned} r^2 &= (2\cos\theta + 1)^2 = 4\cos^2\theta + 4\cos\theta + 1 \\ &= 4\cdot\frac{1 + \cos 2\theta}{2} + 4\cos\theta + 1 \\ &= 2 + 2\cos 2\theta + 4\cos\theta + 1 \\ &= 3 + 2\cos 2\theta + 4\cos\theta, \end{aligned}$$

we have

$$\begin{aligned} A &= \int_{2\pi/3}^{\pi} (3 + 2\cos 2\theta + 4\cos\theta)\, d\theta \\ &= \Big[3\theta + \sin 2\theta + 4\sin\theta\Big]_{2\pi/3}^{\pi} \\ &= (3\pi) - \left(2\pi - \frac{\sqrt{3}}{2} + 4\cdot\frac{\sqrt{3}}{2}\right) \\ &= \pi - \frac{3\sqrt{3}}{2}. \end{aligned}$$

To find the area of a region like the one in Figure 10.52, which lies between two polar curves $r_1 = r_1(\theta)$ and $r_2 = r_2(\theta)$ from $\theta = \alpha$ to $\theta = \beta$, we subtract the integral of $(1/2){r_1}^2\, d\theta$ from the integral of $(1/2){r_2}^2\, d\theta$. This leads to the following formula.

**Area of the Region $0 \le r_1(\theta) \le r \le r_2(\theta)$, $\alpha \le \theta \le \beta$**

$$A = \int_\alpha^\beta \frac{1}{2}{r_2}^2\, d\theta - \int_\alpha^\beta \frac{1}{2}{r_1}^2\, d\theta = \int_\alpha^\beta \frac{1}{2}\left({r_2}^2 - {r_1}^2\right) d\theta \qquad (1)$$

## EXAMPLE 3 Finding Area Between Polar Curves

Find the area of the region that lies inside the circle $r = 1$ and outside the cardioid $r = 1 - \cos\theta$.

**Solution** We sketch the region to determine its boundaries and find the limits of integration (Figure 10.53). The outer curve is $r_2 = 1$, the inner curve is $r_1 = 1 - \cos\theta$, and $\theta$ runs from $-\pi/2$ to $\pi/2$. The area, from Equation (1), is

$$\begin{aligned} A &= \int_{-\pi/2}^{\pi/2} \frac{1}{2}\left({r_2}^2 - {r_1}^2\right) d\theta \\ &= 2\int_0^{\pi/2} \frac{1}{2}\left({r_2}^2 - {r_1}^2\right) d\theta \qquad \text{Symmetry} \\ &= \int_0^{\pi/2} (1 - (1 - 2\cos\theta + \cos^2\theta))\, d\theta \\ &= \int_0^{\pi/2} (2\cos\theta - \cos^2\theta)\, d\theta = \int_0^{\pi/2} \left(2\cos\theta - \frac{1 + \cos 2\theta}{2}\right) d\theta \\ &= \left[2\sin\theta - \frac{\theta}{2} - \frac{\sin 2\theta}{4}\right]_0^{\pi/2} = 2 - \frac{\pi}{4}. \end{aligned}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Length of a Polar Curve

We can obtain a polar coordinate formula for the length of a curve $r = f(\theta), \alpha \le \theta \le \beta$, by parametrizing the curve as

$$x = r\cos\theta = f(\theta)\cos\theta, \qquad y = r\sin\theta = f(\theta)\sin\theta, \qquad \alpha \le \theta \le \beta. \tag{2}$$

The parametric length formula, Equation (1) from Section 6.3, then gives the length as

$$L = \int_\alpha^\beta \sqrt{\left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2}\, d\theta.$$

This equation becomes

$$L = \int_\alpha^\beta \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2}\, d\theta$$

when Equations (2) are substituted for $x$ and $y$ (Exercise 33).

**Length of a Polar Curve**

If $r = f(\theta)$ has a continuous first derivative for $\alpha \le \theta \le \beta$ and if the point $P(r, \theta)$ traces the curve $r = f(\theta)$ exactly once as $\theta$ runs from $\alpha$ to $\beta$, then the length of the curve is

$$L = \int_\alpha^\beta \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2}\, d\theta. \tag{3}$$

**EXAMPLE 4** Finding the Length of a Cardioid

Find the length of the cardioid $r = 1 - \cos\theta$.

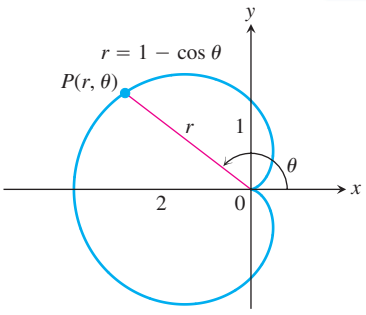

**FIGURE 10.54** Calculating the length of a cardioid (Example 4).

**Solution** We sketch the cardioid to determine the limits of integration (Figure 10.54). The point $P(r, \theta)$ traces the curve once, counterclockwise as $\theta$ runs from 0 to $2\pi$, so these are the values we take for $\alpha$ and $\beta$.

With

$$r = 1 - \cos\theta, \qquad \frac{dr}{d\theta} = \sin\theta,$$

we have

$$r^2 + \left(\frac{dr}{d\theta}\right)^2 = (1 - \cos\theta)^2 + (\sin\theta)^2$$

$$= 1 - 2\cos\theta + \underbrace{\cos^2\theta + \sin^2\theta}_{1} = 2 - 2\cos\theta$$

and

$$L = \int_\alpha^\beta \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2}\, d\theta = \int_0^{2\pi} \sqrt{2 - 2\cos\theta}\, d\theta$$

$$= \int_0^{2\pi} \sqrt{4\sin^2\frac{\theta}{2}}\, d\theta \qquad 1 - \cos\theta = 2\sin^2\frac{\theta}{2}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$$= \int_0^{2\pi} 2\left|\sin\frac{\theta}{2}\right| d\theta$$

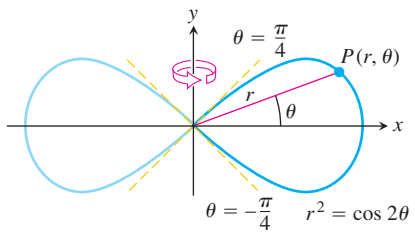
$$= \int_0^{2\pi} 2\sin\frac{\theta}{2}\, d\theta \qquad \sin\frac{\theta}{2} \geq 0 \quad \text{for} \quad 0 \leq \theta \leq 2\pi$$

$$= \left[-4\cos\frac{\theta}{2}\right]_0^{2\pi} = 4 + 4 = 8.$$

## Area of a Surface of Revolution

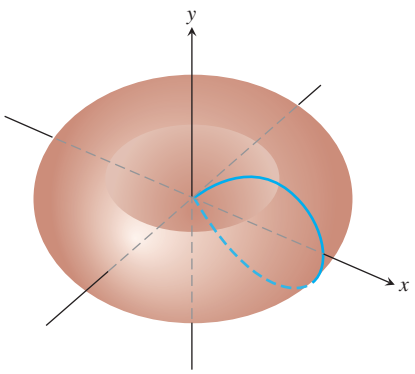
To derive polar coordinate formulas for the area of a surface of revolution, we parametrize the curve $r = f(\theta)$, $\alpha \leq \theta \leq \beta$, with Equations (2) and apply the surface area equations for parametrized curves in Section 6.5.

**Area of a Surface of Revolution of a Polar Curve**



If $r = f(\theta)$ has a continuous first derivative for $\alpha \leq \theta \leq \beta$ and if the point $P(r, \theta)$ traces the curve $r = f(\theta)$ exactly once as $\theta$ runs from $\alpha$ to $\beta$, then the areas of the surfaces generated by revolving the curve about the $x$- and $y$-axes are given by the following formulas:

**1.** Revolution about the $x$-axis ($y \geq 0$):



$$S = \int_\alpha^\beta 2\pi r \sin\theta \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2}\, d\theta \tag{4}$$

**2.** Revolution about the $y$-axis ($x \geq 0$):

$$S = \int_\alpha^\beta 2\pi r \cos\theta \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2}\, d\theta \tag{5}$$

(a)

(b)

**FIGURE 10.55** The right-hand half of a lemniscate (a) is revolved about the $y$-axis to generate a surface (b), whose area is calculated in Example 5.

**EXAMPLE 5** Finding Surface Area

Find the area of the surface generated by revolving the right-hand loop of the lemniscate $r^2 = \cos 2\theta$ about the $y$-axis.

**Solution** We sketch the loop to determine the limits of integration (Figure 10.55a). The point $P(r, \theta)$ traces the curve once, counterclockwise as $\theta$ runs from $-\pi/4$ to $\pi/4$, so these are the values we take for $\alpha$ and $\beta$.

We evaluate the area integrand in Equation (5) in stages. First,

$$2\pi r \cos\theta \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2} = 2\pi \cos\theta \sqrt{r^4 + \left(r\frac{dr}{d\theta}\right)^2}. \tag{6}$$

Next, $r^2 = \cos 2\theta$, so

$$2r\frac{dr}{d\theta} = -2\sin 2\theta$$

$$r\frac{dr}{d\theta} = -\sin 2\theta$$

$$\left(r\frac{dr}{d\theta}\right)^2 = \sin^2 2\theta.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Finally, $r^4 = (r^2)^2 = \cos^2 2\theta$, so the square root on the right-hand side of Equation (6) simplifies to

$$\sqrt{r^4 + \left(r\frac{dr}{d\theta}\right)^2} = \sqrt{\cos^2 2\theta + \sin^2 2\theta} = 1.$$

All together, we have

$$S = \int_{\alpha}^{\beta} 2\pi r \cos\theta \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2}\, d\theta \qquad \text{Equation (5)}$$

$$= \int_{-\pi/4}^{\pi/4} 2\pi \cos\theta \cdot (1)\, d\theta$$

$$= 2\pi \Big[\sin\theta\Big]_{-\pi/4}^{\pi/4}$$

$$= 2\pi\left[\frac{\sqrt{2}}{2} + \frac{\sqrt{2}}{2}\right] = 2\pi\sqrt{2}.$$

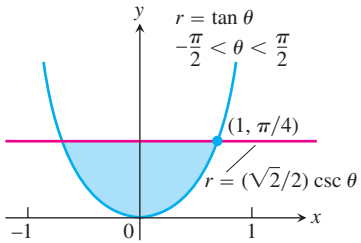
# EXERCISES 10.7

## Areas Inside Polar Curves

Find the areas of the regions in Exercises 1–6.



1. Inside the oval limaçon $r = 4 + 2\cos\theta$
2. Inside the cardioid $r = a(1 + \cos\theta), \quad a > 0$
3. Inside one leaf of the four-leaved rose $r = \cos 2\theta$
4. Inside the lemniscate $r^2 = 2a^2\cos 2\theta, \quad a > 0$
5. Inside one loop of the lemniscate $r^2 = 4\sin 2\theta$
6. Inside the six-leaved rose $r^2 = 2\sin 3\theta$

## Areas Shared by Polar Regions

Find the areas of the regions in Exercises 7–16.

7. Shared by the circles $r = 2\cos\theta$ and $r = 2\sin\theta$
8. Shared by the circles $r = 1$ and $r = 2\sin\theta$
9. Shared by the circle $r = 2$ and the cardioid $r = 2(1 - \cos\theta)$
10. Shared by the cardioids $r = 2(1 + \cos\theta)$ and $r = 2(1 - \cos\theta)$
11. Inside the lemniscate $r^2 = 6\cos 2\theta$ and outside the circle $r = \sqrt{3}$
12. Inside the circle $r = 3a\cos\theta$ and outside the cardioid $r = a(1 + \cos\theta), a > 0$
13. Inside the circle $r = -2\cos\theta$ and outside the circle $r = 1$
14. **a.** Inside the outer loop of the limaçon $r = 2\cos\theta + 1$ (See Figure 10.51.)

    **b.** Inside the outer loop and outside the inner loop of the limaçon $r = 2\cos\theta + 1$
15. Inside the circle $r = 6$ above the line $r = 3\csc\theta$
16. Inside the lemniscate $r^2 = 6\cos 2\theta$ to the right of the line $r = (3/2)\sec\theta$
17. **a.** Find the area of the shaded region in the accompanying figure.

    **b.** It looks as if the graph of $r = \tan\theta, -\pi/2 < \theta < \pi/2$, could be asymptotic to the lines $x = 1$ and $x = -1$. Is it? Give reasons for your answer.
18. The area of the region that lies inside the cardioid curve $r = \cos\theta + 1$ and outside the circle $r = \cos\theta$ is not

$$\frac{1}{2}\int_0^{2\pi} [(\cos\theta + 1)^2 - \cos^2\theta]\, d\theta = \pi.$$

Why not? What *is* the area? Give reasons for your answers.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Lengths of Polar Curves

Find the lengths of the curves in Exercises 19–27.

**19.** The spiral $r = \theta^2, \quad 0 \le \theta \le \sqrt{5}$

**20.** The spiral $r = e^\theta/\sqrt{2}, \quad 0 \le \theta \le \pi$

**21.** The cardioid $r = 1 + \cos\theta$

**22.** The curve $r = a\sin^2(\theta/2), \quad 0 \le \theta \le \pi, \quad a > 0$

**23.** The parabolic segment $r = 6/(1 + \cos\theta), \quad 0 \le \theta \le \pi/2$

**24.** The parabolic segment $r = 2/(1 - \cos\theta), \quad \pi/2 \le \theta \le \pi$

**25.** The curve $r = \cos^3(\theta/3), \quad 0 \le \theta \le \pi/4$

**26.** The curve $r = \sqrt{1 + \sin 2\theta}, \quad 0 \le \theta \le \pi\sqrt{2}$

**27.** The curve $r = \sqrt{1 + \cos 2\theta}, \quad 0 \le \theta \le \pi\sqrt{2}$

**28. Circumferences of circles** As usual, when faced with a new formula, it is a good idea to try it on familiar objects to be sure it gives results consistent with past experience. Use the length formula in Equation (3) to calculate the circumferences of the following circles $(a > 0)$:

**a.** $r = a$ **b.** $r = a\cos\theta$ **c.** $r = a\sin\theta$

## Surface Area

Find the areas of the surfaces generated by revolving the curves in Exercises 29–32 about the indicated axes.

**29.** $r = \sqrt{\cos 2\theta}, \quad 0 \le \theta \le \pi/4, \quad y$-axis

**30.** $r = \sqrt{2}e^{\theta/2}, \quad 0 \le \theta \le \pi/2, \quad x$-axis

**31.** $r^2 = \cos 2\theta, \quad x$-axis

**32.** $r = 2a\cos\theta, \quad a > 0, \quad y$-axis

## Theory and Examples

**33. The length of the curve $r = f(\theta), \alpha \le \theta \le \beta$** Assuming that the necessary derivatives are continuous, show how the substitutions

$$x = f(\theta)\cos\theta, \quad y = f(\theta)\sin\theta$$

(Equations 2 in the text) transform

$$L = \int_\alpha^\beta \sqrt{\left(\frac{dx}{d\theta}\right)^2 + \left(\frac{dy}{d\theta}\right)^2}\, d\theta$$

into

$$L = \int_\alpha^\beta \sqrt{r^2 + \left(\frac{dr}{d\theta}\right)^2}\, d\theta.$$

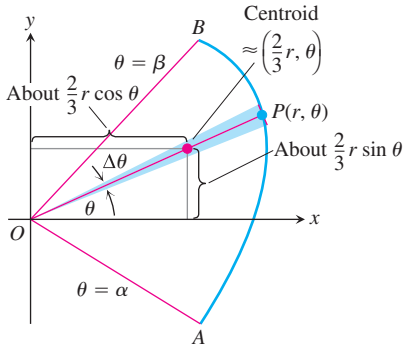
**34. Average value** If $f$ is continuous, the average value of the polar coordinate $r$ over the curve $r = f(\theta), \alpha \le \theta \le \beta$, with respect to $\theta$ is given by the formula

$$r_{av} = \frac{1}{\beta - \alpha}\int_\alpha^\beta f(\theta)\, d\theta.$$

Use this formula to find the average value of $r$ with respect to $\theta$ over the following curves $(a > 0)$.

**a.** The cardioid $r = a(1 - \cos\theta)$

**b.** The circle $r = a$



**c.** The circle $r = a\cos\theta, \quad -\pi/2 \le \theta \le \pi/2$

**35. $r = f(\theta)$ vs. $r = 2f(\theta)$** Can anything be said about the relative lengths of the curves $r = f(\theta), \alpha \le \theta \le \beta$, and $r = 2f(\theta), \alpha \le \theta \le \beta$? Give reasons for your answer.

**36. $r = f(\theta)$ vs. $r = 2f(\theta)$** The curves $r = f(\theta), \alpha \le \theta \le \beta$, and $r = 2f(\theta), \alpha \le \theta \le \beta$, are revolved about the $x$-axis to generate surfaces. Can anything be said about the relative areas of these surfaces? Give reasons for your answer.

## Centroids of Fan-Shaped Regions

Since the centroid of a triangle is located on each median, two-thirds of the way from the vertex to the opposite base, the lever arm for the moment about the $x$-axis of the thin triangular region in the accompanying figure is about $(2/3)r\sin\theta$. Similarly, the lever arm for the moment of the triangular region about the $y$-axis is about $(2/3)r\cos\theta$. These approximations improve as $\Delta\theta \to 0$ and lead to the following formulas for the coordinates of the centroid of region $AOB$:

$$\bar{x} = \frac{\int \frac{2}{3}r\cos\theta \cdot \frac{1}{2}r^2\, d\theta}{\int \frac{1}{2}r^2\, d\theta} = \frac{\frac{2}{3}\int r^3\cos\theta\, d\theta}{\int r^2\, d\theta},$$

$$\bar{y} = \frac{\int \frac{2}{3}r\sin\theta \cdot \frac{1}{2}r^2\, d\theta}{\int \frac{1}{2}r^2\, d\theta} = \frac{\frac{2}{3}\int r^3\sin\theta\, d\theta}{\int r^2\, d\theta},$$

with limits $\theta = \alpha$ to $\theta = \beta$ on all integrals.

**37.** Find the centroid of the region enclosed by the cardioid $r = a(1 + \cos\theta)$.

**38.** Find the centroid of the semicircular region $0 \le r \le a$, $0 \le \theta \le \pi$.

# 10.8 Conic Sections in Polar Coordinates

Polar coordinates are important in astronomy and astronautical engineering because the ellipses, parabolas, and hyperbolas along which satellites, moons, planets, and comets approximately move can all be described with a single relatively simple coordinate equation. We develop that equation here.

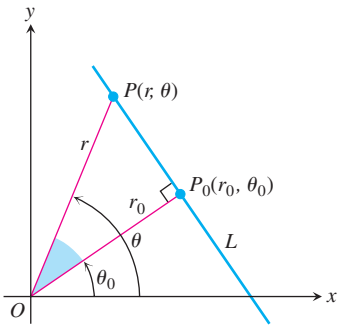

**FIGURE 10.56** We can obtain a polar equation for line $L$ by reading the relation $r_0 = r\cos(\theta - \theta_0)$ from the right triangle $OP_0P$.

## Lines

Suppose the perpendicular from the origin to line $L$ meets $L$ at the point $P_0(r_0, \theta_0)$, with $r_0 \geq 0$ (Figure 10.56). Then, if $P(r, \theta)$ is any other point on $L$, the points $P$, $P_0$, and $O$ are the vertices of a right triangle, from which we can read the relation

$$r_0 = r\cos(\theta - \theta_0).$$

**The Standard Polar Equation for Lines**

If the point $P_0(r_0, \theta_0)$ is the foot of the perpendicular from the origin to the line $L$, and $r_0 \geq 0$, then an equation for $L$ is

$$r\cos(\theta - \theta_0) = r_0. \tag{1}$$

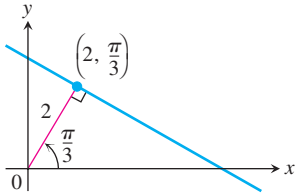

**FIGURE 10.57** The standard polar equation of this line converts to the Cartesian equation $x + \sqrt{3}y = 4$ (Example 1).

**EXAMPLE 1** Converting a Line's Polar Equation to Cartesian Form

Use the identity $\cos(A - B) = \cos A\cos B + \sin A\sin B$ to find a Cartesian equation for the line in Figure 10.57.

**Solution**

$$r\cos\left(\theta - \frac{\pi}{3}\right) = 2$$

$$r\left(\cos\theta\cos\frac{\pi}{3} + \sin\theta\sin\frac{\pi}{3}\right) = 2$$

$$\frac{1}{2}r\cos\theta + \frac{\sqrt{3}}{2}r\sin\theta = 2$$

$$\frac{1}{2}x + \frac{\sqrt{3}}{2}y = 2$$

$$x + \sqrt{3}y = 4$$

■

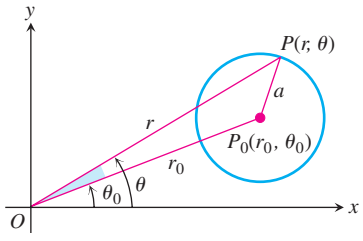

**FIGURE 10.58** We can get a polar equation for this circle by applying the Law of Cosines to triangle $OP_0P$.

## Circles

To find a polar equation for the circle of radius $a$ centered at $P_0(r_0, \theta_0)$, we let $P(r, \theta)$ be a point on the circle and apply the Law of Cosines to triangle $OP_0P$ (Figure 10.58). This gives

$$a^2 = r_0^2 + r^2 - 2r_0r\cos(\theta - \theta_0).$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

If the circle passes through the origin, then $r_0 = a$ and this equation simplifies to

$$a^2 = a^2 + r^2 - 2ar\cos(\theta - \theta_0)$$

$$r^2 = 2ar\cos(\theta - \theta_0)$$

$$r = 2a\cos(\theta - \theta_0).$$

If the circle's center lies on the positive $x$-axis, $\theta_0 = 0$ and we get the further simplification

$$r = 2a\cos\theta$$

(see Figure 10.59a).

If the center lies on the positive $y$-axis, $\theta = \pi/2, \cos(\theta - \pi/2) = \sin\theta$, and the equation $r = 2a\cos(\theta - \theta_0)$ becomes

$$r = 2a\sin\theta$$

(see Figure 10.59b).

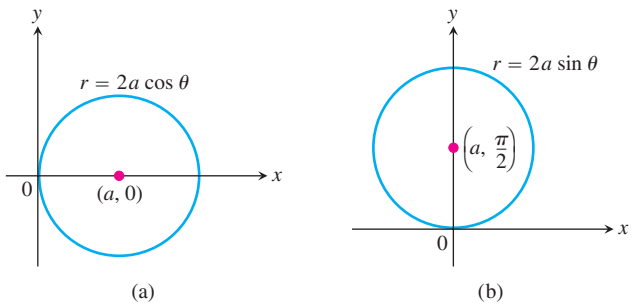

**FIGURE 10.59** Polar equation of a circle of radius $a$ through the origin with center on (a) the positive $x$-axis, and (b) the positive $y$-axis.

Equations for circles through the origin centered on the negative $x$- and $y$-axes can be obtained by replacing $r$ with $-r$ in the above equations (Figure 10.60).

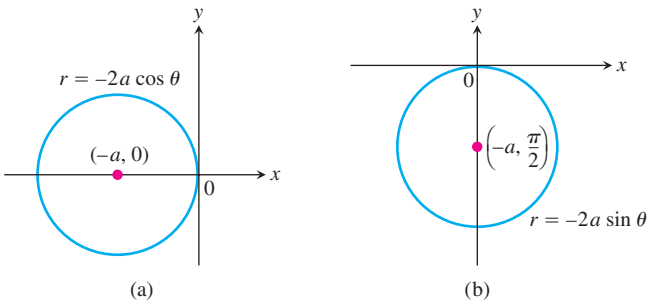

**FIGURE 10.60** Polar equation of a circle of radius $a$ through the origin with center on (a) the negative $x$-axis, and (b) the negative $y$-axis.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 2** Circles Through the Origin

| Radius | Center (polar coordinates) | Polar equation |
|---|---|---|
| 3 | $(3, 0)$ | $r = 6\cos\theta$ |
| 2 | $(2, \pi/2)$ | $r = 4\sin\theta$ |
| $1/2$ | $(-1/2, 0)$ | $r = -\cos\theta$ |
| 1 | $(-1, \pi/2)$ | $r = -2\sin\theta$ |

■

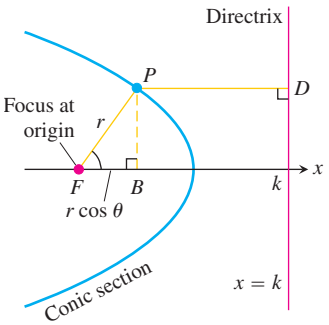

**FIGURE 10.61** If a conic section is put in the position with its focus placed at the origin and a directrix perpendicular to the initial ray and right of the origin, we can find its polar equation from the conic's focus–directrix equation.

## Ellipses, Parabolas, and Hyperbolas

To find polar equations for ellipses, parabolas, and hyperbolas, we place one focus at the origin and the corresponding directrix to the right of the origin along the vertical line $x = k$ (Figure 10.61). This makes

$$PF = r$$

and

$$PD = k - FB = k - r\cos\theta.$$

The conic's focus–directrix equation $PF = e \cdot PD$ then becomes

$$r = e(k - r\cos\theta),$$

which can be solved for $r$ to obtain

**Polar Equation for a Conic with Eccentricity $e$**

$$r = \frac{ke}{1 + e\cos\theta}, \tag{2}$$

where $x = k > 0$ is the vertical directrix.

This equation represents an ellipse if $0 < e < 1$, a parabola if $e = 1$, and a hyperbola if $e > 1$. That is, ellipses, parabolas, and hyperbolas all have the same basic equation expressed in terms of eccentricity and location of the directrix.

**EXAMPLE 3** Polar Equations of Some Conics

$$e = \frac{1}{2}: \quad \text{ellipse} \qquad r = \frac{k}{2 + \cos\theta}$$

$$e = 1: \quad \text{parabola} \qquad r = \frac{k}{1 + \cos\theta}$$

$$e = 2: \quad \text{hyperbola} \qquad r = \frac{2k}{1 + 2\cos\theta}$$

■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

You may see variations of Equation (2) from time to time, depending on the location of the directrix. If the directrix is the line $x = -k$ to the left of the origin (the origin is still a focus), we replace Equation (2) by

$$r = \frac{ke}{1 - e\cos\theta}.$$

The denominator now has a $(-)$ instead of a $(+)$. If the directrix is either of the lines $y = k$ or $y = -k$, the equations have sines in them instead of cosines, as shown in Figure 10.62.

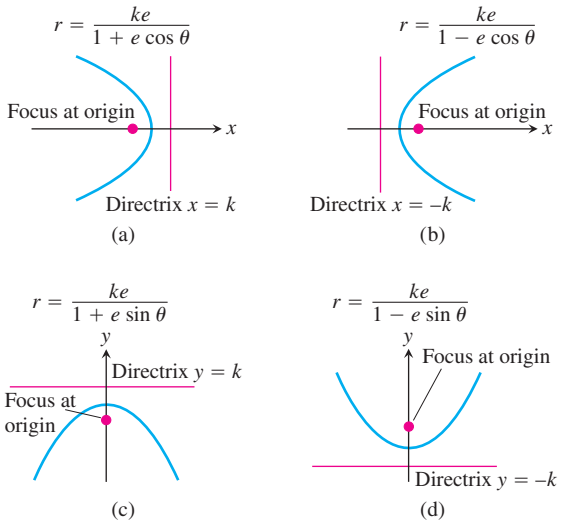

**FIGURE 10.62** Equations for conic sections with eccentricity $e > 0$, but different locations of the directrix. The graphs here show a parabola, so $e = 1$.

**EXAMPLE 4** Polar Equation of a Hyperbola

Find an equation for the hyperbola with eccentricity $3/2$ and directrix $x = 2$.

**Solution** We use Equation (2) with $k = 2$ and $e = 3/2$:

$$r = \frac{2(3/2)}{1 + (3/2)\cos\theta} \quad \text{or} \quad r = \frac{6}{2 + 3\cos\theta}.$$

**EXAMPLE 5** Finding a Directrix

Find the directrix of the parabola

$$r = \frac{25}{10 + 10\cos\theta}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

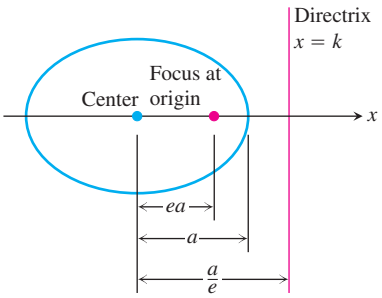

**FIGURE 10.63** In an ellipse with semimajor axis $a$, the focus–directrix distance is $k = (a/e) - ea$, so $ke = a(1 - e^2)$.

**Solution** We divide the numerator and denominator by 10 to put the equation in standard form:

$$r = \frac{5/2}{1 + \cos\theta}.$$

This is the equation

$$r = \frac{ke}{1 + e\cos\theta}$$

with $k = 5/2$ and $e = 1$. The equation of the directrix is $x = 5/2$. ■

From the ellipse diagram in Figure 10.63, we see that $k$ is related to the eccentricity $e$ and the semimajor axis $a$ by the equation

$$k = \frac{a}{e} - ea.$$

From this, we find that $ke = a(1 - e^2)$. Replacing $ke$ in Equation (2) by $a(1 - e^2)$ gives the standard polar equation for an ellipse.

**Polar Equation for the Ellipse with Eccentricity $e$ and Semimajor Axis $a$**

$$r = \frac{a(1 - e^2)}{1 + e\cos\theta} \qquad (3)$$

Notice that when $e = 0$, Equation (3) becomes $r = a$, which represents a circle.

Equation (3) is the starting point for calculating planetary orbits.

## EXAMPLE 6 The Planet Pluto's Orbit

Find a polar equation for an ellipse with semimajor axis 39.44 AU (astronomical units) and eccentricity 0.25. This is the approximate size of Pluto's orbit around the sun.

**Solution** We use Equation (3) with $a = 39.44$ and $e = 0.25$ to find

$$r = \frac{39.44(1 - (0.25)^2)}{1 + 0.25\cos\theta} = \frac{147.9}{4 + \cos\theta}.$$

At its point of closest approach (perihelion) where $\theta = 0$, Pluto is

$$r = \frac{147.9}{4 + 1} = 29.58 \text{ AU}$$

from the sun. At its most distant point (aphelion) where $\theta = \pi$, Pluto is

$$r = \frac{147.9}{4 - 1} = 49.3 \text{ AU}$$

from the sun (Figure 10.64). ■

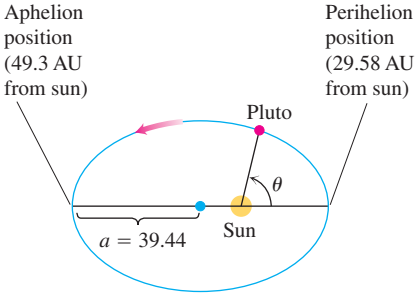

**FIGURE 10.64** The orbit of Pluto (Example 6).

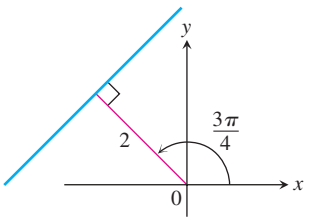
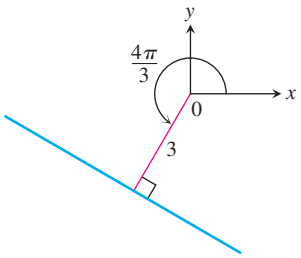
# EXERCISES 10.8

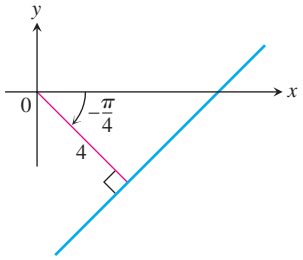


## Lines

Find polar and Cartesian equations for the lines in Exercises 1–4.



**1.**



**2.**

**3.**

**4.**

Sketch the lines in Exercises 5–8 and find Cartesian equations for them.

**5.** $r\cos\left(\theta - \frac{\pi}{4}\right) = \sqrt{2}$

**6.** $r\cos\left(\theta + \frac{3\pi}{4}\right) = 1$

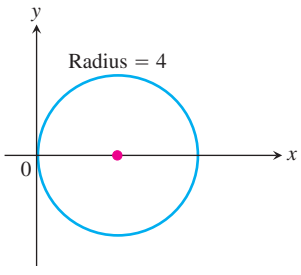
**7.** $r\cos\left(\theta - \frac{2\pi}{3}\right) = 3$

**8.** $r\cos\left(\theta + \frac{\pi}{3}\right) = 2$

Find a polar equation in the form $r\cos(\theta - \theta_0) = r_0$ for each of the lines in Exercises 9–12.

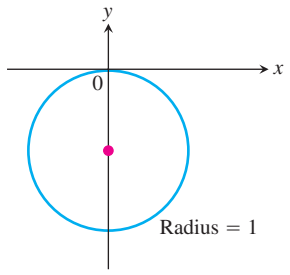
**9.** $\sqrt{2}x + \sqrt{2}y = 6$

**10.** $\sqrt{3}x - y = 1$



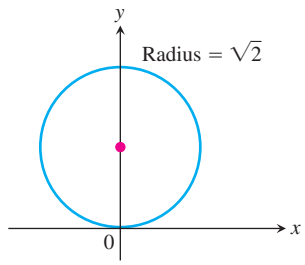
**11.** $y = -5$

**12.** $x = -4$

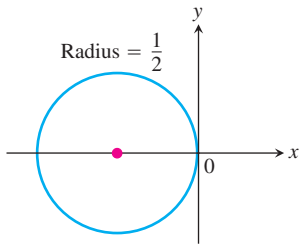


## Circles

Find polar equations for the circles in Exercises 13–16.



**13.**



**14.**

**15.**

**16.**

Sketch the circles in Exercises 17–20. Give polar coordinates for their centers and identify their radii.

**17.** $r = 4\cos\theta$

**18.** $r = 6\sin\theta$

**19.** $r = -2\cos\theta$

**20.** $r = -8\sin\theta$

Find polar equations for the circles in Exercises 21–28. Sketch each circle in the coordinate plane and label it with both its Cartesian and polar equations.

**21.** $(x - 6)^2 + y^2 = 36$

**22.** $(x + 2)^2 + y^2 = 4$

**23.** $x^2 + (y - 5)^2 = 25$

**24.** $x^2 + (y + 7)^2 = 49$

**25.** $x^2 + 2x + y^2 = 0$

**26.** $x^2 - 16x + y^2 = 0$

**27.** $x^2 + y^2 + y = 0$

**28.** $x^2 + y^2 - \frac{4}{3}y = 0$

## Conic Sections from Eccentricities and Directrices

Exercises 29–36 give the eccentricities of conic sections with one focus at the origin, along with the directrix corresponding to that focus. Find a polar equation for each conic section.

**29.** $e = 1, \quad x = 2$

**30.** $e = 1, \quad y = 2$

**31.** $e = 5, \quad y = -6$

**32.** $e = 2, \quad x = 4$

**33.** $e = 1/2, \quad x = 1$

**34.** $e = 1/4, \quad x = -2$

**35.** $e = 1/5, \quad y = -10$

**36.** $e = 1/3, \quad y = 6$

## Parabolas and Ellipses

Sketch the parabolas and ellipses in Exercises 37–44. Include the directrix that corresponds to the focus at the origin. Label the vertices with appropriate polar coordinates. Label the centers of the ellipses as well.

**37.** $r = \frac{1}{1 + \cos\theta}$

**38.** $r = \frac{6}{2 + \cos\theta}$

**39.** $r = \frac{25}{10 - 5\cos\theta}$

**40.** $r = \frac{4}{2 - 2\cos\theta}$

**41.** $r = \frac{400}{16 + 8\sin\theta}$

**42.** $r = \frac{12}{3 + 3\sin\theta}$

**43.** $r = \frac{8}{2 - 2\sin\theta}$

**44.** $r = \frac{4}{2 - \sin\theta}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Graphing Inequalities

Exercises

Sketch the regions defined by the inequalities in Exercises 45 and 46.

**45.** $0 \le r \le 2\cos\theta$ **46.** $-3\cos\theta \le r \le 0$

## T Grapher Explorations

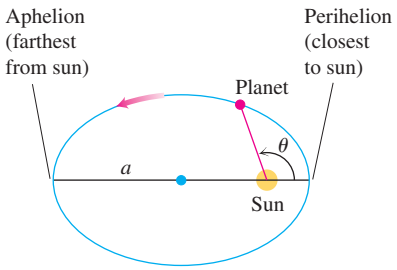
Graph the lines and conic sections in Exercises 47–56.

**47.** $r = 3\sec(\theta - \pi/3)$ **48.** $r = 4\sec(\theta + \pi/6)$

**49.** $r = 4\sin\theta$ **50.** $r = -2\cos\theta$

**51.** $r = 8/(4 + \cos\theta)$ **52.** $r = 8/(4 + \sin\theta)$

**53.** $r = 1/(1 - \sin\theta)$ **54.** $r = 1/(1 + \cos\theta)$



**55.** $r = 1/(1 + 2\sin\theta)$ **56.** $r = 1/(1 + 2\cos\theta)$

## Theory and Examples

**57. Perihelion and aphelion** A planet travels about its sun in an ellipse whose semimajor axis has length $a$. (See accompanying figure.)

**a.** Show that $r = a(1 - e)$ when the planet is closest to the sun and that $r = a(1 + e)$ when the planet is farthest from the sun.

**b.** Use the data in the table in Exercise 58 to find how close each planet in our solar system comes to the sun and how far away each planet gets from the sun.

**58. Planetary orbits** In Example 6, we found a polar equation for the orbit of Pluto. Use the data in the table below to find polar equations for the orbits of the other planets.

| Planet | Semimajor axis (astronomical units) | Eccentricity |
|---|---|---|
| Mercury | 0.3871 | 0.2056 |
| Venus | 0.7233 | 0.0068 |
| Earth | 1.000 | 0.0167 |
| Mars | 1.524 | 0.0934 |
| Jupiter | 5.203 | 0.0484 |
| Saturn | 9.539 | 0.0543 |
| Uranus | 19.18 | 0.0460 |
| Neptune | 30.06 | 0.0082 |
| Pluto | 39.44 | 0.2481 |

**59. a.** Find Cartesian equations for the curves $r = 4\sin\theta$ and $r = \sqrt{3}\sec\theta$.

**b.** Sketch the curves together and label their points of intersection in both Cartesian and polar coordinates.

**60.** Repeat Exercise 59 for $r = 8\cos\theta$ and $r = 2\sec\theta$.

**61.** Find a polar equation for the parabola with focus (0, 0) and directrix $r\cos\theta = 4$.

**62.** Find a polar equation for the parabola with focus (0, 0) and directrix $r\cos(\theta - \pi/2) = 2$.

**63. a. The space engineer's formula for eccentricity** The space engineer's formula for the eccentricity of an elliptical orbit is

$$e = \frac{r_{max} - r_{min}}{r_{max} + r_{min}},$$

where $r$ is the distance from the space vehicle to the attracting focus of the ellipse along which it travels. Why does the formula work?

**b. Drawing ellipses with string** You have a string with a knot in each end that can be pinned to a drawing board. The string is 10 in. long from the center of one knot to the center of the other. How far apart should the pins be to use the method illustrated in Figure 10.5 (Section 10.1) to draw an ellipse of eccentricity 0.2? The resulting ellipse would resemble the orbit of Mercury.

**64. Halley's comet** (See Section 10.2, Example 1.)

**a.** Write an equation for the orbit of Halley's comet in a coordinate system in which the sun lies at the origin and the other focus lies on the negative $x$-axis, scaled in astronomical units.

**b.** How close does the comet come to the sun in astronomical units? In kilometers?

**c.** What is the farthest the comet gets from the sun in astronomical units? In kilometers?

In Exercises 65–68, find a polar equation for the given curve. In each case, sketch a typical curve.

**65.** $x^2 + y^2 - 2ay = 0$ **66.** $y^2 = 4ax + 4a^2$

**67.** $x\cos\alpha + y\sin\alpha = p$ ($\alpha$, $p$ constant)

**68.** $(x^2 + y^2)^2 + 2ax(x^2 + y^2) - a^2y^2 = 0$

### COMPUTER EXPLORATIONS

**69.** Use a CAS to plot the polar equation

$$r = \frac{ke}{1 + e\cos\theta}$$

for various values of $k$ and $e$, $-\pi \le \theta \le \pi$. Answer the following questions.

**a.** Take $k = -2$. Describe what happens to the plots as you take $e$ to be $3/4$, 1, and $5/4$. Repeat for $k = 2$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**b.** Take $k = -1$. Describe what happens to the plots as you take $e$ to be $7/6$, $5/4$, $4/3$, $3/2$, 2, 3, 5, 10, and 20. Repeat for $e = 1/2$, $1/3$, $1/4$, $1/10$, and $1/20$.

**c.** Now keep $e > 0$ fixed and describe what happens as you take $k$ to be $-1$, $-2$, $-3$, $-4$, and $-5$. Be sure to look at graphs for parabolas, ellipses, and hyperbolas.

**70.** Use a CAS to plot the polar ellipse

$$r = \frac{a(1 - e^2)}{1 + e\cos\theta}$$

for various values of $a > 0$ and $0 < e < 1$, $-\pi \le \theta \le \pi$.

**a.** Take $e = 9/10$. Describe what happens to the plots as you let $a$ equal 1, $3/2$, 2, 3, 5, and 10. Repeat with $e = 1/4$.

**b.** Take $a = 2$. Describe what happens as you take $e$ to be $9/10$, $8/10$, $7/10$, $\ldots$, $1/10$, $1/20$, and $1/50$.

# Chapter 10 Additional and Advanced Exercises

## Finding Conic Sections

**1.** Find an equation for the parabola with focus (4, 0) and directrix $x = 3$. Sketch the parabola together with its vertex, focus, and directrix.

**2.** Find the vertex, focus, and directrix of the parabola

$$x^2 - 6x - 12y + 9 = 0.$$

**3.** Find an equation for the curve traced by the point $P(x, y)$ if the distance from $P$ to the vertex of the parabola $x^2 = 4y$ is twice the distance from $P$ to the focus. Identify the curve.

**4.** A line segment of length $a + b$ runs from the $x$-axis to the $y$-axis. The point $P$ on the segment lies $a$ units from one end and $b$ units from the other end. Show that $P$ traces an ellipse as the ends of the segment slide along the axes.

**5.** The vertices of an ellipse of eccentricity 0.5 lie at the points $(0, \pm 2)$. Where do the foci lie?

**6.** Find an equation for the ellipse of eccentricity $2/3$ that has the line $x = 2$ as a directrix and the point (4, 0) as the corresponding focus.

**7.** One focus of a hyperbola lies at the point $(0, -7)$ and the corresponding directrix is the line $y = -1$. Find an equation for the hyperbola if its eccentricity is **(a)** 2, **(b)** 5.

**8.** Find an equation for the hyperbola with foci $(0, -2)$ and $(0, 2)$ that passes through the point (12, 7).

**9. a.** Show that the line

$$b^2xx_1 + a^2yy_1 - a^2b^2 = 0$$

is tangent to the ellipse $b^2x^2 + a^2y^2 - a^2b^2 = 0$ at the point $(x_1, y_1)$ on the ellipse.

**b.** Show that the line

$$b^2xx_1 - a^2yy_1 - a^2b^2 = 0$$

is tangent to the hyperbola $b^2x^2 - a^2y^2 - a^2b^2 = 0$ at the point $(x_1, y_1)$ on the hyperbola.

**10.** Show that the tangent to the conic section

$$Ax^2 + Bxy + Cy^2 + Dx + Ey + F = 0$$

at a point $(x_1, y_1)$ on it has an equation that may be written in the form

$$Axx_1 + B\left(\frac{x_1y + xy_1}{2}\right) + Cyy_1 + D\left(\frac{x + x_1}{2}\right) + E\left(\frac{y + y_1}{2}\right) + F = 0.$$

## Equations and Inequalities

What points in the $xy$-plane satisfy the equations and inequalities in Exercises 11–18? Draw a figure for each exercise.

**11.** $(x^2 - y^2 - 1)(x^2 + y^2 - 25)(x^2 + 4y^2 - 4) = 0$

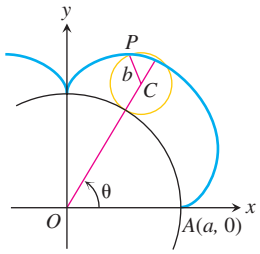
**12.** $(x + y)(x^2 + y^2 - 1) = 0$

**13.** $(x^2/9) + (y^2/16) \le 1$

**14.** $(x^2/9) - (y^2/16) \le 1$

**15.** $(9x^2 + 4y^2 - 36)(4x^2 + 9y^2 - 16) \le 0$

**16.** $(9x^2 + 4y^2 - 36)(4x^2 + 9y^2 - 16) > 0$



**17.** $x^4 - (y^2 - 9)^2 = 0$

**18.** $x^2 + xy + y^2 < 3$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Parametric Equations and Cycloids

**19. Epicycloids** When a circle rolls externally along the circumference of a second, fixed circle, any point $P$ on the circumference of the rolling circle describes an *epicycloid*, as shown here. Let the fixed circle have its center at the origin $O$ and have radius $a$.

Let the radius of the rolling circle be $b$ and let the initial position of the tracing point $P$ be $A(a, 0)$. Find parametric equations for the epicycloid, using as the parameter the angle $\theta$ from the positive $x$-axis to the line through the circles' centers.

**20. a.** Find the centroid of the region enclosed by the $x$-axis and the cycloid arch

$$x = a(t - \sin t), \quad y = a(1 - \cos t); \quad 0 \le t \le 2\pi.$$

**b.** Find the first moments about the coordinate axes of the curve

$$x = (2/3)t^{3/2}, \quad y = 2\sqrt{t}; \quad 0 \le t \le \sqrt{3}.$$

## Polar Coordinates

**21. a.** Find an equation in polar coordinates for the curve

$$x = e^{2t}\cos t, \quad y = e^{2t}\sin t; \quad -\infty < t < \infty.$$

**b.** Find the length of the curve from $t = 0$ to $t = 2\pi$.

**22.** Find the length of the curve $r = 2\sin^3(\theta/3), 0 \le \theta \le 3\pi$, in the polar coordinate plane.

**23.** Find the area of the surface generated by revolving the first-quadrant portion of the cardioid $r = 1 + \cos\theta$ about the $x$-axis. (*Hint*: Use the identities $1 + \cos\theta = 2\cos^2(\theta/2)$ and $\sin\theta = 2\sin(\theta/2)\cos(\theta/2)$ to simplify the integral.)

**24.** Sketch the regions enclosed by the curves $r = 2a\cos^2(\theta/2)$ and $r = 2a\sin^2(\theta/2), a > 0$, in the polar coordinate plane and find the area of the portion of the plane they have in common.

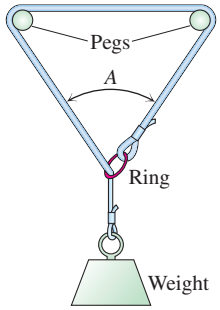
Exercises 25–28 give the eccentricities of conic sections with one focus at the origin of the polar coordinate plane, along with the directrix for that focus. Find a polar equation for each conic section.

**25.** $e = 2, \quad r\cos\theta = 2$

**26.** $e = 1, \quad r\cos\theta = -4$

**27.** $e = 1/2, \quad r\sin\theta = 2$

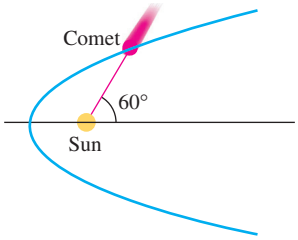
**28.** $e = 1/3, \quad r\sin\theta = -6$



## Theory and Examples

**29.** A rope with a ring in one end is looped over two pegs in a horizontal line. The free end, after being passed through the ring, has a weight suspended from it to make the rope hang taut. If the rope slips freely over the pegs and through the ring, the weight will descend as far as possible. Assume that the length of the rope is at least four times as great as the distance between the pegs and that the configuration of the rope is symmetric with respect to the line of the vertical part of the rope.

**a.** Find the angle $A$ formed at the bottom of the loop in the accompanying figure.



**b.** Show that for each fixed position of the ring on the rope, the possible locations of the ring in space lie on an ellipse with foci at the pegs.

**c.** Justify the original symmetry assumption by combining the result in part (b) with the assumption that the rope and weight will take a rest position of minimal potential energy.

**30.** Two radar stations lie 20 km apart along an east–west line. A low-flying plane traveling from west to east is known to have a speed of $v_0$ km/sec. At $t = 0$ a signal is sent from the station at $(-10, 0)$, bounces off the plane, and is received at $(10, 0)$ $30/c$ seconds later ($c$ is the velocity of the signal). When $t = 10/v_0$, another signal is sent out from the station at $(-10, 0)$, reflects off the plane, and is once again received $30/c$ seconds later by the other station. Find the position of the plane when it reflects the second signal under the assumption that $v_0$ is much less than $c$.

**31.** A comet moves in a parabolic orbit with the sun at the focus. When the comet is $4 \times 10^7$ miles from the sun, the line from the comet to the sun makes a 60° angle with the orbit's axis, as shown here. How close will the comet come to the sun?

**32.** Find the points on the parabola $x = 2t, y = t^2, -\infty < t < \infty$, closest to the point $(0, 3)$.

**33.** Find the eccentricity of the ellipse $x^2 + xy + y^2 = 1$ to the nearest hundredth.

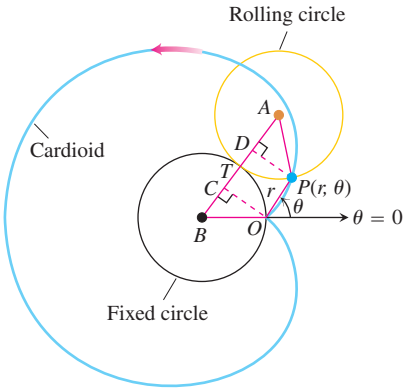
Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**34.** Find the eccentricity of the hyperbola $xy = 1$.

**35.** Is the curve $\sqrt{x} + \sqrt{y} = 1$ part of a conic section? If so, what kind of conic section? If not, why not?

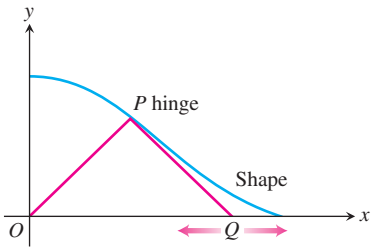
**36.** Show that the curve $2xy - \sqrt{2}\,y + 2 = 0$ is a hyperbola. Find the hyperbola's center, vertices, foci, axes, and asymptotes.

**37.** Find a polar coordinate equation for



**a.** the parabola with focus at the origin and vertex at $(a, \pi/4)$;

**b.** the ellipse with foci at the origin and (2, 0) and one vertex at (4, 0);

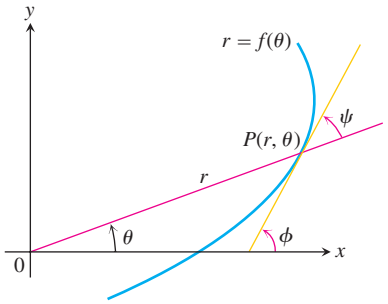


**c.** the hyperbola with one focus at the origin, center at $(2, \pi/2)$, and a vertex at $(1, \pi/2)$.

**38.** Any line through the origin will intersect the ellipse $r = 3/(2 + \cos\theta)$ in two points $P_1$ and $P_2$. Let $d_1$ be the distance between $P_1$ and the origin and let $d_2$ be the distance between $P_2$ and the origin. Compute $(1/d_1) + (1/d_2)$.

**39. Generating a cardioid with circles** Cardioids are special epicycloids (Exercise 18). Show that if you roll a circle of radius $a$ about another circle of radius $a$ in the polar coordinate plane, as in the accompanying figure, the original point of contact $P$ will trace a cardioid. (*Hint:* Start by showing that angles $OBC$ and $PAD$ both have measure $\theta$.)

**40. A bifold closet door** A bifold closet door consists of two 1-ft-wide panels, hinged at point $P$. The outside bottom corner of one panel rests on a pivot at $O$ (see the accompanying figure). The outside bottom corner of the other panel, denoted by $Q$, slides along a straight track, shown in the figure as a portion of the $x$-axis. Assume that as $Q$ moves back and forth, the bottom of the door rubs against a thick carpet. What shape will the door sweep out on the surface of the carpet?



## The Angle Between the Radius Vector and the Tangent Line to a Polar Coordinate Curve

In Cartesian coordinates, when we want to discuss the direction of a curve at a point, we use the angle $\phi$ measured counterclockwise from the positive $x$-axis to the tangent line. In polar coordinates, it is more convenient to calculate the angle $\psi$ from the *radius vector* to the tangent line (see the accompanying figure). The angle $\phi$ can then be calculated from the relation

$$\phi = \theta + \psi, \tag{1}$$

which comes from applying the Exterior Angle Theorem to the triangle in the accompanying figure.

Suppose the equation of the curve is given in the form $r = f(\theta)$, where $f(\theta)$ is a differentiable function of $\theta$. Then

$$x = r\cos\theta \quad \text{and} \quad y = r\sin\theta \tag{2}$$

are differentiable functions of $\theta$ with

$$\begin{aligned} \frac{dx}{d\theta} &= -r\sin\theta + \cos\theta\,\frac{dr}{d\theta}, \\ \frac{dy}{d\theta} &= r\cos\theta + \sin\theta\,\frac{dr}{d\theta}. \end{aligned} \tag{3}$$

Since $\psi = \phi - \theta$ from (1),

$$\tan\psi = \tan(\phi - \theta) = \frac{\tan\phi - \tan\theta}{1 + \tan\phi\tan\theta}.$$

Furthermore,

$$\tan\phi = \frac{dy}{dx} = \frac{dy/d\theta}{dx/d\theta}$$

because $\tan\phi$ is the slope of the curve at $P$. Also,

$$\tan\theta = \frac{y}{x}.$$

Hence

$$\tan\psi = \frac{\dfrac{dy/d\theta}{dx/d\theta} - \dfrac{y}{x}}{1 + \dfrac{y}{x}\dfrac{dy/d\theta}{dx/d\theta}} = \frac{x\dfrac{dy}{d\theta} - y\dfrac{dx}{d\theta}}{x\dfrac{dx}{d\theta} + y\dfrac{dy}{d\theta}}. \tag{4}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The numerator in the last expression in Equation (4) is found from Equations (2) and (3) to be

$$x\frac{dy}{d\theta} - y\frac{dx}{d\theta} = r^2.$$

Similarly, the denominator is

$$x\frac{dx}{d\theta} + y\frac{dy}{d\theta} = r\frac{dr}{d\theta}.$$

When we substitute these into Equation (4), we obtain

$$\tan\psi = \frac{r}{dr/d\theta}. \tag{5}$$

This is the equation we use for finding $\psi$ as a function of $\theta$.

**41.** Show, by reference to a figure, that the angle $\beta$ between the tangents to two curves at a point of intersection may be found from the formula

$$\tan\beta = \frac{\tan\psi_2 - \tan\psi_1}{1 + \tan\psi_2\tan\psi_1}. \tag{6}$$

When will the two curves intersect at right angles?

**42.** Find the value of $\tan\psi$ for the curve $r = \sin^4(\theta/4)$.

**43.** Find the angle between the radius vector to the curve $r = 2a\sin 3\theta$ and its tangent when $\theta = \pi/6$.

T **44.** **a.** Graph the hyperbolic spiral $r\theta = 1$. What appears to happen to $\psi$ as the spiral winds in around the origin?

**b.** Confirm your finding in part (a) analytically.

**45.** The circles $r = \sqrt{3}\cos\theta$ and $r = \sin\theta$ intersect at the point $(\sqrt{3}/2, \pi/3)$. Show that their tangents are perpendicular there.

**46.** Sketch the cardioid $r = a(1 + \cos\theta)$ and circle $r = 3a\cos\theta$ in one diagram and find the angle between their tangents at the point of intersection that lies in the first quadrant.

**47.** Find the points of intersection of the parabolas

$$r = \frac{1}{1 - \cos\theta} \quad \text{and} \quad r = \frac{3}{1 + \cos\theta}$$

and the angles between their tangents at these points.

**48.** Find points on the cardioid $r = a(1 + \cos\theta)$ where the tangent line is **(a)** horizontal, **(b)** vertical.

**49.** Show that parabolas $r = a/(1 + \cos\theta)$ and $r = b/(1 - \cos\theta)$ are orthogonal at each point of intersection $(ab \neq 0)$.

**50.** Find the angle at which the cardioid $r = a(1 - \cos\theta)$ crosses the ray $\theta = \pi/2$.

**51.** Find the angle between the line $r = 3\sec\theta$ and the cardioid $r = 4(1 + \cos\theta)$ at one of their intersections.

**52.** Find the slope of the tangent line to the curve $r = a\tan(\theta/2)$ at $\theta = \pi/2$.

**53.** Find the angle at which the parabolas $r = 1/(1 - \cos\theta)$ and $r = 1/(1 - \sin\theta)$ intersect in the first quadrant.

**54.** The equation $r^2 = 2\csc 2\theta$ represents a curve in polar coordinates.

**a.** Sketch the curve.

**b.** Find an equivalent Cartesian equation for the curve.

**c.** Find the angle at which the curve intersects the ray $\theta = \pi/4$.

**55.** Suppose that the angle $\psi$ from the radius vector to the tangent line of the curve $r = f(\theta)$ has the constant value $\alpha$.

**a.** Show that the area bounded by the curve and two rays $\theta = \theta_1$, $\theta = \theta_2$, is proportional to ${r_2}^2 - {r_1}^2$, where $(r_1, \theta_1)$ and $(r_2, \theta_2)$ are polar coordinates of the ends of the arc of the curve between these rays. Find the factor of proportionality.

**b.** Show that the length of the arc of the curve in part (a) is proportional to $r_2 - r_1$, and find the proportionality constant.

**56.** Let $P$ be a point on the hyperbola $r^2\sin 2\theta = 2a^2$. Show that the triangle formed by $OP$, the tangent at $P$, and the initial line is isosceles.

# Chapter 10 Practice Exercises

## Graphing Conic Sections

Sketch the parabolas in Exercises 1–4. Include the focus and directrix in each sketch.

**1.** $x^2 = -4y$

**2.** $x^2 = 2y$

**3.** $y^2 = 3x$

**4.** $y^2 = -(8/3)x$

Find the eccentricities of the ellipses and hyperbolas in Exercises 5–8. Sketch each conic section. Include the foci, vertices, and asymptotes (as appropriate) in your sketch.

**5.** $16x^2 + 7y^2 = 112$

**6.** $x^2 + 2y^2 = 4$

**7.** $3x^2 - y^2 = 3$

**8.** $5y^2 - 4x^2 = 20$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Shifting Conic Sections

Exercises 9–14 give equations for conic sections and tell how many units up or down and to the right or left each curve is to be shifted. Find an equation for the new conic section and find the new foci, vertices, centers, and asymptotes, as appropriate. If the curve is a parabola, find the new directrix as well.

**9.** $x^2 = -12y$, right 2, up 3

**10.** $y^2 = 10x$, left 1/2, down 1

**11.** $\frac{x^2}{9} + \frac{y^2}{25} = 1$, left 3, down 5

**12.** $\frac{x^2}{169} + \frac{y^2}{144} = 1$, right 5, up 12

**13.** $\frac{y^2}{8} - \frac{x^2}{2} = 1$, right 2, up $2\sqrt{2}$

**14.** $\frac{x^2}{36} - \frac{y^2}{64} = 1$, left 10, down 3

## Identifying Conic Sections

Identify the conic sections in Exercises 15–22 and find their foci, vertices, centers, and asymptotes (as appropriate). If the curve is a parabola, find its directrix as well.

**15.** $x^2 - 4x - 4y^2 = 0$

**16.** $4x^2 - y^2 + 4y = 8$

**17.** $y^2 - 2y + 16x = -49$

**18.** $x^2 - 2x + 8y = -17$

**19.** $9x^2 + 16y^2 + 54x - 64y = -1$

**20.** $25x^2 + 9y^2 - 100x + 54y = 44$

**21.** $x^2 + y^2 - 2x - 2y = 0$

**22.** $x^2 + y^2 + 4x + 2y = 1$

## Using the Discriminant

What conic sections or degenerate cases do the equations in Exercises 23–28 represent? Give a reason for your answer in each case.

**23.** $x^2 + xy + y^2 + x + y + 1 = 0$

**24.** $x^2 + 4xy + 4y^2 + x + y + 1 = 0$

**25.** $x^2 + 3xy + 2y^2 + x + y + 1 = 0$

**26.** $x^2 + 2xy - 2y^2 + x + y + 1 = 0$

**27.** $x^2 - 2xy + y^2 = 0$

**28.** $x^2 - 3xy + 4y^2 = 0$

## Rotating Conic Sections

Identify the conic sections in Exercises 29–32. Then rotate the coordinate axes to find a new equation for the conic section that has no cross product term. (The new equations will vary with the size and direction of the rotations used.)

**29.** $2x^2 + xy + 2y^2 - 15 = 0$

**30.** $3x^2 + 2xy + 3y^2 = 19$

**31.** $x^2 + 2\sqrt{3}\,xy - y^2 + 4 = 0$

**32.** $x^2 - 3xy + y^2 = 5$

## Identifying Parametric Equations in the Plane

Exercises 33–36 give parametric equations and parameter intervals for the motion of a particle in the $xy$-plane. Identify the particle's path by finding a Cartesian equation for it. Graph the Cartesian equation and indicate the direction of motion and the portion traced by the particle.

**33.** $x = (1/2)\tan t$, $y = (1/2)\sec t$; $-\pi/2 < t < \pi/2$

**34.** $x = -2\cos t$, $y = 2\sin t$; $0 \le t \le \pi$

**35.** $x = -\cos t$, $y = \cos^2 t$; $0 \le t \le \pi$

**36.** $x = 4\cos t$, $y = 9\sin t$; $0 \le t \le 2\pi$

## Graphs in the Polar Plane

Sketch the regions defined by the polar coordinate inequalities in Exercises 37 and 38.

**37.** $0 \le r \le 6\cos\theta$

**38.** $-4\sin\theta \le r \le 0$

Match each graph in Exercises 39–46 with the appropriate equation (a)–(l). There are more equations than graphs, so some equations will not be matched.

**a.** $r = \cos 2\theta$

**b.** $r\cos\theta = 1$

**c.** $r = \frac{6}{1 - 2\cos\theta}$

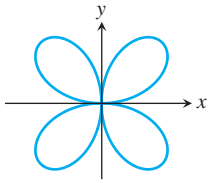
**d.** $r = \sin 2\theta$

**e.** $r = \theta$

**f.** $r^2 = \cos 2\theta$

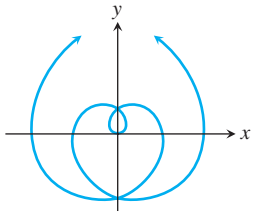
**g.** $r = 1 + \cos\theta$

**h.** $r = 1 - \sin\theta$



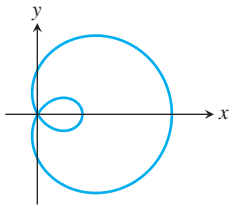
**i.** $r = \frac{2}{1 - \cos\theta}$

**j.** $r^2 = \sin 2\theta$

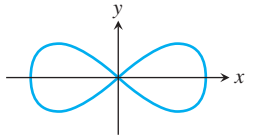


**k.** $r = -\sin\theta$

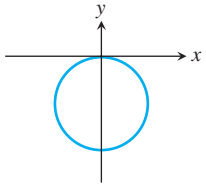
**l.** $r = 2\cos\theta + 1$



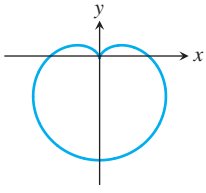
**39.** Four-leaved rose



**40.** Spiral

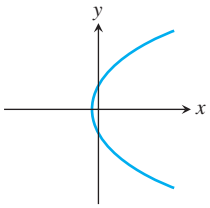


**41.** Limaçon

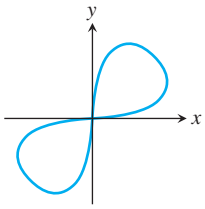


**42.** Lemniscate

**43.** Circle



**44.** Cardioid



Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**45.** Parabola

**46.** Lemniscate

## Intersections of Graphs in the Polar Plane

Find the points of intersection of the curves given by the polar coordinate equations in Exercises 47–54.

**47.** $r = \sin\theta, \quad r = 1 + \sin\theta$ **48.** $r = \cos\theta, \quad r = 1 - \cos\theta$

**49.** $r = 1 + \cos\theta, \quad r = 1 - \cos\theta$

**50.** $r = 1 + \sin\theta, \quad r = 1 - \sin\theta$

**51.** $r = 1 + \sin\theta, \quad r = -1 + \sin\theta$

**52.** $r = 1 + \cos\theta, \quad r = -1 + \cos\theta$

**53.** $r = \sec\theta, \quad r = 2\sin\theta$ **54.** $r = -2\csc\theta, \quad r = -4\cos\theta$

## Polar to Cartesian Equations

Sketch the lines in Exercises 55–60. Also, find a Cartesian equation for each line.

**55.** $r\cos\left(\theta + \dfrac{\pi}{3}\right) = 2\sqrt{3}$ **56.** $r\cos\left(\theta - \dfrac{3\pi}{4}\right) = \dfrac{\sqrt{2}}{2}$

**57.** $r = 2\sec\theta$ **58.** $r = -\sqrt{2}\sec\theta$

**59.** $r = -(3/2)\csc\theta$ **60.** $r = \left(3\sqrt{3}\right)\csc\theta$

Find Cartesian equations for the circles in Exercises 61–64. Sketch each circle in the coordinate plane and label it with both its Cartesian and polar equations.

**61.** $r = -4\sin\theta$ **62.** $r = 3\sqrt{3}\sin\theta$

**63.** $r = 2\sqrt{2}\cos\theta$ **64.** $r = -6\cos\theta$

## Cartesian to Polar Equations

Find polar equations for the circles in Exercises 65–68. Sketch each circle in the coordinate plane and label it with both its Cartesian and polar equations.

**65.** $x^2 + y^2 + 5y = 0$ **66.** $x^2 + y^2 - 2y = 0$

**67.** $x^2 + y^2 - 3x = 0$ **68.** $x^2 + y^2 + 4x = 0$

## Conic Sections in Polar Coordinates

Sketch the conic sections whose polar coordinate equations are given in Exercises 69–72. Give polar coordinates for the vertices and, in the case of ellipses, for the centers as well.

**69.** $r = \dfrac{2}{1 + \cos\theta}$ **70.** $r = \dfrac{8}{2 + \cos\theta}$

**71.** $r = \dfrac{6}{1 - 2\cos\theta}$ **72.** $r = \dfrac{12}{3 + \sin\theta}$

Exercises 73–76 give the eccentricities of conic sections with one focus at the origin of the polar coordinate plane, along with the directrix for that focus. Find a polar equation for each conic section.

**73.** $e = 2, \quad r\cos\theta = 2$ **74.** $e = 1, \quad r\cos\theta = -4$

**75.** $e = 1/2, \quad r\sin\theta = 2$ **76.** $e = 1/3, \quad r\sin\theta = -6$

## Area, Length, and Surface Area in the Polar Plane

Find the areas of the regions in the polar coordinate plane described in Exercises 77–80.

**77.** Enclosed by the limaçon $r = 2 - \cos\theta$

**78.** Enclosed by one leaf of the three-leaved rose $r = \sin 3\theta$

**79.** Inside the "figure eight" $r = 1 + \cos 2\theta$ and outside the circle $r = 1$

**80.** Inside the cardioid $r = 2(1 + \sin\theta)$ and outside the circle $r = 2\sin\theta$

Find the lengths of the curves given by the polar coordinate equations in Exercises 81–84.

**81.** $r = -1 + \cos\theta$

**82.** $r = 2\sin\theta + 2\cos\theta, \quad 0 \le \theta \le \pi/2$

**83.** $r = 8\sin^3(\theta/3), \quad 0 \le \theta \le \pi/4$

**84.** $r = \sqrt{1 + \cos 2\theta}, \quad -\pi/2 \le \theta \le \pi/2$

Find the areas of the surfaces generated by revolving the polar coordinate curves in Exercises 85 and 86 about the indicated axes.

**85.** $r = \sqrt{\cos 2\theta}, \quad 0 \le \theta \le \pi/4, \quad x$-axis

**86.** $r^2 = \sin 2\theta, \quad y$-axis

## Theory and Examples

**87.** Find the volume of the solid generated by revolving the region enclosed by the ellipse $9x^2 + 4y^2 = 36$ about **(a)** the $x$-axis, **(b)** the $y$-axis.

**88.** The "triangular" region in the first quadrant bounded by the $x$-axis, the line $x = 4$, and the hyperbola $9x^2 - 4y^2 = 36$ is revolved about the $x$-axis to generate a solid. Find the volume of the solid.

**89.** A ripple tank is made by bending a strip of tin around the perimeter of an ellipse for the wall of the tank and soldering a flat bottom onto this. An inch or two of water is put in the tank and you drop a marble into it, right at one focus of the ellipse. Ripples radiate outward through the water, reflect from the strip around the edge of the tank, and a few seconds later a drop of water spurts up at the second focus. Why?

**90. LORAN** A radio signal was sent simultaneously from towers $A$ and $B$, located several hundred miles apart on the northern California coast. A ship offshore received the signal from $A$ 1400 microseconds before receiving the signal from $B$. Assuming that the signals traveled at the rate of 980 ft/microsecond, what can be said about the location of the ship relative to the two towers?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**91.** On a level plane, at the same instant, you hear the sound of a rifle and that of the bullet hitting the target. What can be said about your location relative to the rifle and target?

**92. Archimedes spirals** The graph of an equation of the form $r = a\theta$, where $a$ is a nonzero constant, is called an *Archimedes spiral*. Is there anything special about the widths between the successive turns of such a spiral?

**93. a.** Show that the equations $x = r\cos\theta, y = r\sin\theta$ transform the polar equation

$$r = \frac{k}{1 + e\cos\theta}$$

into the Cartesian equation

$$(1 - e^2)x^2 + y^2 + 2kex - k^2 = 0.$$

**b.** Then apply the criteria of Section 10.3 to show that

$$\begin{aligned} e = 0 &\Rightarrow \text{circle}. \\ 0 < e < 1 &\Rightarrow \text{ellipse}. \\ e = 1 &\Rightarrow \text{parabola}. \\ e > 1 &\Rightarrow \text{hyperbola}. \end{aligned}$$

**94. A satellite orbit** A satellite is in an orbit that passes over the North and South Poles of the earth. When it is over the South Pole it is at the highest point of its orbit, 1000 miles above the earth's surface. Above the North Pole it is at the lowest point of its orbit, 300 miles above the earth's surface.

**a.** Assuming that the orbit is an ellipse with one focus at the center of the earth, find its eccentricity. (Take the diameter of the earth to be 8000 miles.)

**b.** Using the north–south axis of the earth as the $x$-axis and the center of the earth as origin, find a polar equation for the orbit.

# Chapter 10 Questions to Guide Your Review

1. What is a parabola? What are the Cartesian equations for parabolas whose vertices lie at the origin and whose foci lie on the coordinate axes? How can you find the focus and directrix of such a parabola from its equation?
2. What is an ellipse? What are the Cartesian equations for ellipses centered at the origin with foci on one of the coordinate axes? How can you find the foci, vertices, and directrices of such an ellipse from its equation?
3. What is a hyperbola? What are the Cartesian equations for hyperbolas centered at the origin with foci on one of the coordinate axes? How can you find the foci, vertices, and directrices of such an ellipse from its equation?
4. What is the eccentricity of a conic section? How can you classify conic sections by eccentricity? How are an ellipse's shape and eccentricity related?
5. Explain the equation $PF = e \cdot PD$.
6. What is a quadratic curve in the $xy$-plane? Give examples of degenerate and nondegenerate quadratic curves.
7. How can you find a Cartesian coordinate system in which the new equation for a conic section in the plane has no $xy$-term? Give an example.
8. How can you tell what kind of graph to expect from a quadratic equation in $x$ and $y$? Give examples.
9. What are some typical parametrizations for conic sections?
10. What is a cycloid? What are typical parametric equations for cycloids? What physical properties account for the importance of cycloids?
11. What are polar coordinates? What equations relate polar coordinates to Cartesian coordinates? Why might you want to change from one coordinate system to the other?
12. What consequence does the lack of uniqueness of polar coordinates have for graphing? Give an example.
13. How do you graph equations in polar coordinates? Include in your discussion symmetry, slope, behavior at the origin, and the use of Cartesian graphs. Give examples.
14. How do you find the area of a region $0 \le r_1(\theta) \le r \le r_2(\theta)$, $\alpha \le \theta \le \beta$, in the polar coordinate plane? Give examples.
15. Under what conditions can you find the length of a curve $r = f(\theta)$, $\alpha \le \theta \le \beta$, in the polar coordinate plane? Give an example of a typical calculation.
16. Under what conditions can you find the area of the surface generated by revolving a curve $r = f(\theta)$, $\alpha \le \theta \le \beta$, about the $x$-axis? The $y$-axis? Give examples of typical calculations.
17. What are the standard equations for lines and conic sections in polar coordinates? Give examples.

Chapter

# 11 INFINITE SEQUENCES AND SERIES

**OVERVIEW** While everyone knows how to add together two numbers, or even several, how to add together infinitely many numbers is not so clear. In this chapter we study such questions, the subject of the theory of infinite series. Infinite series sometimes have a finite sum, as in

$$\frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \cdots = 1.$$

This sum is represented geometrically by the areas of the repeatedly halved unit square shown here. The areas of the small rectangles add together to give the area of the unit square, which they fill. Adding together more and more terms gets us closer and closer to the total.

Other infinite series do not have a finite sum, as with

$$1 + 2 + 3 + 4 + 5 + \cdots.$$

The sum of the first few terms gets larger and larger as we add more and more terms. Taking enough terms makes these sums larger than any prechosen constant.

With some infinite series, such as the harmonic series

$$1 + \frac{1}{2} + \frac{1}{3} + \frac{1}{4} + \frac{1}{5} + \frac{1}{6} + \cdots$$

it is not obvious whether a finite sum exists. It is unclear whether adding more and more terms gets us closer to some sum, or gives sums that grow without bound.

As we develop the theory of infinite sequences and series, an important application gives a method of representing a differentiable function $f(x)$ as an infinite sum of powers of $x$. With this method we can extend our knowledge of how to evaluate, differentiate, and integrate polynomials to a class of functions much more general than polynomials. We also investigate a method of representing a function as an infinite sum of sine and cosine functions. This method will yield a powerful tool to study functions.

# 11.1 Sequences

HISTORICAL ESSAY

Sequences and Series

A sequence is a list of numbers

$$a_1, a_2, a_3, \ldots, a_n, \ldots$$

in a given order. Each of $a_1$, $a_2$, $a_3$ and so on represents a number. These are the **terms** of the sequence. For example the sequence

$$2, 4, 6, 8, 10, 12, \ldots, 2n, \ldots$$

has first term $a_1 = 2$, second term $a_2 = 4$ and $n$th term $a_n = 2n$. The integer $n$ is called the **index** of $a_n$, and indicates where $a_n$ occurs in the list. We can think of the sequence

$$a_1, a_2, a_3, \ldots, a_n, \ldots$$

as a function that sends 1 to $a_1$, 2 to $a_2$, 3 to $a_3$, and in general sends the positive integer $n$ to the $n$th term $a_n$. This leads to the formal definition of a sequence.

**DEFINITION Infinite Sequence**

An **infinite sequence** of numbers is a function whose domain is the set of positive integers.

The function associated to the sequence

$$2, 4, 6, 8, 10, 12, \ldots, 2n, \ldots$$

sends 1 to $a_1 = 2$, 2 to $a_2 = 4$, and so on. The general behavior of this sequence is described by the formula

$$a_n = 2n.$$

We can equally well make the domain the integers larger than a given number $n_0$, and we allow sequences of this type also.

The sequence

$$12, 14, 16, 18, 20, 22 \ldots$$

is described by the formula $a_n = 10 + 2n$. It can also be described by the simpler formula $b_n = 2n$, where the index $n$ starts at 6 and increases. To allow such simpler formulas, we let the first index of the sequence be any integer. In the sequence above, $\{a_n\}$ starts with $a_1$ while $\{b_n\}$ starts with $b_6$. Order is important. The sequence $1, 2, 3, 4 \ldots$ is not the same as the sequence $2, 1, 3, 4 \ldots$.

Sequences can be described by writing rules that specify their terms, such as

$$a_n = \sqrt{n},$$
$$b_n = (-1)^{n+1}\frac{1}{n},$$
$$c_n = \frac{n-1}{n},$$
$$d_n = (-1)^{n+1}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

or by listing terms,

$$\{a_n\} = \{\sqrt{1}, \sqrt{2}, \sqrt{3}, \ldots, \sqrt{n}, \ldots\}$$

$$\{b_n\} = \left\{1, -\frac{1}{2}, \frac{1}{3}, -\frac{1}{4}, \ldots, (-1)^{n+1}\frac{1}{n}, \ldots\right\}$$

$$\{c_n\} = \left\{0, \frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \ldots, \frac{n-1}{n}, \ldots\right\}$$

$$\{d_n\} = \{1, -1, 1, -1, 1, -1, \ldots, (-1)^{n+1}, \ldots\}.$$

We also sometimes write

$$\{a_n\} = \{\sqrt{n}\}_{n=1}^{\infty}.$$

Figure 11.1 shows two ways to represent sequences graphically. The first marks the first few points from $a_1, a_2, a_3, \ldots, a_n, \ldots$ on the real axis. The second method shows the graph of the function defining the sequence. The function is defined only on integer inputs, and the graph consists of some points in the $xy$-plane, located at $(1, a_1)$, $(2, a_2), \ldots, (n, a_n), \ldots$.

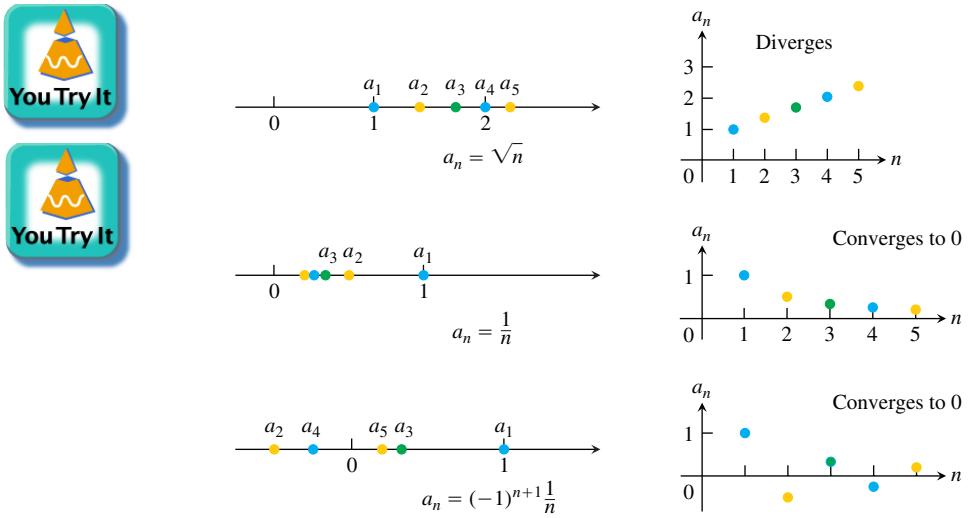

**FIGURE 11.1** Sequences can be represented as points on the real line or as points in the plane where the horizontal axis $n$ is the index number of the term and the vertical axis $a_n$ is its value.

## Convergence and Divergence

Sometimes the numbers in a sequence approach a single value as the index $n$ increases. This happens in the sequence

$$\left\{1, \frac{1}{2}, \frac{1}{3}, \frac{1}{4}, \ldots, \frac{1}{n}, \ldots\right\}$$

whose terms approach 0 as $n$ gets large, and in the sequence

$$\left\{0, \frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \frac{4}{5}, \ldots, 1 - \frac{1}{n}, \ldots\right\}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

whose terms approach 1. On the other hand, sequences like

$$\{\sqrt{1}, \sqrt{2}, \sqrt{3}, \ldots, \sqrt{n}, \ldots\}$$

have terms that get larger than any number as $n$ increases, and sequences like

$$\{1, -1, 1, -1, 1, -1, \ldots, (-1)^{n+1}, \ldots\}$$

bounce back and forth between 1 and $-1$, never converging to a single value. The following definition captures the meaning of having a sequence converge to a limiting value. It says that if we go far enough out in the sequence, by taking the index $n$ to be larger then some value $N$, the difference between $a_n$ and the limit of the sequence becomes less than any preselected number $\epsilon > 0$.

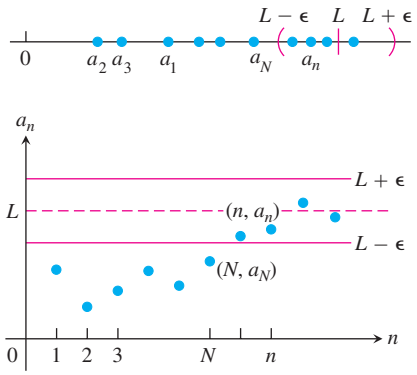

**FIGURE 11.2** $a_n \to L$ if $y = L$ is a horizontal asymptote of the sequence of points $\{(n, a_n)\}$. In this figure, all the $a_n$'s after $a_N$ lie within $\epsilon$ of $L$.

**DEFINITIONS** **Converges, Diverges, Limit**

The sequence $\{a_n\}$ **converges** to the number $L$ if to every positive number $\epsilon$ there corresponds an integer $N$ such that for all $n$,

$$n > N \quad \Rightarrow \quad |a_n - L| < \epsilon.$$

If no such number $L$ exists, we say that $\{a_n\}$ **diverges**.

If $\{a_n\}$ converges to $L$, we write $\lim_{n\to\infty} a_n = L$, or simply $a_n \to L$, and call $L$ the **limit** of the sequence (Figure 11.2).

HISTORICAL BIOGRAPHY

Nicole Oresme
(ca. 1320–1382)

The definition is very similar to the definition of the limit of a function $f(x)$ as $x$ tends to $\infty$ ($\lim_{x\to\infty} f(x)$ in Section 2.4). We will exploit this connection to calculate limits of sequences.

**EXAMPLE 1** Applying the Definition

Show that

**(a)** $\lim_{n\to\infty} \frac{1}{n} = 0$ **(b)** $\lim_{n\to\infty} k = k$ (any constant $k$)

**Solution**

**(a)** Let $\epsilon > 0$ be given. We must show that there exists an integer $N$ such that for all $n$,

$$n > N \quad \Rightarrow \quad \left|\frac{1}{n} - 0\right| < \epsilon.$$

This implication will hold if $(1/n) < \epsilon$ or $n > 1/\epsilon$. If $N$ is any integer greater than $1/\epsilon$, the implication will hold for all $n > N$. This proves that $\lim_{n\to\infty}(1/n) = 0$.

**(b)** Let $\epsilon > 0$ be given. We must show that there exists an integer $N$ such that for all $n$,

$$n > N \quad \Rightarrow \quad |k - k| < \epsilon.$$

Since $k - k = 0$, we can use any positive integer for $N$ and the implication will hold. This proves that $\lim_{n\to\infty} k = k$ for any constant $k$. ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 2** A Divergent Sequence

Show that the sequence $\{1, -1, 1, -1, 1, -1, \ldots, (-1)^{n+1}, \ldots\}$ diverges.

**Solution** Suppose the sequence converges to some number $L$. By choosing $\epsilon = 1/2$ in the definition of the limit, all terms $a_n$ of the sequence with index $n$ larger than some $N$ must lie within $\epsilon = 1/2$ of $L$. Since the number 1 appears repeatedly as every other term of the sequence, we must have that the number 1 lies within the distance $\epsilon = 1/2$ of $L$. It follows that $|L - 1| < 1/2$, or equivalently, $1/2 < L < 3/2$. Likewise, the number $-1$ appears repeatedly in the sequence with arbitrarily high index. So we must also have that $|L - (-1)| < 1/2$, or equivalently, $-3/2 < L < -1/2$. But the number $L$ cannot lie in both of the intervals $(1/2, 3/2)$ and $(-3/2, -1/2)$ because they have no overlap. Therefore, no such limit $L$ exists and so the sequence diverges.

Note that the same argument works for any positive number $\epsilon$ smaller than 1, not just $1/2$. ■

The sequence $\{\sqrt{n}\}$ also diverges, but for a different reason. As $n$ increases, its terms become larger than any fixed number. We describe the behavior of this sequence by writing

$$\lim_{n\to\infty} \sqrt{n} = \infty.$$

In writing infinity as the limit of a sequence, we are not saying that the differences between the terms $a_n$ and $\infty$ become small as $n$ increases. Nor are we asserting that there is some number infinity that the sequence approaches. We are merely using a notation that captures the idea that $a_n$ eventually gets and stays larger than any fixed number as $n$ gets large.

**DEFINITION** Diverges to Infinity

The sequence $\{a_n\}$ **diverges to infinity** if for every number $M$ there is an integer $N$ such that for all $n$ larger than $N$, $a_n > M$. If this condition holds we write

$$\lim_{n\to\infty} a_n = \infty \quad \text{or} \quad a_n \to \infty.$$

Similarly if for every number $m$ there is an integer $N$ such that for all $n > N$ we have $a_n < m$, then we say $\{a_n\}$ **diverges to negative infinity** and write

$$\lim_{n\to\infty} a_n = -\infty \quad \text{or} \quad a_n \to -\infty.$$

A sequence may diverge without diverging to infinity or negative infinity. We saw this in Example 2, and the sequences $\{1, -2, 3, -4, 5, -6, 7, -8, \ldots\}$ and $\{1, 0, 2, 0, 3, 0, \ldots\}$ are also examples of such divergence.

## Calculating Limits of Sequences

If we always had to use the formal definition of the limit of a sequence, calculating with $\epsilon$'s and $N$'s, then computing limits of sequences would be a formidable task. Fortunately we can derive a few basic examples, and then use these to quickly analyze the limits of many more sequences. We will need to understand how to combine and compare sequences. Since sequences are functions with domain restricted to the positive integers, it is not too surprising that the theorems on limits of functions given in Chapter 2 have versions for sequences.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**THEOREM 1**

Let $\{a_n\}$ and $\{b_n\}$ be sequences of real numbers and let $A$ and $B$ be real numbers. The following rules hold if $\lim_{n\to\infty} a_n = A$ and $\lim_{n\to\infty} b_n = B$.

1. *Sum Rule:* $\lim_{n\to\infty}(a_n + b_n) = A + B$
2. *Difference Rule:* $\lim_{n\to\infty}(a_n - b_n) = A - B$
3. *Product Rule:* $\lim_{n\to\infty}(a_n \cdot b_n) = A \cdot B$
4. *Constant Multiple Rule:* $\lim_{n\to\infty}(k \cdot b_n) = k \cdot B$ (Any number $k$)
5. *Quotient Rule:* $\lim_{n\to\infty} \dfrac{a_n}{b_n} = \dfrac{A}{B}$ if $B \neq 0$

The proof is similar to that of Theorem 1 of Section 2.2, and is omitted.

**EXAMPLE 3** Applying Theorem 1

By combining Theorem 1 with the limits of Example 1, we have:

**(a)** $\lim_{n\to\infty}\left(-\dfrac{1}{n}\right) = -1 \cdot \lim_{n\to\infty}\dfrac{1}{n} = -1 \cdot 0 = 0$ Constant Multiple Rule and Example 1a

**(b)** $\lim_{n\to\infty}\left(\dfrac{n-1}{n}\right) = \lim_{n\to\infty}\left(1 - \dfrac{1}{n}\right) = \lim_{n\to\infty} 1 - \lim_{n\to\infty}\dfrac{1}{n} = 1 - 0 = 1$ Difference Rule and Example 1a

**(c)** $\lim_{n\to\infty}\dfrac{5}{n^2} = 5 \cdot \lim_{n\to\infty}\dfrac{1}{n} \cdot \lim_{n\to\infty}\dfrac{1}{n} = 5 \cdot 0 \cdot 0 = 0$ Product Rule

**(d)** $\lim_{n\to\infty}\dfrac{4 - 7n^6}{n^6 + 3} = \lim_{n\to\infty}\dfrac{(4/n^6) - 7}{1 + (3/n^6)} = \dfrac{0 - 7}{1 + 0} = -7.$ Sum and Quotient Rules ■

Be cautious in applying Theorem 1. It does not say, for example, that each of the sequences $\{a_n\}$ and $\{b_n\}$ have limits if their sum $\{a_n + b_n\}$ has a limit. For instance, $\{a_n\} = \{1, 2, 3, \ldots\}$ and $\{b_n\} = \{-1, -2, -3, \ldots\}$ both diverge, but their sum $\{a_n + b_n\} = \{0, 0, 0, \ldots\}$ clearly converges to 0.

One consequence of Theorem 1 is that every nonzero multiple of a divergent sequence $\{a_n\}$ diverges. For suppose, to the contrary, that $\{ca_n\}$ converges for some number $c \neq 0$. Then, by taking $k = 1/c$ in the Constant Multiple Rule in Theorem 1, we see that the sequence

$$\left\{\frac{1}{c} \cdot ca_n\right\} = \{a_n\}$$

converges. Thus, $\{ca_n\}$ cannot converge unless $\{a_n\}$ also converges. If $\{a_n\}$ does not converge, then $\{ca_n\}$ does not converge.

The next theorem is the sequence version of the Sandwich Theorem in Section 2.2. You are asked to prove the theorem in Exercise 95.

**THEOREM 2 The Sandwich Theorem for Sequences**

Let $\{a_n\}$, $\{b_n\}$, and $\{c_n\}$ be sequences of real numbers. If $a_n \le b_n \le c_n$ holds for all $n$ beyond some index $N$, and if $\lim_{n\to\infty} a_n = \lim_{n\to\infty} c_n = L$, then $\lim_{n\to\infty} b_n = L$ also.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

An immediate consequence of Theorem 2 is that, if $|b_n| \le c_n$ and $c_n \to 0$, then $b_n \to 0$ because $-c_n \le b_n \le c_n$. We use this fact in the next example.

**EXAMPLE 4** Applying the Sandwich Theorem

Since $1/n \to 0$, we know that

**(a)** $\dfrac{\cos n}{n} \to 0$ because $-\dfrac{1}{n} \le \dfrac{\cos n}{n} \le \dfrac{1}{n}$;

**(b)** $\dfrac{1}{2^n} \to 0$ because $0 \le \dfrac{1}{2^n} \le \dfrac{1}{n}$;

**(c)** $(-1)^n \dfrac{1}{n} \to 0$ because $-\dfrac{1}{n} \le (-1)^n \dfrac{1}{n} \le \dfrac{1}{n}$. ■

The application of Theorems 1 and 2 is broadened by a theorem stating that applying a continuous function to a convergent sequence produces a convergent sequence. We state the theorem without proof (Exercise 96).

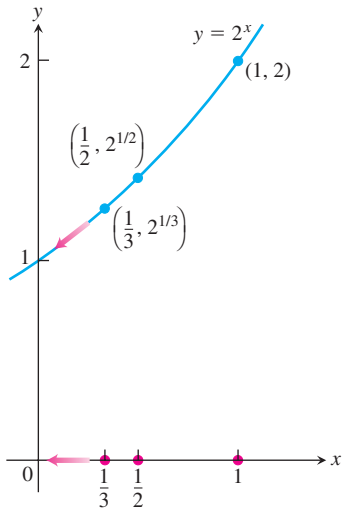

**FIGURE 11.3** As $n \to \infty$, $1/n \to 0$ and $2^{1/n} \to 2^0$ (Example 6).

**THEOREM 3** The Continuous Function Theorem for Sequences

Let $\{a_n\}$ be a sequence of real numbers. If $a_n \to L$ and if $f$ is a function that is continuous at $L$ and defined at all $a_n$, then $f(a_n) \to f(L)$.

**EXAMPLE 5** Applying Theorem 3

Show that $\sqrt{(n+1)/n} \to 1$.

**Solution** We know that $(n+1)/n \to 1$. Taking $f(x) = \sqrt{x}$ and $L = 1$ in Theorem 3 gives $\sqrt{(n+1)/n} \to \sqrt{1} = 1$. ■

**EXAMPLE 6** The Sequence $\{2^{1/n}\}$

The sequence $\{1/n\}$ converges to 0. By taking $a_n = 1/n$, $f(x) = 2^x$, and $L = 0$ in Theorem 3, we see that $2^{1/n} = f(1/n) \to f(L) = 2^0 = 1$. The sequence $\{2^{1/n}\}$ converges to 1 (Figure 11.3). ■

## Using l'Hôpital's Rule

The next theorem enables us to use l'Hôpital's Rule to find the limits of some sequences. It formalizes the connection between $\lim_{n\to\infty} a_n$ and $\lim_{x\to\infty} f(x)$.

**THEOREM 4**

Suppose that $f(x)$ is a function defined for all $x \ge n_0$ and that $\{a_n\}$ is a sequence of real numbers such that $a_n = f(n)$ for $n \ge n_0$. Then

$$\lim_{x\to\infty} f(x) = L \quad \Rightarrow \quad \lim_{n\to\infty} a_n = L.$$

**Proof** Suppose that $\lim_{x\to\infty} f(x) = L$. Then for each positive number $\epsilon$ there is a number $M$ such that for all $x$,

$$x > M \quad \Rightarrow \quad |f(x) - L| < \epsilon.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Let $N$ be an integer greater than $M$ and greater than or equal to $n_0$. Then

$$n > N \quad \Rightarrow \quad a_n = f(n) \quad \text{and} \quad |a_n - L| = |f(n) - L| < \epsilon. \qquad \blacksquare$$

**EXAMPLE 7** Applying L'Hôpital's Rule

Show that

$$\lim_{n\to\infty} \frac{\ln n}{n} = 0.$$

**Solution** The function $(\ln x)/x$ is defined for all $x \geq 1$ and agrees with the given sequence at positive integers. Therefore, by Theorem 5, $\lim_{n\to\infty}(\ln n)/n$ will equal $\lim_{x\to\infty}(\ln x)/x$ if the latter exists. A single application of l'Hôpital's Rule shows that

$$\lim_{x\to\infty} \frac{\ln x}{x} = \lim_{x\to\infty} \frac{1/x}{1} = \frac{0}{1} = 0.$$

We conclude that $\lim_{n\to\infty}(\ln n)/n = 0$. ■

When we use l'Hôpital's Rule to find the limit of a sequence, we often treat $n$ as a continuous real variable and differentiate directly with respect to $n$. This saves us from having to rewrite the formula for $a_n$ as we did in Example 7.

**EXAMPLE 8** Applying L'Hôpital's Rule

Find

$$\lim_{n\to\infty} \frac{2^n}{5n}.$$

**Solution** By l'Hôpital's Rule (differentiating with respect to $n$),

$$\lim_{n\to\infty} \frac{2^n}{5n} = \lim_{n\to\infty} \frac{2^n \cdot \ln 2}{5} = \infty.$$

■

**EXAMPLE 9** Applying L'Hôpital's Rule to Determine Convergence

Does the sequence whose $n$th term is

$$a_n = \left(\frac{n+1}{n-1}\right)^n$$

converge? If so, find $\lim_{n\to\infty} a_n$.

**Solution** The limit leads to the indeterminate form $1^\infty$. We can apply l'Hôpital's Rule if we first change the form to $\infty \cdot 0$ by taking the natural logarithm of $a_n$:

$$\ln a_n = \ln\left(\frac{n+1}{n-1}\right)^n$$

$$= n \ln\left(\frac{n+1}{n-1}\right).$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Then,

$$\lim_{n\to\infty} \ln a_n = \lim_{n\to\infty} n \ln\left(\frac{n+1}{n-1}\right) \qquad \infty \cdot 0$$

$$= \lim_{n\to\infty} \frac{\ln\left(\frac{n+1}{n-1}\right)}{1/n} \qquad \frac{0}{0}$$

$$= \lim_{n\to\infty} \frac{-2/(n^2-1)}{-1/n^2} \qquad \text{l'Hôpital's Rule}$$

$$= \lim_{n\to\infty} \frac{2n^2}{n^2-1} = 2.$$

Since $\ln a_n \to 2$ and $f(x) = e^x$ is continuous, Theorem 4 tells us that

$$a_n = e^{\ln a_n} \to e^2.$$

The sequence $\{a_n\}$ converges to $e^2$. ■

## Commonly Occurring Limits

The next theorem gives some limits that arise frequently.

**THEOREM 5**

The following six sequences converge to the limits listed below:

1. $\lim_{n\to\infty} \frac{\ln n}{n} = 0$
2. $\lim_{n\to\infty} \sqrt[n]{n} = 1$
3. $\lim_{n\to\infty} x^{1/n} = 1 \qquad (x > 0)$
4. $\lim_{n\to\infty} x^n = 0 \qquad (|x| < 1)$
5. $\lim_{n\to\infty} \left(1 + \frac{x}{n}\right)^n = e^x \qquad (\text{any } x)$
6. $\lim_{n\to\infty} \frac{x^n}{n!} = 0 \qquad (\text{any } x)$

In Formulas (3) through (6), $x$ remains fixed as $n \to \infty$.

**Proof** The first limit was computed in Example 7. The next two can be proved by taking logarithms and applying Theorem 4 (Exercises 93 and 94). The remaining proofs are given in Appendix 3. ■

**Factorial Notation**

The notation $n!$ ("$n$ factorial") means the product $1 \cdot 2 \cdot 3 \cdots n$ of the integers from 1 to $n$. Notice that $(n+1)! = (n+1) \cdot n!$. Thus, $4! = 1 \cdot 2 \cdot 3 \cdot 4 = 24$ and $5! = 1 \cdot 2 \cdot 3 \cdot 4 \cdot 5 = 5 \cdot 4! = 120$. We define 0! to be 1. Factorials grow even faster than exponentials, as the table suggests.

| $n$ | $e^n$ (rounded) | $n!$ |
|---|---|---|
| 1 | 3 | 1 |
| 5 | 148 | 120 |
| 10 | 22,026 | 3,628,800 |
| 20 | $4.9 \times 10^8$ | $2.4 \times 10^{18}$ |

**EXAMPLE 10** Applying Theorem 5

**(a)** $\frac{\ln(n^2)}{n} = \frac{2\ln n}{n} \to 2 \cdot 0 = 0$ Formula 1

**(b)** $\sqrt[n]{n^2} = n^{2/n} = (n^{1/n})^2 \to (1)^2 = 1$ Formula 2

**(c)** $\sqrt[n]{3n} = 3^{1/n}(n^{1/n}) \to 1 \cdot 1 = 1$ Formula 3 with $x = 3$ and Formula 2

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**(d)** $\left(-\frac{1}{2}\right)^n \to 0$ Formula 4 with $x = -\frac{1}{2}$

**(e)** $\left(\frac{n-2}{n}\right)^n = \left(1 + \frac{-2}{n}\right)^n \to e^{-2}$ Formula 5 with $x = -2$

**(f)** $\frac{100^n}{n!} \to 0$ Formula 6 with $x = 100$ ■

## Recursive Definitions

So far, we have calculated each $a_n$ directly from the value of $n$. But sequences are often defined **recursively** by giving

1. The value(s) of the initial term or terms, and
2. A rule, called a **recursion formula**, for calculating any later term from terms that precede it.

### EXAMPLE 11 Sequences Constructed Recursively

**(a)** The statements $a_1 = 1$ and $a_n = a_{n-1} + 1$ define the sequence $1, 2, 3, \ldots, n, \ldots$ of positive integers. With $a_1 = 1$, we have $a_2 = a_1 + 1 = 2$, $a_3 = a_2 + 1 = 3$, and so on.

**(b)** The statements $a_1 = 1$ and $a_n = n \cdot a_{n-1}$ define the sequence $1, 2, 6, 24, \ldots, n!, \ldots$ of factorials. With $a_1 = 1$, we have $a_2 = 2 \cdot a_1 = 2$, $a_3 = 3 \cdot a_2 = 6$, $a_4 = 4 \cdot a_3 = 24$, and so on.

**(c)** The statements $a_1 = 1, a_2 = 1$, and $a_{n+1} = a_n + a_{n-1}$ define the sequence $1, 1, 2, 3, 5, \ldots$ of **Fibonacci numbers**. With $a_1 = 1$ and $a_2 = 1$, we have $a_3 = 1 + 1 = 2$, $a_4 = 2 + 1 = 3$, $a_5 = 3 + 2 = 5$, and so on.

**(d)** As we can see by applying Newton's method, the statements $x_0 = 1$ and $x_{n+1} = x_n - [(\sin x_n - x_n^2)/(\cos x_n - 2x_n)]$ define a sequence that converges to a solution of the equation $\sin x - x^2 = 0$. ■

## Bounded Nondecreasing Sequences

The terms of a general sequence can bounce around, sometimes getting larger, sometimes smaller. An important special kind of sequence is one for which each term is at least as large as its predecessor.

**DEFINITION Nondecreasing Sequence**

A sequence $\{a_n\}$ with the property that $a_n \le a_{n+1}$ for all $n$ is called a **nondecreasing sequence**.

### EXAMPLE 12 Nondecreasing Sequences

**(a)** The sequence $1, 2, 3, \ldots, n, \ldots$ of natural numbers

**(b)** The sequence $\frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \ldots, \frac{n}{n+1}, \ldots$

**(c)** The constant sequence $\{3\}$ ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

There are two kinds of nondecreasing sequences—those whose terms increase beyond any finite bound and those whose terms do not.

**DEFINITIONS Bounded, Upper Bound, Least Upper Bound**

A sequence $\{a_n\}$ is **bounded from above** if there exists a number $M$ such that $a_n \le M$ for all $n$. The number $M$ is an **upper bound** for $\{a_n\}$. If $M$ is an upper bound for $\{a_n\}$ but no number less than $M$ is an upper bound for $\{a_n\}$, then $M$ is the **least upper bound** for $\{a_n\}$.

**EXAMPLE 13** Applying the Definition for Boundedness

**(a)** The sequence $1, 2, 3, \ldots, n, \ldots$ has no upper bound.

**(b)** The sequence $\frac{1}{2}, \frac{2}{3}, \frac{3}{4}, \ldots, \frac{n}{n+1}, \ldots$ is bounded above by $M = 1$.

No number less than 1 is an upper bound for the sequence, so 1 is the least upper bound (Exercise 113). ■

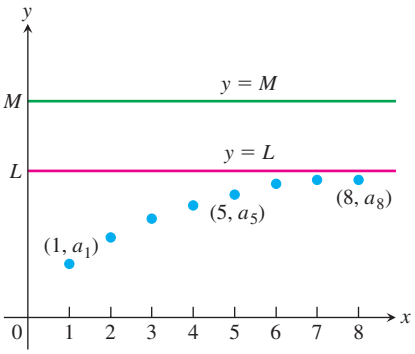

**FIGURE 11.4** If the terms of a nondecreasing sequence have an upper bound $M$, they have a limit $L \le M$.

A nondecreasing sequence that is bounded from above always has a least upper bound. This is the completeness property of the real numbers, discussed in Appendix 4. We will prove that if $L$ is the least upper bound then the sequence converges to $L$.

Suppose we plot the points $(1, a_1), (2, a_2), \ldots, (n, a_n), \ldots$ in the $xy$-plane. If $M$ is an upper bound of the sequence, all these points will lie on or below the line $y = M$ (Figure 11.4). The line $y = L$ is the lowest such line. None of the points $(n, a_n)$ lies above $y = L$, but some do lie above any lower line $y = L - \epsilon$, if $\epsilon$ is a positive number. The sequence converges to $L$ because

**(a)** $a_n \le L$ for *all* values of $n$ and

**(b)** given any $\epsilon > 0$, there exists at least one integer $N$ for which $a_N > L - \epsilon$.

The fact that $\{a_n\}$ is nondecreasing tells us further that

$$a_n \ge a_N > L - \epsilon \qquad \text{for all } n \ge N.$$

Thus, *all* the numbers $a_n$ beyond the $N$th number lie within $\epsilon$ of $L$. This is precisely the condition for $L$ to be the limit of the sequence $\{a_n\}$.

The facts for nondecreasing sequences are summarized in the following theorem. A similar result holds for nonincreasing sequences (Exercise 107).

**THEOREM 6 The Nondecreasing Sequence Theorem**

A nondecreasing sequence of real numbers converges if and only if it is bounded from above. If a nondecreasing sequence converges, it converges to its least upper bound.

Theorem 6 implies that a nondecreasing sequence converges when it is bounded from above. It diverges to infinity if it is not bounded from above.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# EXERCISES 11.1

## Finding Terms of a Sequence

Each of Exercises 1–6 gives a formula for the $n$th term $a_n$ of a sequence $\{a_n\}$. Find the values of $a_1$, $a_2$, $a_3$, and $a_4$.

**1.** $a_n = \dfrac{1 - n}{n^2}$

**2.** $a_n = \dfrac{1}{n!}$

**3.** $a_n = \dfrac{(-1)^{n+1}}{2n - 1}$

**4.** $a_n = 2 + (-1)^n$

**5.** $a_n = \dfrac{2^n}{2^{n+1}}$

**6.** $a_n = \dfrac{2^n - 1}{2^n}$

Each of Exercises 7–12 gives the first term or two of a sequence along with a recursion formula for the remaining terms. Write out the first ten terms of the sequence.

**7.** $a_1 = 1, \quad a_{n+1} = a_n + (1/2^n)$

**8.** $a_1 = 1, \quad a_{n+1} = a_n/(n + 1)$

**9.** $a_1 = 2, \quad a_{n+1} = (-1)^{n+1}a_n/2$

**10.** $a_1 = -2, \quad a_{n+1} = na_n/(n + 1)$

**11.** $a_1 = a_2 = 1, \quad a_{n+2} = a_{n+1} + a_n$

**12.** $a_1 = 2, \quad a_2 = -1, \quad a_{n+2} = a_{n+1}/a_n$

## Finding a Sequence's Formula

In Exercises 13–22, find a formula for the $n$th term of the sequence.

**13.** The sequence $1, -1, 1, -1, 1, \ldots$ — 1's with alternating signs

**14.** The sequence $-1, 1, -1, 1, -1, \ldots$ — 1's with alternating signs

**15.** The sequence $1, -4, 9, -16, 25, \ldots$ — Squares of the positive integers; with alternating signs

**16.** The sequence $1, -\frac{1}{4}, \frac{1}{9}, -\frac{1}{16}, \frac{1}{25}, \ldots$ — Reciprocals of squares of the positive integers, with alternating signs

**17.** The sequence $0, 3, 8, 15, 24, \ldots$ — Squares of the positive integers diminished by 1

**18.** The sequence $-3, -2, -1, 0, 1, \ldots$ — Integers beginning with $-3$

**19.** The sequence $1, 5, 9, 13, 17, \ldots$ — Every other odd positive integer

**20.** The sequence $2, 6, 10, 14, 18, \ldots$ — Every other even positive integer

**21.** The sequence $1, 0, 1, 0, 1, \ldots$ — Alternating 1's and 0's

**22.** The sequence $0, 1, 1, 2, 2, 3, 3, 4, \ldots$ — Each positive integer repeated

## Finding Limits

Which of the sequences $\{a_n\}$ in Exercises 23–84 converge, and which diverge? Find the limit of each convergent sequence.

**23.** $a_n = 2 + (0.1)^n$

**24.** $a_n = \dfrac{n + (-1)^n}{n}$

**25.** $a_n = \dfrac{1 - 2n}{1 + 2n}$

**26.** $a_n = \dfrac{2n + 1}{1 - 3\sqrt{n}}$

**27.** $a_n = \dfrac{1 - 5n^4}{n^4 + 8n^3}$

**28.** $a_n = \dfrac{n + 3}{n^2 + 5n + 6}$

**29.** $a_n = \dfrac{n^2 - 2n + 1}{n - 1}$

**30.** $a_n = \dfrac{1 - n^3}{70 - 4n^2}$

**31.** $a_n = 1 + (-1)^n$

**32.** $a_n = (-1)^n\left(1 - \dfrac{1}{n}\right)$

**33.** $a_n = \left(\dfrac{n + 1}{2n}\right)\left(1 - \dfrac{1}{n}\right)$

**34.** $a_n = \left(2 - \dfrac{1}{2^n}\right)\left(3 + \dfrac{1}{2^n}\right)$

**35.** $a_n = \dfrac{(-1)^{n+1}}{2n - 1}$

**36.** $a_n = \left(-\dfrac{1}{2}\right)^n$

**37.** $a_n = \sqrt{\dfrac{2n}{n + 1}}$

**38.** $a_n = \dfrac{1}{(0.9)^n}$

**39.** $a_n = \sin\left(\dfrac{\pi}{2} + \dfrac{1}{n}\right)$

**40.** $a_n = n\pi \cos(n\pi)$

**41.** $a_n = \dfrac{\sin n}{n}$

**42.** $a_n = \dfrac{\sin^2 n}{2^n}$

**43.** $a_n = \dfrac{n}{2^n}$

**44.** $a_n = \dfrac{3^n}{n^3}$

**45.** $a_n = \dfrac{\ln(n + 1)}{\sqrt{n}}$

**46.** $a_n = \dfrac{\ln n}{\ln 2n}$

**47.** $a_n = 8^{1/n}$

**48.** $a_n = (0.03)^{1/n}$

**49.** $a_n = \left(1 + \dfrac{7}{n}\right)^n$

**50.** $a_n = \left(1 - \dfrac{1}{n}\right)^n$

**51.** $a_n = \sqrt[n]{10n}$

**52.** $a_n = \sqrt[n]{n^2}$

**53.** $a_n = \left(\dfrac{3}{n}\right)^{1/n}$

**54.** $a_n = (n + 4)^{1/(n+4)}$

**55.** $a_n = \dfrac{\ln n}{n^{1/n}}$

**56.** $a_n = \ln n - \ln(n + 1)$

**57.** $a_n = \sqrt[n]{4^n n}$

**58.** $a_n = \sqrt[n]{3^{2n+1}}$

**59.** $a_n = \dfrac{n!}{n^n}$ (*Hint:* Compare with $1/n$.)

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

**60.** $a_n = \dfrac{(-4)^n}{n!}$

**61.** $a_n = \dfrac{n!}{10^{6n}}$

**62.** $a_n = \dfrac{n!}{2^n \cdot 3^n}$

**63.** $a_n = \left(\dfrac{1}{n}\right)^{1/(\ln n)}$

**64.** $a_n = \ln\left(1 + \dfrac{1}{n}\right)^n$

**65.** $a_n = \left(\dfrac{3n+1}{3n-1}\right)^n$

**66.** $a_n = \left(\dfrac{n}{n+1}\right)^n$

**67.** $a_n = \left(\dfrac{x^n}{2n+1}\right)^{1/n}, \quad x > 0$

**68.** $a_n = \left(1 - \dfrac{1}{n^2}\right)^n$

**69.** $a_n = \dfrac{3^n \cdot 6^n}{2^{-n} \cdot n!}$

**70.** $a_n = \dfrac{(10/11)^n}{(9/10)^n + (11/12)^n}$

**71.** $a_n = \tanh n$

**72.** $a_n = \sinh(\ln n)$

**73.** $a_n = \dfrac{n^2}{2n-1}\sin\dfrac{1}{n}$

**74.** $a_n = n\left(1 - \cos\dfrac{1}{n}\right)$

**75.** $a_n = \tan^{-1} n$

**76.** $a_n = \dfrac{1}{\sqrt{n}}\tan^{-1} n$

**77.** $a_n = \left(\dfrac{1}{3}\right)^n + \dfrac{1}{\sqrt{2^n}}$

**78.** $a_n = \sqrt[n]{n^2 + n}$

**79.** $a_n = \dfrac{(\ln n)^{200}}{n}$

**80.** $a_n = \dfrac{(\ln n)^5}{\sqrt{n}}$

**81.** $a_n = n - \sqrt{n^2 - n}$

**82.** $a_n = \dfrac{1}{\sqrt{n^2-1} - \sqrt{n^2+n}}$

**83.** $a_n = \dfrac{1}{n}\displaystyle\int_1^n \frac{1}{x}\,dx$

**84.** $a_n = \displaystyle\int_1^n \frac{1}{x^p}\,dx, \quad p > 1$

## Theory and Examples

**85.** The first term of a sequence is $x_1 = 1$. Each succeeding term is the sum of all those that come before it:

$$x_{n+1} = x_1 + x_2 + \cdots + x_n.$$

Write out enough early terms of the sequence to deduce a general formula for $x_n$ that holds for $n \geq 2$.

**86.** A sequence of rational numbers is described as follows:

$$\frac{1}{1}, \frac{3}{2}, \frac{7}{5}, \frac{17}{12}, \ldots, \frac{a}{b}, \frac{a+2b}{a+b}, \ldots.$$

Here the numerators form one sequence, the denominators form a second sequence, and their ratios form a third sequence. Let $x_n$ and $y_n$ be, respectively, the numerator and the denominator of the $n$th fraction $r_n = x_n/y_n$.

**a.** Verify that $x_1^2 - 2y_1^2 = -1, x_2^2 - 2y_2^2 = +1$ and, more generally, that if $a^2 - 2b^2 = -1$ or $+1$, then

$$(a+2b)^2 - 2(a+b)^2 = +1 \quad \text{or} \quad -1,$$

respectively.

**b.** The fractions $r_n = x_n/y_n$ approach a limit as $n$ increases. What is that limit? (*Hint:* Use part (a) to show that $r_n^2 - 2 = \pm(1/y_n)^2$ and that $y_n$ is not less than $n$.)

**87. Newton's method** The following sequences come from the recursion formula for Newton's method,

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}.$$

Do the sequences converge? If so, to what value? In each case, begin by identifying the function $f$ that generates the sequence.

**a.** $x_0 = 1, \quad x_{n+1} = x_n - \dfrac{x_n^2 - 2}{2x_n} = \dfrac{x_n}{2} + \dfrac{1}{x_n}$

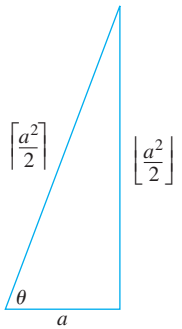
**b.** $x_0 = 1, \quad x_{n+1} = x_n - \dfrac{\tan x_n - 1}{\sec^2 x_n}$

**c.** $x_0 = 1, \quad x_{n+1} = x_n - 1$

**88. a.** Suppose that $f(x)$ is differentiable for all $x$ in $[0, 1]$ and that $f(0) = 0$. Define the sequence $\{a_n\}$ by the rule $a_n = nf(1/n)$. Show that $\lim_{n\to\infty} a_n = f'(0)$.

Use the result in part (a) to find the limits of the following sequences $\{a_n\}$.

**b.** $a_n = n\tan^{-1}\dfrac{1}{n}$



**c.** $a_n = n(e^{1/n} - 1)$

**d.** $a_n = n\ln\left(1 + \dfrac{2}{n}\right)$

**89. Pythagorean triples** A triple of positive integers $a$, $b$, and $c$ is called a **Pythagorean triple** if $a^2 + b^2 = c^2$. Let $a$ be an odd positive integer and let

$$b = \left\lfloor \frac{a^2}{2} \right\rfloor \quad \text{and} \quad c = \left\lceil \frac{a^2}{2} \right\rceil$$

be, respectively, the integer floor and ceiling for $a^2/2$.

**a.** Show that $a^2 + b^2 = c^2$. (*Hint:* Let $a = 2n + 1$ and express $b$ and $c$ in terms of $n$.)

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**b.** By direct calculation, or by appealing to the figure here, find

$$\lim_{a\to\infty} \frac{\left\lfloor \frac{a^2}{2} \right\rfloor}{\left\lceil \frac{a^2}{2} \right\rceil}.$$

**90. The *n*th root of *n*!**

**a.** Show that $\lim_{n\to\infty}(2n\pi)^{1/(2n)} = 1$ and hence, using Stirling's approximation (Chapter 8, Additional Exercise 50a), that

$$\sqrt[n]{n!} \approx \frac{n}{e} \quad \text{for large values of } n.$$

T **b.** Test the approximation in part (a) for $n = 40, 50, 60, \ldots$, as far as your calculator will allow.

**91. a.** Assuming that $\lim_{n\to\infty}(1/n^c) = 0$ if $c$ is any positive constant, show that

$$\lim_{n\to\infty} \frac{\ln n}{n^c} = 0$$

if $c$ is any positive constant.

**b.** Prove that $\lim_{n\to\infty}(1/n^c) = 0$ if $c$ is any positive constant. (*Hint:* If $\epsilon = 0.001$ and $c = 0.04$, how large should $N$ be to ensure that $|1/n^c - 0| < \epsilon$ if $n > N$?)

**92. The zipper theorem** Prove the "zipper theorem" for sequences: If $\{a_n\}$ and $\{b_n\}$ both converge to $L$, then the sequence

$$a_1, b_1, a_2, b_2, \ldots, a_n, b_n, \ldots$$

converges to $L$.

**93.** Prove that $\lim_{n\to\infty}\sqrt[n]{n} = 1$.

**94.** Prove that $\lim_{n\to\infty} x^{1/n} = 1, (x > 0)$.

**95.** Prove Theorem 2. **96.** Prove Theorem 3.

In Exercises 97–100, determine if the sequence is nondecreasing and if it is bounded from above.

**97.** $a_n = \dfrac{3n+1}{n+1}$ **98.** $a_n = \dfrac{(2n+3)!}{(n+1)!}$

**99.** $a_n = \dfrac{2^n 3^n}{n!}$ **100.** $a_n = 2 - \dfrac{2}{n} - \dfrac{1}{2^n}$

Which of the sequences in Exercises 101–106 converge, and which diverge? Give reasons for your answers.

**101.** $a_n = 1 - \dfrac{1}{n}$ **102.** $a_n = n - \dfrac{1}{n}$

**103.** $a_n = \dfrac{2^n - 1}{2^n}$ **104.** $a_n = \dfrac{2^n - 1}{3^n}$

**105.** $a_n = ((-1)^n + 1)\left(\dfrac{n+1}{n}\right)$

**106.** The first term of a sequence is $x_1 = \cos(1)$. The next terms are $x_2 = x_1$ or $\cos(2)$, whichever is larger; and $x_3 = x_2$ or $\cos(3)$, whichever is larger (farther to the right). In general,

$$x_{n+1} = \max\{x_n, \cos(n+1)\}.$$

**107. Nonincreasing sequences** A sequence of numbers $\{a_n\}$ in which $a_n \geq a_{n+1}$ for every $n$ is called a **nonincreasing sequence**. A sequence $\{a_n\}$ is **bounded from below** if there is a number $M$ with $M \leq a_n$ for every $n$. Such a number $M$ is called a **lower bound** for the sequence. Deduce from Theorem 6 that a nonincreasing sequence that is bounded from below converges and that a nonincreasing sequence that is not bounded from below diverges.

(*Continuation of Exercise 107.*) Using the conclusion of Exercise 107, determine which of the sequences in Exercises 108–112 converge and which diverge.

**108.** $a_n = \dfrac{n+1}{n}$ **109.** $a_n = \dfrac{1+\sqrt{2n}}{\sqrt{n}}$

**110.** $a_n = \dfrac{1-4^n}{2^n}$ **111.** $a_n = \dfrac{4^{n+1}+3^n}{4^n}$

**112.** $a_1 = 1, \quad a_{n+1} = 2a_n - 3$

**113. The sequence $\{n/(n+1)\}$ has a least upper bound of 1** Show that if $M$ is a number less than 1, then the terms of $\{n/(n+1)\}$ eventually exceed $M$. That is, if $M < 1$ there is an integer $N$ such that $n/(n+1) > M$ whenever $n > N$. Since $n/(n+1) < 1$ for every $n$, this proves that 1 is a least upper bound for $\{n/(n+1)\}$.

**114. Uniqueness of least upper bounds** Show that if $M_1$ and $M_2$ are least upper bounds for the sequence $\{a_n\}$, then $M_1 = M_2$. That is, a sequence cannot have two different least upper bounds.

**115.** Is it true that a sequence $\{a_n\}$ of positive numbers must converge if it is bounded from above? Give reasons for your answer.

**116.** Prove that if $\{a_n\}$ is a convergent sequence, then to every positive number $\epsilon$ there corresponds an integer $N$ such that for all $m$ and $n$,

$$m > N \quad \text{and} \quad n > N \quad \Rightarrow \quad |a_m - a_n| < \epsilon.$$

**117. Uniqueness of limits** Prove that limits of sequences are unique. That is, show that if $L_1$ and $L_2$ are numbers such that $a_n \to L_1$ and $a_n \to L_2$, then $L_1 = L_2$.

**118. Limits and subsequences** If the terms of one sequence appear in another sequence in their given order, we call the first sequence a **subsequence** of the second. Prove that if two subsequences of a sequence $\{a_n\}$ have different limits $L_1 \neq L_2$, then $\{a_n\}$ diverges.

**119.** For a sequence $\{a_n\}$ the terms of even index are denoted by $a_{2k}$ and the terms of odd index by $a_{2k+1}$. Prove that if $a_{2k} \to L$ and $a_{2k+1} \to L$, then $a_n \to L$.

**120.** Prove that a sequence $\{a_n\}$ converges to 0 if and only if the sequence of absolute values $\{|a_n|\}$ converges to 0.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

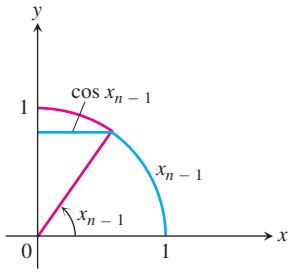
## T Calculator Explorations of Limits

In Exercises 121–124, experiment with a calculator to find a value of $N$ that will make the inequality hold for all $n > N$. Assuming that the inequality is the one from the formal definition of the limit of a sequence, what sequence is being considered in each case and what is its limit?

**121.** $|\sqrt[n]{0.5} - 1| < 10^{-3}$ **122.** $|\sqrt[n]{n} - 1| < 10^{-3}$

**123.** $(0.9)^n < 10^{-3}$ **124.** $2^n/n! < 10^{-7}$

**125. Sequences generated by Newton's method** Newton's method, applied to a differentiable function $f(x)$, begins with a starting value $x_0$ and constructs from it a sequence of numbers $\{x_n\}$ that under favorable circumstances converges to a zero of $f$. The recursion formula for the sequence is



$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}.$$

**a.** Show that the recursion formula for $f(x) = x^2 - a, a > 0$, can be written as $x_{n+1} = (x_n + a/x_n)/2$.

**b.** Starting with $x_0 = 1$ and $a = 3$, calculate successive terms of the sequence until the display begins to repeat. What number is being approximated? Explain.

**126.** (*Continuation of Exercise 125.*) Repeat part (b) of Exercise 125 with $a = 2$ in place of $a = 3$.

**127. A recursive definition of $\pi/2$** If you start with $x_1 = 1$ and define the subsequent terms of $\{x_n\}$ by the rule $x_n = x_{n-1} + \cos x_{n-1}$, you generate a sequence that converges rapidly to $\pi/2$. **a.** Try it. **b.** Use the accompanying figure to explain why the convergence is so rapid.

**128.** According to a front-page article in the December 15, 1992, issue of the *Wall Street Journal*, Ford Motor Company used about $7\frac{1}{4}$ hours of labor to produce stampings for the average vehicle, down from an estimated 15 hours in 1980. The Japanese needed only about $3\frac{1}{2}$ hours.

Ford's improvement since 1980 represents an average decrease of 6% per year. If that rate continues, then $n$ years from 1992 Ford will use about

$$S_n = 7.25(0.94)^n$$

hours of labor to produce stampings for the average vehicle. Assuming that the Japanese continue to spend $3\frac{1}{2}$ hours per vehicle, how many more years will it take Ford to catch up? Find out two ways:

**a.** Find the first term of the sequence $\{S_n\}$ that is less than or equal to 3.5.

T **b.** Graph $f(x) = 7.25(0.94)^x$ and use Trace to find where the graph crosses the line $y = 3.5$.

### COMPUTER EXPLORATIONS

Use a CAS to perform the following steps for the sequences in Exercises 129–140.

**a.** Calculate and then plot the first 25 terms of the sequence. Does the sequence appear to be bounded from above or below? Does it appear to converge or diverge? If it does converge, what is the limit $L$?

**b.** If the sequence converges, find an integer $N$ such that $|a_n - L| \le 0.01$ for $n \ge N$. How far in the sequence do you have to get for the terms to lie within 0.0001 of $L$?

**129.** $a_n = \sqrt[n]{n}$ **130.** $a_n = \left(1 + \frac{0.5}{n}\right)^n$

**131.** $a_1 = 1, \quad a_{n+1} = a_n + \frac{1}{5^n}$

**132.** $a_1 = 1, \quad a_{n+1} = a_n + (-2)^n$

**133.** $a_n = \sin n$ **134.** $a_n = n \sin \frac{1}{n}$

**135.** $a_n = \frac{\sin n}{n}$ **136.** $a_n = \frac{\ln n}{n}$

**137.** $a_n = (0.9999)^n$ **138.** $a_n = 123456^{1/n}$

**139.** $a_n = \frac{8^n}{n!}$ **140.** $a_n = \frac{n^{41}}{19^n}$

**141. Compound interest, deposits, and withdrawals** If you invest an amount of money $A_0$ at a fixed annual interest rate $r$ compounded $m$ times per year, and if the constant amount $b$ is added to the account at the end of each compounding period (or taken from the account if $b < 0$), then the amount you have after $n + 1$ compounding periods is

$$A_{n+1} = \left(1 + \frac{r}{m}\right)A_n + b. \qquad (1)$$

**a.** If $A_0 = 1000, r = 0.02015, m = 12$, and $b = 50$, calculate and plot the first 100 points $(n, A_n)$. How much money is in your account at the end of 5 years? Does $\{A_n\}$ converge? Is $\{A_n\}$ bounded?

**b.** Repeat part (a) with $A_0 = 5000, r = 0.0589, m = 12$, and $b = -50$.

**c.** If you invest 5000 dollars in a certificate of deposit (CD) that pays 4.5% annually, compounded quarterly, and you make no further investments in the CD, approximately how many years will it take before you have 20,000 dollars? What if the CD earns 6.25%?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**d.** It can be shown that for any $k \geq 0$, the sequence defined recursively by Equation (1) satisfies the relation

$$A_k = \left(1 + \frac{r}{m}\right)^k \left(A_0 + \frac{mb}{r}\right) - \frac{mb}{r}. \tag{2}$$

For the values of the constants $A_0$, $r$, $m$, and $b$ given in part (a), validate this assertion by comparing the values of the first 50 terms of both sequences. Then show by direct substitution that the terms in Equation (2) satisfy the recursion formula in Equation (1).

**142. Logistic difference equation** The recursive relation

$$a_{n+1} = ra_n(1 - a_n)$$

is called the *logistic difference equation*, and when the initial value $a_0$ is given the equation defines the *logistic sequence* $\{a_n\}$. Throughout this exercise we choose $a_0$ in the interval $0 < a_0 < 1$, say $a_0 = 0.3$.

**a.** Choose $r = 3/4$. Calculate and plot the points $(n, a_n)$ for the first 100 terms in the sequence. Does it appear to converge? What do you guess is the limit? Does the limit seem to depend on your choice of $a_0$?

**b.** Choose several values of $r$ in the interval $1 < r < 3$ and repeat the procedures in part (a). Be sure to choose some points near the endpoints of the interval. Describe the behavior of the sequences you observe in your plots.

**c.** Now examine the behavior of the sequence for values of $r$ near the endpoints of the interval $3 < r < 3.45$. The transition value $r = 3$ is called a **bifurcation value** and the new behavior of the sequence in the interval is called an **attracting 2-cycle**. Explain why this reasonably describes the behavior.

**d.** Next explore the behavior for $r$ values near the endpoints of each of the intervals $3.45 < r < 3.54$ and $3.54 < r < 3.55$. Plot the first 200 terms of the sequences. Describe in your own words the behavior observed in your plots for each interval. Among how many values does the sequence appear to oscillate for each interval? The values $r = 3.45$ and $r = 3.54$ (rounded to two decimal places) are also called bifurcation values because the behavior of the sequence changes as $r$ crosses over those values.

**e.** The situation gets even more interesting. There is actually an increasing sequence of bifurcation values $3 < 3.45 < 3.54 < \cdots < c_n < c_{n+1} \cdots$ such that for $c_n < r < c_{n+1}$ the logistic sequence $\{a_n\}$ eventually oscillates steadily among $2^n$ values, called an **attracting $2^n$-cycle**. Moreover, the bifurcation sequence $\{c_n\}$ is bounded above by 3.57 (so it converges). If you choose a value of $r < 3.57$ you will observe a $2^n$-cycle of some sort. Choose $r = 3.5695$ and plot 300 points.

**f.** Let us see what happens when $r > 3.57$. Choose $r = 3.65$ and calculate and plot the first 300 terms of $\{a_n\}$. Observe how the terms wander around in an unpredictable, chaotic fashion. You cannot predict the value of $a_{n+1}$ from previous values of the sequence.

**g.** For $r = 3.65$ choose two starting values of $a_0$ that are close together, say, $a_0 = 0.3$ and $a_0 = 0.301$. Calculate and plot the first 300 values of the sequences determined by each starting value. Compare the behaviors observed in your plots. How far out do you go before the corresponding terms of your two sequences appear to depart from each other? Repeat the exploration for $r = 3.75$. Can you see how the plots look different depending on your choice of $a_0$? We say that the logistic sequence is *sensitive to the initial condition* $a_0$.

# 11.2 Infinite Series

An *infinite series* is the sum of an infinite sequence of numbers

$$a_1 + a_2 + a_3 + \cdots + a_n + \cdots$$

The goal of this section is to understand the meaning of such an infinite sum and to develop methods to calculate it. Since there are infinitely many terms to add in an infinite series, we cannot just keep adding to see what comes out. Instead we look at what we get by summing the first $n$ terms of the sequence and stopping. The sum of the first $n$ terms

$$s_n = a_1 + a_2 + a_3 + \cdots + a_n$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

is an ordinary finite sum and can be calculated by normal addition. It is called the *nth partial sum*. As $n$ gets larger, we expect the partial sums to get closer and closer to a limiting value in the same sense that the terms of a sequence approach a limit, as discussed in Section 11.1.

For example, to assign meaning to an expression like

$$1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \frac{1}{16} + \cdots$$

We add the terms one at a time from the beginning and look for a pattern in how these partial sums grow.

| Partial sum | | Suggestive expression for partial sum | Value |
|---|---|---|---|
| First: | $s_1 = 1$ | $2 - 1$ | $1$ |
| Second: | $s_2 = 1 + \frac{1}{2}$ | $2 - \frac{1}{2}$ | $\frac{3}{2}$ |
| Third: | $s_3 = 1 + \frac{1}{2} + \frac{1}{4}$ | $2 - \frac{1}{4}$ | $\frac{7}{4}$ |
| $\vdots$ | $\vdots$ | $\vdots$ | $\vdots$ |
| $n$th: | $s_n = 1 + \frac{1}{2} + \frac{1}{4} + \cdots + \frac{1}{2^{n-1}}$ | $2 - \frac{1}{2^{n-1}}$ | $\frac{2^n - 1}{2^{n-1}}$ |

Indeed there is a pattern. The partial sums form a sequence whose $n$th term is

$$s_n = 2 - \frac{1}{2^{n-1}}.$$

This sequence of partial sums converges to 2 because $\lim_{n\to\infty}(1/2^n) = 0$. We say

$$\text{“the sum of the infinite series } 1 + \frac{1}{2} + \frac{1}{4} + \cdots + \frac{1}{2^{n-1}} + \cdots \text{ is 2.”}$$

Is the sum of any finite number of terms in this series equal to 2? No. Can we actually add an infinite number of terms one by one? No. But we can still define their sum by defining it to be the limit of the sequence of partial sums as $n \to \infty$, in this case 2 (Figure 11.5). Our knowledge of sequences and limits enables us to break away from the confines of finite sums.

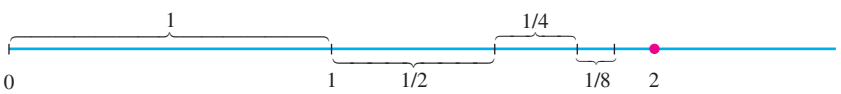

**FIGURE 11.5** As the lengths $1, \frac{1}{2}, \frac{1}{4}, \frac{1}{8}, \ldots$ are added one by one, the sum approaches 2.

HISTORICAL BIOGRAPHY

Blaise Pascal
(1623–1662)

**DEFINITIONS Infinite Series, *n*th Term, Partial Sum, Converges, Sum**

Given a sequence of numbers $\{a_n\}$, an expression of the form

$$a_1 + a_2 + a_3 + \cdots + a_n + \cdots$$

is an **infinite series**. The number $a_n$ is the ***n*th term** of the series. The sequence $\{s_n\}$ defined by

$$\begin{aligned} s_1 &= a_1 \\ s_2 &= a_1 + a_2 \\ &\vdots \\ s_n &= a_1 + a_2 + \cdots + a_n = \sum_{k=1}^{n} a_k \\ &\vdots \end{aligned}$$

is the **sequence of partial sums** of the series, the number $s_n$ being the ***n*th partial sum**. If the sequence of partial sums converges to a limit $L$, we say that the series **converges** and that its **sum** is $L$. In this case, we also write

$$a_1 + a_2 + \cdots + a_n + \cdots = \sum_{n=1}^{\infty} a_n = L.$$

If the sequence of partial sums of the series does not converge, we say that the series **diverges**.

When we begin to study a given series $a_1 + a_2 + \cdots + a_n + \cdots$, we might not know whether it converges or diverges. In either case, it is convenient to use sigma notation to write the series as

$$\sum_{n=1}^{\infty} a_n, \qquad \sum_{k=1}^{\infty} a_k, \qquad \text{or} \qquad \sum a_n$$

A useful shorthand when summation from 1 to $\infty$ is understood

## Geometric Series

**Geometric series** are series of the form

$$a + ar + ar^2 + \cdots + ar^{n-1} + \cdots = \sum_{n=1}^{\infty} ar^{n-1}$$

in which $a$ and $r$ are fixed real numbers and $a \neq 0$. The series can also be written as $\sum_{n=0}^{\infty} ar^n$. The **ratio** $r$ can be positive, as in

$$1 + \frac{1}{2} + \frac{1}{4} + \cdots + \left(\frac{1}{2}\right)^{n-1} + \cdots,$$

or negative, as in

$$1 - \frac{1}{3} + \frac{1}{9} - \cdots + \left(-\frac{1}{3}\right)^{n-1} + \cdots.$$

If $r = 1$, the $n$th partial sum of the geometric series is

$$s_n = a + a(1) + a(1)^2 + \cdots + a(1)^{n-1} = na,$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

and the series diverges because $\lim_{n\to\infty} s_n = \pm\infty$, depending on the sign of $a$. If $r = -1$, the series diverges because the $n$th partial sums alternate between $a$ and 0. If $|r| \neq 1$, we can determine the convergence or divergence of the series in the following way:

$$\begin{aligned} s_n &= a + ar + ar^2 + \cdots + ar^{n-1} \\ rs_n &= ar + ar^2 + \cdots + ar^{n-1} + ar^n \qquad \text{Multiply } s_n \text{ by } r. \\ s_n - rs_n &= a - ar^n \qquad \text{Subtract } rs_n \text{ from } s_n. \text{ Most of the terms on the right cancel.} \\ s_n(1 - r) &= a(1 - r^n) \qquad \text{Factor.} \\ s_n &= \frac{a(1 - r^n)}{1 - r}, \qquad (r \neq 1). \qquad \text{We can solve for } s_n \text{ if } r \neq 1. \end{aligned}$$

If $|r| < 1$, then $r^n \to 0$ as $n \to \infty$ (as in Section 11.1) and $s_n \to a/(1 - r)$. If $|r| > 1$, then $|r^n| \to \infty$ and the series diverges.

If $|r| < 1$, the geometric series $a + ar + ar^2 + \cdots + ar^{n-1} + \cdots$ converges to $a/(1 - r)$:

$$\sum_{n=1}^{\infty} ar^{n-1} = \frac{a}{1 - r}, \qquad |r| < 1.$$

If $|r| \geq 1$, the series diverges.

We have determined when a geometric series converges or diverges, and to what value. Often we can determine that a series converges without knowing the value to which it converges, as we will see in the next several sections. The formula $a/(1 - r)$ for the sum of a geometric series applies *only* when the summation index begins with $n = 1$ in the expression $\sum_{n=1}^{\infty} ar^{n-1}$ (or with the index $n = 0$ if we write the series as $\sum_{n=0}^{\infty} ar^n$).

**EXAMPLE 1** Index Starts with $n = 1$

The geometric series with $a = 1/9$ and $r = 1/3$ is

$$\frac{1}{9} + \frac{1}{27} + \frac{1}{81} + \cdots = \sum_{n=1}^{\infty} \frac{1}{9}\left(\frac{1}{3}\right)^{n-1} = \frac{1/9}{1 - (1/3)} = \frac{1}{6}.$$

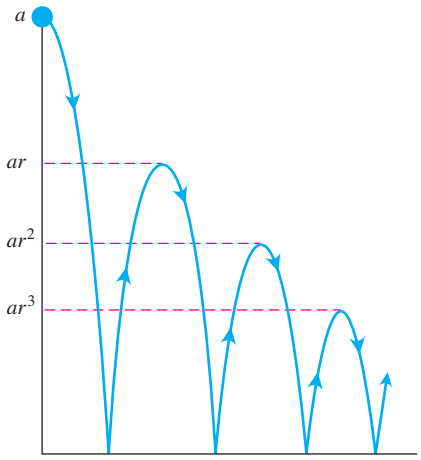
■

**EXAMPLE 2** Index Starts with $n = 0$

The series

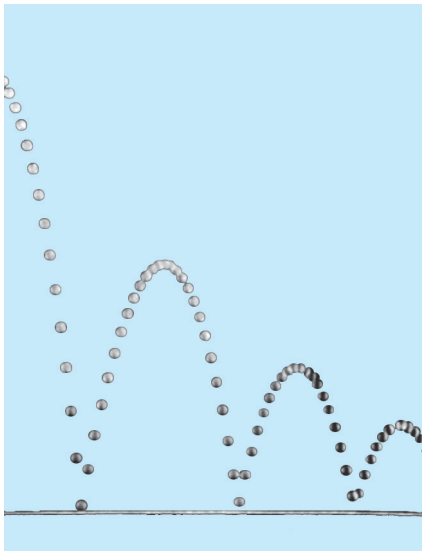
$$\sum_{n=0}^{\infty} \frac{(-1)^n 5}{4^n} = 5 - \frac{5}{4} + \frac{5}{16} - \frac{5}{64} + \cdots$$

is a geometric series with $a = 5$ and $r = -1/4$. It converges to



$$\frac{a}{1 - r} = \frac{5}{1 + (1/4)} = 4.$$

■



**EXAMPLE 3** A Bouncing Ball

You drop a ball from $a$ meters above a flat surface. Each time the ball hits the surface after falling a distance $h$, it rebounds a distance $rh$, where $r$ is positive but less than 1. Find the total distance the ball travels up and down (Figure 11.6).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(a)

(b)

**FIGURE 11.6** (a) Example 3 shows how to use a geometric series to calculate the total vertical distance traveled by a bouncing ball if the height of each rebound is reduced by the factor $r$. (b) A stroboscopic photo of a bouncing ball.

**Solution** The total distance is

$$s = a + \underbrace{2ar + 2ar^2 + 2ar^3 + \cdots}_{\text{This sum is } 2ar/(1-r).} = a + \frac{2ar}{1-r} = a\frac{1+r}{1-r}.$$

If $a = 6$ m and $r = 2/3$, for instance, the distance is

$$s = 6\frac{1 + (2/3)}{1 - (2/3)} = 6\left(\frac{5/3}{1/3}\right) = 30 \text{ m}. \quad \blacksquare$$

## EXAMPLE 4 Repeating Decimals

Express the repeating decimal 5.232323 . . . as the ratio of two integers.

**Solution**

$$\begin{aligned} 5.232323\ldots &= 5 + \frac{23}{100} + \frac{23}{(100)^2} + \frac{23}{(100)^3} + \cdots \\ &= 5 + \frac{23}{100}\underbrace{\left(1 + \frac{1}{100} + \left(\frac{1}{100}\right)^2 + \cdots\right)}_{1/(1-0.01)} \qquad a = 1,\ r = 1/100 \\ &= 5 + \frac{23}{100}\left(\frac{1}{0.99}\right) = 5 + \frac{23}{99} = \frac{518}{99} \end{aligned}$$

$\blacksquare$

Unfortunately, formulas like the one for the sum of a convergent geometric series are rare and we usually have to settle for an estimate of a series' sum (more about this later). The next example, however, is another case in which we can find the sum exactly.

## EXAMPLE 5 A Nongeometric but Telescoping Series

Find the sum of the series $\displaystyle\sum_{n=1}^{\infty} \frac{1}{n(n+1)}$.

**Solution** We look for a pattern in the sequence of partial sums that might lead to a formula for $s_k$. The key observation is the partial fraction decomposition

$$\frac{1}{n(n+1)} = \frac{1}{n} - \frac{1}{n+1},$$

so

$$\sum_{n=1}^{k} \frac{1}{n(n+1)} = \sum_{n=1}^{k} \left(\frac{1}{n} - \frac{1}{n+1}\right)$$

and

$$s_k = \left(\frac{1}{1} - \frac{1}{2}\right) + \left(\frac{1}{2} - \frac{1}{3}\right) + \left(\frac{1}{3} - \frac{1}{4}\right) + \cdots + \left(\frac{1}{k} - \frac{1}{k+1}\right).$$

Removing parentheses and canceling adjacent terms of opposite sign collapses the sum to

$$s_k = 1 - \frac{1}{k+1}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We now see that $s_k \to 1$ as $k \to \infty$. The series converges, and its sum is 1:

$$\sum_{n=1}^{\infty} \frac{1}{n(n+1)} = 1.$$

## Divergent Series

One reason that a series may fail to converge is that its terms don't become small.

**EXAMPLE 6** Partial Sums Outgrow Any Number

**(a)** The series

$$\sum_{n=1}^{\infty} n^2 = 1 + 4 + 9 + \cdots + n^2 + \cdots$$

diverges because the partial sums grow beyond every number $L$. After $n = 1$, the partial sum $s_n = 1 + 4 + 9 + \cdots + n^2$ is greater than $n^2$.

**(b)** The series

$$\sum_{n=1}^{\infty} \frac{n+1}{n} = \frac{2}{1} + \frac{3}{2} + \frac{4}{3} + \cdots + \frac{n+1}{n} + \cdots$$

diverges because the partial sums eventually outgrow every preassigned number. Each term is greater than 1, so the sum of $n$ terms is greater than $n$.

## The *n*th-Term Test for Divergence

Observe that $\lim_{n\to\infty} a_n$ must equal zero if the series $\sum_{n=1}^{\infty} a_n$ converges. To see why, let $S$ represent the series' sum and $s_n = a_1 + a_2 + \cdots + a_n$ the $n$th partial sum. When $n$ is large, both $s_n$ and $s_{n-1}$ are close to $S$, so their difference, $a_n$, is close to zero. More formally,

$$a_n = s_n - s_{n-1} \quad \to \quad S - S = 0.$$

Difference Rule for sequences

This establishes the following theorem.

**Caution**
Theorem 7 *does not say* that $\sum_{n=1}^{\infty} a_n$ converges if $a_n \to 0$. It is possible for a series to diverge when $a_n \to 0$.

**THEOREM 7**
If $\sum_{n=1}^{\infty} a_n$ converges, then $a_n \to 0$.

Theorem 7 leads to a test for detecting the kind of divergence that occurred in Example 6.

**The *n*th-Term Test for Divergence**
$\sum_{n=1}^{\infty} a_n$ diverges if $\lim_{n\to\infty} a_n$ fails to exist or is different from zero.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 7** Applying the *n*th-Term Test

**(a)** $\sum_{n=1}^{\infty} n^2$ diverges because $n^2 \to \infty$

**(b)** $\sum_{n=1}^{\infty} \frac{n+1}{n}$ diverges because $\frac{n+1}{n} \to 1$

**(c)** $\sum_{n=1}^{\infty} (-1)^{n+1}$ diverges because $\lim_{n\to\infty}(-1)^{n+1}$ does not exist

**(d)** $\sum_{n=1}^{\infty} \frac{-n}{2n+5}$ diverges because $\lim_{n\to\infty} \frac{-n}{2n+5} = -\frac{1}{2} \neq 0.$ ■

**EXAMPLE 8** $a_n \to 0$ but the Series Diverges

The series

$$1 + \underbrace{\frac{1}{2} + \frac{1}{2}}_{2 \text{ terms}} + \underbrace{\frac{1}{4} + \frac{1}{4} + \frac{1}{4} + \frac{1}{4}}_{4 \text{ terms}} + \cdots + \underbrace{\frac{1}{2^n} + \frac{1}{2^n} + \cdots + \frac{1}{2^n}}_{2^n \text{ terms}} + \cdots$$

diverges because the terms are grouped into clusters that add to 1, so the partial sums increase without bound. However, the terms of the series form a sequence that converges to 0. Example 1 of Section 11.3 shows that the harmonic series also behaves in this manner. ■

## Combining Series

Whenever we have two convergent series, we can add them term by term, subtract them term by term, or multiply them by constants to make new convergent series.

**THEOREM 8**

If $\sum a_n = A$ and $\sum b_n = B$ are convergent series, then

1. *Sum Rule:* $\sum(a_n + b_n) = \sum a_n + \sum b_n = A + B$
2. *Difference Rule:* $\sum(a_n - b_n) = \sum a_n - \sum b_n = A - B$
3. *Constant Multiple Rule:* $\sum ka_n = k\sum a_n = kA$ (Any number $k$).

**Proof** The three rules for series follow from the analogous rules for sequences in Theorem 1, Section 11.1. To prove the Sum Rule for series, let

$$A_n = a_1 + a_2 + \cdots + a_n, \quad B_n = b_1 + b_2 + \cdots + b_n.$$

Then the partial sums of $\sum(a_n + b_n)$ are

$$\begin{aligned} s_n &= (a_1 + b_1) + (a_2 + b_2) + \cdots + (a_n + b_n) \\ &= (a_1 + \cdots + a_n) + (b_1 + \cdots + b_n) \\ &= A_n + B_n. \end{aligned}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Since $A_n \to A$ and $B_n \to B$, we have $s_n \to A + B$ by the Sum Rule for sequences. The proof of the Difference Rule is similar.

To prove the Constant Multiple Rule for series, observe that the partial sums of $\sum ka_n$ form the sequence

$$s_n = ka_1 + ka_2 + \cdots + ka_n = k(a_1 + a_2 + \cdots + a_n) = kA_n,$$

which converges to $kA$ by the Constant Multiple Rule for sequences. ■

As corollaries of Theorem 8, we have

1. Every nonzero constant multiple of a divergent series diverges.
2. If $\sum a_n$ converges and $\sum b_n$ diverges, then $\sum(a_n + b_n)$ and $\sum(a_n - b_n)$ both diverge.

We omit the proofs.

**CAUTION** Remember that $\sum(a_n + b_n)$ can converge when $\sum a_n$ and $\sum b_n$ both diverge. For example, $\sum a_n = 1 + 1 + 1 + \cdots$ and $\sum b_n = (-1) + (-1) + (-1) + \cdots$ diverge, whereas $\sum(a_n + b_n) = 0 + 0 + 0 + \cdots$ converges to 0.

**EXAMPLE 9** Find the sums of the following series.

**(a)**
$$\sum_{n=1}^{\infty} \frac{3^{n-1} - 1}{6^{n-1}} = \sum_{n=1}^{\infty} \left( \frac{1}{2^{n-1}} - \frac{1}{6^{n-1}} \right)$$
$$= \sum_{n=1}^{\infty} \frac{1}{2^{n-1}} - \sum_{n=1}^{\infty} \frac{1}{6^{n-1}} \qquad \text{Difference Rule}$$
$$= \frac{1}{1 - (1/2)} - \frac{1}{1 - (1/6)} \qquad \text{Geometric series with } a = 1 \text{ and } r = 1/2,\ 1/6$$
$$= 2 - \frac{6}{5}$$
$$= \frac{4}{5}$$

**(b)**
$$\sum_{n=0}^{\infty} \frac{4}{2^n} = 4 \sum_{n=0}^{\infty} \frac{1}{2^n} \qquad \text{Constant Multiple Rule}$$
$$= 4\left( \frac{1}{1 - (1/2)} \right) \qquad \text{Geometric series with } a = 1,\ r = 1/2$$
$$= 8$$

■

## Adding or Deleting Terms

We can add a finite number of terms to a series or delete a finite number of terms without altering the series' convergence or divergence, although in the case of convergence this will usually change the sum. If $\sum_{n=1}^{\infty} a_n$ converges, then $\sum_{n=k}^{\infty} a_n$ converges for any $k > 1$ and

$$\sum_{n=1}^{\infty} a_n = a_1 + a_2 + \cdots + a_{k-1} + \sum_{n=k}^{\infty} a_n.$$

Conversely, if $\sum_{n=k}^{\infty} a_n$ converges for any $k > 1$, then $\sum_{n=1}^{\infty} a_n$ converges. Thus,

$$\sum_{n=1}^{\infty} \frac{1}{5^n} = \frac{1}{5} + \frac{1}{25} + \frac{1}{125} + \sum_{n=4}^{\infty} \frac{1}{5^n}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

and

$$\sum_{n=4}^{\infty} \frac{1}{5^n} = \left(\sum_{n=1}^{\infty} \frac{1}{5^n}\right) - \frac{1}{5} - \frac{1}{25} - \frac{1}{125}.$$

## Reindexing

HISTORICAL BIOGRAPHY

Richard Dedekind
(1831–1916)

As long as we preserve the order of its terms, we can reindex any series without altering its convergence. To raise the starting value of the index $h$ units, replace the $n$ in the formula for $a_n$ by $n - h$:

$$\sum_{n=1}^{\infty} a_n = \sum_{n=1+h}^{\infty} a_{n-h} = a_1 + a_2 + a_3 + \cdots.$$

To lower the starting value of the index $h$ units, replace the $n$ in the formula for $a_n$ by $n + h$:

$$\sum_{n=1}^{\infty} a_n = \sum_{n=1-h}^{\infty} a_{n+h} = a_1 + a_2 + a_3 + \cdots.$$

It works like a horizontal shift. We saw this in starting a geometric series with the index $n = 0$ instead of the index $n = 1$, but we can use any other starting index value as well. We usually give preference to indexings that lead to simple expressions.

### EXAMPLE 10 Reindexing a Geometric Series

We can write the geometric series

$$\sum_{n=1}^{\infty} \frac{1}{2^{n-1}} = 1 + \frac{1}{2} + \frac{1}{4} + \cdots$$

as

$$\sum_{n=0}^{\infty} \frac{1}{2^n}, \qquad \sum_{n=5}^{\infty} \frac{1}{2^{n-5}}, \qquad \text{or even} \qquad \sum_{n=-4}^{\infty} \frac{1}{2^{n+4}}.$$

The partial sums remain the same no matter what indexing we choose. ■

# EXERCISES 11.2

## Finding *n*th Partial Sums

In Exercises 1–6, find a formula for the *n*th partial sum of each series and use it to find the series' sum if the series converges.

**1.** $2 + \frac{2}{3} + \frac{2}{9} + \frac{2}{27} + \cdots + \frac{2}{3^{n-1}} + \cdots$

**2.** $\frac{9}{100} + \frac{9}{100^2} + \frac{9}{100^3} + \cdots + \frac{9}{100^n} + \cdots$

**3.** $1 - \frac{1}{2} + \frac{1}{4} - \frac{1}{8} + \cdots + (-1)^{n-1}\frac{1}{2^{n-1}} + \cdots$

**4.** $1 - 2 + 4 - 8 + \cdots + (-1)^{n-1}\,2^{n-1} + \cdots$

**5.** $\frac{1}{2\cdot 3} + \frac{1}{3\cdot 4} + \frac{1}{4\cdot 5} + \cdots + \frac{1}{(n+1)(n+2)} + \cdots$

**6.** $\frac{5}{1\cdot 2} + \frac{5}{2\cdot 3} + \frac{5}{3\cdot 4} + \cdots + \frac{5}{n(n+1)} + \cdots$

## Series with Geometric Terms

In Exercises 7–14, write out the first few terms of each series to show how the series starts. Then find the sum of the series.

**7.** $\sum_{n=0}^{\infty} \frac{(-1)^n}{4^n}$

**8.** $\sum_{n=2}^{\infty} \frac{1}{4^n}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

9. $\sum_{n=1}^{\infty} \frac{7}{4^n}$

10. $\sum_{n=0}^{\infty} (-1)^n \frac{5}{4^n}$

11. $\sum_{n=0}^{\infty} \left(\frac{5}{2^n} + \frac{1}{3^n}\right)$

12. $\sum_{n=0}^{\infty} \left(\frac{5}{2^n} - \frac{1}{3^n}\right)$

13. $\sum_{n=0}^{\infty} \left(\frac{1}{2^n} + \frac{(-1)^n}{5^n}\right)$

14. $\sum_{n=0}^{\infty} \left(\frac{2^{n+1}}{5^n}\right)$

## Telescoping Series

Use partial fractions to find the sum of each series in Exercises 15–22.

Exercises

15. $\sum_{n=1}^{\infty} \frac{4}{(4n-3)(4n+1)}$

16. $\sum_{n=1}^{\infty} \frac{6}{(2n-1)(2n+1)}$

17. $\sum_{n=1}^{\infty} \frac{40n}{(2n-1)^2(2n+1)^2}$

18. $\sum_{n=1}^{\infty} \frac{2n+1}{n^2(n+1)^2}$

19. $\sum_{n=1}^{\infty} \left(\frac{1}{\sqrt{n}} - \frac{1}{\sqrt{n+1}}\right)$

20. $\sum_{n=1}^{\infty} \left(\frac{1}{2^{1/n}} - \frac{1}{2^{1/(n+1)}}\right)$

21. $\sum_{n=1}^{\infty} \left(\frac{1}{\ln(n+2)} - \frac{1}{\ln(n+1)}\right)$

22. $\sum_{n=1}^{\infty} (\tan^{-1}(n) - \tan^{-1}(n+1))$

## Convergence or Divergence

Which series in Exercises 23–40 converge, and which diverge? Give reasons for your answers. If a series converges, find its sum.

Exercises

23. $\sum_{n=0}^{\infty} \left(\frac{1}{\sqrt{2}}\right)^n$

24. $\sum_{n=0}^{\infty} \left(\sqrt{2}\right)^n$

25. $\sum_{n=1}^{\infty} (-1)^{n+1} \frac{3}{2^n}$

26. $\sum_{n=1}^{\infty} (-1)^{n+1} n$

27. $\sum_{n=0}^{\infty} \cos n\pi$

28. $\sum_{n=0}^{\infty} \frac{\cos n\pi}{5^n}$

29. $\sum_{n=0}^{\infty} e^{-2n}$

30. $\sum_{n=1}^{\infty} \ln \frac{1}{n}$

31. $\sum_{n=1}^{\infty} \frac{2}{10^n}$

32. $\sum_{n=0}^{\infty} \frac{1}{x^n}, \quad |x| > 1$

33. $\sum_{n=0}^{\infty} \frac{2^n - 1}{3^n}$

34. $\sum_{n=1}^{\infty} \left(1 - \frac{1}{n}\right)^n$

35. $\sum_{n=0}^{\infty} \frac{n!}{1000^n}$

36. $\sum_{n=1}^{\infty} \frac{n^n}{n!}$

37. $\sum_{n=1}^{\infty} \ln\left(\frac{n}{n+1}\right)$

38. $\sum_{n=1}^{\infty} \ln\left(\frac{n}{2n+1}\right)$

39. $\sum_{n=0}^{\infty} \left(\frac{e}{\pi}\right)^n$

40. $\sum_{n=0}^{\infty} \frac{e^{n\pi}}{\pi^{ne}}$

## Geometric Series

In each of the geometric series in Exercises 41–44, write out the first few terms of the series to find $a$ and $r$, and find the sum of the series. Then express the inequality $|r| < 1$ in terms of $x$ and find the values of $x$ for which the inequality holds and the series converges.

Exercises

41. $\sum_{n=0}^{\infty} (-1)^n x^n$

42. $\sum_{n=0}^{\infty} (-1)^n x^{2n}$

43. $\sum_{n=0}^{\infty} 3\left(\frac{x-1}{2}\right)^n$

44. $\sum_{n=0}^{\infty} \frac{(-1)^n}{2} \left(\frac{1}{3 + \sin x}\right)^n$

In Exercises 45–50, find the values of $x$ for which the given geometric series converges. Also, find the sum of the series (as a function of $x$) for those values of $x$.

Exercises

45. $\sum_{n=0}^{\infty} 2^n x^n$

46. $\sum_{n=0}^{\infty} (-1)^n x^{-2n}$

47. $\sum_{n=0}^{\infty} (-1)^n (x+1)^n$

48. $\sum_{n=0}^{\infty} \left(-\frac{1}{2}\right)^n (x-3)^n$

49. $\sum_{n=0}^{\infty} \sin^n x$

50. $\sum_{n=0}^{\infty} (\ln x)^n$

## Repeating Decimals

Express each of the numbers in Exercises 51–58 as the ratio of two integers.

Exercises

51. $0.\overline{23} = 0.23\ 23\ 23\ldots$

52. $0.\overline{234} = 0.234\ 234\ 234\ldots$

53. $0.\overline{7} = 0.7777\ldots$

54. $0.\overline{d} = 0.dddd\ldots$, where $d$ is a digit

55. $0.0\overline{6} = 0.06666\ldots$

56. $1.\overline{414} = 1.414\ 414\ 414\ldots$

57. $1.24\overline{123} = 1.24\ 123\ 123\ 123\ldots$

58. $3.\overline{142857} = 3.142857\ 142857\ldots$

## Theory and Examples

59. The series in Exercise 5 can also be written as

$$\sum_{n=1}^{\infty} \frac{1}{(n+1)(n+2)} \quad \text{and} \quad \sum_{n=-1}^{\infty} \frac{1}{(n+3)(n+4)}.$$

Write it as a sum beginning with **(a)** $n = -2$, **(b)** $n = 0$, **(c)** $n = 5$.

60. The series in Exercise 6 can also be written as

$$\sum_{n=1}^{\infty} \frac{5}{n(n+1)} \quad \text{and} \quad \sum_{n=0}^{\infty} \frac{5}{(n+1)(n+2)}.$$

Write it as a sum beginning with **(a)** $n = -1$, **(b)** $n = 3$, **(c)** $n = 20$.

61. Make up an infinite series of nonzero terms whose sum is

**a.** 1 **b.** $-3$ **c.** 0.

62. (*Continuation of Exercise 61.*) Can you make an infinite series of nonzero terms that converges to any number you want? Explain.

63. Show by example that $\sum(a_n/b_n)$ may diverge even though $\sum a_n$ and $\sum b_n$ converge and no $b_n$ equals 0.

# 11.3 The Integral Test

Given a series $\sum a_n$, we have two questions:

1. Does the series converge?
2. If it converges, what is its sum?

Much of the rest of this chapter is devoted to the first question, and in this section we answer that question by making a connection to the convergence of the improper integral $\int_1^\infty f(x)\,dx$. However, as a practical matter the second question is also important, and we will return to it later.

In this section and the next two, we study series that do not have negative terms. The reason for this restriction is that the partial sums of these series form nondecreasing sequences, and nondecreasing sequences that are bounded from above always converge (Theorem 6, Section 11.1). To show that a series of nonnegative terms converges, we need only show that its partial sums are bounded from above.

It may at first seem to be a drawback that this approach establishes the fact of convergence without producing the sum of the series in question. Surely it would be better to compute sums of series directly from formulas for their partial sums. But in most cases such formulas are not available, and in their absence we have to turn instead to the two-step procedure of first establishing convergence and then approximating the sum.

## Nondecreasing Partial Sums

Suppose that $\sum_{n=1}^\infty a_n$ is an infinite series with $a_n \geq 0$ for all $n$. Then each partial sum is greater than or equal to its predecessor because $s_{n+1} = s_n + a_n$:

$$s_1 \leq s_2 \leq s_3 \leq \cdots \leq s_n \leq s_{n+1} \leq \cdots.$$

Since the partial sums form a nondecreasing sequence, the Nondecreasing Sequence Theorem (Theorem 6, Section 11.1) tells us that the series will converge if and only if the partial sums are bounded from above.

**Corollary of Theorem 6**

A series $\sum_{n=1}^\infty a_n$ of nonnegative terms converges if and only if its partial sums are bounded from above.

HISTORICAL BIOGRAPHY

Nicole Oresme
(1320–1382)

**EXAMPLE 1** The Harmonic Series

The series

$$\sum_{n=1}^{\infty} \frac{1}{n} = 1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n} + \cdots$$

is called the **harmonic series**. The harmonic series is divergent, but this doesn't follow from the $n$th-Term Test. The $n$th term $1/n$ does go to zero, but the series still diverges. The reason it diverges is because there is no upper bound for its partial sums. To see why, group the terms of the series in the following way:

$$1 + \frac{1}{2} + \underbrace{\left(\frac{1}{3} + \frac{1}{4}\right)}_{> \frac{2}{4} = \frac{1}{2}} + \underbrace{\left(\frac{1}{5} + \frac{1}{6} + \frac{1}{7} + \frac{1}{8}\right)}_{> \frac{4}{8} = \frac{1}{2}} + \underbrace{\left(\frac{1}{9} + \frac{1}{10} + \cdots + \frac{1}{16}\right)}_{> \frac{8}{16} = \frac{1}{2}} + \cdots.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The sum of the first two terms is 1.5. The sum of the next two terms is $1/3 + 1/4$, which is greater than $1/4 + 1/4 = 1/2$. The sum of the next four terms is $1/5 + 1/6 + 1/7 + 1/8$, which is greater than $1/8 + 1/8 + 1/8 + 1/8 = 1/2$. The sum of the next eight terms is $1/9 + 1/10 + 1/11 + 1/12 + 1/13 + 1/14 + 1/15 + 1/16$, which is greater than $8/16 = 1/2$. The sum of the next 16 terms is greater than $16/32 = 1/2$, and so on. In general, the sum of $2^n$ terms ending with $1/2^{n+1}$ is greater than $2^n/2^{n+1} = 1/2$. The sequence of partial sums is not bounded from above: If $n = 2^k$, the partial sum $s_n$ is greater than $k/2$. The harmonic series diverges. ■

## The Integral Test

We introduce the Integral Test with a series that is related to the harmonic series, but whose $n$th term is $1/n^2$ instead of $1/n$.

**EXAMPLE 2** Does the following series converge?

$$\sum_{n=1}^{\infty} \frac{1}{n^2} = 1 + \frac{1}{4} + \frac{1}{9} + \frac{1}{16} + \cdots + \frac{1}{n^2} + \cdots$$

**Solution** We determine the convergence of $\sum_{n=1}^{\infty}(1/n^2)$ by comparing it with $\int_1^{\infty}(1/x^2)\,dx$. To carry out the comparison, we think of the terms of the series as values of the function $f(x) = 1/x^2$ and interpret these values as the areas of rectangles under the curve $y = 1/x^2$.

As Figure 11.7 shows,

$$\begin{aligned} s_n &= \frac{1}{1^2} + \frac{1}{2^2} + \frac{1}{3^2} + \cdots + \frac{1}{n^2} \\ &= f(1) + f(2) + f(3) + \cdots + f(n) \\ &< f(1) + \int_1^n \frac{1}{x^2}\,dx \\ &< 1 + \int_1^{\infty} \frac{1}{x^2}\,dx \\ &< 1 + 1 = 2. \end{aligned}$$

As in Section 8.8, Example 3, $\int_1^{\infty}(1/x^2)\,dx = 1$.

Thus the partial sums of $\sum_{n=1}^{\infty} 1/n^2$ are bounded from above (by 2) and the series converges. The sum of the series is known to be $\pi^2/6 \approx 1.64493$. (See Exercise 16 in Section 11.11.) ■

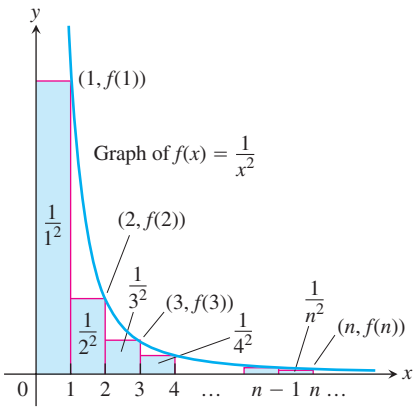

**FIGURE 11.7** The sum of the areas of the rectangles under the graph of $f(x) = 1/x^2$ is less than the area under the graph (Example 2).

**THEOREM 9 The Integral Test**

Let $\{a_n\}$ be a sequence of positive terms. Suppose that $a_n = f(n)$, where $f$ is a continuous, positive, decreasing function of $x$ for all $x \geq N$ ($N$ a positive integer). Then the series $\sum_{n=N}^{\infty} a_n$ and the integral $\int_N^{\infty} f(x)\,dx$ both converge or both diverge.

**Caution**

The series and integral need not have the same value in the convergent case. As we noted in Example 2, $\sum_{n=1}^{\infty}(1/n^2) = \pi^2/6$ while $\int_1^{\infty}(1/x^2)\,dx = 1$.

**Proof** We establish the test for the case $N = 1$. The proof for general $N$ is similar.

We start with the assumption that $f$ is a decreasing function with $f(n) = a_n$ for every $n$. This leads us to observe that the rectangles in Figure 11.8a, which have areas

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

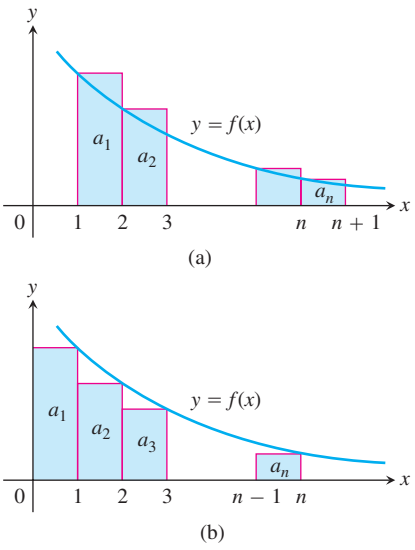

**FIGURE 11.8** Subject to the conditions of the Integral Test, the series $\sum_{n=1}^{\infty} a_n$ and the integral $\int_1^{\infty} f(x)\,dx$ both converge or both diverge.

$a_1, a_2, \ldots, a_n$, collectively enclose more area than that under the curve $y = f(x)$ from $x = 1$ to $x = n + 1$. That is,

$$\int_1^{n+1} f(x)\,dx \le a_1 + a_2 + \cdots + a_n.$$

In Figure 11.8b the rectangles have been faced to the left instead of to the right. If we momentarily disregard the first rectangle, of area $a_1$, we see that

$$a_2 + a_3 + \cdots + a_n \le \int_1^n f(x)\,dx.$$

If we include $a_1$, we have

$$a_1 + a_2 + \cdots + a_n \le a_1 + \int_1^n f(x)\,dx.$$

Combining these results gives

$$\int_1^{n+1} f(x)\,dx \le a_1 + a_2 + \cdots + a_n \le a_1 + \int_1^n f(x)\,dx.$$

These inequalities hold for each $n$, and continue to hold as $n \to \infty$.

If $\int_1^{\infty} f(x)\,dx$ is finite, the right-hand inequality shows that $\sum a_n$ is finite. If $\int_1^{\infty} f(x)\,dx$ is infinite, the left-hand inequality shows that $\sum a_n$ is infinite. Hence the series and the integral are both finite or both infinite. ■

## EXAMPLE 3 The $p$-Series

Show that the ***p*-series**

$$\sum_{n=1}^{\infty} \frac{1}{n^p} = \frac{1}{1^p} + \frac{1}{2^p} + \frac{1}{3^p} + \cdots + \frac{1}{n^p} + \cdots$$

($p$ a real constant) converges if $p > 1$, and diverges if $p \le 1$.

**Solution** If $p > 1$, then $f(x) = 1/x^p$ is a positive decreasing function of $x$. Since

$$\int_1^{\infty} \frac{1}{x^p}\,dx = \int_1^{\infty} x^{-p}\,dx = \lim_{b\to\infty} \left[\frac{x^{-p+1}}{-p+1}\right]_1^b$$

$$= \frac{1}{1-p} \lim_{b\to\infty} \left(\frac{1}{b^{p-1}} - 1\right)$$

$$= \frac{1}{1-p}(0 - 1) = \frac{1}{p-1},$$

$b^{p-1} \to \infty$ as $b \to \infty$ because $p - 1 > 0$.

the series converges by the Integral Test. We emphasize that the sum of the $p$-series is *not* $1/(p-1)$. The series converges, but we don't know the value it converges to.

If $p < 1$, then $1 - p > 0$ and

$$\int_1^{\infty} \frac{1}{x^p}\,dx = \frac{1}{1-p} \lim_{b\to\infty} (b^{1-p} - 1) = \infty.$$

The series diverges by the Integral Test.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

If $p = 1$, we have the (divergent) harmonic series

$$1 + \frac{1}{2} + \frac{1}{3} + \cdots + \frac{1}{n} + \cdots.$$

We have convergence for $p > 1$ but divergence for every other value of $p$. ■

The $p$-series with $p = 1$ is the **harmonic series** (Example 1). The $p$-Series Test shows that the harmonic series is just *barely* divergent; if we increase $p$ to 1.000000001, for instance, the series converges!

The slowness with which the partial sums of the harmonic series approaches infinity is impressive. For instance, it takes about 178,482,301 terms of the harmonic series to move the partial sums beyond 20. It would take your calculator several weeks to compute a sum with this many terms. (See also Exercise 33b.)

### EXAMPLE 4 A Convergent Series

The series

$$\sum_{n=1}^{\infty} \frac{1}{n^2 + 1}$$

converges by the Integral Test. The function $f(x) = 1/(x^2 + 1)$ is positive, continuous, and decreasing for $x \geq 1$, and

$$\begin{aligned} \int_1^{\infty} \frac{1}{x^2 + 1}\, dx &= \lim_{b \to \infty} \Big[\arctan x\Big]_1^b \\ &= \lim_{b \to \infty} [\arctan b - \arctan 1] \\ &= \frac{\pi}{2} - \frac{\pi}{4} = \frac{\pi}{4}. \end{aligned}$$

Again we emphasize that $\pi/4$ is *not* the sum of the series. The series converges, but we do not know the value of its sum. ■

Convergence of the series in Example 4 can also be verified by comparison with the series $\sum 1/n^2$. Comparison tests are studied in the next section.

# EXERCISES 11.3

## Determining Convergence or Divergence

Which of the series in Exercises 1–30 converge, and which diverge? Give reasons for your answers. (When you check an answer, remember that there may be more than one way to determine the series' convergence or divergence.)

1. $\sum_{n=1}^{\infty} \frac{1}{10^n}$
2. $\sum_{n=1}^{\infty} e^{-n}$
3. $\sum_{n=1}^{\infty} \frac{n}{n+1}$
4. $\sum_{n=1}^{\infty} \frac{5}{n+1}$
5. $\sum_{n=1}^{\infty} \frac{3}{\sqrt{n}}$
6. $\sum_{n=1}^{\infty} \frac{-2}{n\sqrt{n}}$
7. $\sum_{n=1}^{\infty} -\frac{1}{8^n}$
8. $\sum_{n=1}^{\infty} \frac{-8}{n}$
9. $\sum_{n=2}^{\infty} \frac{\ln n}{n}$
10. $\sum_{n=2}^{\infty} \frac{\ln n}{\sqrt{n}}$
11. $\sum_{n=1}^{\infty} \frac{2^n}{3^n}$
12. $\sum_{n=1}^{\infty} \frac{5^n}{4^n+3}$
13. $\sum_{n=0}^{\infty} \frac{-2}{n+1}$
14. $\sum_{n=1}^{\infty} \frac{1}{2n-1}$
15. $\sum_{n=1}^{\infty} \frac{2^n}{n+1}$
16. $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}\left(\sqrt{n}+1\right)}$
17. $\sum_{n=2}^{\infty} \frac{\sqrt{n}}{\ln n}$
18. $\sum_{n=1}^{\infty} \left(1+\frac{1}{n}\right)^n$
19. $\sum_{n=1}^{\infty} \frac{1}{(\ln 2)^n}$
20. $\sum_{n=1}^{\infty} \frac{1}{(\ln 3)^n}$
21. $\sum_{n=3}^{\infty} \frac{(1/n)}{(\ln n)\sqrt{\ln^2 n - 1}}$
22. $\sum_{n=1}^{\infty} \frac{1}{n(1+\ln^2 n)}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

**23.** $\sum_{n=1}^{\infty} n \sin \frac{1}{n}$

**24.** $\sum_{n=1}^{\infty} n \tan \frac{1}{n}$

**25.** $\sum_{n=1}^{\infty} \frac{e^n}{1 + e^{2n}}$

**26.** $\sum_{n=1}^{\infty} \frac{2}{1 + e^n}$

**27.** $\sum_{n=1}^{\infty} \frac{8 \tan^{-1} n}{1 + n^2}$

**28.** $\sum_{n=1}^{\infty} \frac{n}{n^2 + 1}$

**29.** $\sum_{n=1}^{\infty} \operatorname{sech} n$

**30.** $\sum_{n=1}^{\infty} \operatorname{sech}^2 n$

## Theory and Examples

For what values of $a$, if any, do the series in Exercises 31 and 32 converge?

**31.** $\sum_{n=1}^{\infty} \left( \frac{a}{n+2} - \frac{1}{n+4} \right)$

**32.** $\sum_{n=3}^{\infty} \left( \frac{1}{n-1} - \frac{2a}{n+1} \right)$

**33. a.** Draw illustrations like those in Figures 11.7 and 11.8 to show that the partial sums of the harmonic series satisfy the inequalities

$$\ln (n+1) = \int_1^{n+1} \frac{1}{x}\, dx \le 1 + \frac{1}{2} + \cdots + \frac{1}{n}$$

$$\le 1 + \int_1^n \frac{1}{x}\, dx = 1 + \ln n.$$

T **b.** There is absolutely no empirical evidence for the divergence of the harmonic series even though we know it diverges. The partial sums just grow too slowly. To see what we mean, suppose you had started with $s_1 = 1$ the day the universe was formed, 13 billion years ago, and added a new term every *second*. About how large would the partial sum $s_n$ be today, assuming a 365-day year?

**34.** Are there any values of $x$ for which $\sum_{n=1}^{\infty} (1/(nx))$ converges? Give reasons for your answer.

**35.** Is it true that if $\sum_{n=1}^{\infty} a_n$ is a divergent series of positive numbers then there is also a divergent series $\sum_{n=1}^{\infty} b_n$ of positive numbers with $b_n < a_n$ for every $n$? Is there a "smallest" divergent series of positive numbers? Give reasons for your answers.

**36.** (*Continuation of Exercise 35.*) Is there a "largest" convergent series of positive numbers? Explain.

**37. The Cauchy condensation test** The Cauchy condensation test says: Let $\{a_n\}$ be a nonincreasing sequence ($a_n \ge a_{n+1}$ for all $n$) of positive terms that converges to 0. Then $\sum a_n$ converges if and only if $\sum 2^n a_{2^n}$ converges. For example, $\sum (1/n)$ diverges because $\sum 2^n \cdot (1/2^n) = \sum 1$ diverges. Show why the test works.

**38.** Use the Cauchy condensation test from Exercise 37 to show that

**a.** $\sum_{n=2}^{\infty} \frac{1}{n \ln n}$ diverges;

**b.** $\sum_{n=1}^{\infty} \frac{1}{n^p}$ converges if $p > 1$ and diverges if $p \le 1$.

**39. Logarithmic *p*-series**

**a.** Show that

$$\int_2^{\infty} \frac{dx}{x (\ln x)^p} \quad (p \text{ a positive constant})$$

converges if and only if $p > 1$.

**b.** What implications does the fact in part (a) have for the convergence of the series

$$\sum_{n=2}^{\infty} \frac{1}{n (\ln n)^p} \, ?$$

Give reasons for your answer.

**40.** (*Continuation of Exercise 39.*) Use the result in Exercise 39 to determine which of the following series converge and which diverge. Support your answer in each case.

**a.** $\sum_{n=2}^{\infty} \frac{1}{n (\ln n)}$

**b.** $\sum_{n=2}^{\infty} \frac{1}{n (\ln n)^{1.01}}$

**c.** $\sum_{n=2}^{\infty} \frac{1}{n \ln (n^3)}$

**d.** $\sum_{n=2}^{\infty} \frac{1}{n (\ln n)^3}$

**41. Euler's constant** Graphs like those in Figure 11.8 suggest that as $n$ increases there is little change in the difference between the sum

$$1 + \frac{1}{2} + \cdots + \frac{1}{n}$$

and the integral

$$\ln n = \int_1^n \frac{1}{x}\, dx.$$

To explore this idea, carry out the following steps.

**a.** By taking $f(x) = 1/x$ in the proof of Theorem 9, show that

$$\ln (n+1) \le 1 + \frac{1}{2} + \cdots + \frac{1}{n} \le 1 + \ln n$$

or

$$0 < \ln (n+1) - \ln n \le 1 + \frac{1}{2} + \cdots + \frac{1}{n} - \ln n \le 1.$$

Thus, the sequence

$$a_n = 1 + \frac{1}{2} + \cdots + \frac{1}{n} - \ln n$$

is bounded from below and from above.

**b.** Show that

$$\frac{1}{n+1} < \int_n^{n+1} \frac{1}{x}\, dx = \ln (n+1) - \ln n,$$

and use this result to show that the sequence $\{a_n\}$ in part (a) is decreasing.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Since a decreasing sequence that is bounded from below converges (Exercise 107 in Section 11.1), the numbers $a_n$ defined in part (a) converge:

$$1 + \frac{1}{2} + \cdots + \frac{1}{n} - \ln n \to \gamma.$$

The number $\gamma$, whose value is $0.5772\ldots$, is called *Euler's constant*. In contrast to other special numbers like $\pi$ and $e$, no other expression with a simple law of formulation has ever been found for $\gamma$.

**42.** Use the integral test to show that

$$\sum_{n=0}^{\infty} e^{-n^2}$$

converges.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# 11.4 Comparison Tests

We have seen how to determine the convergence of geometric series, $p$-series, and a few others. We can test the convergence of many more series by comparing their terms to those of a series whose convergence is known.

**THEOREM 10 The Comparison Test**

Let $\sum a_n$ be a series with no negative terms.

**(a)** $\sum a_n$ converges if there is a convergent series $\sum c_n$ with $a_n \le c_n$ for all $n > N$, for some integer $N$.

**(b)** $\sum a_n$ diverges if there is a divergent series of nonnegative terms $\sum d_n$ with $a_n \ge d_n$ for all $n > N$, for some integer $N$.

HISTORICAL BIOGRAPHY

Albert of Saxony
(ca. 1316–1390)

**Proof** In Part (a), the partial sums of $\sum a_n$ are bounded above by

$$M = a_1 + a_2 + \cdots + a_N + \sum_{n=N+1}^{\infty} c_n.$$

They therefore form a nondecreasing sequence with a limit $L \le M$.

In Part (b), the partial sums of $\sum a_n$ are not bounded from above. If they were, the partial sums for $\sum d_n$ would be bounded by

$$M^* = d_1 + d_2 + \cdots + d_N + \sum_{n=N+1}^{\infty} a_n$$

and $\sum d_n$ would have to converge instead of diverge. ■

**EXAMPLE 1** Applying the Comparison Test

**(a)** The series

$$\sum_{n=1}^{\infty} \frac{5}{5n - 1}$$

diverges because its $n$th term

$$\frac{5}{5n - 1} = \frac{1}{n - \frac{1}{5}} > \frac{1}{n}$$

is greater than the $n$th term of the divergent harmonic series.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**(b)** The series

$$\sum_{n=0}^{\infty} \frac{1}{n!} = 1 + \frac{1}{1!} + \frac{1}{2!} + \frac{1}{3!} + \cdots$$

converges because its terms are all positive and less than or equal to the corresponding terms of

$$1 + \sum_{n=0}^{\infty} \frac{1}{2^n} = 1 + 1 + \frac{1}{2} + \frac{1}{2^2} + \cdots.$$

The geometric series on the left converges and we have

$$1 + \sum_{n=0}^{\infty} \frac{1}{2^n} = 1 + \frac{1}{1 - (1/2)} = 3.$$

The fact that 3 is an upper bound for the partial sums of $\sum_{n=0}^{\infty}(1/n!)$ does not mean that the series converges to 3. As we will see in Section 11.9, the series converges to $e$.

**(c)** The series

$$5 + \frac{2}{3} + \frac{1}{7} + 1 + \frac{1}{2 + \sqrt{1}} + \frac{1}{4 + \sqrt{2}} + \frac{1}{8 + \sqrt{3}} + \cdots + \frac{1}{2^n + \sqrt{n}} + \cdots$$

converges. To see this, we ignore the first three terms and compare the remaining terms with those of the convergent geometric series $\sum_{n=0}^{\infty}(1/2^n)$. The term $1/(2^n + \sqrt{n})$ of the truncated sequence is less than the corresponding term $1/2^n$ of the geometric series. We see that term by term we have the comparison,

$$1 + \frac{1}{2 + \sqrt{1}} + \frac{1}{4 + \sqrt{2}} + \frac{1}{8 + \sqrt{3}} + \cdots \le 1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \cdots$$

So the truncated series and the original series converge by an application of the Comparison Test. ■

## The Limit Comparison Test

We now introduce a comparison test that is particularly useful for series in which $a_n$ is a rational function of $n$.

**THEOREM 11 Limit Comparison Test**

Suppose that $a_n > 0$ and $b_n > 0$ for all $n \ge N$ ($N$ an integer).

1. If $\lim_{n\to\infty} \frac{a_n}{b_n} = c > 0$, then $\sum a_n$ and $\sum b_n$ both converge or both diverge.
2. If $\lim_{n\to\infty} \frac{a_n}{b_n} = 0$ and $\sum b_n$ converges, then $\sum a_n$ converges.
3. If $\lim_{n\to\infty} \frac{a_n}{b_n} = \infty$ and $\sum b_n$ diverges, then $\sum a_n$ diverges.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Proof** We will prove Part 1. Parts 2 and 3 are left as Exercises 37(a) and (b).

Since $c/2 > 0$, there exists an integer $N$ such that for all $n$

$$n > N \Rightarrow \left|\frac{a_n}{b_n} - c\right| < \frac{c}{2}.$$

Limit definition with $\epsilon = c/2$, $L = c$, and $a_n$ replaced by $a_n/b_n$

Thus, for $n > N$,

$$-\frac{c}{2} < \frac{a_n}{b_n} - c < \frac{c}{2},$$

$$\frac{c}{2} < \frac{a_n}{b_n} < \frac{3c}{2},$$

$$\left(\frac{c}{2}\right)b_n < a_n < \left(\frac{3c}{2}\right)b_n.$$

If $\sum b_n$ converges, then $\sum (3c/2)b_n$ converges and $\sum a_n$ converges by the Direct Comparison Test. If $\sum b_n$ diverges, then $\sum (c/2)b_n$ diverges and $\sum a_n$ diverges by the Direct Comparison Test. ■

## EXAMPLE 2 Using the Limit Comparison Test

Which of the following series converge, and which diverge?

**(a)** $\dfrac{3}{4} + \dfrac{5}{9} + \dfrac{7}{16} + \dfrac{9}{25} + \cdots = \displaystyle\sum_{n=1}^{\infty} \frac{2n+1}{(n+1)^2} = \sum_{n=1}^{\infty} \frac{2n+1}{n^2+2n+1}$

**(b)** $\dfrac{1}{1} + \dfrac{1}{3} + \dfrac{1}{7} + \dfrac{1}{15} + \cdots = \displaystyle\sum_{n=1}^{\infty} \frac{1}{2^n - 1}$

**(c)** $\dfrac{1+2\ln 2}{9} + \dfrac{1+3\ln 3}{14} + \dfrac{1+4\ln 4}{21} + \cdots = \displaystyle\sum_{n=2}^{\infty} \frac{1+n\ln n}{n^2+5}$

### Solution

**(a)** Let $a_n = (2n+1)/(n^2+2n+1)$. For large $n$, we expect $a_n$ to behave like $2n/n^2 = 2/n$ since the leading terms dominate for large $n$, so we let $b_n = 1/n$. Since

$$\sum_{n=1}^{\infty} b_n = \sum_{n=1}^{\infty} \frac{1}{n} \text{ diverges}$$

and

$$\lim_{n\to\infty} \frac{a_n}{b_n} = \lim_{n\to\infty} \frac{2n^2+n}{n^2+2n+1} = 2,$$

$\sum a_n$ diverges by Part 1 of the Limit Comparison Test. We could just as well have taken $b_n = 2/n$, but $1/n$ is simpler.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**(b)** Let $a_n = 1/(2^n - 1)$. For large $n$, we expect $a_n$ to behave like $1/2^n$, so we let $b_n = 1/2^n$. Since

$$\sum_{n=1}^{\infty} b_n = \sum_{n=1}^{\infty} \frac{1}{2^n} \text{ converges}$$

and

$$\begin{aligned} \lim_{n\to\infty} \frac{a_n}{b_n} &= \lim_{n\to\infty} \frac{2^n}{2^n - 1} \\ &= \lim_{n\to\infty} \frac{1}{1 - (1/2^n)} \\ &= 1, \end{aligned}$$

$\sum a_n$ converges by Part 1 of the Limit Comparison Test.

**(c)** Let $a_n = (1 + n \ln n)/(n^2 + 5)$. For large $n$, we expect $a_n$ to behave like $(n \ln n)/n^2 = (\ln n)/n$, which is greater than $1/n$ for $n \geq 3$, so we take $b_n = 1/n$. Since

$$\sum_{n=2}^{\infty} b_n = \sum_{n=2}^{\infty} \frac{1}{n} \text{ diverges}$$

and

$$\begin{aligned} \lim_{n\to\infty} \frac{a_n}{b_n} &= \lim_{n\to\infty} \frac{n + n^2 \ln n}{n^2 + 5} \\ &= \infty, \end{aligned}$$

$\sum a_n$ diverges by Part 3 of the Limit Comparison Test. ■

**EXAMPLE 3** Does $\displaystyle\sum_{n=1}^{\infty} \frac{\ln n}{n^{3/2}}$ converge?

**Solution** Because $\ln n$ grows more slowly than $n^c$ for any positive constant $c$ (Section 11.1, Exercise 91), we would expect to have

$$\frac{\ln n}{n^{3/2}} < \frac{n^{1/4}}{n^{3/2}} = \frac{1}{n^{5/4}}$$

for $n$ sufficiently large. Indeed, taking $a_n = (\ln n)/n^{3/2}$ and $b_n = 1/n^{5/4}$, we have

$$\begin{aligned} \lim_{n\to\infty} \frac{a_n}{b_n} &= \lim_{n\to\infty} \frac{\ln n}{n^{1/4}} \\ &= \lim_{n\to\infty} \frac{1/n}{(1/4)n^{-3/4}} \qquad \text{l'Hôpital's Rule} \\ &= \lim_{n\to\infty} \frac{4}{n^{1/4}} = 0. \end{aligned}$$

Since $\sum b_n = \sum(1/n^{5/4})$ (a $p$-series with $p > 1$) converges, $\sum a_n$ converges by Part 2 of the Limit Comparison Test. ■

# EXERCISES 11.4

## Determining Convergence or Divergence

Which of the series in Exercises 1–36 converge, and which diverge? Give reasons for your answers.

1. $\sum_{n=1}^{\infty} \frac{1}{2\sqrt{n} + \sqrt[3]{n}}$
2. $\sum_{n=1}^{\infty} \frac{3}{n + \sqrt{n}}$
3. $\sum_{n=1}^{\infty} \frac{\sin^2 n}{2^n}$
4. $\sum_{n=1}^{\infty} \frac{1 + \cos n}{n^2}$
5. $\sum_{n=1}^{\infty} \frac{2n}{3n - 1}$
6. $\sum_{n=1}^{\infty} \frac{n + 1}{n^2\sqrt{n}}$
7. $\sum_{n=1}^{\infty} \left(\frac{n}{3n + 1}\right)^n$
8. $\sum_{n=1}^{\infty} \frac{1}{\sqrt{n^3 + 2}}$
9. $\sum_{n=3}^{\infty} \frac{1}{\ln(\ln n)}$
10. $\sum_{n=2}^{\infty} \frac{1}{(\ln n)^2}$
11. $\sum_{n=1}^{\infty} \frac{(\ln n)^2}{n^3}$
12. $\sum_{n=1}^{\infty} \frac{(\ln n)^3}{n^3}$
13. $\sum_{n=2}^{\infty} \frac{1}{\sqrt{n}\ln n}$
14. $\sum_{n=1}^{\infty} \frac{(\ln n)^2}{n^{3/2}}$
15. $\sum_{n=1}^{\infty} \frac{1}{1 + \ln n}$
16. $\sum_{n=1}^{\infty} \frac{1}{(1 + \ln n)^2}$
17. $\sum_{n=2}^{\infty} \frac{\ln(n + 1)}{n + 1}$
18. $\sum_{n=1}^{\infty} \frac{1}{(1 + \ln^2 n)}$
19. $\sum_{n=2}^{\infty} \frac{1}{n\sqrt{n^2 - 1}}$
20. $\sum_{n=1}^{\infty} \frac{\sqrt{n}}{n^2 + 1}$
21. $\sum_{n=1}^{\infty} \frac{1 - n}{n2^n}$
22. $\sum_{n=1}^{\infty} \frac{n + 2^n}{n^2 2^n}$
23. $\sum_{n=1}^{\infty} \frac{1}{3^{n-1} + 1}$
24. $\sum_{n=1}^{\infty} \frac{3^{n-1} + 1}{3^n}$
25. $\sum_{n=1}^{\infty} \sin\frac{1}{n}$
26. $\sum_{n=1}^{\infty} \tan\frac{1}{n}$
27. $\sum_{n=1}^{\infty} \frac{10n + 1}{n(n + 1)(n + 2)}$
28. $\sum_{n=3}^{\infty} \frac{5n^3 - 3n}{n^2(n - 2)(n^2 + 5)}$
29. $\sum_{n=1}^{\infty} \frac{\tan^{-1} n}{n^{1.1}}$
30. $\sum_{n=1}^{\infty} \frac{\sec^{-1} n}{n^{1.3}}$
31. $\sum_{n=1}^{\infty} \frac{\coth n}{n^2}$
32. $\sum_{n=1}^{\infty} \frac{\tanh n}{n^2}$
33. $\sum_{n=1}^{\infty} \frac{1}{n\sqrt[n]{n}}$
34. $\sum_{n=1}^{\infty} \frac{\sqrt[n]{n}}{n^2}$
35. $\sum_{n=1}^{\infty} \frac{1}{1 + 2 + 3 + \cdots + n}$
36. $\sum_{n=1}^{\infty} \frac{1}{1 + 2^2 + 3^2 + \cdots + n^2}$

## Theory and Examples

37. Prove **(a)** Part 2 and **(b)** Part 3 of the Limit Comparison Test.

38. If $\sum_{n=1}^{\infty} a_n$ is a convergent series of nonnegative numbers, can anything be said about $\sum_{n=1}^{\infty}(a_n/n)$? Explain.

39. Suppose that $a_n > 0$ and $b_n > 0$ for $n \geq N$ ($N$ an integer). If $\lim_{n\to\infty}(a_n/b_n) = \infty$ and $\sum a_n$ converges, can anything be said about $\sum b_n$? Give reasons for your answer.

40. Prove that if $\sum a_n$ is a convergent series of nonnegative terms, then $\sum a_n^2$ converges.

### COMPUTER EXPLORATION

41. It is not yet known whether the series

$$\sum_{n=1}^{\infty} \frac{1}{n^3 \sin^2 n}$$

converges or diverges. Use a CAS to explore the behavior of the series by performing the following steps.

**a.** Define the sequence of partial sums

$$s_k = \sum_{n=1}^{k} \frac{1}{n^3 \sin^2 n}.$$

What happens when you try to find the limit of $s_k$ as $k \to \infty$? Does your CAS find a closed form answer for this limit?

**b.** Plot the first 100 points $(k, s_k)$ for the sequence of partial sums. Do they appear to converge? What would you estimate the limit to be?

**c.** Next plot the first 200 points $(k, s_k)$. Discuss the behavior in your own words.

**d.** Plot the first 400 points $(k, s_k)$. What happens when $k = 355$? Calculate the number $355/113$. Explain from your calculation what happened at $k = 355$. For what values of $k$ would you guess this behavior might occur again?

You will find an interesting discussion of this series in Chapter 72 of *Mazes for the Mind* by Clifford A. Pickover, St. Martin's Press, Inc., New York, 1992.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# 11.5 The Ratio and Root Tests

The Ratio Test measures the rate of growth (or decline) of a series by examining the ratio $a_{n+1}/a_n$. For a geometric series $\sum ar^n$, this rate is a constant $((ar^{n+1})/(ar^n) = r)$, and the series converges if and only if its ratio is less than 1 in absolute value. The Ratio Test is a powerful rule extending that result. We prove it on the next page using the Comparison Test.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**THEOREM 12 The Ratio Test**

Let $\sum a_n$ be a series with positive terms and suppose that

$$\lim_{n\to\infty} \frac{a_{n+1}}{a_n} = \rho.$$

Then

**(a)** the series *converges* if $\rho < 1$,

**(b)** the series *diverges* if $\rho > 1$ or $\rho$ is infinite,

**(c)** the test is *inconclusive* if $\rho = 1$.

**Proof**

**(a)** $\boldsymbol{\rho < 1}$**.** Let $r$ be a number between $\rho$ and 1. Then the number $\epsilon = r - \rho$ is positive. Since

$$\frac{a_{n+1}}{a_n} \to \rho,$$

$a_{n+1}/a_n$ must lie within $\epsilon$ of $\rho$ when $n$ is large enough, say for all $n \geq N$. In particular

$$\frac{a_{n+1}}{a_n} < \rho + \epsilon = r, \qquad \text{when } n \geq N.$$

That is,

$$\begin{aligned} a_{N+1} &< ra_N, \\ a_{N+2} &< ra_{N+1} < r^2 a_N, \\ a_{N+3} &< ra_{N+2} < r^3 a_N, \\ &\vdots \\ a_{N+m} &< ra_{N+m-1} < r^m a_N. \end{aligned}$$

These inequalities show that the terms of our series, after the $N$th term, approach zero more rapidly than the terms in a geometric series with ratio $r < 1$. More precisely, consider the series $\sum c_n$, where $c_n = a_n$ for $n = 1, 2, \ldots, N$ and $c_{N+1} = ra_N$, $c_{N+2} = r^2 a_N, \ldots, c_{N+m} = r^m a_N, \ldots$. Now $a_n \leq c_n$ for all $n$, and

$$\begin{aligned} \sum_{n=1}^{\infty} c_n &= a_1 + a_2 + \cdots + a_{N-1} + a_N + ra_N + r^2 a_N + \cdots \\ &= a_1 + a_2 + \cdots + a_{N-1} + a_N(1 + r + r^2 + \cdots). \end{aligned}$$

The geometric series $1 + r + r^2 + \cdots$ converges because $|r| < 1$, so $\sum c_n$ converges. Since $a_n \leq c_n$, $\sum a_n$ also converges.

**(b)** $\boldsymbol{1 < \rho \leq \infty}$**.** From some index $M$ on,

$$\frac{a_{n+1}}{a_n} > 1 \qquad \text{and} \qquad a_M < a_{M+1} < a_{M+2} < \cdots.$$

The terms of the series do not approach zero as $n$ becomes infinite, and the series diverges by the $n$th-Term Test.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**(c) $\rho = 1$.** The two series

$$\sum_{n=1}^{\infty} \frac{1}{n} \quad \text{and} \quad \sum_{n=1}^{\infty} \frac{1}{n^2}$$

show that some other test for convergence must be used when $\rho = 1$.

$$\text{For } \sum_{n=1}^{\infty} \frac{1}{n}: \quad \frac{a_{n+1}}{a_n} = \frac{1/(n+1)}{1/n} = \frac{n}{n+1} \to 1.$$

$$\text{For } \sum_{n=1}^{\infty} \frac{1}{n^2}: \quad \frac{a_{n+1}}{a_n} = \frac{1/(n+1)^2}{1/n^2} = \left(\frac{n}{n+1}\right)^2 \to 1^2 = 1.$$

In both cases, $\rho = 1$, yet the first series diverges, whereas the second converges. ■

The Ratio Test is often effective when the terms of a series contain factorials of expressions involving $n$ or expressions raised to a power involving $n$.

## EXAMPLE 1 Applying the Ratio Test

Investigate the convergence of the following series.

**(a)** $\displaystyle\sum_{n=0}^{\infty} \frac{2^n + 5}{3^n}$ **(b)** $\displaystyle\sum_{n=1}^{\infty} \frac{(2n)!}{n!n!}$ **(c)** $\displaystyle\sum_{n=1}^{\infty} \frac{4^n n!n!}{(2n)!}$

**Solution**

**(a)** For the series $\sum_{n=0}^{\infty}(2^n + 5)/3^n$,

$$\frac{a_{n+1}}{a_n} = \frac{(2^{n+1} + 5)/3^{n+1}}{(2^n + 5)/3^n} = \frac{1}{3} \cdot \frac{2^{n+1} + 5}{2^n + 5} = \frac{1}{3} \cdot \left(\frac{2 + 5 \cdot 2^{-n}}{1 + 5 \cdot 2^{-n}}\right) \to \frac{1}{3} \cdot \frac{2}{1} = \frac{2}{3}.$$

The series converges because $\rho = 2/3$ is less than 1. This does *not* mean that $2/3$ is the sum of the series. In fact,

$$\sum_{n=0}^{\infty} \frac{2^n + 5}{3^n} = \sum_{n=0}^{\infty} \left(\frac{2}{3}\right)^n + \sum_{n=0}^{\infty} \frac{5}{3^n} = \frac{1}{1 - (2/3)} + \frac{5}{1 - (1/3)} = \frac{21}{2}.$$

**(b)** If $a_n = \dfrac{(2n)!}{n!n!}$, then $a_{n+1} = \dfrac{(2n+2)!}{(n+1)!(n+1)!}$ and

$$\frac{a_{n+1}}{a_n} = \frac{n!n!(2n+2)(2n+1)(2n)!}{(n+1)!(n+1)!(2n)!}$$

$$= \frac{(2n+2)(2n+1)}{(n+1)(n+1)} = \frac{4n+2}{n+1} \to 4.$$

The series diverges because $\rho = 4$ is greater than 1.

**(c)** If $a_n = 4^n n!n!/(2n)!$, then

$$\frac{a_{n+1}}{a_n} = \frac{4^{n+1}(n+1)!(n+1)!}{(2n+2)(2n+1)(2n)!} \cdot \frac{(2n)!}{4^n n!n!}$$

$$= \frac{4(n+1)(n+1)}{(2n+2)(2n+1)} = \frac{2(n+1)}{2n+1} \to 1.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Because the limit is $\rho = 1$, we cannot decide from the Ratio Test whether the series converges. When we notice that $a_{n+1}/a_n = (2n + 2)/(2n + 1)$, we conclude that $a_{n+1}$ is always greater than $a_n$ because $(2n + 2)/(2n + 1)$ is always greater than 1. Therefore, all terms are greater than or equal to $a_1 = 2$, and the $n$th term does not approach zero as $n \to \infty$. The series diverges. ■

## The Root Test

The convergence tests we have so far for $\sum a_n$ work best when the formula for $a_n$ is relatively simple. But consider the following.

**EXAMPLE 2** Let $a_n = \begin{cases} n/2^n, & n \text{ odd} \\ 1/2^n, & n \text{ even.} \end{cases}$ Does $\sum a_n$ converge?

**Solution** We write out several terms of the series:

$$\sum_{n=1}^{\infty} a_n = \frac{1}{2^1} + \frac{1}{2^2} + \frac{3}{2^3} + \frac{1}{2^4} + \frac{5}{2^5} + \frac{1}{2^6} + \frac{7}{2^7} + \cdots$$
$$= \frac{1}{2} + \frac{1}{4} + \frac{3}{8} + \frac{1}{16} + \frac{5}{32} + \frac{1}{64} + \frac{7}{128} + \cdots.$$

Clearly, this is not a geometric series. The $n$th term approaches zero as $n \to \infty$, so we do not know if the series diverges. The Integral Test does not look promising. The Ratio Test produces

$$\frac{a_{n+1}}{a_n} = \begin{cases} \dfrac{1}{2n}, & n \text{ odd} \\ \dfrac{n+1}{2}, & n \text{ even.} \end{cases}$$

As $n \to \infty$, the ratio is alternately small and large and has no limit.

A test that will answer the question (the series converges) is the Root Test. ■

**THEOREM 13 The Root Test**

Let $\sum a_n$ be a series with $a_n \geq 0$ for $n \geq N$, and suppose that

$$\lim_{n \to \infty} \sqrt[n]{a_n} = \rho.$$

Then

**(a)** the series *converges* if $\rho < 1$,

**(b)** the series *diverges* if $\rho > 1$ or $\rho$ is infinite,

**(c)** the test is *inconclusive* if $\rho = 1$.

**Proof**

**(a)** $\boldsymbol{\rho < 1}$**.** Choose an $\epsilon > 0$ so small that $\rho + \epsilon < 1$. Since $\sqrt[n]{a_n} \to \rho$, the terms $\sqrt[n]{a_n}$ eventually get closer than $\epsilon$ to $\rho$. In other words, there exists an index $M \geq N$ such that

$$\sqrt[n]{a_n} < \rho + \epsilon \qquad \text{when } n \geq M.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Then it is also true that

$$a_n < (\rho + \epsilon)^n \qquad \text{for } n \geq M.$$

Now, $\sum_{n=M}^{\infty} (\rho + \epsilon)^n$, a geometric series with ratio $(\rho + \epsilon) < 1$, converges. By comparison, $\sum_{n=M}^{\infty} a_n$ converges, from which it follows that

$$\sum_{n=1}^{\infty} a_n = a_1 + \cdots + a_{M-1} + \sum_{n=M}^{\infty} a_n$$

converges.

**(b) $1 < \rho \leq \infty$.** For all indices beyond some integer $M$, we have $\sqrt[n]{a_n} > 1$, so that $a_n > 1$ for $n > M$. The terms of the series do not converge to zero. The series diverges by the $n$th-Term Test.

**(c) $\rho = 1$.** The series $\sum_{n=1}^{\infty} (1/n)$ and $\sum_{n=1}^{\infty} (1/n^2)$ show that the test is not conclusive when $\rho = 1$. The first series diverges and the second converges, but in both cases $\sqrt[n]{a_n} \to 1$. ■

## EXAMPLE 3 Applying the Root Test

Which of the following series converges, and which diverges?

**(a)** $\displaystyle\sum_{n=1}^{\infty} \frac{n^2}{2^n}$ **(b)** $\displaystyle\sum_{n=1}^{\infty} \frac{2^n}{n^2}$ **(c)** $\displaystyle\sum_{n=1}^{\infty} \left(\frac{1}{1+n}\right)^n$

**Solution**

**(a)** $\displaystyle\sum_{n=1}^{\infty} \frac{n^2}{2^n}$ converges because $\displaystyle\sqrt[n]{\frac{n^2}{2^n}} = \frac{\sqrt[n]{n^2}}{\sqrt[n]{2^n}} = \frac{\left(\sqrt[n]{n}\right)^2}{2} \to \frac{1}{2} < 1.$

**(b)** $\displaystyle\sum_{n=1}^{\infty} \frac{2^n}{n^2}$ diverges because $\displaystyle\sqrt[n]{\frac{2^n}{n^2}} = \frac{2}{\left(\sqrt[n]{n}\right)^2} \to \frac{2}{1} > 1.$

**(c)** $\displaystyle\sum_{n=1}^{\infty} \left(\frac{1}{1+n}\right)^n$ converges because $\displaystyle\sqrt[n]{\left(\frac{1}{1+n}\right)^n} = \frac{1}{1+n} \to 0 < 1.$ ■

## EXAMPLE 2 Revisited

Let $a_n = \begin{cases} n/2^n, & n \text{ odd} \\ 1/2^n, & n \text{ even.} \end{cases}$ Does $\sum a_n$ converge?

**Solution** We apply the Root Test, finding that

$$\sqrt[n]{a_n} = \begin{cases} \sqrt[n]{n}/2, & n \text{ odd} \\ 1/2, & n \text{ even.} \end{cases}$$

Therefore,

$$\frac{1}{2} \leq \sqrt[n]{a_n} \leq \frac{\sqrt[n]{n}}{2}.$$

Since $\sqrt[n]{n} \to 1$ (Section 11.1, Theorem 5), we have $\lim_{n\to\infty} \sqrt[n]{a_n} = 1/2$ by the Sandwich Theorem. The limit is less than 1, so the series converges by the Root Test. ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# EXERCISES 11.5

## Determining Convergence or Divergence

Which of the series in Exercises 1–26 converge, and which diverge? Give reasons for your answers. (When checking your answers, remember there may be more than one way to determine a series' convergence or divergence.)

1. $\sum_{n=1}^{\infty} \frac{n^{\sqrt{2}}}{2^n}$
2. $\sum_{n=1}^{\infty} n^2 e^{-n}$
3. $\sum_{n=1}^{\infty} n! e^{-n}$
4. $\sum_{n=1}^{\infty} \frac{n!}{10^n}$
5. $\sum_{n=1}^{\infty} \frac{n^{10}}{10^n}$
6. $\sum_{n=1}^{\infty} \left(\frac{n-2}{n}\right)^n$
7. $\sum_{n=1}^{\infty} \frac{2+(-1)^n}{1.25^n}$
8. $\sum_{n=1}^{\infty} \frac{(-2)^n}{3^n}$
9. $\sum_{n=1}^{\infty} \left(1-\frac{3}{n}\right)^n$
10. $\sum_{n=1}^{\infty} \left(1-\frac{1}{3n}\right)^n$
11. $\sum_{n=1}^{\infty} \frac{\ln n}{n^3}$
12. $\sum_{n=1}^{\infty} \frac{(\ln n)^n}{n^n}$
13. $\sum_{n=1}^{\infty} \left(\frac{1}{n}-\frac{1}{n^2}\right)$
14. $\sum_{n=1}^{\infty} \left(\frac{1}{n}-\frac{1}{n^2}\right)^n$
15. $\sum_{n=1}^{\infty} \frac{\ln n}{n}$
16. $\sum_{n=1}^{\infty} \frac{n \ln n}{2^n}$
17. $\sum_{n=1}^{\infty} \frac{(n+1)(n+2)}{n!}$
18. $\sum_{n=1}^{\infty} e^{-n}(n^3)$
19. $\sum_{n=1}^{\infty} \frac{(n+3)!}{3!n!3^n}$
20. $\sum_{n=1}^{\infty} \frac{n2^n(n+1)!}{3^n n!}$
21. $\sum_{n=1}^{\infty} \frac{n!}{(2n+1)!}$
22. $\sum_{n=1}^{\infty} \frac{n!}{n^n}$
23. $\sum_{n=2}^{\infty} \frac{n}{(\ln n)^n}$
24. $\sum_{n=2}^{\infty} \frac{n}{(\ln n)^{(n/2)}}$
25. $\sum_{n=1}^{\infty} \frac{n! \ln n}{n(n+2)!}$
26. $\sum_{n=1}^{\infty} \frac{3^n}{n^3 2^n}$

Which of the series $\sum_{n=1}^{\infty} a_n$ defined by the formulas in Exercises 27–38 converge, and which diverge? Give reasons for your answers.

27. $a_1 = 2, \quad a_{n+1} = \frac{1+\sin n}{n} a_n$
28. $a_1 = 1, \quad a_{n+1} = \frac{1+\tan^{-1} n}{n} a_n$
29. $a_1 = \frac{1}{3}, \quad a_{n+1} = \frac{3n-1}{2n+5} a_n$
30. $a_1 = 3, \quad a_{n+1} = \frac{n}{n+1} a_n$
31. $a_1 = 2, \quad a_{n+1} = \frac{2}{n} a_n$
32. $a_1 = 5, \quad a_{n+1} = \frac{\sqrt[n]{n}}{2} a_n$
33. $a_1 = 1, \quad a_{n+1} = \frac{1+\ln n}{n} a_n$
34. $a_1 = \frac{1}{2}, \quad a_{n+1} = \frac{n+\ln n}{n+10} a_n$
35. $a_1 = \frac{1}{3}, \quad a_{n+1} = \sqrt[n]{a_n}$
36. $a_1 = \frac{1}{2}, \quad a_{n+1} = (a_n)^{n+1}$
37. $a_n = \frac{2^n n! n!}{(2n)!}$
38. $a_n = \frac{(3n)!}{n!(n+1)!(n+2)!}$

Which of the series in Exercises 39–44 converge, and which diverge? Give reasons for your answers.

39. $\sum_{n=1}^{\infty} \frac{(n!)^n}{(n^n)^2}$
40. $\sum_{n=1}^{\infty} \frac{(n!)^n}{n^{(n^2)}}$
41. $\sum_{n=1}^{\infty} \frac{n^n}{2^{(n^2)}}$
42. $\sum_{n=1}^{\infty} \frac{n^n}{(2^n)^2}$
43. $\sum_{n=1}^{\infty} \frac{1 \cdot 3 \cdot \cdots \cdot (2n-1)}{4^n 2^n n!}$
44. $\sum_{n=1}^{\infty} \frac{1 \cdot 3 \cdot \cdots \cdot (2n-1)}{[2 \cdot 4 \cdot \cdots \cdot (2n)](3^n+1)}$

## Theory and Examples

45. Neither the Ratio nor the Root Test helps with $p$-series. Try them on

$$\sum_{n=1}^{\infty} \frac{1}{n^p}$$

and show that both tests fail to provide information about convergence.

46. Show that neither the Ratio Test nor the Root Test provides information about the convergence of

$$\sum_{n=2}^{\infty} \frac{1}{(\ln n)^p} \qquad (p \text{ constant}).$$

47. Let $a_n = \begin{cases} n/2^n, & \text{if } n \text{ is a prime number} \\ 1/2^n, & \text{otherwise.} \end{cases}$

Does $\sum a_n$ converge? Give reasons for your answer.

# 11.6 Alternating Series, Absolute and Conditional Convergence

A series in which the terms are alternately positive and negative is an **alternating series**.

Here are three examples:

$$1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \cdots + \frac{(-1)^{n+1}}{n} + \cdots \tag{1}$$

$$-2 + 1 - \frac{1}{2} + \frac{1}{4} - \frac{1}{8} + \cdots + \frac{(-1)^n 4}{2^n} + \cdots \tag{2}$$

$$1 - 2 + 3 - 4 + 5 - 6 + \cdots + (-1)^{n+1} n + \cdots \tag{3}$$

Series (1), called the **alternating harmonic series**, converges, as we will see in a moment. Series (2) a geometric series with ratio $r = -1/2$, converges to $-2/[1 + (1/2)] = -4/3$. Series (3) diverges because the $n$th term does not approach zero.

We prove the convergence of the alternating harmonic series by applying the Alternating Series Test.

**THEOREM 14 The Alternating Series Test (Leibniz's Theorem)**

The series

$$\sum_{n=1}^{\infty} (-1)^{n+1} u_n = u_1 - u_2 + u_3 - u_4 + \cdots$$

converges if all three of the following conditions are satisfied:

1. The $u_n$'s are all positive.
2. $u_n \geq u_{n+1}$ for all $n \geq N$, for some integer $N$.
3. $u_n \to 0$.

**Proof** If $n$ is an even integer, say $n = 2m$, then the sum of the first $n$ terms is

$$\begin{aligned} s_{2m} &= (u_1 - u_2) + (u_3 - u_4) + \cdots + (u_{2m-1} - u_{2m}) \\ &= u_1 - (u_2 - u_3) - (u_4 - u_5) - \cdots - (u_{2m-2} - u_{2m-1}) - u_{2m}. \end{aligned}$$

The first equality shows that $s_{2m}$ is the sum of $m$ nonnegative terms, since each term in parentheses is positive or zero. Hence $s_{2m+2} \geq s_{2m}$, and the sequence $\{s_{2m}\}$ is nondecreasing. The second equality shows that $s_{2m} \leq u_1$. Since $\{s_{2m}\}$ is nondecreasing and bounded from above, it has a limit, say

$$\lim_{m \to \infty} s_{2m} = L. \tag{4}$$

If $n$ is an odd integer, say $n = 2m + 1$, then the sum of the first $n$ terms is $s_{2m+1} = s_{2m} + u_{2m+1}$. Since $u_n \to 0$,

$$\lim_{m \to \infty} u_{2m+1} = 0$$

and, as $m \to \infty$,

$$s_{2m+1} = s_{2m} + u_{2m+1} \to L + 0 = L. \tag{5}$$

Combining the results of Equations (4) and (5) gives $\lim_{n \to \infty} s_n = L$ (Section 11.1, Exercise 119). ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

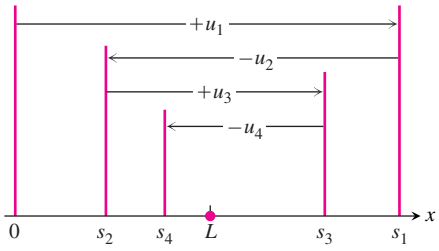

**FIGURE 11.9** The partial sums of an alternating series that satisfies the hypotheses of Theorem 14 for $N = 1$ straddle the limit from the beginning.

**EXAMPLE 1** The alternating harmonic series

$$\sum_{n=1}^{\infty}(-1)^{n+1}\frac{1}{n} = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \cdots$$

satisfies the three requirements of Theorem 14 with $N = 1$; it therefore converges. ■

A graphical interpretation of the partial sums (Figure 11.9) shows how an alternating series converges to its limit $L$ when the three conditions of Theorem 14 are satisfied with $N = 1$. (Exercise 63 asks you to picture the case $N > 1$.) Starting from the origin of the $x$-axis, we lay off the positive distance $s_1 = u_1$. To find the point corresponding to $s_2 = u_1 - u_2$, we back up a distance equal to $u_2$. Since $u_2 \le u_1$, we do not back up any farther than the origin. We continue in this seesaw fashion, backing up or going forward as the signs in the series demand. But for $n \ge N$, each forward or backward step is shorter than (or at most the same size as) the preceding step, because $u_{n+1} \le u_n$. And since the $n$th term approaches zero as $n$ increases, the size of step we take forward or backward gets smaller and smaller. We oscillate across the limit $L$, and the amplitude of oscillation approaches zero. The limit $L$ lies between any two successive sums $s_n$ and $s_{n+1}$ and hence differs from $s_n$ by an amount less than $u_{n+1}$.

Because

$$|L - s_n| < u_{n+1} \qquad \text{for } n \ge N,$$

we can make useful estimates of the sums of convergent alternating series.

**THEOREM 15 The Alternating Series Estimation Theorem**

If the alternating series $\sum_{n=1}^{\infty}(-1)^{n+1}u_n$ satisfies the three conditions of Theorem 14, then for $n \ge N$,

$$s_n = u_1 - u_2 + \cdots + (-1)^{n+1}u_n$$

approximates the sum $L$ of the series with an error whose absolute value is less than $u_{n+1}$, the numerical value of the first unused term. Furthermore, the remainder, $L - s_n$, has the same sign as the first unused term.

We leave the verification of the sign of the remainder for Exercise 53.

**EXAMPLE 2** We try Theorem 15 on a series whose sum we know:

$$\sum_{n=0}^{\infty}(-1)^n\frac{1}{2^n} = 1 - \frac{1}{2} + \frac{1}{4} - \frac{1}{8} + \frac{1}{16} - \frac{1}{32} + \frac{1}{64} - \frac{1}{128} \Big| + \frac{1}{256} - \cdots.$$

The theorem says that if we truncate the series after the eighth term, we throw away a total that is positive and less than $1/256$. The sum of the first eight terms is 0.6640625. The sum of the series is

$$\frac{1}{1 - (-1/2)} = \frac{1}{3/2} = \frac{2}{3}.$$

The difference, $(2/3) - 0.6640625 = 0.0026041666\ldots$, is positive and less than $(1/256) = 0.00390625$. ■

## Absolute and Conditional Convergence

**DEFINITION Absolutely Convergent**

A series $\sum a_n$ **converges absolutely** (is **absolutely convergent**) if the corresponding series of absolute values, $\sum |a_n|$, converges.

The geometric series

$$1 - \frac{1}{2} + \frac{1}{4} - \frac{1}{8} + \cdots$$

converges absolutely because the corresponding series of absolute values

$$1 + \frac{1}{2} + \frac{1}{4} + \frac{1}{8} + \cdots$$

converges. The alternating harmonic series does not converge absolutely. The corresponding series of absolute values is the (divergent) harmonic series.

**DEFINITION Conditionally Convergent**

A series that converges but does not converge absolutely **converges conditionally**.

The alternating harmonic series converges conditionally.

Absolute convergence is important for two reasons. First, we have good tests for convergence of series of positive terms. Second, if a series converges absolutely, then it converges. That is the thrust of the next theorem.

**THEOREM 16 The Absolute Convergence Test**

If $\sum_{n=1}^{\infty} |a_n|$ converges, then $\sum_{n=1}^{\infty} a_n$ converges.

**Proof** For each $n$,

$$-|a_n| \le a_n \le |a_n|, \qquad \text{so} \qquad 0 \le a_n + |a_n| \le 2|a_n|.$$

If $\sum_{n=1}^{\infty} |a_n|$ converges, then $\sum_{n=1}^{\infty} 2|a_n|$ converges and, by the Direct Comparison Test, the nonnegative series $\sum_{n=1}^{\infty} (a_n + |a_n|)$ converges. The equality $a_n = (a_n + |a_n|) - |a_n|$ now lets us express $\sum_{n=1}^{\infty} a_n$ as the difference of two convergent series:

$$\sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} (a_n + |a_n| - |a_n|) = \sum_{n=1}^{\infty} (a_n + |a_n|) - \sum_{n=1}^{\infty} |a_n|.$$

Therefore, $\sum_{n=1}^{\infty} a_n$ converges. ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**CAUTION** We can rephrase Theorem 16 to say that every absolutely convergent series converges. However, the converse statement is false: Many convergent series do not converge absolutely (such as the alternating harmonic series in Example 1).

### EXAMPLE 3 Applying the Absolute Convergence Test

**(a)** For $\sum_{n=1}^{\infty}(-1)^{n+1}\frac{1}{n^2} = 1 - \frac{1}{4} + \frac{1}{9} - \frac{1}{16} + \cdots$, the corresponding series of absolute values is the convergent series

$$\sum_{n=1}^{\infty}\frac{1}{n^2} = 1 + \frac{1}{4} + \frac{1}{9} + \frac{1}{16} + \cdots.$$

The original series converges because it converges absolutely.

**(b)** For $\sum_{n=1}^{\infty}\frac{\sin n}{n^2} = \frac{\sin 1}{1} + \frac{\sin 2}{4} + \frac{\sin 3}{9} + \cdots$, the corresponding series of absolute values is

$$\sum_{n=1}^{\infty}\left|\frac{\sin n}{n^2}\right| = \frac{|\sin 1|}{1} + \frac{|\sin 2|}{4} + \cdots,$$

which converges by comparison with $\sum_{n=1}^{\infty}(1/n^2)$ because $|\sin n| \le 1$ for every $n$. The original series converges absolutely; therefore it converges. ■

### EXAMPLE 4 Alternating $p$-Series

If $p$ is a positive constant, the sequence $\{1/n^p\}$ is a decreasing sequence with limit zero. Therefore the alternating $p$-series

$$\sum_{n=1}^{\infty}\frac{(-1)^{n-1}}{n^p} = 1 - \frac{1}{2^p} + \frac{1}{3^p} - \frac{1}{4^p} + \cdots, \qquad p > 0$$

converges.

If $p > 1$, the series converges absolutely. If $0 < p \le 1$, the series converges conditionally.

Conditional convergence: $1 - \frac{1}{\sqrt{2}} + \frac{1}{\sqrt{3}} - \frac{1}{\sqrt{4}} + \cdots$

Absolute convergence: $1 - \frac{1}{2^{3/2}} + \frac{1}{3^{3/2}} - \frac{1}{4^{3/2}} + \cdots$ ■

## Rearranging Series

**THEOREM 17 The Rearrangement Theorem for Absolutely Convergent Series**

If $\sum_{n=1}^{\infty} a_n$ converges absolutely, and $b_1, b_2, \ldots, b_n, \ldots$ is any arrangement of the sequence $\{a_n\}$, then $\sum b_n$ converges absolutely and

$$\sum_{n=1}^{\infty} b_n = \sum_{n=1}^{\infty} a_n.$$

(For an outline of the proof, see Exercise 60.)

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 5** Applying the Rearrangement Theorem

As we saw in Example 3, the series

$$1 - \frac{1}{4} + \frac{1}{9} - \frac{1}{16} + \cdots + (-1)^{n-1}\frac{1}{n^2} + \cdots$$

converges absolutely. A possible rearrangement of the terms of the series might start with a positive term, then two negative terms, then three positive terms, then four negative terms, and so on: After $k$ terms of one sign, take $k + 1$ terms of the opposite sign. The first ten terms of such a series look like this:

$$1 - \frac{1}{4} - \frac{1}{16} + \frac{1}{9} + \frac{1}{25} + \frac{1}{49} - \frac{1}{36} - \frac{1}{64} - \frac{1}{100} - \frac{1}{144} + \cdots.$$

The Rearrangement Theorem says that both series converge to the same value. In this example, if we had the second series to begin with, we would probably be glad to exchange it for the first, if we knew that we could. We can do even better: The sum of either series is also equal to

$$\sum_{n=1}^{\infty} \frac{1}{(2n-1)^2} - \sum_{n=1}^{\infty} \frac{1}{(2n)^2}.$$

(See Exercise 61.) ■

If we rearrange infinitely many terms of a conditionally convergent series, we can get results that are far different from the sum of the original series. Here is an example.

**EXAMPLE 6** Rearranging the Alternating Harmonic Series

The alternating harmonic series

$$\frac{1}{1} - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \frac{1}{7} - \frac{1}{8} + \frac{1}{9} - \frac{1}{10} + \frac{1}{11} - \cdots$$

can be rearranged to diverge or to reach any preassigned sum.

**(a)** *Rearranging* $\sum_{n=1}^{\infty}(-1)^{n+1}/n$ *to diverge.* The series of terms $\sum[1/(2n-1)]$ diverges to $+\infty$ and the series of terms $\sum(-1/2n)$ diverges to $-\infty$. No matter how far out in the sequence of odd-numbered terms we begin, we can always add enough positive terms to get an arbitrarily large sum. Similarly, with the negative terms, no matter how far out we start, we can add enough consecutive even-numbered terms to get a negative sum of arbitrarily large absolute value. If we wished to do so, we could start adding odd-numbered terms until we had a sum greater than $+3$, say, and then follow that with enough consecutive negative terms to make the new total less than $-4$. We could then add enough positive terms to make the total greater than $+5$ and follow with consecutive unused negative terms to make a new total less than $-6$, and so on. In this way, we could make the swings arbitrarily large in either direction.

**(b)** *Rearranging* $\sum_{n=1}^{\infty}(-1)^{n+1}/n$ *to converge to* 1. Another possibility is to focus on a particular limit. Suppose we try to get sums that converge to 1. We start with the first term, $1/1$, and then subtract $1/2$. Next we add $1/3$ and $1/5$, which brings the total back to 1 or above. Then we add consecutive negative terms until the total is less than 1. We continue in this manner: When the sum is less than 1, add positive terms until the total is 1 or more; then subtract (add negative) terms until the total is again less than 1. This process can be continued indefinitely. Because both the odd-numbered

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

terms and the even-numbered terms of the original series approach zero as $n \to \infty$, the amount by which our partial sums exceed 1 or fall below it approaches zero. So the new series converges to 1. The rearranged series starts like this:

$$\frac{1}{1} - \frac{1}{2} + \frac{1}{3} + \frac{1}{5} - \frac{1}{4} + \frac{1}{7} + \frac{1}{9} - \frac{1}{6} + \frac{1}{11} + \frac{1}{13} - \frac{1}{8} + \frac{1}{15} + \frac{1}{17} - \frac{1}{10} + \frac{1}{19} + \frac{1}{21} - \frac{1}{12} + \frac{1}{23} + \frac{1}{25} - \frac{1}{14} + \frac{1}{27} - \frac{1}{16} + \cdots$$

■

The kind of behavior illustrated by the series in Example 6 is typical of what can happen with any conditionally convergent series. Therefore we must always add the terms of a conditionally convergent series in the order given.

We have now developed several tests for convergence and divergence of series. In summary:

1. **The *n*th-Term Test:** Unless $a_n \to 0$, the series diverges.
2. **Geometric series:** $\sum ar^n$ converges if $|r| < 1$; otherwise it diverges.
3. ***p*-series:** $\sum 1/n^p$ converges if $p > 1$; otherwise it diverges.
4. **Series with nonnegative terms:** Try the Integral Test, Ratio Test, or Root Test. Try comparing to a known series with the Comparison Test.
5. **Series with some negative terms:** Does $\sum |a_n|$ converge? If yes, so does $\sum a_n$, since absolute convergence implies convergence.
6. **Alternating series:** $\sum a_n$ converges if the series satisfies the conditions of the Alternating Series Test.

# EXERCISES 11.6

## Determining Convergence or Divergence

Which of the alternating series in Exercises 1–10 converge, and which diverge? Give reasons for your answers.

1. $\sum_{n=1}^{\infty}(-1)^{n+1}\frac{1}{n^2}$
2. $\sum_{n=1}^{\infty}(-1)^{n+1}\frac{1}{n^{3/2}}$
3. $\sum_{n=1}^{\infty}(-1)^{n+1}\left(\frac{n}{10}\right)^n$
4. $\sum_{n=1}^{\infty}(-1)^{n+1}\frac{10^n}{n^{10}}$
5. $\sum_{n=2}^{\infty}(-1)^{n+1}\frac{1}{\ln n}$
6. $\sum_{n=1}^{\infty}(-1)^{n+1}\frac{\ln n}{n}$
7. $\sum_{n=2}^{\infty}(-1)^{n+1}\frac{\ln n}{\ln n^2}$
8. $\sum_{n=1}^{\infty}(-1)^{n}\ln\left(1+\frac{1}{n}\right)$
9. $\sum_{n=1}^{\infty}(-1)^{n+1}\frac{\sqrt{n}+1}{n+1}$
10. $\sum_{n=1}^{\infty}(-1)^{n+1}\frac{3\sqrt{n}+1}{\sqrt{n}+1}$

## Absolute Convergence

Which of the series in Exercises 11–44 converge absolutely, which converge, and which diverge? Give reasons for your answers.

11. $\sum_{n=1}^{\infty}(-1)^{n+1}(0.1)^n$
12. $\sum_{n=1}^{\infty}(-1)^{n+1}\frac{(0.1)^n}{n}$
13. $\sum_{n=1}^{\infty}(-1)^{n}\frac{1}{\sqrt{n}}$
14. $\sum_{n=1}^{\infty}\frac{(-1)^n}{1+\sqrt{n}}$
15. $\sum_{n=1}^{\infty}(-1)^{n+1}\frac{n}{n^3+1}$
16. $\sum_{n=1}^{\infty}(-1)^{n+1}\frac{n!}{2^n}$
17. $\sum_{n=1}^{\infty}(-1)^{n}\frac{1}{n+3}$
18. $\sum_{n=1}^{\infty}(-1)^{n}\frac{\sin n}{n^2}$
19. $\sum_{n=1}^{\infty}(-1)^{n+1}\frac{3+n}{5+n}$
20. $\sum_{n=2}^{\infty}(-1)^{n}\frac{1}{\ln(n^3)}$
21. $\sum_{n=1}^{\infty}(-1)^{n+1}\frac{1+n}{n^2}$
22. $\sum_{n=1}^{\infty}\frac{(-2)^{n+1}}{n+5^n}$
23. $\sum_{n=1}^{\infty}(-1)^{n}n^2(2/3)^n$
24. $\sum_{n=1}^{\infty}(-1)^{n+1}\left(\sqrt[n]{10}\right)$
25. $\sum_{n=1}^{\infty}(-1)^{n}\frac{\tan^{-1}n}{n^2+1}$
26. $\sum_{n=2}^{\infty}(-1)^{n+1}\frac{1}{n\ln n}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

**27.** $\sum_{n=1}^{\infty}(-1)^n\frac{n}{n+1}$ **28.** $\sum_{n=1}^{\infty}(-1)^n\frac{\ln n}{n-\ln n}$

**29.** $\sum_{n=1}^{\infty}\frac{(-100)^n}{n!}$ **30.** $\sum_{n=1}^{\infty}(-5)^{-n}$

**31.** $\sum_{n=1}^{\infty}\frac{(-1)^{n-1}}{n^2+2n+1}$ **32.** $\sum_{n=2}^{\infty}(-1)^n\left(\frac{\ln n}{\ln n^2}\right)^n$

**33.** $\sum_{n=1}^{\infty}\frac{\cos n\pi}{n\sqrt{n}}$ **34.** $\sum_{n=1}^{\infty}\frac{\cos n\pi}{n}$

**35.** $\sum_{n=1}^{\infty}\frac{(-1)^n(n+1)^n}{(2n)^n}$ **36.** $\sum_{n=1}^{\infty}\frac{(-1)^{n+1}(n!)^2}{(2n)!}$

**37.** $\sum_{n=1}^{\infty}(-1)^n\frac{(2n)!}{2^n n!n}$ **38.** $\sum_{n=1}^{\infty}(-1)^n\frac{(n!)^2\,3^n}{(2n+1)!}$

**39.** $\sum_{n=1}^{\infty}(-1)^n\left(\sqrt{n+1}-\sqrt{n}\right)$ **40.** $\sum_{n=1}^{\infty}(-1)^n\left(\sqrt{n^2+n}-n\right)$

**41.** $\sum_{n=1}^{\infty}(-1)^n\left(\sqrt{n+\sqrt{n}}-\sqrt{n}\right)$

**42.** $\sum_{n=1}^{\infty}\frac{(-1)^n}{\sqrt{n}+\sqrt{n+1}}$ **43.** $\sum_{n=1}^{\infty}(-1)^n\,\text{sech}\,n$

**44.** $\sum_{n=1}^{\infty}(-1)^n\,\text{csch}\,n$

## Error Estimation

In Exercises 45–48, estimate the magnitude of the error involved in using the sum of the first four terms to approximate the sum of the entire series.

Exercises

**45.** $\sum_{n=1}^{\infty}(-1)^{n+1}\frac{1}{n}$ It can be shown that the sum is ln 2.

**46.** $\sum_{n=1}^{\infty}(-1)^{n+1}\frac{1}{10^n}$

**47.** $\sum_{n=1}^{\infty}(-1)^{n+1}\frac{(0.01)^n}{n}$ As you will see in Section 11.7, the sum is ln (1.01).

**48.** $\frac{1}{1+t}=\sum_{n=0}^{\infty}(-1)^n t^n,\quad 0<t<1$

T Approximate the sums in Exercises 49 and 50 with an error of magnitude less than $5\times10^{-6}$.

**49.** $\sum_{n=0}^{\infty}(-1)^n\frac{1}{(2n)!}$ As you will see in Section 11.9, the sum is cos 1, the cosine of 1 radian.

**50.** $\sum_{n=0}^{\infty}(-1)^n\frac{1}{n!}$ As you will see in Section 11.9, the sum is $e^{-1}$.

## Theory and Examples

**51. a.** The series

$$\frac{1}{3}-\frac{1}{2}+\frac{1}{9}-\frac{1}{4}+\frac{1}{27}-\frac{1}{8}+\cdots+\frac{1}{3^n}-\frac{1}{2^n}+\cdots$$

does not meet one of the conditions of Theorem 14. Which one?

**b.** Find the sum of the series in part (a).

T **52.** The limit $L$ of an alternating series that satisfies the conditions of Theorem 14 lies between the values of any two consecutive partial sums. This suggests using the average

$$\frac{s_n+s_{n+1}}{2}=s_n+\frac{1}{2}(-1)^{n+2}a_{n+1}$$

to estimate $L$. Compute

$$s_{20}+\frac{1}{2}\cdot\frac{1}{21}$$

as an approximation to the sum of the alternating harmonic series. The exact sum is $\ln 2 = 0.6931\ldots$.

**53. The sign of the remainder of an alternating series that satisfies the conditions of Theorem 14** Prove the assertion in Theorem 15 that whenever an alternating series satisfying the conditions of Theorem 14 is approximated with one of its partial sums, then the remainder (sum of the unused terms) has the same sign as the first unused term. (*Hint:* Group the remainder's terms in consecutive pairs.)

**54.** Show that the sum of the first $2n$ terms of the series

$$1-\frac{1}{2}+\frac{1}{2}-\frac{1}{3}+\frac{1}{3}-\frac{1}{4}+\frac{1}{4}-\frac{1}{5}+\frac{1}{5}-\frac{1}{6}+\cdots$$

is the same as the sum of the first $n$ terms of the series

$$\frac{1}{1\cdot2}+\frac{1}{2\cdot3}+\frac{1}{3\cdot4}+\frac{1}{4\cdot5}+\frac{1}{5\cdot6}+\cdots.$$

Do these series converge? What is the sum of the first $2n+1$ terms of the first series? If the series converge, what is their sum?

**55.** Show that if $\sum_{n=1}^{\infty}a_n$ diverges, then $\sum_{n=1}^{\infty}|a_n|$ diverges.

**56.** Show that if $\sum_{n=1}^{\infty}a_n$ converges absolutely, then

$$\left|\sum_{n=1}^{\infty}a_n\right|\le\sum_{n=1}^{\infty}|a_n|.$$

**57.** Show that if $\sum_{n=1}^{\infty}a_n$ and $\sum_{n=1}^{\infty}b_n$ both converge absolutely, then so does

**a.** $\sum_{n=1}^{\infty}(a_n+b_n)$ **b.** $\sum_{n=1}^{\infty}(a_n-b_n)$

**c.** $\sum_{n=1}^{\infty}ka_n$ ($k$ any number)

**58.** Show by example that $\sum_{n=1}^{\infty}a_nb_n$ may diverge even if $\sum_{n=1}^{\infty}a_n$ and $\sum_{n=1}^{\infty}b_n$ both converge.

T **59.** In Example 6, suppose the goal is to arrange the terms to get a new series that converges to $-1/2$. Start the new arrangement with the first negative term, which is $-1/2$. Whenever you have a sum that is less than or equal to $-1/2$, start introducing positive terms, taken in order, until the new total is greater than $-1/2$. Then add negative terms until the total is less than or equal to $-1/2$ again. Continue this process until your partial sums have

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

been above the target at least three times and finish at or below it. If $s_n$ is the sum of the first $n$ terms of your new series, plot the points $(n, s_n)$ to illustrate how the sums are behaving.

**60. Outline of the proof of the Rearrangement Theorem (Theorem 17)**

**a.** Let $\epsilon$ be a positive real number, let $L = \sum_{n=1}^{\infty} a_n$, and let $s_k = \sum_{n=1}^{k} a_n$. Show that for some index $N_1$ and for some index $N_2 \geq N_1$,

$$\sum_{n=N_1}^{\infty} |a_n| < \frac{\epsilon}{2} \quad \text{and} \quad |s_{N_2} - L| < \frac{\epsilon}{2}.$$

Since all the terms $a_1, a_2, \ldots, a_{N_2}$ appear somewhere in the sequence $\{b_n\}$, there is an index $N_3 \geq N_2$ such that if $n \geq N_3$, then $\left(\sum_{k=1}^{n} b_k\right) - s_{N_2}$ is at most a sum of terms $a_m$ with $m \geq N_1$. Therefore, if $n \geq N_3$,

$$\left|\sum_{k=1}^{n} b_k - L\right| \leq \left|\sum_{k=1}^{n} b_k - s_{N_2}\right| + |s_{N_2} - L|$$

$$\leq \sum_{k=N_1}^{\infty} |a_k| + |s_{N_2} - L| < \epsilon.$$

**b.** The argument in part (a) shows that if $\sum_{n=1}^{\infty} a_n$ converges absolutely then $\sum_{n=1}^{\infty} b_n$ converges and $\sum_{n=1}^{\infty} b_n = \sum_{n=1}^{\infty} a_n$. Now show that because $\sum_{n=1}^{\infty} |a_n|$ converges, $\sum_{n=1}^{\infty} |b_n|$ converges to $\sum_{n=1}^{\infty} |a_n|$.

**61. Unzipping absolutely convergent series**

**a.** Show that if $\sum_{n=1}^{\infty} |a_n|$ converges and

$$b_n = \begin{cases} a_n, & \text{if } a_n \geq 0 \\ 0, & \text{if } a_n < 0, \end{cases}$$

then $\sum_{n=1}^{\infty} b_n$ converges.

**b.** Use the results in part (a) to show likewise that if $\sum_{n=1}^{\infty} |a_n|$ converges and

$$c_n = \begin{cases} 0, & \text{if } a_n \geq 0 \\ a_n, & \text{if } a_n < 0, \end{cases}$$

then $\sum_{n=1}^{\infty} c_n$ converges.

In other words, if a series converges absolutely, its positive terms form a convergent series, and so do its negative terms. Furthermore,

$$\sum_{n=1}^{\infty} a_n = \sum_{n=1}^{\infty} b_n + \sum_{n=1}^{\infty} c_n$$

because $b_n = (a_n + |a_n|)/2$ and $c_n = (a_n - |a_n|)/2$.

**62.** What is wrong here?:

Multiply both sides of the alternating harmonic series

$$S = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \frac{1}{7} - \frac{1}{8} + \frac{1}{9} - \frac{1}{10} + \frac{1}{11} - \frac{1}{12} + \cdots$$

by 2 to get

$$2S = 2 - 1 + \frac{2}{3} - \frac{1}{2} + \frac{2}{5} - \frac{1}{3} + \frac{2}{7} - \frac{1}{4} + \frac{2}{9} - \frac{1}{5} + \frac{2}{11} - \frac{1}{6} + \cdots.$$

Collect terms with the same denominator, as the arrows indicate, to arrive at

$$2S = 1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \cdots.$$

The series on the right-hand side of this equation is the series we started with. Therefore, $2S = S$, and dividing by $S$ gives $2 = 1$. (*Source:* "Riemann's Rearrangement Theorem" by Stewart Galanor, *Mathematics Teacher*, Vol. 80, No. 8, 1987, pp. 675–681.)

**63.** Draw a figure similar to Figure 11.9 to illustrate the convergence of the series in Theorem 14 when $N > 1$.

# 11.7 Power Series

Now that we can test infinite series for convergence we can study the infinite polynomials mentioned at the beginning of this chapter. We call these polynomials power series because they are defined as infinite series of powers of some variable, in our case $x$. Like polynomials, power series can be added, subtracted, multiplied, differentiated, and integrated to give new power series.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Power Series and Convergence

We begin with the formal definition.

**DEFINITIONS Power Series, Center, Coefficients**

A **power series about $x = 0$** is a series of the form

$$\sum_{n=0}^{\infty} c_n x^n = c_0 + c_1 x + c_2 x^2 + \cdots + c_n x^n + \cdots. \tag{1}$$

A **power series about $x = a$** is a series of the form

$$\sum_{n=0}^{\infty} c_n (x - a)^n = c_0 + c_1 (x - a) + c_2 (x - a)^2 + \cdots + c_n (x - a)^n + \cdots \tag{2}$$

in which the **center** $a$ and the **coefficients** $c_0, c_1, c_2, \ldots, c_n, \ldots$ are constants.

Equation (1) is the special case obtained by taking $a = 0$ in Equation (2).

**EXAMPLE 1** A Geometric Series

Taking all the coefficients to be 1 in Equation (1) gives the geometric power series

$$\sum_{n=0}^{\infty} x^n = 1 + x + x^2 + \cdots + x^n + \cdots.$$

This is the geometric series with first term 1 and ratio $x$. It converges to $1/(1 - x)$ for $|x| < 1$. We express this fact by writing

$$\frac{1}{1 - x} = 1 + x + x^2 + \cdots + x^n + \cdots, \qquad -1 < x < 1. \tag{3}$$

Up to now, we have used Equation (3) as a formula for the sum of the series on the right. We now change the focus: We think of the partial sums of the series on the right as polynomials $P_n(x)$ that approximate the function on the left. For values of $x$ near zero, we need take only a few terms of the series to get a good approximation. As we move toward $x = 1$, or $-1$, we must take more terms. Figure 11.10 shows the graphs of $f(x) = 1/(1 - x)$, and the approximating polynomials $y_n = P_n(x)$ for $n = 0, 1, 2$, and 8. The function $f(x) = 1/(1 - x)$ is not continuous on intervals containing $x = 1$, where it has a vertical asymptote. The approximations do not apply when $x \geq 1$.

**EXAMPLE 2** A Geometric Series

The power series

$$1 - \frac{1}{2}(x - 2) + \frac{1}{4}(x - 2)^2 + \cdots + \left(-\frac{1}{2}\right)^n (x - 2)^n + \cdots \tag{4}$$

matches Equation (2) with $a = 2$, $c_0 = 1$, $c_1 = -1/2$, $c_2 = 1/4, \ldots, c_n = (-1/2)^n$. This is a geometric series with first term 1 and ratio $r = -\dfrac{x - 2}{2}$. The series converges for

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

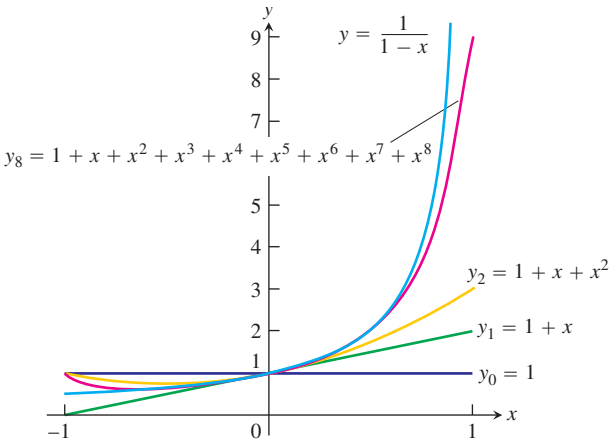

**FIGURE 11.10** The graphs of $f(x) = 1/(1 - x)$ and four of its polynomial approximations (Example 1).

$\left|\frac{x-2}{2}\right| < 1$ or $0 < x < 4$. The sum is

$$\frac{1}{1-r} = \frac{1}{1 + \frac{x-2}{2}} = \frac{2}{x},$$

so

$$\frac{2}{x} = 1 - \frac{(x-2)}{2} + \frac{(x-2)^2}{4} - \cdots + \left(-\frac{1}{2}\right)^n (x-2)^n + \cdots, \qquad 0 < x < 4.$$

Series (4) generates useful polynomial approximations of $f(x) = 2/x$ for values of $x$ near 2:

$$P_0(x) = 1$$

$$P_1(x) = 1 - \frac{1}{2}(x-2) = 2 - \frac{x}{2}$$

$$P_2(x) = 1 - \frac{1}{2}(x-2) + \frac{1}{4}(x-2)^2 = 3 - \frac{3x}{2} + \frac{x^2}{4},$$

and so on (Figure 11.11). ■

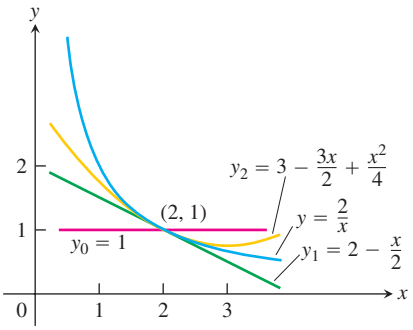

**FIGURE 11.11** The graphs of $f(x) = 2/x$ and its first three polynomial approximations (Example 2).

**EXAMPLE 3** Testing for Convergence Using the Ratio Test

For what values of $x$ do the following power series converge?

**(a)** $\sum_{n=1}^{\infty} (-1)^{n-1} \frac{x^n}{n} = x - \frac{x^2}{2} + \frac{x^3}{3} - \cdots$

**(b)** $\sum_{n=1}^{\infty} (-1)^{n-1} \frac{x^{2n-1}}{2n-1} = x - \frac{x^3}{3} + \frac{x^5}{5} - \cdots$

**(c)** $\sum_{n=0}^{\infty} \frac{x^n}{n!} = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots$

**(d)** $\sum_{n=0}^{\infty} n! x^n = 1 + x + 2!x^2 + 3!x^3 + \cdots$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** Apply the Ratio Test to the series $\sum|u_n|$, where $u_n$ is the $n$th term of the series in question.

**(a)** $\left|\dfrac{u_{n+1}}{u_n}\right| = \dfrac{n}{n+1}|x| \to |x|.$

The series converges absolutely for $|x| < 1$. It diverges if $|x| > 1$ because the $n$th term does not converge to zero. At $x = 1$, we get the alternating harmonic series $1 - 1/2 + 1/3 - 1/4 + \cdots$, which converges. At $x = -1$ we get $-1 - 1/2 - 1/3 - 1/4 - \cdots$, the negative of the harmonic series; it diverges. Series (a) converges for $-1 < x \le 1$ and diverges elsewhere.

**(b)** $\left|\dfrac{u_{n+1}}{u_n}\right| = \dfrac{2n-1}{2n+1}x^2 \to x^2.$

The series converges absolutely for $x^2 < 1$. It diverges for $x^2 > 1$ because the $n$th term does not converge to zero. At $x = 1$ the series becomes $1 - 1/3 + 1/5 - 1/7 + \cdots$, which converges by the Alternating Series Theorem. It also converges at $x = -1$ because it is again an alternating series that satisfies the conditions for convergence. The value at $x = -1$ is the negative of the value at $x = 1$. Series (b) converges for $-1 \le x \le 1$ and diverges elsewhere.

**(c)** $\left|\dfrac{u_{n+1}}{u_n}\right| = \left|\dfrac{x^{n+1}}{(n+1)!}\cdot\dfrac{n!}{x^n}\right| = \dfrac{|x|}{n+1} \to 0$ for every $x$.

The series converges absolutely for all $x$.

**(d)** $\left|\dfrac{u_{n+1}}{u_n}\right| = \left|\dfrac{(n+1)!x^{n+1}}{n!x^n}\right| = (n+1)|x| \to \infty$ unless $x = 0$.

The series diverges for all values of $x$ except $x = 0$.

Example 3 illustrates how we usually test a power series for convergence, and the possible results.

**THEOREM 18 The Convergence Theorem for Power Series**

If the power series $\sum_{n=0}^{\infty} a_n x^n = a_0 + a_1 x + a_2 x^2 + \cdots$ converges for $x = c \ne 0$, then it converges absolutely for all $x$ with $|x| < |c|$. If the series diverges for $x = d$, then it diverges for all $x$ with $|x| > |d|$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Proof** Suppose the series $\sum_{n=0}^{\infty} a_n c^n$ converges. Then $\lim_{n\to\infty} a_n c^n = 0$. Hence, there is an integer $N$ such that $|a_n c^n| < 1$ for all $n \geq N$. That is,

$$|a_n| < \frac{1}{|c|^n} \qquad \text{for } n \geq N. \tag{5}$$

Now take any $x$ such that $|x| < |c|$ and consider

$$|a_0| + |a_1 x| + \cdots + |a_{N-1}x^{N-1}| + |a_N x^N| + |a_{N+1}x^{N+1}| + \cdots.$$

There are only a finite number of terms prior to $|a_N x^N|$, and their sum is finite. Starting with $|a_N x^N|$ and beyond, the terms are less than

$$\left|\frac{x}{c}\right|^N + \left|\frac{x}{c}\right|^{N+1} + \left|\frac{x}{c}\right|^{N+2} + \cdots \tag{6}$$

because of Inequality (5). But Series (6) is a geometric series with ratio $r = |x/c|$, which is less than 1, since $|x| < |c|$. Hence Series (6) converges, so the original series converges absolutely. This proves the first half of the theorem.

The second half of the theorem follows from the first. If the series diverges at $x = d$ and converges at a value $x_0$ with $|x_0| > |d|$, we may take $c = x_0$ in the first half of the theorem and conclude that the series converges absolutely at $d$. But the series cannot converge absolutely and diverge at one and the same time. Hence, if it diverges at $d$, it diverges for all $x$ with $|x| > |d|$. ■

To simplify the notation, Theorem 18 deals with the convergence of series of the form $\sum a_n x^n$. For series of the form $\sum a_n(x - a)^n$ we can replace $x - a$ by $x'$ and apply the results to the series $\sum a_n (x')^n$.

## The Radius of Convergence of a Power Series

The theorem we have just proved and the examples we have studied lead to the conclusion that a power series $\sum c_n(x - a)^n$ behaves in one of three possible ways. It might converge only at $x = a$, or converge everywhere, or converge on some interval of radius $R$ centered at $x = a$. We prove this as a Corollary to Theorem 18.

### COROLLARY TO THEOREM 18

The convergence of the series $\sum c_n(x - a)^n$ is described by one of the following three possibilities:

1. There is a positive number $R$ such that the series diverges for $x$ with $|x - a| > R$ but converges absolutely for $x$ with $|x - a| < R$. The series may or may not converge at either of the endpoints $x = a - R$ and $x = a + R$.
2. The series converges absolutely for every $x$ $(R = \infty)$.
3. The series converges at $x = a$ and diverges elsewhere $(R = 0)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Proof** We assume first that $a = 0$, so that the power series is centered at 0. If the series converges everywhere we are in Case 2. If it converges only at $x = 0$ we are in Case 3. Otherwise there is a nonzero number $d$ such that $\sum c_n d^n$ diverges. The set $S$ of values of $x$ for which the series $\sum c_n x^n$ converges is nonempty because it contains 0 and a positive number $p$ as well. By Theorem 18, the series diverges for all $x$ with $|x| > |d|$, so $|x| \le |d|$ for all $x \in S$, and $S$ is a bounded set. By the Completeness Property of the real numbers (see Appendix 4) a nonempty, bounded set has a least upper bound $R$. (The least upper bound is the smallest number with the property that the elements $x \in S$ satisfy $x \le R$.) If $|x| > R \ge p$, then $x \notin S$ so the series $\sum c_n x^n$ diverges. If $|x| < R$, then $|x|$ is not an upper bound for $S$ (because it's smaller than the least upper bound) so there is a number $b \in S$ such that $b > |x|$. Since $b \in S$, the series $\sum c_n b^n$ converges and therefore the series $\sum c_n |x|^n$ converges by Theorem 18. This proves the Corollary for power series centered at $a = 0$.

For a power series centered at $a \neq 0$, we set $x' = (x - a)$ and repeat the argument with $x'$. Since $x' = 0$ when $x = a$, a radius $R$ interval of convergence for $\sum c_n (x')^n$ centered at $x' = 0$ is the same as a radius $R$ interval of convergence for $\sum c_n (x - a)^n$ centered at $x = a$. This establishes the Corollary for the general case. ■

$R$ is called the **radius of convergence** of the power series and the interval of radius $R$ centered at $x = a$ is called the **interval of convergence**. The interval of convergence may be open, closed, or half-open, depending on the particular series. At points $x$ with $|x - a| < R$, the series converges absolutely. If the series converges for all values of $x$, we say its radius of convergence is infinite. If it converges only at $x = a$, we say its radius of convergence is zero.

### How to Test a Power Series for Convergence

1. *Use the Ratio Test (or nth-Root Test) to find the interval where the series converges absolutely*. Ordinarily, this is an open interval
$$|x - a| < R \qquad \text{or} \qquad a - R < x < a + R.$$
2. *If the interval of absolute convergence is finite, test for convergence or divergence at each endpoint*, as in Examples 3a and b. Use a Comparison Test, the Integral Test, or the Alternating Series Test.
3. *If the interval of absolute convergence is $a - R < x < a + R$, the series diverges for $|x - a| > R$* (it does not even converge conditionally), because the *n*th term does not approach zero for those values of $x$.

## Term-by-Term Differentiation

A theorem from advanced calculus says that a power series can be differentiated term by term at each interior point of its interval of convergence.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**THEOREM 19 The Term-by-Term Differentiation Theorem**

If $\sum c_n(x-a)^n$ converges for $a-R<x<a+R$ for some $R>0$, it defines a function $f$:

$$f(x)=\sum_{n=0}^{\infty} c_n(x-a)^n, \qquad a-R<x<a+R.$$

Such a function $f$ has derivatives of all orders inside the interval of convergence. We can obtain the derivatives by differentiating the original series term by term:

$$f'(x)=\sum_{n=1}^{\infty} nc_n(x-a)^{n-1}$$

$$f''(x)=\sum_{n=2}^{\infty} n(n-1)c_n(x-a)^{n-2},$$

and so on. Each of these derived series converges at every interior point of the interval of convergence of the original series.

**EXAMPLE 4** Applying Term-by-Term Differentiation

Find series for $f'(x)$ and $f''(x)$ if

$$f(x)=\frac{1}{1-x}=1+x+x^2+x^3+x^4+\cdots+x^n+\cdots$$

$$=\sum_{n=0}^{\infty} x^n, \qquad -1<x<1$$

**Solution**

$$f'(x)=\frac{1}{(1-x)^2}=1+2x+3x^2+4x^3+\cdots+nx^{n-1}+\cdots$$

$$=\sum_{n=1}^{\infty} nx^{n-1}, \qquad -1<x<1$$

$$f''(x)=\frac{2}{(1-x)^3}=2+6x+12x^2+\cdots+n(n-1)x^{n-2}+\cdots$$

$$=\sum_{n=2}^{\infty} n(n-1)x^{n-2}, \qquad -1<x<1$$

■

CAUTION Term-by-term differentiation might not work for other kinds of series. For example, the trigonometric series

$$\sum_{n=1}^{\infty} \frac{\sin(n!x)}{n^2}$$

converges for all $x$. But if we differentiate term by term we get the series

$$\sum_{n=1}^{\infty} \frac{n!\cos(n!x)}{n^2},$$

which diverges for all $x$. This is not a power series, since it is not a sum of positive integer powers of $x$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Term-by-Term Integration

Another advanced calculus theorem states that a power series can be integrated term by term throughout its interval of convergence.

**THEOREM 20 The Term-by-Term Integration Theorem**

Suppose that

$$f(x) = \sum_{n=0}^{\infty} c_n(x - a)^n$$

converges for $a - R < x < a + R$ $(R > 0)$. Then

$$\sum_{n=0}^{\infty} c_n \frac{(x - a)^{n+1}}{n + 1}$$

converges for $a - R < x < a + R$ and

$$\int f(x)\,dx = \sum_{n=0}^{\infty} c_n \frac{(x - a)^{n+1}}{n + 1} + C$$

for $a - R < x < a + R$.

**EXAMPLE 5** A Series for $\tan^{-1} x$, $-1 \le x \le 1$

Identify the function

$$f(x) = x - \frac{x^3}{3} + \frac{x^5}{5} - \cdots, \qquad -1 \le x \le 1.$$

**Solution** We differentiate the original series term by term and get

$$f'(x) = 1 - x^2 + x^4 - x^6 + \cdots, \qquad -1 < x < 1.$$

This is a geometric series with first term 1 and ratio $-x^2$, so

$$f'(x) = \frac{1}{1 - (-x^2)} = \frac{1}{1 + x^2}.$$

We can now integrate $f'(x) = 1/(1 + x^2)$ to get

$$\int f'(x)\,dx = \int \frac{dx}{1 + x^2} = \tan^{-1} x + C.$$

The series for $f(x)$ is zero when $x = 0$, so $C = 0$. Hence

$$f(x) = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots = \tan^{-1} x, \qquad -1 < x < 1. \tag{7}$$

In Section 11.10, we will see that the series also converges to $\tan^{-1} x$ at $x = \pm 1$. ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Notice that the original series in Example 5 converges at both endpoints of the original interval of convergence, but Theorem 20 can guarantee the convergence of the differentiated series only inside the interval.

**EXAMPLE 6** A Series for $\ln(1 + x)$, $-1 < x \le 1$

The series

$$\frac{1}{1+t} = 1 - t + t^2 - t^3 + \cdots$$

converges on the open interval $-1 < t < 1$. Therefore,

$$\ln(1+x) = \int_0^x \frac{1}{1+t}\,dt = t - \frac{t^2}{2} + \frac{t^3}{3} - \frac{t^4}{4} + \cdots \Big]_0^x \qquad \text{Theorem 20}$$

$$= x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \cdots, \qquad -1 < x < 1.$$

It can also be shown that the series converges at $x = 1$ to the number $\ln 2$, but that was not guaranteed by the theorem. ■

## USING TECHNOLOGY Study of Series

Series are in many ways analogous to integrals. Just as the number of functions with explicit antiderivatives in terms of elementary functions is small compared to the number of integrable functions, the number of power series in $x$ that agree with explicit elementary functions on $x$-intervals is small compared to the number of power series that converge on some $x$-interval. Graphing utilities can aid in the study of such series in much the same way that numerical integration aids in the study of definite integrals. The ability to study power series at particular values of $x$ is built into most Computer Algebra Systems.

If a series converges rapidly enough, CAS exploration might give us an idea of the sum. For instance, in calculating the early partial sums of the series $\sum_{k=1}^{\infty}[1/(2^{k-1})]$ (Section 11.4, Example 2b), Maple returns $S_n = 1.6066\,95152$ for $31 \le n \le 200$. This suggests that the sum of the series is 1.6066 95152 to 10 digits. Indeed,

$$\sum_{k=201}^{\infty} \frac{1}{2^k - 1} = \sum_{k=201}^{\infty} \frac{1}{2^{k-1}(2 - (1/2^{k-1}))} < \sum_{k=201}^{\infty} \frac{1}{2^{k-1}} = \frac{1}{2^{199}} < 1.25 \times 10^{-60}.$$

The remainder after 200 terms is negligible.

However, CAS and calculator exploration cannot do much for us if the series converges or diverges very slowly, and indeed can be downright misleading. For example, try calculating the partial sums of the series $\sum_{k=1}^{\infty}[1/(10^{10}k)]$. The terms are tiny in comparison to the numbers we normally work with and the partial sums, even for hundreds of terms, are miniscule. We might well be fooled into thinking that the series converges. In fact, it diverges, as we can see by writing it as $(1/10^{10})\sum_{k=1}^{\infty}(1/k)$, a constant times the harmonic series.

We will know better how to interpret numerical results after studying error estimates in Section 11.9.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Multiplication of Power Series

Another theorem from advanced calculus states that absolutely converging power series can be multiplied the way we multiply polynomials. We omit the proof.

**THEOREM 21 The Series Multiplication Theorem for Power Series**
If $A(x) = \sum_{n=0}^{\infty} a_n x^n$ and $B(x) = \sum_{n=0}^{\infty} b_n x^n$ converge absolutely for $|x| < R$, and

$$c_n = a_0 b_n + a_1 b_{n-1} + a_2 b_{n-2} + \cdots + a_{n-1} b_1 + a_n b_0 = \sum_{k=0}^{n} a_k b_{n-k},$$

then $\sum_{n=0}^{\infty} c_n x^n$ converges absolutely to $A(x)B(x)$ for $|x| < R$:

$$\left(\sum_{n=0}^{\infty} a_n x^n\right) \cdot \left(\sum_{n=0}^{\infty} b_n x^n\right) = \sum_{n=0}^{\infty} c_n x^n.$$

**EXAMPLE 7** Multiply the geometric series

$$\sum_{n=0}^{\infty} x^n = 1 + x + x^2 + \cdots + x^n + \cdots = \frac{1}{1-x}, \qquad \text{for } |x| < 1,$$

by itself to get a power series for $1/(1-x)^2$, for $|x| < 1$.

**Solution** Let

$$A(x) = \sum_{n=0}^{\infty} a_n x^n = 1 + x + x^2 + \cdots + x^n + \cdots = 1/(1-x)$$

$$B(x) = \sum_{n=0}^{\infty} b_n x^n = 1 + x + x^2 + \cdots + x^n + \cdots = 1/(1-x)$$

and

$$c_n = \underbrace{a_0 b_n + a_1 b_{n-1} + \cdots + a_k b_{n-k} + \cdots + a_n b_0}_{n+1 \text{ terms}}$$

$$= \underbrace{1 + 1 + \cdots + 1}_{n+1 \text{ ones}} = n + 1.$$

Then, by the Series Multiplication Theorem,

$$A(x) \cdot B(x) = \sum_{n=0}^{\infty} c_n x^n = \sum_{n=0}^{\infty} (n+1) x^n$$

$$= 1 + 2x + 3x^2 + 4x^3 + \cdots + (n+1)x^n + \cdots$$

is the series for $1/(1-x)^2$. The series all converge absolutely for $|x| < 1$.

Notice that Example 4 gives the same answer because

$$\frac{d}{dx}\left(\frac{1}{1-x}\right) = \frac{1}{(1-x)^2}.$$

# EXERCISES 11.7

## Intervals of Convergence

In Exercises 1–32, **(a)** find the series' radius and interval of convergence. For what values of $x$ does the series converge **(b)** absolutely, **(c)** conditionally?

1. $\sum_{n=0}^{\infty} x^n$
2. $\sum_{n=0}^{\infty} (x+5)^n$
3. $\sum_{n=0}^{\infty} (-1)^n (4x+1)^n$
4. $\sum_{n=1}^{\infty} \frac{(3x-2)^n}{n}$
5. $\sum_{n=0}^{\infty} \frac{(x-2)^n}{10^n}$
6. $\sum_{n=0}^{\infty} (2x)^n$
7. $\sum_{n=0}^{\infty} \frac{nx^n}{n+2}$
8. $\sum_{n=1}^{\infty} \frac{(-1)^n (x+2)^n}{n}$
9. $\sum_{n=1}^{\infty} \frac{x^n}{n\sqrt{n}\,3^n}$
10. $\sum_{n=1}^{\infty} \frac{(x-1)^n}{\sqrt{n}}$
11. $\sum_{n=0}^{\infty} \frac{(-1)^n x^n}{n!}$
12. $\sum_{n=0}^{\infty} \frac{3^n x^n}{n!}$
13. $\sum_{n=0}^{\infty} \frac{x^{2n+1}}{n!}$
14. $\sum_{n=0}^{\infty} \frac{(2x+3)^{2n+1}}{n!}$
15. $\sum_{n=0}^{\infty} \frac{x^n}{\sqrt{n^2+3}}$
16. $\sum_{n=0}^{\infty} \frac{(-1)^n x^n}{\sqrt{n^2+3}}$
17. $\sum_{n=0}^{\infty} \frac{n(x+3)^n}{5^n}$
18. $\sum_{n=0}^{\infty} \frac{nx^n}{4^n(n^2+1)}$
19. $\sum_{n=0}^{\infty} \frac{\sqrt{n}x^n}{3^n}$
20. $\sum_{n=1}^{\infty} \sqrt[n]{n}(2x+5)^n$
21. $\sum_{n=1}^{\infty} \left(1+\frac{1}{n}\right)^n x^n$
22. $\sum_{n=1}^{\infty} (\ln n) x^n$
23. $\sum_{n=1}^{\infty} n^n x^n$
24. $\sum_{n=0}^{\infty} n!(x-4)^n$
25. $\sum_{n=1}^{\infty} \frac{(-1)^{n+1}(x+2)^n}{n2^n}$
26. $\sum_{n=0}^{\infty} (-2)^n (n+1)(x-1)^n$
27. $\sum_{n=2}^{\infty} \frac{x^n}{n(\ln n)^2}$ Get the information you need about $\sum 1/(n(\ln n)^2)$ from Section 11.3, Exercise 39.
28. $\sum_{n=2}^{\infty} \frac{x^n}{n \ln n}$ Get the information you need about $\sum 1/(n \ln n)$ from Section 11.3, Exercise 38.
29. $\sum_{n=1}^{\infty} \frac{(4x-5)^{2n+1}}{n^{3/2}}$
30. $\sum_{n=1}^{\infty} \frac{(3x+1)^{n+1}}{2n+2}$
31. $\sum_{n=1}^{\infty} \frac{(x+\pi)^n}{\sqrt{n}}$
32. $\sum_{n=0}^{\infty} \frac{(x-\sqrt{2})^{2n+1}}{2^n}$

In Exercises 33–38, find the series' interval of convergence and, within this interval, the sum of the series as a function of $x$.

33. $\sum_{n=0}^{\infty} \frac{(x-1)^{2n}}{4n}$
34. $\sum_{n=0}^{\infty} \frac{(x+1)^{2n}}{9^n}$
35. $\sum_{n=0}^{\infty} \left(\frac{\sqrt{x}}{2}-1\right)^n$
36. $\sum_{n=0}^{\infty} (\ln x)^n$
37. $\sum_{n=0}^{\infty} \left(\frac{x^2+1}{3}\right)^n$
38. $\sum_{n=0}^{\infty} \left(\frac{x^2-1}{2}\right)^n$

## Theory and Examples

**39.** For what values of $x$ does the series

$$1 - \frac{1}{2}(x-3) + \frac{1}{4}(x-3)^2 + \cdots + \left(-\frac{1}{2}\right)^n (x-3)^n + \cdots$$

converge? What is its sum? What series do you get if you differentiate the given series term by term? For what values of $x$ does the new series converge? What is its sum?

**40.** If you integrate the series in Exercise 39 term by term, what new series do you get? For what values of $x$ does the new series converge, and what is another name for its sum?

**41.** The series

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \frac{x^9}{9!} - \frac{x^{11}}{11!} + \cdots$$

converges to $\sin x$ for all $x$.

**a.** Find the first six terms of a series for $\cos x$. For what values of $x$ should the series converge?

**b.** By replacing $x$ by $2x$ in the series for $\sin x$, find a series that converges to $\sin 2x$ for all $x$.

**c.** Using the result in part (a) and series multiplication, calculate the first six terms of a series for $2 \sin x \cos x$. Compare your answer with the answer in part (b).

**42.** The series

$$e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \frac{x^5}{5!} + \cdots$$

converges to $e^x$ for all $x$.

**a.** Find a series for $(d/dx)e^x$. Do you get the series for $e^x$? Explain your answer.

**b.** Find a series for $\int e^x\,dx$. Do you get the series for $e^x$? Explain your answer.

**c.** Replace $x$ by $-x$ in the series for $e^x$ to find a series that converges to $e^{-x}$ for all $x$. Then multiply the series for $e^x$ and $e^{-x}$ to find the first six terms of a series for $e^{-x} \cdot e^x$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**43.** The series

$$\tan x = x + \frac{x^3}{3} + \frac{2x^5}{15} + \frac{17x^7}{315} + \frac{62x^9}{2835} + \cdots$$

converges to $\tan x$ for $-\pi/2 < x < \pi/2$.

**a.** Find the first five terms of the series for $\ln|\sec x|$. For what values of $x$ should the series converge?

**b.** Find the first five terms of the series for $\sec^2 x$. For what values of $x$ should this series converge?

**c.** Check your result in part (b) by squaring the series given for $\sec x$ in Exercise 44.

**44.** The series

$$\sec x = 1 + \frac{x^2}{2} + \frac{5}{24}x^4 + \frac{61}{720}x^6 + \frac{277}{8064}x^8 + \cdots$$

converges to $\sec x$ for $-\pi/2 < x < \pi/2$.

**a.** Find the first five terms of a power series for the function $\ln|\sec x + \tan x|$. For what values of $x$ should the series converge?

**b.** Find the first four terms of a series for $\sec x \tan x$. For what values of $x$ should the series converge?

**c.** Check your result in part (b) by multiplying the series for $\sec x$ by the series given for $\tan x$ in Exercise 43.

**45. Uniqueness of convergent power series**

**a.** Show that if two power series $\sum_{n=0}^{\infty} a_n x^n$ and $\sum_{n=0}^{\infty} b_n x^n$ are convergent and equal for all values of $x$ in an open interval $(-c, c)$, then $a_n = b_n$ for every $n$. (*Hint:* Let $f(x) = \sum_{n=0}^{\infty} a_n x^n = \sum_{n=0}^{\infty} b_n x^n$. Differentiate term by term to show that $a_n$ and $b_n$ both equal $f^{(n)}(0)/(n!)$.)

**b.** Show that if $\sum_{n=0}^{\infty} a_n x^n = 0$ for all $x$ in an open interval $(-c, c)$, then $a_n = 0$ for every $n$.

**46. The sum of the series $\sum_{n=0}^{\infty}(n^2/2^n)$** To find the sum of this series, express $1/(1 - x)$ as a geometric series, differentiate both sides of the resulting equation with respect to $x$, multiply both sides of the result by $x$, differentiate again, multiply by $x$ again, and set $x$ equal to $1/2$. What do you get? (*Source*: David E. Dobbs' letter to the editor, *Illinois Mathematics Teacher*, Vol. 33, Issue 4, 1982, p. 27.)

**47. Convergence at endpoints** Show by examples that the convergence of a power series at an endpoint of its interval of convergence may be either conditional or absolute.

**48.** Make up a power series whose interval of convergence is

**a.** $(-3, 3)$ **b.** $(-2, 0)$ **c.** $(1, 5)$.

# 11.8 Taylor and Maclaurin Series

This section shows how functions that are infinitely differentiable generate power series called Taylor series. In many cases, these series can provide useful polynomial approximations of the generating functions.

## Series Representations

We know from Theorem 19 that within its interval of convergence the sum of a power series is a continuous function with derivatives of all orders. But what about the other way around? If a function $f(x)$ has derivatives of all orders on an interval $I$, can it be expressed as a power series on $I$? And if it can, what will its coefficients be?

We can answer the last question readily if we assume that $f(x)$ is the sum of a power series

$$\begin{aligned} f(x) &= \sum_{n=0}^{\infty} a_n(x-a)^n \\ &= a_0 + a_1(x-a) + a_2(x-a)^2 + \cdots + a_n(x-a)^n + \cdots \end{aligned}$$

with a positive radius of convergence. By repeated term-by-term differentiation within the interval of convergence $I$ we obtain

$$\begin{aligned} f'(x) &= a_1 + 2a_2(x-a) + 3a_3(x-a)^2 + \cdots + na_n(x-a)^{n-1} + \cdots \\ f''(x) &= 1\cdot 2a_2 + 2\cdot 3a_3(x-a) + 3\cdot 4a_4(x-a)^2 + \cdots \\ f'''(x) &= 1\cdot 2\cdot 3a_3 + 2\cdot 3\cdot 4a_4(x-a) + 3\cdot 4\cdot 5a_5(x-a)^2 + \cdots, \end{aligned}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

with the $n$th derivative, for all $n$, being

$$f^{(n)}(x) = n!a_n + \text{a sum of terms with } (x - a) \text{ as a factor.}$$

Since these equations all hold at $x = a$, we have

$$\begin{aligned} f'(a) &= a_1, \\ f''(a) &= 1 \cdot 2a_2, \\ f'''(a) &= 1 \cdot 2 \cdot 3a_3, \end{aligned}$$

and, in general,

$$f^{(n)}(a) = n!a_n.$$

These formulas reveal a pattern in the coefficients of any power series $\sum_{n=0}^{\infty} a_n(x - a)^n$ that converges to the values of $f$ on $I$ ("represents $f$ on $I$"). If there *is* such a series (still an open question), then there is only one such series and its $n$th coefficient is

$$a_n = \frac{f^{(n)}(a)}{n!}.$$

If $f$ has a series representation, then the series must be

$$f(x) = f(a) + f'(a)(x - a) + \frac{f''(a)}{2!}(x - a)^2 + \cdots + \frac{f^{(n)}(a)}{n!}(x - a)^n + \cdots. \tag{1}$$

But if we start with an arbitrary function $f$ that is infinitely differentiable on an interval $I$ centered at $x = a$ and use it to generate the series in Equation (1), will the series then converge to $f(x)$ at each $x$ in the interior of $I$? The answer is maybe—for some functions it will but for other functions it will not, as we will see.

## Taylor and Maclaurin Series

HISTORICAL BIOGRAPHIES

Brook Taylor
(1685–1731)

Colin Maclaurin
(1698–1746)

**DEFINITIONS Taylor Series, Maclaurin Series**

Let $f$ be a function with derivatives of all orders throughout some interval containing $a$ as an interior point. Then the **Taylor series generated by $f$ at $x = a$ is**

$$\sum_{k=0}^{\infty} \frac{f^{(k)}(a)}{k!}(x - a)^k = f(a) + f'(a)(x - a) + \frac{f''(a)}{2!}(x - a)^2 + \cdots + \frac{f^{(n)}(a)}{n!}(x - a)^n + \cdots.$$

The **Maclaurin series generated by $f$ is**

$$\sum_{k=0}^{\infty} \frac{f^{(k)}(0)}{k!}x^k = f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \cdots + \frac{f^{(n)}(0)}{n!}x^n + \cdots,$$

the Taylor series generated by $f$ at $x = 0$.

The Maclaurin series generated by $f$ is often just called the Taylor series of $f$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 1** Finding a Taylor Series

Find the Taylor series generated by $f(x) = 1/x$ at $a = 2$. Where, if anywhere, does the series converge to $1/x$?

**Solution** We need to find $f(2), f'(2), f''(2), \ldots$. Taking derivatives we get

$$f(x) = x^{-1}, \qquad f(2) = 2^{-1} = \frac{1}{2},$$

$$f'(x) = -x^{-2}, \qquad f'(2) = -\frac{1}{2^2},$$

$$f''(x) = 2!x^{-3}, \qquad \frac{f''(2)}{2!} = 2^{-3} = \frac{1}{2^3},$$

$$f'''(x) = -3!x^{-4}, \qquad \frac{f'''(2)}{3!} = -\frac{1}{2^4},$$

$$\vdots \qquad\qquad \vdots$$

$$f^{(n)}(x) = (-1)^n n! x^{-(n+1)}, \qquad \frac{f^{(n)}(2)}{n!} = \frac{(-1)^n}{2^{n+1}}.$$

The Taylor series is

$$f(2) + f'(2)(x-2) + \frac{f''(2)}{2!}(x-2)^2 + \cdots + \frac{f^{(n)}(2)}{n!}(x-2)^n + \cdots$$

$$= \frac{1}{2} - \frac{(x-2)}{2^2} + \frac{(x-2)^2}{2^3} - \cdots + (-1)^n \frac{(x-2)^n}{2^{n+1}} + \cdots.$$

This is a geometric series with first term $1/2$ and ratio $r = -(x-2)/2$. It converges absolutely for $|x-2| < 2$ and its sum is

$$\frac{1/2}{1 + (x-2)/2} = \frac{1}{2 + (x-2)} = \frac{1}{x}.$$

In this example the Taylor series generated by $f(x) = 1/x$ at $a = 2$ converges to $1/x$ for $|x-2| < 2$ or $0 < x < 4$. ■

## Taylor Polynomials

The linearization of a differentiable function $f$ at a point $a$ is the polynomial of degree one given by

$$P_1(x) = f(a) + f'(a)(x-a).$$

In Section 3.8 we used this linearization to approximate $f(x)$ at values of $x$ near $a$. If $f$ has derivatives of higher order at $a$, then it has higher-order polynomial approximations as well, one for each available derivative. These polynomials are called the Taylor polynomials of $f$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**DEFINITION Taylor Polynomial of Order *n***

Let $f$ be a function with derivatives of order $k$ for $k = 1, 2, \ldots, N$ in some interval containing $a$ as an interior point. Then for any integer $n$ from 0 through $N$, the **Taylor polynomial of order *n*** generated by $f$ at $x = a$ is the polynomial

$$P_n(x) = f(a) + f'(a)(x - a) + \frac{f''(a)}{2!}(x - a)^2 + \cdots + \frac{f^{(k)}(a)}{k!}(x - a)^k + \cdots + \frac{f^{(n)}(a)}{n!}(x - a)^n.$$

We speak of a Taylor polynomial of *order n* rather than *degree n* because $f^{(n)}(a)$ may be zero. The first two Taylor polynomials of $f(x) = \cos x$ at $x = 0$, for example, are $P_0(x) = 1$ and $P_1(x) = 1$. The first-order Taylor polynomial has degree zero, not one.

Just as the linearization of $f$ at $x = a$ provides the best linear approximation of $f$ in the neighborhood of $a$, the higher-order Taylor polynomials provide the best polynomial approximations of their respective degrees. (See Exercise 32.)

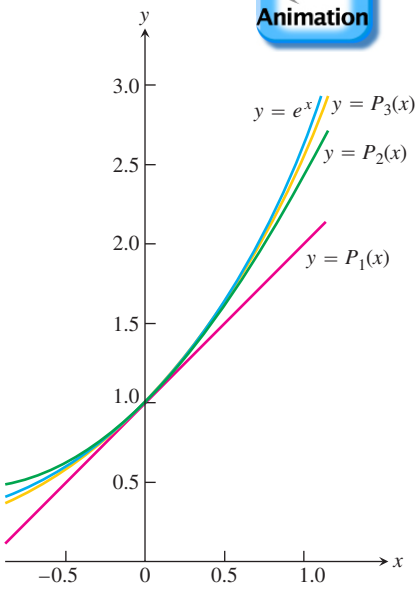

**FIGURE 11.12** The graph of $f(x) = e^x$ and its Taylor polynomials
$P_1(x) = 1 + x$
$P_2(x) = 1 + x + (x^2/2!)$
$P_3(x) = 1 + x + (x^2/2!) + (x^3/3!)$.
Notice the very close agreement near the center $x = 0$ (Example 2).

**EXAMPLE 2** Finding Taylor Polynomials for $e^x$

Find the Taylor series and the Taylor polynomials generated by $f(x) = e^x$ at $x = 0$.

**Solution** Since

$$f(x) = e^x, \quad f'(x) = e^x, \quad \ldots, \quad f^{(n)}(x) = e^x, \quad \ldots,$$

we have

$$f(0) = e^0 = 1, \quad f'(0) = 1, \quad \ldots, \quad f^{(n)}(0) = 1, \quad \ldots.$$

The Taylor series generated by $f$ at $x = 0$ is

$$f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \cdots + \frac{f^{(n)}(0)}{n!}x^n + \cdots$$

$$= 1 + x + \frac{x^2}{2} + \cdots + \frac{x^n}{n!} + \cdots$$

$$= \sum_{k=0}^{\infty} \frac{x^k}{k!}.$$

This is also the Maclaurin series for $e^x$. In Section 11.9 we will see that the series converges to $e^x$ at every $x$.

The Taylor polynomial of order $n$ at $x = 0$ is

$$P_n(x) = 1 + x + \frac{x^2}{2} + \cdots + \frac{x^n}{n!}.$$

See Figure 11.12. ■

**EXAMPLE 3** Finding Taylor Polynomials for $\cos x$

Find the Taylor series and Taylor polynomials generated by $f(x) = \cos x$ at $x = 0$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** The cosine and its derivatives are

$$\begin{aligned} f(x) &= \cos x, & f'(x) &= -\sin x, \\ f''(x) &= -\cos x, & f^{(3)}(x) &= \sin x, \\ &\vdots & &\vdots \\ f^{(2n)}(x) &= (-1)^n \cos x, & f^{(2n+1)}(x) &= (-1)^{n+1} \sin x. \end{aligned}$$

At $x = 0$, the cosines are 1 and the sines are 0, so

$$f^{(2n)}(0) = (-1)^n, \qquad f^{(2n+1)}(0) = 0.$$

The Taylor series generated by $f$ at 0 is

$$\begin{aligned} f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \frac{f'''(0)}{3!}x^3 + \cdots + \frac{f^{(n)}(0)}{n!}x^n + \cdots \\ = 1 + 0 \cdot x - \frac{x^2}{2!} + 0 \cdot x^3 + \frac{x^4}{4!} + \cdots + (-1)^n \frac{x^{2n}}{(2n)!} + \cdots \\ = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k}}{(2k)!}. \end{aligned}$$

This is also the Maclaurin series for $\cos x$. In Section 11.9, we will see that the series converges to $\cos x$ at every $x$.

Because $f^{(2n+1)}(0) = 0$, the Taylor polynomials of orders $2n$ and $2n + 1$ are identical:

$$P_{2n}(x) = P_{2n+1}(x) = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots + (-1)^n \frac{x^{2n}}{(2n)!}.$$

Figure 11.13 shows how well these polynomials approximate $f(x) = \cos x$ near $x = 0$. Only the right-hand portions of the graphs are given because the graphs are symmetric about the $y$-axis. ■

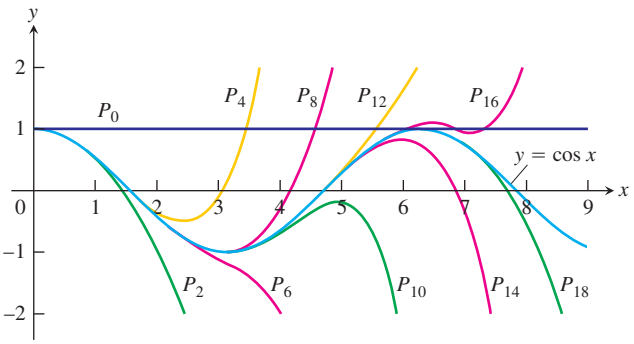

**FIGURE 11.13** The polynomials

$$P_{2n}(x) = \sum_{k=0}^{n} \frac{(-1)^k x^{2k}}{(2k)!}$$

converge to $\cos x$ as $n \to \infty$. We can deduce the behavior of $\cos x$ arbitrarily far away solely from knowing the values of the cosine and its derivatives at $x = 0$ (Example 3).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 4** A Function $f$ Whose Taylor Series Converges at Every $x$ but Converges to $f(x)$ Only at $x = 0$

It can be shown (though not easily) that

$$f(x) = \begin{cases} 0, & x = 0 \\ e^{-1/x^2}, & x \neq 0 \end{cases}$$

(Figure 11.14) has derivatives of all orders at $x = 0$ and that $f^{(n)}(0) = 0$ for all $n$. This means that the Taylor series generated by $f$ at $x = 0$ is

$$f(0) + f'(0)x + \frac{f''(0)}{2!}x^2 + \cdots + \frac{f^{(n)}(0)}{n!}x^n + \cdots$$
$$= 0 + 0 \cdot x + 0 \cdot x^2 + \cdots + 0 \cdot x^n + \cdots$$
$$= 0 + 0 + \cdots + 0 + \cdots.$$

The series converges for every $x$ (its sum is 0) but converges to $f(x)$ only at $x = 0$. ■

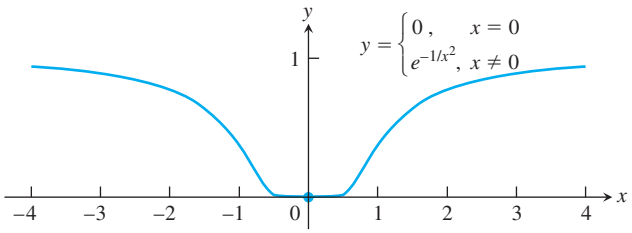

**FIGURE 11.14** The graph of the continuous extension of $y = e^{-1/x^2}$ is so flat at the origin that all of its derivatives there are zero (Example 4).

Two questions still remain.

1. For what values of $x$ can we normally expect a Taylor series to converge to its generating function?
2. How accurately do a function's Taylor polynomials approximate the function on a given interval?

The answers are provided by a theorem of Taylor in the next section.

# EXERCISES 11.8

## Finding Taylor Polynomials

In Exercises 1–8, find the Taylor polynomials of orders 0, 1, 2, and 3 generated by $f$ at $a$.

**1.** $f(x) = \ln x, \quad a = 1$

**2.** $f(x) = \ln(1 + x), \quad a = 0$

**3.** $f(x) = 1/x, \quad a = 2$

**4.** $f(x) = 1/(x + 2), \quad a = 0$

**5.** $f(x) = \sin x, \quad a = \pi/4$

**6.** $f(x) = \cos x, \quad a = \pi/4$

**7.** $f(x) = \sqrt{x}, \quad a = 4$

**8.** $f(x) = \sqrt{x + 4}, \quad a = 0$

## Finding Taylor Series at $x = 0$ (Maclaurin Series)

Find the Maclaurin series for the functions in Exercises 9–20.

**9.** $e^{-x}$

**10.** $e^{x/2}$

**11.** $\dfrac{1}{1 + x}$

**12.** $\dfrac{1}{1 - x}$

**13.** $\sin 3x$

**14.** $\sin \dfrac{x}{2}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

**15.** $7\cos(-x)$ **16.** $5\cos \pi x$

**17.** $\cosh x = \dfrac{e^x + e^{-x}}{2}$ **18.** $\sinh x = \dfrac{e^x - e^{-x}}{2}$

**19.** $x^4 - 2x^3 - 5x + 4$ **20.** $(x + 1)^2$

## Finding Taylor Series

Exercises

In Exercises 21–28, find the Taylor series generated by $f$ at $x = a$.

**21.** $f(x) = x^3 - 2x + 4, \quad a = 2$

**22.** $f(x) = 2x^3 + x^2 + 3x - 8, \quad a = 1$

**23.** $f(x) = x^4 + x^2 + 1, \quad a = -2$

**24.** $f(x) = 3x^5 - x^4 + 2x^3 + x^2 - 2, \quad a = -1$

**25.** $f(x) = 1/x^2, \quad a = 1$

**26.** $f(x) = x/(1 - x), \quad a = 0$

**27.** $f(x) = e^x, \quad a = 2$

**28.** $f(x) = 2^x, \quad a = 1$

## Theory and Examples

**29.** Use the Taylor series generated by $e^x$ at $x = a$ to show that

$$e^x = e^a\left[1 + (x - a) + \frac{(x - a)^2}{2!} + \cdots\right].$$

**30.** (*Continuation of Exercise 29.*) Find the Taylor series generated by $e^x$ at $x = 1$. Compare your answer with the formula in Exercise 29.

**31.** Let $f(x)$ have derivatives through order $n$ at $x = a$. Show that the Taylor polynomial of order $n$ and its first $n$ derivatives have the same values that $f$ and its first $n$ derivatives have at $x = a$.

**32. Of all polynomials of degree $\le n$, the Taylor polynomial of order $n$ gives the best approximation** Suppose that $f(x)$ is differentiable on an interval centered at $x = a$ and that $g(x) = b_0 + b_1(x - a) + \cdots + b_n(x - a)^n$ is a polynomial of degree $n$ with constant coefficients $b_0, \ldots, b_n$. Let $E(x) = f(x) - g(x)$. Show that if we impose on $g$ the conditions

**a.** $E(a) = 0$ The approximation error is zero at $x = a$.

**b.** $\lim\limits_{x \to a} \dfrac{E(x)}{(x - a)^n} = 0,$ The error is negligible when compared to $(x - a)^n$.

then

$$g(x) = f(a) + f'(a)(x - a) + \frac{f''(a)}{2!}(x - a)^2 + \cdots + \frac{f^{(n)}(a)}{n!}(x - a)^n.$$

Thus, the Taylor polynomial $P_n(x)$ is the only polynomial of degree less than or equal to $n$ whose error is both zero at $x = a$ and negligible when compared with $(x - a)^n$.

## Quadratic Approximations

The Taylor polynomial of order 2 generated by a twice-differentiable function $f(x)$ at $x = a$ is called the **quadratic approximation** of $f$ at $x = a$. In Exercises 33–38, find the **(a)** linearization (Taylor polynomial of order 1) and **(b)** quadratic approximation of $f$ at $x = 0$.

**33.** $f(x) = \ln(\cos x)$ **34.** $f(x) = e^{\sin x}$

**35.** $f(x) = 1/\sqrt{1 - x^2}$ **36.** $f(x) = \cosh x$

**37.** $f(x) = \sin x$ **38.** $f(x) = \tan x$

# 11.9 Convergence of Taylor Series; Error Estimates

This section addresses the two questions left unanswered by Section 11.8:

1. When does a Taylor series converge to its generating function?
2. How accurately do a function's Taylor polynomials approximate the function on a given interval?

## Taylor's Theorem

We answer these questions with the following theorem.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**THEOREM 22 Taylor's Theorem**

If $f$ and its first $n$ derivatives $f', f'', \ldots, f^{(n)}$ are continuous on the closed interval between $a$ and $b$, and $f^{(n)}$ is differentiable on the open interval between $a$ and $b$, then there exists a number $c$ between $a$ and $b$ such that

$$f(b) = f(a) + f'(a)(b - a) + \frac{f''(a)}{2!}(b - a)^2 + \cdots + \frac{f^{(n)}(a)}{n!}(b - a)^n + \frac{f^{(n+1)}(c)}{(n + 1)!}(b - a)^{n+1}.$$

Taylor's Theorem is a generalization of the Mean Value Theorem (Exercise 39). There is a proof of Taylor's Theorem at the end of this section.

When we apply Taylor's Theorem, we usually want to hold $a$ fixed and treat $b$ as an independent variable. Taylor's formula is easier to use in circumstances like these if we change $b$ to $x$. Here is a version of the theorem with this change.

**Taylor's Formula**

If $f$ has derivatives of all orders in an open interval $I$ containing $a$, then for each positive integer $n$ and for each $x$ in $I$,

$$f(x) = f(a) + f'(a)(x - a) + \frac{f''(a)}{2!}(x - a)^2 + \cdots + \frac{f^{(n)}(a)}{n!}(x - a)^n + R_n(x), \tag{1}$$

where

$$R_n(x) = \frac{f^{(n+1)}(c)}{(n + 1)!}(x - a)^{n+1} \quad \text{for some } c \text{ between } a \text{ and } x. \tag{2}$$

When we state Taylor's theorem this way, it says that for each $x \in I$,

$$f(x) = P_n(x) + R_n(x).$$

The function $R_n(x)$ is determined by the value of the $(n + 1)$st derivative $f^{(n+1)}$ at a point $c$ that depends on both $a$ and $x$, and which lies somewhere between them. For any value of $n$ we want, the equation gives both a polynomial approximation of $f$ of that order and a formula for the error involved in using that approximation over the interval $I$.

Equation (1) is called **Taylor's formula**. The function $R_n(x)$ is called the **remainder of order $n$** or the **error term** for the approximation of $f$ by $P_n(x)$ over $I$. If $R_n(x) \to 0$ as $n \to \infty$ for all $x \in I$, we say that the Taylor series generated by $f$ at $x = a$ **converges** to $f$ on $I$, and we write

$$f(x) = \sum_{k=0}^{\infty} \frac{f^{(k)}(a)}{k!}(x - a)^k.$$

Often we can estimate $R_n$ without knowing the value of $c$, as the following example illustrates.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 1** The Taylor Series for $e^x$ Revisited

Show that the Taylor series generated by $f(x) = e^x$ at $x = 0$ converges to $f(x)$ for every real value of $x$.

**Solution** The function has derivatives of all orders throughout the interval $I = (-\infty, \infty)$. Equations (1) and (2) with $f(x) = e^x$ and $a = 0$ give

$$e^x = 1 + x + \frac{x^2}{2!} + \cdots + \frac{x^n}{n!} + R_n(x)$$

Polynomial from Section 11.8, Example 2

and

$$R_n(x) = \frac{e^c}{(n+1)!}x^{n+1} \qquad \text{for some } c \text{ between 0 and } x.$$

Since $e^x$ is an increasing function of $x$, $e^c$ lies between $e^0 = 1$ and $e^x$. When $x$ is negative, so is $c$, and $e^c < 1$. When $x$ is zero, $e^x = 1$ and $R_n(x) = 0$. When $x$ is positive, so is $c$, and $e^c < e^x$. Thus,

$$|R_n(x)| \le \frac{|x|^{n+1}}{(n+1)!} \qquad \text{when } x \le 0,$$

and

$$|R_n(x)| < e^x \frac{x^{n+1}}{(n+1)!} \qquad \text{when } x > 0.$$

Finally, because

$$\lim_{n\to\infty} \frac{x^{n+1}}{(n+1)!} = 0 \qquad \text{for every } x,$$

Section 11.1

$\lim_{n\to\infty} R_n(x) = 0$, and the series converges to $e^x$ for every $x$. Thus,

$$e^x = \sum_{k=0}^{\infty} \frac{x^k}{k!} = 1 + x + \frac{x^2}{2!} + \cdots + \frac{x^k}{k!} + \cdots. \tag{3}$$

■

## Estimating the Remainder

It is often possible to estimate $R_n(x)$ as we did in Example 1. This method of estimation is so convenient that we state it as a theorem for future reference.

**THEOREM 23 The Remainder Estimation Theorem**

If there is a positive constant $M$ such that $|f^{(n+1)}(t)| \le M$ for all $t$ between $x$ and $a$, inclusive, then the remainder term $R_n(x)$ in Taylor's Theorem satisfies the inequality

$$|R_n(x)| \le M\frac{|x-a|^{n+1}}{(n+1)!}.$$

If this condition holds for every $n$ and the other conditions of Taylor's Theorem are satisfied by $f$, then the series converges to $f(x)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We are now ready to look at some examples of how the Remainder Estimation Theorem and Taylor's Theorem can be used together to settle questions of convergence. As you will see, they can also be used to determine the accuracy with which a function is approximated by one of its Taylor polynomials.

### EXAMPLE 2 The Taylor Series for sin $x$ at $x = 0$

Show that the Taylor series for sin $x$ at $x = 0$ converges for all $x$.

**Solution** The function and its derivatives are

$$\begin{aligned} f(x) &= \sin x, & f'(x) &= \cos x, \\ f''(x) &= -\sin x, & f'''(x) &= -\cos x, \\ &\vdots & &\vdots \\ f^{(2k)}(x) &= (-1)^k \sin x, & f^{(2k+1)}(x) &= (-1)^k \cos x, \end{aligned}$$

so

$$f^{(2k)}(0) = 0 \quad \text{and} \quad f^{(2k+1)}(0) = (-1)^k.$$

The series has only odd-powered terms and, for $n = 2k + 1$, Taylor's Theorem gives

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots + \frac{(-1)^k x^{2k+1}}{(2k+1)!} + R_{2k+1}(x).$$

All the derivatives of sin $x$ have absolute values less than or equal to 1, so we can apply the Remainder Estimation Theorem with $M = 1$ to obtain

$$|R_{2k+1}(x)| \le 1 \cdot \frac{|x|^{2k+2}}{(2k+2)!}.$$

Since $(|x|^{2k+2}/(2k+2)!) \to 0$ as $k \to \infty$, whatever the value of $x$, $R_{2k+1}(x) \to 0$, and the Maclaurin series for sin $x$ converges to sin $x$ for every $x$. Thus,

$$\sin x = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k+1}}{(2k+1)!} = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots. \tag{4}$$

■

### EXAMPLE 3 The Taylor Series for cos $x$ at $x = 0$ Revisited

Show that the Taylor series for cos $x$ at $x = 0$ converges to cos $x$ for every value of $x$.

**Solution** We add the remainder term to the Taylor polynomial for cos $x$ (Section 11.8, Example 3) to obtain Taylor's formula for cos $x$ with $n = 2k$:

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots + (-1)^k \frac{x^{2k}}{(2k)!} + R_{2k}(x).$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Because the derivatives of the cosine have absolute value less than or equal to 1, the Remainder Estimation Theorem with $M = 1$ gives

$$|R_{2k}(x)| \le 1 \cdot \frac{|x|^{2k+1}}{(2k+1)!}.$$

For every value of $x$, $R_{2k} \to 0$ as $k \to \infty$. Therefore, the series converges to $\cos x$ for every value of $x$. Thus,

$$\cos x = \sum_{k=0}^{\infty} \frac{(-1)^k x^{2k}}{(2k)!} = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \frac{x^6}{6!} + \cdots. \tag{5}$$

■

### EXAMPLE 4 Finding a Taylor Series by Substitution

Find the Taylor series for $\cos 2x$ at $x = 0$.

**Solution** We can find the Taylor series for $\cos 2x$ by substituting $2x$ for $x$ in the Taylor series for $\cos x$:

$$\cos 2x = \sum_{k=0}^{\infty} \frac{(-1)^k (2x)^{2k}}{(2k)!} = 1 - \frac{(2x)^2}{2!} + \frac{(2x)^4}{4!} - \frac{(2x)^6}{6!} + \cdots \qquad \text{Equation (5) with } 2x \text{ for } x$$

$$= 1 - \frac{2^2 x^2}{2!} + \frac{2^4 x^4}{4!} - \frac{2^6 x^6}{6!} + \cdots$$

$$= \sum_{k=0}^{\infty} (-1)^k \frac{2^{2k} x^{2k}}{(2k)!}.$$

Equation (5) holds for $-\infty < x < \infty$, implying that it holds for $-\infty < 2x < \infty$, so the newly created series converges for all $x$. Exercise 45 explains why the series is in fact the Taylor series for $\cos 2x$. ■

### EXAMPLE 5 Finding a Taylor Series by Multiplication

Find the Taylor series for $x \sin x$ at $x = 0$.

**Solution** We can find the Taylor series for $x \sin x$ by multiplying the Taylor series for $\sin x$ (Equation 4) by $x$:

$$x \sin x = x\left(x - \frac{x^3}{3!} + \frac{x^5}{5!} - \frac{x^7}{7!} + \cdots\right)$$

$$= x^2 - \frac{x^4}{3!} + \frac{x^6}{5!} - \frac{x^8}{7!} + \cdots.$$

The new series converges for all $x$ because the series for $\sin x$ converges for all $x$. Exercise 45 explains why the series is the Taylor series for $x \sin x$. ■

## Truncation Error

The Taylor series for $e^x$ at $x = 0$ converges to $e^x$ for all $x$. But we still need to decide how many terms to use to approximate $e^x$ to a given degree of accuracy. We get this information from the Remainder Estimation Theorem.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 6** Calculate $e$ with an error of less than $10^{-6}$.

**Solution** We can use the result of Example 1 with $x = 1$ to write

$$e = 1 + 1 + \frac{1}{2!} + \cdots + \frac{1}{n!} + R_n(1),$$

with

$$R_n(1) = e^c \frac{1}{(n+1)!} \qquad \text{for some } c \text{ between 0 and 1.}$$

For the purposes of this example, we assume that we know that $e < 3$. Hence, we are certain that

$$\frac{1}{(n+1)!} < R_n(1) < \frac{3}{(n+1)!}$$

because $1 < e^c < 3$ for $0 < c < 1$.

By experiment we find that $1/9! > 10^{-6}$, while $3/10! < 10^{-6}$. Thus we should take $(n+1)$ to be at least 10, or $n$ to be at least 9. With an error of less than $10^{-6}$,

$$e = 1 + 1 + \frac{1}{2} + \frac{1}{3!} + \cdots + \frac{1}{9!} \approx 2.718282. \quad \blacksquare$$

**EXAMPLE 7** For what values of $x$ can we replace $\sin x$ by $x - (x^3/3!)$ with an error of magnitude no greater than $3 \times 10^{-4}$?

**Solution** Here we can take advantage of the fact that the Taylor series for $\sin x$ is an alternating series for every nonzero value of $x$. According to the Alternating Series Estimation Theorem (Section 11.6), the error in truncating

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots$$

after $(x^3/3!)$ is no greater than

$$\left|\frac{x^5}{5!}\right| = \frac{|x|^5}{120}.$$

Therefore the error will be less than or equal to $3 \times 10^{-4}$ if

$$\frac{|x|^5}{120} < 3 \times 10^{-4} \quad \text{or} \quad |x| < \sqrt[5]{360 \times 10^{-4}} \approx 0.514. \qquad \text{Rounded down, to be safe}$$

The Alternating Series Estimation Theorem tells us something that the Remainder Estimation Theorem does not: namely, that the estimate $x - (x^3/3!)$ for $\sin x$ is an underestimate when $x$ is positive because then $x^5/120$ is positive.

Figure 11.15 shows the graph of $\sin x$, along with the graphs of a number of its approximating Taylor polynomials. The graph of $P_3(x) = x - (x^3/3!)$ is almost indistinguishable from the sine curve when $-1 \le x \le 1$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

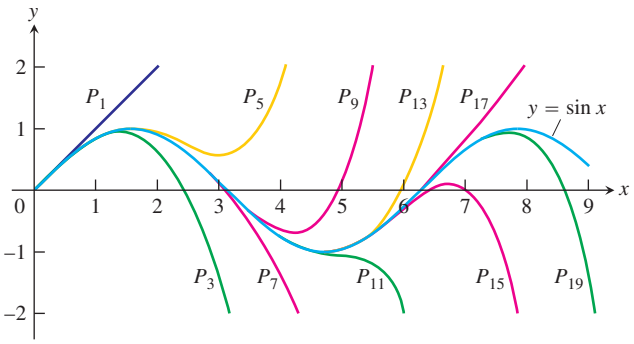

**FIGURE 11.15** The polynomials

$$P_{2n+1}(x) = \sum_{k=0}^{n} \frac{(-1)^k x^{2k+1}}{(2k+1)!}$$

converge to $\sin x$ as $n \to \infty$. Notice how closely $P_3(x)$ approximates the sine curve for $x < 1$ (Example 7).

You might wonder how the estimate given by the Remainder Estimation Theorem compares with the one just obtained from the Alternating Series Estimation Theorem. If we write

$$\sin x = x - \frac{x^3}{3!} + R_3,$$

then the Remainder Estimation Theorem gives

$$|R_3| \le 1 \cdot \frac{|x|^4}{4!} = \frac{|x|^4}{24},$$

which is not as good. But if we recognize that $x - (x^3/3!) = 0 + x + 0x^2 - (x^3/3!) + 0x^4$ is the Taylor polynomial of order 4 as well as of order 3, then

$$\sin x = x - \frac{x^3}{3!} + 0 + R_4,$$

and the Remainder Estimation Theorem with $M = 1$ gives

$$|R_4| \le 1 \cdot \frac{|x|^5}{5!} = \frac{|x|^5}{120}.$$

This is what we had from the Alternating Series Estimation Theorem. ■

## Combining Taylor Series

On the intersection of their intervals of convergence, Taylor series can be added, subtracted, and multiplied by constants, and the results are once again Taylor series. The Taylor series for $f(x) + g(x)$ is the sum of the Taylor series for $f(x)$ and $g(x)$ because the $n$th derivative of $f + g$ is $f^{(n)} + g^{(n)}$, and so on. Thus we obtain the Taylor series for $(1 + \cos 2x)/2$ by adding 1 to the Taylor series for $\cos 2x$ and dividing the combined results by 2, and the Taylor series for $\sin x + \cos x$ is the term-by-term sum of the Taylor series for $\sin x$ and $\cos x$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Euler's Identity

As you may recall, a complex number is a number of the form $a + bi$, where $a$ and $b$ are real numbers and $i = \sqrt{-1}$. If we substitute $x = i\theta$ ($\theta$ real) in the Taylor series for $e^x$ and use the relations

$$i^2 = -1, \qquad i^3 = i^2 i = -i, \qquad i^4 = i^2 i^2 = 1, \qquad i^5 = i^4 i = i,$$

and so on, to simplify the result, we obtain

$$\begin{aligned} e^{i\theta} &= 1 + \frac{i\theta}{1!} + \frac{i^2\theta^2}{2!} + \frac{i^3\theta^3}{3!} + \frac{i^4\theta^4}{4!} + \frac{i^5\theta^5}{5!} + \frac{i^6\theta^6}{6!} + \cdots \\ &= \left(1 - \frac{\theta^2}{2!} + \frac{\theta^4}{4!} - \frac{\theta^6}{6!} + \cdots\right) + i\left(\theta - \frac{\theta^3}{3!} + \frac{\theta^5}{5!} - \cdots\right) = \cos\theta + i\sin\theta. \end{aligned}$$

This does not *prove* that $e^{i\theta} = \cos\theta + i\sin\theta$ because we have not yet defined what it means to raise $e$ to an imaginary power. Rather, it says how to define $e^{i\theta}$ to be consistent with other things we know.

**DEFINITION**

For any real number $\theta$, $e^{i\theta} = \cos\theta + i\sin\theta$. (6)

Equation (6), called **Euler's identity**, enables us to define $e^{a+bi}$ to be $e^a \cdot e^{bi}$ for any complex number $a + bi$. One consequence of the identity is the equation

$$e^{i\pi} = -1.$$

When written in the form $e^{i\pi} + 1 = 0$, this equation combines five of the most important constants in mathematics.

## A Proof of Taylor's Theorem

We prove Taylor's theorem assuming $a < b$. The proof for $a > b$ is nearly the same.

The Taylor polynomial

$$P_n(x) = f(a) + f'(a)(x - a) + \frac{f''(a)}{2!}(x - a)^2 + \cdots + \frac{f^{(n)}(a)}{n!}(x - a)^n$$

and its first $n$ derivatives match the function $f$ and its first $n$ derivatives at $x = a$. We do not disturb that matching if we add another term of the form $K(x - a)^{n+1}$, where $K$ is any constant, because such a term and its first $n$ derivatives are all equal to zero at $x = a$. The new function

$$\phi_n(x) = P_n(x) + K(x - a)^{n+1}$$

and its first $n$ derivatives still agree with $f$ and its first $n$ derivatives at $x = a$.

We now choose the particular value of $K$ that makes the curve $y = \phi_n(x)$ agree with the original curve $y = f(x)$ at $x = b$. In symbols,

$$f(b) = P_n(b) + K(b - a)^{n+1}, \qquad \text{or} \qquad K = \frac{f(b) - P_n(b)}{(b - a)^{n+1}}. \tag{7}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

With $K$ defined by Equation (7), the function

$$F(x) = f(x) - \phi_n(x)$$

measures the difference between the original function $f$ and the approximating function $\phi_n$ for each $x$ in $[a, b]$.

We now use Rolle's Theorem (Section 4.2). First, because $F(a) = F(b) = 0$ and both $F$ and $F'$ are continuous on $[a, b]$, we know that

$$F'(c_1) = 0 \qquad \text{for some } c_1 \text{ in } (a, b).$$

Next, because $F'(a) = F'(c_1) = 0$ and both $F'$ and $F''$ are continuous on $[a, c_1]$, we know that

$$F''(c_2) = 0 \qquad \text{for some } c_2 \text{ in } (a, c_1).$$

Rolle's Theorem, applied successively to $F'', F''', \ldots, F^{(n-1)}$ implies the existence of

$$\begin{aligned} &c_3 \quad \text{in } (a, c_2) \qquad \text{such that } F'''(c_3) = 0, \\ &c_4 \quad \text{in } (a, c_3) \qquad \text{such that } F^{(4)}(c_4) = 0, \\ &\quad\ \vdots \\ &c_n \quad \text{in } (a, c_{n-1}) \qquad \text{such that } F^{(n)}(c_n) = 0. \end{aligned}$$

Finally, because $F^{(n)}$ is continuous on $[a, c_n]$ and differentiable on $(a, c_n)$, and $F^{(n)}(a) = F^{(n)}(c_n) = 0$, Rolle's Theorem implies that there is a number $c_{n+1}$ in $(a, c_n)$ such that

$$F^{(n+1)}(c_{n+1}) = 0. \tag{8}$$

If we differentiate $F(x) = f(x) - P_n(x) - K(x - a)^{n+1}$ a total of $n + 1$ times, we get

$$F^{(n+1)}(x) = f^{(n+1)}(x) - 0 - (n + 1)!K. \tag{9}$$

Equations (8) and (9) together give

$$K = \frac{f^{(n+1)}(c)}{(n + 1)!} \qquad \text{for some number } c = c_{n+1} \text{ in } (a, b). \tag{10}$$

Equations (7) and (10) give

$$f(b) = P_n(b) + \frac{f^{(n+1)}(c)}{(n + 1)!}(b - a)^{n+1}.$$

This concludes the proof. ■

# EXERCISES 11.9

## Taylor Series by Substitution

Use substitution (as in Example 4) to find the Taylor series at $x = 0$ of the functions in Exercises 1–6.

**1.** $e^{-5x}$ **2.** $e^{-x/2}$ **3.** $5 \sin(-x)$

**4.** $\sin\left(\frac{\pi x}{2}\right)$ **5.** $\cos\sqrt{x+1}$ **6.** $\cos\left(x^{3/2}/\sqrt{2}\right)$

## More Taylor Series

Find Taylor series at $x = 0$ for the functions in Exercises 7–18.

**7.** $xe^x$ **8.** $x^2 \sin x$ **9.** $\frac{x^2}{2} - 1 + \cos x$

**10.** $\sin x - x + \frac{x^3}{3!}$ **11.** $x \cos \pi x$ **12.** $x^2 \cos(x^2)$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**13.** $\cos^2 x$ (*Hint:* $\cos^2 x = (1 + \cos 2x)/2$.)

**14.** $\sin^2 x$ **15.** $\dfrac{x^2}{1 - 2x}$ **16.** $x \ln (1 + 2x)$

**17.** $\dfrac{1}{(1 - x)^2}$ **18.** $\dfrac{2}{(1 - x)^3}$

## Error Estimates

**19.** For approximately what values of $x$ can you replace $\sin x$ by $x - (x^3/6)$ with an error of magnitude no greater than $5 \times 10^{-4}$? Give reasons for your answer.

**20.** If $\cos x$ is replaced by $1 - (x^2/2)$ and $|x| < 0.5$, what estimate can be made of the error? Does $1 - (x^2/2)$ tend to be too large, or too small? Give reasons for your answer.

**21.** How close is the approximation $\sin x = x$ when $|x| < 10^{-3}$? For which of these values of $x$ is $x < \sin x$?

**22.** The estimate $\sqrt{1 + x} = 1 + (x/2)$ is used when $x$ is small. Estimate the error when $|x| < 0.01$.

**23.** The approximation $e^x = 1 + x + (x^2/2)$ is used when $x$ is small. Use the Remainder Estimation Theorem to estimate the error when $|x| < 0.1$.

**24.** (*Continuation of Exercise 23.*) When $x < 0$, the series for $e^x$ is an alternating series. Use the Alternating Series Estimation Theorem to estimate the error that results from replacing $e^x$ by $1 + x + (x^2/2)$ when $-0.1 < x < 0$. Compare your estimate with the one you obtained in Exercise 23.

**25.** Estimate the error in the approximation $\sinh x = x + (x^3/3!)$ when $|x| < 0.5$. (*Hint:* Use $R_4$, not $R_3$.)

**26.** When $0 \le h \le 0.01$, show that $e^h$ may be replaced by $1 + h$ with an error of magnitude no greater than 0.6% of $h$. Use $e^{0.01} = 1.01$.

**27.** For what positive values of $x$ can you replace $\ln (1 + x)$ by $x$ with an error of magnitude no greater than 1% of the value of $x$?

**28.** You plan to estimate $\pi/4$ by evaluating the Maclaurin series for $\tan^{-1} x$ at $x = 1$. Use the Alternating Series Estimation Theorem to determine how many terms of the series you would have to add to be sure the estimate is good to two decimal places.

**29. a.** Use the Taylor series for $\sin x$ and the Alternating Series Estimation Theorem to show that

$$1 - \frac{x^2}{6} < \frac{\sin x}{x} < 1, \quad x \neq 0.$$

**T** **b.** Graph $f(x) = (\sin x)/x$ together with the functions $y = 1 - (x^2/6)$ and $y = 1$ for $-5 \le x \le 5$. Comment on the relationships among the graphs.

**30. a.** Use the Taylor series for $\cos x$ and the Alternating Series Estimation Theorem to show that

$$\frac{1}{2} - \frac{x^2}{24} < \frac{1 - \cos x}{x^2} < \frac{1}{2}, \quad x \neq 0.$$

(This is the inequality in Section 2.2, Exercise 52.)

**T** **b.** Graph $f(x) = (1 - \cos x)/x^2$ together with $y = (1/2) - (x^2/24)$ and $y = 1/2$ for $-9 \le x \le 9$. Comment on the relationships among the graphs.

## Finding and Identifying Maclaurin Series

Recall that the Maclaurin series is just another name for the Taylor series at $x = 0$. Each of the series in Exercises 31–34 is the value of the Maclaurin series of a function $f(x)$ at some point. What function and what point? What is the sum of the series?

**31.** $(0.1) - \dfrac{(0.1)^3}{3!} + \dfrac{(0.1)^5}{5!} - \cdots + \dfrac{(-1)^k (0.1)^{2k+1}}{(2k + 1)!} + \cdots$

**32.** $1 - \dfrac{\pi^2}{4^2 \cdot 2!} + \dfrac{\pi^4}{4^4 \cdot 4!} - \cdots + \dfrac{(-1)^k (\pi)^{2k}}{4^{2k} \cdot (2k!)} + \cdots$

**33.** $\dfrac{\pi}{3} - \dfrac{\pi^3}{3^3 \cdot 3} + \dfrac{\pi^5}{3^5 \cdot 5} - \cdots + \dfrac{(-1)^k \pi^{2k+1}}{3^{2k+1}(2k + 1)} + \cdots$

**34.** $\pi - \dfrac{\pi^2}{2} + \dfrac{\pi^3}{3} - \cdots + (-1)^{k-1} \dfrac{\pi^k}{k} + \cdots$

**35.** Multiply the Maclaurin series for $e^x$ and $\sin x$ together to find the first five nonzero terms of the Maclaurin series for $e^x \sin x$.

**36.** Multiply the Maclaurin series for $e^x$ and $\cos x$ together to find the first five nonzero terms of the Maclaurin series for $e^x \cos x$.

**37.** Use the identity $\sin^2 x = (1 - \cos 2x)/2$ to obtain the Maclaurin series for $\sin^2 x$. Then differentiate this series to obtain the Maclaurin series for $2 \sin x \cos x$. Check that this is the series for $\sin 2x$.

**38.** (*Continuation of Exercise 37.*) Use the identity $\cos^2 x = \cos 2x + \sin^2 x$ to obtain a power series for $\cos^2 x$.

## Theory and Examples

**39. Taylor's Theorem and the Mean Value Theorem** Explain how the Mean Value Theorem (Section 4.2, Theorem 4) is a special case of Taylor's Theorem.

**40. Linearizations at inflection points** Show that if the graph of a twice-differentiable function $f(x)$ has an inflection point at $x = a$, then the linearization of $f$ at $x = a$ is also the quadratic approximation of $f$ at $x = a$. This explains why tangent lines fit so well at inflection points.

**41. The (second) second derivative test** Use the equation

$$f(x) = f(a) + f'(a)(x - a) + \frac{f''(c_2)}{2}(x - a)^2$$

to establish the following test.

Let $f$ have continuous first and second derivatives and suppose that $f'(a) = 0$. Then

**a.** $f$ has a local maximum at $a$ if $f'' \le 0$ throughout an interval whose interior contains $a$;

**b.** $f$ has a local minimum at $a$ if $f'' \ge 0$ throughout an interval whose interior contains $a$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**42. A cubic approximation** Use Taylor's formula with $a = 0$ and $n = 3$ to find the standard cubic approximation of $f(x) = 1/(1 - x)$ at $x = 0$. Give an upper bound for the magnitude of the error in the approximation when $|x| \le 0.1$.

**43. a.** Use Taylor's formula with $n = 2$ to find the quadratic approximation of $f(x) = (1 + x)^k$ at $x = 0$ ($k$ a constant).

**b.** If $k = 3$, for approximately what values of $x$ in the interval $[0, 1]$ will the error in the quadratic approximation be less than $1/100$?

**44. Improving approximations to $\pi$**

**a.** Let $P$ be an approximation of $\pi$ accurate to $n$ decimals. Show that $P + \sin P$ gives an approximation correct to $3n$ decimals. (*Hint:* Let $P = \pi + x$.)

T **b.** Try it with a calculator.

**45. The Taylor series generated by $f(x) = \sum_{n=0}^{\infty} a_n x^n$ is $\sum_{n=0}^{\infty} a_n x^n$** A function defined by a power series $\sum_{n=0}^{\infty} a_n x^n$ with a radius of convergence $c > 0$ has a Taylor series that converges to the function at every point of $(-c, c)$. Show this by showing that the Taylor series generated by $f(x) = \sum_{n=0}^{\infty} a_n x^n$ is the series $\sum_{n=0}^{\infty} a_n x^n$ itself.

An immediate consequence of this is that series like

$$x \sin x = x^2 - \frac{x^4}{3!} + \frac{x^6}{5!} - \frac{x^8}{7!} + \cdots$$

and

$$x^2 e^x = x^2 + x^3 + \frac{x^4}{2!} + \frac{x^5}{3!} + \cdots,$$

obtained by multiplying Taylor series by powers of $x$, as well as series obtained by integration and differentiation of convergent power series, are themselves the Taylor series generated by the functions they represent.

**46. Taylor series for even functions and odd functions** (*Continuation of Section 11.7, Exercise 45.*) Suppose that $f(x) = \sum_{n=0}^{\infty} a_n x^n$ converges for all $x$ in an open interval $(-c, c)$. Show that

**a.** If $f$ is even, then $a_1 = a_3 = a_5 = \cdots = 0$, i.e., the Taylor series for $f$ at $x = 0$ contains only even powers of $x$.

**b.** If $f$ is odd, then $a_0 = a_2 = a_4 = \cdots = 0$, i.e., the Taylor series for $f$ at $x = 0$ contains only odd powers of $x$.

**47. Taylor polynomials of periodic functions**

**a.** Show that every continuous periodic function $f(x)$, $-\infty < x < \infty$, is bounded in magnitude by showing that there exists a positive constant $M$ such that $|f(x)| \le M$ for all $x$.

**b.** Show that the graph of every Taylor polynomial of positive degree generated by $f(x) = \cos x$ must eventually move away from the graph of $\cos x$ as $|x|$ increases. You can see this in Figure 11.13. The Taylor polynomials of $\sin x$ behave in a similar way (Figure 11.15).

T **48. a.** Graph the curves $y = (1/3) - (x^2)/5$ and $y = (x - \tan^{-1} x)/x^3$ together with the line $y = 1/3$.

**b.** Use a Taylor series to explain what you see. What is

$$\lim_{x \to 0} \frac{x - \tan^{-1} x}{x^3} ?$$

## Euler's Identity

**49.** Use Equation (6) to write the following powers of $e$ in the form $a + bi$.

**a.** $e^{-i\pi}$ **b.** $e^{i\pi/4}$ **c.** $e^{-i\pi/2}$

**50.** Use Equation (6) to show that

$$\cos\theta = \frac{e^{i\theta} + e^{-i\theta}}{2} \quad \text{and} \quad \sin\theta = \frac{e^{i\theta} - e^{-i\theta}}{2i}.$$

**51.** Establish the equations in Exercise 50 by combining the formal Taylor series for $e^{i\theta}$ and $e^{-i\theta}$.

**52.** Show that

**a.** $\cosh i\theta = \cos\theta$, **b.** $\sinh i\theta = i \sin\theta$.

**53.** By multiplying the Taylor series for $e^x$ and $\sin x$, find the terms through $x^5$ of the Taylor series for $e^x \sin x$. This series is the imaginary part of the series for

$$e^x \cdot e^{ix} = e^{(1+i)x}.$$

Use this fact to check your answer. For what values of $x$ should the series for $e^x \sin x$ converge?

**54.** When $a$ and $b$ are real, we define $e^{(a+ib)x}$ with the equation

$$e^{(a+ib)x} = e^{ax} \cdot e^{ibx} = e^{ax}(\cos bx + i \sin bx).$$

Differentiate the right-hand side of this equation to show that

$$\frac{d}{dx} e^{(a+ib)x} = (a + ib)e^{(a+ib)x}.$$

Thus the familiar rule $(d/dx)e^{kx} = ke^{kx}$ holds for $k$ complex as well as real.

**55.** Use the definition of $e^{i\theta}$ to show that for any real numbers $\theta$, $\theta_1$, and $\theta_2$,

**a.** $e^{i\theta_1} e^{i\theta_2} = e^{i(\theta_1 + \theta_2)}$, **b.** $e^{-i\theta} = 1/e^{i\theta}$.

**56.** Two complex numbers $a + ib$ and $c + id$ are equal if and only if $a = c$ and $b = d$. Use this fact to evaluate

$$\int e^{ax} \cos bx \, dx \quad \text{and} \quad \int e^{ax} \sin bx \, dx$$

from

$$\int e^{(a+ib)x} \, dx = \frac{a - ib}{a^2 + b^2} e^{(a+ib)x} + C,$$

where $C = C_1 + iC_2$ is a complex constant of integration.

COMPUTER EXPLORATIONS

## Linear, Quadratic, and Cubic Approximations

Taylor's formula with $n = 1$ and $a = 0$ gives the linearization of a function at $x = 0$. With $n = 2$ and $n = 3$ we obtain the standard quadratic and cubic approximations. In these exercises we explore the errors associated with these approximations. We seek answers to two questions:

**a.** For what values of $x$ can the function be replaced by each approximation with an error less than $10^{-2}$?

**b.** What is the maximum error we could expect if we replace the function by each approximation over the specified interval?

Using a CAS, perform the following steps to aid in answering questions (a) and (b) for the functions and intervals in Exercises 57–62.

*Step 1:* Plot the function over the specified interval.

*Step 2:* Find the Taylor polynomials $P_1(x)$, $P_2(x)$, and $P_3(x)$ at $x = 0$.

*Step 3:* Calculate the $(n + 1)$st derivative $f^{(n+1)}(c)$ associated with the remainder term for each Taylor polynomial. Plot the derivative as a function of $c$ over the specified interval and estimate its maximum absolute value, $M$.

*Step 4:* Calculate the remainder $R_n(x)$ for each polynomial. Using the estimate $M$ from Step 3 in place of $f^{(n+1)}(c)$, plot $R_n(x)$ over the specified interval. Then estimate the values of $x$ that answer question (a).

*Step 5:* Compare your estimated error with the actual error $E_n(x) = |f(x) - P_n(x)|$ by plotting $E_n(x)$ over the specified interval. This will help answer question (b).

*Step 6:* Graph the function and its three Taylor approximations together. Discuss the graphs in relation to the information discovered in Steps 4 and 5.

**57.** $f(x) = \dfrac{1}{\sqrt{1 + x}}, \quad |x| \le \dfrac{3}{4}$

**58.** $f(x) = (1 + x)^{3/2}, \quad -\dfrac{1}{2} \le x \le 2$

**59.** $f(x) = \dfrac{x}{x^2 + 1}, \quad |x| \le 2$

**60.** $f(x) = (\cos x)(\sin 2x), \quad |x| \le 2$

**61.** $f(x) = e^{-x} \cos 2x, \quad |x| \le 1$

**62.** $f(x) = e^{x/3} \sin 2x, \quad |x| \le 2$

# 11.10 Applications of Power Series

This section introduces the binomial series for estimating powers and roots and shows how series are sometimes used to approximate the solution of an initial value problem, to evaluate nonelementary integrals, and to evaluate limits that lead to indeterminate forms. We provide a self-contained derivation of the Taylor series for $\tan^{-1} x$ and conclude with a reference table of frequently used series.

## The Binomial Series for Powers and Roots

The Taylor series generated by $f(x) = (1 + x)^m$, when $m$ is constant, is

$$1 + mx + \frac{m(m-1)}{2!}x^2 + \frac{m(m-1)(m-2)}{3!}x^3 + \cdots + \frac{m(m-1)(m-2)\cdots(m-k+1)}{k!}x^k + \cdots. \tag{1}$$

This series, called the **binomial series**, converges absolutely for $|x| < 1$. To derive the

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

series, we first list the function and its derivatives:

$$\begin{aligned} f(x) &= (1 + x)^m \\ f'(x) &= m(1 + x)^{m-1} \\ f''(x) &= m(m - 1)(1 + x)^{m-2} \\ f'''(x) &= m(m - 1)(m - 2)(1 + x)^{m-3} \\ &\vdots \\ f^{(k)}(x) &= m(m - 1)(m - 2)\cdots(m - k + 1)(1 + x)^{m-k}. \end{aligned}$$

We then evaluate these at $x = 0$ and substitute into the Taylor series formula to obtain Series (1).

If $m$ is an integer greater than or equal to zero, the series stops after $(m + 1)$ terms because the coefficients from $k = m + 1$ on are zero.

If $m$ is not a positive integer or zero, the series is infinite and converges for $|x| < 1$. To see why, let $u_k$ be the term involving $x^k$. Then apply the Ratio Test for absolute convergence to see that

$$\left|\frac{u_{k+1}}{u_k}\right| = \left|\frac{m - k}{k + 1}x\right| \to |x| \qquad \text{as } k \to \infty.$$

Our derivation of the binomial series shows only that it is generated by $(1 + x)^m$ and converges for $|x| < 1$. The derivation does not show that the series converges to $(1 + x)^m$. It does, but we omit the proof.

**The Binomial Series**

For $-1 < x < 1$,

$$(1 + x)^m = 1 + \sum_{k=1}^{\infty} \binom{m}{k} x^k,$$

where we define

$$\binom{m}{1} = m, \qquad \binom{m}{2} = \frac{m(m - 1)}{2!},$$

and

$$\binom{m}{k} = \frac{m(m - 1)(m - 2)\cdots(m - k + 1)}{k!} \qquad \text{for } k \geq 3.$$

**EXAMPLE 1** Using the Binomial Series

If $m = -1$,

$$\binom{-1}{1} = -1, \qquad \binom{-1}{2} = \frac{-1(-2)}{2!} = 1,$$

and

$$\binom{-1}{k} = \frac{-1(-2)(-3)\cdots(-1 - k + 1)}{k!} = (-1)^k\left(\frac{k!}{k!}\right) = (-1)^k.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

With these coefficient values and with $x$ replaced by $-x$, the binomial series formula gives the familiar geometric series

$$(1 + x)^{-1} = 1 + \sum_{k=1}^{\infty}(-1)^k x^k = 1 - x + x^2 - x^3 + \cdots + (-1)^k x^k + \cdots. \quad \blacksquare$$

### EXAMPLE 2 Using the Binomial Series

We know from Section 3.8, Example 1, that $\sqrt{1 + x} \approx 1 + (x/2)$ for $|x|$ small. With $m = 1/2$, the binomial series gives quadratic and higher-order approximations as well, along with error estimates that come from the Alternating Series Estimation Theorem:

$$(1 + x)^{1/2} = 1 + \frac{x}{2} + \frac{\left(\frac{1}{2}\right)\left(-\frac{1}{2}\right)}{2!}x^2 + \frac{\left(\frac{1}{2}\right)\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)}{3!}x^3 + \frac{\left(\frac{1}{2}\right)\left(-\frac{1}{2}\right)\left(-\frac{3}{2}\right)\left(-\frac{5}{2}\right)}{4!}x^4 + \cdots$$

$$= 1 + \frac{x}{2} - \frac{x^2}{8} + \frac{x^3}{16} - \frac{5x^4}{128} + \cdots.$$

Substitution for $x$ gives still other approximations. For example,

$$\sqrt{1 - x^2} \approx 1 - \frac{x^2}{2} - \frac{x^4}{8} \qquad \text{for } |x^2| \text{ small}$$

$$\sqrt{1 - \frac{1}{x}} \approx 1 - \frac{1}{2x} - \frac{1}{8x^2} \qquad \text{for } \left|\frac{1}{x}\right| \text{ small, that is, } |x| \text{ large}. \quad \blacksquare$$

## Power Series Solutions of Differential Equations and Initial Value Problems

When we cannot find a relatively simple expression for the solution of an initial value problem or differential equation, we try to get information about the solution in other ways. One way is to try to find a power series representation for the solution. If we can do so, we immediately have a source of polynomial approximations of the solution, which may be all that we really need. The first example (Example 3) deals with a first-order linear differential equation that could be solved with the methods of Section 9.2. The example shows how, not knowing this, we can solve the equation with power series. The second example (Example 4) deals with an equation that cannot be solved analytically by previous methods.

### EXAMPLE 3 Series Solution of an Initial Value Problem

Solve the initial value problem

$$y' - y = x, \qquad y(0) = 1.$$

**Solution** We assume that there is a solution of the form

$$y = a_0 + a_1 x + a_2 x^2 + \cdots + a_{n-1}x^{n-1} + a_n x^n + \cdots. \tag{2}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Our goal is to find values for the coefficients $a_k$ that make the series and its first derivative

$$y' = a_1 + 2a_2x + 3a_3x^2 + \cdots + na_nx^{n-1} + \cdots \tag{3}$$

satisfy the given differential equation and initial condition. The series $y' - y$ is the difference of the series in Equations (2) and (3):

$$\begin{aligned} y' - y = (a_1 - a_0) + (2a_2 - a_1)x + (3a_3 - a_2)x^2 + \cdots \\ + (na_n - a_{n-1})x^{n-1} + \cdots. \end{aligned} \tag{4}$$

If $y$ is to satisfy the equation $y' - y = x$, the series in Equation (4) must equal $x$. Since power series representations are unique (Exercise 45 in Section 11.7), the coefficients in Equation (4) must satisfy the equations

$$\begin{aligned} a_1 - a_0 &= 0 && \text{Constant terms} \\ 2a_2 - a_1 &= 1 && \text{Coefficients of } x \\ 3a_3 - a_2 &= 0 && \text{Coefficients of } x^2 \\ &\vdots && \vdots \\ na_n - a_{n-1} &= 0 && \text{Coefficients of } x^{n-1} \\ &\vdots && \vdots \end{aligned}$$

We can also see from Equation (2) that $y = a_0$ when $x = 0$, so that $a_0 = 1$ (this being the initial condition). Putting it all together, we have

$$a_0 = 1, \quad a_1 = a_0 = 1, \quad a_2 = \frac{1 + a_1}{2} = \frac{1 + 1}{2} = \frac{2}{2},$$
$$a_3 = \frac{a_2}{3} = \frac{2}{3 \cdot 2} = \frac{2}{3!}, \ldots, \quad a_n = \frac{a_{n-1}}{n} = \frac{2}{n!}, \ldots$$

Substituting these coefficient values into the equation for $y$ (Equation (2)) gives

$$\begin{aligned} y &= 1 + x + 2 \cdot \frac{x^2}{2!} + 2 \cdot \frac{x^3}{3!} + \cdots + 2 \cdot \frac{x^n}{n!} + \cdots \\ &= 1 + x + 2 \underbrace{\left( \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} + \cdots \right)}_{\text{the Taylor series for } e^x - 1 - x} \\ &= 1 + x + 2(e^x - 1 - x) = 2e^x - 1 - x. \end{aligned}$$

The solution of the initial value problem is $y = 2e^x - 1 - x$.

As a check, we see that

$$y(0) = 2e^0 - 1 - 0 = 2 - 1 = 1$$

and

$$y' - y = (2e^x - 1) - (2e^x - 1 - x) = x. \quad \blacksquare$$

**EXAMPLE 4** Solving a Differential Equation

Find a power series solution for

$$y'' + x^2y = 0. \tag{5}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** We assume that there is a solution of the form

$$y = a_0 + a_1x + a_2x^2 + \cdots + a_nx^n + \cdots, \tag{6}$$

and find what the coefficients $a_k$ have to be to make the series and its second derivative

$$y'' = 2a_2 + 3 \cdot 2a_3x + \cdots + n(n-1)a_nx^{n-2} + \cdots \tag{7}$$

satisfy Equation (5). The series for $x^2y$ is $x^2$ times the right-hand side of Equation (6):

$$x^2y = a_0x^2 + a_1x^3 + a_2x^4 + \cdots + a_nx^{n+2} + \cdots. \tag{8}$$

The series for $y'' + x^2y$ is the sum of the series in Equations (7) and (8):

$$\begin{aligned} y'' + x^2y = {} & 2a_2 + 6a_3x + (12a_4 + a_0)x^2 + (20a_5 + a_1)x^3 \\ & + \cdots + (n(n-1)a_n + a_{n-4})x^{n-2} + \cdots. \end{aligned} \tag{9}$$

Notice that the coefficient of $x^{n-2}$ in Equation (8) is $a_{n-4}$. If $y$ and its second derivative $y''$ are to satisfy Equation (5), the coefficients of the individual powers of $x$ on the right-hand side of Equation (9) must all be zero:

$$2a_2 = 0, \qquad 6a_3 = 0, \qquad 12a_4 + a_0 = 0, \qquad 20a_5 + a_1 = 0, \tag{10}$$

and for all $n \geq 4$,

$$n(n-1)a_n + a_{n-4} = 0. \tag{11}$$

We can see from Equation (6) that

$$a_0 = y(0), \qquad a_1 = y'(0).$$

In other words, the first two coefficients of the series are the values of $y$ and $y'$ at $x = 0$. Equations in (10) and the recursion formula in Equation (11) enable us to evaluate all the other coefficients in terms of $a_0$ and $a_1$.

The first two of Equations (10) give

$$a_2 = 0, \qquad a_3 = 0.$$

Equation (11) shows that if $a_{n-4} = 0$, then $a_n = 0$; so we conclude that

$$a_6 = 0, \qquad a_7 = 0, \qquad a_{10} = 0, \qquad a_{11} = 0,$$

and whenever $n = 4k + 2$ or $4k + 3$, $a_n$ is zero. For the other coefficients we have

$$a_n = \frac{-a_{n-4}}{n(n-1)}$$

so that

$$a_4 = \frac{-a_0}{4 \cdot 3}, \qquad a_8 = \frac{-a_4}{8 \cdot 7} = \frac{a_0}{3 \cdot 4 \cdot 7 \cdot 8}$$

$$a_{12} = \frac{-a_8}{11 \cdot 12} = \frac{-a_0}{3 \cdot 4 \cdot 7 \cdot 8 \cdot 11 \cdot 12}$$

and

$$a_5 = \frac{-a_1}{5 \cdot 4}, \qquad a_9 = \frac{-a_5}{9 \cdot 8} = \frac{a_1}{4 \cdot 5 \cdot 8 \cdot 9}$$

$$a_{13} = \frac{-a_9}{12 \cdot 13} = \frac{-a_1}{4 \cdot 5 \cdot 8 \cdot 9 \cdot 12 \cdot 13}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The answer is best expressed as the sum of two separate series—one multiplied by $a_0$, the other by $a_1$:

$$y = a_0\left(1 - \frac{x^4}{3\cdot 4} + \frac{x^8}{3\cdot 4\cdot 7\cdot 8} - \frac{x^{12}}{3\cdot 4\cdot 7\cdot 8\cdot 11\cdot 12} + \cdots\right)$$
$$+ a_1\left(x - \frac{x^5}{4\cdot 5} + \frac{x^9}{4\cdot 5\cdot 8\cdot 9} - \frac{x^{13}}{4\cdot 5\cdot 8\cdot 9\cdot 12\cdot 13} + \cdots\right).$$

Both series converge absolutely for all $x$, as is readily seen by the Ratio Test. ■

## Evaluating Nonelementary Integrals

Taylor series can be used to express nonelementary integrals in terms of series. Integrals like $\int \sin x^2\, dx$ arise in the study of the diffraction of light.

**EXAMPLE 5** Express $\int \sin x^2\, dx$ as a power series.

**Solution** From the series for $\sin x$ we obtain

$$\sin x^2 = x^2 - \frac{x^6}{3!} + \frac{x^{10}}{5!} - \frac{x^{14}}{7!} + \frac{x^{18}}{9!} - \cdots.$$

Therefore,

$$\int \sin x^2\, dx = C + \frac{x^3}{3} - \frac{x^7}{7\cdot 3!} + \frac{x^{11}}{11\cdot 5!} - \frac{x^{15}}{15\cdot 7!} + \frac{x^{10}}{19\cdot 9!} - \cdots.$$ ■

**EXAMPLE 6** Estimating a Definite Integral

Estimate $\int_0^1 \sin x^2\, dx$ with an error of less than 0.001.

**Solution** From the indefinite integral in Example 5,

$$\int_0^1 \sin x^2\, dx = \frac{1}{3} - \frac{1}{7\cdot 3!} + \frac{1}{11\cdot 5!} - \frac{1}{15\cdot 7!} + \frac{1}{19\cdot 9!} - \cdots.$$

The series alternates, and we find by experiment that

$$\frac{1}{11\cdot 5!} \approx 0.00076$$

is the first term to be numerically less than 0.001. The sum of the preceding two terms gives

$$\int_0^1 \sin x^2\, dx \approx \frac{1}{3} - \frac{1}{42} \approx 0.310.$$

With two more terms we could estimate

$$\int_0^1 \sin x^2\, dx \approx 0.310268$$

with an error of less than $10^{-6}$. With only one term beyond that we have

$$\int_0^1 \sin x^2\, dx \approx \frac{1}{3} - \frac{1}{42} + \frac{1}{1320} - \frac{1}{75600} + \frac{1}{6894720} \approx 0.310268303,$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

with an error of about $1.08 \times 10^{-9}$. To guarantee this accuracy with the error formula for the Trapezoidal Rule would require using about 8000 subintervals. ■

## Arctangents

In Section 11.7, Example 5, we found a series for $\tan^{-1} x$ by differentiating to get

$$\frac{d}{dx}\tan^{-1} x = \frac{1}{1 + x^2} = 1 - x^2 + x^4 - x^6 + \cdots$$

and integrating to get

$$\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots.$$

However, we did not prove the term-by-term integration theorem on which this conclusion depended. We now derive the series again by integrating both sides of the finite formula

$$\frac{1}{1 + t^2} = 1 - t^2 + t^4 - t^6 + \cdots + (-1)^n t^{2n} + \frac{(-1)^{n+1} t^{2n+2}}{1 + t^2}, \tag{12}$$

in which the last term comes from adding the remaining terms as a geometric series with first term $a = (-1)^{n+1} t^{2n+2}$ and ratio $r = -t^2$. Integrating both sides of Equation (12) from $t = 0$ to $t = x$ gives

$$\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots + (-1)^n \frac{x^{2n+1}}{2n + 1} + R_n(x),$$

where

$$R_n(x) = \int_0^x \frac{(-1)^{n+1} t^{2n+2}}{1 + t^2}\, dt.$$

The denominator of the integrand is greater than or equal to 1; hence

$$|R_n(x)| \le \int_0^{|x|} t^{2n+2}\, dt = \frac{|x|^{2n+3}}{2n + 3}.$$

If $|x| \le 1$, the right side of this inequality approaches zero as $n \to \infty$. Therefore $\lim_{n\to\infty} R_n(x) = 0$ if $|x| \le 1$ and

$$\begin{aligned} \tan^{-1} x &= \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{2n + 1}, \qquad |x| \le 1. \\ \tan^{-1} x &= x - \frac{x^3}{3} + \frac{x^5}{5} - \frac{x^7}{7} + \cdots, \qquad |x| \le 1 \end{aligned} \tag{13}$$

We take this route instead of finding the Taylor series directly because the formulas for the higher-order derivatives of $\tan^{-1} x$ are unmanageable. When we put $x = 1$ in Equation (13), we get **Leibniz's formula**:

$$\frac{\pi}{4} = 1 - \frac{1}{3} + \frac{1}{5} - \frac{1}{7} + \frac{1}{9} - \cdots + \frac{(-1)^n}{2n + 1} + \cdots.$$

Because this series converges very slowly, it is not used in approximating $\pi$ to many decimal places. The series for $\tan^{-1} x$ converges most rapidly when $x$ is near zero. For that reason, people who use the series for $\tan^{-1} x$ to compute $\pi$ use various trigonometric identities.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

For example, if

$$\alpha = \tan^{-1}\frac{1}{2} \qquad \text{and} \qquad \beta = \tan^{-1}\frac{1}{3},$$

then

$$\tan(\alpha + \beta) = \frac{\tan\alpha + \tan\beta}{1 - \tan\alpha\tan\beta} = \frac{\frac{1}{2} + \frac{1}{3}}{1 - \frac{1}{6}} = 1 = \tan\frac{\pi}{4}$$

and

$$\frac{\pi}{4} = \alpha + \beta = \tan^{-1}\frac{1}{2} + \tan^{-1}\frac{1}{3}.$$

Now Equation (13) may be used with $x = 1/2$ to evaluate $\tan^{-1}(1/2)$ and with $x = 1/3$ to give $\tan^{-1}(1/3)$. The sum of these results, multiplied by 4, gives $\pi$.

## Evaluating Indeterminate Forms

We can sometimes evaluate indeterminate forms by expressing the functions involved as Taylor series.

### EXAMPLE 7 Limits Using Power Series

Evaluate

$$\lim_{x\to 1}\frac{\ln x}{x - 1}.$$

**Solution** We represent $\ln x$ as a Taylor series in powers of $x - 1$. This can be accomplished by calculating the Taylor series generated by $\ln x$ at $x = 1$ directly or by replacing $x$ by $x - 1$ in the series for $\ln(1 + x)$ in Section 11.7, Example 6. Either way, we obtain

$$\ln x = (x - 1) - \frac{1}{2}(x - 1)^2 + \cdots,$$

from which we find that

$$\lim_{x\to 1}\frac{\ln x}{x - 1} = \lim_{x\to 1}\left(1 - \frac{1}{2}(x - 1) + \cdots\right) = 1. \quad \blacksquare$$

### EXAMPLE 8 Limits Using Power Series

Evaluate

$$\lim_{x\to 0}\frac{\sin x - \tan x}{x^3}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** The Taylor series for $\sin x$ and $\tan x$, to terms in $x^5$, are

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots, \qquad \tan x = x + \frac{x^3}{3} + \frac{2x^5}{15} + \cdots.$$

Hence,

$$\sin x - \tan x = -\frac{x^3}{2} - \frac{x^5}{8} - \cdots = x^3\left(-\frac{1}{2} - \frac{x^2}{8} - \cdots\right)$$

and

$$\lim_{x\to 0} \frac{\sin x - \tan x}{x^3} = \lim_{x\to 0}\left(-\frac{1}{2} - \frac{x^2}{8} - \cdots\right)$$

$$= -\frac{1}{2}.$$

■

If we apply series to calculate $\lim_{x\to 0}((1/\sin x) - (1/x))$, we not only find the limit successfully but also discover an approximation formula for $\csc x$.

**EXAMPLE 9** Approximation Formula for $\csc x$

Find $\lim_{x\to 0}\left(\frac{1}{\sin x} - \frac{1}{x}\right)$.

**Solution**

$$\frac{1}{\sin x} - \frac{1}{x} = \frac{x - \sin x}{x \sin x} = \frac{x - \left(x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots\right)}{x \cdot \left(x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots\right)}$$

$$= \frac{x^3\left(\frac{1}{3!} - \frac{x^2}{5!} + \cdots\right)}{x^2\left(1 - \frac{x^2}{3!} + \cdots\right)} = x\frac{\frac{1}{3!} - \frac{x^2}{5!} + \cdots}{1 - \frac{x^2}{3!} + \cdots}.$$

Therefore,

$$\lim_{x\to 0}\left(\frac{1}{\sin x} - \frac{1}{x}\right) = \lim_{x\to 0}\left(x\frac{\frac{1}{3!} - \frac{x^2}{5!} + \cdots}{1 - \frac{x^2}{3!} + \cdots}\right) = 0.$$

From the quotient on the right, we can see that if $|x|$ is small, then

$$\frac{1}{\sin x} - \frac{1}{x} \approx x \cdot \frac{1}{3!} = \frac{x}{6} \qquad \text{or} \qquad \csc x \approx \frac{1}{x} + \frac{x}{6}.$$

■

**TABLE 11.1** Frequently used Taylor series

$$\frac{1}{1-x} = 1 + x + x^2 + \cdots + x^n + \cdots = \sum_{n=0}^{\infty} x^n, \qquad |x| < 1$$

$$\frac{1}{1+x} = 1 - x + x^2 - \cdots + (-x)^n + \cdots = \sum_{n=0}^{\infty} (-1)^n x^n, \qquad |x| < 1$$

$$e^x = 1 + x + \frac{x^2}{2!} + \cdots + \frac{x^n}{n!} + \cdots = \sum_{n=0}^{\infty} \frac{x^n}{n!}, \qquad |x| < \infty$$

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \cdots + (-1)^n \frac{x^{2n+1}}{(2n+1)!} + \cdots = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{(2n+1)!}, \qquad |x| < \infty$$

$$\cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \cdots + (-1)^n \frac{x^{2n}}{(2n)!} + \cdots = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n}}{(2n)!}, \qquad |x| < \infty$$

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \cdots + (-1)^{n-1} \frac{x^n}{n} + \cdots = \sum_{n=1}^{\infty} \frac{(-1)^{n-1} x^n}{n}, \qquad -1 < x \le 1$$

$$\ln \frac{1+x}{1-x} = 2 \tanh^{-1} x = 2\left(x + \frac{x^3}{3} + \frac{x^5}{5} + \cdots + \frac{x^{2n+1}}{2n+1} + \cdots\right) = 2\sum_{n=0}^{\infty} \frac{x^{2n+1}}{2n+1}, \qquad |x| < 1$$

$$\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \cdots + (-1)^n \frac{x^{2n+1}}{2n+1} + \cdots = \sum_{n=0}^{\infty} \frac{(-1)^n x^{2n+1}}{2n+1}, \qquad |x| \le 1$$

**Binomial Series**

$$(1+x)^m = 1 + mx + \frac{m(m-1)x^2}{2!} + \frac{m(m-1)(m-2)x^3}{3!} + \cdots + \frac{m(m-1)(m-2)\cdots(m-k+1)x^k}{k!} + \cdots$$

$$= 1 + \sum_{k=1}^{\infty} \binom{m}{k} x^k, \qquad |x| < 1,$$

where

$$\binom{m}{1} = m, \qquad \binom{m}{2} = \frac{m(m-1)}{2!}, \qquad \binom{m}{k} = \frac{m(m-1)\cdots(m-k+1)}{k!} \qquad \text{for } k \ge 3.$$

***Note***: To write the binomial series compactly, it is customary to define $\binom{m}{0}$ to be 1 and to take $x^0 = 1$ (even in the usually excluded case where $x = 0$), yielding $(1+x)^m = \sum_{k=0}^{\infty} \binom{m}{k} x^k$. If $m$ is a *positive integer*, the series terminates at $x^m$ and the result converges for all $x$.

# EXERCISES 11.10

## Binomial Series

Find the first four terms of the binomial series for the functions in Exercises 1–10.

**1.** $(1 + x)^{1/2}$

**2.** $(1 + x)^{1/3}$

**3.** $(1 - x)^{-1/2}$

**4.** $(1 - 2x)^{1/2}$

**5.** $\left(1 + \frac{x}{2}\right)^{-2}$

**6.** $\left(1 - \frac{x}{2}\right)^{-2}$

**7.** $(1 + x^3)^{-1/2}$

**8.** $(1 + x^2)^{-1/3}$

**9.** $\left(1 + \frac{1}{x}\right)^{1/2}$

**10.** $\left(1 - \frac{2}{x}\right)^{1/3}$

Find the binomial series for the functions in Exercises 11–14.

**11.** $(1 + x)^4$

**12.** $(1 + x^2)^3$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**13.** $(1 - 2x)^3$ **14.** $\left(1 - \frac{x}{2}\right)^4$

## Initial Value Problems

Find series solutions for the initial value problems in Exercises 15–32.

**15.** $y' + y = 0, \quad y(0) = 1$ **16.** $y' - 2y = 0, \quad y(0) = 1$

**17.** $y' - y = 1, \quad y(0) = 0$ **18.** $y' + y = 1, \quad y(0) = 2$

**19.** $y' - y = x, \quad y(0) = 0$ **20.** $y' + y = 2x, \quad y(0) = -1$

**21.** $y' - xy = 0, \quad y(0) = 1$ **22.** $y' - x^2y = 0, \quad y(0) = 1$

**23.** $(1 - x)y' - y = 0, \quad y(0) = 2$

**24.** $(1 + x^2)y' + 2xy = 0, \quad y(0) = 3$

**25.** $y'' - y = 0, \quad y'(0) = 1$ and $y(0) = 0$

**26.** $y'' + y = 0, \quad y'(0) = 0$ and $y(0) = 1$

**27.** $y'' + y = x, \quad y'(0) = 1$ and $y(0) = 2$

**28.** $y'' - y = x, \quad y'(0) = 2$ and $y(0) = -1$

**29.** $y'' - y = -x, \quad y'(2) = -2$ and $y(2) = 0$

**30.** $y'' - x^2y = 0, \quad y'(0) = b$ and $y(0) = a$

**31.** $y'' + x^2y = x, \quad y'(0) = b$ and $y(0) = a$

**32.** $y'' - 2y' + y = 0, \quad y'(0) = 1$ and $y(0) = 0$

## Approximations and Nonelementary Integrals

T In Exercises 33–36, use series to estimate the integrals' values with an error of magnitude less than $10^{-3}$. (The answer section gives the integrals' values rounded to five decimal places.)

**33.** $\int_0^{0.2} \sin x^2\, dx$ **34.** $\int_0^{0.2} \frac{e^{-x} - 1}{x}\, dx$

**35.** $\int_0^{0.1} \frac{1}{\sqrt{1 + x^4}}\, dx$ **36.** $\int_0^{0.25} \sqrt[3]{1 + x^2}\, dx$

T Use series to approximate the values of the integrals in Exercises 37–40 with an error of magnitude less than $10^{-8}$.

**37.** $\int_0^{0.1} \frac{\sin x}{x}\, dx$ **38.** $\int_0^{0.1} e^{-x^2}\, dx$

**39.** $\int_0^{0.1} \sqrt{1 + x^4}\, dx$ **40.** $\int_0^1 \frac{1 - \cos x}{x^2}\, dx$

**41.** Estimate the error if $\cos t^2$ is approximated by $1 - \frac{t^4}{2} + \frac{t^8}{4!}$ in the integral $\int_0^1 \cos t^2\, dt$.

**42.** Estimate the error if $\cos \sqrt{t}$ is approximated by $1 - \frac{t}{2} + \frac{t^2}{4!} - \frac{t^3}{6!}$ in the integral $\int_0^1 \cos \sqrt{t}\, dt$.

In Exercises 43–46, find a polynomial that will approximate $F(x)$ throughout the given interval with an error of magnitude less than $10^{-3}$.

**43.** $F(x) = \int_0^x \sin t^2\, dt, \quad [0, 1]$

**44.** $F(x) = \int_0^x t^2 e^{-t^2}\, dt, \quad [0, 1]$

**45.** $F(x) = \int_0^x \tan^{-1} t\, dt$, **(a)** $[0, 0.5]$ **(b)** $[0, 1]$

**46.** $F(x) = \int_0^x \frac{\ln(1 + t)}{t}\, dt$, **(a)** $[0, 0.5]$ **(b)** $[0, 1]$

## Indeterminate Forms

Use series to evaluate the limits in Exercises 47–56.

**47.** $\lim_{x \to 0} \frac{e^x - (1 + x)}{x^2}$ **48.** $\lim_{x \to 0} \frac{e^x - e^{-x}}{x}$

**49.** $\lim_{t \to 0} \frac{1 - \cos t - (t^2/2)}{t^4}$ **50.** $\lim_{\theta \to 0} \frac{\sin \theta - \theta + (\theta^3/6)}{\theta^5}$

**51.** $\lim_{y \to 0} \frac{y - \tan^{-1} y}{y^3}$ **52.** $\lim_{y \to 0} \frac{\tan^{-1} y - \sin y}{y^3 \cos y}$

**53.** $\lim_{x \to \infty} x^2(e^{-1/x^2} - 1)$ **54.** $\lim_{x \to \infty} (x + 1) \sin \frac{1}{x + 1}$

**55.** $\lim_{x \to 0} \frac{\ln(1 + x^2)}{1 - \cos x}$ **56.** $\lim_{x \to 2} \frac{x^2 - 4}{\ln(x - 1)}$

## Theory and Examples

**57.** Replace $x$ by $-x$ in the Taylor series for $\ln(1 + x)$ to obtain a series for $\ln(1 - x)$. Then subtract this from the Taylor series for $\ln(1 + x)$ to show that for $|x| < 1$,

$$\ln \frac{1 + x}{1 - x} = 2\left(x + \frac{x^3}{3} + \frac{x^5}{5} + \cdots\right).$$

**58.** How many terms of the Taylor series for $\ln(1 + x)$ should you add to be sure of calculating $\ln(1.1)$ with an error of magnitude less than $10^{-8}$? Give reasons for your answer.

**59.** According to the Alternating Series Estimation Theorem, how many terms of the Taylor series for $\tan^{-1} 1$ would you have to add to be sure of finding $\pi/4$ with an error of magnitude less than $10^{-3}$? Give reasons for your answer.

**60.** Show that the Taylor series for $f(x) = \tan^{-1} x$ diverges for $|x| > 1$.

T **61. Estimating Pi** About how many terms of the Taylor series for $\tan^{-1} x$ would you have to use to evaluate each term on the right-hand side of the equation

$$\pi = 48 \tan^{-1} \frac{1}{18} + 32 \tan^{-1} \frac{1}{57} - 20 \tan^{-1} \frac{1}{239}$$

with an error of magnitude less than $10^{-6}$? In contrast, the convergence of $\sum_{n=1}^{\infty}(1/n^2)$ to $\pi^2/6$ is so slow that even 50 terms will not yield two-place accuracy.

**62.** Integrate the first three nonzero terms of the Taylor series for $\tan t$ from 0 to $x$ to obtain the first three nonzero terms of the Taylor series for $\ln \sec x$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**63. a.** Use the binomial series and the fact that

$$\frac{d}{dx}\sin^{-1}x = (1 - x^2)^{-1/2}$$

to generate the first four nonzero terms of the Taylor series for $\sin^{-1}x$. What is the radius of convergence?

**b. Series for $\cos^{-1}x$** Use your result in part (a) to find the first five nonzero terms of the Taylor series for $\cos^{-1}x$.

**64. a. Series for $\sinh^{-1}x$** Find the first four nonzero terms of the Taylor series for

$$\sinh^{-1}x = \int_0^x \frac{dt}{\sqrt{1 + t^2}}.$$

T **b.** Use the first *three* terms of the series in part (a) to estimate $\sinh^{-1}0.25$. Give an upper bound for the magnitude of the estimation error.

**65.** Obtain the Taylor series for $1/(1 + x)^2$ from the series for $-1/(1 + x)$.

**66.** Use the Taylor series for $1/(1 - x^2)$ to obtain a series for $2x/(1 - x^2)^2$.

T **67. Estimating Pi** The English mathematician Wallis discovered the formula

$$\frac{\pi}{4} = \frac{2\cdot4\cdot4\cdot6\cdot6\cdot8\cdot\cdots}{3\cdot3\cdot5\cdot5\cdot7\cdot7\cdot\cdots}.$$

Find $\pi$ to two decimal places with this formula.

T **68.** Construct a table of natural logarithms $\ln n$ for $n = 1, 2, 3, \ldots, 10$ by using the formula in Exercise 57, but taking advantage of the relationships $\ln 4 = 2\ln 2$, $\ln 6 = \ln 2 + \ln 3$, $\ln 8 = 3\ln 2$, $\ln 9 = 2\ln 3$, and $\ln 10 = \ln 2 + \ln 5$ to reduce the job to the calculation of relatively few logarithms by series. Start by using the following values for $x$ in Exercise 57:

$$\frac{1}{3},\quad \frac{1}{5},\quad \frac{1}{9},\quad \frac{1}{13}.$$

**69. Series for $\sin^{-1}x$** Integrate the binomial series for $(1 - x^2)^{-1/2}$ to show that for $|x| < 1$,

$$\sin^{-1}x = x + \sum_{n=1}^{\infty} \frac{1\cdot3\cdot5\cdot\cdots\cdot(2n-1)}{2\cdot4\cdot6\cdot\cdots\cdot(2n)}\frac{x^{2n+1}}{2n+1}.$$

**70. Series for $\tan^{-1}x$ for $|x| > 1$** Derive the series

$$\tan^{-1}x = \frac{\pi}{2} - \frac{1}{x} + \frac{1}{3x^3} - \frac{1}{5x^5} + \cdots, \quad x > 1$$

$$\tan^{-1}x = -\frac{\pi}{2} - \frac{1}{x} + \frac{1}{3x^3} - \frac{1}{5x^5} + \cdots, \quad x < -1,$$

by integrating the series

$$\frac{1}{1 + t^2} = \frac{1}{t^2}\cdot\frac{1}{1 + (1/t^2)} = \frac{1}{t^2} - \frac{1}{t^4} + \frac{1}{t^6} - \frac{1}{t^8} + \cdots$$

in the first case from $x$ to $\infty$ and in the second case from $-\infty$ to $x$.

**71. The value of $\sum_{n=1}^{\infty}\tan^{-1}(2/n^2)$**

**a.** Use the formula for the tangent of the difference of two angles to show that

$$\tan\left(\tan^{-1}(n + 1) - \tan^{-1}(n - 1)\right) = \frac{2}{n^2}$$

**b.** Show that

$$\sum_{n=1}^{N}\tan^{-1}\frac{2}{n^2} = \tan^{-1}(N + 1) + \tan^{-1}N - \frac{\pi}{4}.$$

**c.** Find the value of $\sum_{n=1}^{\infty}\tan^{-1}\frac{2}{n^2}$.

# 11.11 Fourier Series

HISTORICAL BIOGRAPHY

Jean-Baptiste Joseph Fourier

(1766–1830)

We have seen how Taylor series can be used to approximate a function $f$ by polynomials. The Taylor polynomials give a close fit to $f$ near a particular point $x = a$, but the error in the approximation can be large at points that are far away. There is another method that often gives good approximations on wide intervals, and often works with discontinuous functions for which Taylor polynomials fail. Introduced by Joseph Fourier, this method approximates functions with sums of sine and cosine functions. It is well suited for analyzing periodic functions, such as radio signals and alternating currents, for solving heat transfer problems, and for many other problems in science and engineering.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Suppose we wish to approximate a function $f$ on the interval $[0, 2\pi]$ by a sum of sine and cosine functions,

$$f_n(x) = a_0 + (a_1 \cos x + b_1 \sin x) + (a_2 \cos 2x + b_2 \sin 2x) + \cdots + (a_n \cos nx + b_n \sin nx)$$

or, in sigma notation,

$$f_n(x) = a_0 + \sum_{k=1}^{n} (a_k \cos kx + b_k \sin kx). \tag{1}$$

We would like to choose values for the constants $a_0, a_1, a_2, \ldots a_n$ and $b_1, b_2, \ldots, b_n$ that make $f_n(x)$ a "best possible" approximation to $f(x)$. The notion of "best possible" is defined as follows:

1. $f_n(x)$ and $f(x)$ give the same value when integrated from 0 to $2\pi$.
2. $f_n(x) \cos kx$ and $f(x) \cos kx$ give the same value when integrated from 0 to $2\pi$ $(k = 1, \ldots, n)$.
3. $f_n(x) \sin kx$ and $f(x) \sin kx$ give the same value when integrated from 0 to $2\pi$ $(k = 1, \ldots, n)$.

Altogether we impose $2n + 1$ conditions on $f_n$:

$$\int_0^{2\pi} f_n(x)\, dx = \int_0^{2\pi} f(x)\, dx,$$

$$\int_0^{2\pi} f_n(x) \cos kx\, dx = \int_0^{2\pi} f(x) \cos kx\, dx, \qquad k = 1, \ldots, n,$$

$$\int_0^{2\pi} f_n(x) \sin kx\, dx = \int_0^{2\pi} f(x) \sin kx\, dx, \qquad k = 1, \ldots, n.$$

It is possible to choose $a_0, a_1, a_2, \ldots a_n$ and $b_1, b_2, \ldots, b_n$ so that all these conditions are satisfied, by proceeding as follows. Integrating both sides of Equation (1) from 0 to $2\pi$ gives

$$\int_0^{2\pi} f_n(x)\, dx = 2\pi a_0$$

since the integral over $[0, 2\pi]$ of $\cos kx$ equals zero when $k \geq 1$, as does the integral of $\sin kx$. Only the constant term $a_0$ contributes to the integral of $f_n$ over $[0, 2\pi]$. A similar calculation applies with each of the other terms. If we multiply both sides of Equation (1) by $\cos x$ and integrate from 0 to $2\pi$ then we obtain

$$\int_0^{2\pi} f_n(x) \cos x\, dx = \pi a_1.$$

This follows from the fact that

$$\int_0^{2\pi} \cos px \cos px\, dx = \pi$$

and

$$\int_0^{2\pi} \cos px \cos qx\, dx = \int_0^{2\pi} \cos px \sin mx\, dx = \int_0^{2\pi} \sin px \sin qx\, dx = 0$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

whenever $p$, $q$ and $m$ are integers and $p$ is not equal to $q$ (Exercises 9–13). If we multiply Equation (1) by $\sin x$ and integrate from 0 to $2\pi$ we obtain

$$\int_0^{2\pi} f_n(x) \sin x \, dx = \pi b_1 .$$

Proceeding in a similar fashion with

$$\cos 2x, \sin 2x, \ldots, \cos nx, \sin nx$$

we obtain only one nonzero term each time, the term with a sine-squared or cosine-squared term. To summarize,

$$\int_0^{2\pi} f_n(x) \, dx = 2\pi a_0$$

$$\int_0^{2\pi} f_n(x) \cos kx \, dx = \pi a_k, \qquad k = 1, \ldots, n$$

$$\int_0^{2\pi} f_n(x) \sin kx \, dx = \pi b_k, \qquad k = 1, \ldots, n$$

We chose $f_n$ so that the integrals on the left remain the same when $f_n$ is replaced by $f$, so we can use these equations to find $a_0, a_1, a_2, \ldots a_n$ and $b_1, b_2, \ldots, b_n$ from $f$:

$$a_0 = \frac{1}{2\pi}\int_0^{2\pi} f(x) \, dx \tag{2}$$

$$a_k = \frac{1}{\pi}\int_0^{2\pi} f(x) \cos kx \, dx, \qquad k = 1, \ldots, n \tag{3}$$

$$b_k = \frac{1}{\pi}\int_0^{2\pi} f(x) \sin kx \, dx, \qquad k = 1, \ldots, n \tag{4}$$

The only condition needed to find these coefficients is that the integrals above must exist. If we let $n \to \infty$ and use these rules to get the coefficients of an infinite series, then the resulting sum is called the **Fourier series for $f(x)$**,

$$a_0 + \sum_{k=1}^{\infty} (a_k \cos kx + b_k \sin kx) . \tag{5}$$

**EXAMPLE 1** Finding a Fourier Series Expansion

Fourier series can be used to represent some functions that cannot be represented by Taylor series; for example, the step function $f$ shown in Figure 11.16a.

$$f(x) = \begin{cases} 1, & \text{if } 0 \le x \le \pi \\ 2, & \text{if } \pi < x \le 2\pi . \end{cases}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

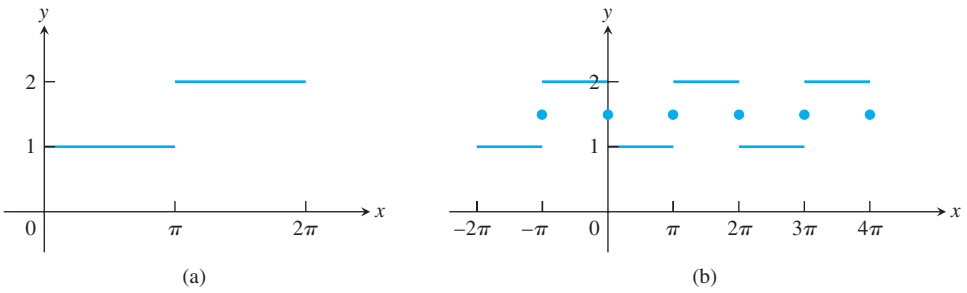

**FIGURE 11.16** (a) The step function

$$f(x) = \begin{cases} 1, & 0 \le x \le \pi \\ 2, & \pi < x \le 2\pi \end{cases}$$

(b) The graph of the Fourier series for $f$ is periodic and has the value $3/2$ at each point of discontinuity (Example 1).

The coefficients of the Fourier series of $f$ are computed using Equations (2), (3), and (4).

$$a_0 = \frac{1}{2\pi}\int_0^{2\pi} f(x)\,dx$$

$$= \frac{1}{2\pi}\left(\int_0^{\pi} 1\,dx + \int_{\pi}^{2\pi} 2\,dx\right) = \frac{3}{2}$$

$$a_k = \frac{1}{\pi}\int_0^{2\pi} f(x)\cos kx\,dx$$

$$= \frac{1}{\pi}\left(\int_0^{\pi} \cos kx\,dx + \int_{\pi}^{2\pi} 2\cos kx\,dx\right)$$

$$= \frac{1}{\pi}\left(\left[\frac{\sin kx}{k}\right]_0^{\pi} + \left[\frac{2\sin kx}{k}\right]_{\pi}^{2\pi}\right) = 0, \qquad k \ge 1$$

$$b_k = \frac{1}{\pi}\int_0^{2\pi} f(x)\sin kx\,dx$$

$$= \frac{1}{\pi}\left(\int_0^{\pi} \sin kx\,dx + \int_{\pi}^{2\pi} 2\sin kx\,dx\right)$$

$$= \frac{1}{\pi}\left(\left[-\frac{\cos kx}{k}\right]_0^{\pi} + \left[-\frac{2\cos kx}{k}\right]_{\pi}^{2\pi}\right)$$

$$= \frac{\cos k\pi - 1}{k\pi} = \frac{(-1)^k - 1}{k\pi}.$$

So

$$a_0 = \frac{3}{2}, \quad a_1 = a_2 = \cdots = 0,$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

and

$$b_1 = -\frac{2}{\pi}, \quad b_2 = 0, \quad b_3 = -\frac{2}{3\pi}, \quad b_4 = 0, \quad b_5 = -\frac{2}{5\pi}, \quad b_6 = 0, \ldots$$

The Fourier series is

$$\frac{3}{2} - \frac{2}{\pi}\left(\sin x + \frac{\sin 3x}{3} + \frac{\sin 5x}{5} + \cdots\right).$$

Notice that at $x = \pi$, where the function $f(x)$ jumps from 1 to 2, all the sine terms vanish, leaving $3/2$ as the value of the series. This is not the value of $f$ at $\pi$, since $f(\pi) = 1$. The Fourier series also sums to $3/2$ at $x = 0$ and $x = 2\pi$. In fact, all terms in the Fourier series are periodic, of period $2\pi$, and the value of the series at $x + 2\pi$ is the same as its value at $x$. The series we obtained represents the periodic function graphed in Figure 11.16b, with domain the entire real line and a pattern that repeats over every interval of width $2\pi$. The function jumps discontinuously at $x = n\pi, n = 0, \pm 1, \pm 2, \ldots$ and at these points has value $3/2$, the average value of the one-sided limits from each side. The convergence of the Fourier series of $f$ is indicated in Figure 11.17. ■

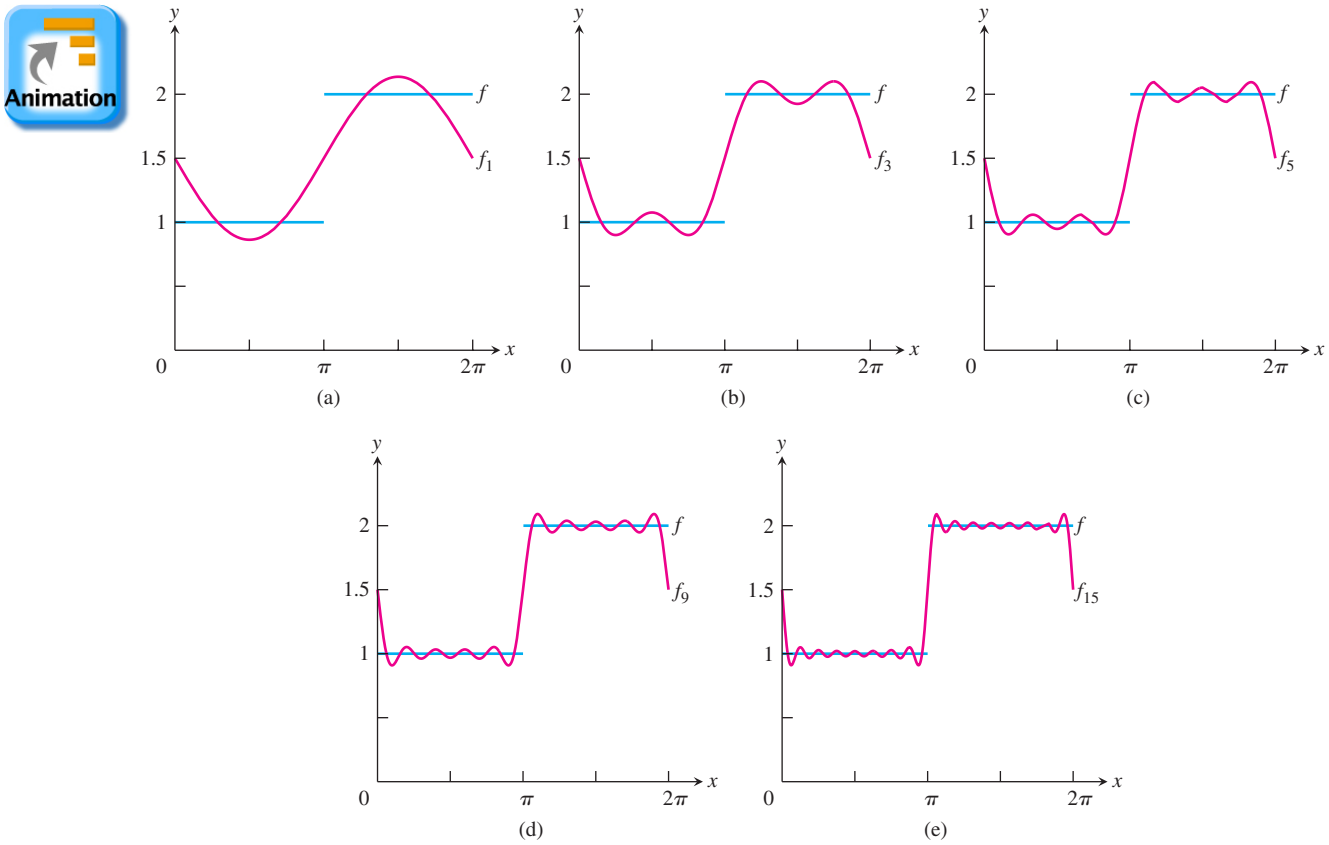

**FIGURE 11.17** The Fourier approximation functions $f_1$, $f_3$, $f_5$, $f_9$, and $f_{15}$ of the function $f(x) = \begin{cases} 1, & 0 \le x \le \pi \\ 2, & \pi < x \le 2\pi \end{cases}$ in Example 1.

## Convergence of Fourier Series

Taylor series are computed from the value of a function and its derivatives at a single point $x = a$, and cannot reflect the behavior of a discontinuous function such as $f$ in Example 1 past a discontinuity. The reason that a Fourier series can be used to represent such functions is that the Fourier series of a function depends on the existence of certain *integrals*, whereas the Taylor series depends on derivatives of a function near a single point. A function can be fairly "rough," even discontinuous, and still be integrable.

The coefficients used to construct Fourier series are precisely those one should choose to minimize the integral of the square of the error in approximating $f$ by $f_n$. That is,

$$\int_0^{2\pi} [f(x) - f_n(x)]^2 \, dx$$

is minimized by choosing $a_0, a_1, a_2, \ldots a_n$ and $b_1, b_2, \ldots, b_n$ as we did. While Taylor series are useful to approximate a function and its derivatives near a point, Fourier series minimize an error which is distributed over an interval.

We state without proof a result concerning the convergence of Fourier series. A function is **piecewise continuous** over an interval $I$ if it has finitely many discontinuities on the interval, and at these discontinuities one-sided limits exist from each side. (See Chapter 5, Additional Exercises 11–18.)

**THEOREM 24** Let $f(x)$ be a function such that $f$ and $f'$ are piecewise continuous on the interval $[0, 2\pi]$. Then $f$ is equal to its Fourier series at all points where $f$ is continuous. At a point $c$ where $f$ has a discontinuity, the Fourier series converges to

$$\frac{f(c^+) + f(c^-)}{2}$$

where $f(c^+)$ and $f(c^-)$ are the right- and left-hand limits of $f$ at $c$.

# EXERCISES 11.11

## Finding Fourier Series

In Exercises 1–8, find the Fourier series associated with the given functions. Sketch each function.

**1.** $f(x) = 1 \quad 0 \le x \le 2\pi$.

**2.** $f(x) = \begin{cases} 1, & 0 \le x \le \pi \\ -1, & \pi < x \le 2\pi \end{cases}$

**3.** $f(x) = \begin{cases} x, & 0 \le x \le \pi \\ x - 2\pi, & \pi < x \le 2\pi \end{cases}$

**4.** $f(x) = \begin{cases} x^2, & 0 \le x \le \pi \\ 0, & \pi < x \le 2\pi \end{cases}$

**5.** $f(x) = e^x \quad 0 \le x \le 2\pi$.

**6.** $f(x) = \begin{cases} e^x, & 0 \le x \le \pi \\ 0, & \pi < x \le 2\pi \end{cases}$

**7.** $f(x) = \begin{cases} \cos x, & 0 \le x \le \pi \\ 0, & \pi < x \le 2\pi \end{cases}$

**8.** $f(x) = \begin{cases} 2, & 0 \le x \le \pi \\ -x, & \pi < x \le 2\pi \end{cases}$

## Theory and Examples

Establish the results in Exercises 9–13, where $p$ and $q$ are positive integers.

**9.** $\displaystyle\int_0^{2\pi} \cos px \, dx = 0$ for all $p$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**10.** $\displaystyle\int_0^{2\pi} \sin px\, dx = 0$ for all $p$.

**11.** $\displaystyle\int_0^{2\pi} \cos px \cos qx\, dx = \begin{cases} 0, & \text{if } p \neq q \\ \pi, & \text{if } p = q \end{cases}$.

(*Hint:* $\cos A \cos B = (1/2)[\cos(A + B) + \cos(A - B)]$.)

**12.** $\displaystyle\int_0^{2\pi} \sin px \sin qx\, dx = \begin{cases} 0, & \text{if } p \neq q \\ \pi, & \text{if } p = q \end{cases}$.

(*Hint:* $\sin A \sin B = (1/2)[\cos(A - B) - \cos(A + B)]$.)

**13.** $\displaystyle\int_0^{2\pi} \sin px \cos qx\, dx = 0$ for all $p$ and $q$.

(*Hint*: $\sin A \cos B = (1/2)[\sin(A + B) + \sin(A - B)]$.)

**14. Fourier series of sums of functions** If $f$ and $g$ both satisfy the conditions of Theorem 24, is the Fourier series of $f + g$ on $[0, 2\pi]$ the sum of the Fourier series of $f$ and the Fourier series of $g$? Give reasons for your answer.

**15. Term-by-term differentiation**

**a.** Use Theorem 24 to verify that the Fourier series for $f(x)$ in Exercise 3 converges to $f(x)$ for $0 < x < 2\pi$.

**b.** Although $f'(x) = 1$, show that the series obtained by term-by-term differentiation of the Fourier series in part (a) diverges.

**16.** Use Theorem 24 to find the Value of the Fourier series determined in Exercise 4 and show that $\dfrac{\pi^2}{6} = \displaystyle\sum_{n=1}^{\infty} \frac{1}{n^2}$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# Chapter 11 Additional and Advanced Exercises

## Convergence or Divergence

Which of the series $\sum_{n=1}^{\infty} a_n$ defined by the formulas in Exercises 1–4 converge, and which diverge? Give reasons for your answers.

**1.** $\displaystyle\sum_{n=1}^{\infty} \frac{1}{(3n-2)^{n+(1/2)}}$

**2.** $\displaystyle\sum_{n=1}^{\infty} \frac{(\tan^{-1} n)^2}{n^2+1}$

**3.** $\displaystyle\sum_{n=1}^{\infty} (-1)^n \tanh n$

**4.** $\displaystyle\sum_{n=2}^{\infty} \frac{\log_n (n!)}{n^3}$

Which of the series $\sum_{n=1}^{\infty} a_n$ defined by the formulas in Exercises 5–8 converge, and which diverge? Give reasons for your answers.

**5.** $a_1 = 1, \quad a_{n+1} = \dfrac{n(n+1)}{(n+2)(n+3)} a_n$

(*Hint:* Write out several terms, see which factors cancel, and then generalize.)

**6.** $a_1 = a_2 = 7, \quad a_{n+1} = \dfrac{n}{(n-1)(n+1)} a_n \quad \text{if } n \geq 2$

**7.** $a_1 = a_2 = 1, \quad a_{n+1} = \dfrac{1}{1+a_n} \quad \text{if } n \geq 2$

**8.** $a_n = 1/3^n$ if $n$ is odd, $\quad a_n = n/3^n$ if $n$ is even

## Choosing Centers for Taylor Series

Taylor's formula

$$f(x) = f(a) + f'(a)(x-a) + \frac{f''(a)}{2!}(x-a)^2 + \cdots + \frac{f^{(n)}(a)}{n!}(x-a)^n + \frac{f^{(n+1)}(c)}{(n+1)!}(x-a)^{n+1}$$

expresses the value of $f$ at $x$ in terms of the values of $f$ and its derivatives at $x = a$. In numerical computations, we therefore need $a$ to be a point where we know the values of $f$ and its derivatives. We also need $a$ to be close enough to the values of $f$ we are interested in to make $(x-a)^{n+1}$ so small we can neglect the remainder.

In Exercises 9–14, what Taylor series would you choose to represent the function near the given value of $x$? (There may be more than one good answer.) Write out the first four nonzero terms of the series you choose.

**9.** $\cos x$ near $x = 1$

**10.** $\sin x$ near $x = 6.3$

**11.** $e^x$ near $x = 0.4$

**12.** $\ln x$ near $x = 1.3$

**13.** $\cos x$ near $x = 69$

**14.** $\tan^{-1} x$ near $x = 2$

## Theory and Examples

**15.** Let $a$ and $b$ be constants with $0 < a < b$. Does the sequence $\{(a^n + b^n)^{1/n}\}$ converge? If it does converge, what is the limit?

**16.** Find the sum of the infinite series

$$1 + \frac{2}{10} + \frac{3}{10^2} + \frac{7}{10^3} + \frac{2}{10^4} + \frac{3}{10^5} + \frac{7}{10^6} + \frac{2}{10^7} + \frac{3}{10^8} + \frac{7}{10^9} + \cdots.$$

**17.** Evaluate

$$\sum_{n=0}^{\infty} \int_n^{n+1} \frac{1}{1+x^2}\, dx.$$

**18.** Find all values of $x$ for which

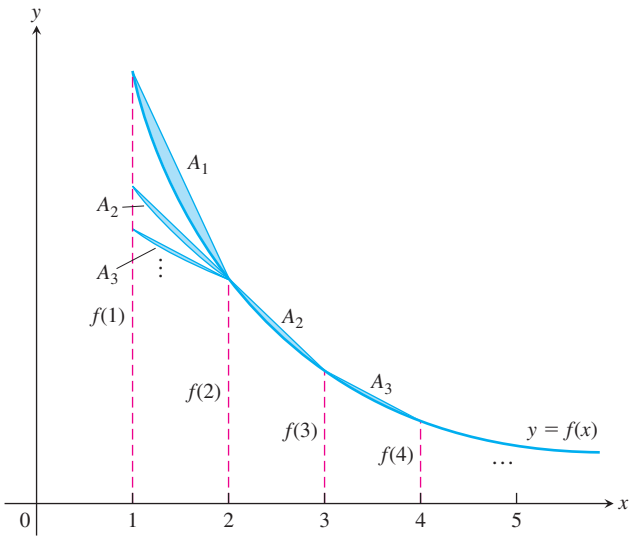
$$\sum_{n=1}^{\infty} \frac{nx^n}{(n+1)(2x+1)^n}$$

converges absolutely.

**19. Generalizing Euler's constant** The accompanying figure shows the graph of a positive twice-differentiable decreasing function $f$ whose second derivative is positive on $(0, \infty)$. For each $n$, the number $A_n$ is the area of the lunar region between the curve and the line segment joining the points $(n, f(n))$ and $(n+1, f(n+1))$.

**a.** Use the figure to show that $\sum_{n=1}^{\infty} A_n < (1/2)(f(1) - f(2))$.

**b.** Then show the existence of



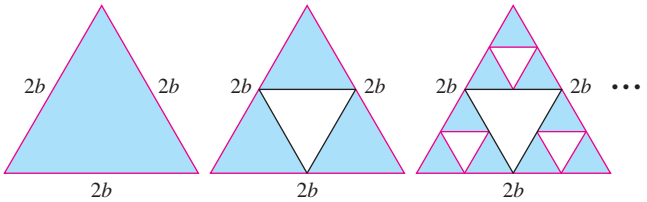
$$\lim_{n\to\infty} \left[ \sum_{k=1}^{n} f(k) - \frac{1}{2}(f(1) + f(n)) - \int_1^n f(x)\, dx \right].$$

**c.** Then show the existence of

$$\lim_{n\to\infty} \left[ \sum_{k=1}^{n} f(k) - \int_1^n f(x)\, dx \right].$$

If $f(x) = 1/x$, the limit in part (c) is Euler's constant (Section 11.3, Exercise 41). (*Source:* "Convergence with Pictures" by P. J. Rippon, *American Mathematical Monthly*, Vol. 93, No. 6, 1986, pp. 476–478.)

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



**20.** This exercise refers to the "right side up" equilateral triangle with sides of length $2b$ in the accompanying figure. "Upside down" equilateral triangles are removed from the original triangle as the sequence of pictures suggests. The sum of the areas removed from the original triangle forms an infinite series.

**a.** Find this infinite series.

**b.** Find the sum of this infinite series and hence find the total area removed from the original triangle.

**c.** Is every point on the original triangle removed? Explain why or why not.

T **21. a.** Does the value of

$$\lim_{n\to\infty}\left(1-\frac{\cos(a/n)}{n}\right)^n, \quad a \text{ constant},$$

appear to depend on the value of $a$? If so, how?

**b.** Does the value of

$$\lim_{n\to\infty}\left(1-\frac{\cos(a/n)}{bn}\right)^n, \quad a \text{ and } b \text{ constant}, b \neq 0,$$

appear to depend on the value of $b$? If so, how?

**c.** Use calculus to confirm your findings in parts (a) and (b).

**22.** Show that if $\sum_{n=1}^{\infty} a_n$ converges, then

$$\sum_{n=1}^{\infty}\left(\frac{1+\sin(a_n)}{2}\right)^n$$

converges.

**23.** Find a value for the constant $b$ that will make the radius of convergence of the power series

$$\sum_{n=2}^{\infty}\frac{b^n x^n}{\ln n}$$

equal to 5.

**24.** How do you know that the functions $\sin x$, $\ln x$, and $e^x$ are not polynomials? Give reasons for your answer.

**25.** Find the value of $a$ for which the limit

$$\lim_{x\to 0}\frac{\sin(ax)-\sin x - x}{x^3}$$

is finite and evaluate the limit.

**26.** Find values of $a$ and $b$ for which

$$\lim_{x\to 0}\frac{\cos(ax)-b}{2x^2} = -1.$$

**27. Raabe's (or Gauss's) test** The following test, which we state without proof, is an extension of the Ratio Test.

*Raabe's test:* If $\sum_{n=1}^{\infty} u_n$ is a series of positive constants and there exist constants $C$, $K$, and $N$ such that

$$\frac{u_n}{u_{n+1}} = 1 + \frac{C}{n} + \frac{f(n)}{n^2}, \tag{1}$$

where $|f(n)| < K$ for $n \geq N$, then $\sum_{n=1}^{\infty} u_n$ converges if $C > 1$ and diverges if $C \leq 1$.

Show that the results of Raabe's test agree with what you know about the series $\sum_{n=1}^{\infty}(1/n^2)$ and $\sum_{n=1}^{\infty}(1/n)$.

**28.** (*Continuation of Exercise 27.*) Suppose that the terms of $\sum_{n=1}^{\infty} u_n$ are defined recursively by the formulas

$$u_1 = 1, \quad u_{n+1} = \frac{(2n-1)^2}{(2n)(2n+1)}u_n.$$

Apply Raabe's test to determine whether the series converges.

**29.** If $\sum_{n=1}^{\infty} a_n$ converges, and if $a_n \neq 1$ and $a_n > 0$ for all $n$,

**a.** Show that $\sum_{n=1}^{\infty} a_n^2$ converges.

**b.** Does $\sum_{n=1}^{\infty} a_n/(1-a_n)$ converge? Explain.

**30.** (*Continuation of Exercise 29.*) If $\sum_{n=1}^{\infty} a_n$ converges, and if $1 > a_n > 0$ for all $n$, show that $\sum_{n=1}^{\infty} \ln(1-a_n)$ converges.

(*Hint:* First show that $|\ln(1-a_n)| \leq a_n/(1-a_n)$.)

**31. Nicole Oresme's Theorem** Prove Nicole Oresme's Theorem that

$$1 + \frac{1}{2}\cdot 2 + \frac{1}{4}\cdot 3 + \cdots + \frac{n}{2^{n-1}} + \cdots = 4.$$

(*Hint:* Differentiate both sides of the equation $1/(1-x) = 1 + \sum_{n=1}^{\infty} x^n$.)

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**32. a.** Show that

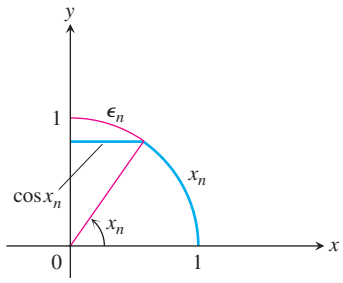
$$\sum_{n=1}^{\infty} \frac{n(n+1)}{x^n} = \frac{2x^2}{(x-1)^3}$$

for $|x| > 1$ by differentiating the identity

$$\sum_{n=1}^{\infty} x^{n+1} = \frac{x^2}{1-x}$$

twice, multiplying the result by $x$, and then replacing $x$ by $1/x$.

**b.** Use part (a) to find the real solution greater than 1 of the equation



$$x = \sum_{n=1}^{\infty} \frac{n(n+1)}{x^n}.$$

**33. A fast estimate of $\pi/2$** As you saw if you did Exercise 127 in Section 11.1, the sequence generated by starting with $x_0 = 1$ and applying the recursion formula $x_{n+1} = x_n + \cos x_n$ converges rapidly to $\pi/2$. To explain the speed of the convergence, let $\epsilon_n = (\pi/2) - x_n$. (See the accompanying figure.) Then

$$\begin{aligned}\epsilon_{n+1} &= \frac{\pi}{2} - x_n - \cos x_n \\ &= \epsilon_n - \cos\left(\frac{\pi}{2} - \epsilon_n\right) \\ &= \epsilon_n - \sin \epsilon_n \\ &= \frac{1}{3!}(\epsilon_n)^3 - \frac{1}{5!}(\epsilon_n)^5 + \cdots.\end{aligned}$$

Use this equality to show that

$$0 < \epsilon_{n+1} < \frac{1}{6}(\epsilon_n)^3.$$

**34.** If $\sum_{n=1}^{\infty} a_n$ is a convergent series of positive numbers, can anything be said about the convergence of $\sum_{n=1}^{\infty} \ln(1 + a_n)$? Give reasons for your answer.

**35. Quality control**

**a.** Differentiate the series

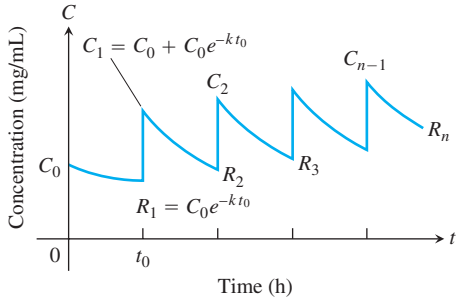
$$\frac{1}{1-x} = 1 + x + x^2 + \cdots + x^n + \cdots$$

to obtain a series for $1/(1-x)^2$.

**b.** In one throw of two dice, the probability of getting a roll of 7 is $p = 1/6$. If you throw the dice repeatedly, the probability that a 7 will appear for the first time at the $n$th throw is $q^{n-1}p$, where $q = 1 - p = 5/6$. The expected number of throws until a 7 first appears is $\sum_{n=1}^{\infty} nq^{n-1}p$. Find the sum of this series.

**c.** As an engineer applying statistical control to an industrial operation, you inspect items taken at random from the assembly line. You classify each sampled item as either "good" or "bad." If the probability of an item's being good is $p$ and of an item's being bad is $q = 1 - p$, the probability that the first bad item found is the $n$th one inspected is $p^{n-1}q$. The average number inspected up to and including the first bad item found is $\sum_{n=1}^{\infty} np^{n-1}q$. Evaluate this sum, assuming $0 < p < 1$.

**36. Expected value** Suppose that a random variable $X$ may assume the values 1, 2, 3, . . . , with probabilities $p_1, p_2, p_3, \ldots$, where $p_k$ is the probability that $X$ equals $k$ ($k = 1, 2, 3, \ldots$). Suppose also that $p_k \geq 0$ and that $\sum_{k=1}^{\infty} p_k = 1$. The **expected value** of $X$, denoted by $E(X)$, is the number $\sum_{k=1}^{\infty} kp_k$, provided the series converges. In each of the following cases, show that $\sum_{k=1}^{\infty} p_k = 1$ and find $E(X)$ if it exists. (*Hint:* See Exercise 35.)



**a.** $p_k = 2^{-k}$ **b.** $p_k = \dfrac{5^{k-1}}{6^k}$

**c.** $p_k = \dfrac{1}{k(k+1)} = \dfrac{1}{k} - \dfrac{1}{k+1}$

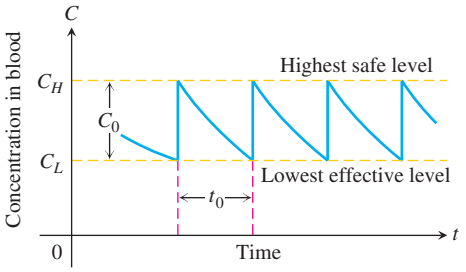
**T** **37. Safe and effective dosage** The concentration in the blood resulting from a single dose of a drug normally decreases with time as the drug is eliminated from the body. Doses may therefore need to be repeated periodically to keep the concentration from dropping below some particular level. One model for the effect of repeated doses gives the residual concentration just before the $(n+1)$st dose as

$$R_n = C_0 e^{-kt_0} + C_0 e^{-2kt_0} + \cdots + C_0 e^{-nkt_0},$$

where $C_0$ = the change in concentration achievable by a single dose (mg/mL), $k$ = the *elimination constant* ($h^{-1}$), and $t_0$ = time between doses (h). See the accompanying figure.

**a.** Write $R_n$ in closed form as a single fraction, and find $R = \lim_{n\to\infty} R_n$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



**b.** Calculate $R_1$ and $R_{10}$ for $C_0 = 1$ mg/mL, $k = 0.1\ \text{h}^{-1}$, and $t_0 = 10$ h. How good an estimate of $R$ is $R_{10}$?

**c.** If $k = 0.01\ \text{h}^{-1}$ and $t_0 = 10$ h, find the smallest $n$ such that $R_n > (1/2)R$.

*(Source: Prescribing Safe and Effective Dosage,* B. Horelick and S. Koont, COMAP, Inc., Lexington, MA.)

**38. Time between drug doses** (*Continuation of Exercise 37.*) If a drug is known to be ineffective below a concentration $C_L$ and harmful above some higher concentration $C_H$, one needs to find values of $C_0$ and $t_0$ that will produce a concentration that is safe (not above $C_H$) but effective (not below $C_L$). See the accompanying figure. We therefore want to find values for $C_0$ and $t_0$ for which

$$R = C_L \quad \text{and} \quad C_0 + R = C_H.$$

Thus $C_0 = C_H - C_L$. When these values are substituted in the equation for $R$ obtained in part (a) of Exercise 37, the resulting equation simplifies to

$$t_0 = \frac{1}{k} \ln \frac{C_H}{C_L}.$$

To reach an effective level rapidly, one might administer a "loading" dose that would produce a concentration of $C_H$ mg/mL. This could be followed every $t_0$ hours by a dose that raises the concentration by $C_0 = C_H - C_L$ mg/mL.

**a.** Verify the preceding equation for $t_0$.

**b.** If $k = 0.05\ \text{h}^{-1}$ and the highest safe concentration is $e$ times the lowest effective concentration, find the length of time between doses that will assure safe and effective concentrations.

**c.** Given $C_H = 2$ mg/mL, $C_L = 0.5$ mg/mL, and $k = 0.02\ \text{h}^{-1}$, determine a scheme for administering the drug.

**d.** Suppose that $k = 0.2\ \text{h}^{-1}$ and that the smallest effective concentration is 0.03 mg/mL. A single dose that produces a concentration of 0.1 mg/mL is administered. About how long will the drug remain effective?

**39. An infinite product** The infinite product

$$\prod_{n=1}^{\infty}(1 + a_n) = (1 + a_1)(1 + a_2)(1 + a_3)\cdots$$

is said to converge if the series

$$\sum_{n=1}^{\infty} \ln(1 + a_n),$$

obtained by taking the natural logarithm of the product, converges. Prove that the product converges if $a_n > -1$ for every $n$ and if $\sum_{n=1}^{\infty} |a_n|$ converges. (*Hint:* Show that

$$|\ln(1 + a_n)| \le \frac{|a_n|}{1 - |a_n|} \le 2|a_n|$$

when $|a_n| < 1/2$.)

**40.** If $p$ is a constant, show that the series

$$1 + \sum_{n=3}^{\infty} \frac{1}{n \cdot \ln n \cdot [\ln(\ln n)]^p}$$

**a.** converges if $p > 1$, **b.** diverges if $p \le 1$. In general, if $f_1(x) = x$, $f_{n+1}(x) = \ln(f_n(x))$, and $n$ takes on the values $1, 2, 3, \ldots$, we find that $f_2(x) = \ln x$, $f_3(x) = \ln(\ln x)$, and so on. If $f_n(a) > 1$, then

$$\int_a^{\infty} \frac{dx}{f_1(x)f_2(x)\cdots f_n(x)(f_{n+1}(x))^p}$$

converges if $p > 1$ and diverges if $p \le 1$.

**41. a.** Prove the following theorem: If $\{c_n\}$ is a sequence of numbers such that every sum $t_n = \sum_{k=1}^{n} c_k$ is bounded, then the series $\sum_{n=1}^{\infty} c_n/n$ converges and is equal to $\sum_{n=1}^{\infty} t_n/(n(n+1))$.

*Outline of proof:* Replace $c_1$ by $t_1$ and $c_n$ by $t_n - t_{n-1}$ for $n \ge 2$. If $s_{2n+1} = \sum_{k=1}^{2n+1} c_k/k$, show that

$$s_{2n+1} = t_1\left(1 - \frac{1}{2}\right) + t_2\left(\frac{1}{2} - \frac{1}{3}\right) + \cdots + t_{2n}\left(\frac{1}{2n} - \frac{1}{2n+1}\right) + \frac{t_{2n+1}}{2n+1}$$

$$= \sum_{k=1}^{2n} \frac{t_k}{k(k+1)} + \frac{t_{2n+1}}{2n+1}.$$

Because $|t_k| < M$ for some constant $M$, the series

$$\sum_{k=1}^{\infty} \frac{t_k}{k(k+1)}$$

converges absolutely and $s_{2n+1}$ has a limit as $n \to \infty$. Finally, if $s_{2n} = \sum_{k=1}^{2n} c_k/k$, then $s_{2n+1} - s_{2n} = c_{2n+1}/(2n+1)$ approaches zero as $n \to \infty$ because $|c_{2n+1}| = |t_{2n+1} - t_{2n}| < 2M$. Hence the sequence of partial sums of the series $\sum c_k/k$ converges and the limit is $\sum_{k=1}^{\infty} t_k/(k(k+1))$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**b.** Show how the foregoing theorem applies to the alternating harmonic series

$$1 - \frac{1}{2} + \frac{1}{3} - \frac{1}{4} + \frac{1}{5} - \frac{1}{6} + \cdots.$$

**c.** Show that the series

$$1 - \frac{1}{2} - \frac{1}{3} + \frac{1}{4} + \frac{1}{5} - \frac{1}{6} - \frac{1}{7} + \cdots.$$

converges. (After the first term, the signs are two negative, two positive, two negative, two positive, and so on in that pattern.)

**42. The convergence of $\sum_{n=1}^{\infty}[(-1)^{n-1}x^n]/n$ to $\ln(1+x)$ for $-1 < x \le 1$**

**a.** Show by long division or otherwise that

$$\frac{1}{1+t} = 1 - t + t^2 - t^3 + \cdots + (-1)^n t^n + \frac{(-1)^{n+1}t^{n+1}}{1+t}.$$

**b.** By integrating the equation of part (a) with respect to $t$ from 0 to $x$, show that

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \cdots + (-1)^n \frac{x^{n+1}}{n+1} + R_{n+1}$$

where

$$R_{n+1} = (-1)^{n+1}\int_0^x \frac{t^{n+1}}{1+t}\,dt.$$

**c.** If $x \ge 0$, show that

$$|R_{n+1}| \le \int_0^x t^{n+1}\,dt = \frac{x^{n+2}}{n+2}.$$

(*Hint:* As $t$ varies from 0 to $x$,

$$1 + t \ge 1 \quad \text{and} \quad t^{n+1}/(1+t) \le t^{n+1},$$

and

$$\left|\int_0^x f(t)\,dt\right| \le \int_0^x |f(t)|\,dt.\right)$$

**d.** If $-1 < x < 0$, show that

$$|R_{n+1}| \le \left|\int_0^x \frac{t^{n+1}}{1-|x|}\,dt\right| = \frac{|x|^{n+2}}{(n+2)(1-|x|)}.$$

(*Hint:* If $x < t \le 0$, then $|1+t| \ge 1 - |x|$ and

$$\left|\frac{t^{n+1}}{1+t}\right| \le \frac{|t|^{n+1}}{1-|x|}.\right)$$

**e.** Use the foregoing results to prove that the series

$$x - \frac{x^2}{2} + \frac{x^3}{3} - \frac{x^4}{4} + \cdots + \frac{(-1)^n x^{n+1}}{n+1} + \cdots$$

converges to $\ln(1+x)$ for $-1 < x \le 1$.

# Chapter 11 Practice Exercises

## Convergent or Divergent Sequences

Which of the sequences whose $n$th terms appear in Exercises 1–18 converge, and which diverge? Find the limit of each convergent sequence.

**1.** $a_n = 1 + \dfrac{(-1)^n}{n}$

**2.** $a_n = \dfrac{1 - (-1)^n}{\sqrt{n}}$

**3.** $a_n = \dfrac{1 - 2^n}{2^n}$

**4.** $a_n = 1 + (0.9)^n$

**5.** $a_n = \sin\dfrac{n\pi}{2}$

**6.** $a_n = \sin n\pi$

**7.** $a_n = \dfrac{\ln(n^2)}{n}$

**8.** $a_n = \dfrac{\ln(2n + 1)}{n}$

**9.** $a_n = \dfrac{n + \ln n}{n}$

**10.** $a_n = \dfrac{\ln(2n^3 + 1)}{n}$

**11.** $a_n = \left(\dfrac{n - 5}{n}\right)^n$

**12.** $a_n = \left(1 + \dfrac{1}{n}\right)^{-n}$

**13.** $a_n = \sqrt[n]{\dfrac{3^n}{n}}$

**14.** $a_n = \left(\dfrac{3}{n}\right)^{1/n}$

**15.** $a_n = n(2^{1/n} - 1)$

**16.** $a_n = \sqrt[n]{2n + 1}$

**17.** $a_n = \dfrac{(n + 1)!}{n!}$

**18.** $a_n = \dfrac{(-4)^n}{n!}$

## Convergent Series

Find the sums of the series in Exercises 19–24.

**19.** $\displaystyle\sum_{n=3}^{\infty} \frac{1}{(2n - 3)(2n - 1)}$

**20.** $\displaystyle\sum_{n=2}^{\infty} \frac{-2}{n(n + 1)}$

**21.** $\displaystyle\sum_{n=1}^{\infty} \frac{9}{(3n - 1)(3n + 2)}$

**22.** $\displaystyle\sum_{n=3}^{\infty} \frac{-8}{(4n - 3)(4n + 1)}$

**23.** $\displaystyle\sum_{n=0}^{\infty} e^{-n}$

**24.** $\displaystyle\sum_{n=1}^{\infty} (-1)^n \frac{3}{4^n}$

## Convergent or Divergent Series

Which of the series in Exercises 25–40 converge absolutely, which converge conditionally, and which diverge? Give reasons for your answers.

**25.** $\displaystyle\sum_{n=1}^{\infty} \frac{1}{\sqrt{n}}$

**26.** $\displaystyle\sum_{n=1}^{\infty} \frac{-5}{n}$

**27.** $\displaystyle\sum_{n=1}^{\infty} \frac{(-1)^n}{\sqrt{n}}$

**28.** $\displaystyle\sum_{n=1}^{\infty} \frac{1}{2n^3}$

**29.** $\displaystyle\sum_{n=1}^{\infty} \frac{(-1)^n}{\ln(n + 1)}$

**30.** $\displaystyle\sum_{n=2}^{\infty} \frac{1}{n(\ln n)^2}$

**31.** $\displaystyle\sum_{n=1}^{\infty} \frac{\ln n}{n^3}$

**32.** $\displaystyle\sum_{n=3}^{\infty} \frac{\ln n}{\ln(\ln n)}$

**33.** $\displaystyle\sum_{n=1}^{\infty} \frac{(-1)^n}{n\sqrt{n^2 + 1}}$

**34.** $\displaystyle\sum_{n=1}^{\infty} \frac{(-1)^n 3n^2}{n^3 + 1}$

**35.** $\displaystyle\sum_{n=1}^{\infty} \frac{n + 1}{n!}$

**36.** $\displaystyle\sum_{n=1}^{\infty} \frac{(-1)^n(n^2 + 1)}{2n^2 + n - 1}$

**37.** $\displaystyle\sum_{n=1}^{\infty} \frac{(-3)^n}{n!}$

**38.** $\displaystyle\sum_{n=1}^{\infty} \frac{2^n 3^n}{n^n}$

**39.** $\displaystyle\sum_{n=1}^{\infty} \frac{1}{\sqrt{n(n + 1)(n + 2)}}$

**40.** $\displaystyle\sum_{n=2}^{\infty} \frac{1}{n\sqrt{n^2 - 1}}$

## Power Series

In Exercises 41–50, **(a)** find the series' radius and interval of convergence. Then identify the values of $x$ for which the series converges **(b)** absolutely and **(c)** conditionally.

**41.** $\displaystyle\sum_{n=1}^{\infty} \frac{(x + 4)^n}{n3^n}$

**42.** $\displaystyle\sum_{n=1}^{\infty} \frac{(x - 1)^{2n-2}}{(2n - 1)!}$

**43.** $\displaystyle\sum_{n=1}^{\infty} \frac{(-1)^{n-1}(3x - 1)^n}{n^2}$

**44.** $\displaystyle\sum_{n=0}^{\infty} \frac{(n + 1)(2x + 1)^n}{(2n + 1)2^n}$

**45.** $\displaystyle\sum_{n=1}^{\infty} \frac{x^n}{n^n}$

**46.** $\displaystyle\sum_{n=1}^{\infty} \frac{x^n}{\sqrt{n}}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**47.** $\sum_{n=0}^{\infty} \frac{(n+1)x^{2n-1}}{3^n}$ **48.** $\sum_{n=0}^{\infty} \frac{(-1)^n(x-1)^{2n+1}}{2n+1}$

**49.** $\sum_{n=1}^{\infty} (\operatorname{csch} n)x^n$ **50.** $\sum_{n=1}^{\infty} (\coth n)x^n$

## Maclaurin Series

Each of the series in Exercises 51–56 is the value of the Taylor series at $x = 0$ of a function $f(x)$ at a particular point. What function and what point? What is the sum of the series?

**51.** $1 - \frac{1}{4} + \frac{1}{16} - \cdots + (-1)^n \frac{1}{4^n} + \cdots$

**52.** $\frac{2}{3} - \frac{4}{18} + \frac{8}{81} - \cdots + (-1)^{n-1} \frac{2^n}{n3^n} + \cdots$

**53.** $\pi - \frac{\pi^3}{3!} + \frac{\pi^5}{5!} - \cdots + (-1)^n \frac{\pi^{2n+1}}{(2n+1)!} + \cdots$

**54.** $1 - \frac{\pi^2}{9 \cdot 2!} + \frac{\pi^4}{81 \cdot 4!} - \cdots + (-1)^n \frac{\pi^{2n}}{3^{2n}(2n)!} + \cdots$

**55.** $1 + \ln 2 + \frac{(\ln 2)^2}{2!} + \cdots + \frac{(\ln 2)^n}{n!} + \cdots$

**56.** $\frac{1}{\sqrt{3}} - \frac{1}{9\sqrt{3}} + \frac{1}{45\sqrt{3}} - \cdots + (-1)^{n-1} \frac{1}{(2n-1)\left(\sqrt{3}\right)^{2n-1}} + \cdots$

Find Taylor series at $x = 0$ for the functions in Exercises 57–64.

**57.** $\frac{1}{1-2x}$ **58.** $\frac{1}{1+x^3}$

**59.** $\sin \pi x$ **60.** $\sin \frac{2x}{3}$

**61.** $\cos (x^{5/2})$ **62.** $\cos \sqrt{5x}$

**63.** $e^{(\pi x/2)}$ **64.** $e^{-x^2}$

## Taylor Series

In Exercises 65–68, find the first four nonzero terms of the Taylor series generated by $f$ at $x = a$.

**65.** $f(x) = \sqrt{3 + x^2}$ at $x = -1$

**66.** $f(x) = 1/(1 - x)$ at $x = 2$

**67.** $f(x) = 1/(x + 1)$ at $x = 3$

**68.** $f(x) = 1/x$ at $x = a > 0$

## Initial Value Problems

Use power series to solve the initial value problems in Exercises 69–76.

**69.** $y' + y = 0, \quad y(0) = -1$ **70.** $y' - y = 0, \quad y(0) = -3$

**71.** $y' + 2y = 0, \quad y(0) = 3$ **72.** $y' + y = 1, \quad y(0) = 0$

**73.** $y' - y = 3x, \quad y(0) = -1$ **74.** $y' + y = x, \quad y(0) = 0$

**75.** $y' - y = x, \quad y(0) = 1$ **76.** $y' - y = -x, \quad y(0) = 2$

## Nonelementary Integrals

Use series to approximate the values of the integrals in Exercises 77–80 with an error of magnitude less than $10^{-8}$. (The answer section gives the integrals' values rounded to 10 decimal places.)

**77.** $\int_0^{1/2} e^{-x^3}\, dx$ **78.** $\int_0^1 x \sin (x^3)\, dx$

**79.** $\int_0^{1/2} \frac{\tan^{-1} x}{x}\, dx$ **80.** $\int_0^{1/64} \frac{\tan^{-1} x}{\sqrt{x}}\, dx$

## Indeterminate Forms

In Exercises 81–86:

**a.** Use power series to evaluate the limit.

T **b.** Then use a grapher to support your calculation.

**81.** $\lim_{x \to 0} \frac{7 \sin x}{e^{2x} - 1}$ **82.** $\lim_{\theta \to 0} \frac{e^\theta - e^{-\theta} - 2\theta}{\theta - \sin \theta}$

**83.** $\lim_{t \to 0} \left( \frac{1}{2 - 2\cos t} - \frac{1}{t^2} \right)$ **84.** $\lim_{h \to 0} \frac{(\sin h)/h - \cos h}{h^2}$

**85.** $\lim_{z \to 0} \frac{1 - \cos^2 z}{\ln (1 - z) + \sin z}$ **86.** $\lim_{y \to 0} \frac{y^2}{\cos y - \cosh y}$

**87.** Use a series representation of $\sin 3x$ to find values of $r$ and $s$ for which

$$\lim_{x \to 0} \left( \frac{\sin 3x}{x^3} + \frac{r}{x^2} + s \right) = 0.$$

**88. a.** Show that the approximation $\csc x \approx 1/x + x/6$ in Section 11.10, Example 9, leads to the approximation $\sin x \approx 6x/(6 + x^2)$.

T **b.** Compare the accuracies of the approximations $\sin x \approx x$ and $\sin x \approx 6x/(6 + x^2)$ by comparing the graphs of $f(x) = \sin x - x$ and $g(x) = \sin x - (6x/(6 + x^2))$. Describe what you find.

## Theory and Examples

**89. a.** Show that the series

$$\sum_{n=1}^{\infty} \left( \sin \frac{1}{2n} - \sin \frac{1}{2n+1} \right)$$

converges.

T **b.** Estimate the magnitude of the error involved in using the sum of the sines through $n = 20$ to approximate the sum of the series. Is the approximation too large, or too small? Give reasons for your answer.

**90. a.** Show that the series $\sum_{n=1}^{\infty} \left( \tan \frac{1}{2n} - \tan \frac{1}{2n+1} \right)$ converges.

T **b.** Estimate the magnitude of the error in using the sum of the tangents through $-\tan (1/41)$ to approximate the sum of the series. Is the approximation too large, or too small? Give reasons for your answer.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**91.** Find the radius of convergence of the series

$$\sum_{n=1}^{\infty} \frac{2 \cdot 5 \cdot 8 \cdot \cdots \cdot (3n-1)}{2 \cdot 4 \cdot 6 \cdot \cdots \cdot (2n)} x^n.$$

**92.** Find the radius of convergence of the series

$$\sum_{n=1}^{\infty} \frac{3 \cdot 5 \cdot 7 \cdot \cdots \cdot (2n+1)}{4 \cdot 9 \cdot 14 \cdot \cdots \cdot (5n-1)} (x-1)^n.$$

**93.** Find a closed-form formula for the $n$th partial sum of the series $\sum_{n=2}^{\infty} \ln(1 - (1/n^2))$ and use it to determine the convergence or divergence of the series.

**94.** Evaluate $\sum_{k=2}^{\infty} (1/(k^2-1))$ by finding the limits as $n \to \infty$ of the series' $n$th partial sum.

**95. a.** Find the interval of convergence of the series

$$y = 1 + \frac{1}{6}x^3 + \frac{1}{180}x^6 + \cdots + \frac{1 \cdot 4 \cdot 7 \cdot \cdots \cdot (3n-2)}{(3n)!} x^{3n} + \cdots.$$

**b.** Show that the function defined by the series satisfies a differential equation of the form

$$\frac{d^2y}{dx^2} = x^a y + b$$

and find the values of the constants $a$ and $b$.

**96. a.** Find the Maclaurin series for the function $x^2/(1+x)$.

**b.** Does the series converge at $x = 1$? Explain.

**97.** If $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ are convergent series of nonnegative numbers, can anything be said about $\sum_{n=1}^{\infty} a_n b_n$? Give reasons for your answer.

**98.** If $\sum_{n=1}^{\infty} a_n$ and $\sum_{n=1}^{\infty} b_n$ are divergent series of nonnegative numbers, can anything be said about $\sum_{n=1}^{\infty} a_n b_n$? Give reasons for your answer.

**99.** Prove that the sequence $\{x_n\}$ and the series $\sum_{k=1}^{\infty} (x_{k+1} - x_k)$ both converge or both diverge.

**100.** Prove that $\sum_{n=1}^{\infty} (a_n/(1+a_n))$ converges if $a_n > 0$ for all $n$ and $\sum_{n=1}^{\infty} a_n$ converges.

**101.** (*Continuation of Section 4.7, Exercise 27.*) If you did Exercise 27 in Section 4.7, you saw that in practice Newton's method stopped too far from the root of $f(x) = (x-1)^{40}$ to give a useful estimate of its value, $x = 1$. Prove that nevertheless, for any starting value $x_0 \neq 1$, the sequence $x_0, x_1, x_2, \ldots, x_n, \ldots$ of approximations generated by Newton's method really does converge to 1.

**102.** Suppose that $a_1, a_2, a_3, \ldots, a_n$ are positive numbers satisfying the following conditions:

**i.** $a_1 \geq a_2 \geq a_3 \geq \cdots$;

**ii.** the series $a_2 + a_4 + a_8 + a_{16} + \cdots$ diverges.

Show that the series

$$\frac{a_1}{1} + \frac{a_2}{2} + \frac{a_3}{3} + \cdots$$

diverges.

**103.** Use the result in Exercise 102 to show that

$$1 + \sum_{n=2}^{\infty} \frac{1}{n \ln n}$$

diverges.

**104.** Suppose you wish to obtain a quick estimate for the value of $\int_0^1 x^2 e^x \, dx$. There are several ways to do this.

**a.** Use the Trapezoidal Rule with $n = 2$ to estimate $\int_0^1 x^2 e^x \, dx$.

**b.** Write out the first three nonzero terms of the Taylor series at $x = 0$ for $x^2 e^x$ to obtain the fourth Taylor polynomial $P(x)$ for $x^2 e^x$. Use $\int_0^1 P(x) \, dx$ to obtain another estimate for $\int_0^1 x^2 e^x \, dx$.

**c.** The second derivative of $f(x) = x^2 e^x$ is positive for all $x > 0$. Explain why this enables you to conclude that the Trapezoidal Rule estimate obtained in part (a) is too large. (*Hint:* What does the second derivative tell you about the graph of a function? How does this relate to the trapezoidal approximation of the area under this graph?)

**d.** All the derivatives of $f(x) = x^2 e^x$ are positive for $x > 0$. Explain why this enables you to conclude that all Maclaurin polynomial approximations to $f(x)$ for $x$ in $[0, 1]$ will be too small. (*Hint:* $f(x) = P_n(x) + R_n(x)$.)

**e.** Use integration by parts to evaluate $\int_0^1 x^2 e^x \, dx$.

## Fourier Series

Find the Fourier series for the functions in Exercises 105–108. Sketch each function.

**105.** $f(x) = \begin{cases} 0, & 0 \leq x \leq \pi \\ 1, & \pi < x \leq 2\pi \end{cases}$

**106.** $f(x) = \begin{cases} x, & 0 \leq x \leq \pi \\ 1, & \pi < x \leq 2\pi \end{cases}$

**107.** $f(x) = \begin{cases} \pi - x, & 0 \leq x \leq \pi \\ x - 2\pi, & \pi < x \leq 2\pi \end{cases}$

**108.** $f(x) = |\sin x|, \quad 0 \leq x \leq 2\pi$

# Chapter 11 Questions to Guide Your Review

1. What is an infinite sequence? What does it mean for such a sequence to converge? To diverge? Give examples.
2. What is a nondecreasing sequence? Under what circumstances does such a sequence have a limit? Give examples.
3. What theorems are available for calculating limits of sequences? Give examples.
4. What theorem sometimes enables us to use l'Hôpital's Rule to calculate the limit of a sequence? Give an example.
5. What six sequence limits are likely to arise when you work with sequences and series?
6. What is an infinite series? What does it mean for such a series to converge? To diverge? Give examples.
7. What is a geometric series? When does such a series converge? Diverge? When it does converge, what is its sum? Give examples.
8. Besides geometric series, what other convergent and divergent series do you know?
9. What is the $n$th-Term Test for Divergence? What is the idea behind the test?
10. What can be said about term-by-term sums and differences of convergent series? About constant multiples of convergent and divergent series?
11. What happens if you add a finite number of terms to a convergent series? A divergent series? What happens if you delete a finite number of terms from a convergent series? A divergent series?
12. How do you reindex a series? Why might you want to do this?
13. Under what circumstances will an infinite series of nonnegative terms converge? Diverge? Why study series of nonnegative terms?
14. What is the Integral Test? What is the reasoning behind it? Give an example of its use.
15. When do $p$-series converge? Diverge? How do you know? Give examples of convergent and divergent $p$-series.
16. What are the Direct Comparison Test and the Limit Comparison Test? What is the reasoning behind these tests? Give examples of their use.
17. What are the Ratio and Root Tests? Do they always give you the information you need to determine convergence or divergence? Give examples.
18. What is an alternating series? What theorem is available for determining the convergence of such a series?
19. How can you estimate the error involved in approximating the sum of an alternating series with one of the series' partial sums? What is the reasoning behind the estimate?
20. What is absolute convergence? Conditional convergence? How are the two related?
21. What do you know about rearranging the terms of an absolutely convergent series? Of a conditionally convergent series? Give examples.
22. What is a power series? How do you test a power series for convergence? What are the possible outcomes?
23. What are the basic facts about
    **a.** term-by-term differentiation of power series?
    **b.** term-by-term integration of power series?
    **c.** multiplication of power series?
    Give examples.
24. What is the Taylor series generated by a function $f(x)$ at a point $x = a$? What information do you need about $f$ to construct the series? Give an example.
25. What is a Maclaurin series?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**26.** Does a Taylor series always converge to its generating function? Explain.

**27.** What are Taylor polynomials? Of what use are they?

**28.** What is Taylor's formula? What does it say about the errors involved in using Taylor polynomials to approximate functions? In particular, what does Taylor's formula say about the error in a linearization? A quadratic approximation?

**29.** What is the binomial series? On what interval does it converge? How is it used?

**30.** How can you sometimes use power series to solve initial value problems?

**31.** How can you sometimes use power series to estimate the values of nonelementary definite integrals?

**32.** What are the Taylor series for $1/(1 - x)$, $1/(1 + x)$, $e^x$, $\sin x$, $\cos x$, $\ln(1 + x)$, $\ln[(1 + x)/(1 - x)]$, and $\tan^{-1} x$? How do you estimate the errors involved in replacing these series with their partial sums?

**33.** What is a Fourier series? How do you calculate the Fourier coefficients $a_0, a_1, a_2, \ldots$ and $b_1, b_2, \ldots$ for a function $f(x)$ defined on the interval $[0, 2\pi]$?

**34.** State the theorem on convergence of the Fourier series for $f(x)$ when $f$ and $f'$ are piecewise continuous on $[0, 2\pi]$.

Chapter

# 12 VECTORS AND THE GEOMETRY OF SPACE

**OVERVIEW** To apply calculus in many real-world situations and in higher mathematics, we need a mathematical description of three-dimensional space. In this chapter we introduce three-dimensional coordinate systems and vectors. Building on what we already know about coordinates in the $xy$-plane, we establish coordinates in space by adding a third axis that measures distance above and below the $xy$-plane. Vectors are used to study the analytic geometry of space, where they give simple ways to describe lines, planes, surfaces, and curves in space. We use these geometric ideas in the rest of the book to study motion in space and the calculus of functions of several variables, with their many important applications in science, engineering, economics, and higher mathematics.

## 12.1 Three-Dimensional Coordinate Systems

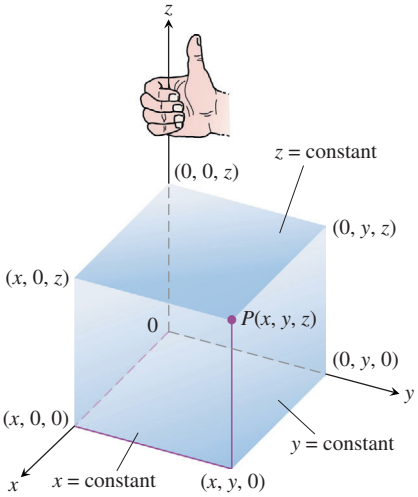

**FIGURE 12.1** The Cartesian coordinate system is right-handed.

To locate a point in space, we use three mutually perpendicular coordinate axes, arranged as in Figure 12.1. The axes shown there make a *right-handed* coordinate frame. When you hold your right hand so that the fingers curl from the positive $x$-axis toward the positive $y$-axis, your thumb points along the positive $z$-axis. So when you look down on the $xy$-plane from the positive direction of the $z$-axis, positive angles in the plane are measured counterclockwise from the positive $x$-axis and around the positive $z$-axis. (In a *left-handed* coordinate frame, the $z$-axis would point downward in Figure 12.1 and angles in the plane would be positive when measured clockwise from the positive $x$-axis. This is not the convention we have used for measuring angles in the $xy$-plane. Right-handed and left-handed coordinate frames are not equivalent.)

The Cartesian coordinates $(x, y, z)$ of a point $P$ in space are the numbers at which the planes through $P$ perpendicular to the axes cut the axes. Cartesian coordinates for space are also called **rectangular coordinates** because the axes that define them meet at right angles. Points on the $x$-axis have $y$- and $z$-coordinates equal to zero. That is, they have coordinates of the form $(x, 0, 0)$. Similarly, points on the $y$-axis have coordinates of the form $(0, y, 0)$, and points on the $z$-axis have coordinates of the form $(0, 0, z)$.

The planes determined by the coordinates axes are the ***xy*-plane**, whose standard equation is $z = 0$; the ***yz*-plane**, whose standard equation is $x = 0$; and the ***xz*-plane**, whose standard equation is $y = 0$. They meet at the **origin** $(0, 0, 0)$ (Figure 12.2). The origin is also identified by simply 0 or sometimes the letter $O$.

The three **coordinate planes** $x = 0, y = 0$, and $z = 0$ divide space into eight cells called **octants**. The octant in which the point coordinates are all positive is called the **first octant**; there is no conventional numbering for the other seven octants.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The points in a plane perpendicular to the $x$-axis all have the same $x$-coordinate, this being the number at which that plane cuts the $x$-axis. The $y$- and $z$-coordinates can be any numbers. Similarly, the points in a plane perpendicular to the $y$-axis have a common $y$-coordinate and the points in a plane perpendicular to the $z$-axis have a common $z$-coordinate. To write equations for these planes, we name the common coordinate's value. The plane $x = 2$ is the plane perpendicular to the $x$-axis at $x = 2$. The plane $y = 3$ is the plane perpendicular to the $y$-axis at $y = 3$. The plane $z = 5$ is the plane perpendicular to the $z$-axis at $z = 5$. Figure 12.3 shows the planes $x = 2$, $y = 3$, and $z = 5$, together with their intersection point (2, 3, 5).

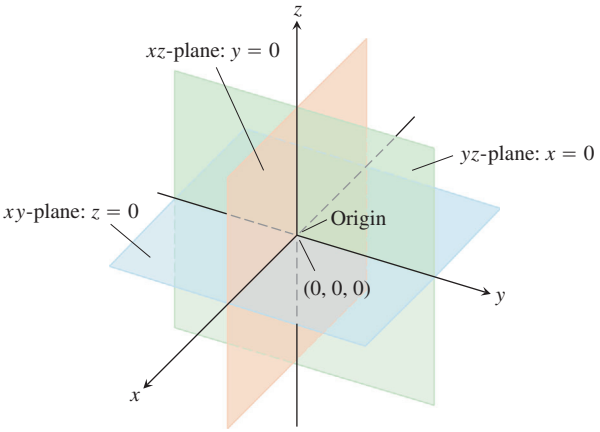

**FIGURE 12.2** The planes $x = 0$, $y = 0$, and $z = 0$ divide space into eight octants.

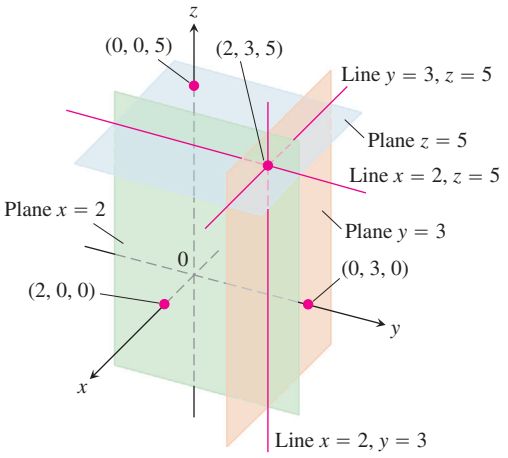

**FIGURE 12.3** The planes $x = 2$, $y = 3$, and $z = 5$ determine three lines through the point (2, 3, 5).

The planes $x = 2$ and $y = 3$ in Figure 12.3 intersect in a line parallel to the $z$-axis. This line is described by the *pair* of equations $x = 2, y = 3$. A point $(x, y, z)$ lies on the line if and only if $x = 2$ and $y = 3$. Similarly, the line of intersection of the planes $y = 3$ and $z = 5$ is described by the equation pair $y = 3, z = 5$. This line runs parallel to the $x$-axis. The line of intersection of the planes $x = 2$ and $z = 5$, parallel to the $y$-axis, is described by the equation pair $x = 2, z = 5$.

In the following examples, we match coordinate equations and inequalities with the sets of points they define in space.

**EXAMPLE 1** Interpreting Equations and Inequalities Geometrically

| | |
|---|---|
| **(a)** $z \geq 0$ | The half-space consisting of the points on and above the $xy$-plane. |
| **(b)** $x = -3$ | The plane perpendicular to the $x$-axis at $x = -3$. This plane lies parallel to the $yz$-plane and 3 units behind it. |
| **(c)** $z = 0, x \leq 0, y \geq 0$ | The second quadrant of the $xy$-plane. |
| **(d)** $x \geq 0, y \geq 0, z \geq 0$ | The first octant. |
| **(e)** $-1 \leq y \leq 1$ | The slab between the planes $y = -1$ and $y = 1$ (planes included). |
| **(f)** $y = -2, z = 2$ | The line in which the planes $y = -2$ and $z = 2$ intersect. Alternatively, the line through the point $(0, -2, 2)$ parallel to the $x$-axis. ■ |

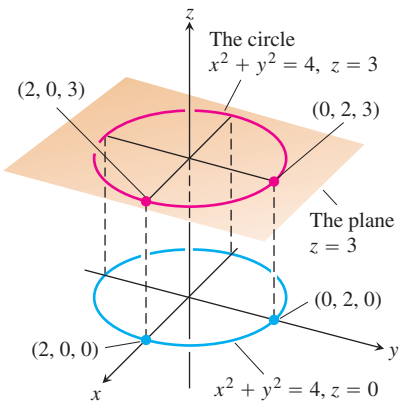

**FIGURE 12.4** The circle $x^2 + y^2 = 4$ in the plane $z = 3$ (Example 2).

**EXAMPLE 2** Graphing Equations

What points $P(x, y, z)$ satisfy the equations

$$x^2 + y^2 = 4 \quad \text{and} \quad z = 3?$$

**Solution** The points lie in the horizontal plane $z = 3$ and, in this plane, make up the circle $x^2 + y^2 = 4$. We call this set of points "the circle $x^2 + y^2 = 4$ in the plane $z = 3$" or, more simply, "the circle $x^2 + y^2 = 4, z = 3$" (Figure 12.4). ■

## Distance and Spheres in Space

The formula for the distance between two points in the $xy$-plane extends to points in space.

**The Distance Between $P_1(x_1, y_1, z_1)$ and $P_2(x_2, y_2, z_2)$ is**

$$|P_1P_2| = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$$

**Proof** We construct a rectangular box with faces parallel to the coordinate planes and the points $P_1$ and $P_2$ at opposite corners of the box (Figure 12.5). If $A(x_2, y_1, z_1)$ and $B(x_2, y_2, z_1)$ are the vertices of the box indicated in the figure, then the three box edges $P_1A$, $AB$, and $BP_2$ have lengths

$$|P_1A| = |x_2 - x_1|, \qquad |AB| = |y_2 - y_1|, \qquad |BP_2| = |z_2 - z_1|.$$

Because triangles $P_1BP_2$ and $P_1AB$ are both right-angled, two applications of the Pythagorean theorem give

$$|P_1P_2|^2 = |P_1B|^2 + |BP_2|^2 \quad \text{and} \quad |P_1B|^2 = |P_1A|^2 + |AB|^2$$

(see Figure 12.5).
So

$$\begin{aligned} |P_1P_2|^2 &= |P_1B|^2 + |BP_2|^2 \\ &= |P_1A|^2 + |AB|^2 + |BP_2|^2 \qquad \text{Substitute } |P_1B|^2 = |P_1A|^2 + |AB|^2. \\ &= |x_2 - x_1|^2 + |y_2 - y_1|^2 + |z_2 - z_1|^2 \\ &= (x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2 \end{aligned}$$

Therefore

$$|P_1P_2| = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$$ ■

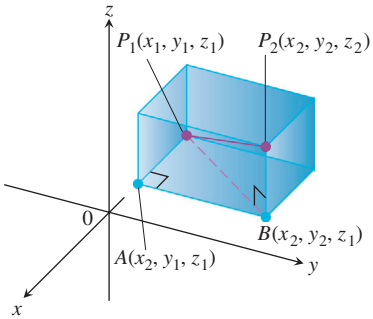

**FIGURE 12.5** We find the distance between $P_1$ and $P_2$ by applying the Pythagorean theorem to the right triangles $P_1AB$ and $P_1BP_2$.

**EXAMPLE 3** Finding the Distance Between Two Points

The distance between $P_1(2, 1, 5)$ and $P_2(-2, 3, 0)$ is

$$\begin{aligned} |P_1P_2| &= \sqrt{(-2 - 2)^2 + (3 - 1)^2 + (0 - 5)^2} \\ &= \sqrt{16 + 4 + 25} \\ &= \sqrt{45} \approx 6.708. \end{aligned}$$ ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

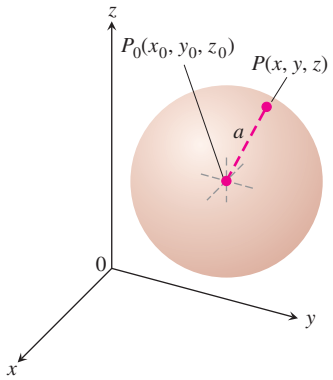

**FIGURE 12.6** The standard equation of the sphere of radius $a$ centered at the point $(x_0, y_0, z_0)$ is

$$(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 = a^2.$$

We can use the distance formula to write equations for spheres in space (Figure 12.6). A point $P(x, y, z)$ lies on the sphere of radius $a$ centered at $P_0(x_0, y_0, z_0)$ precisely when $|P_0P| = a$ or

$$(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 = a^2.$$

**The Standard Equation for the Sphere of Radius $a$ and Center $(x_0, y_0, z_0)$**

$$(x - x_0)^2 + (y - y_0)^2 + (z - z_0)^2 = a^2$$

## EXAMPLE 4 Finding the Center and Radius of a Sphere

Find the center and radius of the sphere

$$x^2 + y^2 + z^2 + 3x - 4z + 1 = 0.$$

**Solution** We find the center and radius of a sphere the way we find the center and radius of a circle: Complete the squares on the $x$-, $y$-, and $z$-terms as necessary and write each quadratic as a squared linear expression. Then, from the equation in standard form, read off the center and radius. For the sphere here, we have

$$x^2 + y^2 + z^2 + 3x - 4z + 1 = 0$$

$$(x^2 + 3x) + y^2 + (z^2 - 4z) = -1$$

$$\left(x^2 + 3x + \left(\frac{3}{2}\right)^2\right) + y^2 + \left(z^2 - 4z + \left(\frac{-4}{2}\right)^2\right) = -1 + \left(\frac{3}{2}\right)^2 + \left(\frac{-4}{2}\right)^2$$

$$\left(x + \frac{3}{2}\right)^2 + y^2 + (z - 2)^2 = -1 + \frac{9}{4} + 4 = \frac{21}{4}.$$

From this standard form, we read that $x_0 = -3/2, y_0 = 0, z_0 = 2$, and $a = \sqrt{21}/2$. The center is $(-3/2, 0, 2)$. The radius is $\sqrt{21}/2$. ■

## EXAMPLE 5 Interpreting Equations and Inequalities

| | |
|---|---|
| **(a)** $x^2 + y^2 + z^2 < 4$ | The interior of the sphere $x^2 + y^2 + z^2 = 4$. |
| **(b)** $x^2 + y^2 + z^2 \le 4$ | The solid ball bounded by the sphere $x^2 + y^2 + z^2 = 4$. Alternatively, the sphere $x^2 + y^2 + z^2 = 4$ together with its interior. |
| **(c)** $x^2 + y^2 + z^2 > 4$ | The exterior of the sphere $x^2 + y^2 + z^2 = 4$. |
| **(d)** $x^2 + y^2 + z^2 = 4, z \le 0$ | The lower hemisphere cut from the sphere $x^2 + y^2 + z^2 = 4$ by the $xy$-plane (the plane $z = 0$). |

■

Just as polar coordinates give another way to locate points in the $xy$-plane (Section 10.5), alternative coordinate systems, different from the Cartesian coordinate system developed here, exist for three-dimensional space. We examine two of these coordinate systems in Section 15.6.

# EXERCISES 12.1

## Sets, Equations, and Inequalities

In Exercises 1–12, give a geometric description of the set of points in space whose coordinates satisfy the given pairs of equations.

**1.** $x = 2, \quad y = 3$ **2.** $x = -1, \quad z = 0$

**3.** $y = 0, \quad z = 0$ **4.** $x = 1, \quad y = 0$

**5.** $x^2 + y^2 = 4, \quad z = 0$ **6.** $x^2 + y^2 = 4, \quad z = -2$

**7.** $x^2 + z^2 = 4, \quad y = 0$ **8.** $y^2 + z^2 = 1, \quad x = 0$

**9.** $x^2 + y^2 + z^2 = 1, \quad x = 0$

**10.** $x^2 + y^2 + z^2 = 25, \quad y = -4$

**11.** $x^2 + y^2 + (z + 3)^2 = 25, \quad z = 0$

**12.** $x^2 + (y - 1)^2 + z^2 = 4, \quad y = 0$

In Exercises 13–18, describe the sets of points in space whose coordinates satisfy the given inequalities or combinations of equations and inequalities.

**13. a.** $x \geq 0, \quad y \geq 0, \quad z = 0$ **b.** $x \geq 0, \quad y \leq 0, \quad z = 0$

**14. a.** $0 \leq x \leq 1$ **b.** $0 \leq x \leq 1, \quad 0 \leq y \leq 1$

**c.** $0 \leq x \leq 1, \quad 0 \leq y \leq 1, \quad 0 \leq z \leq 1$

**15. a.** $x^2 + y^2 + z^2 \leq 1$ **b.** $x^2 + y^2 + z^2 > 1$

**16. a.** $x^2 + y^2 \leq 1, \quad z = 0$ **b.** $x^2 + y^2 \leq 1, \quad z = 3$

**c.** $x^2 + y^2 \leq 1$, no restriction on $z$

**17. a.** $x^2 + y^2 + z^2 = 1, \quad z \geq 0$

**b.** $x^2 + y^2 + z^2 \leq 1, \quad z \geq 0$

**18. a.** $x = y, \quad z = 0$ **b.** $x = y$, no restriction on $z$

In Exercises 19–28, describe the given set with a single equation or with a pair of equations.

**19.** The plane perpendicular to the

**a.** $x$-axis at $(3, 0, 0)$ **b.** $y$-axis at $(0, -1, 0)$

**c.** $z$-axis at $(0, 0, -2)$

**20.** The plane through the point $(3, -1, 2)$ perpendicular to the

**a.** $x$-axis **b.** $y$-axis **c.** $z$-axis

**21.** The plane through the point $(3, -1, 1)$ parallel to the

**a.** $xy$-plane **b.** $yz$-plane **c.** $xz$-plane

**22.** The circle of radius 2 centered at $(0, 0, 0)$ and lying in the

**a.** $xy$-plane **b.** $yz$-plane **c.** $xz$-plane

**23.** The circle of radius 2 centered at $(0, 2, 0)$ and lying in the

**a.** $xy$-plane **b.** $yz$-plane **c.** plane $y = 2$

**24.** The circle of radius 1 centered at $(-3, 4, 1)$ and lying in a plane parallel to the

**a.** $xy$-plane **b.** $yz$-plane **c.** $xz$-plane

**25.** The line through the point $(1, 3, -1)$ parallel to the

**a.** $x$-axis **b.** $y$-axis **c.** $z$-axis

**26.** The set of points in space equidistant from the origin and the point $(0, 2, 0)$

**27.** The circle in which the plane through the point $(1, 1, 3)$ perpendicular to the $z$-axis meets the sphere of radius 5 centered at the origin

**28.** The set of points in space that lie 2 units from the point $(0, 0, 1)$ and, at the same time, 2 units from the point $(0, 0, -1)$

Write inequalities to describe the sets in Exercises 29–34.

**29.** The slab bounded by the planes $z = 0$ and $z = 1$ (planes included)

**30.** The solid cube in the first octant bounded by the coordinate planes and the planes $x = 2, y = 2$, and $z = 2$

**31.** The half-space consisting of the points on and below the $xy$-plane

**32.** The upper hemisphere of the sphere of radius 1 centered at the origin

**33.** The **(a)** interior and **(b)** exterior of the sphere of radius 1 centered at the point $(1, 1, 1)$

**34.** The closed region bounded by the spheres of radius 1 and radius 2 centered at the origin. (*Closed* means the spheres are to be included. Had we wanted the spheres left out, we would have asked for the *open* region bounded by the spheres. This is analogous to the way we use *closed* and *open* to describe intervals: *closed* means endpoints included, *open* means endpoints left out. Closed sets include boundaries; open sets leave them out.)

## Distance

In Exercises 35–40, find the distance between points $P_1$ and $P_2$.

**35.** $P_1(1, 1, 1), \quad P_2(3, 3, 0)$

**36.** $P_1(-1, 1, 5), \quad P_2(2, 5, 0)$

**37.** $P_1(1, 4, 5), \quad P_2(4, -2, 7)$

**38.** $P_1(3, 4, 5), \quad P_2(2, 3, 4)$

**39.** $P_1(0, 0, 0), \quad P_2(2, -2, -2)$

**40.** $P_1(5, 3, -2), \quad P_2(0, 0, 0)$

## Spheres

Find the centers and radii of the spheres in Exercises 41–44.

**41.** $(x + 2)^2 + y^2 + (z - 2)^2 = 8$

**42.** $\left(x + \frac{1}{2}\right)^2 + \left(y + \frac{1}{2}\right)^2 + \left(z + \frac{1}{2}\right)^2 = \frac{21}{4}$

**43.** $\left(x - \sqrt{2}\right)^2 + \left(y - \sqrt{2}\right)^2 + \left(z + \sqrt{2}\right)^2 = 2$

**44.** $x^2 + \left(y + \frac{1}{3}\right)^2 + \left(z - \frac{1}{3}\right)^2 = \frac{29}{9}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Find equations for the spheres whose centers and radii are given in Exercises 45–48.

| | Center | Radius |
|---|---|---|
| **45.** | $(1, 2, 3)$ | $\sqrt{14}$ |
| **46.** | $(0, -1, 5)$ | $2$ |
| **47.** | $(-2, 0, 0)$ | $\sqrt{3}$ |
| **48.** | $(0, -7, 0)$ | $7$ |

Find the centers and radii of the spheres in Exercises 49–52.

**49.** $x^2 + y^2 + z^2 + 4x - 4z = 0$

**50.** $x^2 + y^2 + z^2 - 6y + 8z = 0$

**51.** $2x^2 + 2y^2 + 2z^2 + x + y + z = 9$

**52.** $3x^2 + 3y^2 + 3z^2 + 2y - 2z = 9$

## Theory and Examples

**53.** Find a formula for the distance from the point $P(x, y, z)$ to the

**a.** $x$-axis **b.** $y$-axis **c.** $z$-axis

**54.** Find a formula for the distance from the point $P(x, y, z)$ to the

**a.** $xy$-plane **b.** $yz$-plane **c.** $xz$-plane

**55.** Find the perimeter of the triangle with vertices $A(-1, 2, 1)$, $B(1, -1, 3)$, and $C(3, 4, 5)$.

**56.** Show that the point $P(3, 1, 2)$ is equidistant from the points $A(2, -1, 3)$ and $B(4, 3, 1)$.

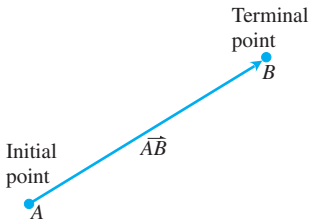
# 12.2 Vectors

Some of the things we measure are determined simply by their magnitudes. To record mass, length, or time, for example, we need only write down a number and name an appropriate unit of measure. We need more information to describe a force, displacement, or velocity. To describe a force, we need to record the direction in which it acts as well as how large it is. To describe a body's displacement, we have to say in what direction it moved as well as how far. To describe a body's velocity, we have to know where the body is headed as well as how fast it is going.

## Component Form



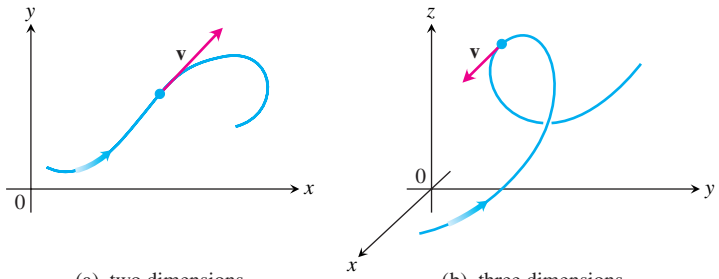


**FIGURE 12.7** The directed line segment $\overrightarrow{AB}$.

A quantity such as force, displacement, or velocity is called a *vector* and is represented by a **directed line segment** (Figure 12.7). The arrow points in the direction of the action and its length gives the magnitude of the action in terms of a suitably chosen unit. For example, a force vector points in the direction in which the force acts; its length is a measure of the force's strength; a velocity vector points in the direction of motion and its length is the speed of the moving object. Figure 12.8 displays the velocity vector **v** at a specific location for a particle moving along a path in the plane or in space. (This application of vectors is studied in Chapter 13.)

(a) two dimensions (b) three dimensions

**FIGURE 12.8** The velocity vector of a particle moving along a path (a) in the plane (b) in space. The arrowhead on the path indicates the direction of motion of the particle.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

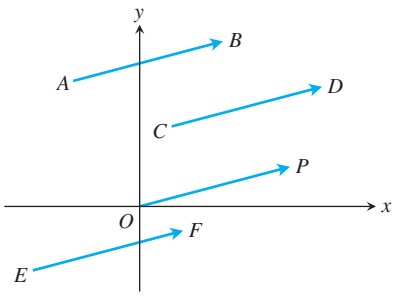

**FIGURE 12.9** The four arrows in the plane (directed line segments) shown here have the same length and direction. They therefore represent the same vector, and we write $\overrightarrow{AB} = \overrightarrow{CD} = \overrightarrow{OP} = \overrightarrow{EF}$.

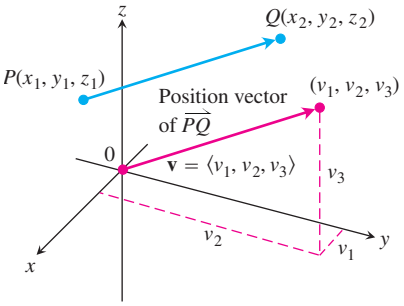

**FIGURE 12.10** A vector $\overrightarrow{PQ}$ in standard position has its initial point at the origin. The directed line segments $\overrightarrow{PQ}$ and $\mathbf{v}$ are parallel and have the same length.

**DEFINITIONS Vector, Initial and Terminal Point, Length**

A **vector** in the plane is a directed line segment. The directed line segment $\overrightarrow{AB}$ has **initial point** $A$ and **terminal point** $B$; its **length** is denoted by $|\overrightarrow{AB}|$. Two vectors are **equal** if they have the same length and direction.

The arrows we use when we draw vectors are understood to represent the same vector if they have the same length, are parallel, and point in the same direction (Figure 12.9) regardless of the initial point.

In textbooks, vectors are usually written in lowercase, boldface letters, for example **u**, **v**, and **w**. Sometimes we use uppercase boldface letters, such as **F**, to denote a force vector. In handwritten form, it is customary to draw small arrows above the letters, for example $\vec{u}$, $\vec{v}$, $\vec{w}$, and $\vec{F}$.

We need a way to represent vectors algebraically so that we can be more precise about the direction of a vector.

Let $\mathbf{v} = \overrightarrow{PQ}$. There is one directed line segment equal to $\overrightarrow{PQ}$ whose initial point is the origin (Figure 12.10). It is the representative of **v** in **standard position** and is the vector we normally use to represent **v**. We can specify **v** by writing the coordinates of its terminal point $(v_1, v_2, v_3)$ when **v** is in standard position. If **v** is a vector in the plane its terminal point $(v_1, v_2)$ has two coordinates.

**DEFINITION Component Form**

If **v** is a **two-dimensional** vector in the plane equal to the vector with initial point at the origin and terminal point $(v_1, v_2)$, then the **component form** of **v** is

$$\mathbf{v} = \langle v_1, v_2 \rangle.$$

If **v** is a **three-dimensional** vector equal to the vector with initial point at the origin and terminal point $(v_1, v_2, v_3)$, then the **component form** of **v** is

$$\mathbf{v} = \langle v_1, v_2, v_3 \rangle.$$

So a two-dimensional vector is an ordered pair $\mathbf{v} = \langle v_1, v_2 \rangle$ of real numbers, and a three-dimensional vector is an ordered triple $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ of real numbers. The numbers $v_1$, $v_2$, and $v_3$ are called the **components** of **v**.

Observe that if $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ is represented by the directed line segment $\overrightarrow{PQ}$, where the initial point is $P(x_1, y_1, z_1)$ and the terminal point is $Q(x_2, y_2, z_2)$, then $x_1 + v_1 = x_2$, $y_1 + v_2 = y_2$, and $z_1 + v_3 = z_2$ (see Figure 12.10). Thus, $v_1 = x_2 - x_1$, $v_2 = y_2 - y_1$, and $v_3 = z_2 - z_1$ are the components of $\overrightarrow{PQ}$.

In summary, given the points $P(x_1, y_1, z_1)$ and $Q(x_2, y_2, z_2)$, the standard position vector $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ equal to $\overrightarrow{PQ}$ is

$$\mathbf{v} = \langle x_2 - x_1, y_2 - y_1, z_2, -z_1 \rangle.$$

If **v** is two-dimensional with $P(x_1, y_1)$ and $Q(x_2, y_2)$ as points in the plane, then $\mathbf{v} = \langle x_2 - x_1, y_2 - y_1 \rangle$. There is no third component for planar vectors. With this understanding, we will develop the algebra of three-dimensional vectors and simply drop the third component when the vector is two-dimensional (a planar vector).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Two vectors are equal if and only if their standard position vectors are identical. Thus $\langle u_1, u_2, u_3 \rangle$ and $\langle v_1, v_2, v_3 \rangle$ are equal if and only if $u_1 = v_1$, $u_2 = v_2$, and $u_3 = v_3$.

The **magnitude** or **length** of the vector $\overrightarrow{PQ}$ is the length of any of its equivalent directed line segment representations. In particular, if $\mathbf{v} = \langle x_2 - x_1, y_2 - y_1, z_2 - z_1 \rangle$ is the standard position vector for $\overrightarrow{PQ}$, then the distance formula gives the magnitude or length of $\mathbf{v}$, denoted by the symbol $|\mathbf{v}|$ or $\|\mathbf{v}\|$.

The **magnitude** or **length** of the vector $\mathbf{v} = \overrightarrow{PQ}$ is the nonnegative number

$$|\mathbf{v}| = \sqrt{v_1^2 + v_2^2 + v_3^2} = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2 + (z_2 - z_1)^2}$$

(See Figure 12.10.)

The only vector with length 0 is the **zero vector** $\mathbf{0} = \langle 0, 0 \rangle$ or $\mathbf{0} = \langle 0, 0, 0 \rangle$. This vector is also the only vector with no specific direction.

## EXAMPLE 1 Component Form and Length of a Vector

Find the **(a)** component form and **(b)** length of the vector with initial point $P(-3, 4, 1)$ and terminal point $Q(-5, 2, 2)$.

**Solution**

**(a)** The standard position vector $\mathbf{v}$ representing $\overrightarrow{PQ}$ has components

$$v_1 = x_2 - x_1 = -5 - (-3) = -2, \qquad v_2 = y_2 - y_1 = 2 - 4 = -2,$$

and

$$v_3 = z_2 - z_1 = 2 - 1 = 1.$$

The component form of $\overrightarrow{PQ}$ is

$$\mathbf{v} = \langle -2, -2, 1 \rangle.$$

**(b)** The length or magnitude of $\mathbf{v} = \overrightarrow{PQ}$ is

$$|\mathbf{v}| = \sqrt{(-2)^2 + (-2)^2 + (1)^2} = \sqrt{9} = 3.$$ ■

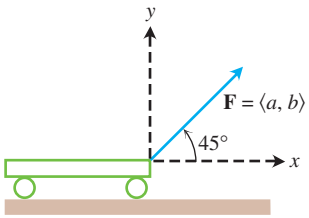

**FIGURE 12.11** The force pulling the cart forward is represented by the vector $\mathbf{F}$ of magnitude 20 (pounds) making an angle of 45° with the horizontal ground (positive $x$-axis) (Example 2).

## EXAMPLE 2 Force Moving a Cart

A small cart is being pulled along a smooth horizontal floor with a 20-lb force $\mathbf{F}$ making a 45° angle to the floor (Figure 12.11). What is the *effective* force moving the cart forward?

**Solution** The effective force is the horizontal component of $\mathbf{F} = \langle a, b \rangle$, given by

$$a = |\mathbf{F}| \cos 45° = (20)\left(\frac{\sqrt{2}}{2}\right) \approx 14.14 \text{ lb}.$$

Notice that $\mathbf{F}$ is a two-dimensional vector. ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Vector Algebra Operations

Two principal operations involving vectors are *vector addition* and *scalar multiplication*. A **scalar** is simply a real number, and is called such when we want to draw attention to its differences from vectors. Scalars can be positive, negative, or zero.

**DEFINITIONS Vector Addition and Multiplication of a Vector by a Scalar**

Let $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$ and $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ be vectors with $k$ a scalar.

**Addition:** $\mathbf{u} + \mathbf{v} = \langle u_1 + v_1, u_2 + v_2, u_3 + v_3 \rangle$

**Scalar multiplication:** $k\mathbf{u} = \langle ku_1, ku_2, ku_3 \rangle$

We add vectors by adding the corresponding components of the vectors. We multiply a vector by a scalar by multiplying each component by the scalar. The definitions apply to planar vectors except there are only two components, $\langle u_1, u_2 \rangle$ and $\langle v_1, v_2 \rangle$.

The definition of vector addition is illustrated geometrically for planar vectors in Figure 12.12a, where the initial point of one vector is placed at the terminal point of the other. Another interpretation is shown in Figure 12.12b (called the **parallelogram law** of addition), where the sum, called the **resultant vector**, is the diagonal of the parallelogram. In physics, forces add vectorially as do velocities, accelerations, and so on. So the force acting on a particle subject to electric and gravitational forces is obtained by adding the two force vectors.

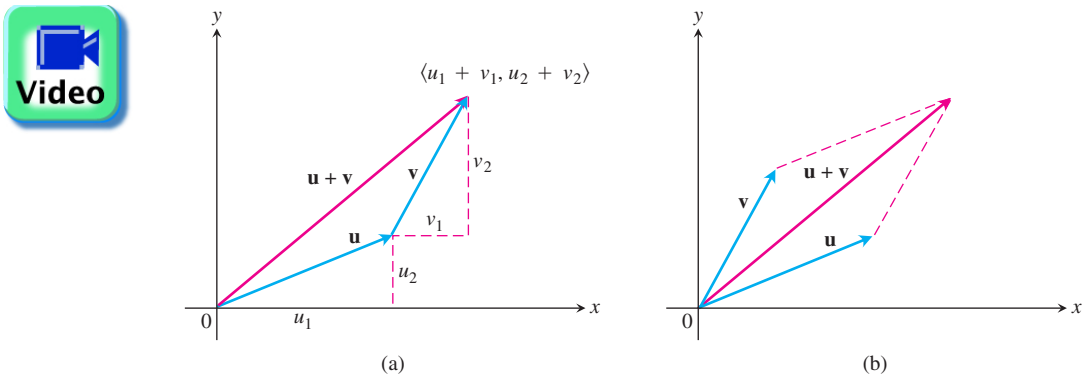

**FIGURE 12.12** (a) Geometric interpretation of the vector sum. (b) The parallelogram law of vector addition.

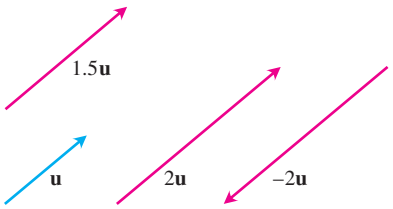
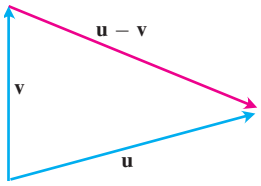
Figure 12.13 displays a geometric interpretation of the product $k\mathbf{u}$ of the scalar $k$ and vector $\mathbf{u}$. If $k > 0$, then $k\mathbf{u}$ has the same direction as $\mathbf{u}$; if $k < 0$, then the direction of $k\mathbf{u}$ is opposite to that of $\mathbf{u}$. Comparing the lengths of $\mathbf{u}$ and $k\mathbf{u}$, we see that

$$|k\mathbf{u}| = \sqrt{(ku_1)^2 + (ku_2)^2 + (ku_3)^2} = \sqrt{k^2(u_1^2 + u_2^2 + u_3^2)}$$

$$= \sqrt{k^2}\sqrt{u_1^2 + u_2^2 + u_3^2} = |k|\,|\mathbf{u}|.$$

The length of $k\mathbf{u}$ is the absolute value of the scalar $k$ times the length of $\mathbf{u}$. The vector $(-1)\mathbf{u} = -\mathbf{u}$ has the same length as $\mathbf{u}$ but points in the opposite direction.





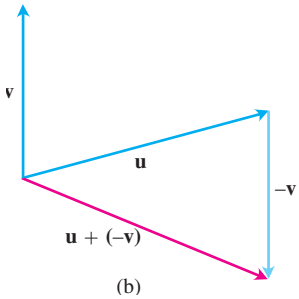


**FIGURE 12.13** Scalar multiples of $\mathbf{u}$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(a)

(b)

**FIGURE 12.14** (a) The vector $\mathbf{u} - \mathbf{v}$, when added to $\mathbf{v}$, gives $\mathbf{u}$. (b) $\mathbf{u} - \mathbf{v} = \mathbf{u} + (-\mathbf{v})$.

By the **difference** $\mathbf{u} - \mathbf{v}$ of two vectors, we mean

$$\mathbf{u} - \mathbf{v} = \mathbf{u} + (-\mathbf{v}).$$

If $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$ and $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$, then

$$\mathbf{u} - \mathbf{v} = \langle u_1 - v_1, u_2 - v_2, u_3 - v_3 \rangle.$$

Note that $(\mathbf{u} - \mathbf{v}) + \mathbf{v} = \mathbf{u}$, so adding the vector $(\mathbf{u} - \mathbf{v})$ to $\mathbf{v}$ gives $\mathbf{u}$ (Figure 12.14a).

Figure 12.14b shows the difference $\mathbf{u} - \mathbf{v}$ as the sum $\mathbf{u} + (-\mathbf{v})$.

## EXAMPLE 3 Performing Operations on Vectors

Let $\mathbf{u} = \langle -1, 3, 1 \rangle$ and $\mathbf{v} = \langle 4, 7, 0 \rangle$. Find

**(a)** $2\mathbf{u} + 3\mathbf{v}$ **(b)** $\mathbf{u} - \mathbf{v}$ **(c)** $\left|\frac{1}{2}\mathbf{u}\right|$.

**Solution**

**(a)** $2\mathbf{u} + 3\mathbf{v} = 2\langle -1, 3, 1 \rangle + 3\langle 4, 7, 0 \rangle = \langle -2, 6, 2 \rangle + \langle 12, 21, 0 \rangle = \langle 10, 27, 2 \rangle$

**(b)** $\mathbf{u} - \mathbf{v} = \langle -1, 3, 1 \rangle - \langle 4, 7, 0 \rangle = \langle -1 - 4, 3 - 7, 1 - 0 \rangle = \langle -5, -4, 1 \rangle$

**(c)** $$\left|\frac{1}{2}\mathbf{u}\right| = \left|\left\langle -\frac{1}{2}, \frac{3}{2}, \frac{1}{2} \right\rangle\right| = \sqrt{\left(-\frac{1}{2}\right)^2 + \left(\frac{3}{2}\right)^2 + \left(\frac{1}{2}\right)^2} = \frac{1}{2}\sqrt{11}.$$ ■

Vector operations have many of the properties of ordinary arithmetic. These properties are readily verified using the definitions of vector addition and multiplication by a scalar.

### Properties of Vector Operations

Let $\mathbf{u}$, $\mathbf{v}$, $\mathbf{w}$ be vectors and $a$, $b$ be scalars.

1. $\mathbf{u} + \mathbf{v} = \mathbf{v} + \mathbf{u}$
2. $(\mathbf{u} + \mathbf{v}) + \mathbf{w} = \mathbf{u} + (\mathbf{v} + \mathbf{w})$
3. $\mathbf{u} + \mathbf{0} = \mathbf{u}$
4. $\mathbf{u} + (-\mathbf{u}) = \mathbf{0}$
5. $0\mathbf{u} = \mathbf{0}$
6. $1\mathbf{u} = \mathbf{u}$
7. $a(b\mathbf{u}) = (ab)\mathbf{u}$
8. $a(\mathbf{u} + \mathbf{v}) = a\mathbf{u} + a\mathbf{v}$
9. $(a + b)\mathbf{u} = a\mathbf{u} + b\mathbf{u}$

An important application of vectors occurs in navigation.

## EXAMPLE 4 Finding Ground Speed and Direction

A Boeing® 767® airplane, flying due east at 500 mph in still air, encounters a 70-mph tailwind blowing in the direction 60° north of east. The airplane holds its compass heading due east but, because of the wind, acquires a new ground speed and direction. What are they?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

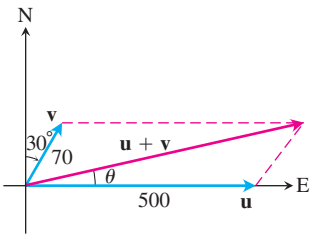

**FIGURE 12.15** Vectors representing the velocities of the airplane **u** and tailwind **v** in Example 4.

**Solution** If $\mathbf{u}$ = the velocity of the airplane alone and $\mathbf{v}$ = the velocity of the tailwind, then $|\mathbf{u}| = 500$ and $|\mathbf{v}| = 70$ (Figure 12.15). The velocity of the airplane with respect to the ground is given by the magnitude and direction of the *resultant vector* $\mathbf{u} + \mathbf{v}$. If we let the positive $x$-axis represent east and the positive $y$-axis represent north, then the component forms of $\mathbf{u}$ and $\mathbf{v}$ are

$$\mathbf{u} = \langle 500, 0 \rangle \qquad \text{and} \qquad \mathbf{v} = \langle 70 \cos 60°, 70 \sin 60° \rangle = \langle 35, 35\sqrt{3} \rangle.$$

Therefore,

$$\mathbf{u} + \mathbf{v} = \langle 535, 35\sqrt{3} \rangle$$

$$|\mathbf{u} + \mathbf{v}| = \sqrt{535^2 + (35\sqrt{3})^2} \approx 538.4$$

and

$$\theta = \tan^{-1} \frac{35\sqrt{3}}{535} \approx 6.5°. \qquad \text{Figure 12.15}$$

The new ground speed of the airplane is about 538.4 mph, and its new direction is about 6.5° north of east. ■

## Unit Vectors

A vector $\mathbf{v}$ of length 1 is called a **unit vector**. The **standard unit vectors** are

$$\mathbf{i} = \langle 1, 0, 0 \rangle, \qquad \mathbf{j} = \langle 0, 1, 0 \rangle, \qquad \text{and} \qquad \mathbf{k} = \langle 0, 0, 1 \rangle.$$

Any vector $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ can be written as a *linear combination* of the standard unit vectors as follows:

$$\mathbf{v} = \langle v_1, v_2, v_3 \rangle = \langle v_1, 0, 0 \rangle + \langle 0, v_2, 0 \rangle + \langle 0, 0, v_3 \rangle$$

$$= v_1\langle 1, 0, 0 \rangle + v_2\langle 0, 1, 0 \rangle + v_3\langle 0, 0, 1 \rangle$$

$$= v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}.$$

We call the scalar (or number) $v_1$ the **i-component** of the vector $\mathbf{v}$, $v_2$ the **j-component**, and $v_3$ the **k-component**. In component form, the vector from $P_1(x_1, y_1, z_1)$ to $P_2(x_2, y_2, z_2)$ is

$$\overrightarrow{P_1P_2} = (x_2 - x_1)\mathbf{i} + (y_2 - y_1)\mathbf{j} + (z_2 - z_1)\mathbf{k}$$

(Figure 12.16).

Whenever $\mathbf{v} \neq \mathbf{0}$, its length $|\mathbf{v}|$ is not zero and

$$\left| \frac{1}{|\mathbf{v}|}\mathbf{v} \right| = \frac{1}{|\mathbf{v}|}|\mathbf{v}| = 1.$$

That is, $\mathbf{v}/|\mathbf{v}|$ is a unit vector in the direction of $\mathbf{v}$, called **the direction** of the nonzero vector $\mathbf{v}$.

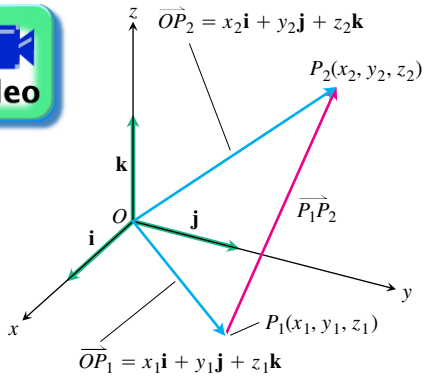

**FIGURE 12.16** The vector from $P_1$ to $P_2$ is $\overrightarrow{P_1P_2} = (x_2 - x_1)\mathbf{i} + (y_2 - y_1)\mathbf{j} + (z_2 - z_1)\mathbf{k}$.

### EXAMPLE 5 Finding a Vector's Direction

Find a unit vector $\mathbf{u}$ in the direction of the vector from $P_1(1, 0, 1)$ to $P_2(3, 2, 0)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** We divide $\overrightarrow{P_1P_2}$ by its length:

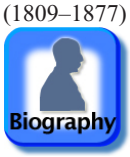
$$\overrightarrow{P_1P_2} = (3 - 1)\mathbf{i} + (2 - 0)\mathbf{j} + (0 - 1)\mathbf{k} = 2\mathbf{i} + 2\mathbf{j} - \mathbf{k}$$

$$|\overrightarrow{P_1P_2}| = \sqrt{(2)^2 + (2)^2 + (-1)^2} = \sqrt{4 + 4 + 1} = \sqrt{9} = 3$$

$$\mathbf{u} = \frac{\overrightarrow{P_1P_2}}{|\overrightarrow{P_1P_2}|} = \frac{2\mathbf{i} + 2\mathbf{j} - \mathbf{k}}{3} = \frac{2}{3}\mathbf{i} + \frac{2}{3}\mathbf{j} - \frac{1}{3}\mathbf{k}.$$

The unit vector $\mathbf{u}$ is the direction of $\overrightarrow{P_1P_2}$. ■

### EXAMPLE 6 Expressing Velocity as Speed Times Direction



If $\mathbf{v} = 3\mathbf{i} - 4\mathbf{j}$ is a velocity vector, express $\mathbf{v}$ as a product of its speed times a unit vector in the direction of motion.

**Solution** Speed is the magnitude (length) of $\mathbf{v}$:

$$|\mathbf{v}| = \sqrt{(3)^2 + (-4)^2} = \sqrt{9 + 16} = 5.$$

HISTORICAL BIOGRAPHY

Hermann Grassmann
(1809–1877)

The unit vector $\mathbf{v}/|\mathbf{v}|$ has the same direction as $\mathbf{v}$:

$$\frac{\mathbf{v}}{|\mathbf{v}|} = \frac{3\mathbf{i} - 4\mathbf{j}}{5} = \frac{3}{5}\mathbf{i} - \frac{4}{5}\mathbf{j}.$$

So

$$\mathbf{v} = 3\mathbf{i} - 4\mathbf{j} = 5\left(\frac{3}{5}\mathbf{i} - \frac{4}{5}\mathbf{j}\right).$$

Length (speed) — Direction of motion

■

In summary, we can express any nonzero vector $\mathbf{v}$ in terms of its two important features, length and direction, by writing $\mathbf{v} = |\mathbf{v}|\dfrac{\mathbf{v}}{|\mathbf{v}|}$.

If $\mathbf{v} \neq \mathbf{0}$, then

1. $\dfrac{\mathbf{v}}{|\mathbf{v}|}$ is a unit vector in the direction of $\mathbf{v}$;
2. the equation $\mathbf{v} = |\mathbf{v}|\dfrac{\mathbf{v}}{|\mathbf{v}|}$ expresses $\mathbf{v}$ in terms of its length and direction.

### EXAMPLE 7 A Force Vector

A force of 6 newtons is applied in the direction of the vector $\mathbf{v} = 2\mathbf{i} + 2\mathbf{j} - \mathbf{k}$. Express the force $\mathbf{F}$ as a product of its magnitude and direction.

**Solution** The force vector has magnitude 6 and direction $\dfrac{\mathbf{v}}{|\mathbf{v}|}$, so

$$\mathbf{F} = 6\frac{\mathbf{v}}{|\mathbf{v}|} = 6\frac{2\mathbf{i} + 2\mathbf{j} - \mathbf{k}}{\sqrt{2^2 + 2^2 + (-1)^2}} = 6\frac{2\mathbf{i} + 2\mathbf{j} - \mathbf{k}}{3}$$

$$= 6\left(\frac{2}{3}\mathbf{i} + \frac{2}{3}\mathbf{j} - \frac{1}{3}\mathbf{k}\right).$$

■

## Midpoint of a Line Segment

Vectors are often useful in geometry. For example, the coordinates of the midpoint of a line segment are found by averaging.

The **midpoint** $M$ of the line segment joining points $P_1(x_1, y_1, z_1)$ and $P_2(x_2, y_2, z_2)$ is the point

$$\left(\frac{x_1 + x_2}{2}, \frac{y_1 + y_2}{2}, \frac{z_1 + z_2}{2}\right).$$

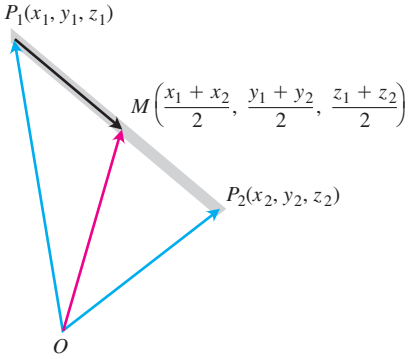

**FIGURE 12.17** The coordinates of the midpoint are the averages of the coordinates of $P_1$ and $P_2$.

To see why, observe (Figure 12.17) that

$$\begin{aligned}\overrightarrow{OM} &= \overrightarrow{OP}_1 + \frac{1}{2}(\overrightarrow{P_1P_2}) = \overrightarrow{OP}_1 + \frac{1}{2}(\overrightarrow{OP}_2 - \overrightarrow{OP}_1)\\ &= \frac{1}{2}(\overrightarrow{OP}_1 + \overrightarrow{OP}_2)\\ &= \frac{x_1 + x_2}{2}\mathbf{i} + \frac{y_1 + y_2}{2}\mathbf{j} + \frac{z_1 + z_2}{2}\mathbf{k}.\end{aligned}$$

**EXAMPLE 8** Finding Midpoints

The midpoint of the segment joining $P_1(3, -2, 0)$ and $P_2(7, 4, 4)$ is

$$\left(\frac{3 + 7}{2}, \frac{-2 + 4}{2}, \frac{0 + 4}{2}\right) = (5, 1, 2).$$

# EXERCISES 12.2

## Vectors in the Plane

In Exercises 1–8, let $\mathbf{u} = \langle 3, -2 \rangle$ and $\mathbf{v} = \langle -2, 5 \rangle$. Find the **(a)** component form and **(b)** magnitude (length) of the vector.

1. $3\mathbf{u}$
2. $-2\mathbf{v}$
3. $\mathbf{u} + \mathbf{v}$
4. $\mathbf{u} - \mathbf{v}$
5. $2\mathbf{u} - 3\mathbf{v}$
6. $-2\mathbf{u} + 5\mathbf{v}$
7. $\frac{3}{5}\mathbf{u} + \frac{4}{5}\mathbf{v}$
8. $-\frac{5}{13}\mathbf{u} + \frac{12}{13}\mathbf{v}$

In Exercises 9–16, find the component form of the vector.

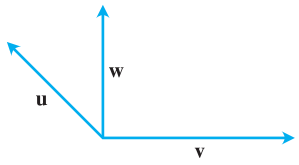
9. The vector $\overrightarrow{PQ}$, where $P = (1, 3)$ and $Q = (2, -1)$
10. The vector $\overrightarrow{OP}$ where $O$ is the origin and $P$ is the midpoint of segment $RS$, where $R = (2, -1)$ and $S = (-4, 3)$
11. The vector from the point $A = (2, 3)$ to the origin
12. The sum of $\overrightarrow{AB}$ and $\overrightarrow{CD}$, where $A = (1, -1)$, $B = (2, 0)$, $C = (-1, 3)$, and $D = (-2, 2)$
13. The unit vector that makes an angle $\theta = 2\pi/3$ with the positive $x$-axis
14. The unit vector that makes an angle $\theta = -3\pi/4$ with the positive $x$-axis
15. The unit vector obtained by rotating the vector $\langle 0, 1 \rangle$ 120° counterclockwise about the origin
16. The unit vector obtained by rotating the vector $\langle 1, 0 \rangle$ 135° counterclockwise about the origin

## Vectors in Space

In Exercises 17–22, express each vector in the form $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$.

17. $\overrightarrow{P_1P_2}$ if $P_1$ is the point $(5, 7, -1)$ and $P_2$ is the point $(2, 9, -2)$
18. $\overrightarrow{P_1P_2}$ if $P_1$ is the point $(1, 2, 0)$ and $P_2$ is the point $(-3, 0, 5)$
19. $\overrightarrow{AB}$ if $A$ is the point $(-7, -8, 1)$ and $B$ is the point $(-10, 8, 1)$
20. $\overrightarrow{AB}$ if $A$ is the point $(1, 0, 3)$ and $B$ is the point $(-1, 4, 5)$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

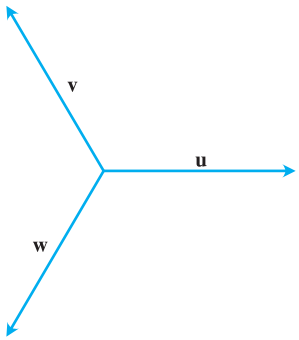


**21.** $5\mathbf{u} - \mathbf{v}$ if $\mathbf{u} = \langle 1, 1, -1\rangle$ and $\mathbf{v} = \langle 2, 0, 3\rangle$

**22.** $-2\mathbf{u} + 3\mathbf{v}$ if $\mathbf{u} = \langle -1, 0, 2\rangle$ and $\mathbf{v} = \langle 1, 1, 1\rangle$

## Geometry and Calculation

In Exercises 23 and 24, copy vectors **u**, **v**, and **w** head to tail as needed to sketch the indicated vector.



**23.**

**a.** $\mathbf{u} + \mathbf{v}$ **b.** $\mathbf{u} + \mathbf{v} + \mathbf{w}$

**c.** $\mathbf{u} - \mathbf{v}$ **d.** $\mathbf{u} - \mathbf{w}$

**24.**

**a.** $\mathbf{u} - \mathbf{v}$ **b.** $\mathbf{u} - \mathbf{v} + \mathbf{w}$

**c.** $2\mathbf{u} - \mathbf{v}$ **d.** $\mathbf{u} + \mathbf{v} + \mathbf{w}$

## Length and Direction

In Exercises 25–30, express each vector as a product of its length and direction.

**25.** $2\mathbf{i} + \mathbf{j} - 2\mathbf{k}$ **26.** $9\mathbf{i} - 2\mathbf{j} + 6\mathbf{k}$

**27.** $5\mathbf{k}$ **28.** $\frac{3}{5}\mathbf{i} + \frac{4}{5}\mathbf{k}$

**29.** $\frac{1}{\sqrt{6}}\mathbf{i} - \frac{1}{\sqrt{6}}\mathbf{j} - \frac{1}{\sqrt{6}}\mathbf{k}$ **30.** $\frac{\mathbf{i}}{\sqrt{3}} + \frac{\mathbf{j}}{\sqrt{3}} + \frac{\mathbf{k}}{\sqrt{3}}$

**31.** Find the vectors whose lengths and directions are given. Try to do the calculations without writing.

| Length | Direction |
|---|---|
| **a.** 2 | $\mathbf{i}$ |
| **b.** $\sqrt{3}$ | $-\mathbf{k}$ |
| **c.** $\frac{1}{2}$ | $\frac{3}{5}\mathbf{j} + \frac{4}{5}\mathbf{k}$ |
| **d.** 7 | $\frac{6}{7}\mathbf{i} - \frac{2}{7}\mathbf{j} + \frac{3}{7}\mathbf{k}$ |

**32.** Find the vectors whose lengths and directions are given. Try to do the calculations without writing.

| Length | Direction |
|---|---|
| **a.** 7 | $-\mathbf{j}$ |
| **b.** $\sqrt{2}$ | $-\frac{3}{5}\mathbf{i} - \frac{4}{5}\mathbf{k}$ |
| **c.** $\frac{13}{12}$ | $\frac{3}{13}\mathbf{i} - \frac{4}{13}\mathbf{j} - \frac{12}{13}\mathbf{k}$ |
| **d.** $a > 0$ | $\frac{1}{\sqrt{2}}\mathbf{i} + \frac{1}{\sqrt{3}}\mathbf{j} - \frac{1}{\sqrt{6}}\mathbf{k}$ |

**33.** Find a vector of magnitude 7 in the direction of $\mathbf{v} = 12\mathbf{i} - 5\mathbf{k}$.

**34.** Find a vector of magnitude 3 in the direction opposite to the direction of $\mathbf{v} = (1/2)\mathbf{i} - (1/2)\mathbf{j} - (1/2)\mathbf{k}$.

## Vectors Determined by Points; Midpoints

In Exercises 35–38, find

**a.** the direction of $\overrightarrow{P_1P_2}$ and

**b.** the midpoint of line segment $P_1P_2$.

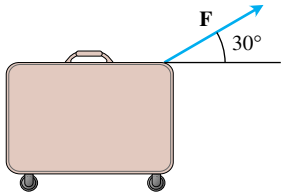
**35.** $P_1(-1, 1, 5)$ $P_2(2, 5, 0)$

**36.** $P_1(1, 4, 5)$ $P_2(4, -2, 7)$

**37.** $P_1(3, 4, 5)$ $P_2(2, 3, 4)$

**38.** $P_1(0, 0, 0)$ $P_2(2, -2, -2)$

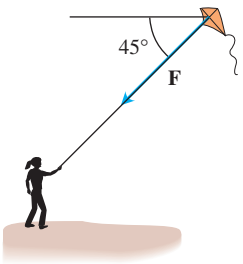
**39.** If $\overrightarrow{AB} = \mathbf{i} + 4\mathbf{j} - 2\mathbf{k}$ and $B$ is the point $(5, 1, 3)$, find $A$.



**40.** If $\overrightarrow{AB} = -7\mathbf{i} + 3\mathbf{j} + 8\mathbf{k}$ and $A$ is the point $(-2, -3, 6)$, find $B$.

## Theory and Applications

**41. Linear combination** Let $\mathbf{u} = 2\mathbf{i} + \mathbf{j}$, $\mathbf{v} = \mathbf{i} + \mathbf{j}$, and $\mathbf{w} = \mathbf{i} - \mathbf{j}$. Find scalars $a$ and $b$ such that $\mathbf{u} = a\mathbf{v} + b\mathbf{w}$.



**42. Linear combination** Let $\mathbf{u} = \mathbf{i} - 2\mathbf{j}$, $\mathbf{v} = 2\mathbf{i} + 3\mathbf{j}$, and $\mathbf{w} = \mathbf{i} + \mathbf{j}$. Write $\mathbf{u} = \mathbf{u}_1 + \mathbf{u}_2$, where $\mathbf{u}_1$ is parallel to $\mathbf{v}$ and $\mathbf{u}_2$ is parallel to $\mathbf{w}$. (See Exercise 41.)

**43. Force vector** You are pulling on a suitcase with a force $\mathbf{F}$ (pictured here) whose magnitude is $|\mathbf{F}| = 10$ lb. Find the $\mathbf{i}$- and $\mathbf{j}$-components of $\mathbf{F}$.

**44. Force vector** A kite string exerts a 12-lb pull ($|\mathbf{F}| = 12$) on a kite and makes a 45° angle with the horizontal. Find the horizontal and vertical components of $\mathbf{F}$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

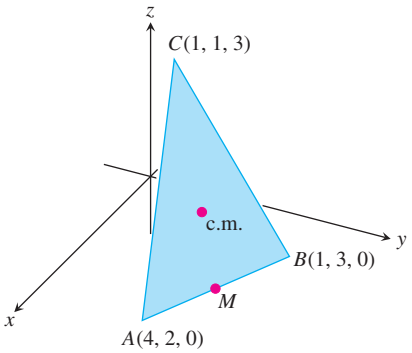
**45. Velocity** An airplane is flying in the direction 25° west of north at 800 km/h. Find the component form of the velocity of the airplane, assuming that the positive $x$-axis represents due east and the positive $y$-axis represents due north.

**46. Velocity** An airplane is flying in the direction 10° east of south at 600 km/h. Find the component form of the velocity of the airplane, assuming that the positive $x$-axis represents due east and the positive $y$-axis represents due north.

**47. Location** A bird flies from its nest 5 km in the direction 60° north of east, where it stops to rest on a tree. It then flies 10 km in the direction due southeast and lands atop a telephone pole. Place an $xy$-coordinate system so that the origin is the bird's nest, the $x$-axis points east, and the $y$-axis points north.

**a.** At what point is the tree located?

**b.** At what point is the telephone pole?



**48.** Use similar triangles to find the coordinates of the point $Q$ that divides the segment from $P_1(x_1, y_1, z_1)$ to $P_2(x_2, y_2, z_2)$ into two lengths whose ratio is $p/q = r$.

**49. Medians of a triangle** Suppose that $A$, $B$, and $C$ are the corner points of the thin triangular plate of constant density shown here.

**a.** Find the vector from $C$ to the midpoint $M$ of side $AB$.

**b.** Find the vector from $C$ to the point that lies two-thirds of the way from $C$ to $M$ on the median $CM$.

**c.** Find the coordinates of the point in which the medians of $\Delta ABC$ intersect. According to Exercise 29, Section 6.4, this point is the plate's center of mass.

**50.** Find the vector from the origin to the point of intersection of the medians of the triangle whose vertices are

$$A(1, -1, 2), \quad B(2, 1, 3), \quad \text{and} \quad C(-1, 2, -1).$$

**51.** Let $ABCD$ be a general, not necessarily planar, quadrilateral in space. Show that the two segments joining the midpoints of opposite sides of $ABCD$ bisect each other. (*Hint:* Show that the segments have the same midpoint.)

**52.** Vectors are drawn from the center of a regular $n$-sided polygon in the plane to the vertices of the polygon. Show that the sum of the vectors is zero. (*Hint:* What happens to the sum if you rotate the polygon about its center?)

**53.** Suppose that $A$, $B$, and $C$ are vertices of a triangle and that $a$, $b$, and $c$ are, respectively, the midpoints of the opposite sides. Show that $\overrightarrow{Aa} + \overrightarrow{Bb} + \overrightarrow{Cc} = 0$.

**54. Unit vectors in the plane** Show that a unit vector in the plane can be expressed as $\mathbf{u} = (\cos\theta)\mathbf{i} + (\sin\theta)\mathbf{j}$, obtained by rotating $\mathbf{i}$ through an angle $\theta$ in the counterclockwise direction. Explain why this form gives *every* unit vector in the plane.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# 12.3 The Dot Product

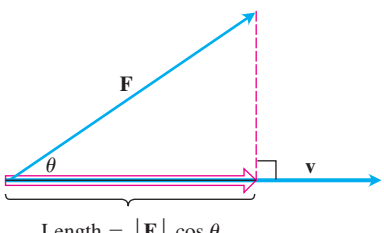


**FIGURE 12.18** The magnitude of the force **F** in the direction of vector **v** is the length $|\mathbf{F}| \cos\theta$ of the projection of **F** onto **v**.

If a force **F** is applied to a particle moving along a path, we often need to know the magnitude of the force in the direction of motion. If **v** is parallel to the tangent line to the path at the point where **F** is applied, then we want the magnitude of **F** in the direction of **v**. Figure 12.18 shows that the scalar quantity we seek is the length $|\mathbf{F}| \cos\theta$, where $\theta$ is the angle between the two vectors **F** and **v**.

In this section, we show how to calculate easily the angle between two vectors directly from their components. A key part of the calculation is an expression called the *dot product*. Dot products are also called *inner* or *scalar* products because the product results in a scalar, not a vector. After investigating the dot product, we apply it to finding the projection of one vector onto another (as displayed in Figure 12.18) and to finding the work done by a constant force acting through a displacement.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

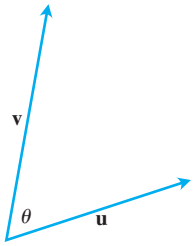

FIGURE 12.19 The angle between **u** and **v**.

## Angle Between Vectors

When two nonzero vectors **u** and **v** are placed so their initial points coincide, they form an angle $\theta$ of measure $0 \le \theta \le \pi$ (Figure 12.19). If the vectors do not lie along the same line, the angle $\theta$ is measured in the plane containing both of them. If they do lie along the same line, the angle between them is 0 if they point in the same direction, and $\pi$ if they point in opposite directions. The angle $\theta$ is the **angle between u and v**. Theorem 1 gives a formula to determine this angle.

**THEOREM 1 Angle Between Two Vectors**

The angle $\theta$ between two nonzero vectors $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$ and $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ is given by

$$\theta = \cos^{-1}\left(\frac{u_1v_1 + u_2v_2 + u_3v_3}{|\mathbf{u}|\,|\mathbf{v}|}\right).$$

Before proving Theorem 1 (which is a consequence of the law of cosines), let's focus attention on the expression $u_1v_1 + u_2v_2 + u_3v_3$ in the calculation for $\theta$.

**DEFINITION Dot Product**

The **dot product** $\mathbf{u} \cdot \mathbf{v}$ ("**u** dot **v**") of vectors $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$ and $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$ is

$$\mathbf{u} \cdot \mathbf{v} = u_1v_1 + u_2v_2 + u_3v_3.$$

**EXAMPLE 1** Finding Dot Products

**(a)** $\langle 1, -2, -1 \rangle \cdot \langle -6, 2, -3 \rangle = (1)(-6) + (-2)(2) + (-1)(-3)$
$= -6 - 4 + 3 = -7$

**(b)** $\left(\frac{1}{2}\mathbf{i} + 3\mathbf{j} + \mathbf{k}\right) \cdot (4\mathbf{i} - \mathbf{j} + 2\mathbf{k}) = \left(\frac{1}{2}\right)(4) + (3)(-1) + (1)(2) = 1$ ■

The dot product of a pair of two-dimensional vectors is defined in a similar fashion:

$$\langle u_1, u_2 \rangle \cdot \langle v_1, v_2 \rangle = u_1v_1 + u_2v_2.$$

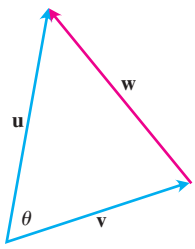

FIGURE 12.20 The parallelogram law of addition of vectors gives $\mathbf{w} = \mathbf{u} - \mathbf{v}$.

**Proof of Theorem 1** Applying the law of cosines (Equation (6), Section 1.6) to the triangle in Figure 12.20, we find that

$$|\mathbf{w}|^2 = |\mathbf{u}|^2 + |\mathbf{v}|^2 - 2|\mathbf{u}|\,|\mathbf{v}| \cos\theta \qquad \text{Law of cosines}$$

$$2|\mathbf{u}|\,|\mathbf{v}| \cos\theta = |\mathbf{u}|^2 + |\mathbf{v}|^2 - |\mathbf{w}|^2.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Because $\mathbf{w} = \mathbf{u} - \mathbf{v}$, the component form of $\mathbf{w}$ is $\langle u_1 - v_1, u_2 - v_2, u_3 - v_3 \rangle$. So

$$|\mathbf{u}|^2 = \left(\sqrt{{u_1}^2 + {u_2}^2 + {u_3}^2}\right)^2 = {u_1}^2 + {u_2}^2 + {u_3}^2$$

$$|\mathbf{v}|^2 = \left(\sqrt{{v_1}^2 + {v_2}^2 + {v_3}^2}\right)^2 = {v_1}^2 + {v_2}^2 + {v_3}^2$$

$$|\mathbf{w}|^2 = \left(\sqrt{(u_1 - v_1)^2 + (u_2 - v_2)^2 + (u_3 - v_3)^2}\right)^2$$

$$= (u_1 - v_1)^2 + (u_2 - v_2)^2 + (u_3 - v_3)^2$$

$$= {u_1}^2 - 2u_1v_1 + {v_1}^2 + {u_2}^2 - 2u_2v_2 + {v_2}^2 + {u_3}^2 - 2u_3v_3 + {v_3}^2$$

and

$$|\mathbf{u}|^2 + |\mathbf{v}|^2 - |\mathbf{w}|^2 = 2(u_1v_1 + u_2v_2 + u_3v_3).$$

Therefore,

$$2|\mathbf{u}||\mathbf{v}| \cos\theta = |\mathbf{u}|^2 + |\mathbf{v}|^2 - |\mathbf{w}|^2 = 2(u_1v_1 + u_2v_2 + u_3v_3)$$

$$|\mathbf{u}||\mathbf{v}| \cos\theta = u_1v_1 + u_2v_2 + u_3v_3$$

$$\cos\theta = \frac{u_1v_1 + u_2v_2 + u_3v_3}{|\mathbf{u}||\mathbf{v}|}$$

So

$$\theta = \cos^{-1}\left(\frac{u_1v_1 + u_2v_2 + u_3v_3}{|\mathbf{u}||\mathbf{v}|}\right)$$ ■

With the notation of the dot product, the angle between two vectors $\mathbf{u}$ and $\mathbf{v}$ can be written as

$$\theta = \cos^{-1}\left(\frac{\mathbf{u} \cdot \mathbf{v}}{|\mathbf{u}||\mathbf{v}|}\right).$$

**EXAMPLE 2** Finding the Angle Between Two Vectors in Space

Find the angle between $\mathbf{u} = \mathbf{i} - 2\mathbf{j} - 2\mathbf{k}$ and $\mathbf{v} = 6\mathbf{i} + 3\mathbf{j} + 2\mathbf{k}$.

**Solution** We use the formula above:

$$\mathbf{u} \cdot \mathbf{v} = (1)(6) + (-2)(3) + (-2)(2) = 6 - 6 - 4 = -4$$

$$|\mathbf{u}| = \sqrt{(1)^2 + (-2)^2 + (-2)^2} = \sqrt{9} = 3$$

$$|\mathbf{v}| = \sqrt{(6)^2 + (3)^2 + (2)^2} = \sqrt{49} = 7$$

$$\theta = \cos^{-1}\left(\frac{\mathbf{u} \cdot \mathbf{v}}{|\mathbf{u}||\mathbf{v}|}\right)$$

$$= \cos^{-1}\left(\frac{-4}{(3)(7)}\right) \approx 1.76 \text{ radians}.$$ ■

The angle formula applies to two-dimensional vectors as well.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

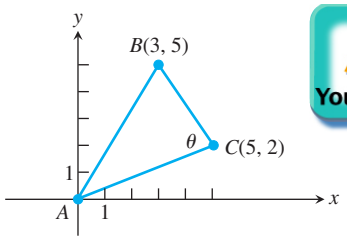

**FIGURE 12.21** The triangle in Example 3.

**EXAMPLE 3** Finding an Angle of a Triangle

Find the angle $\theta$ in the triangle $ABC$ determined by the vertices $A = (0, 0)$, $B = (3, 5)$, and $C = (5, 2)$ (Figure 12.21).

**Solution** The angle $\theta$ is the angle between the vectors $\overrightarrow{CA}$ and $\overrightarrow{CB}$. The component forms of these two vectors are

$$\overrightarrow{CA} = \langle -5, -2 \rangle \quad \text{and} \quad \overrightarrow{CB} = \langle -2, 3 \rangle.$$

First we calculate the dot product and magnitudes of these two vectors.

$$\overrightarrow{CA} \cdot \overrightarrow{CB} = (-5)(-2) + (-2)(3) = 4$$

$$|\overrightarrow{CA}| = \sqrt{(-5)^2 + (-2)^2} = \sqrt{29}$$

$$|\overrightarrow{CB}| = \sqrt{(-2)^2 + (3)^2} = \sqrt{13}$$

Then applying the angle formula, we have

$$\theta = \cos^{-1}\left(\frac{\overrightarrow{CA} \cdot \overrightarrow{CB}}{|\overrightarrow{CA}||\overrightarrow{CB}|}\right)$$

$$= \cos^{-1}\left(\frac{4}{\left(\sqrt{29}\right)\left(\sqrt{13}\right)}\right)$$

$$\approx 78.1^\circ \quad \text{or} \quad 1.36 \text{ radians}.$$

■

## Perpendicular (Orthogonal) Vectors

Two nonzero vectors $\mathbf{u}$ and $\mathbf{v}$ are perpendicular or **orthogonal** if the angle between them is $\pi/2$. For such vectors, we have $\mathbf{u} \cdot \mathbf{v} = 0$ because $\cos(\pi/2) = 0$. The converse is also true. If $\mathbf{u}$ and $\mathbf{v}$ are nonzero vectors with $\mathbf{u} \cdot \mathbf{v} = |\mathbf{u}||\mathbf{v}| \cos\theta = 0$, then $\cos\theta = 0$ and $\theta = \cos^{-1} 0 = \pi/2$.

**DEFINITION** **Orthogonal Vectors**

Vectors $\mathbf{u}$ and $\mathbf{v}$ are **orthogonal** (or **perpendicular**) if and only if $\mathbf{u} \cdot \mathbf{v} = 0$.

**EXAMPLE 4** Applying the Definition of Orthogonality

**(a)** $\mathbf{u} = \langle 3, -2 \rangle$ and $\mathbf{v} = \langle 4, 6 \rangle$ are orthogonal because $\mathbf{u} \cdot \mathbf{v} = (3)(4) + (-2)(6) = 0$.

**(b)** $\mathbf{u} = 3\mathbf{i} - 2\mathbf{j} + \mathbf{k}$ and $\mathbf{v} = 2\mathbf{j} + 4\mathbf{k}$ are orthogonal because $\mathbf{u} \cdot \mathbf{v} = (3)(0) + (-2)(2) + (1)(4) = 0$.

**(c)** $\mathbf{0}$ is orthogonal to every vector $\mathbf{u}$ since

$$\mathbf{0} \cdot \mathbf{u} = \langle 0, 0, 0 \rangle \cdot \langle u_1, u_2, u_3 \rangle$$

$$= (0)(u_1) + (0)(u_2) + (0)(u_3)$$

$$= 0.$$

## Dot Product Properties and Vector Projections

The dot product obeys many of the laws that hold for ordinary products of real numbers (scalars).

### Properties of the Dot Product

If $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ are any vectors and $c$ is a scalar, then

1. $\mathbf{u} \cdot \mathbf{v} = \mathbf{v} \cdot \mathbf{u}$
2. $(c\mathbf{u}) \cdot \mathbf{v} = \mathbf{u} \cdot (c\mathbf{v}) = c(\mathbf{u} \cdot \mathbf{v})$
3. $\mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) = \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}$
4. $\mathbf{u} \cdot \mathbf{u} = |\mathbf{u}|^2$
5. $\mathbf{0} \cdot \mathbf{u} = 0$.

HISTORICAL BIOGRAPHY

Carl Friedrich Gauss
(1777–1855)

**Proofs of Properties 1 and 3** The properties are easy to prove using the definition. For instance, here are the proofs of Properties 1 and 3.

1. $\mathbf{u} \cdot \mathbf{v} = u_1v_1 + u_2v_2 + u_3v_3 = v_1u_1 + v_2u_2 + v_3u_3 = \mathbf{v} \cdot \mathbf{u}$

3. $$\begin{aligned}\mathbf{u} \cdot (\mathbf{v} + \mathbf{w}) &= \langle u_1, u_2, u_3 \rangle \cdot \langle v_1 + w_1, v_2 + w_2, v_3 + w_3 \rangle \\ &= u_1(v_1 + w_1) + u_2(v_2 + w_2) + u_3(v_3 + w_3) \\ &= u_1v_1 + u_1w_1 + u_2v_2 + u_2w_2 + u_3v_3 + u_3w_3 \\ &= (u_1v_1 + u_2v_2 + u_3v_3) + (u_1w_1 + u_2w_2 + u_3w_3) \\ &= \mathbf{u} \cdot \mathbf{v} + \mathbf{u} \cdot \mathbf{w}\end{aligned}$$ ■

We now return to the problem of projecting one vector onto another, posed in the opening to this section. The **vector projection** of $\mathbf{u} = \overrightarrow{PQ}$ onto a nonzero vector $\mathbf{v} = \overrightarrow{PS}$ (Figure 12.22) is the vector $\overrightarrow{PR}$ determined by dropping a perpendicular from $Q$ to the line $PS$. The notation for this vector is

$$\text{proj}_{\mathbf{v}}\, \mathbf{u} \qquad (\text{“the vector projection of } \mathbf{u} \text{ onto } \mathbf{v}\text{”}).$$

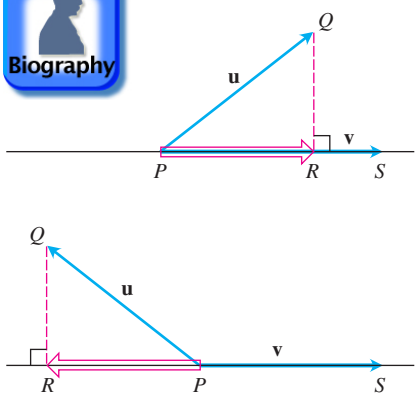

**FIGURE 12.22** The vector projection of $\mathbf{u}$ onto $\mathbf{v}$.

If $\mathbf{u}$ represents a force, then $\text{proj}_{\mathbf{v}}\, \mathbf{u}$ represents the effective force in the direction of $\mathbf{v}$ (Figure 12.23).

If the angle $\theta$ between $\mathbf{u}$ and $\mathbf{v}$ is acute, $\text{proj}_{\mathbf{v}}\, \mathbf{u}$ has length $|\mathbf{u}| \cos\theta$ and direction $\mathbf{v}/|\mathbf{v}|$ (Figure 12.24). If $\theta$ is obtuse, $\cos\theta < 0$ and $\text{proj}_{\mathbf{v}}\, \mathbf{u}$ has length $-|\mathbf{u}| \cos\theta$ and direction $-\mathbf{v}/|\mathbf{v}|$. In both cases,

$$\begin{aligned}\text{proj}_{\mathbf{v}}\, \mathbf{u} &= (|\mathbf{u}| \cos\theta)\frac{\mathbf{v}}{|\mathbf{v}|} \\ &= \left(\frac{\mathbf{u} \cdot \mathbf{v}}{|\mathbf{v}|}\right)\frac{\mathbf{v}}{|\mathbf{v}|} \qquad |\mathbf{u}| \cos\theta = \frac{|\mathbf{u}||\mathbf{v}| \cos\theta}{|\mathbf{v}|} = \frac{\mathbf{u} \cdot \mathbf{v}}{|\mathbf{v}|} \\ &= \left(\frac{\mathbf{u} \cdot \mathbf{v}}{|\mathbf{v}|^2}\right)\mathbf{v}.\end{aligned}$$

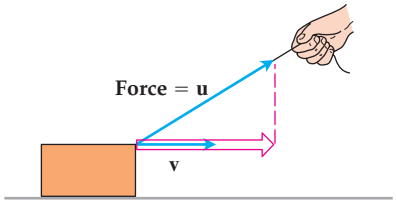

**FIGURE 12.23** If we pull on the box with force $\mathbf{u}$, the effective force moving the box forward in the direction $\mathbf{v}$ is the projection of $\mathbf{u}$ onto $\mathbf{v}$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

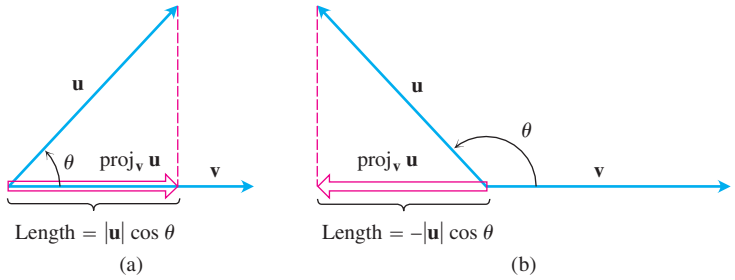

**FIGURE 12.24** The length of $\text{proj}_{\mathbf{v}}\mathbf{u}$ is (a) $|\mathbf{u}|\cos\theta$ if $\cos\theta \geq 0$ and (b) $-|\mathbf{u}|\cos\theta$ if $\cos\theta < 0$.

The number $|\mathbf{u}|\cos\theta$ is called the **scalar component of u in the direction of v**. To summarize,

Vector projection of $\mathbf{u}$ onto $\mathbf{v}$:

$$\text{proj}_{\mathbf{v}}\mathbf{u} = \left(\frac{\mathbf{u}\cdot\mathbf{v}}{|\mathbf{v}|^2}\right)\mathbf{v} \tag{1}$$

Scalar component of $\mathbf{u}$ in the direction of $\mathbf{v}$:

$$|\mathbf{u}|\cos\theta = \frac{\mathbf{u}\cdot\mathbf{v}}{|\mathbf{v}|} = \mathbf{u}\cdot\frac{\mathbf{v}}{|\mathbf{v}|} \tag{2}$$

Note that both the vector projection of $\mathbf{u}$ onto $\mathbf{v}$ and the scalar component of $\mathbf{u}$ onto $\mathbf{v}$ depend only on the direction of the vector $\mathbf{v}$ and not its length (because we dot $\mathbf{u}$ with $\mathbf{v}/|\mathbf{v}|$, which is the direction of $\mathbf{v}$).

## EXAMPLE 5 Finding the Vector Projection

Find the vector projection of $\mathbf{u} = 6\mathbf{i} + 3\mathbf{j} + 2\mathbf{k}$ onto $\mathbf{v} = \mathbf{i} - 2\mathbf{j} - 2\mathbf{k}$ and the scalar component of $\mathbf{u}$ in the direction of $\mathbf{v}$.

**Solution** We find $\text{proj}_{\mathbf{v}}\mathbf{u}$ from Equation (1):

$$\text{proj}_{\mathbf{v}}\mathbf{u} = \frac{\mathbf{u}\cdot\mathbf{v}}{\mathbf{v}\cdot\mathbf{v}}\mathbf{v} = \frac{6 - 6 - 4}{1 + 4 + 4}(\mathbf{i} - 2\mathbf{j} - 2\mathbf{k})$$

$$= -\frac{4}{9}(\mathbf{i} - 2\mathbf{j} - 2\mathbf{k}) = -\frac{4}{9}\mathbf{i} + \frac{8}{9}\mathbf{j} + \frac{8}{9}\mathbf{k}.$$

We find the scalar component of $\mathbf{u}$ in the direction of $\mathbf{v}$ from Equation (2):

$$|\mathbf{u}|\cos\theta = \mathbf{u}\cdot\frac{\mathbf{v}}{|\mathbf{v}|} = (6\mathbf{i} + 3\mathbf{j} + 2\mathbf{k})\cdot\left(\frac{1}{3}\mathbf{i} - \frac{2}{3}\mathbf{j} - \frac{2}{3}\mathbf{k}\right)$$

$$= 2 - 2 - \frac{4}{3} = -\frac{4}{3}.$$

■

Equations (1) and (2) also apply to two-dimensional vectors.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 6** Finding Vector Projections and Scalar Components

Find the vector projection of a force $\mathbf{F} = 5\mathbf{i} + 2\mathbf{j}$ onto $\mathbf{v} = \mathbf{i} - 3\mathbf{j}$ and the scalar component of $\mathbf{F}$ in the direction of $\mathbf{v}$.

**Solution** The vector projection is

$$\begin{aligned}\text{proj}_{\mathbf{v}}\,\mathbf{F} &= \left(\frac{\mathbf{F}\cdot\mathbf{v}}{|\mathbf{v}|^2}\right)\mathbf{v} \\ &= \frac{5-6}{1+9}(\mathbf{i}-3\mathbf{j}) = -\frac{1}{10}(\mathbf{i}-3\mathbf{j}) \\ &= -\frac{1}{10}\mathbf{i} + \frac{3}{10}\mathbf{j}.\end{aligned}$$

The scalar component of $\mathbf{F}$ in the direction of $\mathbf{v}$ is

$$|\mathbf{F}|\cos\theta = \frac{\mathbf{F}\cdot\mathbf{v}}{|\mathbf{v}|} = \frac{5-6}{\sqrt{1+9}} = -\frac{1}{\sqrt{10}}.$$

■

## Work

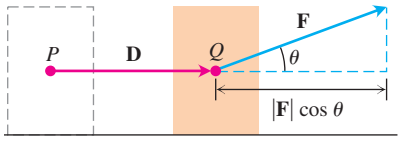

**FIGURE 12.25** The work done by a constant force $\mathbf{F}$ during a displacement $\mathbf{D}$ is $(|\mathbf{F}|\cos\theta)|\mathbf{D}|$.

In Chapter 6, we calculated the work done by a constant force of magnitude $F$ in moving an object through a distance $d$ as $W = Fd$. That formula holds only if the force is directed along the line of motion. If a force $\mathbf{F}$ moving an object through a displacement $\mathbf{D} = \overrightarrow{PQ}$ has some other direction, the work is performed by the component of $\mathbf{F}$ in the direction of $\mathbf{D}$. If $\theta$ is the angle between $\mathbf{F}$ and $\mathbf{D}$ (Figure 12.25), then

$$\begin{aligned}\text{Work} &= \begin{pmatrix}\text{scalar component of } \mathbf{F} \\ \text{in the direction of } \mathbf{D}\end{pmatrix}(\text{length of } \mathbf{D}) \\ &= (|\mathbf{F}|\cos\theta)|\mathbf{D}| \\ &= \mathbf{F}\cdot\mathbf{D}.\end{aligned}$$

**DEFINITION** **Work by Constant Force**

The **work** done by a constant force $\mathbf{F}$ acting through a displacement $\mathbf{D} = \overrightarrow{PQ}$ is

$$W = \mathbf{F}\cdot\mathbf{D} = |\mathbf{F}||\mathbf{D}|\cos\theta,$$

where $\theta$ is the angle between $\mathbf{F}$ and $\mathbf{D}$.

**EXAMPLE 7** Applying the Definition of Work

If $|\mathbf{F}| = 40$ N (newtons), $|\mathbf{D}| = 3$ m, and $\theta = 60°$, the work done by $\mathbf{F}$ in acting from $P$ to $Q$ is

$$\begin{aligned}\text{Work} &= |\mathbf{F}||\mathbf{D}|\cos\theta && \text{Definition} \\ &= (40)(3)\cos 60° && \text{Given values} \\ &= (120)(1/2) \\ &= 60 \text{ J (joules)}.\end{aligned}$$

■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We encounter more challenging work problems in Chapter 16 when we learn to find the work done by a variable force along a *path* in space.

## Writing a Vector as a Sum of Orthogonal Vectors

We know one way to write a vector $\mathbf{u} = \langle u_1, u_2 \rangle$ or $\mathbf{u} = \langle u_1, u_2, u_3 \rangle$ as a sum of two orthogonal vectors:

$$\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j} \qquad \text{or} \qquad \mathbf{u} = u_1\mathbf{i} + (u_2\mathbf{j} + u_3\mathbf{k})$$

(since $\mathbf{i} \cdot \mathbf{j} = \mathbf{i} \cdot \mathbf{k} = \mathbf{j} \cdot \mathbf{k} = 0$).

Sometimes, however, it is more informative to express $\mathbf{u}$ as a different sum. In mechanics, for instance, we often need to write a vector $\mathbf{u}$ as a sum of a vector parallel to a given vector $\mathbf{v}$ and a vector orthogonal to $\mathbf{v}$. As an example, in studying the motion of a particle moving along a path in the plane (or space), it is desirable to know the components of the acceleration vector in the direction of the tangent to the path (at a point) and of the normal to the path. (These *tangential* and *normal components* of acceleration are investigated in Section 13.4.) The acceleration vector can then be expressed as the sum of its (vector) tangential and normal components (which reflect important geometric properties about the nature of the path itself, such as *curvature*). Velocity and acceleration vectors are studied in the next chapter.

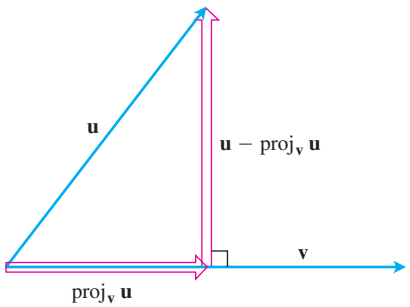

**FIGURE 12.26** Writing $\mathbf{u}$ as the sum of vectors parallel and orthogonal to $\mathbf{v}$.

Generally, for vectors $\mathbf{u}$ and $\mathbf{v}$, it is easy to see from Figure 12.26 that the vector

$$\mathbf{u} - \text{proj}_{\mathbf{v}}\,\mathbf{u}$$

is orthogonal to the projection vector $\text{proj}_{\mathbf{v}}\,\mathbf{u}$ (which has the same direction as $\mathbf{v}$). The following calculation verifies this observation:

$$\begin{aligned}
(\mathbf{u} - \text{proj}_{\mathbf{v}}\,\mathbf{u}) \cdot \text{proj}_{\mathbf{v}}\,\mathbf{u} &= \left(\mathbf{u} - \left(\frac{\mathbf{u}\cdot\mathbf{v}}{|\mathbf{v}|^2}\right)\mathbf{v}\right) \cdot \left(\frac{\mathbf{u}\cdot\mathbf{v}}{|\mathbf{v}|^2}\right)\mathbf{v} && \text{Equation (1)} \\
&= \left(\frac{\mathbf{u}\cdot\mathbf{v}}{|\mathbf{v}|^2}\right)(\mathbf{u}\cdot\mathbf{v}) - \left(\frac{\mathbf{u}\cdot\mathbf{v}}{|\mathbf{v}|^2}\right)^2(\mathbf{v}\cdot\mathbf{v}) && \text{Dot product properties 2 and 3} \\
&= \frac{(\mathbf{u}\cdot\mathbf{v})^2}{|\mathbf{v}|^2} - \frac{(\mathbf{u}\cdot\mathbf{v})^2}{|\mathbf{v}|^2} && \mathbf{v}\cdot\mathbf{v} = |\mathbf{v}|^2 \text{ cancels} \\
&= 0.
\end{aligned}$$

So the equation

$$\mathbf{u} = \text{proj}_{\mathbf{v}}\,\mathbf{u} + (\mathbf{u} - \text{proj}_{\mathbf{v}}\,\mathbf{u})$$

expresses $\mathbf{u}$ as a sum of orthogonal vectors.

**How to Write u as a Vector Parallel to v Plus a Vector Orthogonal to v**

$$\mathbf{u} = \text{proj}_{\mathbf{v}}\,\mathbf{u} + (\mathbf{u} - \text{proj}_{\mathbf{v}}\,\mathbf{u})$$

$$= \underbrace{\left(\frac{\mathbf{u}\cdot\mathbf{v}}{|\mathbf{v}|^2}\right)\mathbf{v}}_{\text{Parallel to } \mathbf{v}} + \underbrace{\left(\mathbf{u} - \left(\frac{\mathbf{u}\cdot\mathbf{v}}{|\mathbf{v}|^2}\right)\mathbf{v}\right)}_{\text{Orthogonal to } \mathbf{v}}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 8** Force on a Spacecraft

A force $\mathbf{F} = 2\mathbf{i} + \mathbf{j} - 3\mathbf{k}$ is applied to a spacecraft with velocity vector $\mathbf{v} = 3\mathbf{i} - \mathbf{j}$. Express $\mathbf{F}$ as a sum of a vector parallel to $\mathbf{v}$ and a vector orthogonal to $\mathbf{v}$.

**Solution**

$$\begin{aligned}
\mathbf{F} &= \text{proj}_{\mathbf{v}}\,\mathbf{F} + (\mathbf{F} - \text{proj}_{\mathbf{v}}\,\mathbf{F}) \\
&= \frac{\mathbf{F}\cdot\mathbf{v}}{\mathbf{v}\cdot\mathbf{v}}\mathbf{v} + \left(\mathbf{F} - \frac{\mathbf{F}\cdot\mathbf{v}}{\mathbf{v}\cdot\mathbf{v}}\mathbf{v}\right) \\
&= \left(\frac{6-1}{9+1}\right)\mathbf{v} + \left(\mathbf{F} - \left(\frac{6-1}{9+1}\right)\mathbf{v}\right) \\
&= \frac{5}{10}(3\mathbf{i} - \mathbf{j}) + \left(2\mathbf{i} + \mathbf{j} - 3\mathbf{k} - \frac{5}{10}(3\mathbf{i} - \mathbf{j})\right) \\
&= \left(\frac{3}{2}\mathbf{i} - \frac{1}{2}\mathbf{j}\right) + \left(\frac{1}{2}\mathbf{i} + \frac{3}{2}\mathbf{j} - 3\mathbf{k}\right).
\end{aligned}$$

The force $(3/2)\mathbf{i} - (1/2)\mathbf{j}$ is the effective force parallel to the velocity $\mathbf{v}$. The force $(1/2)\mathbf{i} + (3/2)\mathbf{j} - 3\mathbf{k}$ is orthogonal to $\mathbf{v}$. To check that this vector is orthogonal to $\mathbf{v}$, we find the dot product:

$$\left(\frac{1}{2}\mathbf{i} + \frac{3}{2}\mathbf{j} - 3\mathbf{k}\right)\cdot(3\mathbf{i} - \mathbf{j}) = \frac{3}{2} - \frac{3}{2} = 0.$$

# EXERCISES 12.3

## Dot Product and Projections

In Exercises 1–8, find

**a.** $\mathbf{v} \cdot \mathbf{u}$, $|\mathbf{v}|$, $|\mathbf{u}|$

**b.** the cosine of the angle between $\mathbf{v}$ and $\mathbf{u}$

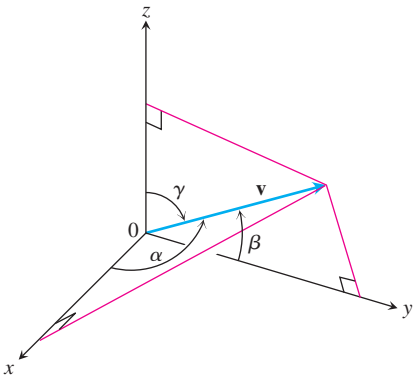
**c.** the scalar component of $\mathbf{u}$ in the direction of $\mathbf{v}$

**d.** the vector $\text{proj}_{\mathbf{v}}\,\mathbf{u}$.

1. $\mathbf{v} = 2\mathbf{i} - 4\mathbf{j} + \sqrt{5}\mathbf{k}, \quad \mathbf{u} = -2\mathbf{i} + 4\mathbf{j} - \sqrt{5}\mathbf{k}$
2. $\mathbf{v} = (3/5)\mathbf{i} + (4/5)\mathbf{k}, \quad \mathbf{u} = 5\mathbf{i} + 12\mathbf{j}$
3. $\mathbf{v} = 10\mathbf{i} + 11\mathbf{j} - 2\mathbf{k}, \quad \mathbf{u} = 3\mathbf{j} + 4\mathbf{k}$
4. $\mathbf{v} = 2\mathbf{i} + 10\mathbf{j} - 11\mathbf{k}, \quad \mathbf{u} = 2\mathbf{i} + 2\mathbf{j} + \mathbf{k}$
5. $\mathbf{v} = 5\mathbf{j} - 3\mathbf{k}, \quad \mathbf{u} = \mathbf{i} + \mathbf{j} + \mathbf{k}$
6. $\mathbf{v} = -\mathbf{i} + \mathbf{j}, \quad \mathbf{u} = \sqrt{2}\mathbf{i} + \sqrt{3}\mathbf{j} + 2\mathbf{k}$
7. $\mathbf{v} = 5\mathbf{i} + \mathbf{j}, \quad \mathbf{u} = 2\mathbf{i} + \sqrt{17}\mathbf{j}$
8. $\mathbf{v} = \left\langle \frac{1}{\sqrt{2}}, \frac{1}{\sqrt{3}} \right\rangle, \quad \mathbf{u} = \left\langle \frac{1}{\sqrt{2}}, -\frac{1}{\sqrt{3}} \right\rangle$

## T Angles Between Vectors

Find the angles between the vectors in Exercises 9–12 to the nearest hundredth of a radian.



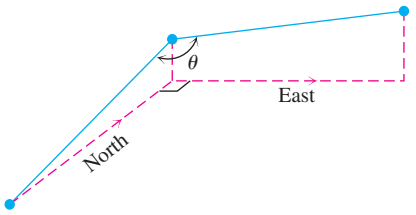
9. $\mathbf{u} = 2\mathbf{i} + \mathbf{j}, \quad \mathbf{v} = \mathbf{i} + 2\mathbf{j} - \mathbf{k}$
10. $\mathbf{u} = 2\mathbf{i} - 2\mathbf{j} + \mathbf{k}, \quad \mathbf{v} = 3\mathbf{i} + 4\mathbf{k}$
11. $\mathbf{u} = \sqrt{3}\mathbf{i} - 7\mathbf{j}, \quad \mathbf{v} = \sqrt{3}\mathbf{i} + \mathbf{j} - 2\mathbf{k}$
12. $\mathbf{u} = \mathbf{i} + \sqrt{2}\mathbf{j} - \sqrt{2}\mathbf{k}, \quad \mathbf{v} = -\mathbf{i} + \mathbf{j} + \mathbf{k}$
13. **Triangle** Find the measures of the angles of the triangle whose vertices are $A = (-1, 0)$, $B = (2, 1)$, and $C = (1, -2)$.
14. **Rectangle** Find the measures of the angles between the diagonals of the rectangle whose vertices are $A = (1, 0)$, $B = (0, 3)$, $C = (3, 4)$, and $D = (4, 1)$.
15. **Direction angles and direction cosines** The *direction angles* $\alpha$, $\beta$, and $\gamma$ of a vector $\mathbf{v} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k}$ are defined as follows:

    $\alpha$ is the angle between $\mathbf{v}$ and the positive $x$-axis $(0 \le \alpha \le \pi)$

    $\beta$ is the angle between $\mathbf{v}$ and the positive $y$-axis $(0 \le \beta \le \pi)$

    $\gamma$ is the angle between $\mathbf{v}$ and the positive $z$-axis $(0 \le \gamma \le \pi)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



**a.** Show that

$$\cos\alpha = \frac{a}{|\mathbf{v}|}, \qquad \cos\beta = \frac{b}{|\mathbf{v}|}, \qquad \cos\gamma = \frac{c}{|\mathbf{v}|},$$

and $\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$. These cosines are called the *direction cosines* of $\mathbf{v}$.

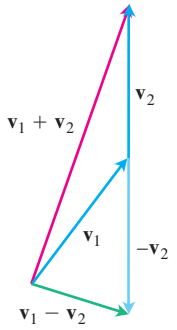
**b. Unit vectors are built from direction cosines** Show that if $\mathbf{v} = a\mathbf{i} + b\mathbf{j} + c\mathbf{k}$ is a unit vector, then $a$, $b$, and $c$ are the direction cosines of $\mathbf{v}$.

**16. Water main construction** A water main is to be constructed with a 20% grade in the north direction and a 10% grade in the east direction. Determine the angle $\theta$ required in the water main for the turn from north to east.

## Decomposing Vectors

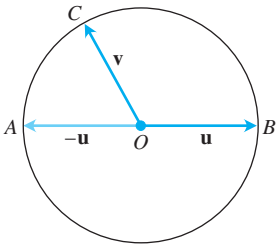
In Exercises 17–19, write $\mathbf{u}$ as the sum of a vector parallel to $\mathbf{v}$ and a vector orthogonal to $\mathbf{v}$.

**17.** $\mathbf{u} = 3\mathbf{j} + 4\mathbf{k}$, $\mathbf{v} = \mathbf{i} + \mathbf{j}$



**18.** $\mathbf{u} = \mathbf{j} + \mathbf{k}$, $\mathbf{v} = \mathbf{i} + \mathbf{j}$

**19.** $\mathbf{u} = 8\mathbf{i} + 4\mathbf{j} - 12\mathbf{k}$, $\mathbf{v} = \mathbf{i} + 2\mathbf{j} - \mathbf{k}$

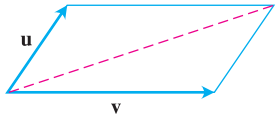


**20. Sum of vectors** $\mathbf{u} = \mathbf{i} + (\mathbf{j} + \mathbf{k})$ is already the sum of a vector parallel to $\mathbf{i}$ and a vector orthogonal to $\mathbf{i}$. If you use $\mathbf{v} = \mathbf{i}$, in the decomposition $\mathbf{u} = \text{proj}_{\mathbf{v}}\,\mathbf{u} + (\mathbf{u} - \text{proj}_{\mathbf{v}}\,\mathbf{u})$, do you get $\text{proj}_{\mathbf{v}}\,\mathbf{u} = \mathbf{i}$ and $(\mathbf{u} - \text{proj}_{\mathbf{v}}\,\mathbf{u}) = \mathbf{j} + \mathbf{k}$? Try it and find out.

## Geometry and Examples

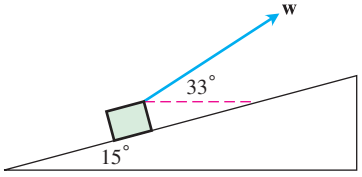
**21. Sums and differences** In the accompanying figure, it looks as if $\mathbf{v}_1 + \mathbf{v}_2$ and $\mathbf{v}_1 - \mathbf{v}_2$ are orthogonal. Is this mere coincidence, or are there circumstances under which we may expect the sum of two vectors to be orthogonal to their difference? Give reasons for your answer.

**22. Orthogonality on a circle** Suppose that $AB$ is the diameter of a circle with center $O$ and that $C$ is a point on one of the two arcs joining $A$ and $B$. Show that $\overrightarrow{CA}$ and $\overrightarrow{CB}$ are orthogonal.



**23. Diagonals of a rhombus** Show that the diagonals of a rhombus (parallelogram with sides of equal length) are perpendicular.

**24. Perpendicular diagonals** Show that squares are the only rectangles with perpendicular diagonals.



**25. When parallelograms are rectangles** Prove that a parallelogram is a rectangle if and only if its diagonals are equal in length. (This fact is often exploited by carpenters.)

**26. Diagonal of parallelogram** Show that the indicated diagonal of the parallelogram determined by vectors $\mathbf{u}$ and $\mathbf{v}$ bisects the angle between $\mathbf{u}$ and $\mathbf{v}$ if $|\mathbf{u}| = |\mathbf{v}|$.

**27. Projectile motion** A gun with muzzle velocity of 1200 ft/sec is fired at an angle of 8° above the horizontal. Find the horizontal and vertical components of the velocity.

**28. Inclined plane** Suppose that a box is being towed up an inclined plane as shown in the figure. Find the force $\mathbf{w}$ needed to make the component of the force parallel to the inclined plane equal to 2.5 lb.

## Theory and Examples

**29. a. Cauchy-Schwartz inequality** Use the fact that $\mathbf{u} \cdot \mathbf{v} = |\mathbf{u}||\mathbf{v}| \cos\theta$ to show that the inequality $|\mathbf{u} \cdot \mathbf{v}| \leq |\mathbf{u}||\mathbf{v}|$ holds for any vectors $\mathbf{u}$ and $\mathbf{v}$.

**b.** Under what circumstances, if any, does $|\mathbf{u} \cdot \mathbf{v}|$ equal $|\mathbf{u}||\mathbf{v}|$? Give reasons for your answer.

**30.** Copy the axes and vector shown here. Then shade in the points $(x, y)$ for which $(x\mathbf{i} + y\mathbf{j}) \cdot \mathbf{v} \leq 0$. Justify your answer.

**31. Orthogonal unit vectors** If $\mathbf{u}_1$ and $\mathbf{u}_2$ are orthogonal unit vectors and $\mathbf{v} = a\mathbf{u}_1 + b\mathbf{u}_2$, find $\mathbf{v} \cdot \mathbf{u}_1$.

**32. Cancellation in dot products** In real-number multiplication, if $uv_1 = uv_2$ and $u \neq 0$, we can cancel the $u$ and conclude that $v_1 = v_2$. Does the same rule hold for the dot product: If $\mathbf{u} \cdot \mathbf{v}_1 = \mathbf{u} \cdot \mathbf{v}_2$ and $\mathbf{u} \neq \mathbf{0}$, can you conclude that $\mathbf{v}_1 = \mathbf{v}_2$? Give reasons for your answer.

## Equations for Lines in the Plane

**33. Line perpendicular to a vector** Show that the vector $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$ is perpendicular to the line $ax + by = c$ by establishing that the slope of $\mathbf{v}$ is the negative reciprocal of the slope of the given line.

**34. Line parallel to a vector** Show that the vector $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$ is parallel to the line $bx - ay = c$ by establishing that the slope of the line segment representing $\mathbf{v}$ is the same as the slope of the given line.

In Exercises 35–38, use the result of Exercise 33 to find an equation for the line through $P$ perpendicular to $\mathbf{v}$. Then sketch the line. Include $\mathbf{v}$ in your sketch *as a vector starting at the origin.*

**35.** $P(2, 1)$, $\mathbf{v} = \mathbf{i} + 2\mathbf{j}$

**36.** $P(-1, 2)$, $\mathbf{v} = -2\mathbf{i} - \mathbf{j}$

**37.** $P(-2, -7)$, $\mathbf{v} = -2\mathbf{i} + \mathbf{j}$

**38.** $P(11, 10)$, $\mathbf{v} = 2\mathbf{i} - 3\mathbf{j}$

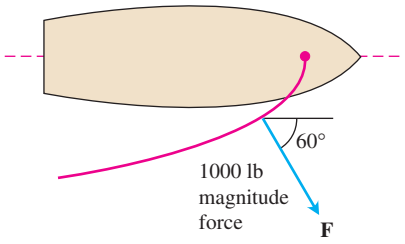
In Exercises 39–42, use the result of Exercise 34 to find an equation for the line through $P$ parallel to $\mathbf{v}$. Then sketch the line. Include $\mathbf{v}$ in your sketch *as a vector starting at the origin.*

**39.** $P(-2, 1)$, $\mathbf{v} = \mathbf{i} - \mathbf{j}$

**40.** $P(0, -2)$, $\mathbf{v} = 2\mathbf{i} + 3\mathbf{j}$

**41.** $P(1, 2)$, $\mathbf{v} = -\mathbf{i} - 2\mathbf{j}$

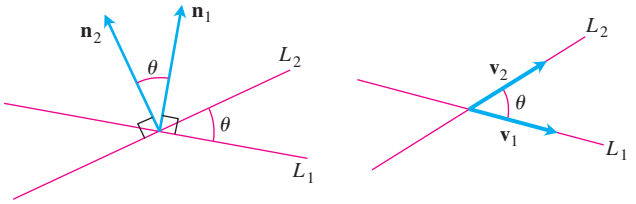
**42.** $P(1, 3)$, $\mathbf{v} = 3\mathbf{i} - 2\mathbf{j}$



## Work

**43. Work along a line** Find the work done by a force $\mathbf{F} = 5\mathbf{i}$ (magnitude 5 N) in moving an object along the line from the origin to the point (1, 1) (distance in meters).

**44. Locomotive** The union Pacific's *Big Boy* locomotive could pull 6000-ton trains with a tractive effort (pull) of 602,148 N (135,375 lb). At this level of effort, about how much work did *Big Boy* do on the (approximately straight) 605-km journey from San Francisco to Los Angeles?



**45. Inclined plane** How much work does it take to slide a crate 20 m along a loading dock by pulling on it with a 200 N force at an angle of 30° from the horizontal?

**46. Sailboat** The wind passing over a boat's sail exerted a 1000-lb magnitude force $\mathbf{F}$ as shown here. How much work did the wind perform in moving the boat forward 1 mi? Answer in foot-pounds.

## Angles Between Lines in the Plane

The acute angle between intersecting lines that do not cross at right angles is the same as the angle determined by vectors normal to the lines or by the vectors parallel to the lines.

Use this fact and the results of Exercise 33 or 34 to find the acute angles between the lines in Exercises 47–52.

**47.** $3x + y = 5$, $2x - y = 4$

**48.** $y = \sqrt{3}x - 1$, $y = -\sqrt{3}x + 2$

**49.** $\sqrt{3}x - y = -2$, $x - \sqrt{3}y = 1$

**50.** $x + \sqrt{3}y = 1$, $\left(1 - \sqrt{3}\right)x + \left(1 + \sqrt{3}\right)y = 8$

**51.** $3x - 4y = 3$, $x - y = 7$

**52.** $12x + 5y = 1$, $2x - 2y = 3$

## Angles Between Differentiable Curves

The angles between two differentiable curves at a point of intersection are the angles between the curves' tangent lines at these points. Find

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

the angles between the curves in Exercises 53–56. Note that if $\mathbf{v} = a\mathbf{i} + b\mathbf{j}$ is a vector in the plane, then the vector has slope $b/a$ provided $a \neq 0$.

**53.** $y = (3/2) - x^2, \quad y = x^2$ (two points of intersection)

**54.** $x = (3/4) - y^2, \quad x = y^2 - (3/4)$ (two points of intersection)

**55.** $y = x^3, \quad x = y^2$ (two points of intersection)

**56.** $y = -x^2, \quad y = \sqrt{x}$ (two points of intersection)

# 12.4 The Cross Product

In studying lines in the plane, when we needed to describe how a line was tilting, we used the notions of slope and angle of inclination. In space, we want a way to describe how a *plane* is tilting. We accomplish this by multiplying two vectors in the plane together to get a third vector perpendicular to the plane. The direction of this third vector tells us the "inclination" of the plane. The product we use to multiply the vectors together is the *vector* or *cross product*, the second of the two vector multiplication methods we study in calculus.

Cross products are widely used to describe the effects of forces in studies of electricity, magnetism, fluid flows, and orbital mechanics. This section presents the mathematical properties that account for the use of cross products in these fields.

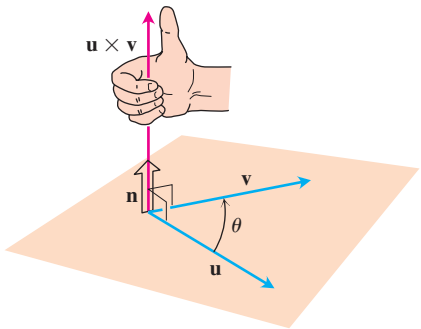

**FIGURE 12.27** The construction of $\mathbf{u} \times \mathbf{v}$.

## The Cross Product of Two Vectors in Space

We start with two nonzero vectors $\mathbf{u}$ and $\mathbf{v}$ in space. If $\mathbf{u}$ and $\mathbf{v}$ are not parallel, they determine a plane. We select a unit vector $\mathbf{n}$ perpendicular to the plane by the **right-hand rule**. This means that we choose $\mathbf{n}$ to be the unit (normal) vector that points the way your right thumb points when your fingers curl through the angle $\theta$ from $\mathbf{u}$ to $\mathbf{v}$ (Figure 12.27). Then the **cross product** $\mathbf{u} \times \mathbf{v}$ ("$\mathbf{u}$ cross $\mathbf{v}$") is the *vector* defined as follows.

**DEFINITION Cross Product**

$$\mathbf{u} \times \mathbf{v} = (|\mathbf{u}||\mathbf{v}| \sin\theta)\,\mathbf{n}$$

Unlike the dot product, the cross product is a vector. For this reason it's also called the **vector product** of $\mathbf{u}$ and $\mathbf{v}$, and applies *only* to vectors in space. The vector $\mathbf{u} \times \mathbf{v}$ is orthogonal to both $\mathbf{u}$ and $\mathbf{v}$ because it is a scalar multiple of $\mathbf{n}$.

Since the sines of 0 and $\pi$ are both zero, it makes sense to define the cross product of two parallel nonzero vectors to be $\mathbf{0}$. If one or both of $\mathbf{u}$ and $\mathbf{v}$ are zero, we also define $\mathbf{u} \times \mathbf{v}$ to be zero. This way, the cross product of two vectors $\mathbf{u}$ and $\mathbf{v}$ is zero if and only if $\mathbf{u}$ and $\mathbf{v}$ are parallel or one or both of them are zero.

**Parallel Vectors**

Nonzero vectors $\mathbf{u}$ and $\mathbf{v}$ are parallel if and only if $\mathbf{u} \times \mathbf{v} = \mathbf{0}$.

The cross product obeys the following laws.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

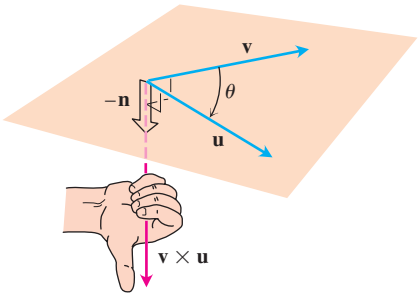

**FIGURE 12.28** The construction of $\mathbf{v} \times \mathbf{u}$.

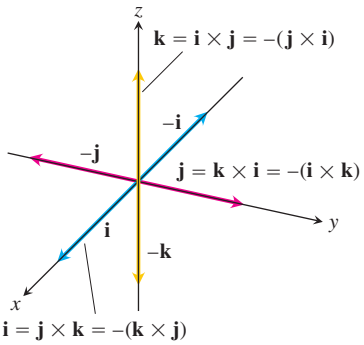

**FIGURE 12.29** The pairwise cross products of $\mathbf{i}$, $\mathbf{j}$, and $\mathbf{k}$.

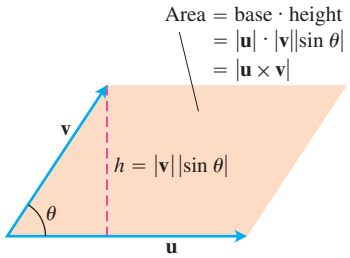

**FIGURE 12.30** The parallelogram determined by $\mathbf{u}$ and $\mathbf{v}$.

### Properties of the Cross Product

If $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ are any vectors and $r$, $s$ are scalars, then

1. $(r\mathbf{u}) \times (s\mathbf{v}) = (rs)(\mathbf{u} \times \mathbf{v})$
2. $\mathbf{u} \times (\mathbf{v} + \mathbf{w}) = \mathbf{u} \times \mathbf{v} + \mathbf{u} \times \mathbf{w}$
3. $(\mathbf{v} + \mathbf{w}) \times \mathbf{u} = \mathbf{v} \times \mathbf{u} + \mathbf{w} \times \mathbf{u}$
4. $\mathbf{v} \times \mathbf{u} = -(\mathbf{u} \times \mathbf{v})$
5. $\mathbf{0} \times \mathbf{u} = \mathbf{0}$

To visualize Property 4, for example, notice that when the fingers of a right hand curl through the angle $\theta$ from $\mathbf{v}$ to $\mathbf{u}$, the thumb points the opposite way and the unit vector we choose in forming $\mathbf{v} \times \mathbf{u}$ is the negative of the one we choose in forming $\mathbf{u} \times \mathbf{v}$ (Figure 12.28).

Property 1 can be verified by applying the definition of cross product to both sides of the equation and comparing the results. Property 2 is proved in Appendix 6. Property 3 follows by multiplying both sides of the equation in Property 2 by $-1$ and reversing the order of the products using Property 4. Property 5 is a definition. As a rule, cross product multiplication is *not associative* so $(\mathbf{u} \times \mathbf{v}) \times \mathbf{w}$ does not generally equal $\mathbf{u} \times (\mathbf{v} \times \mathbf{w})$. (See Additional Exercise 15.)

When we apply the definition to calculate the pairwise cross products of $\mathbf{i}$, $\mathbf{j}$, and $\mathbf{k}$, we find (Figure 12.29)

$$\mathbf{i} \times \mathbf{j} = -(\mathbf{j} \times \mathbf{i}) = \mathbf{k}$$

$$\mathbf{j} \times \mathbf{k} = -(\mathbf{k} \times \mathbf{j}) = \mathbf{i}$$

$$\mathbf{k} \times \mathbf{i} = -(\mathbf{i} \times \mathbf{k}) = \mathbf{j}$$

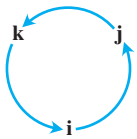

Diagram for recalling these products

and

$$\mathbf{i} \times \mathbf{i} = \mathbf{j} \times \mathbf{j} = \mathbf{k} \times \mathbf{k} = \mathbf{0}.$$

## $|\mathbf{u} \times \mathbf{v}|$ Is the Area of a Parallelogram

Because $\mathbf{n}$ is a unit vector, the magnitude of $\mathbf{u} \times \mathbf{v}$ is

$$|\mathbf{u} \times \mathbf{v}| = |\mathbf{u}||\mathbf{v}||\sin\theta||\mathbf{n}| = |\mathbf{u}||\mathbf{v}|\sin\theta.$$

This is the area of the parallelogram determined by $\mathbf{u}$ and $\mathbf{v}$ (Figure 12.30), $|\mathbf{u}|$ being the base of the parallelogram and $|\mathbf{v}||\sin\theta|$ the height.

## Determinant Formula for $\mathbf{u} \times \mathbf{v}$

Our next objective is to calculate $\mathbf{u} \times \mathbf{v}$ from the components of $\mathbf{u}$ and $\mathbf{v}$ relative to a Cartesian coordinate system.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

### Determinants

$2 \times 2$ and $3 \times 3$ determinants are evaluated as follows:

$$\begin{vmatrix} a & b \\ c & d \end{vmatrix} = ad - bc$$

**EXAMPLE**

$$\begin{vmatrix} 2 & 1 \\ -4 & 3 \end{vmatrix} = (2)(3) - (1)(-4) = 6 + 4 = 10$$

$$\begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} = a_1 \begin{vmatrix} b_2 & b_3 \\ c_2 & c_3 \end{vmatrix} - a_2 \begin{vmatrix} b_1 & b_3 \\ c_1 & c_3 \end{vmatrix} + a_3 \begin{vmatrix} b_1 & b_2 \\ c_1 & c_2 \end{vmatrix}$$

**EXAMPLE**

$$\begin{vmatrix} -5 & 3 & 1 \\ 2 & 1 & 1 \\ -4 & 3 & 1 \end{vmatrix} = (-5)\begin{vmatrix} 1 & 1 \\ 3 & 1 \end{vmatrix} - (3)\begin{vmatrix} 2 & 1 \\ -4 & 1 \end{vmatrix} + (1)\begin{vmatrix} 2 & 1 \\ -4 & 3 \end{vmatrix}$$
$$= -5(1 - 3) - 3(2 + 4) + 1(6 + 4)$$
$$= 10 - 18 + 10 = 2$$

(For more information, see the Web site at **www.aw-bc.com/thomas.**)

Suppose that

$$\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}, \qquad \mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}.$$

Then the distributive laws and the rules for multiplying $\mathbf{i}$, $\mathbf{j}$, and $\mathbf{k}$ tell us that

$$\begin{aligned} \mathbf{u} \times \mathbf{v} &= (u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}) \times (v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}) \\ &= u_1v_1\mathbf{i} \times \mathbf{i} + u_1v_2\mathbf{i} \times \mathbf{j} + u_1v_3\mathbf{i} \times \mathbf{k} \\ &\quad + u_2v_1\mathbf{j} \times \mathbf{i} + u_2v_2\mathbf{j} \times \mathbf{j} + u_2v_3\mathbf{j} \times \mathbf{k} \\ &\quad + u_3v_1\mathbf{k} \times \mathbf{i} + u_3v_2\mathbf{k} \times \mathbf{j} + u_3v_3\mathbf{k} \times \mathbf{k} \\ &= (u_2v_3 - u_3v_2)\mathbf{i} - (u_1v_3 - u_3v_1)\mathbf{j} + (u_1v_2 - u_2v_1)\mathbf{k}. \end{aligned}$$

The terms in the last line are the same as the terms in the expansion of the symbolic determinant

$$\begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{vmatrix}.$$

We therefore have the following rule.

**Calculating Cross Products Using Determinants**

If $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}$ and $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$, then

$$\mathbf{u} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \end{vmatrix}.$$

**EXAMPLE 1** Calculating Cross Products with Determinants

Find $\mathbf{u} \times \mathbf{v}$ and $\mathbf{v} \times \mathbf{u}$ if $\mathbf{u} = 2\mathbf{i} + \mathbf{j} + \mathbf{k}$ and $\mathbf{v} = -4\mathbf{i} + 3\mathbf{j} + \mathbf{k}$.

**Solution**

$$\mathbf{u} \times \mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 1 & 1 \\ -4 & 3 & 1 \end{vmatrix} = \begin{vmatrix} 1 & 1 \\ 3 & 1 \end{vmatrix}\mathbf{i} - \begin{vmatrix} 2 & 1 \\ -4 & 1 \end{vmatrix}\mathbf{j} + \begin{vmatrix} 2 & 1 \\ -4 & 3 \end{vmatrix}\mathbf{k}$$
$$= -2\mathbf{i} - 6\mathbf{j} + 10\mathbf{k}$$
$$\mathbf{v} \times \mathbf{u} = -(\mathbf{u} \times \mathbf{v}) = 2\mathbf{i} + 6\mathbf{j} - 10\mathbf{k}$$

■

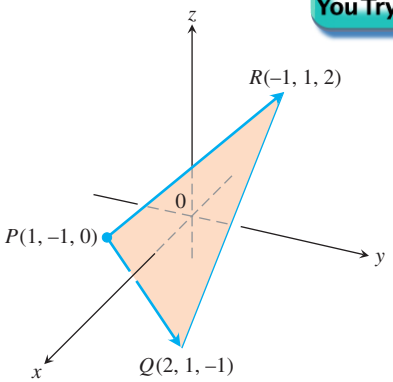

**FIGURE 12.31** The area of triangle $PQR$ is half of $|\overrightarrow{PQ} \times \overrightarrow{PR}|$ (Example 2).

**EXAMPLE 2** Finding Vectors Perpendicular to a Plane

Find a vector perpendicular to the plane of $P(1, -1, 0)$, $Q(2, 1, -1)$, and $R(-1, 1, 2)$ (Figure 12.31).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** The vector $\overrightarrow{PQ} \times \overrightarrow{PR}$ is perpendicular to the plane because it is perpendicular to both vectors. In terms of components,

$$\overrightarrow{PQ} = (2 - 1)\mathbf{i} + (1 + 1)\mathbf{j} + (-1 - 0)\mathbf{k} = \mathbf{i} + 2\mathbf{j} - \mathbf{k}$$

$$\overrightarrow{PR} = (-1 - 1)\mathbf{i} + (1 + 1)\mathbf{j} + (2 - 0)\mathbf{k} = -2\mathbf{i} + 2\mathbf{j} + 2\mathbf{k}$$

$$\overrightarrow{PQ} \times \overrightarrow{PR} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 1 & 2 & -1 \\ -2 & 2 & 2 \end{vmatrix} = \begin{vmatrix} 2 & -1 \\ 2 & 2 \end{vmatrix}\mathbf{i} - \begin{vmatrix} 1 & -1 \\ -2 & 2 \end{vmatrix}\mathbf{j} + \begin{vmatrix} 1 & 2 \\ -2 & 2 \end{vmatrix}\mathbf{k}$$

$$= 6\mathbf{i} + 6\mathbf{k}.$$

■

## EXAMPLE 3 Finding the Area of a Triangle

Find the area of the triangle with vertices $P(1, -1, 0)$, $Q(2, 1, -1)$, and $R(-1, 1, 2)$ (Figure 12.31).

**Solution** The area of the parallelogram determined by $P$, $Q$, and $R$ is

$$|\overrightarrow{PQ} \times \overrightarrow{PR}| = |6\mathbf{i} + 6\mathbf{k}| \qquad \text{Values from Example 2.}$$

$$= \sqrt{(6)^2 + (6)^2} = \sqrt{2 \cdot 36} = 6\sqrt{2}.$$

The triangle's area is half of this, or $3\sqrt{2}$. ■

## EXAMPLE 4 Finding a Unit Normal to a Plane

Find a unit vector perpendicular to the plane of $P(1, -1, 0)$, $Q(2, 1, -1)$, and $R(-1, 1, 2)$.

**Solution** Since $\overrightarrow{PQ} \times \overrightarrow{PR}$ is perpendicular to the plane, its direction $\mathbf{n}$ is a unit vector perpendicular to the plane. Taking values from Examples 2 and 3, we have

$$\mathbf{n} = \frac{\overrightarrow{PQ} \times \overrightarrow{PR}}{|\overrightarrow{PQ} \times \overrightarrow{PR}|} = \frac{6\mathbf{i} + 6\mathbf{k}}{6\sqrt{2}} = \frac{1}{\sqrt{2}}\mathbf{i} + \frac{1}{\sqrt{2}}\mathbf{k}.$$

■

For ease in calculating the cross product using determinants, we usually write vectors in the form $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$ rather than as ordered triples $\mathbf{v} = \langle v_1, v_2, v_3 \rangle$.

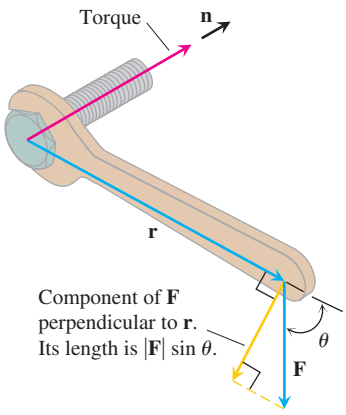

**FIGURE 12.32** The torque vector describes the tendency of the force $\mathbf{F}$ to drive the bolt forward.

## Torque

When we turn a bolt by applying a force $\mathbf{F}$ to a wrench (Figure 12.32), the torque we produce acts along the axis of the bolt to drive the bolt forward. The magnitude of the torque depends on how far out on the wrench the force is applied and on how much of the force is perpendicular to the wrench at the point of application. The number we use to measure the torque's magnitude is the product of the length of the lever arm $\mathbf{r}$ and the scalar component of $\mathbf{F}$ perpendicular to $\mathbf{r}$. In the notation of Figure 12.32,

$$\text{Magnitude of torque vector} = |\mathbf{r}|\,|\mathbf{F}| \sin\theta,$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

or $|\mathbf{r} \times \mathbf{F}|$. If we let $\mathbf{n}$ be a unit vector along the axis of the bolt in the direction of the torque, then a complete description of the torque vector is $\mathbf{r} \times \mathbf{F}$, or

$$\text{Torque vector} = (|\mathbf{r}||\mathbf{F}| \sin\theta)\,\mathbf{n}.$$

Recall that we defined $\mathbf{u} \times \mathbf{v}$ to be $\mathbf{0}$ when $\mathbf{u}$ and $\mathbf{v}$ are parallel. This is consistent with the torque interpretation as well. If the force $\mathbf{F}$ in Figure 12.32 is parallel to the wrench, meaning that we are trying to turn the bolt by pushing or pulling along the line of the wrench's handle, the torque produced is zero.

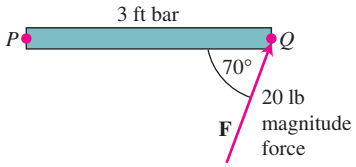

**FIGURE 12.33** The magnitude of the torque exerted by $\mathbf{F}$ at $P$ is about 56.4 ft-lb (Example 5).

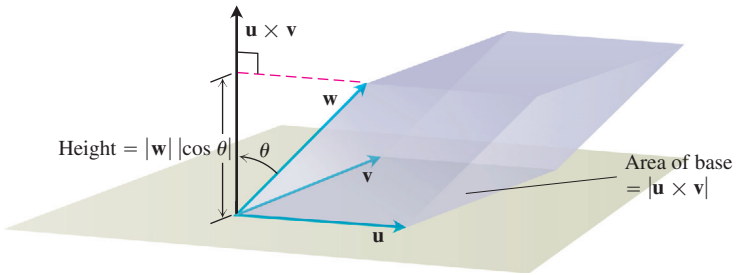
**EXAMPLE 5** Finding the Magnitude of a Torque

The magnitude of the torque generated by force $\mathbf{F}$ at the pivot point $P$ in Figure 12.33 is

$$\begin{aligned} |\overrightarrow{PQ} \times \mathbf{F}| &= |\overrightarrow{PQ}||\mathbf{F}| \sin 70° \\ &\approx (3)(20)(0.94) \\ &\approx 56.4 \text{ ft-lb}. \end{aligned}$$



■

## Triple Scalar or Box Product

The product $(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}$ is called the **triple scalar product** of $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ (in that order). As you can see from the formula

$$|(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}| = |\mathbf{u} \times \mathbf{v}||\mathbf{w}||\cos\theta|,$$

the absolute value of the product is the volume of the parallelepiped (parallelogram-sided box) determined by $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ (Figure 12.34). The number $|\mathbf{u} \times \mathbf{v}|$ is the area of the base parallelogram. The number $|\mathbf{w}||\cos\theta|$ is the parallelepiped's height. Because of this geometry, $(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}$ is also called the **box product** of $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$.

Volume = area of base · height
$= |\mathbf{u} \times \mathbf{v}|\,|\mathbf{w}|\,|\cos\theta|$
$= |(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}|$

**FIGURE 12.34** The number $|(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}|$ is the volume of a parallelepiped.

The dot and cross may be interchanged in a triple scalar product without altering its value.

By treating the planes of $\mathbf{v}$ and $\mathbf{w}$ and of $\mathbf{w}$ and $\mathbf{u}$ as the base planes of the parallelepiped determined by $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$, we see that

$$(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w} = (\mathbf{v} \times \mathbf{w}) \cdot \mathbf{u} = (\mathbf{w} \times \mathbf{u}) \cdot \mathbf{v}.$$

Since the dot product is commutative, we also have

$$(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w} = \mathbf{u} \cdot (\mathbf{v} \times \mathbf{w}).$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The triple scalar product can be evaluated as a determinant:

$$(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w} = \left[ \begin{vmatrix} u_2 & u_3 \\ v_2 & v_3 \end{vmatrix} \mathbf{i} - \begin{vmatrix} u_1 & u_3 \\ v_1 & v_3 \end{vmatrix} \mathbf{j} + \begin{vmatrix} u_1 & u_2 \\ v_1 & v_2 \end{vmatrix} \mathbf{k} \right] \cdot \mathbf{w}$$

$$= w_1 \begin{vmatrix} u_2 & u_3 \\ v_2 & v_3 \end{vmatrix} - w_2 \begin{vmatrix} u_1 & u_3 \\ v_1 & v_3 \end{vmatrix} + w_3 \begin{vmatrix} u_1 & u_2 \\ v_1 & v_2 \end{vmatrix}$$

$$= \begin{vmatrix} u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix}.$$

**Calculating the Triple Scalar Product**

$$(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w} = \begin{vmatrix} u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix}$$

**EXAMPLE 6** Finding the Volume of a Parallelepiped

Find the volume of the box (parallelepiped) determined by $\mathbf{u} = \mathbf{i} + 2\mathbf{j} - \mathbf{k}$, $\mathbf{v} = -2\mathbf{i} + 3\mathbf{k}$, and $\mathbf{w} = 7\mathbf{j} - 4\mathbf{k}$.

**Solution** Using the rule for calculating determinants, we find

$$(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w} = \begin{vmatrix} 1 & 2 & -1 \\ -2 & 0 & 3 \\ 0 & 7 & -4 \end{vmatrix} = -23.$$

The volume is $|(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}| = 23$ units cubed. ■

# EXERCISES 12.4

## Cross Product Calculations

In Exercises 1–8, find the length and direction (when defined) of $\mathbf{u} \times \mathbf{v}$ and $\mathbf{v} \times \mathbf{u}$.

1. $\mathbf{u} = 2\mathbf{i} - 2\mathbf{j} - \mathbf{k}, \quad \mathbf{v} = \mathbf{i} - \mathbf{k}$
2. $\mathbf{u} = 2\mathbf{i} + 3\mathbf{j}, \quad \mathbf{v} = -\mathbf{i} + \mathbf{j}$
3. $\mathbf{u} = 2\mathbf{i} - 2\mathbf{j} + 4\mathbf{k}, \quad \mathbf{v} = -\mathbf{i} + \mathbf{j} - 2\mathbf{k}$
4. $\mathbf{u} = \mathbf{i} + \mathbf{j} - \mathbf{k}, \quad \mathbf{v} = \mathbf{0}$
5. $\mathbf{u} = 2\mathbf{i}, \quad \mathbf{v} = -3\mathbf{j}$
6. $\mathbf{u} = \mathbf{i} \times \mathbf{j}, \quad \mathbf{v} = \mathbf{j} \times \mathbf{k}$
7. $\mathbf{u} = -8\mathbf{i} - 2\mathbf{j} - 4\mathbf{k}, \quad \mathbf{v} = 2\mathbf{i} + 2\mathbf{j} + \mathbf{k}$
8. $\mathbf{u} = \frac{3}{2}\mathbf{i} - \frac{1}{2}\mathbf{j} + \mathbf{k}, \quad \mathbf{v} = \mathbf{i} + \mathbf{j} + 2\mathbf{k}$

In Exercises 9–14, sketch the coordinate axes and then include the vectors $\mathbf{u}$, $\mathbf{v}$ and $\mathbf{u} \times \mathbf{v}$ as vectors starting at the origin.

9. $\mathbf{u} = \mathbf{i}, \quad \mathbf{v} = \mathbf{j}$
10. $\mathbf{u} = \mathbf{i} - \mathbf{k}, \quad \mathbf{v} = \mathbf{j}$
11. $\mathbf{u} = \mathbf{i} - \mathbf{k}, \quad \mathbf{v} = \mathbf{j} + \mathbf{k}$
12. $\mathbf{u} = 2\mathbf{i} - \mathbf{j}, \quad \mathbf{v} = \mathbf{i} + 2\mathbf{j}$
13. $\mathbf{u} = \mathbf{i} + \mathbf{j}, \quad \mathbf{v} = \mathbf{i} - \mathbf{j}$
14. $\mathbf{u} = \mathbf{j} + 2\mathbf{k}, \quad \mathbf{v} = \mathbf{i}$

## Triangles in Space

In Exercises 15–18,

**a.** Find the area of the triangle determined by the points $P$, $Q$, and $R$.

**b.** Find a unit vector perpendicular to plane $PQR$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

**15.** $P(1, -1, 2)$, $Q(2, 0, -1)$, $R(0, 2, 1)$

**16.** $P(1, 1, 1)$, $Q(2, 1, 3)$, $R(3, -1, 1)$

**17.** $P(2, -2, 1)$, $Q(3, -1, 2)$, $R(3, -1, 1)$

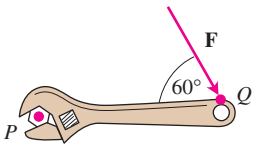
**18.** $P(-2, 2, 0)$, $Q(0, 1, -1)$, $R(-1, 2, -2)$

## Triple Scalar Products

In Exercises 19–22, verify that $(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w} = (\mathbf{v} \times \mathbf{w}) \cdot \mathbf{u} = (\mathbf{w} \times \mathbf{u}) \cdot \mathbf{v}$ and find the volume of the parallelepiped (box) determined by $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$.

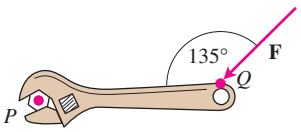
Exercises

| | $\mathbf{u}$ | $\mathbf{v}$ | $\mathbf{w}$ |
|---|---|---|---|
| **19.** | $2\mathbf{i}$ | $2\mathbf{j}$ | $2\mathbf{k}$ |
| **20.** | $\mathbf{i} - \mathbf{j} + \mathbf{k}$ | $2\mathbf{i} + \mathbf{j} - 2\mathbf{k}$ | $-\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ |
| **21.** | $2\mathbf{i} + \mathbf{j}$ | $2\mathbf{i} - \mathbf{j} + \mathbf{k}$ | $\mathbf{i} + 2\mathbf{k}$ |
| **22.** | $\mathbf{i} + \mathbf{j} - 2\mathbf{k}$ | $-\mathbf{i} - \mathbf{k}$ | $2\mathbf{i} + 4\mathbf{j} - 2\mathbf{k}$ |



## Theory and Examples

**23. Parallel and perpendicular vectors** Let $\mathbf{u} = 5\mathbf{i} - \mathbf{j} + \mathbf{k}$, $\mathbf{v} = \mathbf{j} - 5\mathbf{k}$, $\mathbf{w} = -15\mathbf{i} + 3\mathbf{j} - 3\mathbf{k}$. Which vectors, if any, are **(a)** perpendicular? **(b)** Parallel? Give reasons for your answers.



**24. Parallel and perpendicular vectors** Let $\mathbf{u} = \mathbf{i} + 2\mathbf{j} - \mathbf{k}$, $\mathbf{v} = -\mathbf{i} + \mathbf{j} + \mathbf{k}$, $\mathbf{w} = \mathbf{i} + \mathbf{k}$, $\mathbf{r} = -(\pi/2)\mathbf{i} - \pi\mathbf{j} + (\pi/2)\mathbf{k}$. Which vectors, if any, are **(a)** perpendicular? **(b)** Parallel? Give reasons for your answers.

In Exercises 39 and 40, find the magnitude of the torque exerted by $\mathbf{F}$ on the bolt at $P$ if $|\overrightarrow{PQ}| = 8$ in. and $|\mathbf{F}| = 30$ lb. Answer in foot-pounds.

**25.**

**26.**

**27.** Which of the following are *always true*, and which are *not always true*? Give reasons for your answers.

**a.** $|\mathbf{u}| = \sqrt{\mathbf{u} \cdot \mathbf{u}}$ **b.** $\mathbf{u} \cdot \mathbf{u} = |\mathbf{u}|$

**c.** $\mathbf{u} \times \mathbf{0} = \mathbf{0} \times \mathbf{u} = \mathbf{0}$ **d.** $\mathbf{u} \times (-\mathbf{u}) = \mathbf{0}$

**e.** $\mathbf{u} \times \mathbf{v} = \mathbf{v} \times \mathbf{u}$

**f.** $\mathbf{u} \times (\mathbf{v} + \mathbf{w}) = \mathbf{u} \times \mathbf{v} + \mathbf{u} \times \mathbf{w}$

**g.** $(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{v} = 0$

**h.** $(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w} = \mathbf{u} \cdot (\mathbf{v} \times \mathbf{w})$

**28.** Which of the following are *always true*, and which are *not always true*? Give reasons for your answers.

**a.** $\mathbf{u} \cdot \mathbf{v} = \mathbf{v} \cdot \mathbf{u}$ **b.** $\mathbf{u} \times \mathbf{v} = -(\mathbf{v} \times \mathbf{u})$

**c.** $(-\mathbf{u}) \times \mathbf{v} = -(\mathbf{u} \times \mathbf{v})$

**d.** $(c\mathbf{u}) \cdot \mathbf{v} = \mathbf{u} \cdot (c\mathbf{v}) = c(\mathbf{u} \cdot \mathbf{v})$ (any number $c$)

**e.** $c(\mathbf{u} \times \mathbf{v}) = (c\mathbf{u}) \times \mathbf{v} = \mathbf{u} \times (c\mathbf{v})$ (any number $c$)

**f.** $\mathbf{u} \cdot \mathbf{u} = |\mathbf{u}|^2$ **g.** $(\mathbf{u} \times \mathbf{u}) \cdot \mathbf{u} = 0$

**h.** $(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{u} = \mathbf{v} \cdot (\mathbf{u} \times \mathbf{v})$

**29.** Given nonzero vectors $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$, use dot product and cross product notation, as appropriate, to describe the following.

**a.** The vector projection of $\mathbf{u}$ onto $\mathbf{v}$

**b.** A vector orthogonal to $\mathbf{u}$ and $\mathbf{v}$

**c.** A vector orthogonal to $\mathbf{u} \times \mathbf{v}$ and $\mathbf{w}$

**d.** The volume of the parallelepiped determined by $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$

**30.** Given nonzero vectors $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$, use dot product and cross product notation to describe the following.

**a.** A vector orthogonal to $\mathbf{u} \times \mathbf{v}$ and $\mathbf{u} \times \mathbf{w}$

**b.** A vector orthogonal to $\mathbf{u} + \mathbf{v}$ and $\mathbf{u} - \mathbf{v}$

**c.** A vector of length $|\mathbf{u}|$ in the direction of $\mathbf{v}$

**d.** The area of the parallelogram determined by $\mathbf{u}$ and $\mathbf{w}$

**31.** Let $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ be vectors. Which of the following make sense, and which do not? Give reasons for your answers.

**a.** $(\mathbf{u} \times \mathbf{v}) \cdot \mathbf{w}$ **b.** $\mathbf{u} \times (\mathbf{v} \cdot \mathbf{w})$

**c.** $\mathbf{u} \times (\mathbf{v} \times \mathbf{w})$ **d.** $\mathbf{u} \cdot (\mathbf{v} \cdot \mathbf{w})$

**32. Cross products of three vectors** Show that except in degenerate cases, $(\mathbf{u} \times \mathbf{v}) \times \mathbf{w}$ lies in the plane of $\mathbf{u}$ and $\mathbf{v}$, whereas $\mathbf{u} \times (\mathbf{v} \times \mathbf{w})$ lies in the plane of $\mathbf{v}$ and $\mathbf{w}$. What *are* the degenerate cases?

**33. Cancellation in cross products** If $\mathbf{u} \times \mathbf{v} = \mathbf{u} \times \mathbf{w}$ and $\mathbf{u} \neq \mathbf{0}$, then does $\mathbf{v} = \mathbf{w}$? Give reasons for your answer.

**34. Double cancellation** If $\mathbf{u} \neq \mathbf{0}$ and if $\mathbf{u} \times \mathbf{v} = \mathbf{u} \times \mathbf{w}$ and $\mathbf{u} \cdot \mathbf{v} = \mathbf{u} \cdot \mathbf{w}$, then does $\mathbf{v} = \mathbf{w}$? Give reasons for your answer.

## Area in the Plane

Find the areas of the parallelograms whose vertices are given in Exercises 35–38.

**35.** $A(1, 0)$, $B(0, 1)$, $C(-1, 0)$, $D(0, -1)$

**36.** $A(0, 0)$, $B(7, 3)$, $C(9, 8)$, $D(2, 5)$

**37.** $A(-1, 2)$, $B(2, 0)$, $C(7, 1)$, $D(4, 3)$

**38.** $A(-6, 0)$, $B(1, -4)$, $C(3, 1)$, $D(-4, 5)$

Find the areas of the triangles whose vertices are given in Exercises 39–42.

**39.** $A(0, 0)$, $B(-2, 3)$, $C(3, 1)$

**40.** $A(-1, -1)$, $B(3, 3)$, $C(2, 1)$

**41.** $A(-5, 3)$, $B(1, -2)$, $C(6, -2)$

**42.** $A(-6, 0)$, $B(10, -5)$, $C(-2, 4)$

**43. Triangle area** Find a formula for the area of the triangle in the $xy$-plane with vertices at $(0, 0)$, $(a_1, a_2)$, and $(b_1, b_2)$. Explain your work.

**44. Triangle area** Find a concise formula for the area of a triangle with vertices $(a_1, a_2)$, $(b_1, b_2)$, and $(c_1, c_2)$.

# 12.5 Lines and Planes in Space

In the calculus of functions of a single variable, we used our knowledge of lines to study curves in the plane. We investigated tangents and found that, when highly magnified, differentiable curves were effectively linear.

To study the calculus of functions of more than one variable in the next chapter, we start with planes and use our knowledge of planes to study the surfaces that are the graphs of functions in space.

This section shows how to use scalar and vector products to write equations for lines, line segments, and planes in space.

## Lines and Line Segments in Space

In the plane, a line is determined by a point and a number giving the slope of the line. In space a line is determined by a point and a *vector* giving the direction of the line.

Suppose that $L$ is a line in space passing through a point $P_0(x_0, y_0, z_0)$ parallel to a vector $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$. Then $L$ is the set of all points $P(x, y, z)$ for which $\overrightarrow{P_0P}$ is parallel to $\mathbf{v}$ (Figure 12.35). Thus, $\overrightarrow{P_0P} = t\mathbf{v}$ for some scalar parameter $t$. The value of $t$ depends on the location of the point $P$ along the line, and the domain of $t$ is $(-\infty, \infty)$. The expanded form of the equation $\overrightarrow{P_0P} = t\mathbf{v}$ is

$$(x - x_0)\mathbf{i} + (y - y_0)\mathbf{j} + (z - z_0)\mathbf{k} = t(v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}),$$

which can be rewritten as

$$x\mathbf{i} + y\mathbf{j} + z\mathbf{k} = x_0\mathbf{i} + y_0\mathbf{j} + z_0\mathbf{k} + t(v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}). \tag{1}$$

If $\mathbf{r}(t)$ is the position vector of a point $P(x, y, z)$ on the line and $\mathbf{r}_0$ is the position vector of the point $P_0(x_0, y_0, z_0)$, then Equation (1) gives the following vector form for the equation of a line in space.

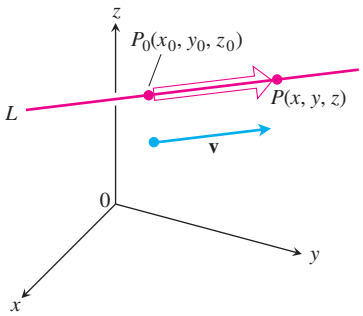

**FIGURE 12.35** A point $P$ lies on $L$ through $P_0$ parallel to $\mathbf{v}$ if and only if $\overrightarrow{P_0P}$ is a scalar multiple of $\mathbf{v}$.

**Vector Equation for a Line**

**A vector equation for the line $L$ through $P_0(x_0, y_0, z_0)$ parallel to $\mathbf{v}$** is

$$\mathbf{r}(t) = \mathbf{r}_0 + t\mathbf{v}, \qquad -\infty < t < \infty, \tag{2}$$

where $\mathbf{r}$ is the position vector of a point $P(x, y, z)$ on $L$ and $\mathbf{r}_0$ is the position vector of $P_0(x_0, y_0, z_0)$.

Equating the corresponding components of the two sides of Equation (1) gives three scalar equations involving the parameter $t$:

$$x = x_0 + tv_1, \qquad y = y_0 + tv_2, \qquad z = z_0 + tv_3.$$

These equations give us the standard parametrization of the line for the parameter interval $-\infty < t < \infty$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

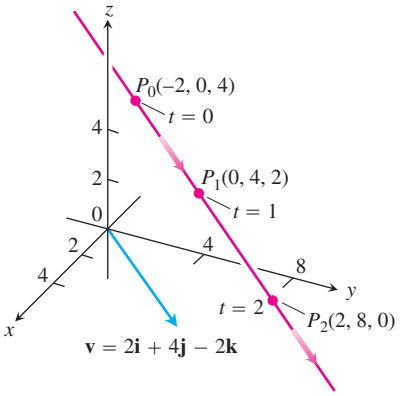

**FIGURE 12.36** Selected points and parameter values on the line $x = -2 + 2t, y = 4t, z = 4 - 2t$. The arrows show the direction of increasing $t$ (Example 1).

**Parametric Equations for a Line**

**The standard parametrization of the line through $P_0(x_0, y_0, z_0)$ parallel to $\mathbf{v} = v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$ is**

$$x = x_0 + tv_1, \quad y = y_0 + tv_2, \quad z = z_0 + tv_3, \quad -\infty < t < \infty \qquad (3)$$

## EXAMPLE 1 Parametrizing a Line Through a Point Parallel to a Vector

Find parametric equations for the line through $(-2, 0, 4)$ parallel to $\mathbf{v} = 2\mathbf{i} + 4\mathbf{j} - 2\mathbf{k}$ (Figure 12.36).

**Solution** With $P_0(x_0, y_0, z_0)$ equal to $(-2, 0, 4)$ and $v_1\mathbf{i} + v_2\mathbf{j} + v_3\mathbf{k}$ equal to $2\mathbf{i} + 4\mathbf{j} - 2\mathbf{k}$, Equations (3) become

$$x = -2 + 2t, \qquad y = 4t, \qquad z = 4 - 2t.$$

■

## EXAMPLE 2 Parametrizing a Line Through Two Points

Find parametric equations for the line through $P(-3, 2, -3)$ and $Q(1, -1, 4)$.

**Solution** The vector

$$\begin{aligned}\overrightarrow{PQ} &= (1 - (-3))\mathbf{i} + (-1 - 2)\mathbf{j} + (4 - (-3))\mathbf{k} \\ &= 4\mathbf{i} - 3\mathbf{j} + 7\mathbf{k}\end{aligned}$$

is parallel to the line, and Equations (3) with $(x_0, y_0, z_0) = (-3, 2, -3)$ give

$$x = -3 + 4t, \qquad y = 2 - 3t, \qquad z = -3 + 7t.$$

We could have chosen $Q(1, -1, 4)$ as the "base point" and written

$$x = 1 + 4t, \quad y = -1 - 3t, \quad z = 4 + 7t.$$

These equations serve as well as the first; they simply place you at a different point on the line for a given value of $t$. ■

Notice that parametrizations are not unique. Not only can the "base point" change, but so can the parameter. The equations $x = -3 + 4t^3, y = 2 - 3t^3$, and $z = -3 + 7t^3$ also parametrize the line in Example 2.

To parametrize a line segment joining two points, we first parametrize the line through the points. We then find the $t$-values for the endpoints and restrict $t$ to lie in the closed interval bounded by these values. The line equations together with this added restriction parametrize the segment.

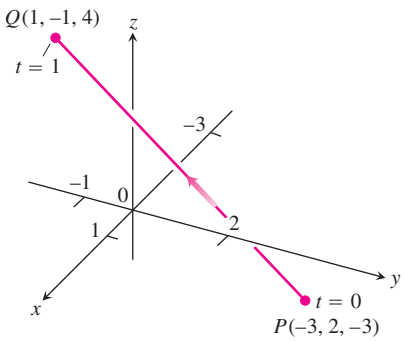

**FIGURE 12.37** Example 3 derives a parametrization of line segment $PQ$. The arrow shows the direction of increasing $t$.

## EXAMPLE 3 Parametrizing a Line Segment

Parametrize the line segment joining the points $P(-3, 2, -3)$ and $Q(1, -1, 4)$ (Figure 12.37).

**Solution** We begin with equations for the line through $P$ and $Q$, taking them, in this case, from Example 2:

$$x = -3 + 4t, \qquad y = 2 - 3t, \qquad z = -3 + 7t.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We observe that the point

$$(x, y, z) = (-3 + 4t, 2 - 3t, -3 + 7t)$$

on the line passes through $P(-3, 2, -3)$ at $t = 0$ and $Q(1, -1, 4)$ at $t = 1$. We add the restriction $0 \le t \le 1$ to parametrize the segment:

$$x = -3 + 4t, \qquad y = 2 - 3t, \qquad z = -3 + 7t, \qquad 0 \le t \le 1. \quad \blacksquare$$

The vector form (Equation (2)) for a line in space is more revealing if we think of a line as the path of a particle starting at position $P_0(x_0, y_0, z_0)$ and moving in the direction of vector $\mathbf{v}$. Rewriting Equation (2), we have

$$\begin{aligned} \mathbf{r}(t) &= \mathbf{r}_0 + t\mathbf{v} \\ &= \mathbf{r}_0 + t|\mathbf{v}|\frac{\mathbf{v}}{|\mathbf{v}|}. \end{aligned} \tag{4}$$

Initial position — Time — Speed — Direction

In other words, the position of the particle at time $t$ is its initial position plus its distance moved (speed $\times$ time) in the direction $\mathbf{v}/|\mathbf{v}|$ of its straight-line motion.

## EXAMPLE 4 Flight of a Helicopter

A helicopter is to fly directly from a helipad at the origin in the direction of the point (1, 1, 1) at a speed of 60 ft/sec. What is the position of the helicopter after 10 sec?

**Solution** We place the origin at the starting position (helipad) of the helicopter. Then the unit vector

$$\mathbf{u} = \frac{1}{\sqrt{3}}\mathbf{i} + \frac{1}{\sqrt{3}}\mathbf{j} + \frac{1}{\sqrt{3}}\mathbf{k}$$

gives the flight direction of the helicopter. From Equation (4), the position of the helicopter at any time $t$ is

$$\begin{aligned} \mathbf{r}(t) &= \mathbf{r}_0 + t(\text{speed})\mathbf{u} \\ &= \mathbf{0} + t(60)\left(\frac{1}{\sqrt{3}}\mathbf{i} + \frac{1}{\sqrt{3}}\mathbf{j} + \frac{1}{\sqrt{3}}\mathbf{k}\right) \\ &= 20\sqrt{3}t(\mathbf{i} + \mathbf{j} + \mathbf{k}). \end{aligned}$$

When $t = 10$ sec,

$$\begin{aligned} \mathbf{r}(10) &= 200\sqrt{3}\,(\mathbf{i} + \mathbf{j} + \mathbf{k}) \\ &= \left\langle 200\sqrt{3}, 200\sqrt{3}, 200\sqrt{3} \right\rangle. \end{aligned}$$

After 10 sec of flight from the origin toward (1, 1, 1), the helicopter is located at the point $(200\sqrt{3}, 200\sqrt{3}, 200\sqrt{3})$ in space. It has traveled a distance of (60 ft/sec)(10 sec) = 600 ft, which is the length of the vector $\mathbf{r}(10)$. $\blacksquare$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

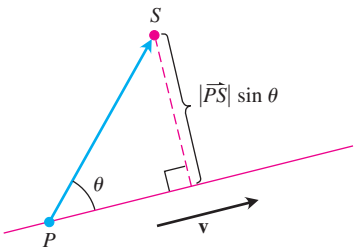

**FIGURE 12.38** The distance from $S$ to the line through $P$ parallel to $\mathbf{v}$ is $|\overrightarrow{PS}|\sin\theta$, where $\theta$ is the angle between $\overrightarrow{PS}$ and $\mathbf{v}$.

## The Distance from a Point to a Line in Space

To find the distance from a point $S$ to a line that passes through a point $P$ parallel to a vector $\mathbf{v}$, we find the absolute value of the scalar component of $\overrightarrow{PS}$ in the direction of a vector normal to the line (Figure 12.38). In the notation of the figure, the absolute value of the scalar component is, $|\overrightarrow{PS}|\sin\theta$, which is $\dfrac{|\overrightarrow{PS}\times\mathbf{v}|}{|\mathbf{v}|}$.

**Distance from a Point $S$ to a Line Through $P$ Parallel to $\mathbf{v}$**

$$d = \frac{|\overrightarrow{PS}\times\mathbf{v}|}{|\mathbf{v}|} \tag{5}$$

**EXAMPLE 5** Finding Distance from a Point to a Line

Find the distance from the point $S(1, 1, 5)$ to the line

$$L: \quad x = 1 + t, \quad y = 3 - t, \quad z = 2t.$$

**Solution** We see from the equations for $L$ that $L$ passes through $P(1, 3, 0)$ parallel to $\mathbf{v} = \mathbf{i} - \mathbf{j} + 2\mathbf{k}$. With

$$\overrightarrow{PS} = (1-1)\mathbf{i} + (1-3)\mathbf{j} + (5-0)\mathbf{k} = -2\mathbf{j} + 5\mathbf{k}$$

and

$$\overrightarrow{PS}\times\mathbf{v} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 0 & -2 & 5 \\ 1 & -1 & 2 \end{vmatrix} = \mathbf{i} + 5\mathbf{j} + 2\mathbf{k},$$

Equation (5) gives

$$d = \frac{|\overrightarrow{PS}\times\mathbf{v}|}{|\mathbf{v}|} = \frac{\sqrt{1+25+4}}{\sqrt{1+1+4}} = \frac{\sqrt{30}}{\sqrt{6}} = \sqrt{5}.$$

■

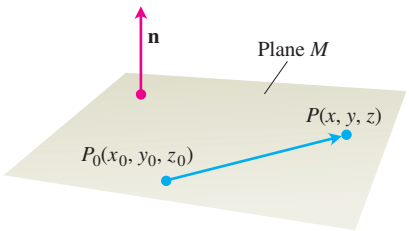

**FIGURE 12.39** The standard equation for a plane in space is defined in terms of a vector normal to the plane: A point $P$ lies in the plane through $P_0$ normal to $\mathbf{n}$ if and only if $\mathbf{n}\cdot\overrightarrow{P_0P} = 0$.

## An Equation for a Plane in Space

A plane in space is determined by knowing a point on the plane and its "tilt" or orientation. This "tilt" is defined by specifying a vector that is perpendicular or normal to the plane.

Suppose that plane $M$ passes through a point $P_0(x_0, y_0, z_0)$ and is normal to the nonzero vector $\mathbf{n} = A\mathbf{i} + B\mathbf{j} + C\mathbf{k}$. Then $M$ is the set of all points $P(x, y, z)$ for which $\overrightarrow{P_0P}$ is orthogonal to $\mathbf{n}$ (Figure 12.39). Thus, the dot product $\mathbf{n}\cdot\overrightarrow{P_0P} = 0$. This equation is equivalent to

$$(A\mathbf{i} + B\mathbf{j} + C\mathbf{k})\cdot[(x-x_0)\mathbf{i} + (y-y_0)\mathbf{j} + (z-z_0)\mathbf{k}] = 0$$

or

$$A(x-x_0) + B(y-y_0) + C(z-z_0) = 0.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Equation for a Plane**

The plane through $P_0(x_0, y_0, z_0)$ normal to $\mathbf{n} = A\mathbf{i} + B\mathbf{j} + C\mathbf{k}$ has

| | |
|---|---|
| Vector equation: | $\mathbf{n} \cdot \overrightarrow{P_0P} = 0$ |
| Component equation: | $A(x - x_0) + B(y - y_0) + C(z - z_0) = 0$ |
| Component equation simplified: | $Ax + By + Cz = D$, where $D = Ax_0 + By_0 + Cz_0$ |

**EXAMPLE 6** Finding an Equation for a Plane

Find an equation for the plane through $P_0(-3, 0, 7)$ perpendicular to $\mathbf{n} = 5\mathbf{i} + 2\mathbf{j} - \mathbf{k}$.

**Solution** The component equation is

$$5(x - (-3)) + 2(y - 0) + (-1)(z - 7) = 0.$$

Simplifying, we obtain

$$5x + 15 + 2y - z + 7 = 0$$
$$5x + 2y - z = -22.$$

■

Notice in Example 6 how the components of $\mathbf{n} = 5\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ became the coefficients of $x$, $y$, and $z$ in the equation $5x + 2y - z = -22$. The vector $\mathbf{n} = A\mathbf{i} + B\mathbf{j} + C\mathbf{k}$ is normal to the plane $Ax + By + Cz = D$.

**EXAMPLE 7** Finding an Equation for a Plane Through Three Points

Find an equation for the plane through $A(0, 0, 1)$, $B(2, 0, 0)$, and $C(0, 3, 0)$.

**Solution** We find a vector normal to the plane and use it with one of the points (it does not matter which) to write an equation for the plane.

The cross product

$$\overrightarrow{AB} \times \overrightarrow{AC} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 0 & -1 \\ 0 & 3 & -1 \end{vmatrix} = 3\mathbf{i} + 2\mathbf{j} + 6\mathbf{k}$$

is normal to the plane. We substitute the components of this vector and the coordinates of A(0, 0, 1) into the component form of the equation to obtain

$$3(x - 0) + 2(y - 0) + 6(z - 1) = 0$$
$$3x + 2y + 6z = 6.$$

■

## Lines of Intersection

Just as lines are parallel if and only if they have the same direction, two planes are **parallel** if and only if their normals are parallel, or $\mathbf{n}_1 = k\mathbf{n}_2$ for some scalar $k$. Two planes that are not parallel intersect in a line.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

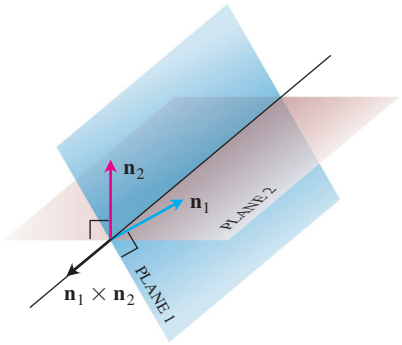

**FIGURE 12.40** How the line of intersection of two planes is related to the planes' normal vectors (Example 8).

**EXAMPLE 8** Finding a Vector Parallel to the Line of Intersection of Two Planes

Find a vector parallel to the line of intersection of the planes $3x - 6y - 2z = 15$ and $2x + y - 2z = 5$.

**Solution** The line of intersection of two planes is perpendicular to both planes' normal vectors $\mathbf{n}_1$ and $\mathbf{n}_2$ (Figure 12.40) and therefore parallel to $\mathbf{n}_1 \times \mathbf{n}_2$. Turning this around, $\mathbf{n}_1 \times \mathbf{n}_2$ is a vector parallel to the planes' line of intersection. In our case,

$$\mathbf{n}_1 \times \mathbf{n}_2 = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 3 & -6 & -2 \\ 2 & 1 & -2 \end{vmatrix} = 14\mathbf{i} + 2\mathbf{j} + 15\mathbf{k}.$$

Any nonzero scalar multiple of $\mathbf{n}_1 \times \mathbf{n}_2$ will do as well. ■

**EXAMPLE 9** Parametrizing the Line of Intersection of Two Planes

Find parametric equations for the line in which the planes $3x - 6y - 2z = 15$ and $2x + y - 2z = 5$ intersect.

**Solution** We find a vector parallel to the line and a point on the line and use Equations (3).

Example 8 identifies $\mathbf{v} = 14\mathbf{i} + 2\mathbf{j} + 15\mathbf{k}$ as a vector parallel to the line. To find a point on the line, we can take any point common to the two planes. Substituting $z = 0$ in the plane equations and solving for $x$ and $y$ simultaneously identifies one of these points as $(3, -1, 0)$. The line is

$$x = 3 + 14t, \qquad y = -1 + 2t, \qquad z = 15t.$$

The choice $z = 0$ is arbitrary and we could have chosen $z = 1$ or $z = -1$ just as well. Or we could have let $x = 0$ and solved for $y$ and $z$. The different choices would simply give different parametrizations of the same line. ■

Sometimes we want to know where a line and a plane intersect. For example, if we are looking at a flat plate and a line segment passes through it, we may be interested in knowing what portion of the line segment is hidden from our view by the plate. This application is used in computer graphics (Exercise 74).

**EXAMPLE 10** Finding the Intersection of a Line and a Plane

Find the point where the line

$$x = \frac{8}{3} + 2t, \qquad y = -2t, \qquad z = 1 + t$$

intersects the plane $3x + 2y + 6z = 6$.

**Solution** The point

$$\left(\frac{8}{3} + 2t, -2t, 1 + t\right)$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

lies in the plane if its coordinates satisfy the equation of the plane, that is, if

$$3\left(\frac{8}{3} + 2t\right) + 2(-2t) + 6(1 + t) = 6$$
$$8 + 6t - 4t + 6 + 6t = 6$$
$$8t = -8$$
$$t = -1.$$

The point of intersection is

$$(x, y, z)|_{t=-1} = \left(\frac{8}{3} - 2, 2, 1 - 1\right) = \left(\frac{2}{3}, 2, 0\right).$$ ■

## The Distance from a Point to a Plane

If $P$ is a point on a plane with normal $\mathbf{n}$, then the distance from any point $S$ to the plane is the length of the vector projection of $\overrightarrow{PS}$ onto $\mathbf{n}$. That is, the distance from $S$ to the plane is

$$d = \left|\overrightarrow{PS} \cdot \frac{\mathbf{n}}{|\mathbf{n}|}\right| \tag{6}$$

where $\mathbf{n} = A\mathbf{i} + B\mathbf{j} + C\mathbf{k}$ is normal to the plane.

**EXAMPLE 11** Finding the Distance from a Point to a Plane

Find the distance from $S(1, 1, 3)$ to the plane $3x + 2y + 6z = 6$.

**Solution** We find a point $P$ in the plane and calculate the length of the vector projection of $\overrightarrow{PS}$ onto a vector $\mathbf{n}$ normal to the plane (Figure 12.41). The coefficients in the equation $3x + 2y + 6z = 6$ give

$$\mathbf{n} = 3\mathbf{i} + 2\mathbf{j} + 6\mathbf{k}.$$

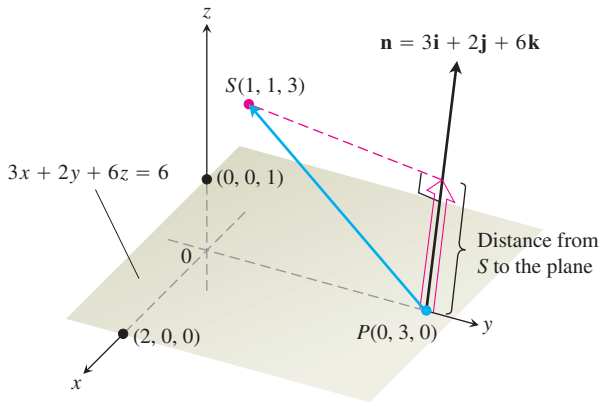

**FIGURE 12.41** The distance from $S$ to the plane is the length of the vector projection of $\overrightarrow{PS}$ onto $\mathbf{n}$ (Example 11).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The points on the plane easiest to find from the plane's equation are the intercepts. If we take $P$ to be the $y$-intercept $(0, 3, 0)$, then

$$\overrightarrow{PS} = (1 - 0)\mathbf{i} + (1 - 3)\mathbf{j} + (3 - 0)\mathbf{k}$$
$$= \mathbf{i} - 2\mathbf{j} + 3\mathbf{k},$$
$$|\mathbf{n}| = \sqrt{(3)^2 + (2)^2 + (6)^2} = \sqrt{49} = 7.$$

The distance from $S$ to the plane is

$$d = \left|\overrightarrow{PS} \cdot \frac{\mathbf{n}}{|\mathbf{n}|}\right| \qquad \text{length of } \operatorname{proj}_{\mathbf{n}} \overrightarrow{PS}$$
$$= \left|(\mathbf{i} - 2\mathbf{j} + 3\mathbf{k}) \cdot \left(\frac{3}{7}\mathbf{i} + \frac{2}{7}\mathbf{j} + \frac{6}{7}\mathbf{k}\right)\right|$$
$$= \left|\frac{3}{7} - \frac{4}{7} + \frac{18}{7}\right| = \frac{17}{7}.$$

■

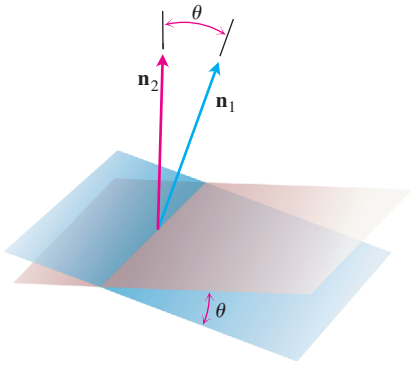

**FIGURE 12.42** The angle between two planes is obtained from the angle between their normals.

## Angles Between Planes

The angle between two intersecting planes is defined to be the (acute) angle determined by their normal vectors (Figure 12.42).

**EXAMPLE 12** Find the angle between the planes $3x - 6y - 2z = 15$ and $2x + y - 2z = 5$.

**Solution** The vectors

$$\mathbf{n}_1 = 3\mathbf{i} - 6\mathbf{j} - 2\mathbf{k}, \qquad \mathbf{n}_2 = 2\mathbf{i} + \mathbf{j} - 2\mathbf{k}$$

are normals to the planes. The angle between them is

$$\theta = \cos^{-1}\left(\frac{\mathbf{n}_1 \cdot \mathbf{n}_2}{|\mathbf{n}_1||\mathbf{n}_2|}\right)$$
$$= \cos^{-1}\left(\frac{4}{21}\right)$$
$$\approx 1.38 \text{ radians.} \qquad \text{About 79 deg}$$

# EXERCISES 12.5

## Lines and Line Segments

Find parametric equations for the lines in Exercises 1–12.

1. The line through the point $P(3, -4, -1)$ parallel to the vector $\mathbf{i} + \mathbf{j} + \mathbf{k}$
2. The line through $P(1, 2, -1)$ and $Q(-1, 0, 1)$
3. The line through $P(-2, 0, 3)$ and $Q(3, 5, -2)$
4. The line through $P(1, 2, 0)$ and $Q(1, 1, -1)$
5. The line through the origin parallel to the vector $2\mathbf{j} + \mathbf{k}$
6. The line through the point $(3, -2, 1)$ parallel to the line $x = 1 + 2t, y = 2 - t, z = 3t$
7. The line through $(1, 1, 1)$ parallel to the $z$-axis
8. The line through $(2, 4, 5)$ perpendicular to the plane $3x + 7y - 5z = 21$
9. The line through $(0, -7, 0)$ perpendicular to the plane $x + 2y + 2z = 13$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**10.** The line through (2, 3, 0) perpendicular to the vectors $\mathbf{u} = \mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$ and $\mathbf{v} = 3\mathbf{i} + 4\mathbf{j} + 5\mathbf{k}$

**11.** The $x$-axis

**12.** The $z$-axis

Find parametrizations for the line segments joining the points in Exercises 13–20. Draw coordinate axes and sketch each segment, indicating the direction of increasing $t$ for your parametrization.

**13.** $(0, 0, 0)$, $(1, 1, 3/2)$

**14.** $(0, 0, 0)$, $(1, 0, 0)$

**15.** $(1, 0, 0)$, $(1, 1, 0)$

**16.** $(1, 1, 0)$, $(1, 1, 1)$

**17.** $(0, 1, 1)$, $(0, -1, 1)$

**18.** $(0, 2, 0)$, $(3, 0, 0)$

**19.** $(2, 0, 2)$, $(0, 2, 0)$

**20.** $(1, 0, -1)$, $(0, 3, 0)$

## Planes

Find equations for the planes in Exercises 21–26.

**21.** The plane through $P_0(0, 2, -1)$ normal to $\mathbf{n} = 3\mathbf{i} - 2\mathbf{j} - \mathbf{k}$

**22.** The plane through $(1, -1, 3)$ parallel to the plane

$$3x + y + z = 7$$

**23.** The plane through $(1, 1, -1)$, $(2, 0, 2)$, and $(0, -2, 1)$

**24.** The plane through $(2, 4, 5)$, $(1, 5, 7)$, and $(-1, 6, 8)$

**25.** The plane through $P_0(2, 4, 5)$ perpendicular to the line

$$x = 5 + t, \quad y = 1 + 3t, \quad z = 4t$$

**26.** The plane through $A(1, -2, 1)$ perpendicular to the vector from the origin to $A$

**27.** Find the point of intersection of the lines $x = 2t + 1$, $y = 3t + 2, z = 4t + 3$, and $x = s + 2, y = 2s + 4, z = -4s - 1$, and then find the plane determined by these lines.

**28.** Find the point of intersection of the lines $x = t, y = -t + 2, z = t + 1$, and $x = 2s + 2, y = s + 3, z = 5s + 6$, and then find the plane determined by these lines.

In Exercises 29 and 30, find the plane determined by the intersecting lines.

**29.** $L1$: $x = -1 + t$, $y = 2 + t$, $z = 1 - t$; $-\infty < t < \infty$
$L2$: $x = 1 - 4s$, $y = 1 + 2s$, $z = 2 - 2s$; $-\infty < s < \infty$

**30.** $L1$: $x = t$, $y = 3 - 3t$, $z = -2 - t$; $-\infty < t < \infty$
$L2$: $x = 1 + s$, $y = 4 + s$, $z = -1 + s$; $-\infty < s < \infty$

**31.** Find a plane through $P_0(2, 1, -1)$ and perpendicular to the line of intersection of the planes $2x + y - z = 3, x + 2y + z = 2$.

**32.** Find a plane through the points $P_1(1, 2, 3)$, $P_2(3, 2, 1)$ and perpendicular to the plane $4x - y + 2z = 7$.

## Distances

In Exercises 33–38, find the distance from the point to the line.

**33.** $(0, 0, 12)$; $x = 4t$, $y = -2t$, $z = 2t$

**34.** $(0, 0, 0)$; $x = 5 + 3t$, $y = 5 + 4t$, $z = -3 - 5t$

**35.** $(2, 1, 3)$; $x = 2 + 2t$, $y = 1 + 6t$, $z = 3$

**36.** $(2, 1, -1)$; $x = 2t$, $y = 1 + 2t$, $z = 2t$

**37.** $(3, -1, 4)$; $x = 4 - t$, $y = 3 + 2t$, $z = -5 + 3t$

**38.** $(-1, 4, 3)$; $x = 10 + 4t$, $y = -3$, $z = 4t$

In Exercises 39–44, find the distance from the point to the plane.

**39.** $(2, -3, 4)$, $x + 2y + 2z = 13$

**40.** $(0, 0, 0)$, $3x + 2y + 6z = 6$

**41.** $(0, 1, 1)$, $4y + 3z = -12$

**42.** $(2, 2, 3)$, $2x + y + 2z = 4$

**43.** $(0, -1, 0)$, $2x + y + 2z = 4$

**44.** $(1, 0, -1)$, $-4x + y + z = 4$

**45.** Find the distance from the plane $x + 2y + 6z = 1$ to the plane $x + 2y + 6z = 10$.

**46.** Find the distance from the line $x = 2 + t, y = 1 + t, z = -(1/2) - (1/2)t$ to the plane $x + 2y + 6z = 10$.

## Angles

Find the angles between the planes in Exercises 47 and 48.

**47.** $x + y = 1$, $2x + y - 2z = 2$

**48.** $5x + y - z = 10$, $x - 2y + 3z = -1$

T Use a calculator to find the acute angles between the planes in Exercises 49–52 to the nearest hundredth of a radian.

**49.** $2x + 2y + 2z = 3$, $2x - 2y - z = 5$

**50.** $x + y + z = 1$, $z = 0$ (the $xy$-plane)

**51.** $2x + 2y - z = 3$, $x + 2y + z = 2$

**52.** $4y + 3z = -12$, $3x + 2y + 6z = 6$

## Intersecting Lines and Planes

In Exercises 53–56, find the point in which the line meets the plane.

**53.** $x = 1 - t$, $y = 3t$, $z = 1 + t$; $2x - y + 3z = 6$

**54.** $x = 2$, $y = 3 + 2t$, $z = -2 - 2t$; $6x + 3y - 4z = -12$

**55.** $x = 1 + 2t$, $y = 1 + 5t$, $z = 3t$; $x + y + z = 2$

**56.** $x = -1 + 3t$, $y = -2$, $z = 5t$; $2x - 3z = 7$

Find parametrizations for the lines in which the planes in Exercises 57–60 intersect.

**57.** $x + y + z = 1$, $x + y = 2$

**58.** $3x - 6y - 2z = 3$, $2x + y - 2z = 2$

**59.** $x - 2y + 4z = 2$, $x + y - 2z = 5$

**60.** $5x - 2y = 11$, $4y - 5z = -17$

Given two lines in space, either they are parallel, or they intersect, or they are skew (imagine, for example, the flight paths of two planes in the sky). Exercises 61 and 62 each give three lines. In each exercise, determine whether the lines, taken two at a time, are parallel, intersect, or are skew. If they intersect, find the point of intersection.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**61.** $L1$: $x = 3 + 2t,\ y = -1 + 4t,\ z = 2 - t;\ -\infty < t < \infty$
$L2$: $x = 1 + 4s,\ y = 1 + 2s,\ z = -3 + 4s;\ -\infty < s < \infty$
$L3$: $x = 3 + 2r,\ y = 2 + r,\ z = -2 + 2r;\ -\infty < r < \infty$

**62.** $L1$: $x = 1 + 2t,\quad y = -1 - t,\quad z = 3t;\quad -\infty < t < \infty$
$L2$: $x = 2 - s,\quad y = 3s,\quad z = 1 + s;\quad -\infty < s < \infty$
$L3$: $x = 5 + 2r,\quad y = 1 - r,\quad z = 8 + 3r;\ -\infty < r < \infty$

## Theory and Examples

**63.** Use Equations (3) to generate a parametrization of the line through $P(2, -4, 7)$ parallel to $\mathbf{v}_1 = 2\mathbf{i} - \mathbf{j} + 3\mathbf{k}$. Then generate another parametrization of the line using the point $P_2(-2, -2, 1)$ and the vector $\mathbf{v}_2 = -\mathbf{i} + (1/2)\mathbf{j} - (3/2)\mathbf{k}$.

**64.** Use the component form to generate an equation for the plane through $P_1(4, 1, 5)$ normal to $\mathbf{n}_1 = \mathbf{i} - 2\mathbf{j} + \mathbf{k}$. Then generate another equation for the same plane using the point $P_2(3, -2, 0)$ and the normal vector $\mathbf{n}_2 = -\sqrt{2}\mathbf{i} + 2\sqrt{2}\mathbf{j} - \sqrt{2}\mathbf{k}$.

**65.** Find the points in which the line $x = 1 + 2t, y = -1 - t, z = 3t$ meets the coordinate planes. Describe the reasoning behind your answer.

**66.** Find equations for the line in the plane $z = 3$ that makes an angle of $\pi/6$ rad with $\mathbf{i}$ and an angle of $\pi/3$ rad with $\mathbf{j}$. Describe the reasoning behind your answer.

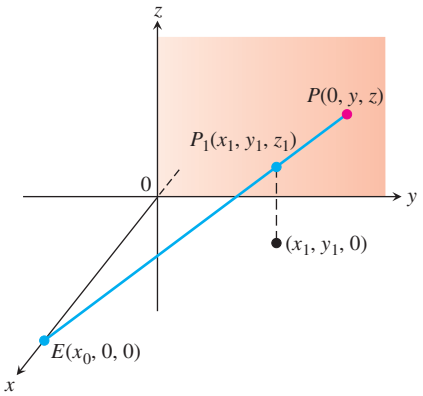
**67.** Is the line $x = 1 - 2t, y = 2 + 5t, z = -3t$ parallel to the plane $2x + y - z = 8$? Give reasons for your answer.

**68.** How can you tell when two planes $A_1x + B_1y + C_1z = D_1$ and $A_2x + B_2y + C_2z = D_2$ are parallel? Perpendicular? Give reasons for your answer.

**69.** Find two different planes whose intersection is the line $x = 1 + t, y = 2 - t, z = 3 + 2t$. Write equations for each plane in the form $Ax + By + Cz = D$.

**70.** Find a plane through the origin that meets the plane $M$: $2x + 3y + z = 12$ in a right angle. How do you know that your plane is perpendicular to $M$?

**71.** For any nonzero numbers $a$, $b$, and $c$, the graph of $(x/a) + (y/b) + (z/c) = 1$ is a plane. Which planes have an equation of this form?



**72.** Suppose $L_1$ and $L_2$ are disjoint (nonintersecting) nonparallel lines. Is it possible for a nonzero vector to be perpendicular to both $L_1$ and $L_2$? Give reasons for your answer.

## Computer Graphics

**73. Perspective in computer graphics** In computer graphics and perspective drawing, we need to represent objects seen by the eye in space as images on a two-dimensional plane. Suppose that the eye is at $E(x_0, 0, 0)$ as shown here and that we want to represent a point $P_1(x_1, y_1, z_1)$ as a point on the $yz$-plane. We do this by projecting $P_1$ onto the plane with a ray from $E$. The point $P_1$ will be portrayed as the point $P(0, y, z)$. The problem for us as graphics designers is to find $y$ and $z$ given $E$ and $P_1$.

**a.** Write a vector equation that holds between $\overrightarrow{EP}$ and $\overrightarrow{EP_1}$. Use the equation to express $y$ and $z$ in terms of $x_0, x_1, y_1$, and $z_1$.

**b.** Test the formulas obtained for $y$ and $z$ in part (a) by investigating their behavior at $x_1 = 0$ and $x_1 = x_0$ and by seeing what happens as $x_0 \to \infty$. What do you find?

**74. Hidden lines** Here is another typical problem in computer graphics. Your eye is at $(4, 0, 0)$. You are looking at a triangular plate whose vertices are at $(1, 0, 1)$, $(1, 1, 0)$, and $(-2, 2, 2)$. The line segment from $(1, 0, 0)$ to $(0, 2, 2)$ passes through the plate. What portion of the line segment is hidden from your view by the plate? (This is an exercise in finding intersections of lines and planes.)

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# 12.6 Cylinders and Quadric Surfaces

Up to now, we have studied two special types of surfaces: spheres and planes. In this section, we extend our inventory to include a variety of cylinders and quadric surfaces. Quadric surfaces are surfaces defined by second-degree equations in $x$, $y$, and $z$. Spheres are quadric surfaces, but there are others of equal interest.

## Cylinders

A **cylinder** is a surface that is generated by moving a straight line along a given planar curve while holding the line parallel to a given fixed line. The curve is called a **generating curve** for the cylinder (Figure 12.43). In solid geometry, where *cylinder* means *circular*

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

*cylinder*, the generating curves are circles, but now we allow generating curves of any kind. The cylinder in our first example is generated by a parabola.

When graphing a cylinder or other surface by hand or analyzing one generated by a computer, it helps to look at the curves formed by intersecting the surface with planes parallel to the coordinate planes. These curves are called **cross-sections** or **traces**.

**EXAMPLE 1** The Parabolic Cylinder $y = x^2$

Find an equation for the cylinder made by the lines parallel to the $z$-axis that pass through the parabola $y = x^2, z = 0$ (Figure 12.44).

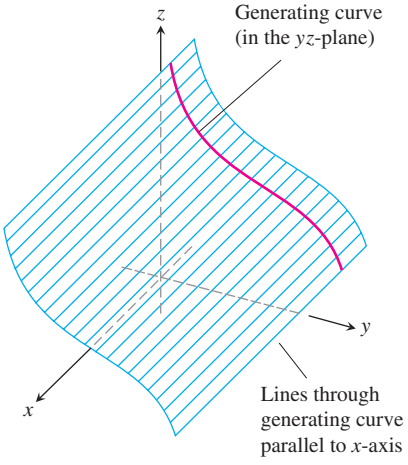


**FIGURE 12.43** A cylinder and generating curve.

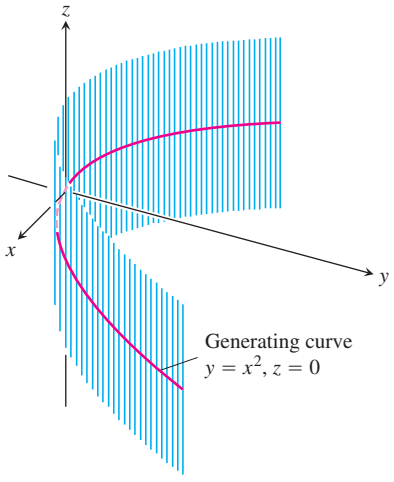

**FIGURE 12.44** The cylinder of lines passing through the parabola $y = x^2$ in the $xy$-plane parallel to the $z$-axis (Example 1).

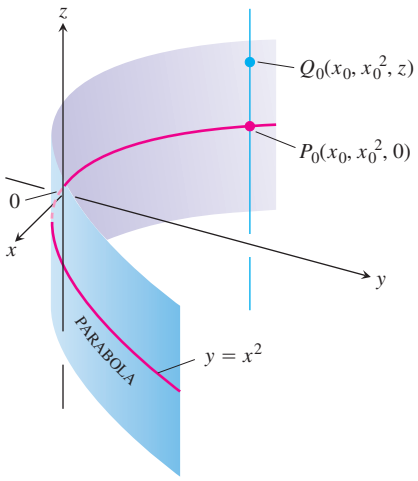

**FIGURE 12.45** Every point of the cylinder in Figure 12.44 has coordinates of the form $(x_0, x_0^2, z)$. We call it "the cylinder $y = x^2$."

**Solution** Suppose that the point $P_0(x_0, x_0^2, 0)$ lies on the parabola $y = x^2$ in the $xy$-plane. Then, for any value of $z$, the point $Q(x_0, x_0^2, z)$ will lie on the cylinder because it lies on the line $x = x_0, y = x_0^2$ through $P_0$ parallel to the $z$-axis. Conversely, any point $Q(x_0, x_0^2, z)$ whose $y$-coordinate is the square of its $x$-coordinate lies on the cylinder because it lies on the line $x = x_0, y = x_0^2$ through $P_0$ parallel to the $z$-axis (Figure 12.45).

Regardless of the value of $z$, therefore, the points on the surface are the points whose coordinates satisfy the equation $y = x^2$. This makes $y = x^2$ an equation for the cylinder. Because of this, we call the cylinder "the cylinder $y = x^2$." ■

As Example 1 suggests, any curve $f(x, y) = c$ in the $xy$-plane defines a cylinder parallel to the $z$-axis whose equation is also $f(x, y) = c$. The equation $x^2 + y^2 = 1$ defines the circular cylinder made by the lines parallel to the $z$-axis that pass through the circle $x^2 + y^2 = 1$ in the $xy$-plane. The equation $x^2 + 4y^2 = 9$ defines the elliptical cylinder made by the lines parallel to the $z$-axis that pass through the ellipse $x^2 + 4y^2 = 9$ in the $xy$-plane.

In a similar way, any curve $g(x, z) = c$ in the $xz$-plane defines a cylinder parallel to the $y$-axis whose space equation is also $g(x, z) = c$ (Figure 12.46). Any curve $h(y, z) = c$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

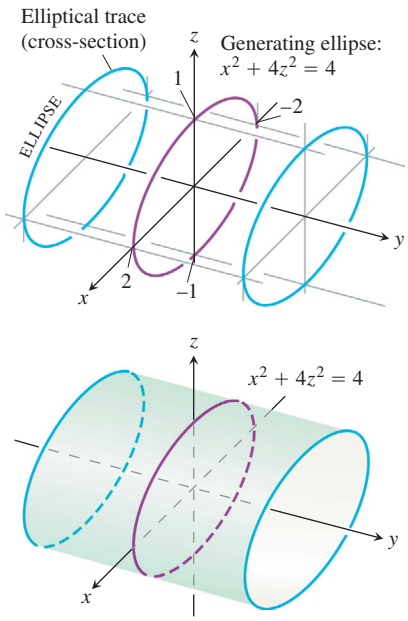

**FIGURE 12.46** The elliptical cylinder $x^2 + 4z^2 = 4$ is made of lines parallel to the $y$-axis and passing through the ellipse $x^2 + 4z^2 = 4$ in the $xz$-plane. The cross-sections or "traces" of the cylinder in planes perpendicular to the $y$-axis are ellipses congruent to the generating ellipse. The cylinder extends along the entire $y$-axis.

defines a cylinder parallel to the $x$-axis whose space equation is also $h(y, z) = c$ (Figure 12.47). The axis of a cylinder need not be parallel to a coordinate axis, however.

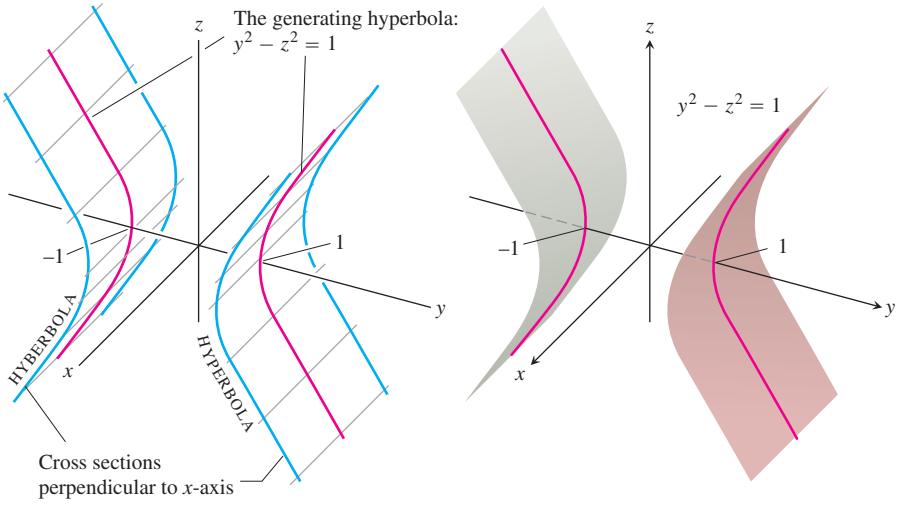

**FIGURE 12.47** The hyperbolic cylinder $y^2 - z^2 = 1$ is made of lines parallel to the $x$-axis and passing through the hyperbola $y^2 - z^2 = 1$ in the $yz$-plane. The cross-sections of the cylinder in planes perpendicular to the $x$-axis are hyperbolas congruent to the generating hyperbola.

## Quadric Surfaces

The next type of surface we examine is a *quadric* surface. These surfaces are the three-dimensional analogues of ellipses, parabolas, and hyperbolas.

A **quadric surface** is the graph in space of a second-degree equation in $x$, $y$, and $z$. The most general form is

$$Ax^2 + By^2 + Cz^2 + Dxy + Eyz + Fxz + Gx + Hy + Jz + K = 0,$$

where $A$, $B$, $C$, and so on are constants. However, this equation can be simplified by translation and rotation, as in the two-dimensional case. We will study only the simpler equations. Although defined differently, the cylinders in Figures 12.45 through 12.47 were also examples of quadric surfaces. The basic quadric surfaces are **ellipsoids**, **paraboloids**, **elliptical cones**, and **hyperboloids**. (We think of spheres as special ellipsoids.) We now present examples of each type.

### EXAMPLE 2 Ellipsoids

The **ellipsoid**

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1 \tag{1}$$

(Figure 12.48) cuts the coordinate axes at $(\pm a, 0, 0)$, $(0, \pm b, 0)$, and $(0, 0, \pm c)$. It lies within the rectangular box defined by the inequalities $|x| \le a$, $|y| \le b$, and $|z| \le c$. The surface is symmetric with respect to each of the coordinate planes because each variable in the defining equation is squared.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

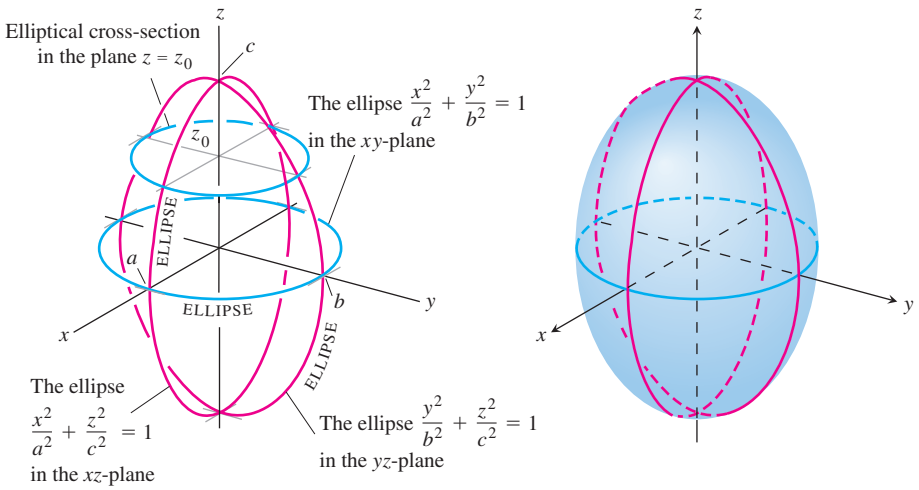

**FIGURE 12.48** The ellipsoid

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$$

in Example 2 has elliptical cross-sections in each of the three coordinate planes.

The curves in which the three coordinate planes cut the surface are ellipses. For example,

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \qquad \text{when} \qquad z = 0.$$

The section cut from the surface by the plane $z = z_0$, $|z_0| < c$, is the ellipse

$$\frac{x^2}{a^2(1 - (z_0/c)^2)} + \frac{y^2}{b^2(1 - (z_0/c)^2)} = 1.$$

If any two of the semiaxes $a$, $b$, and $c$ are equal, the surface is an **ellipsoid of revolution**. If all three are equal, the surface is a sphere. ■

**EXAMPLE 3** Paraboloids

The **elliptical paraboloid**

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = \frac{z}{c} \tag{2}$$

is symmetric with respect to the planes $x = 0$ and $y = 0$ (Figure 12.49). The only intercept on the axes is the origin. Except for this point, the surface lies above (if $c > 0$) or entirely below (if $c < 0$) the $xy$-plane, depending on the sign of $c$. The sections cut by the coordinate planes are

$x = 0$: the parabola $z = \frac{c}{b^2} y^2$

$y = 0$: the parabola $z = \frac{c}{a^2} x^2$

$z = 0$: the point $(0, 0, 0)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

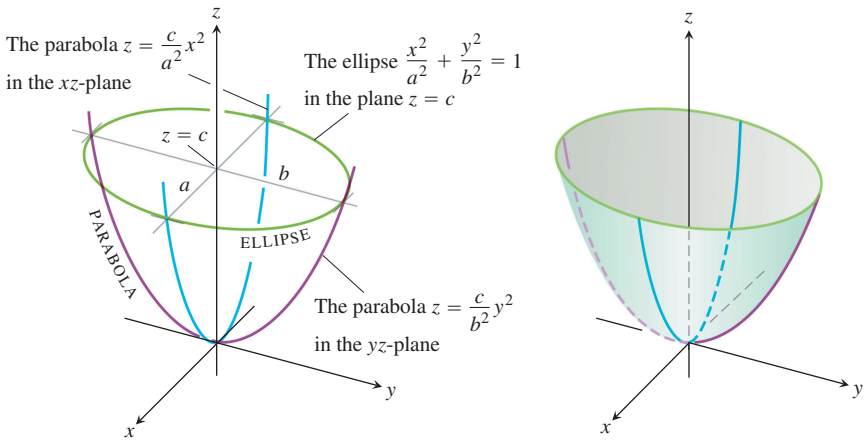

**FIGURE 12.49** The elliptical paraboloid $(x^2/a^2) + (y^2/b^2) = z/c$ in Example 3, shown for $c > 0$. The cross-sections perpendicular to the $z$-axis above the $xy$-plane are ellipses. The cross-sections in the planes that contain the $z$-axis are parabolas.

Each plane $z = z_0$ above the $xy$-plane cuts the surface in the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = \frac{z_0}{c}.$$

**EXAMPLE 4** Cones

The **elliptical cone**

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = \frac{z^2}{c^2} \tag{3}$$

is symmetric with respect to the three coordinate planes (Figure 12.50). The sections cut

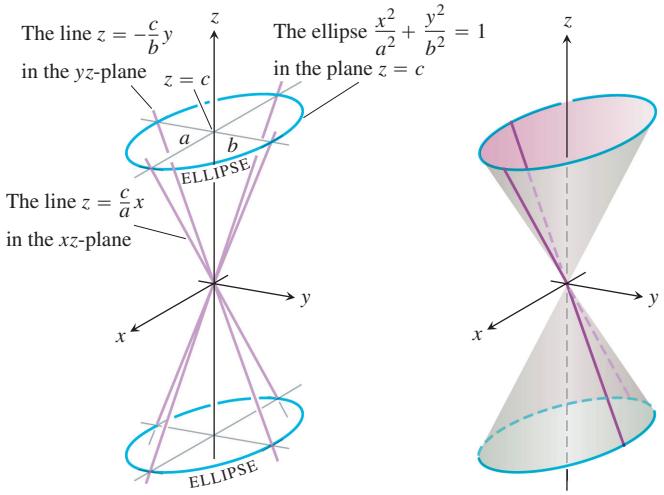

**FIGURE 12.50** The elliptical cone $(x^2/a^2) + (y^2/b^2) = (z^2/c^2)$ in Example 4. Planes perpendicular to the $z$-axis cut the cone in ellipses above and below the $xy$-plane. Vertical planes that contain the $z$-axis cut it in pairs of intersecting lines.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

by the coordinate planes are

$$x = 0: \quad \text{the lines } z = \pm\frac{c}{b}y$$

$$y = 0: \quad \text{the lines } z = \pm\frac{c}{a}x$$

$$z = 0: \quad \text{the point } (0, 0, 0).$$

The sections cut by planes $z = z_0$ above and below the $xy$-plane are ellipses whose centers lie on the $z$-axis and whose vertices lie on the lines given above.

If $a = b$, the cone is a right circular cone. ■

**EXAMPLE 5** Hyperboloids

The **hyperboloid of one sheet**

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1 \tag{4}$$

is symmetric with respect to each of the three coordinate planes (Figure 12.51).

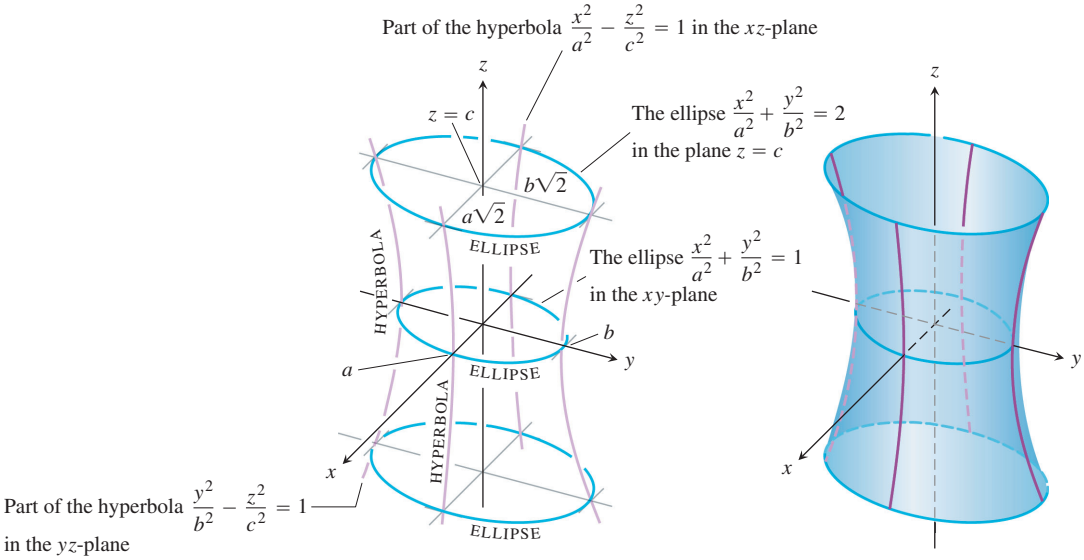

**FIGURE 12.51** The hyperboloid $(x^2/a^2) + (y^2/b^2) - (z^2/c^2) = 1$ in Example 5. Planes perpendicular to the $z$-axis cut it in ellipses. Vertical planes containing the $z$-axis cut it in hyperbolas.

The sections cut out by the coordinate planes are

$$x = 0: \quad \text{the hyperbola } \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$$

$$y = 0: \quad \text{the hyperbola } \frac{x^2}{a^2} - \frac{z^2}{c^2} = 1$$

$$z = 0: \quad \text{the ellipse } \frac{x^2}{a^2} + \frac{y^2}{b^2} = 1.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The plane $z = z_0$ cuts the surface in an ellipse with center on the $z$-axis and vertices on one of the hyperbolic sections above.

The surface is connected, meaning that it is possible to travel from one point on it to any other without leaving the surface. For this reason, it is said to have *one* sheet, in contrast to the hyperboloid in the next example, which has two sheets.

If $a = b$, the hyperboloid is a surface of revolution. ■

**EXAMPLE 6** Hyperboloids

The **hyperboloid of two sheets**

$$\frac{z^2}{c^2} - \frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \tag{5}$$

is symmetric with respect to the three coordinate planes (Figure 12.52). The plane $z = 0$ does not intersect the surface; in fact, for a horizontal plane to intersect the surface, we must have $|z| \geq c$. The hyperbolic sections

$$x = 0: \quad \frac{z^2}{c^2} - \frac{y^2}{b^2} = 1$$

$$y = 0: \quad \frac{z^2}{c^2} - \frac{x^2}{a^2} = 1$$

have their vertices and foci on the $z$-axis. The surface is separated into two portions, one above the plane $z = c$ and the other below the plane $z = -c$. This accounts for its name.

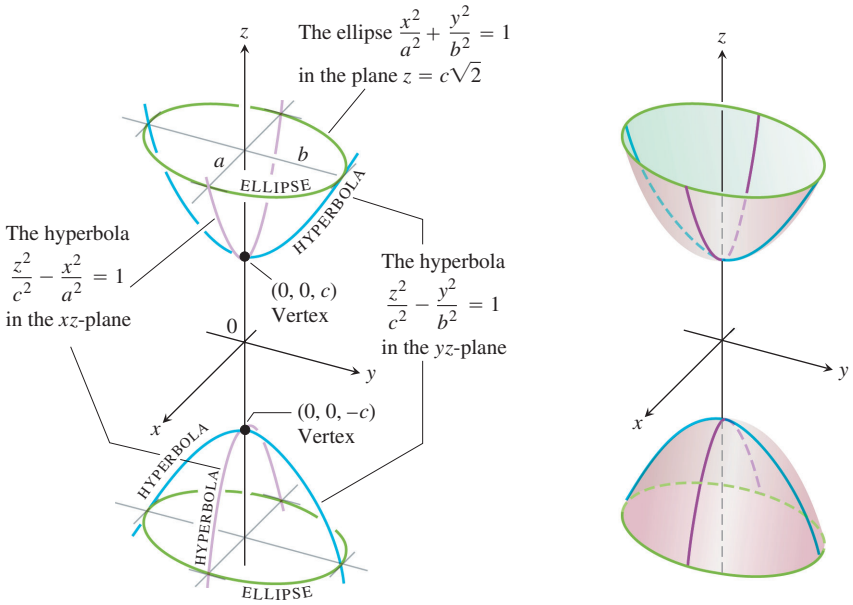

**FIGURE 12.52** The hyperboloid $(z^2/c^2) - (x^2/a^2) - (y^2/b^2) = 1$ in Example 6. Planes perpendicular to the $z$-axis above and below the vertices cut it in ellipses. Vertical planes containing the $z$-axis cut it in hyperbolas.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

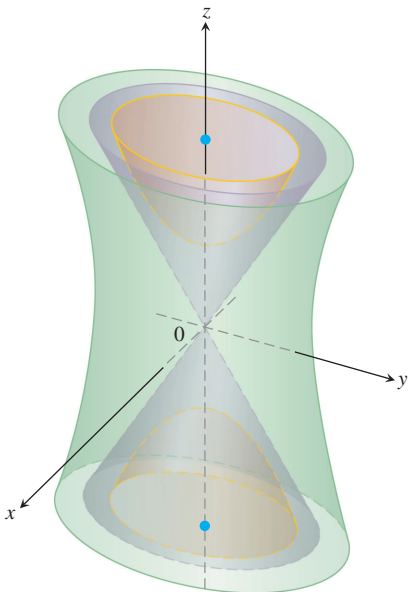

**FIGURE 12.53** Both hyperboloids are asymptotic to the cone (Example 6).

Equations (4) and (5) have different numbers of negative terms. The number in each case is the same as the number of sheets of the hyperboloid. If we replace the 1 on the right side of either Equation (4) or Equation (5) by 0, we obtain the equation

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = \frac{z^2}{c^2}$$

for an elliptical cone (Equation 3). The hyperboloids are asymptotic to this cone (Figure 12.53) in the same way that the hyperbolas

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = \pm 1$$

are asymptotic to the lines

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 0$$

in the $xy$-plane. ■

## EXAMPLE 7 A Saddle Point

The **hyperbolic paraboloid**

$$\frac{y^2}{b^2} - \frac{x^2}{a^2} = \frac{z}{c}, \qquad c > 0 \tag{6}$$

has symmetry with respect to the planes $x = 0$ and $y = 0$ (Figure 12.54). The sections in these planes are

$$x = 0: \quad \text{the parabola } z = \frac{c}{b^2}y^2. \tag{7}$$

$$y = 0: \quad \text{the parabola } z = -\frac{c}{a^2}x^2. \tag{8}$$

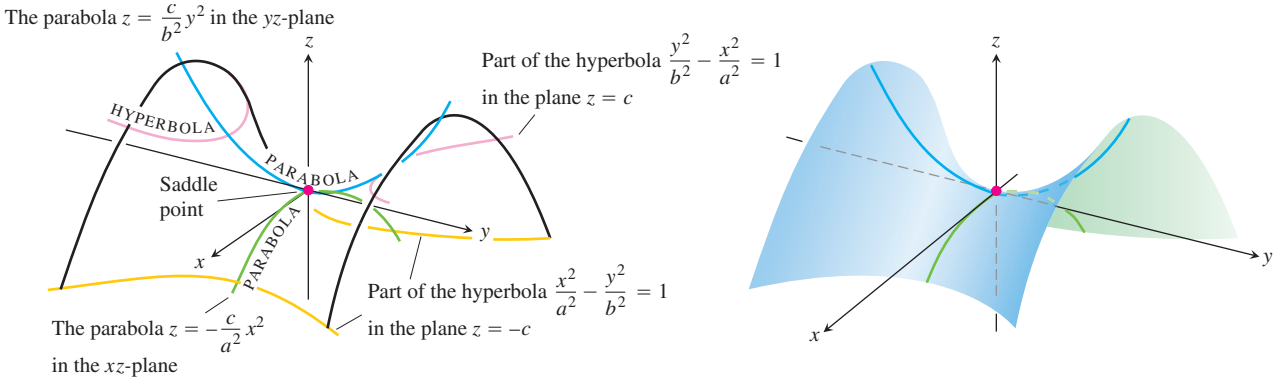

**FIGURE 12.54** The hyperbolic paraboloid $(y^2/b^2) - (x^2/a^2) = z/c$, $c > 0$. The cross-sections in planes perpendicular to the $z$-axis above and below the $xy$-plane are hyperbolas. The cross-sections in planes perpendicular to the other axes are parabolas.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

In the plane $x = 0$, the parabola opens upward from the origin. The parabola in the plane $y = 0$ opens downward.

If we cut the surface by a plane $z = z_0 > 0$, the section is a hyperbola,

$$\frac{y^2}{b^2} - \frac{x^2}{a^2} = \frac{z_0}{c},$$

with its focal axis parallel to the $y$-axis and its vertices on the parabola in Equation (7). If $z_0$ is negative, the focal axis is parallel to the $x$-axis and the vertices lie on the parabola in Equation (8).

Near the origin, the surface is shaped like a saddle or mountain pass. To a person traveling along the surface in the $yz$-plane the origin looks like a minimum. To a person traveling in the $xz$-plane the origin looks like a maximum. Such a point is called a **saddle point** of a surface. ■

### USING TECHNOLOGY Visualizing in Space

A CAS or other graphing utility can help in visualizing surfaces in space. It can draw traces in different planes, and many computer graphing systems can rotate a figure so you can see it as if it were a physical model you could turn in your hand. Hidden-line algorithms (see Exercise 74, Section 12.5) are used to block out portions of the surface that you would not see from your current viewing angle. A system may require surfaces to be entered in parametric form, as discussed in Section 16.6 (see also CAS Exercises 57 through 60 in Section 14.1). Sometimes you may have to manipulate the grid mesh to see all portions of a surface.

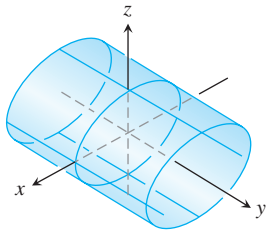
# EXERCISES 12.6

## Matching Equations with Surfaces



In Exercises 1–12, match the equation with the surface it defines. Also, identify each surface by type (paraboloid, ellipsoid, etc.) The surfaces are labeled (a)–(l).

1. $x^2 + y^2 + 4z^2 = 10$
2. $z^2 + 4y^2 - 4x^2 = 4$
3. $9y^2 + z^2 = 16$
4. $y^2 + z^2 = x^2$
5. $x = y^2 - z^2$
6. $x = -y^2 - z^2$
7. $x^2 + 2z^2 = 8$
8. $z^2 + x^2 - y^2 = 1$
9. $x = z^2 - y^2$
10. $z = -4x^2 - y^2$
11. $x^2 + 4z^2 = y^2$
12. $9x^2 + 4y^2 + 2z^2 = 36$

## Drawing

Sketch the surfaces in Exercises 13–76.

Exercises

### CYLINDERS

**13.** $x^2 + y^2 = 4$ **14.** $x^2 + z^2 = 4$

**15.** $z = y^2 - 1$ **16.** $x = y^2$

**17.** $x^2 + 4z^2 = 16$ **18.** $4x^2 + y^2 = 36$

**19.** $z^2 - y^2 = 1$ **20.** $yz = 1$

### ELLIPSOIDS

**21.** $9x^2 + y^2 + z^2 = 9$ **22.** $4x^2 + 4y^2 + z^2 = 16$

**23.** $4x^2 + 9y^2 + 4z^2 = 36$ **24.** $9x^2 + 4y^2 + 36z^2 = 36$

### PARABOLOIDS

**25.** $z = x^2 + 4y^2$ **26.** $z = x^2 + 9y^2$

**27.** $z = 8 - x^2 - y^2$ **28.** $z = 18 - x^2 - 9y^2$

**29.** $x = 4 - 4y^2 - z^2$ **30.** $y = 1 - x^2 - z^2$

### CONES

**31.** $x^2 + y^2 = z^2$ **32.** $y^2 + z^2 = x^2$

**33.** $4x^2 + 9z^2 = 9y^2$ **34.** $9x^2 + 4y^2 = 36z^2$

### HYPERBOLOIDS

**35.** $x^2 + y^2 - z^2 = 1$ **36.** $y^2 + z^2 - x^2 = 1$

**37.** $(y^2/4) + (z^2/9) - (x^2/4) = 1$

**38.** $(x^2/4) + (y^2/4) - (z^2/9) = 1$

**39.** $z^2 - x^2 - y^2 = 1$ **40.** $(y^2/4) - (x^2/4) - z^2 = 1$

**41.** $x^2 - y^2 - (z^2/4) = 1$ **42.** $(x^2/4) - y^2 - (z^2/4) = 1$

### HYPERBOLIC PARABOLOIDS

**43.** $y^2 - x^2 = z$ **44.** $x^2 - y^2 = z$

### ASSORTED

**45.** $x^2 + y^2 + z^2 = 4$ **46.** $4x^2 + 4y^2 = z^2$

**47.** $z = 1 + y^2 - x^2$ **48.** $y^2 - z^2 = 4$

**49.** $y = -(x^2 + z^2)$ **50.** $z^2 - 4x^2 - 4y^2 = 4$

**51.** $16x^2 + 4y^2 = 1$ **52.** $z = x^2 + y^2 + 1$

**53.** $x^2 + y^2 - z^2 = 4$ **54.** $x = 4 - y^2$

**55.** $x^2 + z^2 = y$ **56.** $z^2 - (x^2/4) - y^2 = 1$

**57.** $x^2 + z^2 = 1$ **58.** $4x^2 + 4y^2 + z^2 = 4$

**59.** $16y^2 + 9z^2 = 4x^2$ **60.** $z = x^2 - y^2 - 1$

**61.** $9x^2 + 4y^2 + z^2 = 36$ **62.** $4x^2 + 9z^2 = y^2$

**63.** $x^2 + y^2 - 16z^2 = 16$ **64.** $z^2 + 4y^2 = 9$

**65.** $z = -(x^2 + y^2)$ **66.** $y^2 - x^2 - z^2 = 1$

**67.** $x^2 - 4y^2 = 1$ **68.** $z = 4x^2 + y^2 - 4$

**69.** $4y^2 + z^2 - 4x^2 = 4$ **70.** $z = 1 - x^2$

**71.** $x^2 + y^2 = z$ **72.** $(x^2/4) + y^2 - z^2 = 1$

**73.** $yz = 1$ **74.** $36x^2 + 9y^2 + 4z^2 = 36$

**75.** $9x^2 + 16y^2 = 4z^2$ **76.** $4z^2 - x^2 - y^2 = 4$

## Theory and Examples

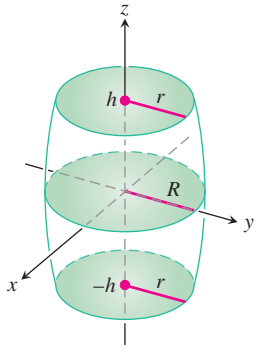
**77. a.** Express the area $A$ of the cross-section cut from the ellipsoid

$$x^2 + \frac{y^2}{4} + \frac{z^2}{9} = 1$$

by the plane $z = c$ as a function of $c$. (The area of an ellipse with semiaxes $a$ and $b$ is $\pi ab$.)

**b.** Use slices perpendicular to the $z$-axis to find the volume of the ellipsoid in part (a).

**c.** Now find the volume of the ellipsoid



$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1.$$

Does your formula give the volume of a sphere of radius $a$ if $a = b = c$?

**78.** The barrel shown here is shaped like an ellipsoid with equal pieces cut from the ends by planes perpendicular to the $z$-axis. The cross-sections perpendicular to the $z$-axis are circular. The

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

barrel is $2h$ units high, its midsection radius is $R$, and its end radii are both $r$. Find a formula for the barrel's volume. Then check two things. First, suppose the sides of the barrel are straightened to turn the barrel into a cylinder of radius $R$ and height $2h$. Does your formula give the cylinder's volume? Second, suppose $r = 0$ and $h = R$ so the barrel is a sphere. Does your formula give the sphere's volume?

**79.** Show that the volume of the segment cut from the paraboloid

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = \frac{z}{c}$$

by the plane $z = h$ equals half the segment's base times its altitude. (Figure 12.49 shows the segment for the special case $h = c$.)

**80.** **a.** Find the volume of the solid bounded by the hyperboloid

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$$

and the planes $z = 0$ and $z = h$, $h > 0$.

**b.** Express your answer in part (a) in terms of $h$ and the areas $A_0$ and $A_h$ of the regions cut by the hyperboloid from the planes $z = 0$ and $z = h$.

**c.** Show that the volume in part (a) is also given by the formula

$$V = \frac{h}{6}(A_0 + 4A_m + A_h),$$

where $A_m$ is the area of the region cut by the hyperboloid from the plane $z = h/2$.

**81.** If the hyperbolic paraboloid $(y^2/b^2) - (x^2/a^2) = z/c$ is cut by the plane $y = y_1$, the resulting curve is a parabola. Find its vertex and focus.

**82.** Suppose you set $z = 0$ in the equation

$$Ax^2 + By^2 + Cz^2 + Dxy + Eyz + Fxz + Gx + Hy + Jz + K = 0$$

to obtain a curve in the $xy$-plane. What will the curve be like? Give reasons for your answer.

**83.** Every time we found the trace of a quadric surface in a plane parallel to one of the coordinate planes, it turned out to be a conic section. Was this mere coincidence? Did it have to happen? Give reasons for your answer.

**84.** Suppose you intersect a quadric surface with a plane that is *not* parallel to one of the coordinate planes. What will the trace in the plane be like? Give reasons for your answer.

## T Computer Grapher Explorations

Plot the surfaces in Exercises 85–88 over the indicated domains. If you can, rotate the surface into different viewing positions.

**85.** $z = y^2, \quad -2 \le x \le 2, \quad -0.5 \le y \le 2$

**86.** $z = 1 - y^2, \quad -2 \le x \le 2, \quad -2 \le y \le 2$

**87.** $z = x^2 + y^2, \quad -3 \le x \le 3, \quad -3 \le y \le 3$

**88.** $z = x^2 + 2y^2$ over

**a.** $-3 \le x \le 3, \quad -3 \le y \le 3$

**b.** $-1 \le x \le 1, \quad -2 \le y \le 3$

**c.** $-2 \le x \le 2, \quad -2 \le y \le 2$

**d.** $-2 \le x \le 2, \quad -1 \le y \le 1$

### COMPUTER EXPLORATIONS

## Surface Plots

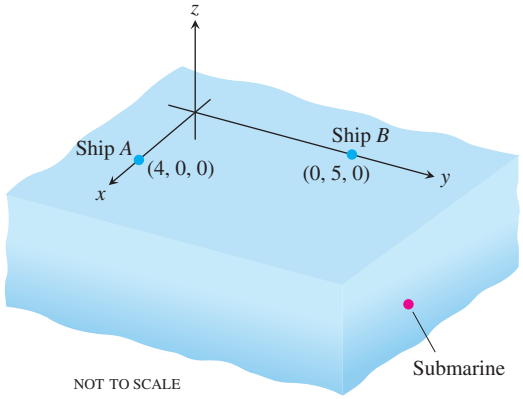
Use a CAS to plot the surfaces in Exercises 89–94. Identify the type of quadric surface from your graph.

**89.** $\frac{x^2}{9} + \frac{y^2}{36} = 1 - \frac{z^2}{25}$

**90.** $\frac{x^2}{9} - \frac{z^2}{9} = 1 - \frac{y^2}{16}$

**91.** $5x^2 = z^2 - 3y^2$

**92.** $\frac{y^2}{16} = 1 - \frac{x^2}{9} + z$



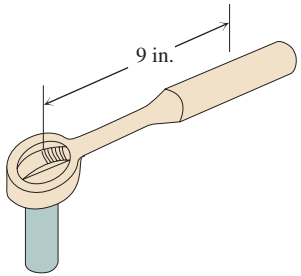
**93.** $\frac{x^2}{9} - 1 = \frac{y^2}{16} + \frac{z^2}{2}$

**94.** $y - \sqrt{4 - z^2} = 0$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

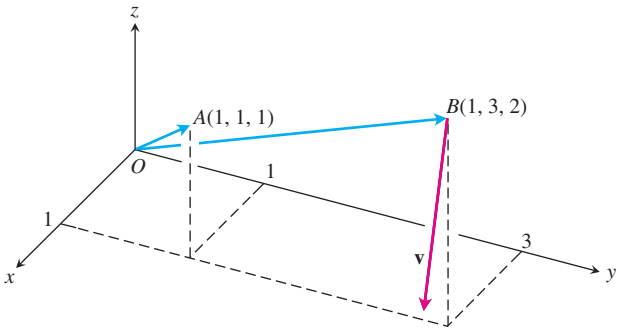
# Chapter 12 Additional and Advanced Exercises

**1. Submarine hunting** Two surface ships on maneuvers are trying to determine a submarine's course and speed to prepare for an aircraft intercept. As shown here, ship $A$ is located at $(4, 0, 0)$, whereas ship $B$ is located at $(0, 5, 0)$. All coordinates are given in thousands of feet. Ship $A$ locates the submarine in the direction of the vector $2\mathbf{i} + 3\mathbf{j} - (1/3)\mathbf{k}$, and ship $B$ locates it in the direction of the vector $18\mathbf{i} - 6\mathbf{j} - \mathbf{k}$. Four minutes ago, the submarine was located at $(2, -1, -1/3)$. The aircraft is due in 20 min. Assuming that the submarine moves in a straight line at a constant speed, to what position should the surface ships direct the aircraft?



**2. A helicopter rescue** Two helicopters, $H_1$ and $H_2$, are traveling together. At time $t = 0$, they separate and follow different straight-line paths given by

$$H_1: \quad x = 6 + 40t, \quad y = -3 + 10t, \quad z = -3 + 2t$$
$$H_2: \quad x = 6 + 110t, \quad y = -3 + 4t, \quad z = -3 + t.$$



Time $t$ is measured in hours and all coordinates are measured in miles. Due to system malfunctions, $H_2$ stops its flight at (446, 13, 1) and, in a negligible amount of time, lands at (446, 13, 0). Two hours later, $H_1$ is advised of this fact and heads toward $H_2$ at 150 mph. How long will it take $H_1$ to reach $H_2$?

**3. Torque** The operator's manual for the Toro® 21 in. lawnmower says "tighten the spark plug to 15 ft-lb (20.4 N · m)." If you are installing the plug with a 10.5-in. socket wrench that places the center of your hand 9 in. from the axis of the spark plug, about how hard should you pull? Answer in pounds.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**4. Rotating body** The line through the origin and the point $A(1, 1, 1)$ is the axis of rotation of a right body rotating with a constant angular speed of $3/2$ rad/sec. The rotation appears to be clockwise when we look toward the origin from $A$. Find the velocity $\mathbf{v}$ of the point of the body that is at the position $B(1, 3, 2)$.

**5. Determinants and planes**

**a.** Show that

$$\begin{vmatrix} x_1 - x & y_1 - y & z_1 - z \\ x_2 - x & y_2 - y & z_2 - z \\ x_3 - x & y_3 - y & z_3 - z \end{vmatrix} = 0$$

is an equation for the plane through the three noncollinear points $P_1(x_1, y_1, z_1)$, $P_2(x_2, y_2, z_2)$, and $P_3(x_3, y_3, z_3)$.

**b.** What set of points in space is described by the equation

$$\begin{vmatrix} x & y & z & 1 \\ x_1 & y_1 & z_1 & 1 \\ x_2 & y_2 & z_2 & 1 \\ x_3 & y_3 & z_3 & 1 \end{vmatrix} = 0?$$

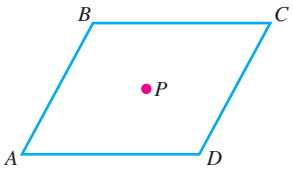
**6. Determinants and lines** Show that the lines

$$x = a_1 s + b_1, y = a_2 s + b_2, z = a_3 s + b_3, -\infty < s < \infty,$$

and

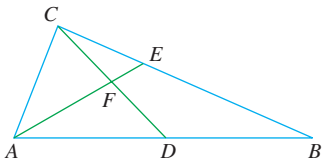
$$x = c_1 t + d_1, y = c_2 t + d_2, z = c_3 t + d_3, -\infty < t < \infty,$$

intersect or are parallel if and only if



$$\begin{vmatrix} a_1 & c_1 & b_1 - d_1 \\ a_2 & c_2 & b_2 - d_2 \\ a_3 & c_3 & b_3 - d_3 \end{vmatrix} = 0.$$

**7. Parallelogram** The accompanying figure shows parallelogram $ABCD$ and the midpoint $P$ of diagonal $BD$.



**a.** Express $\overrightarrow{BD}$ in terms of $\overrightarrow{AB}$ and $\overrightarrow{AD}$.

**b.** Express $\overrightarrow{AP}$ in terms of $\overrightarrow{AB}$ and $\overrightarrow{AD}$.

**c.** Prove that $P$ is also the midpoint of diagonal $AC$.

**8.** In the figure here, $D$ is the midpoint of side $AB$ of triangle $ABC$, and $E$ is one-third of the way between $C$ and $B$. Use vectors to prove that $F$ is the midpoint of line segment $CD$.

**9.** Use vectors to show that the distance from $P_1(x_1, y_1)$ to the line $ax + by = c$ is

$$d = \frac{|ax_1 + by_1 - c|}{\sqrt{a^2 + b^2}}.$$

**10. a.** Use vectors to show that the distance from $P_1(x_1, y_1, z_1)$ to the plane $Ax + By + Cz = D$ is

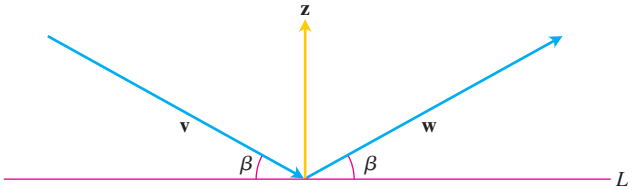
$$d = \frac{|Ax_1 + By_1 + Cz_1 - D|}{\sqrt{A^2 + B^2 + C^2}}.$$

**b.** Find an equation for the sphere that is tangent to the planes $x + y + z = 3$ and $x + y + z = 9$ if the planes $2x - y = 0$ and $3x - z = 0$ pass through the center of the sphere.

**11. a.** Show that the distance between the parallel planes $Ax + By + Cz = D_1$ and $Ax + By + Cz = D_2$ is

$$d = \frac{|D_1 - D_2|}{|A\mathbf{i} + B\mathbf{j} + C\mathbf{k}|}.$$

**b.** Find the distance between the planes $2x + 3y - z = 6$ and $2x + 3y - z = 12$.



**c.** Find an equation for the plane parallel to the plane $2x - y + 2z = -4$ if the point $(3, 2, -1)$ is equidistant from the two planes.

**d.** Write equations for the planes that lie parallel to and 5 units away from the plane $x - 2y + z = 3$.

**12.** Prove that four points $A$, $B$, $C$, and $D$ are coplanar (lie in a common plane) if and only if $\overrightarrow{AD} \cdot (\overrightarrow{AB} \times \overrightarrow{BC}) = 0$.

**13. The projection of a vector on a plane** Let $P$ be a plane in space and let $\mathbf{v}$ be a vector. The vector projection of $\mathbf{v}$ onto the plane $P$, $\text{proj}_P\mathbf{v}$, can be defined informally as follows. Suppose the sun is shining so that its rays are normal to the plane $P$. Then $\text{proj}_P\mathbf{v}$ is the "shadow" of $\mathbf{v}$ onto $P$. If $P$ is the plane $x + 2y + 6z = 6$ and $\mathbf{v} = \mathbf{i} + \mathbf{j} + \mathbf{k}$, find $\text{proj}_P\mathbf{v}$.

**14.** The accompanying figure shows nonzero vectors $\mathbf{v}$, $\mathbf{w}$, and $\mathbf{z}$, with $\mathbf{z}$ orthogonal to the line $L$, and $\mathbf{v}$ and $\mathbf{w}$ making equal angles $\beta$ with $L$. Assuming $|\mathbf{v}| = |\mathbf{w}|$, find $\mathbf{w}$ in terms of $\mathbf{v}$ and $\mathbf{z}$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**15. Triple vector products** The *triple vector products* $(\mathbf{u} \times \mathbf{v}) \times \mathbf{w}$ and $\mathbf{u} \times (\mathbf{v} \times \mathbf{w})$ are usually not equal, although the formulas for evaluating them from components are similar:

$$(\mathbf{u} \times \mathbf{v}) \times \mathbf{w} = (\mathbf{u} \cdot \mathbf{w})\mathbf{v} - (\mathbf{v} \cdot \mathbf{w})\mathbf{u}.$$
$$\mathbf{u} \times (\mathbf{v} \times \mathbf{w}) = (\mathbf{u} \cdot \mathbf{w})\mathbf{v} - (\mathbf{u} \cdot \mathbf{v})\mathbf{w}.$$

Verify each formula for the following vectors by evaluating its two sides and comparing the results.

| | $\mathbf{u}$ | $\mathbf{v}$ | $\mathbf{w}$ |
|---|---|---|---|
| **a.** | $2\mathbf{i}$ | $2\mathbf{j}$ | $2\mathbf{k}$ |
| **b.** | $\mathbf{i} - \mathbf{j} + \mathbf{k}$ | $2\mathbf{i} + \mathbf{j} - 2\mathbf{k}$ | $-\mathbf{i} + 2\mathbf{j} - \mathbf{k}$ |
| **c.** | $2\mathbf{i} + \mathbf{j}$ | $2\mathbf{i} - \mathbf{j} + \mathbf{k}$ | $\mathbf{i} + 2\mathbf{k}$ |
| **d.** | $\mathbf{i} + \mathbf{j} - 2\mathbf{k}$ | $-\mathbf{i} - \mathbf{k}$ | $2\mathbf{i} + 4\mathbf{j} - 2\mathbf{k}$ |

**16. Cross and dot products** Show that if $\mathbf{u}$, $\mathbf{v}$, $\mathbf{w}$, and $\mathbf{r}$ are any vectors, then

**a.** $\mathbf{u} \times (\mathbf{v} \times \mathbf{w}) + \mathbf{v} \times (\mathbf{w} \times \mathbf{u}) + \mathbf{w} \times (\mathbf{u} \times \mathbf{v}) = \mathbf{0}$

**b.** $\mathbf{u} \times \mathbf{v} = (\mathbf{u} \cdot \mathbf{v} \times \mathbf{i})\mathbf{i} + (\mathbf{u} \cdot \mathbf{v} \times \mathbf{j})\mathbf{j} + (\mathbf{u} \cdot \mathbf{v} \times \mathbf{k})\mathbf{k}$

**c.** $(\mathbf{u} \times \mathbf{v}) \cdot (\mathbf{w} \times \mathbf{r}) = \begin{vmatrix} \mathbf{u} \cdot \mathbf{w} & \mathbf{v} \cdot \mathbf{w} \\ \mathbf{u} \cdot \mathbf{r} & \mathbf{v} \cdot \mathbf{r} \end{vmatrix}$.

**17. Cross and dot products** Prove or disprove the formula

$$\mathbf{u} \times (\mathbf{u} \times (\mathbf{u} \times \mathbf{v})) \cdot \mathbf{w} = -|\mathbf{u}|^2 \mathbf{u} \cdot \mathbf{v} \times \mathbf{w}.$$

**18.** By forming the cross product of two appropriate vectors, derive the trigonometric identity

$$\sin(A - B) = \sin A \cos B - \cos A \sin B.$$

**19.** Use vectors to prove that

$$(a^2 + b^2)(c^2 + d^2) \geq (ac + bd)^2$$

for any four numbers $a$, $b$, $c$, and $d$. (*Hint:* Let $\mathbf{u} = a\mathbf{i} + b\mathbf{j}$ and $\mathbf{v} = c\mathbf{i} + d\mathbf{j}$.)

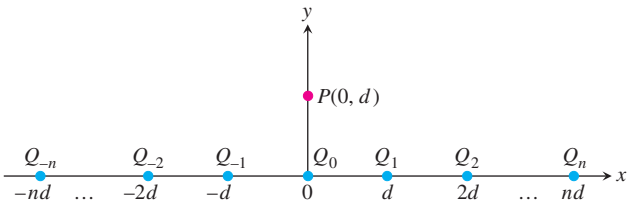
**20.** Suppose that vectors $\mathbf{u}$ and $\mathbf{v}$ are not parallel and that $\mathbf{u} = \mathbf{w} + \mathbf{r}$, where $\mathbf{w}$ is parallel to $\mathbf{v}$ and $\mathbf{r}$ is orthogonal to $\mathbf{v}$. Express $\mathbf{w}$ and $\mathbf{r}$ in terms of $\mathbf{u}$ and $\mathbf{v}$.

**21.** Show that $|\mathbf{u} + \mathbf{v}| \leq |\mathbf{u}| + |\mathbf{v}|$ for any vectors $\mathbf{u}$ and $\mathbf{v}$.

**22.** Show that $\mathbf{w} = |\mathbf{v}|\mathbf{u} + |\mathbf{u}|\mathbf{v}$ bisects the angle between $\mathbf{u}$ and $\mathbf{v}$.

**23.** Show that $|\mathbf{v}|\mathbf{u} + |\mathbf{u}|\mathbf{v}$ and $|\mathbf{v}|\mathbf{u} - |\mathbf{u}|\mathbf{v}$ are orthogonal.

**24. Dot multiplication is positive definite** Show that dot multiplication of vectors is *positive definite*; that is, show that $\mathbf{u} \cdot \mathbf{u} \geq 0$ for every vector $\mathbf{u}$ and that $\mathbf{u} \cdot \mathbf{u} = 0$ if and only if $\mathbf{u} = \mathbf{0}$.



**25. Point masses and gravitation** In physics, the law of gravitation says that if $P$ and $Q$ are (point) masses with mass $M$ and $m$, respectively, then $P$ is attracted to $Q$ by the force

$$\mathbf{F} = \frac{GMm\mathbf{r}}{|\mathbf{r}|^3},$$

where $\mathbf{r}$ is the vector from $P$ to $Q$ and $G$ is the universal gravitational constant. Moreover, if $Q_1, \ldots, Q_k$ are (point) masses with mass $m_1, \ldots, m_k$, respectively, then the force on $P$ due to all the $Q_i$'s is

$$\mathbf{F} = \sum_{i=1}^{k} \frac{GMm_i}{|\mathbf{r}_i|^3}\mathbf{r}_i,$$

where $\mathbf{r}_i$ is the vector from $P$ to $Q_i$.

**a.** Let point $P$ with mass $M$ be located at the point $(0, d)$, $d > 0$, in the coordinate plane. For $i = -n, -n+1, \ldots, -1, 0, 1, \ldots, n$, let $Q_i$ be located at the point $(id, 0)$ and have mass $mi$. Find the magnitude of the gravitational force on $P$ due to all the $Q_i$'s.

**b.** Is the limit as $n \to \infty$ of the magnitude of the force on $P$ finite? Why, or why not?

**26. Relativistic sums** Einstein's special theory of relativity roughly says that with respect to a reference frame (coordinate system) no material object can travel as fast as $c$, the speed of light. So, if $\vec{x}$ and $\vec{y}$ are two velocities such that $|\vec{x}| < c$ and $|\vec{y}| < c$, then the *relativistic sum* $\vec{x} \oplus \vec{y}$ of $\vec{x}$ and $\vec{y}$ must have length less than $c$. Einstein's special theory of relativity says that

$$\vec{x} \oplus \vec{y} = \frac{\vec{x} + \vec{y}}{1 + \dfrac{\vec{x} \cdot \vec{y}}{c^2}} + \frac{1}{c^2} \cdot \frac{\gamma_x}{\gamma_x + 1} \cdot \frac{\vec{x} \times (\vec{x} \times \vec{y})}{1 + \dfrac{\vec{x} \cdot \vec{y}}{c^2}},$$

where

$$\gamma_x = \frac{1}{\sqrt{1 - \dfrac{\vec{x} \cdot \vec{x}}{c^2}}}.$$

It can be shown that if $|\vec{x}| < c$ and $|\vec{y}| < c$, then $|\vec{x} \oplus \vec{y}| < c$. This exercise deals with two special cases.

**a.** Prove that if $\vec{x}$ and $\vec{y}$ are orthogonal, $|\vec{x}| < c$, $|\vec{y}| < c$, then $|\vec{x} \oplus \vec{y}| < c$.

**b.** Prove that if $\vec{x}$ and $\vec{y}$ are parallel, $|\vec{x}| < c$, $|\vec{y}| < c$, then $|\vec{x} \oplus \vec{y}| < c$.

**c.** Compute $\lim_{c \to \infty} \vec{x} \oplus \vec{y}$.

# Chapter 12 Practice Exercises

## Vector Calculations in Two Dimensions

In Exercises 1–4, let $\mathbf{u} = \langle -3, 4\rangle$ and $\mathbf{v} = \langle 2, -5\rangle$. Find **(a)** the component form of the vector and **(b)** its magnitude.

**1.** $3\mathbf{u} - 4\mathbf{v}$ **2.** $\mathbf{u} + \mathbf{v}$

**3.** $-2\mathbf{u}$ **4.** $5\mathbf{v}$

In Exercises 5–8, find the component form of the vector.

**5.** The vector obtained by rotating $\langle 0, 1\rangle$ through an angle of $2\pi/3$ radians

**6.** The unit vector that makes an angle of $\pi/6$ radian with the positive $x$-axis

**7.** The vector 2 units long in the direction $4\mathbf{i} - \mathbf{j}$

**8.** The vector 5 units long in the direction opposite to the direction of $(3/5)\mathbf{i} + (4/5)\mathbf{j}$

Express the vectors in Exercises 9–12 in terms of their lengths and directions.

**9.** $\sqrt{2}\mathbf{i} + \sqrt{2}\mathbf{j}$ **10.** $-\mathbf{i} - \mathbf{j}$

**11.** Velocity vector $\mathbf{v} = (-2\sin t)\mathbf{i} + (2\cos t)\mathbf{j}$ when $t = \pi/2$.

**12.** Velocity vector $\mathbf{v} = (e^t\cos t - e^t\sin t)\mathbf{i} + (e^t\sin t + e^t\cos t)\mathbf{j}$ when $t = \ln 2$.

## Vector Calculations in Three Dimensions

Express the vectors in Exercises 13 and 14 in terms of their lengths and directions.

**13.** $2\mathbf{i} - 3\mathbf{j} + 6\mathbf{k}$ **14.** $\mathbf{i} + 2\mathbf{j} - \mathbf{k}$

**15.** Find a vector 2 units long in the direction of $\mathbf{v} = 4\mathbf{i} - \mathbf{j} + 4\mathbf{k}$.

**16.** Find a vector 5 units long in the direction opposite to the direction of $\mathbf{v} = (3/5)\mathbf{i} + (4/5)\mathbf{k}$.

In Exercises 17 and 18, find $|\mathbf{v}|$, $|\mathbf{u}|$, $\mathbf{v}\cdot\mathbf{u}$, $\mathbf{u}\cdot\mathbf{v}$, $\mathbf{v}\times\mathbf{u}$, $\mathbf{u}\times\mathbf{v}$, $|\mathbf{v}\times\mathbf{u}|$, the angle between $\mathbf{v}$ and $\mathbf{u}$, the scalar component of $\mathbf{u}$ in the direction of $\mathbf{v}$, and the vector projection of $\mathbf{u}$ onto $\mathbf{v}$.

**17.** $\mathbf{v} = \mathbf{i} + \mathbf{j}$, $\mathbf{u} = 2\mathbf{i} + \mathbf{j} - 2\mathbf{k}$

**18.** $\mathbf{v} = \mathbf{i} + \mathbf{j} + 2\mathbf{k}$, $\mathbf{u} = -\mathbf{i} - \mathbf{k}$

In Exercises 19 and 20, write $\mathbf{u}$ as the sum of a vector parallel to $\mathbf{v}$ and a vector orthogonal to $\mathbf{v}$.

**19.** $\mathbf{v} = 2\mathbf{i} + \mathbf{j} - \mathbf{k}$, $\mathbf{u} = \mathbf{i} + \mathbf{j} - 5\mathbf{k}$

**20.** $\mathbf{u} = \mathbf{i} - 2\mathbf{j}$, $\mathbf{v} = \mathbf{i} + \mathbf{j} + \mathbf{k}$

In Exercises 21 and 22, draw coordinate axes and then sketch $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{u}\times\mathbf{v}$ as vectors at the origin.

**21.** $\mathbf{u} = \mathbf{i}$, $\mathbf{v} = \mathbf{i} + \mathbf{j}$ **22.** $\mathbf{u} = \mathbf{i} - \mathbf{j}$, $\mathbf{v} = \mathbf{i} + \mathbf{j}$

**23.** If $|\mathbf{v}| = 2$, $|\mathbf{w}| = 3$, and the angle between $\mathbf{v}$ and $\mathbf{w}$ is $\pi/3$, find $|\mathbf{v} - 2\mathbf{w}|$.

**24.** For what value or values of $a$ will the vectors $\mathbf{u} = 2\mathbf{i} + 4\mathbf{j} - 5\mathbf{k}$ and $\mathbf{v} = -4\mathbf{i} - 8\mathbf{j} + a\mathbf{k}$ be parallel?

In Exercises 25 and 26, find **(a)** the area of the parallelogram determined by vectors $\mathbf{u}$ and $\mathbf{v}$ and **(b)** the volume of the parallelepiped determined by the vectors $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$.

**25.** $\mathbf{u} = \mathbf{i} + \mathbf{j} - \mathbf{k}$, $\mathbf{v} = 2\mathbf{i} + \mathbf{j} + \mathbf{k}$, $\mathbf{w} = -\mathbf{i} - 2\mathbf{j} + 3\mathbf{k}$

**26.** $\mathbf{u} = \mathbf{i} + \mathbf{j}$, $\mathbf{v} = \mathbf{j}$, $\mathbf{w} = \mathbf{i} + \mathbf{j} + \mathbf{k}$

## Lines, Planes, and Distances

**27.** Suppose that $\mathbf{n}$ is normal to a plane and that $\mathbf{v}$ is parallel to the plane. Describe how you would find a vector $\mathbf{n}$ that is both perpendicular to $\mathbf{v}$ and parallel to the plane.

**28.** Find a vector in the plane parallel to the line $ax + by = c$.

In Exercises 29 and 30, find the distance from the point to the line.

**29.** $(2, 2, 0)$; $x = -t$, $y = t$, $z = -1 + t$

**30.** $(0, 4, 1)$; $x = 2 + t$, $y = 2 + t$, $z = t$

**31.** Parametrize the line that passes through the point $(1, 2, 3)$ parallel to the vector $\mathbf{v} = -3\mathbf{i} + 7\mathbf{k}$.

**32.** Parametrize the line segment joining the points $P(1, 2, 0)$ and $Q(1, 3, -1)$.

In Exercises 33 and 34, find the distance from the point to the plane.

**33.** $(6, 0, -6)$, $x - y = 4$

**34.** $(3, 0, 10)$, $2x + 3y + z = 2$

**35.** Find an equation for the plane that passes through the point $(3, -2, 1)$ normal to the vector $\mathbf{n} = 2\mathbf{i} + \mathbf{j} + \mathbf{k}$.

**36.** Find an equation for the plane that passes through the point $(-1, 6, 0)$ perpendicular to the line $x = -1 + t, y = 6 - 2t, z = 3t$.

In Exercises 37 and 38, find an equation for the plane through points $P$, $Q$, and $R$.

**37.** $P(1, -1, 2)$, $Q(2, 1, 3)$, $R(-1, 2, -1)$

**38.** $P(1, 0, 0)$, $Q(0, 1, 0)$, $R(0, 0, 1)$

**39.** Find the points in which the line $x = 1 + 2t, y = -1 - t, z = 3t$ meets the three coordinate planes.

**40.** Find the point in which the line through the origin perpendicular to the plane $2x - y - z = 4$ meets the plane $3x - 5y + 2z = 6$.

**41.** Find the acute angle between the planes $x = 7$ and $x + y + \sqrt{2}z = -3$.

**42.** Find the acute angle between the planes $x + y = 1$ and $y + z = 1$.

**43.** Find parametric equations for the line in which the planes $x + 2y + z = 1$ and $x - y + 2z = -8$ intersect.

**44.** Show that the line in which the planes

$$x + 2y - 2z = 5 \quad \text{and} \quad 5x - 2y - z = 0$$

intersect is parallel to the line

$$x = -3 + 2t, \quad y = 3t, \quad z = 1 + 4t.$$

**45.** The planes $3x + 6z = 1$ and $2x + 2y - z = 3$ intersect in a line.

**a.** Show that the planes are orthogonal.

**b.** Find equations for the line of intersection.

**46.** Find an equation for the plane that passes through the point $(1, 2, 3)$ parallel to $\mathbf{u} = 2\mathbf{i} + 3\mathbf{j} + \mathbf{k}$ and $\mathbf{v} = \mathbf{i} - \mathbf{j} + 2\mathbf{k}$.

**47.** Is $\mathbf{v} = 2\mathbf{i} - 4\mathbf{j} + \mathbf{k}$ related in any special way to the plane $2x + y = 5$? Give reasons for your answer.

**48.** The equation $\mathbf{n} \cdot \overrightarrow{P_0P} = 0$ represents the plane through $P_0$ normal to $\mathbf{n}$. What set does the inequality $\mathbf{n} \cdot \overrightarrow{P_0P} > 0$ represent?

**49.** Find the distance from the point $P(1, 4, 0)$ to the plane through $A(0, 0, 0)$, $B(2, 0, -1)$ and $C(2, -1, 0)$.

**50.** Find the distance from the point $(2, 2, 3)$ to the plane $2x + 3y + 5z = 0$.

**51.** Find a vector parallel to the plane $2x - y - z = 4$ and orthogonal to $\mathbf{i} + \mathbf{j} + \mathbf{k}$.

**52.** Find a unit vector orthogonal to $\mathbf{A}$ in the plane of $\mathbf{B}$ and $\mathbf{C}$ if $\mathbf{A} = 2\mathbf{i} - \mathbf{j} + \mathbf{k}$, $\mathbf{B} = \mathbf{i} + 2\mathbf{j} + \mathbf{k}$, and $\mathbf{C} = \mathbf{i} + \mathbf{j} - 2\mathbf{k}$.

**53.** Find a vector of magnitude 2 parallel to the line of intersection of the planes $x + 2y + z - 1 = 0$ and $x - y + 2z + 7 = 0$.

**54.** Find the point in which the line through the origin perpendicular to the plane $2x - y - z = 4$ meets the plane $3x - 5y + 2z = 6$.

**55.** Find the point in which the line through $P(3, 2, 1)$ normal to the plane $2x - y + 2z = -2$ meets the plane.

**56.** What angle does the line of intersection of the planes $2x + y - z = 0$ and $x + y + 2z = 0$ make with the positive $x$-axis?

**57.** The line

$$L: \quad x = 3 + 2t, \quad y = 2t, \quad z = t$$

intersects the plane $x + 3y - z = -4$ in a point $P$. Find the coordinates of $P$ and find equations for the line in the plane through $P$ perpendicular to $L$.

**58.** Show that for every real number $k$ the plane

$$x - 2y + z + 3 + k(2x - y - z + 1) = 0$$

contains the line of intersection of the planes

$$x - 2y + z + 3 = 0 \quad \text{and} \quad 2x - y - z + 1 = 0.$$

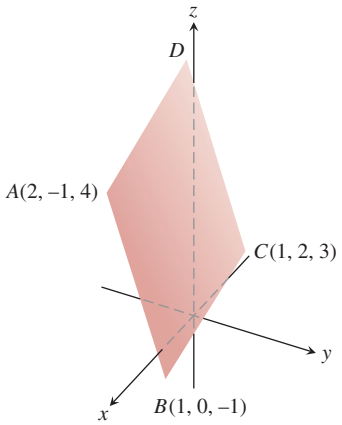
**59.** Find an equation for the plane through $A(-2, 0, -3)$ and $B(1, -2, 1)$ that lies parallel to the line through $C(-2, -13/5, 26/5)$ and $D(16/5, -13/5, 0)$.

**60.** Is the line $x = 1 + 2t, y = -2 + 3t, z = -5t$ related in any way to the plane $-4x - 6y + 10z = 9$? Give reasons for your answer.

**61.** Which of the following are equations for the plane through the points $P(1, 1, -1)$, $Q(3, 0, 2)$, and $R(-2, 1, 0)$?

**a.** $(2\mathbf{i} - 3\mathbf{j} + 3\mathbf{k}) \cdot ((x + 2)\mathbf{i} + (y - 1)\mathbf{j} + z\mathbf{k}) = 0$

**b.** $x = 3 - t$, $y = -11t$, $z = 2 - 3t$



**c.** $(x + 2) + 11(y - 1) = 3z$

**d.** $(2\mathbf{i} - 3\mathbf{j} + 3\mathbf{k}) \times ((x + 2)\mathbf{i} + (y - 1)\mathbf{j} + z\mathbf{k}) = \mathbf{0}$

**e.** $(2\mathbf{i} - \mathbf{j} + 3\mathbf{k}) \times (-3\mathbf{i} + \mathbf{k}) \cdot ((x + 2)\mathbf{i} + (y - 1)\mathbf{j} + z\mathbf{k}) = 0$

**62.** The parallelogram shown on page 902 has vertices at $A(2, -1, 4)$, $B(1, 0, -1)$, $C(1, 2, 3)$, and $D$. Find

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**a.** the coordinates of $D$,

**b.** the cosine of the interior angle at $B$,

**c.** the vector projection of $\overrightarrow{BA}$ onto $\overrightarrow{BC}$,

**d.** the area of the parallelogram,

**e.** an equation for the plane of the parallelogram,

**f.** the areas of the orthogonal projections of the parallelogram on the three coordinate planes.

**63. Distance between lines** Find the distance between the line $L_1$ through the points $A(1, 0, -1)$ and $B(-1, 1, 0)$ and the line $L_2$ through the points $C(3, 1, -1)$ and $D(4, 5, -2)$. The distance is to be measured along the line perpendicular to the two lines. First find a vector $\mathbf{n}$ perpendicular to both lines. Then project $\overrightarrow{AC}$ onto $\mathbf{n}$.

**64.** (*Continuation of Exercise 63.*) Find the distance between the line through $A(4, 0, 2)$ and $B(2, 4, 1)$ and the line through $C(1, 3, 2)$ and $D(2, 2, 4)$.

## Quadric Surfaces

Identify and sketch the surfaces in Exercises 65–76.

**65.** $x^2 + y^2 + z^2 = 4$

**66.** $x^2 + (y - 1)^2 + z^2 = 1$

**67.** $4x^2 + 4y^2 + z^2 = 4$

**68.** $36x^2 + 9y^2 + 4z^2 = 36$

**69.** $z = -(x^2 + y^2)$

**70.** $y = -(x^2 + z^2)$

**71.** $x^2 + y^2 = z^2$

**72.** $x^2 + z^2 = y^2$

**73.** $x^2 + y^2 - z^2 = 4$

**74.** $4y^2 + z^2 - 4x^2 = 4$

**75.** $y^2 - x^2 - z^2 = 1$

**76.** $z^2 - x^2 - y^2 = 1$

# Chapter 12 Questions to Guide Your Review

1. When do directed line segments in the plane represent the same vector?
2. How are vectors added and subtracted geometrically? Algebraically?
3. How do you find a vector's magnitude and direction?
4. If a vector is multiplied by a positive scalar, how is the result related to the original vector? What if the scalar is zero? Negative?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

5. Define the *dot product* (*scalar product*) of two vectors. Which algebraic laws are satisfied by dot products? Give examples. When is the dot product of two vectors equal to zero?
6. What geometric interpretation does the dot product have? Give examples.
7. What is the vector projection of a vector **u** onto a vector **v**? How do you write **u** as the sum of a vector parallel to **v** and a vector orthogonal to **v**?
8. Define the *cross product* (*vector product*) of two vectors. Which algebraic laws are satisfied by cross products, and which are not? Give examples. When is the cross product of two vectors equal to zero?
9. What geometric or physical interpretations do cross products have? Give examples.
10. What is the determinant formula for calculating the cross product of two vectors relative to the Cartesian **i**, **j**, **k**-coordinate system? Use it in an example.
11. How do you find equations for lines, line segments, and planes in space? Give examples. Can you express a line in space by a single equation? A plane?
12. How do you find the distance from a point to a line in space? From a point to a plane? Give examples.
13. What are box products? What significance do they have? How are they evaluated? Give an example.
14. How do you find equations for spheres in space? Give examples.
15. How do you find the intersection of two lines in space? A line and a plane? Two planes? Give examples.
16. What is a cylinder? Give examples of equations that define cylinders in Cartesian coordinates.
17. What are quadric surfaces? Give examples of different kinds of ellipsoids, paraboloids, cones, and hyperboloids (equations and sketches).

Chapter

13

# Vector-Valued Functions and Motion in Space

**OVERVIEW** When a body (or object) travels through space, the equations $x = f(t)$, $y = g(t)$, and $z = h(t)$ that give the body's coordinates as functions of time serve as parametric equations for the body's motion and path. With vector notation, we can condense these into a single equation $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$ that gives the body's position as a vector function of time. For an object moving in the $xy$-plane, the component function $h(t)$ is zero for all time (that is, identically zero).

In this chapter, we use calculus to study the paths, velocities, and accelerations of moving bodies. As we go along, we will see how our work answers the standard questions about the paths and motions of projectiles, planets, and satellites. In the final section, we use our new vector calculus to derive Kepler's laws of planetary motion from Newton's laws of motion and gravitation.

## 13.1 Vector Functions

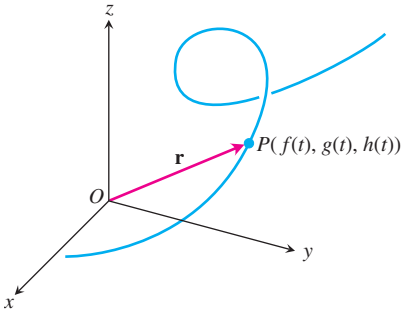

**FIGURE 13.1** The position vector $\mathbf{r} = \overrightarrow{OP}$ of a particle moving through space is a function of time.

When a particle moves through space during a time interval $I$, we think of the particle's coordinates as functions defined on $I$:

$$x = f(t), \qquad y = g(t), \qquad z = h(t), \qquad t \in I. \tag{1}$$

The points $(x, y, z) = (f(t), g(t), h(t))$, $t \in I$, make up the **curve** in space that we call the particle's **path**. The equations and interval in Equation (1) **parametrize** the curve. A curve in space can also be represented in vector form. The vector

$$\mathbf{r}(t) = \overrightarrow{OP} = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k} \tag{2}$$

from the origin to the particle's **position** $P(f(t), g(t), h(t))$ at time $t$ is the particle's **position vector** (Figure 13.1). The functions $f$, $g$, and $h$ are the **component functions (components)** of the position vector. We think of the particle's path as the **curve traced by r** during the time interval $I$. Figure 13.2 displays several space curves generated by a computer graphing program. It would not be easy to plot these curves by hand.

Equation (2) defines $\mathbf{r}$ as a vector function of the real variable $t$ on the interval $I$. More generally, a **vector function** or **vector-valued function** on a domain set $D$ is a rule that assigns a vector in space to each element in $D$. For now, the domains will be intervals of real numbers resulting in a space curve. Later, in Chapter 16, the domains will be regions

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

in the plane. Vector functions will then represent surfaces in space. Vector functions on a domain in the plane or space also give rise to "vector fields," which are important to the study of the flow of a fluid, gravitational fields, and electromagnetic phenomena. We investigate vector fields and their applications in Chapter 16.

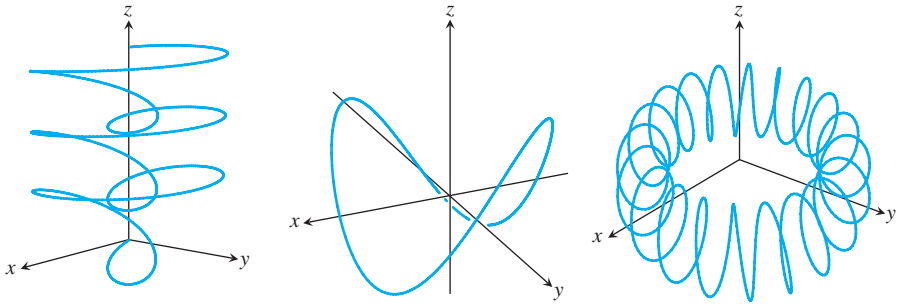

**FIGURE 13.2** Computer-generated space curves are defined by the position vectors $\mathbf{r}(t)$.

We refer to real-valued functions as **scalar functions** to distinguish them from vector functions. The components of $\mathbf{r}$ are scalar functions of $t$. When we define a vector-valued function by giving its component functions, we assume the vector function's domain to be the common domain of the components.

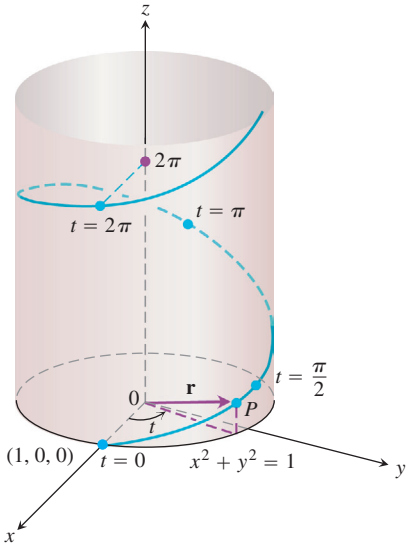

**FIGURE 13.3** The upper half of the helix $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + t\mathbf{k}$ (Example 1).

## EXAMPLE 1 Graphing a Helix

Graph the vector function

$$\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + t\mathbf{k}.$$

**Solution** The vector function

$$\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + t\mathbf{k}$$

is defined for all real values of $t$. The curve traced by $\mathbf{r}$ is a helix (from an old Greek word for "spiral") that winds around the circular cylinder $x^2 + y^2 = 1$ (Figure 13.3). The curve lies on the cylinder because the $\mathbf{i}$- and $\mathbf{j}$-components of $\mathbf{r}$, being the $x$- and $y$-coordinates of the tip of $\mathbf{r}$, satisfy the cylinder's equation:

$$x^2 + y^2 = (\cos t)^2 + (\sin t)^2 = 1.$$

The curve rises as the $\mathbf{k}$-component $z = t$ increases. Each time $t$ increases by $2\pi$, the curve completes one turn around the cylinder. The equations

$$x = \cos t, \qquad y = \sin t, \qquad z = t$$

parametrize the helix, the interval $-\infty < t < \infty$ being understood. You will find more helices in Figure 13.4. ■

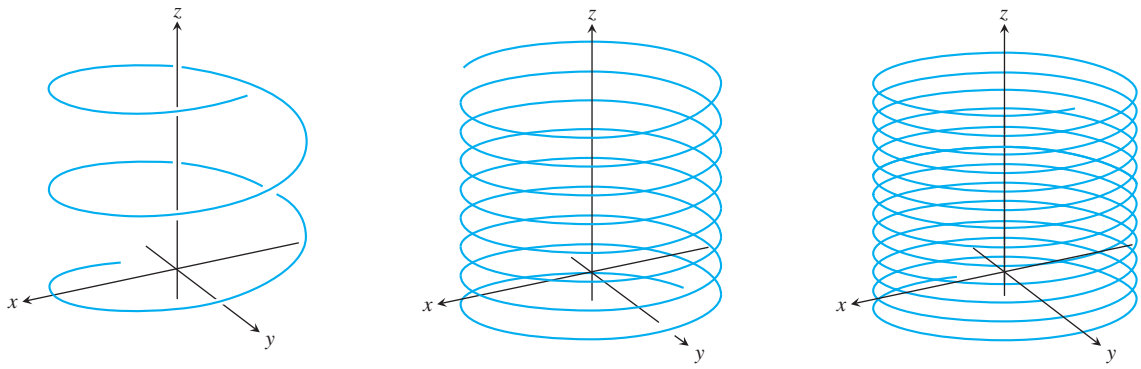

**FIGURE 13.4** Helices drawn by computer.

## Limits and Continuity

The way we define limits of vector-valued functions is similar to the way we define limits of real-valued functions.

**DEFINITION Limit of Vector Functions**

Let $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$ be a vector function and $\mathbf{L}$ a vector. We say that $\mathbf{r}$ has **limit** $\mathbf{L}$ as $t$ approaches $t_0$ and write

$$\lim_{t \to t_0} \mathbf{r}(t) = \mathbf{L}$$

if, for every number $\epsilon > 0$, there exists a corresponding number $\delta > 0$ such that for all $t$

$$0 < |t - t_0| < \delta \quad \Rightarrow \quad |\mathbf{r}(t) - \mathbf{L}| < \epsilon.$$

If $\mathbf{L} = L_1\mathbf{i} + L_2\mathbf{j} + L_3\mathbf{k}$, then $\lim_{t \to t_0} \mathbf{r}(t) = \mathbf{L}$ precisely when

$$\lim_{t \to t_0} f(t) = L_1, \qquad \lim_{t \to t_0} g(t) = L_2, \qquad \text{and} \qquad \lim_{t \to t_0} h(t) = L_3.$$

The equation

$$\lim_{t \to t_0} \mathbf{r}(t) = \left(\lim_{t \to t_0} f(t)\right)\mathbf{i} + \left(\lim_{t \to t_0} g(t)\right)\mathbf{j} + \left(\lim_{t \to t_0} h(t)\right)\mathbf{k} \tag{3}$$

provides a practical way to calculate limits of vector functions.

**EXAMPLE 2** Finding Limits of Vector Functions

If $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + t\mathbf{k}$, then

$$\begin{aligned}\lim_{t \to \pi/4} \mathbf{r}(t) &= \left(\lim_{t \to \pi/4} \cos t\right)\mathbf{i} + \left(\lim_{t \to \pi/4} \sin t\right)\mathbf{j} + \left(\lim_{t \to \pi/4} t\right)\mathbf{k} \\ &= \frac{\sqrt{2}}{2}\mathbf{i} + \frac{\sqrt{2}}{2}\mathbf{j} + \frac{\pi}{4}\mathbf{k}.\end{aligned}$$

■

We define continuity for vector functions the same way we define continuity for scalar functions.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**DEFINITION Continuous at a Point**

A vector function $\mathbf{r}(t)$ is **continuous at a point** $t = t_0$ in its domain if $\lim_{t \to t_0} \mathbf{r}(t) = \mathbf{r}(t_0)$. The function is **continuous** if it is continuous at every point in its domain.

From Equation (3), we see that $\mathbf{r}(t)$ is continuous at $t = t_0$ if and only if each component function is continuous there.

**EXAMPLE 3** Continuity of Space Curves

**(a)** All the space curves shown in Figures 13.2 and 13.4 are continuous because their component functions are continuous at every value of $t$ in $(-\infty, \infty)$.

**(b)** The function

$$\mathbf{g}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + \lfloor t \rfloor \mathbf{k}$$

is discontinuous at every integer, where the greatest integer function $\lfloor t \rfloor$ is discontinuous. ■

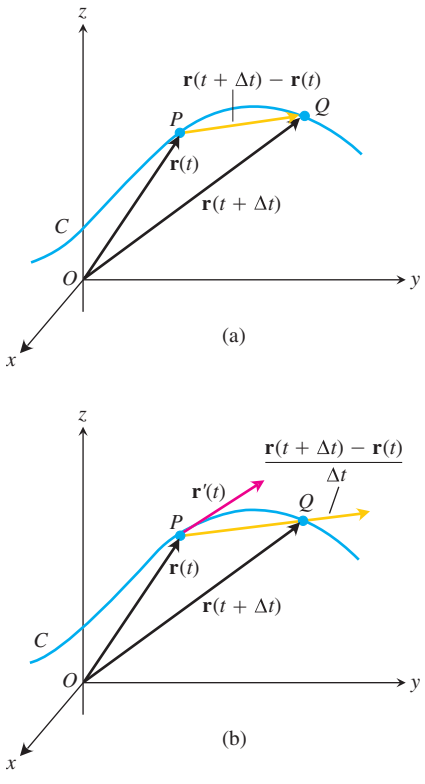

**FIGURE 13.5** As $\Delta t \to 0$, the point $Q$ approaches the point $P$ along the curve $C$. In the limit, the vector $\overrightarrow{PQ}/\Delta t$ becomes the tangent vector $\mathbf{r}'(t)$.

## Derivatives and Motion

Suppose that $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$ is the position vector of a particle moving along a curve in space and that $f$, $g$, and $h$ are differentiable functions of $t$. Then the difference between the particle's positions at time $t$ and time $t + \Delta t$ is

$$\Delta \mathbf{r} = \mathbf{r}(t + \Delta t) - \mathbf{r}(t)$$

(Figure 13.5a). In terms of components,

$$\begin{aligned}
\Delta \mathbf{r} &= \mathbf{r}(t + \Delta t) - \mathbf{r}(t) \\
&= [f(t + \Delta t)\mathbf{i} + g(t + \Delta t)\mathbf{j} + h(t + \Delta t)\mathbf{k}] \\
&\quad - [f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}] \\
&= [f(t + \Delta t) - f(t)]\mathbf{i} + [g(t + \Delta t) - g(t)]\mathbf{j} + [h(t + \Delta t) - h(t)]\mathbf{k}.
\end{aligned}$$

As $\Delta t$ approaches zero, three things seem to happen simultaneously. First, $Q$ approaches $P$ along the curve. Second, the secant line $PQ$ seems to approach a limiting position tangent to the curve at $P$. Third, the quotient $\Delta \mathbf{r}/\Delta t$ (Figure 13.5b) approaches the limit

$$\begin{aligned}
\lim_{\Delta t \to 0} \frac{\Delta \mathbf{r}}{\Delta t} &= \left[\lim_{\Delta t \to 0} \frac{f(t + \Delta t) - f(t)}{\Delta t}\right]\mathbf{i} + \left[\lim_{\Delta t \to 0} \frac{g(t + \Delta t) - g(t)}{\Delta t}\right]\mathbf{j} \\
&\quad + \left[\lim_{\Delta t \to 0} \frac{h(t + \Delta t) - h(t)}{\Delta t}\right]\mathbf{k} \\
&= \left[\frac{df}{dt}\right]\mathbf{i} + \left[\frac{dg}{dt}\right]\mathbf{j} + \left[\frac{dh}{dt}\right]\mathbf{k}.
\end{aligned}$$

We are therefore led by past experience to the following definition.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**DEFINITION Derivative**

The vector function $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$ has a **derivative (is differentiable) at** $t$ if $f$, $g$, and $h$ have derivatives at $t$. The derivative is the vector function

$$\mathbf{r}'(t) = \frac{d\mathbf{r}}{dt} = \lim_{\Delta t \to 0} \frac{\mathbf{r}(t + \Delta t) - \mathbf{r}(t)}{\Delta t} = \frac{df}{dt}\mathbf{i} + \frac{dg}{dt}\mathbf{j} + \frac{dh}{dt}\mathbf{k}.$$

A vector function $\mathbf{r}$ is **differentiable** if it is differentiable at every point of its domain. The curve traced by $\mathbf{r}$ is **smooth** if $d\mathbf{r}/dt$ is continuous and never $\mathbf{0}$, that is, if $f$, $g$, and $h$ have continuous first derivatives that are not simultaneously 0.

The geometric significance of the definition of derivative is shown in Figure 13.5. The points $P$ and $Q$ have position vectors $\mathbf{r}(t)$ and $\mathbf{r}(t + \Delta t)$, and the vector $\overrightarrow{PQ}$ is represented by $\mathbf{r}(t + \Delta t) - \mathbf{r}(t)$. For $\Delta t > 0$, the scalar multiple $(1/\Delta t)(\mathbf{r}(t + \Delta t) - \mathbf{r}(t))$ points in the same direction as the vector $\overrightarrow{PQ}$. As $\Delta t \to 0$, this vector approaches a vector that is tangent to the curve at $P$ (Figure 13.5b). The vector $\mathbf{r}'(t)$, when different from $\mathbf{0}$, is defined to be the vector **tangent** to the curve at $P$. The **tangent line** to the curve at a point $(f(t_0), g(t_0), h(t_0))$ is defined to be the line through the point parallel to $\mathbf{r}'(t_0)$. We require $d\mathbf{r}/dt \neq \mathbf{0}$ for a smooth curve to make sure the curve has a continuously turning tangent at each point. On a smooth curve, there are no sharp corners or cusps.

A curve that is made up of a finite number of smooth curves pieced together in a continuous fashion is called **piecewise smooth** (Figure 13.6).

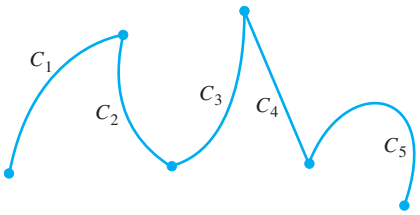

**FIGURE 13.6** A piecewise smooth curve made up of five smooth curves connected end to end in continuous fashion.

Look once again at Figure 13.5. We drew the figure for $\Delta t$ positive, so $\Delta\mathbf{r}$ points forward, in the direction of the motion. The vector $\Delta\mathbf{r}/\Delta t$, having the same direction as $\Delta\mathbf{r}$, points forward too. Had $\Delta t$ been negative, $\Delta\mathbf{r}$ would have pointed backward, against the direction of motion. The quotient $\Delta\mathbf{r}/\Delta t$, however, being a negative scalar multiple of $\Delta\mathbf{r}$, would once again have pointed forward. No matter how $\Delta\mathbf{r}$ points, $\Delta\mathbf{r}/\Delta t$ points forward and we expect the vector $d\mathbf{r}/dt = \lim_{\Delta t \to 0} \Delta\mathbf{r}/\Delta t$, when different from $\mathbf{0}$, to do the same. This means that the derivative $d\mathbf{r}/dt$ is just what we want for modeling a particle's velocity. It points in the direction of motion and gives the rate of change of position with respect to time. For a smooth curve, the velocity is never zero; the particle does not stop or reverse direction.

**DEFINITIONS Velocity, Direction, Speed, Acceleration**

If $\mathbf{r}$ is the position vector of a particle moving along a smooth curve in space, then

$$\mathbf{v}(t) = \frac{d\mathbf{r}}{dt}$$

is the particle's **velocity vector**, tangent to the curve. At any time $t$, the direction of $\mathbf{v}$ is the **direction of motion**, the magnitude of $\mathbf{v}$ is the particle's **speed**, and the derivative $\mathbf{a} = d\mathbf{v}/dt$, when it exists, is the particle's **acceleration vector**. In summary,

1. Velocity is the derivative of position: $\mathbf{v} = \dfrac{d\mathbf{r}}{dt}$.
2. Speed is the magnitude of velocity: $\text{Speed} = |\mathbf{v}|$.
3. Acceleration is the derivative of velocity: $\mathbf{a} = \dfrac{d\mathbf{v}}{dt} = \dfrac{d^2\mathbf{r}}{dt^2}$.
4. The unit vector $\mathbf{v}/|\mathbf{v}|$ is the direction of motion at time $t$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We can express the velocity of a moving particle as the product of its speed and direction:

$$\text{Velocity} = |\mathbf{v}|\left(\frac{\mathbf{v}}{|\mathbf{v}|}\right) = (\text{speed})(\text{direction}).$$

In Section 12.5, Example 4 we found this expression for velocity useful in locating, for example, the position of a helicopter moving along a straight line in space. Now let's look at an example of an object moving along a (nonlinear) space curve.

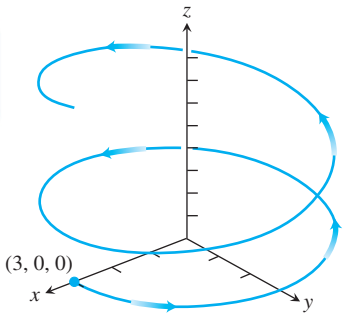

**FIGURE 13.7** The path of a hang glider with position vector $\mathbf{r}(t) = (3\cos t)\mathbf{i} + (3\sin t)\mathbf{j} + t^2\mathbf{k}$ (Example 4).

**EXAMPLE 4** Flight of a Hang Glider

A person on a hang glider is spiraling upward due to rapidly rising air on a path having position vector $\mathbf{r}(t) = (3\cos t)\mathbf{i} + (3\sin t)\mathbf{j} + t^2\mathbf{k}$. The path is similar to that of a helix (although it's *not* a helix, as you will see in Section 13.4) and is shown in Figure 13.7 for $0 \le t \le 4\pi$. Find

**(a)** the velocity and acceleration vectors,

**(b)** the glider's speed at any time $t$,

**(c)** the times, if any, when the glider's acceleration is orthogonal to its velocity.

**Solution**

**(a)** $\mathbf{r} = (3\cos t)\mathbf{i} + (3\sin t)\mathbf{j} + t^2\mathbf{k}$

$$\mathbf{v} = \frac{d\mathbf{r}}{dt} = -(3\sin t)\mathbf{i} + (3\cos t)\mathbf{j} + 2t\mathbf{k}$$

$$\mathbf{a} = \frac{d^2\mathbf{r}}{dt^2} = -(3\cos t)\mathbf{i} - (3\sin t)\mathbf{j} + 2\mathbf{k}$$

**(b)** Speed is the magnitude of $\mathbf{v}$:

$$|\mathbf{v}(t)| = \sqrt{(-3\sin t)^2 + (3\cos t)^2 + (2t)^2}$$

$$= \sqrt{9\sin^2 t + 9\cos^2 t + 4t^2}$$

$$= \sqrt{9 + 4t^2}.$$

The glider is moving faster and faster as it rises along its path.

**(c)** To find the times when $\mathbf{v}$ and $\mathbf{a}$ are orthogonal, we look for values of $t$ for which

$$\mathbf{v}\cdot\mathbf{a} = 9\sin t\cos t - 9\cos t\sin t + 4t = 4t = 0.$$

Thus, the only time the acceleration vector is orthogonal to $\mathbf{v}$ is when $t = 0$. We study acceleration for motions along paths in more detail in Section 13.5. There we discover how the acceleration vector reveals the curving nature and tendency of the path to "twist" out of a certain plane containing the velocity vector. ■

## Differentiation Rules

Because the derivatives of vector functions may be computed component by component, the rules for differentiating vector functions have the same form as the rules for differentiating scalar functions.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Differentiation Rules for Vector Functions**

Let $\mathbf{u}$ and $\mathbf{v}$ be differentiable vector functions of $t$, $\mathbf{C}$ a constant vector, $c$ any scalar, and $f$ any differentiable scalar function.

1. *Constant Function Rule:* $\dfrac{d}{dt}\mathbf{C} = \mathbf{0}$
2. *Scalar Multiple Rules:* $\dfrac{d}{dt}[c\mathbf{u}(t)] = c\mathbf{u}'(t)$

   $\dfrac{d}{dt}[f(t)\mathbf{u}(t)] = f'(t)\mathbf{u}(t) + f(t)\mathbf{u}'(t)$
3. *Sum Rule:* $\dfrac{d}{dt}[\mathbf{u}(t) + \mathbf{v}(t)] = \mathbf{u}'(t) + \mathbf{v}'(t)$
4. *Difference Rule:* $\dfrac{d}{dt}[\mathbf{u}(t) - \mathbf{v}(t)] = \mathbf{u}'(t) - \mathbf{v}'(t)$
5. *Dot Product Rule:* $\dfrac{d}{dt}[\mathbf{u}(t)\cdot\mathbf{v}(t)] = \mathbf{u}'(t)\cdot\mathbf{v}(t) + \mathbf{u}(t)\cdot\mathbf{v}'(t)$
6. *Cross Product Rule:* $\dfrac{d}{dt}[\mathbf{u}(t)\times\mathbf{v}(t)] = \mathbf{u}'(t)\times\mathbf{v}(t) + \mathbf{u}(t)\times\mathbf{v}'(t)$
7. *Chain Rule:* $\dfrac{d}{dt}[\mathbf{u}(f(t))] = f'(t)\mathbf{u}'(f(t))$

When you use the Cross Product Rule, remember to preserve the order of the factors. If $\mathbf{u}$ comes first on the left side of the equation, it must also come first on the right or the signs will be wrong.

We will prove the product rules and Chain Rule but leave the rules for constants, scalar multiples, sums, and differences as exercises.

**Proof of the Dot Product Rule** Suppose that

$$\mathbf{u} = u_1(t)\mathbf{i} + u_2(t)\mathbf{j} + u_3(t)\mathbf{k}$$

and

$$\mathbf{v} = v_1(t)\mathbf{i} + v_2(t)\mathbf{j} + v_3(t)\mathbf{k}.$$

Then

$$\begin{aligned}\frac{d}{dt}(\mathbf{u}\cdot\mathbf{v}) &= \frac{d}{dt}(u_1v_1 + u_2v_2 + u_3v_3)\\ &= \underbrace{u_1'v_1 + u_2'v_2 + u_3'v_3}_{\mathbf{u}'\cdot\mathbf{v}} + \underbrace{u_1v_1' + u_2v_2' + u_3v_3'}_{\mathbf{u}\cdot\mathbf{v}'}.\end{aligned}$$

■

**Proof of the Cross Product Rule** We model the proof after the proof of the Product Rule for scalar functions. According to the definition of derivative,

$$\frac{d}{dt}(\mathbf{u}\times\mathbf{v}) = \lim_{h\to 0}\frac{\mathbf{u}(t+h)\times\mathbf{v}(t+h) - \mathbf{u}(t)\times\mathbf{v}(t)}{h}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

To change this fraction into an equivalent one that contains the difference quotients for the derivatives of $\mathbf{u}$ and $\mathbf{v}$, we subtract and add $\mathbf{u}(t) \times \mathbf{v}(t + h)$ in the numerator. Then

$$\begin{aligned}
&\frac{d}{dt}(\mathbf{u} \times \mathbf{v}) \\
&= \lim_{h \to 0} \frac{\mathbf{u}(t+h) \times \mathbf{v}(t+h) - \mathbf{u}(t) \times \mathbf{v}(t+h) + \mathbf{u}(t) \times \mathbf{v}(t+h) - \mathbf{u}(t) \times \mathbf{v}(t)}{h} \\
&= \lim_{h \to 0} \left[ \frac{\mathbf{u}(t+h) - \mathbf{u}(t)}{h} \times \mathbf{v}(t+h) + \mathbf{u}(t) \times \frac{\mathbf{v}(t+h) - \mathbf{v}(t)}{h} \right] \\
&= \lim_{h \to 0} \frac{\mathbf{u}(t+h) - \mathbf{u}(t)}{h} \times \lim_{h \to 0} \mathbf{v}(t+h) + \lim_{h \to 0} \mathbf{u}(t) \times \lim_{h \to 0} \frac{\mathbf{v}(t+h) - \mathbf{v}(t)}{h}.
\end{aligned}$$

The last of these equalities holds because the limit of the cross product of two vector functions is the cross product of their limits if the latter exist (Exercise 52). As $h$ approaches zero, $\mathbf{v}(t + h)$ approaches $\mathbf{v}(t)$ because $\mathbf{v}$, being differentiable at $t$, is continuous at $t$ (Exercise 53). The two fractions approach the values of $d\mathbf{u}/dt$ and $d\mathbf{v}/dt$ at $t$. In short,

$$\frac{d}{dt}(\mathbf{u} \times \mathbf{v}) = \frac{d\mathbf{u}}{dt} \times \mathbf{v} + \mathbf{u} \times \frac{d\mathbf{v}}{dt}. \qquad \blacksquare$$

As an algebraic convenience, we sometimes write the product of a scalar $c$ and a vector $\mathbf{v}$ as $\mathbf{v}c$ instead of $c\mathbf{v}$. This permits us, for instance, to write the Chain Rule in a familiar form:

$$\frac{d\mathbf{u}}{dt} = \frac{d\mathbf{u}}{ds}\frac{ds}{dt},$$

where $s = f(t)$.

**Proof of the Chain Rule** Suppose that $\mathbf{u}(s) = a(s)\mathbf{i} + b(s)\mathbf{j} + c(s)\mathbf{k}$ is a differentiable vector function of $s$ and that $s = f(t)$ is a differentiable scalar function of $t$. Then $a$, $b$, and $c$ are differentiable functions of $t$, and the Chain Rule for differentiable real-valued functions gives

$$\begin{aligned}
\frac{d}{dt}[\mathbf{u}(s)] &= \frac{da}{dt}\mathbf{i} + \frac{db}{dt}\mathbf{j} + \frac{dc}{dt}\mathbf{k} \\
&= \frac{da}{ds}\frac{ds}{dt}\mathbf{i} + \frac{db}{ds}\frac{ds}{dt}\mathbf{j} + \frac{dc}{ds}\frac{ds}{dt}\mathbf{k} \\
&= \frac{ds}{dt}\left(\frac{da}{ds}\mathbf{i} + \frac{db}{ds}\mathbf{j} + \frac{dc}{ds}\mathbf{k}\right) \\
&= \frac{ds}{dt}\frac{d\mathbf{u}}{ds} \\
&= f'(t)\mathbf{u}'(f(t)). \qquad s = f(t)
\end{aligned}$$

$\blacksquare$

## Vector Functions of Constant Length

When we track a particle moving on a sphere centered at the origin (Figure 13.8), the position vector has a constant length equal to the radius of the sphere. The velocity vector $d\mathbf{r}/dt$, tangent to the path of motion, is tangent to the sphere and hence perpendicular to $\mathbf{r}$. This is always the case for a differentiable vector function of constant length: The vector and its first derivative are orthogonal. With the length constant, the change in the function is a change in direction only, and direction changes take place at right angles. We can also obtain this result by direct calculation:

$$\begin{aligned}
\mathbf{r}(t) \cdot \mathbf{r}(t) &= c^2 && |\mathbf{r}(t)| = c \text{ is constant.} \\
\frac{d}{dt}[\mathbf{r}(t) \cdot \mathbf{r}(t)] &= 0 && \text{Differentiate both sides.} \\
\mathbf{r}'(t) \cdot \mathbf{r}(t) + \mathbf{r}(t) \cdot \mathbf{r}'(t) &= 0 && \text{Rule 5 with } \mathbf{r}(t) = \mathbf{u}(t) = \mathbf{v}(t) \\
2\mathbf{r}'(t) \cdot \mathbf{r}(t) &= 0.
\end{aligned}$$

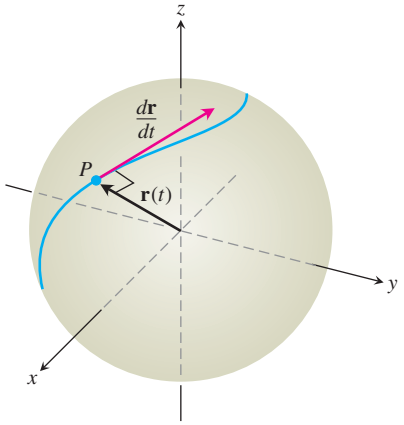

**FIGURE 13.8** If a particle moves on a sphere in such a way that its position $\mathbf{r}$ is a differentiable function of time, then $\mathbf{r} \cdot (d\mathbf{r}/dt) = 0$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The vectors $\mathbf{r}'(t)$ and $\mathbf{r}(t)$ are orthogonal because their dot product is 0. In summary,

If $\mathbf{r}$ is a differentiable vector function of $t$ of constant length, then

$$\mathbf{r} \cdot \frac{d\mathbf{r}}{dt} = 0. \tag{4}$$

We will use this observation repeatedly in Section 13.4.

**EXAMPLE 5** Supporting Equation (4)

Show that $\mathbf{r}(t) = (\sin t)\mathbf{i} + (\cos t)\mathbf{j} + \sqrt{3}\mathbf{k}$ has constant length and is orthogonal to its derivative.

**Solution**

$$\mathbf{r}(t) = (\sin t)\mathbf{i} + (\cos t)\mathbf{j} + \sqrt{3}\mathbf{k}$$

$$|\mathbf{r}(t)| = \sqrt{(\sin t)^2 + (\cos t)^2 + \left(\sqrt{3}\right)^2} = \sqrt{1 + 3} = 2$$

$$\frac{d\mathbf{r}}{dt} = (\cos t)\mathbf{i} - (\sin t)\mathbf{j}$$

$$\mathbf{r} \cdot \frac{d\mathbf{r}}{dt} = \sin t \cos t - \sin t \cos t = 0$$

■

## Integrals of Vector Functions

A differentiable vector function $\mathbf{R}(t)$ is an **antiderivative** of a vector function $\mathbf{r}(t)$ on an interval $I$ if $d\mathbf{R}/dt = \mathbf{r}$ at each point of $I$. If $\mathbf{R}$ is an antiderivative of $\mathbf{r}$ on $I$, it can be shown, working one component at a time, that every antiderivative of $\mathbf{r}$ on $I$ has the form $\mathbf{R} + \mathbf{C}$ for some constant vector $\mathbf{C}$ (Exercise 56). The set of all antiderivatives of $\mathbf{r}$ on $I$ is the **indefinite integral** of $\mathbf{r}$ on $I$.

**DEFINITION** **Indefinite Integral**

The **indefinite integral** of $\mathbf{r}$ with respect to $t$ is the set of all antiderivatives of $\mathbf{r}$, denoted by $\int \mathbf{r}(t)\, dt$. If $\mathbf{R}$ is any antiderivative of $\mathbf{r}$, then

$$\int \mathbf{r}(t)\, dt = \mathbf{R}(t) + \mathbf{C}.$$

The usual arithmetic rules for indefinite integrals apply.

**EXAMPLE 6** Finding Indefinite Integrals

$$\int ((\cos t)\mathbf{i} + \mathbf{j} - 2t\mathbf{k})\, dt = \left(\int \cos t\, dt\right)\mathbf{i} + \left(\int dt\right)\mathbf{j} - \left(\int 2t\, dt\right)\mathbf{k} \tag{5}$$

$$= (\sin t + C_1)\mathbf{i} + (t + C_2)\mathbf{j} - (t^2 + C_3)\mathbf{k} \tag{6}$$

$$= (\sin t)\mathbf{i} + t\mathbf{j} - t^2\mathbf{k} + \mathbf{C} \qquad \mathbf{C} = C_1\mathbf{i} + C_2\mathbf{j} - C_3\mathbf{k}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

As in the integration of scalar functions, we recommend that you skip the steps in Equations (5) and (6) and go directly to the final form. Find an antiderivative for each component and add a constant vector at the end. ■

Definite integrals of vector functions are best defined in terms of components.

**DEFINITION Definite Integral**

If the components of $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$ are integrable over $[a, b]$, then so is $\mathbf{r}$, and the **definite integral** of $\mathbf{r}$ from $a$ to $b$ is

$$\int_a^b \mathbf{r}(t)\,dt = \left(\int_a^b f(t)\,dt\right)\mathbf{i} + \left(\int_a^b g(t)\,dt\right)\mathbf{j} + \left(\int_a^b h(t)\,dt\right)\mathbf{k}.$$

**EXAMPLE 7** Evaluating Definite Integrals

$$\begin{aligned}\int_0^{\pi} ((\cos t)\mathbf{i} + \mathbf{j} - 2t\mathbf{k})\,dt &= \left(\int_0^{\pi} \cos t\,dt\right)\mathbf{i} + \left(\int_0^{\pi} dt\right)\mathbf{j} - \left(\int_0^{\pi} 2t\,dt\right)\mathbf{k} \\ &= \left[\sin t\right]_0^{\pi}\mathbf{i} + \left[t\right]_0^{\pi}\mathbf{j} - \left[t^2\right]_0^{\pi}\mathbf{k} \\ &= [0 - 0]\mathbf{i} + [\pi - 0]\mathbf{j} - [\pi^2 - 0^2]\mathbf{k} \\ &= \pi\mathbf{j} - \pi^2\mathbf{k}\end{aligned}$$

■

The Fundamental Theorem of Calculus for continuous vector functions says that

$$\int_a^b \mathbf{r}(t)\,dt = \mathbf{R}(t)\Big]_a^b = \mathbf{R}(b) - \mathbf{R}(a)$$

where $\mathbf{R}$ is any antiderivative of $\mathbf{r}$, so that $\mathbf{R}'(t) = \mathbf{r}(t)$ (Exercise 57).

**EXAMPLE 8** Revisiting the Flight of a Glider

Suppose that we did not know the path of the glider in Example 4, but only its acceleration vector $\mathbf{a}(t) = -(3\cos t)\mathbf{i} - (3\sin t)\mathbf{j} + 2\mathbf{k}$. We also know that initially (at time $t = 0$), the glider departed from the point $(3, 0, 0)$ with velocity $\mathbf{v}(0) = 3\mathbf{j}$. Find the glider's position as a function of $t$.

**Solution** Our goal is to find $\mathbf{r}(t)$ knowing

The differential equation: $\mathbf{a} = \dfrac{d^2\mathbf{r}}{dt^2} = -(3\cos t)\mathbf{i} - (3\sin t)\mathbf{j} + 2\mathbf{k}$

The initial conditions: $\mathbf{v}(0) = 3\mathbf{j}$ and $\mathbf{r}(0) = 3\mathbf{i} + 0\mathbf{j} + 0\mathbf{k}$.

Integrating both sides of the differential equation with respect to $t$ gives

$$\mathbf{v}(t) = -(3\sin t)\mathbf{i} + (3\cos t)\mathbf{j} + 2t\mathbf{k} + \mathbf{C}_1.$$

We use $\mathbf{v}(0) = 3\mathbf{j}$ to find $\mathbf{C}_1$:

$$\begin{aligned}3\mathbf{j} &= -(3\sin 0)\mathbf{i} + (3\cos 0)\mathbf{j} + (0)\mathbf{k} + \mathbf{C}_1 \\ 3\mathbf{j} &= 3\mathbf{j} + \mathbf{C}_1 \\ \mathbf{C}_1 &= \mathbf{0}.\end{aligned}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The glider's velocity as a function of time is

$$\frac{d\mathbf{r}}{dt} = \mathbf{v}(t) = -(3\sin t)\mathbf{i} + (3\cos t)\mathbf{j} + 2t\mathbf{k}.$$

Integrating both sides of this last differential equation gives

$$\mathbf{r}(t) = (3\cos t)\mathbf{i} + (3\sin t)\mathbf{j} + t^2\mathbf{k} + \mathbf{C}_2.$$

We then use the initial condition $\mathbf{r}(0) = 3\mathbf{i}$ to find $\mathbf{C}_2$:

$$\begin{aligned} 3\mathbf{i} &= (3\cos 0)\mathbf{i} + (3\sin 0)\mathbf{j} + (0^2)\mathbf{k} + \mathbf{C}_2 \\ 3\mathbf{i} &= 3\mathbf{i} + (0)\mathbf{j} + (0)\mathbf{k} + \mathbf{C}_2 \\ \mathbf{C}_2 &= \mathbf{0}. \end{aligned}$$

The glider's position as a function of $t$ is

$$\mathbf{r}(t) = (3\cos t)\mathbf{i} + (3\sin t)\mathbf{j} + t^2\mathbf{k}.$$

This is the path of the glider we know from Example 4 and is shown in Figure 13.7.

*Note:* It was peculiar to this example that both of the constant vectors of integration, $\mathbf{C}_1$ and $\mathbf{C}_2$, turned out to be $\mathbf{0}$. Exercises 31 and 32 give different results for these constants. ■

# EXERCISES 13.1

## Motion in the *xy*-plane

In Exercises 1–4, $\mathbf{r}(t)$ is the position of a particle in the $xy$-plane at time $t$. Find an equation in $x$ and $y$ whose graph is the path of the particle. Then find the particle's velocity and acceleration vectors at the given value of $t$.

1. $\mathbf{r}(t) = (t + 1)\mathbf{i} + (t^2 - 1)\mathbf{j}, \quad t = 1$
2. $\mathbf{r}(t) = (t^2 + 1)\mathbf{i} + (2t - 1)\mathbf{j}, \quad t = 1/2$
3. $\mathbf{r}(t) = e^t\mathbf{i} + \frac{2}{9}e^{2t}\mathbf{j}, \quad t = \ln 3$
4. $\mathbf{r}(t) = (\cos 2t)\mathbf{i} + (3 \sin 2t)\mathbf{j}, \quad t = 0$

Exercises 5–8 give the position vectors of particles moving along various curves in the $xy$-plane. In each case, find the particle's velocity and acceleration vectors at the stated times and sketch them as vectors on the curve.

5. **Motion on the circle $x^2 + y^2 = 1$**

$$\mathbf{r}(t) = (\sin t)\mathbf{i} + (\cos t)\mathbf{j}; \quad t = \pi/4 \text{ and } \pi/2$$

6. **Motion on the circle $x^2 + y^2 = 16$**

$$\mathbf{r}(t) = \left(4 \cos \frac{t}{2}\right)\mathbf{i} + \left(4 \sin \frac{t}{2}\right)\mathbf{j}; \quad t = \pi \text{ and } 3\pi/2$$

7. **Motion on the cycloid $x = t - \sin t$, $y = 1 - \cos t$**

$$\mathbf{r}(t) = (t - \sin t)\mathbf{i} + (1 - \cos t)\mathbf{j}; \quad t = \pi \text{ and } 3\pi/2$$

8. **Motion on the parabola $y = x^2 + 1$**

$$\mathbf{r}(t) = t\mathbf{i} + (t^2 + 1)\mathbf{j}; \quad t = -1, 0, \text{ and } 1$$

## Velocity and Acceleration in Space

In Exercises 9–14, $\mathbf{r}(t)$ is the position of a particle in space at time $t$. Find the particle's velocity and acceleration vectors. Then find the particle's speed and direction of motion at the given value of $t$. Write the particle's velocity at that time as the product of its speed and direction.

9. $\mathbf{r}(t) = (t + 1)\mathbf{i} + (t^2 - 1)\mathbf{j} + 2t\mathbf{k}, \quad t = 1$
10. $\mathbf{r}(t) = (1 + t)\mathbf{i} + \frac{t^2}{\sqrt{2}}\mathbf{j} + \frac{t^3}{3}\mathbf{k}, \quad t = 1$
11. $\mathbf{r}(t) = (2 \cos t)\mathbf{i} + (3 \sin t)\mathbf{j} + 4t\mathbf{k}, \quad t = \pi/2$
12. $\mathbf{r}(t) = (\sec t)\mathbf{i} + (\tan t)\mathbf{j} + \frac{4}{3}t\mathbf{k}, \quad t = \pi/6$
13. $\mathbf{r}(t) = (2 \ln (t + 1))\mathbf{i} + t^2\mathbf{j} + \frac{t^2}{2}\mathbf{k}, \quad t = 1$
14. $\mathbf{r}(t) = (e^{-t})\mathbf{i} + (2 \cos 3t)\mathbf{j} + (2 \sin 3t)\mathbf{k}, \quad t = 0$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

In Exercises 15–18, $\mathbf{r}(t)$ is the position of a particle in space at time $t$. Find the angle between the velocity and acceleration vectors at time $t = 0$.

**15.** $\mathbf{r}(t) = (3t + 1)\mathbf{i} + \sqrt{3}t\mathbf{j} + t^2\mathbf{k}$

**16.** $\mathbf{r}(t) = \left(\frac{\sqrt{2}}{2}t\right)\mathbf{i} + \left(\frac{\sqrt{2}}{2}t - 16t^2\right)\mathbf{j}$

**17.** $\mathbf{r}(t) = (\ln(t^2 + 1))\mathbf{i} + (\tan^{-1} t)\mathbf{j} + \sqrt{t^2 + 1}\,\mathbf{k}$

**18.** $\mathbf{r}(t) = \frac{4}{9}(1 + t)^{3/2}\mathbf{i} + \frac{4}{9}(1 - t)^{3/2}\mathbf{j} + \frac{1}{3}t\mathbf{k}$

In Exercises 19 and 20, $\mathbf{r}(t)$ is the position vector of a particle in space at time $t$. Find the time or times in the given time interval when the velocity and acceleration vectors are orthogonal.

**19.** $\mathbf{r}(t) = (t - \sin t)\mathbf{i} + (1 - \cos t)\mathbf{j}, \quad 0 \le t \le 2\pi$

**20.** $\mathbf{r}(t) = (\sin t)\mathbf{i} + t\mathbf{j} + (\cos t)\mathbf{k}, \quad t \ge 0$

## Integrating Vector-Valued Functions

Evaluate the integrals in Exercises 21–26.

**21.** $\displaystyle\int_0^1 [t^3\mathbf{i} + 7\mathbf{j} + (t + 1)\mathbf{k}]\,dt$

**22.** $\displaystyle\int_1^2 \left[(6 - 6t)\mathbf{i} + 3\sqrt{t}\mathbf{j} + \left(\frac{4}{t^2}\right)\mathbf{k}\right] dt$

**23.** $\displaystyle\int_{-\pi/4}^{\pi/4} [(\sin t)\mathbf{i} + (1 + \cos t)\mathbf{j} + (\sec^2 t)\mathbf{k}]\,dt$

**24.** $\displaystyle\int_0^{\pi/3} [(\sec t \tan t)\mathbf{i} + (\tan t)\mathbf{j} + (2 \sin t \cos t)\mathbf{k}]\,dt$

**25.** $\displaystyle\int_1^4 \left[\frac{1}{t}\mathbf{i} + \frac{1}{5 - t}\mathbf{j} + \frac{1}{2t}\mathbf{k}\right] dt$

**26.** $\displaystyle\int_0^1 \left[\frac{2}{\sqrt{1 - t^2}}\mathbf{i} + \frac{\sqrt{3}}{1 + t^2}\mathbf{k}\right] dt$

## Initial Value Problems for Vector-Valued Functions

Solve the initial value problems in Exercises 27–32 for $\mathbf{r}$ as a vector function of $t$.

**27.** Differential equation: $\dfrac{d\mathbf{r}}{dt} = -t\mathbf{i} - t\mathbf{j} - t\mathbf{k}$

Initial condition: $\mathbf{r}(0) = \mathbf{i} + 2\mathbf{j} + 3\mathbf{k}$

**28.** Differential equation: $\dfrac{d\mathbf{r}}{dt} = (180t)\mathbf{i} + (180t - 16t^2)\mathbf{j}$

Initial condition: $\mathbf{r}(0) = 100\mathbf{j}$

**29.** Differential equation: $\dfrac{d\mathbf{r}}{dt} = \dfrac{3}{2}(t + 1)^{1/2}\mathbf{i} + e^{-t}\mathbf{j} + \dfrac{1}{t + 1}\mathbf{k}$

Initial condition: $\mathbf{r}(0) = \mathbf{k}$

**30.** Differential equation: $\dfrac{d\mathbf{r}}{dt} = (t^3 + 4t)\mathbf{i} + t\mathbf{j} + 2t^2\mathbf{k}$

Initial condition: $\mathbf{r}(0) = \mathbf{i} + \mathbf{j}$

**31.** Differential equation: $\dfrac{d^2\mathbf{r}}{dt^2} = -32\mathbf{k}$

Initial conditions: $\mathbf{r}(0) = 100\mathbf{k}$ and $\left.\dfrac{d\mathbf{r}}{dt}\right|_{t=0} = 8\mathbf{i} + 8\mathbf{j}$

**32.** Differential equation: $\dfrac{d^2\mathbf{r}}{dt^2} = -(\mathbf{i} + \mathbf{j} + \mathbf{k})$

Initial conditions: $\mathbf{r}(0) = 10\mathbf{i} + 10\mathbf{j} + 10\mathbf{k}$ and $\left.\dfrac{d\mathbf{r}}{dt}\right|_{t=0} = \mathbf{0}$

## Tangent Lines to Smooth Curves

As mentioned in the text, the tangent line to a smooth curve $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$ at $t = t_0$ is the line that passes through the point $(f(t_0), g(t_0), h(t_0))$ parallel to $\mathbf{v}(t_0)$, the curve's velocity vector at $t_0$. In Exercises 33–36, find parametric equations for the line that is tangent to the given curve at the given parameter value $t = t_0$.

**33.** $\mathbf{r}(t) = (\sin t)\mathbf{i} + (t^2 - \cos t)\mathbf{j} + e^t\mathbf{k}, \quad t_0 = 0$

**34.** $\mathbf{r}(t) = (2 \sin t)\mathbf{i} + (2 \cos t)\mathbf{j} + 5t\mathbf{k}, \quad t_0 = 4\pi$

**35.** $\mathbf{r}(t) = (a \sin t)\mathbf{i} + (a \cos t)\mathbf{j} + bt\mathbf{k}, \quad t_0 = 2\pi$

**36.** $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + (\sin 2t)\mathbf{k}, \quad t_0 = \dfrac{\pi}{2}$

## Motion on Circular Paths

**37.** Each of the following equations in parts (a)–(e) describes the motion of a particle having the same path, namely the unit circle $x^2 + y^2 = 1$. Although the path of each particle in parts (a)–(e) is the same, the behavior, or "dynamics," of each particle is different. For each particle, answer the following questions.

**i.** Does the particle have constant speed? If so, what is its constant speed?

**ii.** Is the particle's acceleration vector always orthogonal to its velocity vector?

**iii.** Does the particle move clockwise or counterclockwise around the circle?

**iv.** Does the particle begin at the point $(1, 0)$?

**a.** $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j}, \quad t \ge 0$

**b.** $\mathbf{r}(t) = \cos(2t)\mathbf{i} + \sin(2t)\mathbf{j}, \quad t \ge 0$

**c.** $\mathbf{r}(t) = \cos(t - \pi/2)\mathbf{i} + \sin(t - \pi/2)\mathbf{j}, \quad t \ge 0$

**d.** $\mathbf{r}(t) = (\cos t)\mathbf{i} - (\sin t)\mathbf{j}, \quad t \ge 0$

**e.** $\mathbf{r}(t) = \cos(t^2)\mathbf{i} + \sin(t^2)\mathbf{j}, \quad t \ge 0$

**38.** Show that the vector-valued function

$$\mathbf{r}(t) = (2\mathbf{i} + 2\mathbf{j} + \mathbf{k}) + \cos t\left(\frac{1}{\sqrt{2}}\mathbf{i} - \frac{1}{\sqrt{2}}\mathbf{j}\right) + \sin t\left(\frac{1}{\sqrt{3}}\mathbf{i} + \frac{1}{\sqrt{3}}\mathbf{j} + \frac{1}{\sqrt{3}}\mathbf{k}\right)$$

describes the motion of a particle moving in the circle of radius 1 centered at the point $(2, 2, 1)$ and lying in the plane $x + y - 2z = 2$.

## Motion Along a Straight Line

**39.** At time $t = 0$, a particle is located at the point (1, 2, 3). It travels in a straight line to the point (4, 1, 4), has speed 2 at (1, 2, 3) and constant acceleration $3\mathbf{i} - \mathbf{j} + \mathbf{k}$. Find an equation for the position vector $\mathbf{r}(t)$ of the particle at time $t$.

**40.** A particle traveling in a straight line is located at the point $(1, -1, 2)$ and has speed 2 at time $t = 0$. The particle moves toward the point (3, 0, 3) with constant acceleration $2\mathbf{i} + \mathbf{j} + \mathbf{k}$. Find its position vector $\mathbf{r}(t)$ at time $t$.

## Theory and Examples

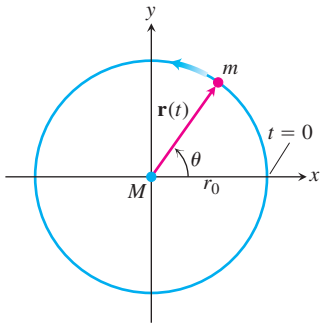
**41. Motion along a parabola** A particle moves along the top of the parabola $y^2 = 2x$ from left to right at a constant speed of 5 units per second. Find the velocity of the particle as it moves through the point (2, 2).

**42. Motion along a cycloid** A particle moves in the $xy$-plane in such a way that its position at time $t$ is

$$\mathbf{r}(t) = (t - \sin t)\mathbf{i} + (1 - \cos t)\mathbf{j}.$$

T **a.** Graph $\mathbf{r}(t)$. The resulting curve is a cycloid.

**b.** Find the maximum and minimum values of $|\mathbf{v}|$ and $|\mathbf{a}|$. (*Hint:* Find the extreme values of $|\mathbf{v}|^2$ and $|\mathbf{a}|^2$ first and take square roots later.)



**43. Motion along an ellipse** A particle moves around the ellipse $(y/3)^2 + (z/2)^2 = 1$ in the $yz$-plane in such a way that its position at time $t$ is

$$\mathbf{r}(t) = (3\cos t)\mathbf{j} + (2\sin t)\mathbf{k}.$$

Find the maximum and minimum values of $|\mathbf{v}|$ and $|\mathbf{a}|$. (*Hint:* Find the extreme values of $|\mathbf{v}|^2$ and $|\mathbf{a}|^2$ first and take square roots later.)

**44. A satellite in circular orbit** A satellite of mass $m$ is revolving at a constant speed $v$ around a body of mass $M$ (Earth, for example) in a circular orbit of radius $r_0$ (measured from the body's center of mass). Determine the satellite's orbital period $T$ (the time to complete one full orbit), as follows:

**a.** Coordinatize the orbital plane by placing the origin at the body's center of mass, with the satellite on the $x$-axis at $t = 0$ and moving counterclockwise, as in the accompanying figure.

Let $\mathbf{r}(t)$ be the satellite's position vector at time $t$. Show that $\theta = vt/r_0$ and hence that

$$\mathbf{r}(t) = \left(r_0 \cos\frac{vt}{r_0}\right)\mathbf{i} + \left(r_0 \sin\frac{vt}{r_0}\right)\mathbf{j}.$$

**b.** Find the acceleration of the satellite.

**c.** According to Newton's law of gravitation, the gravitational force exerted on the satellite is directed toward $M$ and is given by

$$\mathbf{F} = \left(-\frac{GmM}{{r_0}^2}\right)\frac{\mathbf{r}}{r_0},$$

where $G$ is the universal constant of gravitation. Using Newton's second law, $\mathbf{F} = m\mathbf{a}$, show that $v^2 = GM/r_0$.

**d.** Show that the orbital period $T$ satisfies $vT = 2\pi r_0$.

**e.** From parts (c) and (d), deduce that

$$T^2 = \frac{4\pi^2}{GM}{r_0}^3.$$

That is, the square of the period of a satellite in circular orbit is proportional to the cube of the radius from the orbital center.

**45.** Let $\mathbf{v}$ be a differentiable vector function of $t$. Show that if $\mathbf{v} \cdot (d\mathbf{v}/dt) = 0$ for all $t$, then $|\mathbf{v}|$ is constant.

**46. Derivatives of triple scalar products**

**a.** Show that if $\mathbf{u}$, $\mathbf{v}$, and $\mathbf{w}$ are differentiable vector functions of $t$, then

$$\frac{d}{dt}(\mathbf{u}\cdot\mathbf{v}\times\mathbf{w}) = \frac{d\mathbf{u}}{dt}\cdot\mathbf{v}\times\mathbf{w} + \mathbf{u}\cdot\frac{d\mathbf{v}}{dt}\times\mathbf{w} + \mathbf{u}\cdot\mathbf{v}\times\frac{d\mathbf{w}}{dt}. \tag{7}$$

**b.** Show that Equation (7) is equivalent to

$$\frac{d}{dt}\begin{vmatrix} u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix} = \begin{vmatrix} \frac{du_1}{dt} & \frac{du_2}{dt} & \frac{du_3}{dt} \\ v_1 & v_2 & v_3 \\ w_1 & w_2 & w_3 \end{vmatrix} + \begin{vmatrix} u_1 & u_2 & u_3 \\ \frac{dv_1}{dt} & \frac{dv_2}{dt} & \frac{dv_3}{dt} \\ w_1 & w_2 & w_3 \end{vmatrix} + \begin{vmatrix} u_1 & u_2 & u_3 \\ v_1 & v_2 & v_3 \\ \frac{dw_1}{dt} & \frac{dw_2}{dt} & \frac{dw_3}{dt} \end{vmatrix}. \tag{8}$$

Equation (8) says that the derivative of a 3 by 3 determinant of differentiable functions is the sum of the three determinants obtained from the original by differentiating one row at a time. The result extends to determinants of any order.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**47.** (*Continuation of Exercise 46.*) Suppose that $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$ and that $f$, $g$, and $h$ have derivatives through order three. Use Equation (7) or (8) to show that

$$\frac{d}{dt}\left(\mathbf{r}\cdot\frac{d\mathbf{r}}{dt}\times\frac{d^2\mathbf{r}}{dt^2}\right) = \mathbf{r}\cdot\left(\frac{d\mathbf{r}}{dt}\times\frac{d^3\mathbf{r}}{dt^3}\right). \tag{9}$$

(*Hint:* Differentiate on the left and look for vectors whose products are zero.)

**48. Constant Function Rule** Prove that if $\mathbf{u}$ is the vector function with the constant value $\mathbf{C}$, then $d\mathbf{u}/dt = \mathbf{0}$.

**49. Scalar Multiple Rules**

**a.** Prove that if $\mathbf{u}$ is a differentiable function of $t$ and $c$ is any real number, then

$$\frac{d(c\,\mathbf{u})}{dt} = c\,\frac{d\mathbf{u}}{dt}.$$

**b.** Prove that if $\mathbf{u}$ is a differentiable function of $t$ and $f$ is a differentiable scalar function of $t$, then

$$\frac{d}{dt}(f\mathbf{u}) = \frac{df}{dt}\mathbf{u} + f\frac{d\mathbf{u}}{dt}.$$

**50. Sum and Difference Rules** Prove that if $\mathbf{u}$ and $\mathbf{v}$ are differentiable functions of $t$, then

$$\frac{d}{dt}(\mathbf{u}+\mathbf{v}) = \frac{d\mathbf{u}}{dt} + \frac{d\mathbf{v}}{dt}$$

and

$$\frac{d}{dt}(\mathbf{u}-\mathbf{v}) = \frac{d\mathbf{u}}{dt} - \frac{d\mathbf{v}}{dt}.$$

**51. Component Test for Continuity at a Point** Show that the vector function $\mathbf{r}$ defined by $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$ is continuous at $t = t_0$ if and only if $f$, $g$, and $h$ are continuous at $t_0$.

**52. Limits of cross products of vector functions** Suppose that $\mathbf{r}_1(t) = f_1(t)\mathbf{i} + f_2(t)\mathbf{j} + f_3(t)\mathbf{k}$, $\mathbf{r}_2(t) = g_1(t)\mathbf{i} + g_2(t)\mathbf{j} + g_3(t)\mathbf{k}$, $\lim_{t\to t_0}\mathbf{r}_1(t) = \mathbf{A}$, and $\lim_{t\to t_0}\mathbf{r}_2(t) = \mathbf{B}$. Use the determinant formula for cross products and the Limit Product Rule for scalar functions to show that

$$\lim_{t\to t_0}(\mathbf{r}_1(t)\times\mathbf{r}_2(t)) = \mathbf{A}\times\mathbf{B}$$

**53. Differentiable vector functions are continuous** Show that if $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$ is differentiable at $t = t_0$, then it is continuous at $t_0$ as well.

**54.** Establish the following properties of integrable vector functions.

**a.** The *Constant Scalar Multiple Rule:*

$$\int_a^b k\mathbf{r}(t)\,dt = k\int_a^b \mathbf{r}(t)\,dt \quad \text{(any scalar } k\text{)}$$

The *Rule for Negatives*,

$$\int_a^b (-\mathbf{r}(t))\,dt = -\int_a^b \mathbf{r}(t)\,dt,$$

is obtained by taking $k = -1$.

**b.** The *Sum and Difference Rules:*

$$\int_a^b (\mathbf{r}_1(t) \pm \mathbf{r}_2(t))\,dt = \int_a^b \mathbf{r}_1(t)\,dt \pm \int_a^b \mathbf{r}_2(t)\,dt$$

**c.** The *Constant Vector Multiple Rules:*

$$\int_a^b \mathbf{C}\cdot\mathbf{r}(t)\,dt = \mathbf{C}\cdot\int_a^b \mathbf{r}(t)\,dt \quad \text{(any constant vector } \mathbf{C}\text{)}$$

and

$$\int_a^b \mathbf{C}\times\mathbf{r}(t)\,dt = \mathbf{C}\times\int_a^b \mathbf{r}(t)\,dt \quad \text{(any constant vector } \mathbf{C}\text{)}$$

**55. Products of scalar and vector functions** Suppose that the scalar function $u(t)$ and the vector function $\mathbf{r}(t)$ are both defined for $a \le t \le b$.

**a.** Show that $u\mathbf{r}$ is continuous on $[a, b]$ if $u$ and $\mathbf{r}$ are continuous on $[a, b]$.

**b.** If $u$ and $\mathbf{r}$ are both differentiable on $[a, b]$, show that $u\mathbf{r}$ is differentiable on $[a, b]$ and that

$$\frac{d}{dt}(u\mathbf{r}) = u\frac{d\mathbf{r}}{dt} + \mathbf{r}\frac{du}{dt}.$$

**56. Antiderivatives of vector functions**

**a.** Use Corollary 2 of the Mean Value Theorem for scalar functions to show that if two vector functions $\mathbf{R}_1(t)$ and $\mathbf{R}_2(t)$ have identical derivatives on an interval $I$, then the functions differ by a constant vector value throughout $I$.

**b.** Use the result in part (a) to show that if $\mathbf{R}(t)$ is any antiderivative of $\mathbf{r}(t)$ on $I$, then any other antiderivative of $\mathbf{r}$ on $I$ equals $\mathbf{R}(t) + \mathbf{C}$ for some constant vector $\mathbf{C}$.

**57. The Fundamental Theorem of Calculus** The Fundamental Theorem of Calculus for scalar functions of a real variable holds for vector functions of a real variable as well. Prove this by using the theorem for scalar functions to show first that if a vector function $\mathbf{r}(t)$ is continuous for $a \le t \le b$, then

$$\frac{d}{dt}\int_a^t \mathbf{r}(\tau)\,d\tau = \mathbf{r}(t)$$

at every point $t$ of $(a, b)$. Then use the conclusion in part (b) of Exercise 56 to show that if $\mathbf{R}$ is any antiderivative of $\mathbf{r}$ on $[a, b]$ then

$$\int_a^b \mathbf{r}(t)\,dt = \mathbf{R}(b) - \mathbf{R}(a).$$

**COMPUTER EXPLORATIONS**

## Drawing Tangents to Space Curves

Use a CAS to perform the following steps in Exercises 58–61.

**a.** Plot the space curve traced out by the position vector $\mathbf{r}$.

**b.** Find the components of the velocity vector $d\mathbf{r}/dt$.

**c.** Evaluate $d\mathbf{r}/dt$ at the given point $t_0$ and determine the equation of the tangent line to the curve at $\mathbf{r}(t_0)$.

**d.** Plot the tangent line together with the curve over the given interval.

**58.** $\mathbf{r}(t) = (\sin t - t\cos t)\mathbf{i} + (\cos t + t\sin t)\mathbf{j} + t^2\mathbf{k}$, $0 \le t \le 6\pi$, $t_0 = 3\pi/2$

**59.** $\mathbf{r}(t) = \sqrt{2}t\mathbf{i} + e^t\mathbf{j} + e^{-t}\mathbf{k}$, $-2 \le t \le 3$, $t_0 = 1$

**60.** $\mathbf{r}(t) = (\sin 2t)\mathbf{i} + (\ln(1+t))\mathbf{j} + t\mathbf{k}$, $0 \le t \le 4\pi$, $t_0 = \pi/4$

**61.** $\mathbf{r}(t) = (\ln(t^2+2))\mathbf{i} + (\tan^{-1}3t)\mathbf{j} + \sqrt{t^2+1}\,\mathbf{k}$, $-3 \le t \le 5$, $t_0 = 3$

In Exercises 62 and 63, you will explore graphically the behavior of the helix

$$\mathbf{r}(t) = (\cos at)\mathbf{i} + (\sin at)\mathbf{j} + bt\mathbf{k}.$$

as you change the values of the constants $a$ and $b$. Use a CAS to perform the steps in each exercise.

**62.** Set $b = 1$. Plot the helix $\mathbf{r}(t)$ together with the tangent line to the curve at $t = 3\pi/2$ for $a = 1, 2, 4$, and 6 over the interval $0 \le t \le 4\pi$. Describe in your own words what happens to the graph of the helix and the position of the tangent line as $a$ increases through these positive values.

**63.** Set $a = 1$. Plot the helix $\mathbf{r}(t)$ together with the tangent line to the curve at $t = 3\pi/2$ for $b = 1/4, 1/2, 2$, and 4 over the interval $0 \le t \le 4\pi$. Describe in your own words what happens to the graph of the helix and the position of the tangent line as $b$ increases through these positive values.

# 13.2 Modeling Projectile Motion

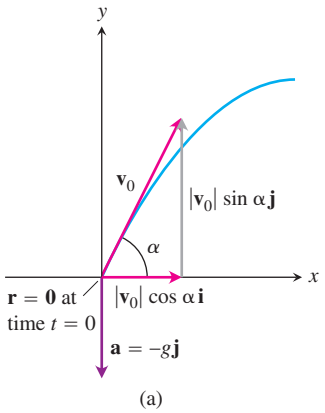
When we shoot a projectile into the air we usually want to know beforehand how far it will go (will it reach the target?), how high it will rise (will it clear the hill?), and when it will land (when do we get results?). We get this information from the direction and magnitude of the projectile's initial velocity vector, using Newton's second law of motion.

## The Vector and Parametric Equations for Ideal Projectile Motion

To derive equations for projectile motion, we assume that the projectile behaves like a particle moving in a vertical coordinate plane and that the only force acting on the projectile during its flight is the constant force of gravity, which always points straight down. In practice, none of these assumptions really holds. The ground moves beneath the projectile as the earth turns, the air creates a frictional force that varies with the projectile's speed and altitude, and the force of gravity changes as the projectile moves along. All this must be taken into account by applying corrections to the predictions of the *ideal* equations we are about to derive. The corrections, however, are not the subject of this section.

We assume that the projectile is launched from the origin at time $t = 0$ into the first quadrant with an initial velocity $\mathbf{v}_0$ (Figure 13.9). If $\mathbf{v}_0$ makes an angle $\alpha$ with the horizontal, then

$$\mathbf{v}_0 = (|\mathbf{v}_0| \cos \alpha)\mathbf{i} + (|\mathbf{v}_0| \sin \alpha)\mathbf{j}.$$



If we use the simpler notation $v_0$ for the initial speed $|\mathbf{v}_0|$, then

$$\mathbf{v}_0 = (v_0 \cos \alpha)\mathbf{i} + (v_0 \sin \alpha)\mathbf{j}. \tag{1}$$

The projectile's initial position is

$$\mathbf{r}_0 = 0\mathbf{i} + 0\mathbf{j} = \mathbf{0}. \tag{2}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

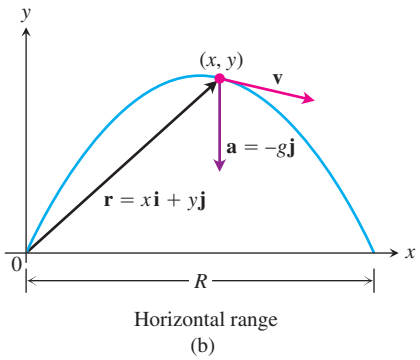


**FIGURE 13.9** (a) Position, velocity, acceleration, and launch angle at $t = 0$. (b) Position, velocity, and acceleration at a later time $t$.

Newton's second law of motion says that the force acting on the projectile is equal to the projectile's mass $m$ times its acceleration, or $m(d^2\mathbf{r}/dt^2)$ if $\mathbf{r}$ is the projectile's position vector and $t$ is time. If the force is solely the gravitational force $-mg\mathbf{j}$, then

$$m\frac{d^2\mathbf{r}}{dt^2} = -mg\mathbf{j} \qquad \text{and} \qquad \frac{d^2\mathbf{r}}{dt^2} = -g\mathbf{j}.$$

We find $\mathbf{r}$ as a function of $t$ by solving the following initial value problem.

$$\text{Differential equation:} \quad \frac{d^2\mathbf{r}}{dt^2} = -g\mathbf{j}$$

$$\text{Initial conditions:} \quad \mathbf{r} = \mathbf{r}_0 \quad \text{and} \quad \frac{d\mathbf{r}}{dt} = \mathbf{v}_0 \quad \text{when } t = 0$$

The first integration gives

$$\frac{d\mathbf{r}}{dt} = -(gt)\mathbf{j} + \mathbf{v}_0.$$

A second integration gives

$$\mathbf{r} = -\frac{1}{2}gt^2\mathbf{j} + \mathbf{v}_0 t + \mathbf{r}_0.$$

Substituting the values of $\mathbf{v}_0$ and $\mathbf{r}_0$ from Equations (1) and (2) gives

$$\mathbf{r} = -\frac{1}{2}gt^2\mathbf{j} + \underbrace{(v_0 \cos\alpha)t\mathbf{i} + (v_0 \sin\alpha)t\mathbf{j}}_{\mathbf{v}_0 t} + \mathbf{0}$$

Collecting terms, we have

**Ideal Projectile Motion Equation**

$$\mathbf{r} = (v_0 \cos\alpha)t\mathbf{i} + \left((v_0 \sin\alpha)t - \frac{1}{2}gt^2\right)\mathbf{j}. \tag{3}$$

Equation (3) is the *vector equation* for ideal projectile motion. The angle $\alpha$ is the projectile's **launch angle** (**firing angle**, **angle of elevation**), and $v_0$, as we said before, is the projectile's **initial speed**. The components of $\mathbf{r}$ give the parametric equations

$$x = (v_0 \cos\alpha)t \qquad \text{and} \qquad y = (v_0 \sin\alpha)t - \frac{1}{2}gt^2, \tag{4}$$

where $x$ is the distance downrange and $y$ is the height of the projectile at time $t \geq 0$.

**EXAMPLE 1** Firing an Ideal Projectile

A projectile is fired from the origin over horizontal ground at an initial speed of 500 m/sec and a launch angle of 60°. Where will the projectile be 10 sec later?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** We use Equation (3) with $v_0 = 500$, $\alpha = 60°$, $g = 9.8$, and $t = 10$ to find the projectile's components 10 sec after firing.

$$\mathbf{r} = (v_0 \cos\alpha)t\mathbf{i} + \left((v_0 \sin\alpha)t - \frac{1}{2}gt^2\right)\mathbf{j}$$

$$= (500)\left(\frac{1}{2}\right)(10)\mathbf{i} + \left((500)\left(\frac{\sqrt{3}}{2}\right)10 - \left(\frac{1}{2}\right)(9.8)(100)\right)\mathbf{j}$$

$$\approx 2500\mathbf{i} + 3840\mathbf{j}.$$

Ten seconds after firing, the projectile is about 3840 m in the air and 2500 m downrange. ■

## Height, Flight Time, and Range

Equation (3) enables us to answer most questions about the ideal motion for a projectile fired from the origin.

The projectile reaches its highest point when its vertical velocity component is zero, that is, when

$$\frac{dy}{dt} = v_0 \sin\alpha - gt = 0, \qquad \text{or} \qquad t = \frac{v_0 \sin\alpha}{g}.$$

For this value of $t$, the value of $y$ is

$$y_{\max} = (v_0 \sin\alpha)\left(\frac{v_0 \sin\alpha}{g}\right) - \frac{1}{2}g\left(\frac{v_0 \sin\alpha}{g}\right)^2 = \frac{(v_0 \sin\alpha)^2}{2g}.$$

To find when the projectile lands when fired over horizontal ground, we set the vertical component equal to zero in Equation (3) and solve for $t$.

$$(v_0 \sin\alpha)t - \frac{1}{2}gt^2 = 0$$

$$t\left(v_0 \sin\alpha - \frac{1}{2}gt\right) = 0$$

$$t = 0, \qquad t = \frac{2v_0 \sin\alpha}{g}$$

Since 0 is the time the projectile is fired, $(2v_0 \sin\alpha)/g$ must be the time when the projectile strikes the ground.

To find the projectile's **range** $R$, the distance from the origin to the point of impact on horizontal ground, we find the value of the horizontal component when $t = (2v_0 \sin\alpha)/g$.

$$x = (v_0 \cos\alpha)t$$

$$R = (v_0 \cos\alpha)\left(\frac{2v_0 \sin\alpha}{g}\right) = \frac{{v_0}^2}{g}(2 \sin\alpha \cos\alpha) = \frac{{v_0}^2}{g}\sin 2\alpha$$

The range is largest when $\sin 2\alpha = 1$ or $\alpha = 45°$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Height, Flight Time, and Range for Ideal Projectile Motion**
For ideal projectile motion when an object is launched from the origin over a horizontal surface with initial speed $v_0$ and launch angle $\alpha$:

$$\textit{Maximum height}: \quad y_{\max} = \frac{(v_0 \sin \alpha)^2}{2g}$$

$$\textit{Flight time}: \quad t = \frac{2v_0 \sin \alpha}{g}$$

$$\textit{Range}: \quad R = \frac{v_0^2}{g} \sin 2\alpha.$$

## EXAMPLE 2 Investigating Ideal Projectile Motion

Find the maximum height, flight time, and range of a projectile fired from the origin over horizontal ground at an initial speed of 500 m/sec and a launch angle of 60° (same projectile as Example 1).

**Solution**

$$\text{Maximum height:} \quad y_{\max} = \frac{(v_0 \sin \alpha)^2}{2g} = \frac{(500 \sin 60°)^2}{2(9.8)} \approx 9566 \text{ m}$$

$$\text{Flight time:} \quad t = \frac{2v_0 \sin \alpha}{g} = \frac{2(500) \sin 60°}{9.8} \approx 88.4 \text{ sec}$$

$$\text{Range:} \quad R = \frac{v_0^2}{g} \sin 2\alpha = \frac{(500)^2 \sin 120°}{9.8} \approx 22{,}092 \text{ m}$$

From Equation (3), the position vector of the projectile is

$$\mathbf{r} = (v_0 \cos \alpha)t\mathbf{i} + \left((v_0 \sin \alpha)t - \frac{1}{2}gt^2\right)\mathbf{j}$$

$$= (500 \cos 60°)t\mathbf{i} + \left((500 \sin 60°)t - \frac{1}{2}(9.8)t^2\right)\mathbf{j}$$

$$= 250t\mathbf{i} + \left(\left(250\sqrt{3}\right)t - 4.9t^2\right)\mathbf{j}.$$

A graph of the projectile's path is shown in Figure 13.10. ■

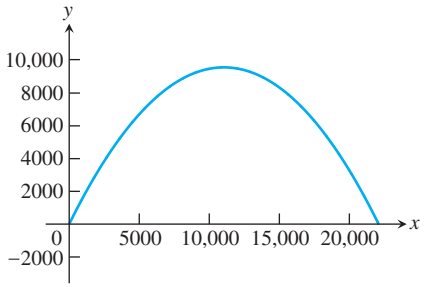

**FIGURE 13.10** The graph of the projectile described in Example 2.

## Ideal Trajectories Are Parabolic

It is often claimed that water from a hose traces a parabola in the air, but anyone who looks closely enough will see this is not so. The air slows the water down, and its forward progress is too slow at the end to keep pace with the rate at which it falls.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

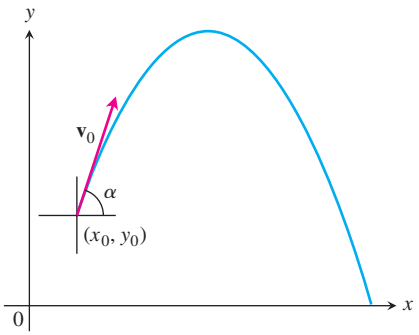

**FIGURE 13.11** The path of a projectile fired from $(x_0, y_0)$ with an initial velocity $\mathbf{v}_0$ at an angle of $\alpha$ degrees with the horizontal.

What is really being claimed is that ideal projectiles move along parabolas, and this we can see from Equations (4). If we substitute $t = x/(v_0 \cos \alpha)$ from the first equation into the second, we obtain the Cartesian-coordinate equation

$$y = -\left(\frac{g}{2v_0^2 \cos^2 \alpha}\right)x^2 + (\tan \alpha)x.$$

This equation has the form $y = ax^2 + bx$, so its graph is a parabola.

## Firing from $(x_0, y_0)$

If we fire our ideal projectile from the point $(x_0, y_0)$ instead of the origin (Figure 13.11), the position vector for the path of motion is

$$\mathbf{r} = (x_0 + (v_0 \cos \alpha)t)\mathbf{i} + \left(y_0 + (v_0 \sin \alpha)t - \frac{1}{2}gt^2\right)\mathbf{j}, \tag{5}$$

as you are asked to show in Exercise 19.

### EXAMPLE 3 Firing a Flaming Arrow

To open the 1992 Summer Olympics in Barcelona, bronze medalist archer Antonio Rebollo lit the Olympic torch with a flaming arrow (Figure 13.12). Suppose that Rebollo shot the arrow at a height of 6 ft above ground level 90 ft from the 70-ft-high cauldron, and he wanted the arrow to reach maximum height exactly 4 ft above the center of the cauldron (Figure 13.12).

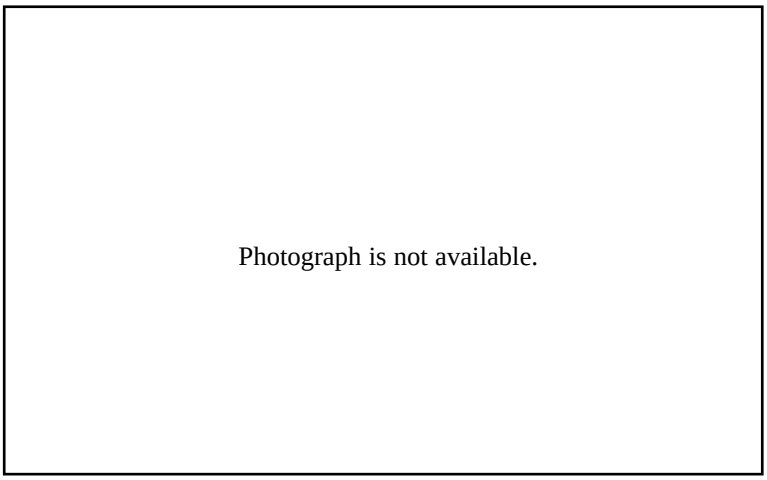

**FIGURE 13.12** Spanish archer Antonio Rebollo lights the Olympic torch in Barcelona with a flaming arrow.

**(a)** Express $y_{\max}$ in terms of the initial speed $v_0$ and firing angle $\alpha$.

**(b)** Use $y_{\max} = 74$ ft (Figure 13.13) and the result from part (a) to find the value of $v_0 \sin \alpha$.

**(c)** Find the value of $v_0 \cos \alpha$.

**(d)** Find the initial firing angle of the arrow.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

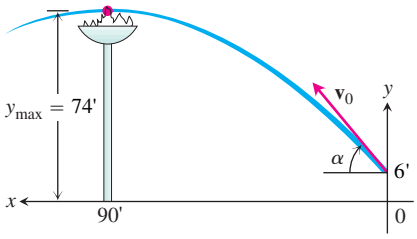

**FIGURE 13.13** Ideal path of the arrow that lit the Olympic torch (Example 3).

**Solution**

**(a)** We use a coordinate system in which the positive $x$-axis lies along the ground toward the left (to match the second photograph in Figure 13.12) and the coordinates of the flaming arrow at $t = 0$ are $x_0 = 0$ and $y_0 = 6$ (Figure 13.13). We have

$$y = y_0 + (v_0 \sin\alpha)t - \frac{1}{2}gt^2 \qquad \text{Equation (5), } \mathbf{j}\text{-component}$$

$$= 6 + (v_0 \sin\alpha)t - \frac{1}{2}gt^2. \qquad y_0 = 6$$

We find the time when the arrow reaches its highest point by setting $dy/dt = 0$ and solving for $t$, obtaining

$$t = \frac{v_0 \sin\alpha}{g}.$$

For this value of $t$, the value of $y$ is

$$y_{max} = 6 + (v_0 \sin\alpha)\left(\frac{v_0 \sin\alpha}{g}\right) - \frac{1}{2}g\left(\frac{v_0 \sin\alpha}{g}\right)^2$$

$$= 6 + \frac{(v_0 \sin\alpha)^2}{2g}.$$

**(b)** Using $y_{max} = 74$ and $g = 32$, we see from the preceeding equation in part (a) that

$$74 = 6 + \frac{(v_0 \sin\alpha)^2}{2(32)}$$

or

$$v_0 \sin\alpha = \sqrt{(68)(64)}.$$

**(c)** When the arrow reaches $y_{max}$, the horizontal distance traveled to the center of the cauldron is $x = 90$ ft. We substitute the time to reach $y_{max}$ from part (a) and the horizontal distance $x = 90$ ft into the **i**-component of Equation (5) to obtain

$$x = x_0 + (v_0 \cos\alpha)t \qquad \text{Equation (5), } \mathbf{i}\text{-component}$$

$$90 = 0 + (v_0 \cos\alpha)t \qquad x = 90,\ x_0 = 0$$

$$= (v_0 \cos\alpha)\left(\frac{v_0 \sin\alpha}{g}\right). \qquad t = (v_0 \sin\alpha)/g$$

Solving this equation for $v_0 \cos\alpha$ and using $g = 32$ and the result from part (b), we have

$$v_0 \cos\alpha = \frac{90g}{v_0 \sin\alpha} = \frac{(90)(32)}{\sqrt{(68)(64)}}.$$

**(d)** Parts (b) and (c) together tell us that

$$\tan\alpha = \frac{v_0 \sin\alpha}{v_0 \cos\alpha} = \frac{\left(\sqrt{(68)(64)}\right)^2}{(90)(32)} = \frac{68}{45}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

or

$$\alpha = \tan^{-1}\left(\frac{68}{45}\right) \approx 56.5°.$$

This is Rebollo's firing angle. ■

## Projectile Motion with Wind Gusts

The next example shows how to account for another force acting on a projectile. We also assume that the path of the baseball in Example 4 lies in a vertical plane.

### EXAMPLE 4 Hitting a Baseball

A baseball is hit when it is 3 ft above the ground. It leaves the bat with initial speed of 152 ft/sec, making an angle of 20° with the horizontal. At the instant the ball is hit, an instantaneous gust of wind blows in the horizontal direction directly opposite the direction the ball is taking toward the outfield, adding a component of $-8.8\mathbf{i}$ (ft/sec) to the ball's initial velocity (8.8 ft/sec = 6 mph).

**(a)** Find a vector equation (position vector) for the path of the baseball.

**(b)** How high does the baseball go, and when does it reach maximum height?

**(c)** Assuming that the ball is not caught, find its range and flight time.

**Solution**

**(a)** Using Equation (1) and accounting for the gust of wind, the initial velocity of the baseball is

$$\begin{aligned}\mathbf{v}_0 &= (v_0 \cos\alpha)\mathbf{i} + (v_0 \sin\alpha)\mathbf{j} - 8.8\mathbf{i} \\ &= (152 \cos 20°)\mathbf{i} + (152 \sin 20°)\mathbf{j} - (8.8)\mathbf{i} \\ &= (152 \cos 20° - 8.8)\mathbf{i} + (152 \sin 20°)\mathbf{j}.\end{aligned}$$

The initial position is $\mathbf{r}_0 = 0\mathbf{i} + 3\mathbf{j}$. Integration of $d^2\mathbf{r}/dt^2 = -g\mathbf{j}$ gives

$$\frac{d\mathbf{r}}{dt} = -(gt)\mathbf{j} + \mathbf{v}_0.$$

A second integration gives

$$\mathbf{r} = -\frac{1}{2}gt^2\mathbf{j} + \mathbf{v}_0 t + \mathbf{r}_0.$$

Substituting the values of $\mathbf{v}_0$ and $\mathbf{r}_0$ into the last equation gives the position vector of the baseball.

$$\begin{aligned}\mathbf{r} &= -\frac{1}{2}gt^2\mathbf{j} + \mathbf{v}_0 t + \mathbf{r}_0 \\ &= -16t^2\mathbf{j} + (152 \cos 20° - 8.8)t\mathbf{i} + (152 \sin 20°)t\mathbf{j} + 3\mathbf{j} \\ &= (152 \cos 20° - 8.8)t\mathbf{i} + \left(3 + (152 \sin 20°)t - 16t^2\right)\mathbf{j}.\end{aligned}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**(b)** The baseball reaches its highest point when the vertical component of velocity is zero, or

$$\frac{dy}{dt} = 152 \sin 20° - 32t = 0.$$

Solving for $t$ we find

$$t = \frac{152 \sin 20°}{32} \approx 1.62 \text{ sec}.$$

Substituting this time into the vertical component for **r** gives the maximum height

$$\begin{aligned} y_{\max} &= 3 + (152 \sin 20°)(1.62) - 16(1.62)^2 \\ &\approx 45.2 \text{ ft}. \end{aligned}$$

That is, the maximum height of the baseball is about 45.2 ft, reached about 1.6 sec after leaving the bat.

**(c)** To find when the baseball lands, we set the vertical component for **r** equal to 0 and solve for $t$:

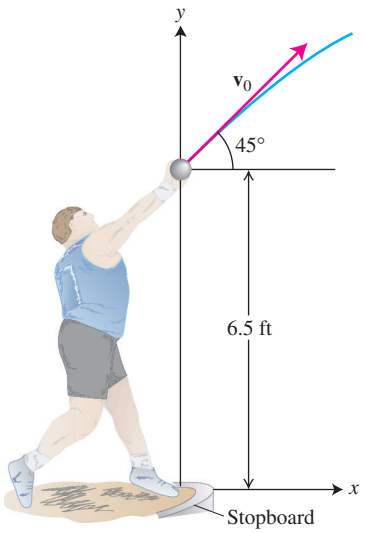
$$\begin{aligned} 3 + (152 \sin 20°)t - 16t^2 &= 0 \\ 3 + (51.99)t - 16t^2 &= 0. \end{aligned}$$

The solution values are about $t = 3.3$ sec and $t = -0.06$ sec. Substituting the positive time into the horizontal component for **r**, we find the range

$$\begin{aligned} R &= (152 \cos 20° - 8.8)(3.3) \\ &\approx 442 \text{ ft}. \end{aligned}$$

Thus, the horizontal range is about 442 ft, and the flight time is about 3.3 sec. ■

In Exercises 29 through 31, we consider projectile motion when there is air resistance slowing down the flight.



Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## EXERCISES 13.2

Projectile flights in the following exercises are to be treated as ideal unless stated otherwise. All launch angles are assumed to be measured from the horizontal. All projectiles are assumed to be launched from the origin over a horizontal surface unless stated otherwise.

1. **Travel time** A projectile is fired at a speed of 840 m/sec at an angle of 60°. How long will it take to get 21 km downrange?
2. **Finding muzzle speed** Find the muzzle speed of a gun whose maximum range is 24.5 km.
3. **Flight time and height** A projectile is fired with an initial speed of 500 m/sec at an angle of elevation of 45°.
   a. When and how far away will the projectile strike?
   b. How high overhead will the projectile be when it is 5 km downrange?
   c. What is the greatest height reached by the projectile?
4. **Throwing a baseball** A baseball is thrown from the stands 32 ft above the field at an angle of 30° up from the horizontal. When and how far away will the ball strike the ground if its initial speed is 32 ft/sec?
5. **Shot put** An athlete puts a 16-lb shot at an angle of 45° to the horizontal from 6.5 ft above the ground at an initial speed of 44 ft/sec as suggested in the accompanying figure. How long after launch and how far from the inner edge of the stopboard does the shot land?

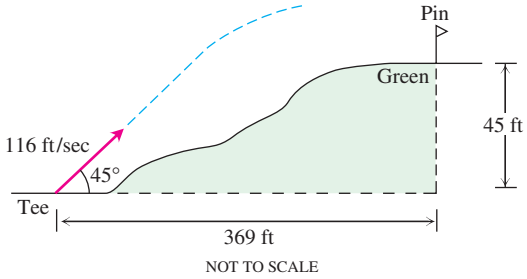
Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**6.** (*Continuation of Exercise* 5.) Because of its initial elevation, the shot in Exercise 5 would have gone slightly farther if it had been launched at a 40° angle. How much farther? Answer in inches.

**7. Firing golf balls** A spring gun at ground level fires a golf ball at an angle of 45°. The ball lands 10 m away.

**a.** What was the ball's initial speed?

**b.** For the same initial speed, find the two firing angles that make the range 6 m.

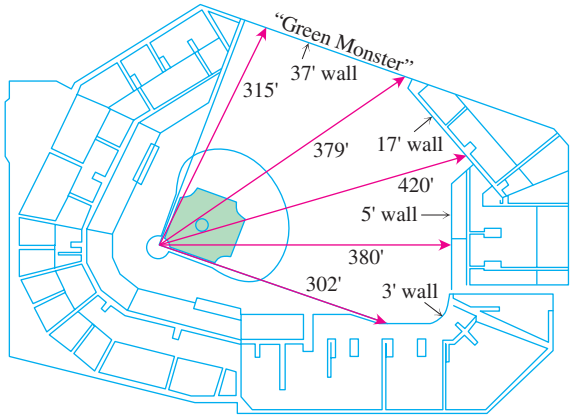


**8. Beaming electrons** An electron in a TV tube is beamed horizontally at a speed of $5 \times 10^6$ m/sec toward the face of the tube 40 cm away. About how far will the electron drop before it hits?

**9. Finding golf ball speed** Laboratory tests designed to find how far golf balls of different hardness go when hit with a driver showed that a 100-compression ball hit with a club-head speed of 100 mph at a launch angle of 9° carried 248.8 yd. What was the launch speed of the ball? (It was more than 100 mph. At the same time the club head was moving forward, the compressed ball was kicking away from the club face, adding to the ball's forward speed.)

**10.** A *human cannonball* is to be fired with an initial speed of $v_0 = 80\sqrt{10}/3$ ft/sec. The circus performer (of the right caliber, naturally) hopes to land on a special cushion located 200 ft downrange at the same height as the muzzle of the cannon. The circus is being held in a large room with a flat ceiling 75 ft higher than the muzzle. Can the performer be fired to the cushion without striking the ceiling? If so, what should the cannon's angle of elevation be?

**11.** A golf ball leaves the ground at a 30° angle at a speed of 90 ft/sec. Will it clear the top of a 30-ft tree that is in the way, 135 ft down the fairway? Explain.



**12. Elevated green** A golf ball is hit with an initial speed of 116 ft/sec at an angle of elevation of 45° from the tee to a green that is elevated 45 ft above the tee as shown in the diagram. Assuming that the pin, 369 ft downrange, does not get in the way, where will the ball land in relation to the pin?

**13. The Green Monster** A baseball hit by a Boston Red Sox player at a 20° angle from 3 ft above the ground just cleared the left end of the "Green Monster," the left-field wall in Fenway Park. This wall is 37 ft high and 315 ft from home plate (see the accompanying figure).

**a.** What was the initial speed of the ball?

**b.** How long did it take the ball to reach the wall?

**14. Equal-range firing angles** Show that a projectile fired at an angle of $\alpha$ degrees, $0 < \alpha < 90$, has the same range as a projectile fired at the same speed at an angle of $(90 - \alpha)$ degrees. (In models that take air resistance into account, this symmetry is lost.)

**15. Equal-range firing angles** What two angles of elevation will enable a projectile to reach a target 16 km downrange on the same level as the gun if the projectile's initial speed is 400 m/sec?

**16. Range and height versus speed**

**a.** Show that doubling a projectile's initial speed at a given launch angle multiplies its range by 4.

**b.** By about what percentage should you increase the initial speed to double the height and range?

**17. Shot put** In Moscow in 1987, Natalya Lisouskaya set a women's world record by putting an 8 lb 13 oz shot 73 ft 10 in. Assuming that she launched the shot at a 40° angle to the horizontal from 6.5 ft above the ground, what was the shot's initial speed?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**18. Height versus time** Show that a projectile attains three-quarters of its maximum height in half the time it takes to reach the maximum height.

**19. Firing from $(x_0, y_0)$** Derive the equations

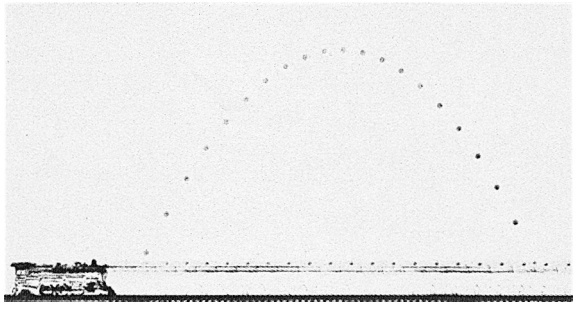
$$x = x_0 + (v_0 \cos \alpha)t,$$

$$y = y_0 + (v_0 \sin \alpha)t - \frac{1}{2}gt^2,$$

(see Equation (5) in the text) by solving the following initial value problem for a vector $\mathbf{r}$ in the plane.

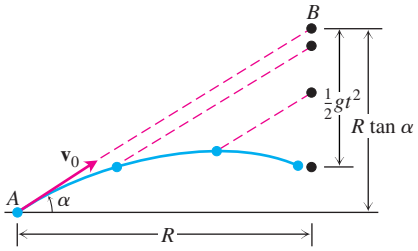
Differential equation: $\dfrac{d^2\mathbf{r}}{dt^2} = -g\mathbf{j}$

Initial conditions: $\mathbf{r}(0) = x_0\mathbf{i} + y_0\mathbf{j}$



$$\frac{d\mathbf{r}}{dt}(0) = (v_0 \cos \alpha)\mathbf{i} + (v_0 \sin \alpha)\mathbf{j}$$

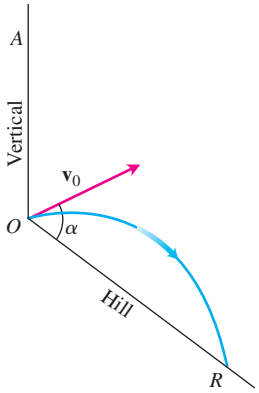
**20. Flaming arrow** Using the firing angle found in Example 3, find the speed at which the flaming arrow left Rebollo's bow. See Figure 13.13.



**21. Flaming arrow** The cauldron in Example 3 is 12 ft in diameter. Using Equation (5) and Example 3c, find how long it takes the flaming arrow to cover the horizontal distance to the rim. How high is the arrow at this time?

**22.** Describe the path of a projectile given by Equations (4) when $\alpha = 90°$.

**23. Model train** The accompanying multiflash photograph shows a model train engine moving at a constant speed on a straight horizontal track. As the engine moved along, a marble was fired into the air by a spring in the engine's smokestack. The marble, which continued to move with the same forward speed as the engine, rejoined the engine 1 sec after it was fired. Measure the angle the marble's path made with the horizontal and use the information to find how high the marble went and how fast the engine was moving.



**24. Colliding marbles** The figure shows an experiment with two marbles. Marble $A$ was launched toward marble $B$ with launch angle $\alpha$ and initial speed $v_0$. At the same instant, marble $B$ was released to fall from rest at $R \tan \alpha$ units directly above a spot $R$ units downrange from $A$. The marbles were found to collide regardless of the value of $v_0$. Was this mere coincidence, or must this happen? Give reasons for your answer.

**25. Launching downhill** An ideal projectile is launched straight down an inclined plane as shown in the accompanying figure.

**a.** Show that the greatest downhill range is achieved when the initial velocity vector bisects angle $AOR$.

**b.** If the projectile were fired uphill instead of down, what launch angle would maximize its range? Give reasons for your answer.

**26. Hitting a baseball under a wind gust** A baseball is hit when it is 2.5 ft above the ground. It leaves the bat with an initial velocity of 145 ft/sec at a launch angle of 23°. At the instant the ball is hit, an instantaneous gust of wind blows against the ball, adding a component of $-14\mathbf{i}$ (ft/sec) to the ball's initial velocity. A 15-ft-high fence lies 300 ft from home plate in the direction of the flight.

**a.** Find a vector equation for the path of the baseball.

**b.** How high does the baseball go, and when does it reach maximum height?

**c.** Find the range and flight time of the baseball, assuming that the ball is not caught.

**d.** When is the baseball 20 ft high? How far (ground distance) is the baseball from home plate at that height?

**e.** Has the batter hit a home run? Explain.

**27. Volleyball** A volleyball is hit when it is 4 ft above the ground and 12 ft from a 6-ft-high net. It leaves the point of impact with an initial velocity of 35 ft/sec at an angle of 27° and slips by the opposing team untouched.

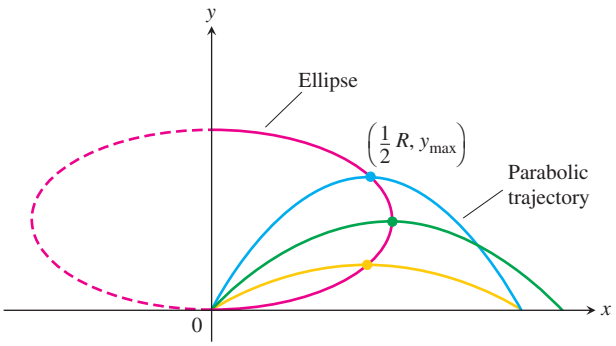
Exercises

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**a.** Find a vector equation for the path of the volleyball.

**b.** How high does the volleyball go, and when does it reach maximum height?

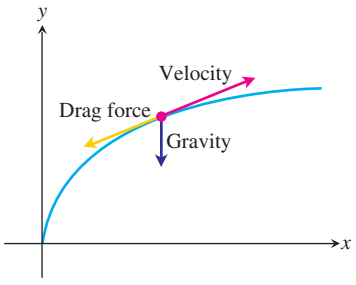
**c.** Find its range and flight time.



**d.** When is the volleyball 7 ft above the ground? How far (ground distance) is the volleyball from where it will land?

**e.** Suppose that the net is raised to 8 ft. Does this change things? Explain.

**28. Where trajectories crest** For a projectile fired from the ground at launch angle $\alpha$ with initial speed $v_0$, consider $\alpha$ as a variable and $v_0$ as a fixed constant. For each $\alpha$, $0 < \alpha < \pi/2$, we obtain a parabolic trajectory as shown in the accompanying figure. Show that the points in the plane that give the maximum heights of these parabolic trajectories all lie on the ellipse



$$x^2 + 4\left(y - \frac{v_0^2}{4g}\right)^2 = \frac{v_0^4}{4g^2},$$

where $x \geq 0$.

## Projectile Motion with Linear Drag

The main force affecting the motion of a projectile, other than gravity, is air resistance. This slowing down force is **drag force**, and it acts in a direction *opposite* to the velocity of the projectile (see accompanying figure). For projectiles moving through the air at relatively low speeds, however, the drag force is (very nearly) proportional to the speed (to the first power) and so is called **linear**.

**29. Linear drag** Derive the equations

$$x = \frac{v_0}{k}(1 - e^{-kt})\cos\alpha$$

$$y = \frac{v_0}{k}(1 - e^{-kt})(\sin\alpha) + \frac{g}{k^2}(1 - kt - e^{-kt})$$

by solving the following initial value problem for a vector $\mathbf{r}$ in the plane.

Differential equation: $\dfrac{d^2\mathbf{r}}{dt^2} = -g\mathbf{j} - k\mathbf{v} = -g\mathbf{j} - k\dfrac{d\mathbf{r}}{dt}$

Initial conditions: $\mathbf{r}(0) = \mathbf{0}$

$$\left.\frac{d\mathbf{r}}{dt}\right|_{t=0} = \mathbf{v}_0 = (v_0\cos\alpha)\mathbf{i} + (v_0\sin\alpha)\mathbf{j}$$

The **drag coefficient** $k$ is a positive constant representing resistance due to air density, $v_0$ and $\alpha$ are the projectile's initial speed and launch angle, and $g$ is the acceleration of gravity.

**30. Hitting a baseball with linear drag** Consider the baseball problem in Example 4 when there is linear drag (see Exercise 29). Assume a drag coefficient $k = 0.12$, but no gust of wind.

**a.** From Exercise 29, find a vector form for the path of the baseball.

**b.** How high does the baseball go, and when does it reach maximum height?

**c.** Find the range and flight time of the baseball.

**d.** When is the baseball 30 ft high? How far (ground distance) is the baseball from home plate at that height?

**e.** A 10-ft-high outfield fence is 340 ft from home plate in the direction of the flight of the baseball. The outfielder can jump and catch any ball up to 11 ft off the ground to stop it from going over the fence. Has the batter hit a home run?

**31. Hitting a baseball with linear drag under a wind gust** Consider again the baseball problem in Example 4. This time assume a drag coefficient of 0.08 *and* an instantaneous gust of wind that adds a component of $-17.6\mathbf{i}$ (ft/sec) to the initial velocity at the instant the baseball is hit.

**a.** Find a vector equation for the path of the baseball.

**b.** How high does the baseball go, and when does it reach maximum height?

**c.** Find the range and flight time of the baseball.

**d.** When is the baseball 35 ft high? How far (ground distance) is the baseball from home plate at that height?

**e.** A 20-ft-high outfield fence is 380 ft from home plate in the direction of the flight of the baseball. Has the batter hit a home run? If "yes," what change in the horizontal component of the ball's initial velocity would have kept the ball in the park? If "no," what change would have allowed it to be a home run?

# 13.3 Arc Length and the Unit Tangent Vector T

Imagine the motions you might experience traveling at high speeds along a path through the air or space. Specifically, imagine the motions of turning to your left or right and the up-and-down motions tending to lift you from, or pin you down to, your seat. Pilots flying through the atmosphere, turning and twisting in flight acrobatics, certainly experience these motions. Turns that are too tight, descents or climbs that are too steep, or either one coupled with high and increasing speed can cause an aircraft to spin out of control, possibly even to break up in midair, and crash to Earth.

In this and the next two sections, we study the features of a curve's shape that describe mathematically the sharpness of its turning and its twisting perpendicular to the forward motion.

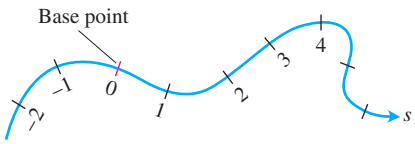

**FIGURE 13.14** Smooth curves can be scaled like number lines, the coordinate of each point being its directed distance along the curve from a preselected base point.

## Arc Length Along a Space Curve

One of the features of smooth space curves is that they have a measurable length. This enables us to locate points along these curves by giving their directed distance $s$ along the curve from some **base point**, the way we locate points on coordinate axes by giving their directed distance from the origin (Figure 13.14). Time is the natural parameter for describing a moving body's velocity and acceleration, but $s$ is the natural parameter for studying a curve's shape. Both parameters appear in analyses of space flight.

To measure distance along a smooth curve in space, we add a $z$-term to the formula we use for curves in the plane.

**DEFINITION Length of a Smooth Curve**

The **length** of a smooth curve $\mathbf{r}(t) = x(t)\mathbf{i} + y(t)\mathbf{j} + z(t)\mathbf{k}$, $a \le t \le b$, that is traced exactly once as $t$ increases from $t = a$ to $t = b$, is

$$L = \int_a^b \sqrt{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2 + \left(\frac{dz}{dt}\right)^2}\, dt. \tag{1}$$

Just as for plane curves, we can calculate the length of a curve in space from any convenient parametrization that meets the stated conditions. We omit the proof.

The square root in Equation (1) is $|\mathbf{v}|$, the length of a velocity vector $d\mathbf{r}/dt$. This enables us to write the formula for length a shorter way.

**Arc Length Formula**

$$L = \int_a^b |\mathbf{v}|\, dt \tag{2}$$

**EXAMPLE 1** Distance Traveled by a Glider

A glider is soaring upward along the helix $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + t\mathbf{k}$. How far does the glider travel along its path from $t = 0$ to $t = 2\pi \approx 6.28$ sec?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

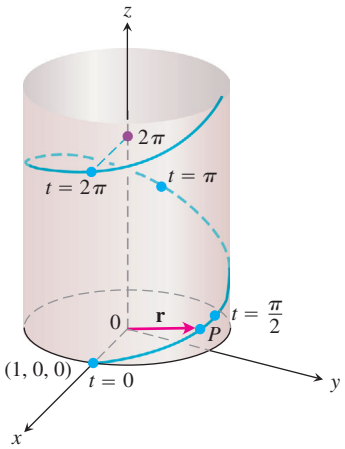

**FIGURE 13.15** The helix $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + t\mathbf{k}$ in Example 1.

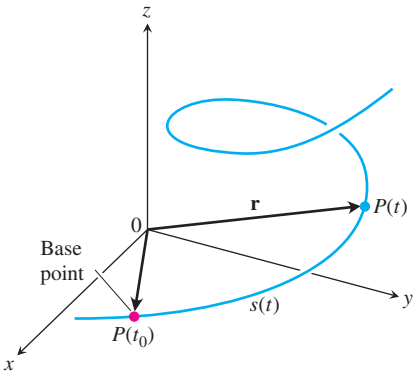

**FIGURE 13.16** The directed distance along the curve from $P(t_0)$ to any point $P(t)$ is

$$s(t) = \int_{t_0}^{t} |\mathbf{v}(\tau)|\, d\tau.$$

**Solution** The path segment during this time corresponds to one full turn of the helix (Figure 13.15). The length of this portion of the curve is

$$L = \int_a^b |\mathbf{v}|\, dt = \int_0^{2\pi} \sqrt{(-\sin t)^2 + (\cos t)^2 + (1)^2}\, dt$$

$$= \int_0^{2\pi} \sqrt{2}\, dt = 2\pi\sqrt{2} \text{ units of length.}$$

This is $\sqrt{2}$ times the length of the circle in the $xy$-plane over which the helix stands. ■

If we choose a base point $P(t_0)$ on a smooth curve $C$ parametrized by $t$, each value of $t$ determines a point $P(t) = (x(t), y(t), z(t))$ on $C$ and a "directed distance"

$$s(t) = \int_{t_0}^{t} |\mathbf{v}(\tau)|\, d\tau,$$

measured along $C$ from the base point (Figure 13.16). If $t > t_0$, $s(t)$ is the distance from $P(t_0)$ to $P(t)$. If $t < t_0$, $s(t)$ is the negative of the distance. Each value of $s$ determines a point on $C$ and this parametrizes $C$ with respect to $s$. We call $s$ an **arc length parameter** for the curve. The parameter's value increases in the direction of increasing $t$. The arc length parameter is particularly effective for investigating the turning and twisting nature of a space curve.

We use the Greek letter $\tau$ ("tau") as the variable of integration because the letter $t$ is already in use as the upper limit.

**Arc Length Parameter with Base Point $P(t_0)$**

$$s(t) = \int_{t_0}^{t} \sqrt{[x'(\tau)]^2 + [y'(\tau)]^2 + [z'(\tau)]^2}\, d\tau = \int_{t_0}^{t} |\mathbf{v}(\tau)|\, d\tau \qquad (3)$$

If a curve $\mathbf{r}(t)$ is already given in terms of some parameter $t$ and $s(t)$ is the arc length function given by Equation (3), then we may be able to solve for $t$ as a function of $s$: $t = t(s)$. Then the curve can be reparametrized in terms of $s$ by substituting for $t$: $\mathbf{r} = \mathbf{r}(t(s))$.

**EXAMPLE 2** Finding an Arc Length Parametrization

If $t_0 = 0$, the arc length parameter along the helix

$$\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + t\mathbf{k}$$

from $t_0$ to $t$ is

$$s(t) = \int_{t_0}^{t} |\mathbf{v}(\tau)|\, d\tau \qquad \text{Equation (3)}$$

$$= \int_0^t \sqrt{2}\, d\tau \qquad \text{Value from Example 1}$$

$$= \sqrt{2}\, t.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Solving this equation for $t$ gives $t = s/\sqrt{2}$. Substituting into the position vector $\mathbf{r}$ gives the following arc length parametrization for the helix:

$$\mathbf{r}(t(s)) = \left(\cos\frac{s}{\sqrt{2}}\right)\mathbf{i} + \left(\sin\frac{s}{\sqrt{2}}\right)\mathbf{j} + \frac{s}{\sqrt{2}}\,\mathbf{k}.$$

■

Unlike Example 2, the arc length parametrization is generally difficult to find analytically for a curve already given in terms of some other parameter $t$. Fortunately, however, we rarely need an exact formula for $s(t)$ or its inverse $t(s)$.

**EXAMPLE 3** Distance Along a Line

Show that if $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}$ is a unit vector, then the arc length parameter along the line

$$\mathbf{r}(t) = (x_0 + tu_1)\mathbf{i} + (y_0 + tu_2)\mathbf{j} + (z_0 + tu_3)\mathbf{k}$$

from the point $P_0(x_0, y_0, z_0)$ where $t = 0$ is $t$ itself.

**Solution**

$$\mathbf{v} = \frac{d}{dt}(x_0 + tu_1)\mathbf{i} + \frac{d}{dt}(y_0 + tu_2)\mathbf{j} + \frac{d}{dt}(z_0 + tu_3)\mathbf{k} = u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k} = \mathbf{u},$$

so

$$s(t) = \int_0^t |\mathbf{v}|\,d\tau = \int_0^t |\mathbf{u}|\,d\tau = \int_0^t 1\,d\tau = t.$$

■

## Speed on a Smooth Curve

Since the derivatives beneath the radical in Equation (3) are continuous (the curve is smooth), the Fundamental Theorem of Calculus tells us that $s$ is a differentiable function of $t$ with derivative

$$\frac{ds}{dt} = |\mathbf{v}(t)|. \tag{4}$$

As we already knew, the speed with which a particle moves along its path is the magnitude of $\mathbf{v}$.

Notice that although the base point $P(t_0)$ plays a role in defining $s$ in Equation (3), it plays no role in Equation (4). The rate at which a moving particle covers distance along its path is independent of how far away it is from the base point.

Notice also that $ds/dt > 0$ since, by definition, $|\mathbf{v}|$ is never zero for a smooth curve. We see once again that $s$ is an increasing function of $t$.

## Unit Tangent Vector T

We already know the velocity vector $\mathbf{v} = d\mathbf{r}/dt$ is tangent to the curve and that the vector

$$\mathbf{T} = \frac{\mathbf{v}}{|\mathbf{v}|}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

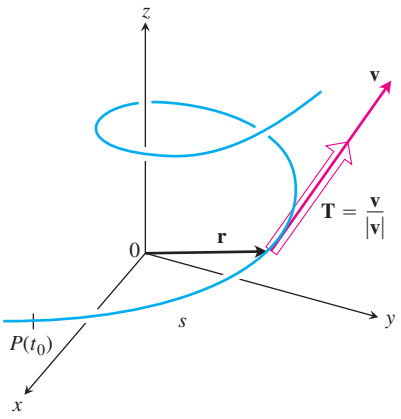

**FIGURE 13.17** We find the unit tangent vector **T** by dividing **v** by $|\mathbf{v}|$.

is therefore a unit vector tangent to the (smooth) curve. Since $ds/dt > 0$ for the curves we are considering, $s$ is one-to-one and has an inverse that gives $t$ as a differentiable function of $s$ (Section 7.1). The derivative of the inverse is

$$\frac{dt}{ds} = \frac{1}{ds/dt} = \frac{1}{|\mathbf{v}|}.$$

This makes $\mathbf{r}$ a differentiable function of $s$ whose derivative can be calculated with the Chain Rule to be

$$\frac{d\mathbf{r}}{ds} = \frac{d\mathbf{r}}{dt}\frac{dt}{ds} = \mathbf{v}\frac{1}{|\mathbf{v}|} = \frac{\mathbf{v}}{|\mathbf{v}|} = \mathbf{T}.$$

This equation says that $d\mathbf{r}/ds$ is the unit tangent vector in the direction of the velocity vector $\mathbf{v}$ (Figure 13.17).

**DEFINITION Unit Tangent Vector**

The **unit tangent vector** of a smooth curve $\mathbf{r}(t)$ is

$$\mathbf{T} = \frac{d\mathbf{r}}{ds} = \frac{d\mathbf{r}/dt}{ds/dt} = \frac{\mathbf{v}}{|\mathbf{v}|}. \tag{5}$$

The unit tangent vector $\mathbf{T}$ is a differentiable function of $t$ whenever $\mathbf{v}$ is a differentiable function of $t$. As we see in Section 13.5, $\mathbf{T}$ is one of three unit vectors in a traveling reference frame that is used to describe the motion of space vehicles and other bodies traveling in three dimensions.

**EXAMPLE 4** Finding the Unit Tangent Vector **T**

Find the unit tangent vector of the curve

$$\mathbf{r}(t) = (3\cos t)\mathbf{i} + (3\sin t)\mathbf{j} + t^2\mathbf{k}$$

representing the path of the glider in Example 4, Section 13.1.

**Solution** In that example, we found

$$\mathbf{v} = \frac{d\mathbf{r}}{dt} = -(3\sin t)\mathbf{i} + (3\cos t)\mathbf{j} + 2t\mathbf{k}$$

and

$$|\mathbf{v}| = \sqrt{9 + 4t^2}.$$

Thus,

$$\mathbf{T} = \frac{\mathbf{v}}{|\mathbf{v}|} = -\frac{3\sin t}{\sqrt{9+4t^2}}\mathbf{i} + \frac{3\cos t}{\sqrt{9+4t^2}}\mathbf{j} + \frac{2t}{\sqrt{9+4t^2}}\mathbf{k}.$$

■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

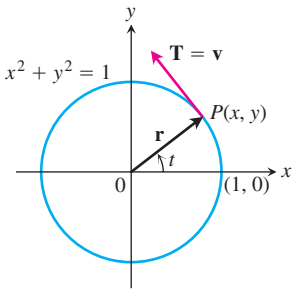

**FIGURE 13.18** The motion $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j}$ (Example 5).

**EXAMPLE 5** Motion on the Unit Circle

For the counterclockwise motion

$$\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j}$$

around the unit circle,

$$\mathbf{v} = (-\sin t)\mathbf{i} + (\cos t)\mathbf{j}$$

is already a unit vector, so $\mathbf{T} = \mathbf{v}$ (Figure 13.18). ■

# EXERCISES 13.3

## Finding Unit Tangent Vectors and Lengths of Curves

In Exercises 1–8, find the curve's unit tangent vector. Also, find the length of the indicated portion of the curve.

1. $\mathbf{r}(t) = (2\cos t)\mathbf{i} + (2\sin t)\mathbf{j} + \sqrt{5}t\,\mathbf{k}, \quad 0 \le t \le \pi$
2. $\mathbf{r}(t) = (6\sin 2t)\mathbf{i} + (6\cos 2t)\mathbf{j} + 5t\,\mathbf{k}, \quad 0 \le t \le \pi$
3. $\mathbf{r}(t) = t\,\mathbf{i} + (2/3)t^{3/2}\mathbf{k}, \quad 0 \le t \le 8$
4. $\mathbf{r}(t) = (2 + t)\mathbf{i} - (t + 1)\mathbf{j} + t\,\mathbf{k}, \quad 0 \le t \le 3$
5. $\mathbf{r}(t) = (\cos^3 t)\mathbf{j} + (\sin^3 t)\mathbf{k}, \quad 0 \le t \le \pi/2$
6. $\mathbf{r}(t) = 6t^3\mathbf{i} - 2t^3\mathbf{j} - 3t^3\mathbf{k}, \quad 1 \le t \le 2$
7. $\mathbf{r}(t) = (t\cos t)\mathbf{i} + (t\sin t)\mathbf{j} + \left(2\sqrt{2}/3\right)t^{3/2}\mathbf{k}, \quad 0 \le t \le \pi$
8. $\mathbf{r}(t) = (t\sin t + \cos t)\mathbf{i} + (t\cos t - \sin t)\mathbf{j}, \quad \sqrt{2} \le t \le 2$
9. Find the point on the curve

$$\mathbf{r}(t) = (5\sin t)\mathbf{i} + (5\cos t)\mathbf{j} + 12t\,\mathbf{k}$$

at a distance $26\pi$ units along the curve from the origin in the direction of increasing arc length.

10. Find the point on the curve

$$\mathbf{r}(t) = (12\sin t)\mathbf{i} - (12\cos t)\mathbf{j} + 5t\,\mathbf{k}$$

at a distance $13\pi$ units along the curve from the origin in the direction opposite to the direction of increasing arc length.

## Arc Length Parameter

In Exercises 11–14, find the arc length parameter along the curve from the point where $t = 0$ by evaluating the integral

$$s = \int_0^t |\mathbf{v}(\tau)|\,d\tau$$

from Equation (3). Then find the length of the indicated portion of the curve.

11. $\mathbf{r}(t) = (4\cos t)\mathbf{i} + (4\sin t)\mathbf{j} + 3t\,\mathbf{k}, \quad 0 \le t \le \pi/2$
12. $\mathbf{r}(t) = (\cos t + t\sin t)\mathbf{i} + (\sin t - t\cos t)\mathbf{j}, \quad \pi/2 \le t \le \pi$
13. $\mathbf{r}(t) = (e^t\cos t)\mathbf{i} + (e^t\sin t)\mathbf{j} + e^t\mathbf{k}, \quad -\ln 4 \le t \le 0$
14. $\mathbf{r}(t) = (1 + 2t)\mathbf{i} + (1 + 3t)\mathbf{j} + (6 - 6t)\mathbf{k}, \quad -1 \le t \le 0$

## Theory and Examples

15. **Arc length** Find the length of the curve

$$\mathbf{r}(t) = \left(\sqrt{2}t\right)\mathbf{i} + \left(\sqrt{2}t\right)\mathbf{j} + (1 - t^2)\mathbf{k}$$

from $(0, 0, 1)$ to $\left(\sqrt{2}, \sqrt{2}, 0\right)$.

16. **Length of helix** The length $2\pi\sqrt{2}$ of the turn of the helix in Example 1 is also the length of the diagonal of a square $2\pi$ units on a side. Show how to obtain this square by cutting away and flattening a portion of the cylinder around which the helix winds.

17. **Ellipse**

**a.** Show that the curve $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + (1 - \cos t)\mathbf{k}$, $0 \le t \le 2\pi$, is an ellipse by showing that it is the intersection of a right circular cylinder and a plane. Find equations for the cylinder and plane.

**b.** Sketch the ellipse on the cylinder. Add to your sketch the unit tangent vectors at $t = 0, \pi/2, \pi$, and $3\pi/2$.

**c.** Show that the acceleration vector always lies parallel to the plane (orthogonal to a vector normal to the plane). Thus, if you draw the acceleration as a vector attached to the ellipse, it will lie in the plane of the ellipse. Add the acceleration vectors for $t = 0, \pi/2, \pi$, and $3\pi/2$ to your sketch.

**d.** Write an integral for the length of the ellipse. Do not try to evaluate the integral; it is nonelementary.

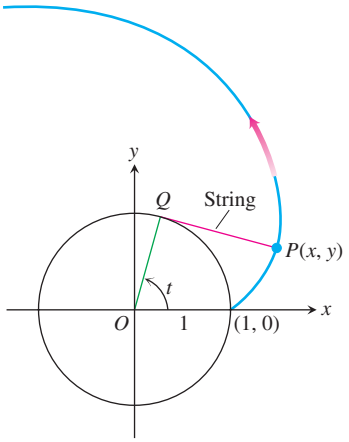
**T** **e. Numerical integrator** Estimate the length of the ellipse to two decimal places.

18. **Length is independent of parametrization** To illustrate that the length of a smooth space curve does not depend on

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

the parametrization you use to compute it, calculate the length of one turn of the helix in Example 1 with the following parametrizations.

**a.** $\mathbf{r}(t) = (\cos 4t)\mathbf{i} + (\sin 4t)\mathbf{j} + 4t\mathbf{k}, \quad 0 \le t \le \pi/2$



**b.** $\mathbf{r}(t) = [\cos(t/2)]\mathbf{i} + [\sin(t/2)]\mathbf{j} + (t/2)\mathbf{k}, \quad 0 \le t \le 4\pi$

**c.** $\mathbf{r}(t) = (\cos t)\mathbf{i} - (\sin t)\mathbf{j} - t\mathbf{k}, \quad -2\pi \le t \le 0$

**19. The involute of a circle** If a string wound around a fixed circle is unwound while held taut in the plane of the circle, its end $P$ traces an *involute* of the circle. In the accompanying figure, the circle in question is the circle $x^2 + y^2 = 1$ and the tracing point starts at (1, 0). The unwound portion of the string is tangent to the circle at $Q$, and $t$ is the radian measure of the angle from the positive $x$-axis to segment $OQ$. Derive the parametric equations

$$x = \cos t + t \sin t, \quad y = \sin t - t \cos t, \quad t > 0$$

of the point $P(x, y)$ for the involute.

**20.** (*Continuation of Exercise 19.*) Find the unit tangent vector to the involute of the circle at the point $P(x, y)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# 13.4 Curvature and the Unit Normal Vector N

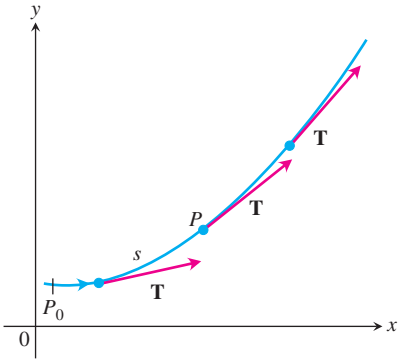


**FIGURE 13.19** As $P$ moves along the curve in the direction of increasing arc length, the unit tangent vector turns. The value of $|d\mathbf{T}/ds|$ at $P$ is called the *curvature* of the curve at $P$.

In this section we study how a curve turns or bends. We look first at curves in the coordinate plane, and then at curves in space.

## Curvature of a Plane Curve

As a particle moves along a smooth curve in the plane, $\mathbf{T} = d\mathbf{r}/ds$ turns as the curve bends. Since $\mathbf{T}$ is a unit vector, its length remains constant and only its direction changes as the particle moves along the curve. The rate at which $\mathbf{T}$ turns per unit of length along the curve is called the *curvature* (Figure 13.19). The traditional symbol for the curvature function is the Greek letter $\kappa$ ("kappa").

**DEFINITION Curvature**

If $\mathbf{T}$ is the unit vector of a smooth curve, the **curvature** function of the curve is

$$\kappa = \left|\frac{d\mathbf{T}}{ds}\right|.$$

If $|d\mathbf{T}/ds|$ is large, $\mathbf{T}$ turns sharply as the particle passes through $P$, and the curvature at $P$ is large. If $|d\mathbf{T}/ds|$ is close to zero, $\mathbf{T}$ turns more slowly and the curvature at $P$ is smaller.

If a smooth curve $\mathbf{r}(t)$ is already given in terms of some parameter $t$ other than the arc length parameter $s$, we can calculate the curvature as

$$\kappa = \left|\frac{d\mathbf{T}}{ds}\right| = \left|\frac{d\mathbf{T}}{dt}\frac{dt}{ds}\right| \qquad \text{Chain Rule}$$

$$= \frac{1}{|ds/dt|}\left|\frac{d\mathbf{T}}{dt}\right|$$

$$= \frac{1}{|\mathbf{v}|}\left|\frac{d\mathbf{T}}{dt}\right|. \qquad \frac{ds}{dt} = |\mathbf{v}|$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

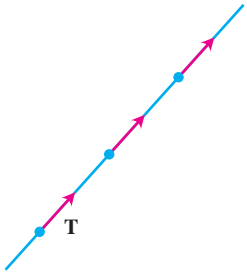

**FIGURE 13.20** Along a straight line, **T** always points in the same direction. The curvature, $|d\mathbf{T}/ds|$, is zero (Example 1).

**Formula for Calculating Curvature**

If $\mathbf{r}(t)$ is a smooth curve, then the curvature is

$$\kappa = \frac{1}{|\mathbf{v}|}\left|\frac{d\mathbf{T}}{dt}\right|, \tag{1}$$

where $\mathbf{T} = \mathbf{v}/|\mathbf{v}|$ is the unit tangent vector.

Testing the definition, we see in Examples 1 and 2 below that the curvature is constant for straight lines and circles.

**EXAMPLE 1** The Curvature of a Straight Line Is Zero

On a straight line, the unit tangent vector **T** always points in the same direction, so its components are constants. Therefore, $|d\mathbf{T}/ds| = |\mathbf{0}| = 0$ (Figure 13.20). ■

**EXAMPLE 2** The Curvature of a Circle of Radius $a$ is $1/a$

To see why, we begin with the parametrization

$$\mathbf{r}(t) = (a\cos t)\mathbf{i} + (a\sin t)\mathbf{j}$$

of a circle of radius $a$. Then,

$$\mathbf{v} = \frac{d\mathbf{r}}{dt} = -(a\sin t)\mathbf{i} + (a\cos t)\mathbf{j}$$

$$|\mathbf{v}| = \sqrt{(-a\sin t)^2 + (a\cos t)^2} = \sqrt{a^2} = |a| = a. \qquad \text{Since } a > 0,\ |a| = a.$$

From this we find

$$\mathbf{T} = \frac{\mathbf{v}}{|\mathbf{v}|} = -(\sin t)\mathbf{i} + (\cos t)\mathbf{j}$$

$$\frac{d\mathbf{T}}{dt} = -(\cos t)\mathbf{i} - (\sin t)\mathbf{j}$$

$$\left|\frac{d\mathbf{T}}{dt}\right| = \sqrt{\cos^2 t + \sin^2 t} = 1.$$

Hence, for any value of the parameter $t$,

$$\kappa = \frac{1}{|\mathbf{v}|}\left|\frac{d\mathbf{T}}{dt}\right| = \frac{1}{a}(1) = \frac{1}{a}.$$

■

Although the formula for calculating $\kappa$ in Equation (1) is also valid for space curves, in the next section we find a computational formula that is usually more convenient to apply.

Among the vectors orthogonal to the unit tangent vector **T** is one of particular significance because it points in the direction in which the curve is turning. Since **T** has constant length (namely, 1), the derivative $d\mathbf{T}/ds$ is orthogonal to **T** (Section 13.1). Therefore, if we divide $d\mathbf{T}/ds$ by its length $\kappa$, we obtain a *unit* vector **N** orthogonal to **T** (Figure 13.21).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

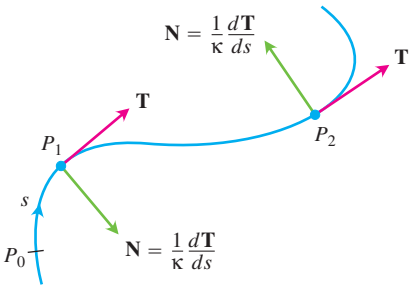

**FIGURE 13.21** The vector $d\mathbf{T}/ds$, normal to the curve, always points in the direction in which $\mathbf{T}$ is turning. The unit normal vector $\mathbf{N}$ is the direction of $d\mathbf{T}/ds$.

**DEFINITION Principal Unit Normal**

At a point where $\kappa \neq 0$, the **principal unit normal** vector for a smooth curve in the plane is

$$\mathbf{N} = \frac{1}{\kappa}\frac{d\mathbf{T}}{ds}.$$

The vector $d\mathbf{T}/ds$ points in the direction in which $\mathbf{T}$ turns as the curve bends. Therefore, if we face in the direction of increasing arc length, the vector $d\mathbf{T}/ds$ points toward the right if $\mathbf{T}$ turns clockwise and toward the left if $\mathbf{T}$ turns counterclockwise. In other words, the principal normal vector $\mathbf{N}$ will point toward the concave side of the curve (Figure 13.21).

If a smooth curve $\mathbf{r}(t)$ is already given in terms of some parameter $t$ other than the arc length parameter $s$, we can use the Chain Rule to calculate $\mathbf{N}$ directly:

$$\mathbf{N} = \frac{d\mathbf{T}/ds}{|d\mathbf{T}/ds|}$$

$$= \frac{(d\mathbf{T}/dt)(dt/ds)}{|d\mathbf{T}/dt||dt/ds|}$$

$$= \frac{d\mathbf{T}/dt}{|d\mathbf{T}/dt|}. \qquad \frac{dt}{ds} = \frac{1}{ds/dt} > 0 \text{ cancels}$$

This formula enables us to find $\mathbf{N}$ without having to find $\kappa$ and $s$ first.

**Formula for Calculating N**

If $\mathbf{r}(t)$ is a smooth curve, then the principal unit normal is

$$\mathbf{N} = \frac{d\mathbf{T}/dt}{|d\mathbf{T}/dt|}, \tag{2}$$

where $\mathbf{T} = \mathbf{v}/|\mathbf{v}|$ is the unit tangent vector.

**EXAMPLE 3** Finding **T** and **N**

Find $\mathbf{T}$ and $\mathbf{N}$ for the circular motion

$$\mathbf{r}(t) = (\cos 2t)\mathbf{i} + (\sin 2t)\mathbf{j}.$$

**Solution** We first find $\mathbf{T}$:

$$\mathbf{v} = -(2\sin 2t)\mathbf{i} + (2\cos 2t)\mathbf{j}$$

$$|\mathbf{v}| = \sqrt{4\sin^2 2t + 4\cos^2 2t} = 2$$

$$\mathbf{T} = \frac{\mathbf{v}}{|\mathbf{v}|} = -(\sin 2t)\mathbf{i} + (\cos 2t)\mathbf{j}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

From this we find

$$\frac{d\mathbf{T}}{dt} = -(2\cos 2t)\mathbf{i} - (2\sin 2t)\mathbf{j}$$

$$\left|\frac{d\mathbf{T}}{dt}\right| = \sqrt{4\cos^2 2t + 4\sin^2 2t} = 2$$

and

$$\mathbf{N} = \frac{d\mathbf{T}/dt}{|d\mathbf{T}/dt|}$$

$$= -(\cos 2t)\mathbf{i} - (\sin 2t)\mathbf{j}. \quad \text{Equation (2)}$$

Notice that $\mathbf{T} \cdot \mathbf{N} = 0$, verifying that $\mathbf{N}$ is orthogonal to $\mathbf{T}$. Notice too, that for the circular motion here, $\mathbf{N}$ points from $\mathbf{r}(t)$ towards the circle's center at the origin. ■

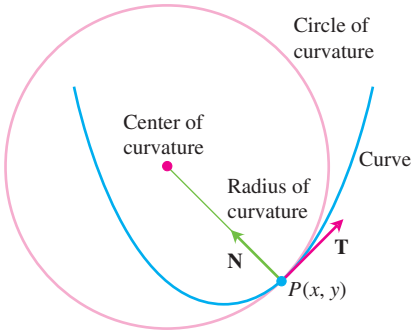

**FIGURE 13.22** The osculating circle at $P(x, y)$ lies toward the inner side of the curve.

## Circle of Curvature for Plane Curves

The **circle of curvature** or **osculating circle** at a point $P$ on a plane curve where $\kappa \neq 0$ is the circle in the plane of the curve that

1. is tangent to the curve at $P$ (has the same tangent line the curve has)
2. has the same curvature the curve has at $P$
3. lies toward the concave or inner side of the curve (as in Figure 13.22).

The **radius of curvature** of the curve at $P$ is the radius of the circle of curvature, which, according to Example 2, is

$$\text{Radius of curvature} = \rho = \frac{1}{\kappa}.$$

To find $\rho$, we find $\kappa$ and take the reciprocal. The **center of curvature** of the curve at $P$ is the center of the circle of curvature.

### EXAMPLE 4 Finding the Osculating Circle for a Parabola

Find and graph the osculating circle of the parabola $y = x^2$ at the origin.

**Solution** We parametrize the parabola using the parameter $t = x$ (Section 10.4, Example 1)

$$\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j}.$$

First we find the curvature of the parabola at the origin, using Equation (1):

$$\mathbf{v} = \frac{d\mathbf{r}}{dt} = \mathbf{i} + 2t\mathbf{j}$$

$$|\mathbf{v}| = \sqrt{1 + 4t^2}$$

so that

$$\mathbf{T} = \frac{\mathbf{v}}{|\mathbf{v}|} = (1 + 4t^2)^{-1/2}\mathbf{i} + 2t(1 + 4t^2)^{-1/2}\mathbf{j}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

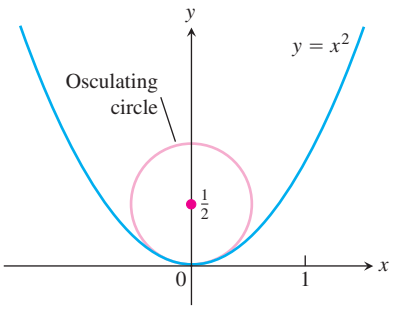

**FIGURE 13.23** The osculating circle for the parabola $y = x^2$ at the origin (Example 4).

From this we find

$$\frac{d\mathbf{T}}{dt} = -4t(1 + 4t^2)^{-3/2}\,\mathbf{i} + [2(1 + 4t^2)^{-1/2} - 8t^2(1 + 4t^2)^{-3/2}]\,\mathbf{j}.$$

At the origin, $t = 0$, so the curvature is

$$\kappa(0) = \frac{1}{|\mathbf{v}(0)|}\left|\frac{d\mathbf{T}}{dt}(0)\right| \qquad \text{Equation (1)}$$

$$= \frac{1}{\sqrt{1}}|0\mathbf{i} + 2\mathbf{j}|$$

$$= (1)\sqrt{0^2 + 2^2} = 2.$$

Therefore, the radius of curvature is $1/\kappa = 1/2$ and the center of the circle is $(0, 1/2)$ (see Figure 13.23). The equation of the osculating circle is

$$(x - 0)^2 + \left(y - \frac{1}{2}\right)^2 = \left(\frac{1}{2}\right)^2$$

or

$$x^2 + \left(y - \frac{1}{2}\right)^2 = \frac{1}{4}.$$

You can see from Figure 13.23 that the osculating circle is a better approximation to the parabola at the origin than is the tangent line approximation $y = 0$. ■

## Curvature and Normal Vectors for Space Curves

If a smooth curve in space is specified by the position vector $\mathbf{r}(t)$ as a function of some parameter $t$, and if $s$ is the arc length parameter of the curve, then the unit tangent vector $\mathbf{T}$ is $d\mathbf{r}/ds = \mathbf{v}/|\mathbf{v}|$. The **curvature** in space is then defined to be

$$\kappa = \left|\frac{d\mathbf{T}}{ds}\right| = \frac{1}{|\mathbf{v}|}\left|\frac{d\mathbf{T}}{dt}\right| \tag{3}$$

just as for plane curves. The vector $d\mathbf{T}/ds$ is orthogonal to $\mathbf{T}$, and we define the **principal unit normal** to be

$$\mathbf{N} = \frac{1}{\kappa}\frac{d\mathbf{T}}{ds} = \frac{d\mathbf{T}/dt}{|d\mathbf{T}/dt|}. \tag{4}$$

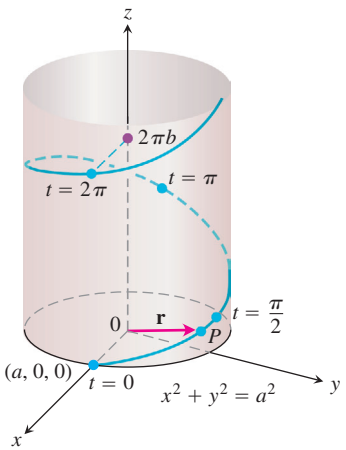

**FIGURE 13.24** The helix

$$\mathbf{r}(t) = (a\cos t)\mathbf{i} + (a\sin t)\mathbf{j} + bt\mathbf{k},$$

drawn with $a$ and $b$ positive and $t \geq 0$ (Example 5).

**EXAMPLE 5** Finding Curvature

Find the curvature for the helix (Figure 13.24)

$$\mathbf{r}(t) = (a\cos t)\mathbf{i} + (a\sin t)\mathbf{j} + bt\mathbf{k}, \qquad a, b \geq 0, \qquad a^2 + b^2 \neq 0.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** We calculate **T** from the velocity vector **v**:

$$\mathbf{v} = -(a\sin t)\mathbf{i} + (a\cos t)\mathbf{j} + b\mathbf{k}$$

$$|\mathbf{v}| = \sqrt{a^2\sin^2 t + a^2\cos^2 t + b^2} = \sqrt{a^2 + b^2}$$

$$\mathbf{T} = \frac{\mathbf{v}}{|\mathbf{v}|} = \frac{1}{\sqrt{a^2 + b^2}}[-(a\sin t)\mathbf{i} + (a\cos t)\mathbf{j} + b\mathbf{k}].$$

Then using Equation (3),

$$\kappa = \frac{1}{|\mathbf{v}|}\left|\frac{d\mathbf{T}}{dt}\right|$$

$$= \frac{1}{\sqrt{a^2 + b^2}}\left|\frac{1}{\sqrt{a^2 + b^2}}[-(a\cos t)\mathbf{i} - (a\sin t)\mathbf{j}]\right|$$

$$= \frac{a}{a^2 + b^2}|-(\cos t)\mathbf{i} - (\sin t)\mathbf{j}|$$

$$= \frac{a}{a^2 + b^2}\sqrt{(\cos t)^2 + (\sin t)^2} = \frac{a}{a^2 + b^2}.$$

From this equation, we see that increasing $b$ for a fixed $a$ decreases the curvature. Decreasing $a$ for a fixed $b$ eventually decreases the curvature as well. Stretching a spring tends to straighten it.

If $b = 0$, the helix reduces to a circle of radius $a$ and its curvature reduces to $1/a$, as it should. If $a = 0$, the helix becomes the $z$-axis, and its curvature reduces to 0, again as it should. ■

## EXAMPLE 6 Finding the Principal Unit Normal Vector **N**

Find **N** for the helix in Example 5.

**Solution** We have

$$\frac{d\mathbf{T}}{dt} = -\frac{1}{\sqrt{a^2 + b^2}}[(a\cos t)\mathbf{i} + (a\sin t)\mathbf{j}] \qquad \text{Example 5}$$

$$\left|\frac{d\mathbf{T}}{dt}\right| = \frac{1}{\sqrt{a^2 + b^2}}\sqrt{a^2\cos^2 t + a^2\sin^2 t} = \frac{a}{\sqrt{a^2 + b^2}}$$

$$\mathbf{N} = \frac{d\mathbf{T}/dt}{|d\mathbf{T}/dt|} \qquad \text{Equatiion (4)}$$

$$= -\frac{\sqrt{a^2 + b^2}}{a}\cdot\frac{1}{\sqrt{a^2 + b^2}}[(a\cos t)\mathbf{i} + (a\sin t)\mathbf{j}]$$

$$= -(\cos t)\mathbf{i} - (\sin t)\mathbf{j}.$$ ■

# EXERCISES 13.4

## Plane Curves

Find **T**, **N**, and $\kappa$ for the plane curves in Exercises 1–4.

1. $\mathbf{r}(t) = t\mathbf{i} + (\ln \cos t)\mathbf{j}, \quad -\pi/2 < t < \pi/2$
2. $\mathbf{r}(t) = (\ln \sec t)\mathbf{i} + t\mathbf{j}, \quad -\pi/2 < t < \pi/2$
3. $\mathbf{r}(t) = (2t + 3)\mathbf{i} + (5 - t^2)\mathbf{j}$
4. $\mathbf{r}(t) = (\cos t + t \sin t)\mathbf{i} + (\sin t - t \cos t)\mathbf{j}, \quad t > 0$
5. **A formula for the curvature of the graph of a function in the *xy*-plane**
   a. The graph $y = f(x)$ in the $xy$-plane automatically has the parametrization $x = x, y = f(x)$, and the vector formula $\mathbf{r}(x) = x\mathbf{i} + f(x)\mathbf{j}$. Use this formula to show that if $f$ is a twice-differentiable function of $x$, then
   $$\kappa(x) = \frac{|f''(x)|}{\left[1 + (f'(x))^2\right]^{3/2}}.$$
   b. Use the formula for $\kappa$ in part (a) to find the curvature of $y = \ln(\cos x)$, $-\pi/2 < x < \pi/2$. Compare your answer with the answer in Exercise 1.
   c. Show that the curvature is zero at a point of inflection.
6. **A formula for the curvature of a parametrized plane curve**
   a. Show that the curvature of a smooth curve $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j}$ defined by twice-differentiable functions $x = f(t)$ and $y = g(t)$ is given by the formula
   $$\kappa = \frac{|\dot{x}\ddot{y} - \dot{y}\ddot{x}|}{(\dot{x}^2 + \dot{y}^2)^{3/2}}.$$
   Apply the formula to find the curvatures of the following curves.
   b. $\mathbf{r}(t) = t\mathbf{i} + (\ln \sin t)\mathbf{j}, \quad 0 < t < \pi$
   c. $\mathbf{r}(t) = [\tan^{-1}(\sinh t)]\mathbf{i} + (\ln \cosh t)\mathbf{j}$.
7. **Normals to plane curves**
   a. Show that $\mathbf{n}(t) = -g'(t)\mathbf{i} + f'(t)\mathbf{j}$ and $-\mathbf{n}(t) = g'(t)\mathbf{i} - f'(t)\mathbf{j}$ are both normal to the curve $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j}$ at the point $(f(t), g(t))$.
   To obtain **N** for a particular plane curve, we can choose the one of **n** or $-\mathbf{n}$ from part (a) that points toward the concave side of the curve, and make it into a unit vector. (See Figure 13.21.) Apply this method to find **N** for the following curves.
   b. $\mathbf{r}(t) = t\mathbf{i} + e^{2t}\mathbf{j}$
   c. $\mathbf{r}(t) = \sqrt{4 - t^2}\,\mathbf{i} + t\mathbf{j}, \quad -2 \le t \le 2$
8. (*Continuation of Exercise 7.*)
   a. Use the method of Exercise 7 to find **N** for the curve $\mathbf{r}(t) = t\mathbf{i} + (1/3)t^3\mathbf{j}$ when $t < 0$; when $t > 0$.
   b. Calculate
   $$\mathbf{N} = \frac{d\mathbf{T}/dt}{|d\mathbf{T}/dt|}, \quad t \ne 0,$$
   for the curve in part (a). Does **N** exist at $t = 0$? Graph the curve and explain what is happening to **N** as $t$ passes from negative to positive values.

## Space Curves

Find **T**, **N**, and $\kappa$ for the space curves in Exercises 9–16.

9. $\mathbf{r}(t) = (3 \sin t)\mathbf{i} + (3 \cos t)\mathbf{j} + 4t\mathbf{k}$
10. $\mathbf{r}(t) = (\cos t + t \sin t)\mathbf{i} + (\sin t - t \cos t)\mathbf{j} + 3\mathbf{k}$
11. $\mathbf{r}(t) = (e^t \cos t)\mathbf{i} + (e^t \sin t)\mathbf{j} + 2\mathbf{k}$
12. $\mathbf{r}(t) = (6 \sin 2t)\mathbf{i} + (6 \cos 2t)\mathbf{j} + 5t\mathbf{k}$
13. $\mathbf{r}(t) = (t^3/3)\mathbf{i} + (t^2/2)\mathbf{j}, \quad t > 0$
14. $\mathbf{r}(t) = (\cos^3 t)\mathbf{i} + (\sin^3 t)\mathbf{j}, \quad 0 < t < \pi/2$
15. $\mathbf{r}(t) = t\mathbf{i} + (a \cosh(t/a))\mathbf{j}, \quad a > 0$
16. $\mathbf{r}(t) = (\cosh t)\mathbf{i} - (\sinh t)\mathbf{j} + t\mathbf{k}$

## More on Curvature

17. Show that the parabola $y = ax^2, a \ne 0$, has its largest curvature at its vertex and has no minimum curvature. (*Note:* Since the curvature of a curve remains the same if the curve is translated or rotated, this result is true for any parabola.)
18. Show that the ellipse $x = a \cos t, y = b \sin t, a > b > 0$, has its largest curvature on its major axis and its smallest curvature on its minor axis. (As in Exercise 17, the same is true for any ellipse.)
19. **Maximizing the curvature of a helix** In Example 5, we found the curvature of the helix $\mathbf{r}(t) = (a \cos t)\mathbf{i} + (a \sin t)\mathbf{j} + bt\mathbf{k}$ $(a, b \ge 0)$ to be $\kappa = a/(a^2 + b^2)$. What is the largest value $\kappa$ can have for a given value of $b$? Give reasons for your answer.
20. **Total curvature** We find the **total curvature** of the portion of a smooth curve that runs from $s = s_0$ to $s = s_1 > s_0$ by integrating $\kappa$ from $s_0$ to $s_1$. If the curve has some other parameter, say $t$, then the total curvature is
   $$K = \int_{s_0}^{s_1} \kappa\, ds = \int_{t_0}^{t_1} \kappa \frac{ds}{dt}\, dt = \int_{t_0}^{t_1} \kappa |\mathbf{v}|\, dt,$$
   where $t_0$ and $t_1$ correspond to $s_0$ and $s_1$. Find the total curvatures of
   a. The portion of the helix $\mathbf{r}(t) = (3 \cos t)\mathbf{i} + (3 \sin t)\mathbf{j} + t\mathbf{k}$, $0 \le t \le 4\pi$.
   b. The parabola $y = x^2, -\infty < x < \infty$.
21. Find an equation for the circle of curvature of the curve $\mathbf{r}(t) = t\mathbf{i} + (\sin t)\mathbf{j}$ at the point $(\pi/2, 1)$. (The curve parametrizes the graph of $y = \sin x$ in the $xy$-plane.)

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**22.** Find an equation for the circle of curvature of the curve $\mathbf{r}(t) = (2 \ln t)\mathbf{i} - [t + (1/t)]\mathbf{j}$, $e^{-2} \le t \le e^2$, at the point $(0, -2)$, where $t = 1$.

## T Grapher Explorations

The formula

$$\kappa(x) = \frac{|f''(x)|}{\left[1 + (f'(x))^2\right]^{3/2}},$$

derived in Exercise 5, expresses the curvature $\kappa(x)$ of a twice-differentiable plane curve $y = f(x)$ as a function of $x$. Find the curvature function of each of the curves in Exercises 23–26. Then graph $f(x)$ together with $\kappa(x)$ over the given interval. You will find some surprises.

**23.** $y = x^2$, $-2 \le x \le 2$ **24.** $y = x^4/4$, $-2 \le x \le 2$

**25.** $y = \sin x$, $0 \le x \le 2\pi$ **26.** $y = e^x$, $-1 \le x \le 2$

### COMPUTER EXPLORATIONS

## Circles of Curvature

In Exercises 27–34 you will use a CAS to explore the osculating circle at a point $P$ on a plane curve where $\kappa \neq 0$. Use a CAS to perform the following steps:

**a.** Plot the plane curve given in parametric or function form over the specified interval to see what it looks like.

**b.** Calculate the curvature $\kappa$ of the curve at the given value $t_0$ using the appropriate formula from Exercise 5 or 6. Use the parametrization $x = t$ and $y = f(t)$ if the curve is given as a function $y = f(x)$.

**c.** Find the unit normal vector **N** at $t_0$. Notice that the signs of the components of **N** depend on whether the unit tangent vector **T** is turning clockwise or counterclockwise at $t = t_0$. (See Exercise 7.)

**d.** If $\mathbf{C} = a\mathbf{i} + b\mathbf{j}$ is the vector from the origin to the center $(a, b)$ of the osculating circle, find the center **C** from the vector equation

$$\mathbf{C} = \mathbf{r}(t_0) + \frac{1}{\kappa(t_0)}\mathbf{N}(t_0).$$

The point $P(x_0, y_0)$ on the curve is given by the position vector $\mathbf{r}(t_0)$.

**e.** Plot implicitly the equation $(x - a)^2 + (y - b)^2 = 1/\kappa^2$ of the osculating circle. Then plot the curve and osculating circle together. You may need to experiment with the size of the viewing window, but be sure it is square.

**27.** $\mathbf{r}(t) = (3 \cos t)\mathbf{i} + (5 \sin t)\mathbf{j}$, $0 \le t \le 2\pi$, $t_0 = \pi/4$

**28.** $\mathbf{r}(t) = (\cos^3 t)\mathbf{i} + (\sin^3 t)\mathbf{j}$, $0 \le t \le 2\pi$, $t_0 = \pi/4$

**29.** $\mathbf{r}(t) = t^2\mathbf{i} + (t^3 - 3t)\mathbf{j}$, $-4 \le t \le 4$, $t_0 = 3/5$

**30.** $\mathbf{r}(t) = (t^3 - 2t^2 - t)\mathbf{i} + \dfrac{3t}{\sqrt{1 + t^2}}\mathbf{j}$, $-2 \le t \le 5$, $t_0 = 1$

**31.** $\mathbf{r}(t) = (2t - \sin t)\mathbf{i} + (2 - 2\cos t)\mathbf{j}$, $0 \le t \le 3\pi$, $t_0 = 3\pi/2$

**32.** $\mathbf{r}(t) = (e^{-t}\cos t)\mathbf{i} + (e^{-t}\sin t)\mathbf{j}$, $0 \le t \le 6\pi$, $t_0 = \pi/4$

**33.** $y = x^2 - x$, $-2 \le x \le 5$, $x_0 = 1$

**34.** $y = x(1 - x)^{2/5}$, $-1 \le x \le 2$, $x_0 = 1/2$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# 13.5 Torsion and the Unit Binormal Vector B

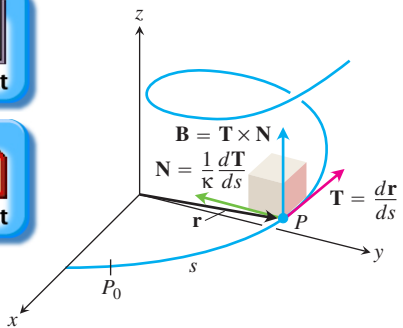

**FIGURE 13.25** The **TNB** frame of mutually orthogonal unit vectors traveling along a curve in space.

If you are traveling along a space curve, the Cartesian **i**, **j**, and **k** coordinate system for representing the vectors describing your motion are not truly relevant to you. What is meaningful instead are the vectors representative of your forward direction (the unit tangent vector **T**), the direction in which your path is turning (the unit normal vector **N**), and the tendency of your motion to "twist" out of the plane created by these vectors in the direction perpendicular to this plane (defined by the *unit binormal vector* $\mathbf{B} = \mathbf{T} \times \mathbf{N}$). Expressing the acceleration vector along the curve as a linear combination of this **TNB** frame of mutually orthogonal unit vectors traveling with the motion (Figure 13.25) is particularly revealing of the nature of the path and motion along it.

## Torsion

The **binormal vector** of a curve in space is $\mathbf{B} = \mathbf{T} \times \mathbf{N}$, a unit vector orthogonal to both **T** and **N** (Figure 13.26). Together **T**, **N**, and **B** define a moving right-handed vector frame that plays a significant role in calculating the paths of particles moving through space. It is

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

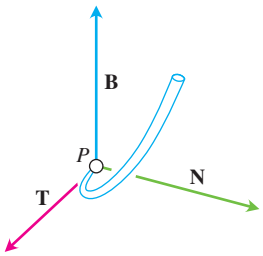

**FIGURE 13.26** The vectors **T**, **N**, and **B** (in that order) make a right-handed frame of mutually orthogonal unit vectors in space.

called the **Frenet** ("fre-*nay*") **frame** (after Jean-Frédéric Frenet, 1816–1900), or the **TNB frame**.

How does $d\mathbf{B}/ds$ behave in relation to **T**, **N**, and **B**? From the rule for differentiating a cross product, we have

$$\frac{d\mathbf{B}}{ds} = \frac{d\mathbf{T}}{ds} \times \mathbf{N} + \mathbf{T} \times \frac{d\mathbf{N}}{ds}.$$

Since **N** is the direction of $d\mathbf{T}/ds$, $(d\mathbf{T}/ds) \times \mathbf{N} = \mathbf{0}$ and

$$\frac{d\mathbf{B}}{ds} = \mathbf{0} + \mathbf{T} \times \frac{d\mathbf{N}}{ds} = \mathbf{T} \times \frac{d\mathbf{N}}{ds}.$$

From this we see that $d\mathbf{B}/ds$ is orthogonal to **T** since a cross product is orthogonal to its factors.

Since $d\mathbf{B}/ds$ is also orthogonal to **B** (the latter has constant length), it follows that $d\mathbf{B}/ds$ is orthogonal to the plane of **B** and **T**. In other words, $d\mathbf{B}/ds$ is parallel to **N**, so $d\mathbf{B}/ds$ is a scalar multiple of **N**. In symbols,

$$\frac{d\mathbf{B}}{ds} = -\tau\mathbf{N}.$$

The negative sign in this equation is traditional. The scalar $\tau$ is called the *torsion* along the curve. Notice that

$$\frac{d\mathbf{B}}{ds} \cdot \mathbf{N} = -\tau\mathbf{N} \cdot \mathbf{N} = -\tau(1) = -\tau,$$

so that

$$\tau = -\frac{d\mathbf{B}}{ds} \cdot \mathbf{N}.$$

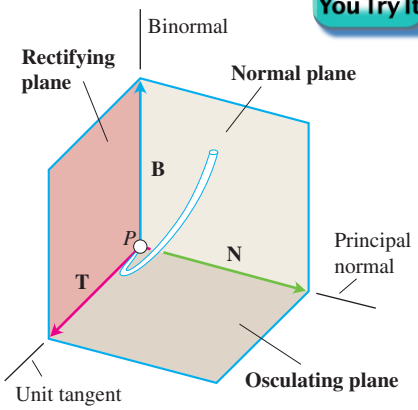

**FIGURE 13.27** The names of the three planes determined by **T**, **N**, and **B**.

**DEFINITION** **Torsion**

Let $\mathbf{B} = \mathbf{T} \times \mathbf{N}$. The **torsion** function of a smooth curve is

$$\tau = -\frac{d\mathbf{B}}{ds} \cdot \mathbf{N}. \tag{1}$$

Unlike the curvature $\kappa$, which is never negative, the torsion $\tau$ may be positive, negative, or zero.

The three planes determined by **T**, **N**, and **B** are named and shown in Figure 13.27. The curvature $\kappa = |d\mathbf{T}/ds|$ can be thought of as the rate at which the normal plane turns as the point $P$ moves along its path. Similarly, the torsion $\tau = -(d\mathbf{B}/ds) \cdot \mathbf{N}$ is the rate at which the osculating plane turns about **T** as $P$ moves along the curve. Torsion measures how the curve twists.

If we think of the curve as the path of a moving body, then $|d\mathbf{T}/ds|$ tells how much the path turns to the left or right as the object moves along; it is called the *curvature* of the object's path. The number $-(d\mathbf{B}/ds) \cdot \mathbf{N}$ tells how much a body's path rotates or

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

twists out of its plane of motion as the object moves along; it is called the *torsion* of the body's path. Look at Figure 13.28. If $P$ is a train climbing up a curved track, the rate at which the headlight turns from side to side per unit distance is the curvature of the track. The rate at which the engine tends to twist out of the plane formed by **T** and **N** is the torsion.

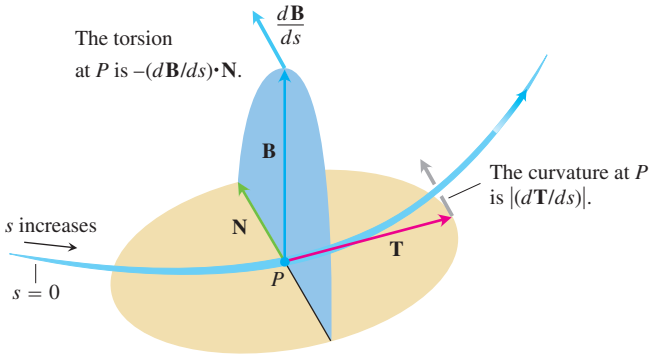

**FIGURE 13.28** Every moving body travels with a **TNB** frame that characterizes the geometry of its path of motion.

## Tangential and Normal Components of Acceleration

When a body is accelerated by gravity, brakes, a combination of rocket motors, or whatever, we usually want to know how much of the acceleration acts in the direction of motion, in the tangential direction **T**. We can calculate this using the Chain Rule to rewrite **v** as

$$\mathbf{v} = \frac{d\mathbf{r}}{dt} = \frac{d\mathbf{r}}{ds}\frac{ds}{dt} = \mathbf{T}\frac{ds}{dt}$$

and differentiating both ends of this string of equalities to get

$$\begin{aligned}\mathbf{a} &= \frac{d\mathbf{v}}{dt} = \frac{d}{dt}\left(\mathbf{T}\frac{ds}{dt}\right) = \frac{d^2s}{dt^2}\mathbf{T} + \frac{ds}{dt}\frac{d\mathbf{T}}{dt} \\ &= \frac{d^2s}{dt^2}\mathbf{T} + \frac{ds}{dt}\left(\frac{d\mathbf{T}}{ds}\frac{ds}{dt}\right) = \frac{d^2s}{dt^2}\mathbf{T} + \frac{ds}{dt}\left(\kappa\mathbf{N}\frac{ds}{dt}\right) \qquad \frac{d\mathbf{T}}{ds} = \kappa\mathbf{N} \\ &= \frac{d^2s}{dt^2}\mathbf{T} + \kappa\left(\frac{ds}{dt}\right)^2\mathbf{N}.\end{aligned}$$

**DEFINITION** **Tangential and Normal Components of Acceleration**

$$\mathbf{a} = a_T\mathbf{T} + a_N\mathbf{N}, \tag{2}$$

where

$$a_T = \frac{d^2s}{dt^2} = \frac{d}{dt}|\mathbf{v}| \quad \text{and} \quad a_N = \kappa\left(\frac{ds}{dt}\right)^2 = \kappa|\mathbf{v}|^2 \tag{3}$$

are the **tangential** and **normal** scalar components of acceleration.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

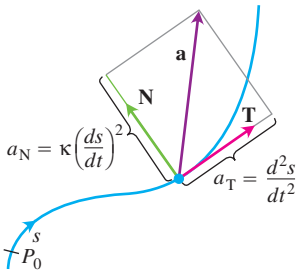

**FIGURE 13.29** The tangential and normal components of acceleration. The acceleration **a** always lies in the plane of **T** and **N**, orthogonal to **B**.

Notice that the binormal vector **B** does not appear in Equation (2). No matter how the path of the moving body we are watching may appear to twist and turn in space, the acceleration **a** *always lies in the plane of* **T** and **N** orthogonal to **B**. The equation also tells us exactly how much of the acceleration takes place tangent to the motion ($d^2s/dt^2$) and how much takes place normal to the motion [$\kappa(ds/dt)^2$] (Figure 13.29).

What information can we glean from Equations (3)? By definition, acceleration **a** is the rate of change of velocity **v**, and in general, both the length and direction of **v** change as a body moves along its path. The tangential component of acceleration $a_T$ measures the rate of change of the *length* of **v** (that is, the change in the speed). The normal component of acceleration $a_N$ measures the rate of change of the *direction* of **v**.

Notice that the normal scalar component of the acceleration is the curvature times the *square* of the speed. This explains why you have to hold on when your car makes a sharp (large $\kappa$), high-speed (large $|\mathbf{v}|$) turn. If you double the speed of your car, you will experience four times the normal component of acceleration for the same curvature.

If a body moves in a circle at a constant speed, $d^2s/dt^2$ is zero and all the acceleration points along **N** toward the circle's center. If the body is speeding up or slowing down, **a** has a nonzero tangential component (Figure 13.30).

To calculate $a_N$, we usually use the formula $a_N = \sqrt{|\mathbf{a}|^2 - a_T{}^2}$, which comes from solving the equation $|\mathbf{a}|^2 = \mathbf{a}\cdot\mathbf{a} = a_T{}^2 + a_N{}^2$ for $a_N$. With this formula, we can find $a_N$ without having to calculate $\kappa$ first.

**Formula for Calculating the Normal Component of Acceleration**

$$a_N = \sqrt{|\mathbf{a}|^2 - a_T{}^2} \tag{4}$$

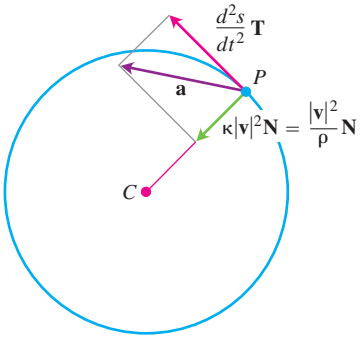

**FIGURE 13.30** The tangential and normal components of the acceleration of a body that is speeding up as it moves counterclockwise around a circle of radius $\rho$.

**EXAMPLE 1** Finding the Acceleration Scalar Components $a_T$, $a_N$

Without finding **T** and **N**, write the acceleration of the motion

$$\mathbf{r}(t) = (\cos t + t\sin t)\mathbf{i} + (\sin t - t\cos t)\mathbf{j}, \qquad t > 0$$

in the form $\mathbf{a} = a_T\mathbf{T} + a_N\mathbf{N}$. (The path of the motion is the involute of the circle in Figure 13.31.)

**Solution** We use the first of Equations (3) to find $a_T$:

$$\mathbf{v} = \frac{d\mathbf{r}}{dt} = (-\sin t + \sin t + t\cos t)\mathbf{i} + (\cos t - \cos t + t\sin t)\mathbf{j}$$

$$= (t\cos t)\mathbf{i} + (t\sin t)\mathbf{j}$$

$$|\mathbf{v}| = \sqrt{t^2\cos^2 t + t^2\sin^2 t} = \sqrt{t^2} = |t| = t \qquad t > 0$$

$$a_T = \frac{d}{dt}|\mathbf{v}| = \frac{d}{dt}(t) = 1. \qquad \text{Equation (3)}$$

Knowing $a_T$, we use Equation (4) to find $a_N$:

$$\mathbf{a} = (\cos t - t\sin t)\mathbf{i} + (\sin t + t\cos t)\mathbf{j}$$

$$|\mathbf{a}|^2 = t^2 + 1 \qquad \text{After some algebra}$$

$$a_N = \sqrt{|\mathbf{a}|^2 - a_T{}^2}$$

$$= \sqrt{(t^2 + 1) - (1)} = \sqrt{t^2} = t.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

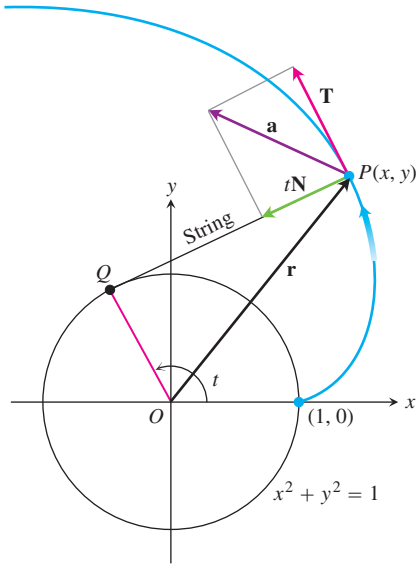

**FIGURE 13.31** The tangential and normal components of the acceleration of the motion $\mathbf{r}(t) = (\cos t + t \sin t)\mathbf{i} + (\sin t - t \cos t)\mathbf{j}$, for $t > 0$. If a string wound around a fixed circle is unwound while held taut in the plane of the circle, its end $P$ traces an involute of the circle (Example 1).

We then use Equation (2) to find **a**:

$$\mathbf{a} = a_T\mathbf{T} + a_N\mathbf{N} = (1)\mathbf{T} + (t)\mathbf{N} = \mathbf{T} + t\mathbf{N}.$$ ■

## Formulas for Computing Curvature and Torsion

We now give some easy-to-use formulas for computing the curvature and torsion of a smooth curve. From Equation (2), we have

$$\mathbf{v} \times \mathbf{a} = \left(\frac{ds}{dt}\mathbf{T}\right) \times \left[\frac{d^2s}{dt^2}\mathbf{T} + \kappa\left(\frac{ds}{dt}\right)^2\mathbf{N}\right] \qquad \mathbf{v} = d\mathbf{r}/dt = (ds/dt)\mathbf{T}$$

$$= \left(\frac{ds}{dt}\frac{d^2s}{dt^2}\right)(\mathbf{T} \times \mathbf{T}) + \kappa\left(\frac{ds}{dt}\right)^3(\mathbf{T} \times \mathbf{N})$$

$$= \kappa\left(\frac{ds}{dt}\right)^3\mathbf{B}. \qquad \mathbf{T} \times \mathbf{T} = \mathbf{0} \text{ and } \mathbf{T} \times \mathbf{N} = \mathbf{B}$$

It follows that

$$|\mathbf{v} \times \mathbf{a}| = \kappa\left|\frac{ds}{dt}\right|^3|\mathbf{B}| = \kappa|\mathbf{v}|^3. \qquad \frac{ds}{dt} = |\mathbf{v}| \text{ and } |\mathbf{B}| = 1$$

Solving for $\kappa$ gives the following formula.

**Vector Formula for Curvature**

$$\kappa = \frac{|\mathbf{v} \times \mathbf{a}|}{|\mathbf{v}|^3} \tag{5}$$

Equation (5) calculates the curvature, a geometric property of the curve, from the velocity and acceleration of any vector representation of the curve in which $|\mathbf{v}|$ is different from zero. Take a moment to think about how remarkable this really is: From any formula for motion along a curve, no matter how variable the motion may be (as long as **v** is never zero), we can calculate a physical property of the curve that seems to have nothing to do with the way the curve is traversed.

The most widely used formula for torsion, derived in more advanced texts, is

$$\tau = \frac{\begin{vmatrix} \dot{x} & \dot{y} & \dot{z} \\ \ddot{x} & \ddot{y} & \ddot{z} \\ \dddot{x} & \dddot{y} & \dddot{z} \end{vmatrix}}{|\mathbf{v} \times \mathbf{a}|^2} \qquad (\text{if } \mathbf{v} \times \mathbf{a} \neq \mathbf{0}). \tag{6}$$

**Newton's Dot Notation for Derivatives**

The dots in Equation (6) denote differentiation with respect to $t$, one derivative for each dot. Thus, $\dot{x}$ ("$x$ dot") means $dx/dt$, $\ddot{x}$ ("$x$ double dot") means $d^2x/dt^2$, and $\dddot{x}$ ("$x$ triple dot") means $d^3x/dt^3$. Similarly, $\dot{y} = dy/dt$, and so on.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

This formula calculates the torsion directly from the derivatives of the component functions $x = f(t), y = g(t), z = h(t)$ that make up $\mathbf{r}$. The determinant's first row comes from $\mathbf{v}$, the second row comes from $\mathbf{a}$, and the third row comes from $\dot{\mathbf{a}} = d\mathbf{a}/dt$.

**EXAMPLE 2** Finding Curvature and Torsion

Use Equations (5) and (6) to find $\kappa$ and $\tau$ for the helix

$$\mathbf{r}(t) = (a\cos t)\mathbf{i} + (a\sin t)\mathbf{j} + bt\mathbf{k}, \qquad a, b \geq 0, \qquad a^2 + b^2 \neq 0.$$

**Solution** We calculate the curvature with Equation (5):

$$\mathbf{v} = -(a\sin t)\mathbf{i} + (a\cos t)\mathbf{j} + b\mathbf{k}$$

$$\mathbf{a} = -(a\cos t)\mathbf{i} - (a\sin t)\mathbf{j}$$

$$\mathbf{v} \times \mathbf{a} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ -a\sin t & a\cos t & b \\ -a\cos t & -a\sin t & 0 \end{vmatrix}$$

$$= (ab\sin t)\mathbf{i} - (ab\cos t)\mathbf{j} + a^2\mathbf{k}$$

$$\kappa = \frac{|\mathbf{v} \times \mathbf{a}|}{|\mathbf{v}|^3} = \frac{\sqrt{a^2b^2 + a^4}}{(a^2 + b^2)^{3/2}} = \frac{a\sqrt{a^2 + b^2}}{(a^2 + b^2)^{3/2}} = \frac{a}{a^2 + b^2}. \tag{7}$$

Notice that Equation (7) agrees with the result in Example 5 in Section 13.4, where we calculated the curvature directly from its definition.

To evaluate Equation (6) for the torsion, we find the entries in the determinant by differentiating $\mathbf{r}$ with respect to $t$. We already have $\mathbf{v}$ and $\mathbf{a}$, and

$$\dot{\mathbf{a}} = \frac{d\mathbf{a}}{dt} = (a\sin t)\mathbf{i} - (a\cos t)\mathbf{j}.$$

Hence,

$$\tau = \frac{\begin{vmatrix} \dot{x} & \dot{y} & \dot{z} \\ \ddot{x} & \ddot{y} & \ddot{z} \\ \dddot{x} & \dddot{y} & \dddot{z} \end{vmatrix}}{|\mathbf{v} \times \mathbf{a}|^2} = \frac{\begin{vmatrix} -a\sin t & a\cos t & b \\ -a\cos t & -a\sin t & 0 \\ a\sin t & -a\cos t & 0 \end{vmatrix}}{\left(a\sqrt{a^2 + b^2}\right)^2}$$

Value of $|\mathbf{v} \times \mathbf{a}|$ from Equation (7)

$$= \frac{b(a^2\cos^2 t + a^2\sin^2 t)}{a^2(a^2 + b^2)}$$

$$= \frac{b}{a^2 + b^2}.$$

From this last equation we see that the torsion of a helix about a circular cylinder is constant. In fact, constant curvature and constant torsion characterize the helix among all curves in space. ■

### Formulas for Curves in Space

Unit tangent vector: $\mathbf{T} = \dfrac{\mathbf{v}}{|\mathbf{v}|}$

Principal unit normal vector: $\mathbf{N} = \dfrac{d\mathbf{T}/dt}{|d\mathbf{T}/dt|}$

Binormal vector: $\mathbf{B} = \mathbf{T} \times \mathbf{N}$

Curvature: $\kappa = \left|\dfrac{d\mathbf{T}}{ds}\right| = \dfrac{|\mathbf{v} \times \mathbf{a}|}{|\mathbf{v}|^3}$

Torsion: $\tau = -\dfrac{d\mathbf{B}}{ds} \cdot \mathbf{N} = \dfrac{\begin{vmatrix} \dot{x} & \dot{y} & \dot{z} \\ \ddot{x} & \ddot{y} & \ddot{z} \\ \dddot{x} & \dddot{y} & \dddot{z} \end{vmatrix}}{|\mathbf{v} \times \mathbf{a}|^2}$

Tangential and normal scalar components of acceleration:

$$\mathbf{a} = a_T\mathbf{T} + a_N\mathbf{N}$$

$$a_T = \frac{d}{dt}|\mathbf{v}|$$

$$a_N = \kappa|\mathbf{v}|^2 = \sqrt{|\mathbf{a}|^2 - {a_T}^2}$$

# EXERCISES 13.5

## Finding Torsion and the Binormal Vector

For Exercises 1–8 you found **T**, **N**, and $\kappa$ in Section 13.4 (Exercises 9–16). Find now **B** and $\tau$ for these space curves.

1. $\mathbf{r}(t) = (3\sin t)\mathbf{i} + (3\cos t)\mathbf{j} + 4t\mathbf{k}$
2. $\mathbf{r}(t) = (\cos t + t\sin t)\mathbf{i} + (\sin t - t\cos t)\mathbf{j} + 3\mathbf{k}$
3. $\mathbf{r}(t) = (e^t\cos t)\mathbf{i} + (e^t\sin t)\mathbf{j} + 2\mathbf{k}$
4. $\mathbf{r}(t) = (6\sin 2t)\mathbf{i} + (6\cos 2t)\mathbf{j} + 5t\mathbf{k}$
5. $\mathbf{r}(t) = (t^3/3)\mathbf{i} + (t^2/2)\mathbf{j}, \quad t > 0$
6. $\mathbf{r}(t) = (\cos^3 t)\mathbf{i} + (\sin^3 t)\mathbf{j}, \quad 0 < t < \pi/2$
7. $\mathbf{r}(t) = t\mathbf{i} + (a\cosh(t/a))\mathbf{j}, \quad a > 0$
8. $\mathbf{r}(t) = (\cosh t)\mathbf{i} - (\sinh t)\mathbf{j} + t\mathbf{k}$

## Tangential and Normal Components of Acceleration

In Exercises 9 and 10, write **a** in the form $a_T\mathbf{T} + a_N\mathbf{N}$ without finding **T** and **N**.

9. $\mathbf{r}(t) = (a\cos t)\mathbf{i} + (a\sin t)\mathbf{j} + bt\mathbf{k}$
10. $\mathbf{r}(t) = (1 + 3t)\mathbf{i} + (t - 2)\mathbf{j} - 3t\mathbf{k}$

In Exercises 11–14, write **a** in the form $\mathbf{a} = a_T\mathbf{T} + a_N\mathbf{N}$ at the given value of $t$ without finding **T** and **N**.

11. $\mathbf{r}(t) = (t + 1)\mathbf{i} + 2t\mathbf{j} + t^2\mathbf{k}, \quad t = 1$
12. $\mathbf{r}(t) = (t\cos t)\mathbf{i} + (t\sin t)\mathbf{j} + t^2\mathbf{k}, \quad t = 0$
13. $\mathbf{r}(t) = t^2\mathbf{i} + (t + (1/3)t^3)\mathbf{j} + (t - (1/3)t^3)\mathbf{k}, \quad t = 0$
14. $\mathbf{r}(t) = (e^t\cos t)\mathbf{i} + (e^t\sin t)\mathbf{j} + \sqrt{2}e^t\mathbf{k}, \quad t = 0$

In Exercises 15 and 16, find **r**, **T**, **N**, and **B** at the given value of $t$. Then find equations for the osculating, normal, and rectifying planes at that value of $t$.

15. $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} - \mathbf{k}, \quad t = \pi/4$
16. $\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + t\mathbf{k}, \quad t = 0$

## Physical Applications

17. The speedometer on your car reads a steady 35 mph. Could you be accelerating? Explain.
18. Can anything be said about the acceleration of a particle that is moving at a constant speed? Give reasons for your answer.
19. Can anything be said about the speed of a particle whose acceleration is always orthogonal to its velocity? Give reasons for your answer.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**20.** An object of mass $m$ travels along the parabola $y = x^2$ with a constant speed of 10 units/sec. What is the force on the object due to its acceleration at (0, 0)? at $(2^{1/2}, 2)$? Write your answers in terms of **i** and **j**. (Remember Newton's law, $\mathbf{F} = m\mathbf{a}$.)

**21.** The following is a quotation from an article in *The American Mathematical Monthly*, titled "Curvature in the Eighties" by Robert Osserman (October 1990, page 731):

> Curvature also plays a key role in physics. The magnitude of a force required to move an object at constant speed along a curved path is, according to Newton's laws, a constant multiple of the curvature of the trajectories.

Explain mathematically why the second sentence of the quotation is true.

**22.** Show that a moving particle will move in a straight line if the normal component of its acceleration is zero.

**23. A sometime shortcut to curvature** If you already know $|a_N|$ and $|\mathbf{v}|$, then the formula $a_N = \kappa|\mathbf{v}|^2$ gives a convenient way to find the curvature. Use it to find the curvature and radius of curvature of the curve

$$\mathbf{r}(t) = (\cos t + t\sin t)\mathbf{i} + (\sin t - t\cos t)\mathbf{j}, \quad t > 0.$$

(Take $a_N$ and $|\mathbf{v}|$ from Example 1.)

**24.** Show that $\kappa$ and $\tau$ are both zero for the line

$$\mathbf{r}(t) = (x_0 + At)\mathbf{i} + (y_0 + Bt)\mathbf{j} + (z_0 + Ct)\mathbf{k}.$$

## Theory and Examples

**25.** What can be said about the torsion of a smooth plane curve $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j}$? Give reasons for your answer.

**26. The torsion of a helix** In Example 2, we found the torsion of the helix

$$\mathbf{r}(t) = (a\cos t)\mathbf{i} + (a\sin t)\mathbf{j} + bt\mathbf{k}, \quad a, b \geq 0$$

to be $\tau = b/(a^2 + b^2)$. What is the largest value $\tau$ can have for a given value of $a$? Give reasons for your answer.

**27. Differentiable curves with zero torsion lie in planes** That a sufficiently differentiable curve with zero torsion lies in a plane is a special case of the fact that a particle whose velocity remains perpendicular to a fixed vector **C** moves in a plane perpendicular to **C**. This, in turn, can be viewed as the solution of the following problem in calculus.

Suppose $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j} + h(t)\mathbf{k}$ is twice differentiable for all $t$ in an interval $[a, b]$, that $\mathbf{r} = 0$ when $t = a$, and that $\mathbf{v}\cdot\mathbf{k} = 0$ for all $t$ in $[a, b]$. Then $h(t) = 0$ for all $t$ in $[a, b]$.

Solve this problem. (*Hint:* Start with $\mathbf{a} = d^2\mathbf{r}/dt^2$ and apply the initial conditions in reverse order.)

**28. A formula that calculates $\tau$ from B and v** If we start with the definition $\tau = -(d\mathbf{B}/ds)\cdot\mathbf{N}$ and apply the Chain Rule to rewrite $d\mathbf{B}/ds$ as

$$\frac{d\mathbf{B}}{ds} = \frac{d\mathbf{B}}{dt}\frac{dt}{ds} = \frac{d\mathbf{B}}{dt}\frac{1}{|\mathbf{v}|},$$

we arrive at the formula

$$\tau = -\frac{1}{|\mathbf{v}|}\left(\frac{d\mathbf{B}}{dt}\cdot\mathbf{N}\right).$$

The advantage of this formula over Equation (6) is that it is easier to derive and state. The disadvantage is that it can take a lot of work to evaluate without a computer. Use the new formula to find the torsion of the helix in Example 2.

### COMPUTER EXPLORATIONS

## Curvature, Torsion, and the TNB Frame

Rounding the answers to four decimal places, use a CAS to find **v**, **a**, speed, **T**, **N**, **B**, $\kappa$, $\tau$, and the tangential and normal components of acceleration for the curves in Exercises 29–32 at the given values of $t$.

**29.** $\mathbf{r}(t) = (t\cos t)\mathbf{i} + (t\sin t)\mathbf{j} + t\mathbf{k}, \quad t = \sqrt{3}$

**30.** $\mathbf{r}(t) = (e^t\cos t)\mathbf{i} + (e^t\sin t)\mathbf{j} + e^t\mathbf{k}, \quad t = \ln 2$

**31.** $\mathbf{r}(t) = (t - \sin t)\mathbf{i} + (1 - \cos t)\mathbf{j} + \sqrt{-t}\,\mathbf{k}, \quad t = -3\pi$

**32.** $\mathbf{r}(t) = (3t - t^2)\mathbf{i} + (3t^2)\mathbf{j} + (3t + t^3)\mathbf{k}, \quad t = 1$

## 13.6 Planetary Motion and Satellites

In this section, we derive Kepler's laws of planetary motion from Newton's laws of motion and gravitation and discuss the orbits of Earth satellites. The derivation of Kepler's laws from Newton's is one of the triumphs of calculus. It draws on almost everything we have studied so far, including the algebra and geometry of vectors in space, the calculus of vector functions, the solutions of differential equations and initial value problems, and the polar coordinate description of conic sections.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

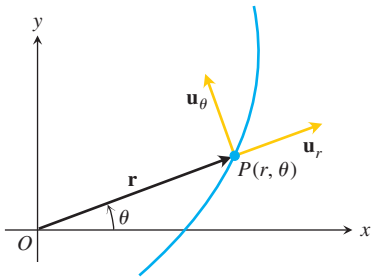

**FIGURE 13.32** The length of $\mathbf{r}$ is the positive polar coordinate $r$ of the point $P$. Thus, $\mathbf{u}_r$, which is $\mathbf{r}/|\mathbf{r}|$, is also $\mathbf{r}/r$. Equations (1) express $\mathbf{u}_r$ and $\mathbf{u}_\theta$ in terms of $\mathbf{i}$ and $\mathbf{j}$.

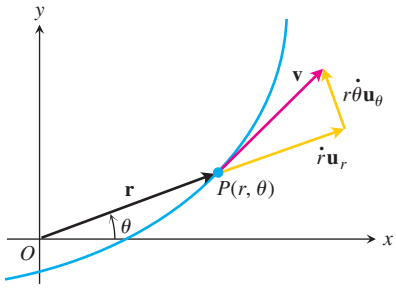

**FIGURE 13.33** In polar coordinates, the velocity vector is

$$\mathbf{v} = \dot{r}\,\mathbf{u}_r + r\dot{\theta}\,\mathbf{u}_\theta$$

Notice that $|\mathbf{r}| \neq r$ if $z \neq 0$.

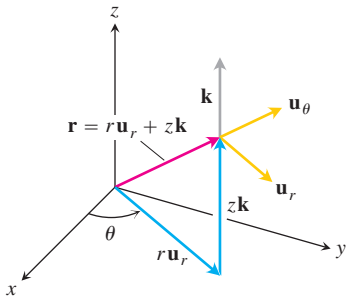

**FIGURE 13.34** Position vector and basic unit vectors in cylindrical coordinates.

## Motion in Polar and Cylindrical Coordinates

When a particle moves along a curve in the polar coordinate plane, we express its position, velocity, and acceleration in terms of the moving unit vectors

$$\mathbf{u}_r = (\cos\theta)\mathbf{i} + (\sin\theta)\mathbf{j}, \qquad \mathbf{u}_\theta = -(\sin\theta)\mathbf{i} + (\cos\theta)\mathbf{j}, \tag{1}$$

shown in Figure 13.32. The vector $\mathbf{u}_r$ points along the position vector $\overrightarrow{OP}$, so $\mathbf{r} = r\mathbf{u}_r$. The vector $\mathbf{u}_\theta$, orthogonal to $\mathbf{u}_r$, points in the direction of increasing $\theta$.

We find from Equations (1) that

$$\begin{aligned} \frac{d\mathbf{u}_r}{d\theta} &= -(\sin\theta)\mathbf{i} + (\cos\theta)\mathbf{j} = \mathbf{u}_\theta \\ \frac{d\mathbf{u}_\theta}{d\theta} &= -(\cos\theta)\mathbf{i} - (\sin\theta)\mathbf{j} = -\mathbf{u}_r. \end{aligned} \tag{2}$$

When we differentiate $\mathbf{u}_r$ and $\mathbf{u}_\theta$ with respect to $t$ to find how they change with time, the Chain Rule gives

$$\dot{\mathbf{u}}_r = \frac{d\mathbf{u}_r}{d\theta}\dot{\theta} = \dot{\theta}\mathbf{u}_\theta, \qquad \dot{\mathbf{u}}_\theta = \frac{d\mathbf{u}_\theta}{d\theta}\dot{\theta} = -\dot{\theta}\mathbf{u}_r. \tag{3}$$

Hence,

$$\mathbf{v} = \dot{\mathbf{r}} = \frac{d}{dt}\left(r\mathbf{u}_r\right) = \dot{r}\mathbf{u}_r + r\dot{\mathbf{u}}_r = \dot{r}\mathbf{u}_r + r\dot{\theta}\mathbf{u}_\theta. \tag{4}$$

See Figure 13.33. As in the previous section, we use Newton's dot notation for time derivatives to keep the formulas as simple as we can: $\dot{\mathbf{u}}_r$ means $d\mathbf{u}_r/dt$, $\dot{\theta}$ means $d\theta/dt$, and so on.

The acceleration is

$$\mathbf{a} = \dot{\mathbf{v}} = (\ddot{r}\mathbf{u}_r + \dot{r}\dot{\mathbf{u}}_r) + (\dot{r}\dot{\theta}\mathbf{u}_\theta + r\ddot{\theta}\mathbf{u}_\theta + r\dot{\theta}\dot{\mathbf{u}}_\theta). \tag{5}$$

When Equations (3) are used to evaluate $\dot{\mathbf{u}}_r$ and $\dot{\mathbf{u}}_\theta$ and the components are separated, the equation for acceleration becomes

$$\mathbf{a} = (\ddot{r} - r\dot{\theta}^2)\mathbf{u}_r + (r\ddot{\theta} + 2\dot{r}\dot{\theta})\mathbf{u}_\theta. \tag{6}$$

To extend these equations of motion to space, we add $z\mathbf{k}$ to the right-hand side of the equation $\mathbf{r} = r\mathbf{u}_r$. Then, in these *cylindrical coordinates*,

$$\begin{aligned} \mathbf{r} &= r\mathbf{u}_r + z\mathbf{k} \\ \mathbf{v} &= \dot{r}\mathbf{u}_r + r\dot{\theta}\mathbf{u}_\theta + \dot{z}\mathbf{k} \\ \mathbf{a} &= (\ddot{r} - r\dot{\theta}^2)\mathbf{u}_r + (r\ddot{\theta} + 2\dot{r}\dot{\theta})\mathbf{u}_\theta + \ddot{z}\mathbf{k}. \end{aligned} \tag{7}$$

The vectors $\mathbf{u}_r$, $\mathbf{u}_\theta$, and $\mathbf{k}$ make a right-handed frame (Figure 13.34) in which

$$\mathbf{u}_r \times \mathbf{u}_\theta = \mathbf{k}, \qquad \mathbf{u}_\theta \times \mathbf{k} = \mathbf{u}_r, \qquad \mathbf{k} \times \mathbf{u}_r = \mathbf{u}_\theta. \tag{8}$$

## Planets Move in Planes

Newton's law of gravitation says that if $\mathbf{r}$ is the radius vector from the center of a sun of mass $M$ to the center of a planet of mass $m$, then the force $\mathbf{F}$ of the gravitational attraction between the planet and sun is

$$\mathbf{F} = -\frac{GmM}{|\mathbf{r}|^2}\frac{\mathbf{r}}{|\mathbf{r}|} \tag{9}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

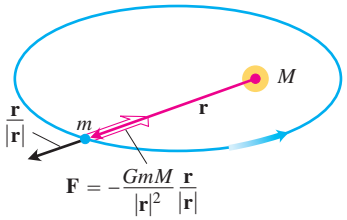

**FIGURE 13.35** The force of gravity is directed along the line joining the centers of mass.

(Figure 13.35). The number $G$ is the **universal gravitational constant**. If we measure mass in kilograms, force in newtons, and distance in meters, $G$ is about $6.6726 \times 10^{-11}\ \text{Nm}^2\,\text{kg}^{-2}$.

Combining Equation (9) with Newton's second law, $\mathbf{F} = m\ddot{\mathbf{r}}$, for the force acting on the planet gives

$$m\ddot{\mathbf{r}} = -\frac{GmM}{|\mathbf{r}|^2}\frac{\mathbf{r}}{|\mathbf{r}|},$$

$$\ddot{\mathbf{r}} = -\frac{GM}{|\mathbf{r}|^2}\frac{\mathbf{r}}{|\mathbf{r}|}. \tag{10}$$

The planet is accelerated toward the sun's center at all times.

Equation (10) says that $\ddot{\mathbf{r}}$ is a scalar multiple of $\mathbf{r}$, so that

$$\mathbf{r} \times \ddot{\mathbf{r}} = \mathbf{0}. \tag{11}$$

A routine calculation shows $\mathbf{r} \times \ddot{\mathbf{r}}$ to be the derivative of $\mathbf{r} \times \dot{\mathbf{r}}$:

$$\frac{d}{dt}(\mathbf{r} \times \dot{\mathbf{r}}) = \underbrace{\dot{\mathbf{r}} \times \dot{\mathbf{r}}}_{\mathbf{0}} + \mathbf{r} \times \ddot{\mathbf{r}} = \mathbf{r} \times \ddot{\mathbf{r}}. \tag{12}$$

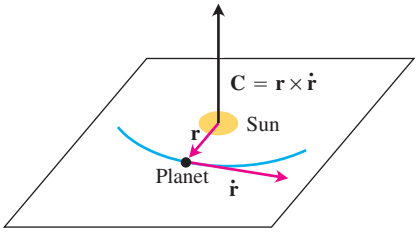

**FIGURE 13.36** A planet that obeys Newton's laws of gravitation and motion travels in the plane through the sun's center of mass perpendicular to $\mathbf{C} = \mathbf{r} \times \dot{\mathbf{r}}$.

Hence Equation (11) is equivalent to

$$\frac{d}{dt}(\mathbf{r} \times \dot{\mathbf{r}}) = \mathbf{0}, \tag{13}$$

which integrates to

$$\mathbf{r} \times \dot{\mathbf{r}} = \mathbf{C} \tag{14}$$

for some constant vector $\mathbf{C}$.

Equation (14) tells us that $\mathbf{r}$ and $\dot{\mathbf{r}}$ always lie in a plane perpendicular to $\mathbf{C}$. Hence, the planet moves in a fixed plane through the center of its sun (Figure 13.36).

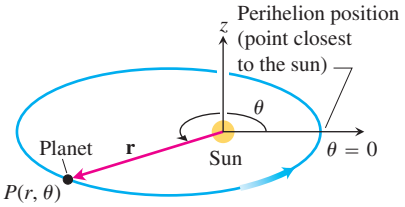

**FIGURE 13.37** The coordinate system for planetary motion. The motion is counterclockwise when viewed from above, as it is here, and $\dot{\theta} > 0$.

## Coordinates and Initial Conditions

We now introduce coordinates in a way that places the origin at the sun's center of mass and makes the plane of the planet's motion the polar coordinate plane. This makes $\mathbf{r}$ the planet's polar coordinate position vector and makes $|\mathbf{r}|$ equal to $r$ and $\mathbf{r}/|\mathbf{r}|$ equal to $\mathbf{u}_r$. We also position the $z$-axis in a way that makes $\mathbf{k}$ the direction of $\mathbf{C}$. Thus, $\mathbf{k}$ has the same right-hand relation to $\mathbf{r} \times \dot{\mathbf{r}}$ that $\mathbf{C}$ does, and the planet's motion is counterclockwise when viewed from the positive $z$-axis. This makes $\theta$ increase with $t$, so that $\dot{\theta} > 0$ for all $t$. Finally, we rotate the polar coordinate plane about the $z$-axis, if necessary, to make the initial ray coincide with the direction $\mathbf{r}$ has when the planet is closest to the sun. This runs the ray through the planet's **perihelion** position (Figure 13.37).

If we measure time so that $t = 0$ at perihelion, we have the following initial conditions for the planet's motion.

1. $r = r_0$, the minimum radius, when $t = 0$
2. $\dot{r} = 0$ when $t = 0$ (because $r$ has a minimum value then)
3. $\theta = 0$ when $t = 0$
4. $|\mathbf{v}| = v_0$ when $t = 0$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Since

$$\begin{aligned} v_0 &= |\mathbf{v}|_{t=0} \\ &= |\dot{r}\mathbf{u}_r + r\dot{\theta}\mathbf{u}_\theta|_{t=0} && \text{Equation (4)} \\ &= |r\dot{\theta}\mathbf{u}_\theta|_{t=0} && \dot{r} = 0 \text{ when } t = 0 \\ &= (|r\dot{\theta}||\mathbf{u}_\theta|)_{t=0} \\ &= |r\dot{\theta}|_{t=0} && |\mathbf{u}_\theta| = 1 \\ &= (r\dot{\theta})_{t=0}, && r \text{ and } \dot{\theta} \text{ both positive} \end{aligned}$$

we also know that

**5.** $r\dot{\theta} = v_0$ when $t = 0$.

HISTORICAL BIOGRAPHY

Johannes Kepler
(1571–1630)

## Kepler's First Law (The Conic Section Law)

*Kepler's first law* says that a planet's path is a conic section with the sun at one focus. The eccentricity of the conic is

$$e = \frac{r_0 v_0^2}{GM} - 1 \tag{15}$$

and the polar equation is

$$r = \frac{(1 + e)r_0}{1 + e\cos\theta}. \tag{16}$$

The derivation uses Kepler's second law, so we will state and prove the second law before proving the first law.

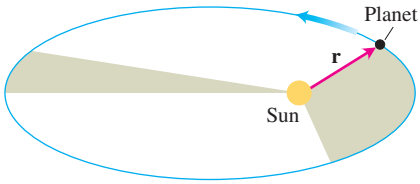

**FIGURE 13.38** The line joining a planet to its sun sweeps over equal areas in equal times.

## Kepler's Second Law (The Equal Area Law)

*Kepler's second law* says that the radius vector from the sun to a planet (the vector $\mathbf{r}$ in our model) sweeps out equal areas in equal times (Figure 13.38). To derive the law, we use Equation (4) to evaluate the cross product $\mathbf{C} = \mathbf{r} \times \dot{\mathbf{r}}$ from Equation (14):

$$\begin{aligned} \mathbf{C} &= \mathbf{r} \times \dot{\mathbf{r}} = \mathbf{r} \times \mathbf{v} \\ &= r\mathbf{u}_r \times (\dot{r}\mathbf{u}_r + r\dot{\theta}\mathbf{u}_\theta) && \text{Equation (4)} \\ &= r\dot{r}\underbrace{(\mathbf{u}_r \times \mathbf{u}_r)}_{\mathbf{0}} + r(r\dot{\theta})\underbrace{(\mathbf{u}_r \times \mathbf{u}_\theta)}_{\mathbf{k}} \\ &= r(r\dot{\theta})\mathbf{k}. \end{aligned} \tag{17}$$

Setting $t$ equal to zero shows that

$$\mathbf{C} = [r(r\dot{\theta})]_{t=0}\,\mathbf{k} = r_0 v_0 \mathbf{k}. \tag{18}$$

Substituting this value for $\mathbf{C}$ in Equation (17) gives

$$r_0 v_0 \mathbf{k} = r^2\dot{\theta}\mathbf{k}, \qquad \text{or} \qquad r^2\dot{\theta} = r_0 v_0. \tag{19}$$

This is where the area comes in. The area differential in polar coordinates is

$$dA = \frac{1}{2}r^2\,d\theta$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

(Section 10.7). Accordingly, $dA/dt$ has the constant value

$$\frac{dA}{dt} = \frac{1}{2}r^2\dot{\theta} = \frac{1}{2}r_0 v_0. \tag{20}$$

So $dA/dt$ is constant, giving Kepler's second law.

For Earth, $r_0$ is about 150,000,000 km, $v_0$ is about 30 km/sec, and $dA/dt$ is about 2,250,000,000 $\text{km}^2/\text{sec}$. Every time your heart beats, Earth advances 30 km along its orbit, and the radius joining Earth to the sun sweeps out 2,250,000,000 $\text{km}^2$ of area.

## Proof of Kepler's First Law

To prove that a planet moves along a conic section with one focus at its sun, we need to express the planet's radius $r$ as a function of $\theta$. This requires a long sequence of calculations and some substitutions that are not altogether obvious.

We begin with the equation that comes from equating the coefficients of $\mathbf{u}_r = \mathbf{r}/|\mathbf{r}|$ in Equations (6) and (10):

$$\ddot{r} - r\dot{\theta}^2 = -\frac{GM}{r^2}. \tag{21}$$

We eliminate $\dot{\theta}$ temporarily by replacing it with $r_0 v_0/r^2$ from Equation (19) and rearrange the resulting equation to get

$$\ddot{r} = \frac{r_0^2 v_0^2}{r^3} - \frac{GM}{r^2}. \tag{22}$$

We change this into a first-order equation by a change of variable. With

$$p = \frac{dr}{dt}, \qquad \frac{d^2r}{dt^2} = \frac{dp}{dt} = \frac{dp}{dr}\frac{dr}{dt} = p\frac{dp}{dr}, \qquad \text{Chain Rule}$$

Equation (22) becomes

$$p\frac{dp}{dr} = \frac{r_0^2 v_0^2}{r^3} - \frac{GM}{r^2}. \tag{23}$$

Multiplying through by 2 and integrating with respect to $r$ gives

$$p^2 = (\dot{r})^2 = -\frac{r_0^2 v_0^2}{r^2} + \frac{2GM}{r} + C_1. \tag{24}$$

The initial conditions that $r = r_0$ and $\dot{r} = 0$ when $t = 0$ determine the value of $C_1$ to be

$$C_1 = v_0^2 - \frac{2GM}{r_0}.$$

Accordingly, Equation (24), after a suitable rearrangement, becomes

$$\dot{r}^2 = v_0^2\left(1 - \frac{r_0^2}{r^2}\right) + 2GM\left(\frac{1}{r} - \frac{1}{r_0}\right). \tag{25}$$

The effect of going from Equation (21) to Equation (25) has been to replace a second-order differential equation in $r$ by a first-order differential equation in $r$. Our goal is still to express $r$ in terms of $\theta$, so we now bring $\theta$ back into the picture. To accomplish this, we

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

divide both sides of Equation (25) by the squares of the corresponding sides of the equation $r^2\dot{\theta} = r_0 v_0$ (Equation 19) and use the fact that $\dot{r}/\dot{\theta} = (dr/dt)/(d\theta/dt) = dr/d\theta$ to get

$$\begin{aligned}\frac{1}{r^4}\left(\frac{dr}{d\theta}\right)^2 &= \frac{1}{{r_0}^2} - \frac{1}{r^2} + \frac{2GM}{{r_0}^2 {v_0}^2}\left(\frac{1}{r} - \frac{1}{r_0}\right) \\ &= \frac{1}{{r_0}^2} - \frac{1}{r^2} + 2h\left(\frac{1}{r} - \frac{1}{r_0}\right). \qquad h = \frac{GM}{{r_0}^2 {v_0}^2}\end{aligned} \tag{26}$$

To simplify further, we substitute

$$u = \frac{1}{r}, \qquad u_0 = \frac{1}{r_0}, \qquad \frac{du}{d\theta} = -\frac{1}{r^2}\frac{dr}{d\theta}, \qquad \left(\frac{du}{d\theta}\right)^2 = \frac{1}{r^4}\left(\frac{dr}{d\theta}\right)^2,$$

obtaining

$$\left(\frac{du}{d\theta}\right)^2 = {u_0}^2 - u^2 + 2hu - 2hu_0 = (u_0 - h)^2 - (u - h)^2, \tag{27}$$

$$\frac{du}{d\theta} = \pm\sqrt{(u_0 - h)^2 - (u - h)^2}. \tag{28}$$

Which sign do we take? We know that $\dot{\theta} = r_0 v_0/r^2$ is positive. Also, $r$ starts from a minimum value at $t = 0$, so it cannot immediately decrease, and $\dot{r} \geq 0$, at least for early positive values of $t$. Therefore,

$$\frac{dr}{d\theta} = \frac{\dot{r}}{\dot{\theta}} \geq 0 \qquad \text{and} \qquad \frac{du}{d\theta} = -\frac{1}{r^2}\frac{dr}{d\theta} \leq 0.$$

The correct sign for Equation (28) is the negative sign. With this determined, we rearrange Equation (28) and integrate both sides with respect to $\theta$:

$$\begin{aligned}\frac{-1}{\sqrt{(u_0 - h)^2 - (u - h)^2}}\frac{du}{d\theta} &= 1 \\ \cos^{-1}\left(\frac{u - h}{u_0 - h}\right) &= \theta + C_2.\end{aligned} \tag{29}$$

The constant $C_2$ is zero because $u = u_0$ when $\theta = 0$ and $\cos^{-1}(1) = 0$. Therefore,

$$\frac{u - h}{u_0 - h} = \cos\theta$$

and

$$\frac{1}{r} = u = h + (u_0 - h)\cos\theta. \tag{30}$$

A few more algebraic maneuvers produce the final equation

$$r = \frac{(1 + e)r_0}{1 + e\cos\theta}, \tag{31}$$

where

$$e = \frac{1}{r_0 h} - 1 = \frac{r_0 {v_0}^2}{GM} - 1. \tag{32}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Together, Equations (31) and (32) say that the path of the planet is a conic section with one focus at the sun and with eccentricity $(r_0 v_0^2/GM) - 1$. This is the modern formulation of Kepler's first law.

## Kepler's Third Law (The Time–Distance Law)

The time $T$ it takes a planet to go around its sun once is the planet's **orbital period**. *Kepler's third law* says that $T$ and the orbit's semimajor axis $a$ are related by the equation

$$\frac{T^2}{a^3} = \frac{4\pi^2}{GM}. \tag{33}$$

Since the right-hand side of this equation is constant within a given solar system, the ratio of $T^2$ to $a^3$ *is the same for every planet in the system*.

Kepler's third law is the starting point for working out the size of our solar system. It allows the semimajor axis of each planetary orbit to be expressed in astronomical units, Earth's semimajor axis being one unit. The distance between any two planets at any time can then be predicted in astronomical units and all that remains is to find one of these distances in kilometers. This can be done by bouncing radar waves off Venus, for example. The astronomical unit is now known, after a series of such measurements, to be 149,597,870 km.

We derive Kepler's third law by combining two formulas for the area enclosed by the planet's elliptical orbit:

Formula 1: $\text{Area} = \pi ab$ — The geometry formula in which $a$ is the semimajor axis and $b$ is the semiminor axis

Formula 2:
$$\text{Area} = \int_0^T dA$$
$$= \int_0^T \frac{1}{2} r_0 v_0 \, dt \quad \text{Equation (20)}$$
$$= \frac{1}{2} T r_0 v_0.$$

Equating these gives

$$T = \frac{2\pi ab}{r_0 v_0} = \frac{2\pi a^2}{r_0 v_0}\sqrt{1 - e^2}. \tag{34}$$

For any ellipse, $b = a\sqrt{1 - e^2}$

It remains only to express $a$ and $e$ in terms of $r_0$, $v_0$, $G$, and $M$. Equation (32) does this for $e$. For $a$, we observe that setting $\theta$ equal to $\pi$ in Equation (31) gives

$$r_{\max} = r_0 \frac{1 + e}{1 - e}.$$

Hence,

$$2a = r_0 + r_{\max} = \frac{2r_0}{1 - e} = \frac{2r_0 GM}{2GM - r_0 v_0^2}. \tag{35}$$

Squaring both sides of Equation (34) and substituting the results of Equations (32) and (35) now produces Kepler's third law (Exercise 15).

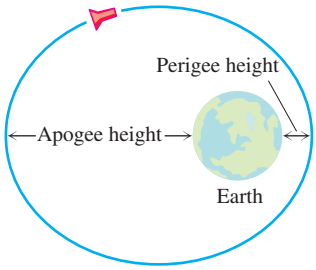

**FIGURE 13.39** The orbit of an Earth satellite: $2a$ = diameter of Earth + perigee height + apogee height.

## Orbit Data

Although Kepler discovered his laws empirically and stated them only for the six planets known at the time, the modern derivations of Kepler's laws show that they apply to any body driven by a force that obeys an inverse square law like Equation (9). They apply to Halley's comet and the asteroid Icarus. They apply to the moon's orbit about Earth, and they applied to the orbit of the spacecraft *Apollo 8* about the moon.

Tables 13.1 through 13.3 give additional data for planetary orbits and for the orbits of seven of Earth's artificial satellites (Figure 13.39). *Vanguard 1* sent back data that revealed differences between the levels of Earth's oceans and provided the first determination of the precise locations of some of the more isolated Pacific islands. The data also verified that the gravitation of the sun and moon would affect the orbits of Earth's satellites and that solar radiation could exert enough pressure to deform an orbit.

**TABLE 13.1** Values of $a$, $e$, and $T$ for the major planets

| Planet | Semimajor axis $a^*$ | Eccentricity $e$ | Period $T$ |
|---|---|---|---|
| Mercury | 57.95 | 0.2056 | 87.967 days |
| Venus | 108.11 | 0.0068 | 224.701 days |
| Earth | 149.57 | 0.0167 | 365.256 days |
| Mars | 227.84 | 0.0934 | 1.8808 years |
| Jupiter | 778.14 | 0.0484 | 11.8613 years |
| Saturn | 1427.0 | 0.0543 | 29.4568 years |
| Uranus | 2870.3 | 0.0460 | 84.0081 years |
| Neptune | 4499.9 | 0.0082 | 164.784 years |
| Pluto | 5909 | 0.2481 | 248.35 years |

*Millions of kilometers.

**TABLE 13.2** Data on Earth's satellites

| Name | Launch date | Time or expected time aloft | Mass at launch (kg) | Period (min) | Perigee height (km) | Apogee height (km) | Semimajor axis $a$ (km) | Eccentricity |
|---|---|---|---|---|---|---|---|---|
| *Sputnik 1* | Oct. 1957 | 57.6 days | 83.6 | 96.2 | 215 | 939 | 6955 | 0.052 |
| *Vanguard 1* | Mar. 1958 | 300 years | 1.47 | 138.5 | 649 | 4340 | 8872 | 0.208 |
| *Syncom 3* | Aug. 1964 | $>10^6$ years | 39 | 1436.2 | 35,718 | 35,903 | 42,189 | 0.002 |
| *Skylab 4* | Nov. 1973 | 84.06 days | 13,980 | 93.11 | 422 | 437 | 6808 | 0.001 |

## EXERCISES 13.6

*Reminder:* When a calculation involves the gravitational constant $G$, express force in newtons, distance in meters, mass in kilograms, and time in seconds.

1. **Period of *Skylab 4*** Since the orbit of *Skylab 4* had a semimajor axis of $a = 6808$ km, Kepler's third law with $M$ equal to Earth's mass should give the period. Calculate it. Compare your result with the value in Table 13.2.
2. **Earth's velocity at perihelion** Earth's distance from the sun at perihelion is approximately 149,577,000 km, and the eccentricity of Earth's orbit about the sun is 0.0167. Find the velocity $v_0$ of Earth in its orbit at perihelion. (Use Equation (15).)
3. **Semimajor axis of *Proton I*** In July 1965, the USSR launched *Proton I*, weighing 12,200 kg (at launch), with a perigee height of 183 km, an apogee height of 589 km, and a period of 92.25 min. Using the relevant data for the mass of Earth and the gravitational constant $G$, find the semimajor axis $a$ of the orbit from Equation (3). Compare your answer with the number you get by adding the perigee and apogee heights to the diameter of the Earth.
4. **Semimajor axis of *Viking I*** The *Viking I* orbiter, which surveyed Mars from August 1975 to June 1976, had a period of 1639 min. Use this and the mass of Mars, $6.418 \times 10^{23}$ kg, to find the semimajor axis of the *Viking I* orbit.
5. **Average diameter of Mars** (*Continuation of Exercise 4.*) The *Viking I* orbiter was 1499 km from the surface of Mars at its closest point and 35,800 km from the surface at its farthest point. Use this information together with the value you obtained in Exercise 4 to estimate the average diameter of Mars.
6. **Period of *Viking 2*** The *Viking 2* orbiter, which surveyed Mars from September 1975 to August 1976, moved in an ellipse whose semimajor axis was 22,030 km. What was the orbital period? (Express your answer in minutes.)
7. **Geosynchronous orbits** Several satellites in Earth's equatorial plane have nearly circular orbits whose periods are the same as Earth's rotational period. Such orbits are *geosynchronous* or *geostationary* because they hold the satellite over the same spot on the Earth's surface.
   a. Approximately what is the semimajor axis of a geosynchronous orbit? Give reasons for your answer.
   b. About how high is a geosynchronous orbit above Earth's surface?
   c. Which of the satellites in Table 13.2 have (nearly) geosynchronous orbits?
8. The mass of Mars is $6.418 \times 10^{23}$ kg. If a satellite revolving about Mars is to hold a stationary orbit (have the same period as

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

the period of Mars's rotation, which is 1477.4 min), what must the semimajor axis of its orbit be? Give reasons for your answer.

**9. Distance from Earth to the moon** The period of the moon's rotation about Earth is $2.36055 \times 10^6$ sec. About how far away is the moon?

**10. Finding satellite speed** A satellite moves around Earth in a circular orbit. Express the satellite's speed as a function of the orbit's radius.

**11. Orbital period** If $T$ is measured in seconds and $a$ in meters, what is the value of $T^2/a^3$ for planets in our solar system? For satellites orbiting Earth? For satellites orbiting the moon? (The moon's mass is $7.354 \times 10^{22}$ kg.)

**12. Type of orbit** For what values of $v_0$ in Equation (15) is the orbit in Equation (16) a circle? An ellipse? A parabola? A hyperbola?

**13. Circular orbits** Show that a planet in a circular orbit moves with a constant speed. (*Hint:* This is a consequence of one of Kepler's laws.)

**14.** Suppose that $\mathbf{r}$ is the position vector of a particle moving along a plane curve and $dA/dt$ is the rate at which the vector sweeps out area. Without introducing coordinates, and assuming the necessary derivatives exist, give a geometric argument based on increments and limits for the validity of the equation

$$\frac{dA}{dt} = \frac{1}{2}|\mathbf{r} \times \dot{\mathbf{r}}|.$$

**15. Kepler's third law** Complete the derivation of Kepler's third law (the part following Equation (34)).

In Exercises 16 and 17, two planets, planet $A$ and planet $B$, are orbiting their sun in circular orbits with $A$ being the inner planet and $B$ being farther away from the sun. Suppose the positions of $A$ and $B$ at time $t$ are

$$\mathbf{r}_A(t) = 2\cos(2\pi t)\mathbf{i} + 2\sin(2\pi t)\mathbf{j}$$

and

$$\mathbf{r}_B(t) = 3\cos(\pi t)\mathbf{i} + 3\sin(\pi t)\mathbf{j},$$

respectively, where the sun is assumed to be located at the origin and distance is measured in astronomical units. (Notice that planet $A$ moves faster than planet $B$.)

The people on planet $A$ regard their planet, not the sun, as the center of their planetary system (their solar system).

**16.** Using planet $A$ as the origin of a new coordinate system, give parametric equations for the location of planet $B$ at time $t$. Write your answer in terms of $\cos(\pi t)$ and $\sin(\pi t)$.

T **17.** Using planet $A$ as the origin, graph the path of planet $B$.

This exercise illustrates the difficulty that people before Kepler's time, with an earth-centered (planet $A$) view of our solar system, had in understanding the motions of the planets (i.e., planet $B$ = Mars). See D. G. Saari's article in the *American Mathematical Monthly*, Vol. 97 (Feb. 1990), pp. 105–119.

**18.** Kepler discovered that the path of Earth around the sun is an ellipse with the sun at one of the foci. Let $\mathbf{r}(t)$ be the position vector from the center of the sun to the center of Earth at time $t$. Let $\mathbf{w}$ be the vector from Earth's South Pole to North Pole. It is known that $\mathbf{w}$ is constant and not orthogonal to the plane of the ellipse (Earth's axis is tilted). In terms of $\mathbf{r}(t)$ and $\mathbf{w}$, give the mathematical meaning of (i) perihelion, (ii) aphelion, (iii) equinox, (iv) summer solstice, (v) winter solstice.

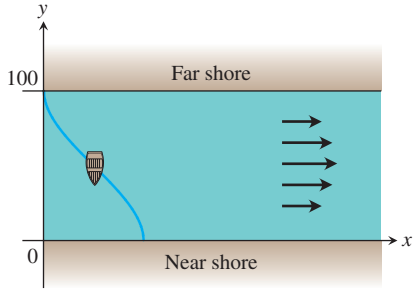
# Chapter 13 Additional and Advanced Exercises

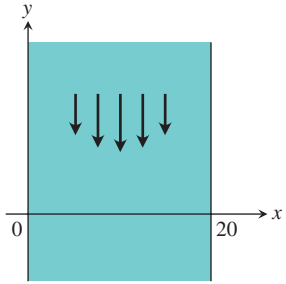


## Applications

**1.** A straight river is 100 m wide. A rowboat leaves the far shore at time $t = 0$. The person in the boat rows at a rate of 20 m/min, always toward the near shore. The velocity of the river at $(x, y)$ is

$$\mathbf{v} = \left(-\frac{1}{250}(y - 50)^2 + 10\right)\mathbf{i} \text{ m/min}, \quad 0 < y < 100.$$

**a.** Given that $\mathbf{r}(0) = 0\mathbf{i} + 100\mathbf{j}$, what is the position of the boat at time $t$?



**b.** How far downstream will the boat land on the near shore?

**2.** A straight river is 20 m wide. The velocity of the river at $(x, y)$ is

$$\mathbf{v} = -\frac{3x(20 - x)}{100}\mathbf{j} \text{ m/min}, \quad 0 \le x \le 20.$$

A boat leaves the shore at (0, 0) and travels through the water with a constant velocity. It arrives at the opposite shore at (20, 0). The speed of the boat is always $\sqrt{20}$ m/min.

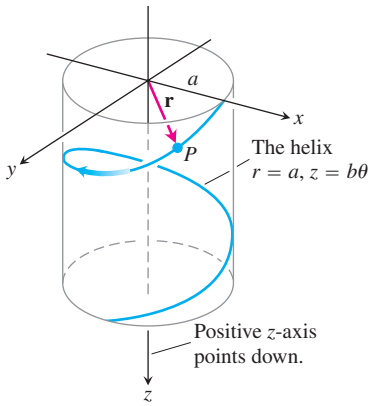
**a.** Find the velocity of the boat.

**b.** Find the location of the boat at time $t$.

**c.** Sketch the path of the boat.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**3.** A frictionless particle $P$, starting from rest at time $t = 0$ at the point $(a, 0, 0)$, slides down the helix

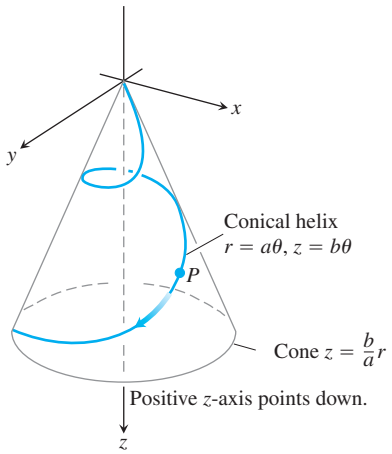


$$\mathbf{r}(\theta) = (a\cos\theta)\mathbf{i} + (a\sin\theta)\mathbf{j} + b\theta\mathbf{k} \quad (a, b > 0)$$

under the influence of gravity, as in the accompanying figure. The $\theta$ in this equation is the cylindrical coordinate $\theta$ and the helix is the curve $r = a, z = b\theta, \theta \geq 0$, in cylindrical coordinates. We assume $\theta$ to be a differentiable function of $t$ for the motion. The law of conservation of energy tells us that the particle's speed after it has fallen straight down a distance $z$ is $\sqrt{2gz}$, where $g$ is the constant acceleration of gravity.

**a.** Find the angular velocity $d\theta/dt$ when $\theta = 2\pi$.

**b.** Express the particle's $\theta$- and $z$-coordinates as functions of $t$.



**c.** Express the tangential and normal components of the velocity $d\mathbf{r}/dt$ and acceleration $d^2\mathbf{r}/dt^2$ as functions of $t$. Does the acceleration have any nonzero component in the direction of the binormal vector $\mathbf{B}$?

**4.** Suppose the curve in Exercise 3 is replaced by the conical helix $r = a\theta, z = b\theta$ shown in the accompanying figure.

**a.** Express the angular velocity $d\theta/dt$ as a function of $\theta$.

**b.** Express the distance the particle travels along the helix as a function of $\theta$.

## Polar Coordinate Systems and Motion in Space

**5.** Deduce from the orbit equation

$$r = \frac{(1 + e)r_0}{1 + e\cos\theta}$$

that a planet is closest to its sun when $\theta = 0$ and show that $r = r_0$ at that time.

T **6. A Kepler equation** The problem of locating a planet in its orbit at a given time and date eventually leads to solving "Kepler" equations of the form

$$f(x) = x - 1 - \frac{1}{2}\sin x = 0.$$

**a.** Show that this particular equation has a solution between $x = 0$ and $x = 2$.

**b.** With your computer or calculator in radian mode, use Newton's method to find the solution to as many places as you can.

**7.** In Section 13.6, we found the velocity of a particle moving in the plane to be

$$\mathbf{v} = \dot{x}\,\mathbf{i} + \dot{y}\,\mathbf{j} = \dot{r}\,\mathbf{u}_r + r\dot{\theta}\,\mathbf{u}_\theta.$$

**a.** Express $\dot{x}$ and $\dot{y}$ in terms of $\dot{r}$ and $r\dot{\theta}$ by evaluating the dot products $\mathbf{v}\cdot\mathbf{i}$ and $\mathbf{v}\cdot\mathbf{j}$.

**b.** Express $\dot{r}$ and $r\dot{\theta}$ in terms of $\dot{x}$ and $\dot{y}$ by evaluating the dot products $\mathbf{v}\cdot\mathbf{u}_r$ and $\mathbf{v}\cdot\mathbf{u}_\theta$.

**8.** Express the curvature of a twice-differentiable curve $r = f(\theta)$ in the polar coordinate plane in terms of $f$ and its derivatives.

**9.** A slender rod through the origin of the polar coordinate plane rotates (in the plane) about the origin at the rate of 3 rad/min. A beetle starting from the point (2, 0) crawls along the rod toward the origin at the rate of 1 in./min.

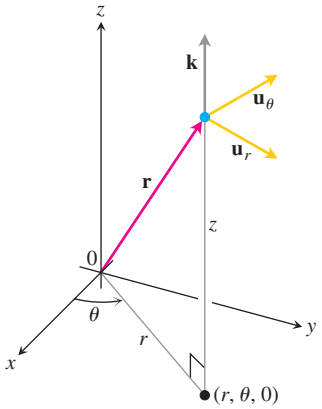
**a.** Find the beetle's acceleration and velocity in polar form when it is halfway to (1 in. from) the origin.

T **b.** To the nearest tenth of an inch, what will be the length of the path the beetle has traveled by the time it reaches the origin?

**10. Conservation of angular momentum** Let $\mathbf{r}(t)$ denote the position in space of a moving object at time $t$. Suppose the force acting on the object at time $t$ is

$$\mathbf{F}(t) = -\frac{c}{|\mathbf{r}(t)|^3}\mathbf{r}(t),$$

where $c$ is a constant. In physics the **angular momentum** of an object at time $t$ is defined to be $\mathbf{L}(t) = \mathbf{r}(t) \times m\mathbf{v}(t)$, where $m$ is the mass of the object and $\mathbf{v}(t)$ is the velocity. Prove that angular momentum is a conserved quantity; i.e., prove that $\mathbf{L}(t)$ is a constant vector, independent of time. Remember Newton's law $\mathbf{F} = m\mathbf{a}$. (This is a calculus problem, not a physics problem.)



Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Cylindrical Coordinate Systems

**11. Unit vectors for position and motion in cylindrical coordinates** When the position of a particle moving in space is given in cylindrical coordinates, the unit vectors we use to describe its position and motion are

$$\mathbf{u}_r = (\cos\theta)\mathbf{i} + (\sin\theta)\mathbf{j}, \qquad \mathbf{u}_\theta = -(\sin\theta)\mathbf{i} + (\cos\theta)\mathbf{j},$$

and $\mathbf{k}$ (see accompanying figure). The particle's position vector is then $\mathbf{r} = r\,\mathbf{u}_r + z\,\mathbf{k}$, where $r$ is the positive polar distance coordinate of the particle's position.

**a.** Show that $\mathbf{u}_r$, $\mathbf{u}_\theta$, and $\mathbf{k}$, in this order, form a right-handed frame of unit vectors.

**b.** Show that

$$\frac{d\mathbf{u}_r}{d\theta} = \mathbf{u}_\theta \quad \text{and} \quad \frac{d\mathbf{u}_\theta}{d\theta} = -\mathbf{u}_r.$$

**c.** Assuming that the necessary derivatives with respect to $t$ exist, express $\mathbf{v} = \dot{\mathbf{r}}$ and $\mathbf{a} = \ddot{\mathbf{r}}$ in terms of $\mathbf{u}_r$, $\mathbf{u}_\theta$, $\mathbf{k}$, $\dot{r}$, and $\dot{\theta}$. (The dots indicate derivatives with respect to $t$: $\dot{\mathbf{r}}$ means $d\mathbf{r}/dt$, $\ddot{\mathbf{r}}$ means $d^2\mathbf{r}/dt^2$, and so on.) Section 13.6 derives these formulas and shows how the vectors mentioned here are used in describing planetary motion.

**12. Arc length in cylindrical coordinates**

**a.** Show that when you express $ds^2 = dx^2 + dy^2 + dz^2$ in terms of cylindrical coordinates, you get $ds^2 = dr^2 + r^2\,d\theta^2 + dz^2$.

**b.** Interpret this result geometrically in terms of the edges and a diagonal of a box. Sketch the box.

**c.** Use the result in part (a) to find the length of the curve $r = e^\theta, z = e^\theta, 0 \le \theta \le \theta \ln 8$.

# Chapter 13 Practice Exercises

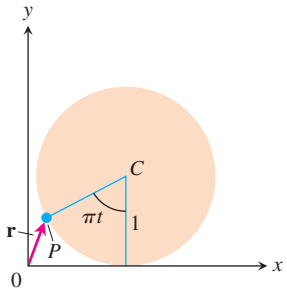
## Motion in a Cartesian Plane

In Exercises 1 and 2, graph the curves and sketch their velocity and acceleration vectors at the given values of $t$. Then write $\mathbf{a}$ in the form $\mathbf{a} = a_T\mathbf{T} + a_N\mathbf{N}$ without finding $\mathbf{T}$ and $\mathbf{N}$, and find the value of $\kappa$ at the given values of $t$.

1. $\mathbf{r}(t) = (4\cos t)\mathbf{i} + \left(\sqrt{2}\sin t\right)\mathbf{j}, \quad t = 0 \text{ and } \pi/4$
2. $\mathbf{r}(t) = \left(\sqrt{3}\sec t\right)\mathbf{i} + \left(\sqrt{3}\tan t\right)\mathbf{j}, \quad t = 0$
3. The position of a particle in the plane at time $t$ is

$$\mathbf{r} = \frac{1}{\sqrt{1+t^2}}\mathbf{i} + \frac{t}{\sqrt{1+t^2}}\mathbf{j}.$$

Find the particle's highest speed.



4. Suppose $\mathbf{r}(t) = (e^t\cos t)\mathbf{i} + (e^t\sin t)\mathbf{j}$. Show that the angle between $\mathbf{r}$ and $\mathbf{a}$ never changes. What *is* the angle?
5. **Finding curvature** At point $P$, the velocity and acceleration of a particle moving in the plane are $\mathbf{v} = 3\mathbf{i} + 4\mathbf{j}$ and $\mathbf{a} = 5\mathbf{i} + 15\mathbf{j}$. Find the curvature of the particle's path at $P$.
6. Find the point on the curve $y = e^x$ where the curvature is greatest.
7. A particle moves around the unit circle in the $xy$-plane. Its position at time $t$ is $\mathbf{r} = x\mathbf{i} + y\mathbf{j}$, where $x$ and $y$ are differentiable functions of $t$. Find $dy/dt$ if $\mathbf{v}\cdot\mathbf{i} = y$. Is the motion clockwise, or counterclockwise?
8. You send a message through a pneumatic tube that follows the curve $9y = x^3$ (distance in meters). At the point $(3, 3)$, $\mathbf{v}\cdot\mathbf{i} = 4$ and $\mathbf{a}\cdot\mathbf{i} = -2$. Find the values of $\mathbf{v}\cdot\mathbf{j}$ and $\mathbf{a}\cdot\mathbf{j}$ at $(3, 3)$.
9. **Characterizing circular motion** A particle moves in the plane so that its velocity and position vectors are always orthogonal. Show that the particle moves in a circle centered at the origin.
10. **Speed along a cycloid** A circular wheel with radius 1 ft and center $C$ rolls to the right along the $x$-axis at a half-turn per second. (See the accompanying figure.) At time $t$ seconds, the position vector of the point $P$ on the wheel's circumference is

$$\mathbf{r} = (\pi t - \sin \pi t)\mathbf{i} + (1 - \cos \pi t)\mathbf{j}.$$

**a.** Sketch the curve traced by $P$ during the interval $0 \le t \le 3$.

**b.** Find $\mathbf{v}$ and $\mathbf{a}$ at $t = 0, 1, 2$, and 3 and add these vectors to your sketch.

**c.** At any given time, what is the forward speed of the topmost point of the wheel? Of $C$?

## Projectile Motion and Motion in a Plane

11. **Shot put** A shot leaves the thrower's hand 6.5 ft above the ground at a 45° angle at 44 ft/sec. Where is it 3 sec later?
12. **Javelin** A javelin leaves the thrower's hand 7 ft above the ground at a 45° angle at 80 ft/sec. How high does it go?
13. A golf ball is hit with an initial speed $v_0$ at an angle $\alpha$ to the horizontal from a point that lies at the foot of a straight-sided hill that is inclined at an angle $\phi$ to the horizontal, where

$$0 < \phi < \alpha < \frac{\pi}{2}.$$

Show that the ball lands at a distance

$$\frac{2v_0^2\cos\alpha}{g\cos^2\phi}\sin(\alpha - \phi),$$

measured up the face of the hill. Hence, show that the greatest range that can be achieved for a given $v_0$ occurs when $\alpha = (\phi/2) + (\pi/4)$, i.e., when the initial velocity vector bisects the angle between the vertical and the hill.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**T** **14. The Dictator** The Civil War mortar Dictator weighed so much (17,120 lb) that it had to be mounted on a railroad car. It had a 13-in. bore and used a 20-lb powder charge to fire a 200-lb shell. The mortar was made by Mr. Charles Knapp in his ironworks in Pittsburgh, Pennsylvania, and was used by the Union army in 1864 in the siege of Petersburg, Virginia. How far did it shoot? Here we have a difference of opinion. The ordnance manual claimed 4325 yd, while field officers claimed 4752 yd. Assuming a 45° firing angle, what muzzle speeds are involved here?

**T** **15. The World's record for popping a champagne cork**

**a.** Until 1988, the world's record for popping a champagne cork was 109 ft. 6 in., once held by Captain Michael Hill of the British Royal Artillery (of course). Assuming Cpt. Hill held the bottle neck at ground level at a 45° angle, and the cork behaved like an ideal projectile, how fast was the cork going as it left the bottle?

**b.** A new world record of 177 ft. 9 in. was set on June 5, 1988, by Prof. Emeritus Heinrich of Rensselaer Polytechnic Institute, firing from 4 ft. above ground level at the Woodbury Vineyards Winery, New York. Assuming an ideal trajectory, what was the cork's initial speed?

**T** **16. Javelin** In Potsdam in 1988, Petra Felke of (then) East Germany set a women's world record by throwing a javelin 262 ft 5 in.

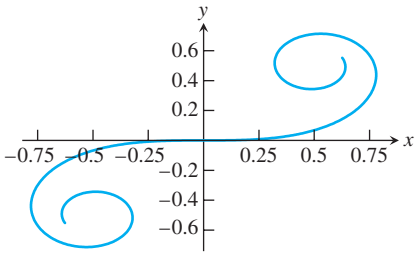
**a.** Assuming that Felke launched the javelin at a 40° angle to the horizontal 6.5 ft above the ground, what was the javelin's initial speed?

**b.** How high did the javelin go?

**17. Synchronous curves** By eliminating $\alpha$ from the ideal projectile equations

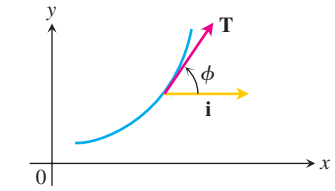
$$x = (v_0 \cos\alpha)t, \quad y = (v_0 \sin\alpha)t - \frac{1}{2}gt^2,$$

show that $x^2 + (y + gt^2/2)^2 = v_0^2 t^2$. This shows that projectiles launched simultaneously from the origin at the same initial speed will, at any given instant, all lie on the circle of radius $v_0 t$ centered at $(0, -gt^2/2)$, regardless of their launch angle. These circles are the *synchronous curves* of the launching.



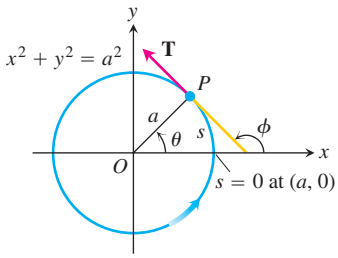
**18. Radius of curvature** Show that the radius of curvature of a twice-differentiable plane curve $\mathbf{r}(t) = f(t)\mathbf{i} + g(t)\mathbf{j}$ is given by the formula

$$\rho = \frac{\dot{x}^2 + \dot{y}^2}{\sqrt{\ddot{x}^2 + \ddot{y}^2 - \ddot{s}^2}}, \quad \text{where} \quad \ddot{s} = \frac{d}{dt}\sqrt{\dot{x}^2 + \dot{y}^2}.$$



**19. Curvature** Express the curvature of the curve

$$\mathbf{r}(t) = \left(\int_0^t \cos\left(\frac{1}{2}\pi\theta^2\right)d\theta\right)\mathbf{i} + \left(\int_0^t \sin\left(\frac{1}{2}\pi\theta^2\right)d\theta\right)\mathbf{j}$$



as a function of the directed distance $s$ measured along the curve from the origin. (See the accompanying figure.)

**20. An alternative definition of curvature in the plane** An alternative definition gives the curvature of a sufficiently differentiable plane curve to be $|d\phi/ds|$, where $\phi$ is the angle between **T** and **i** (Figure 13.40a). Figure 13.40b shows the distance $s$ measured counterclockwise around the circle $x^2 + y^2 = a^2$ from the point $(a, 0)$ to a point $P$, along with the angle $\phi$ at $P$. Calculate the circle's curvature using the alternative definition. (*Hint:* $\phi = \theta + \pi/2$.)

(a)

(b)

**FIGURE 13.40** Figures for Exercise 20.

## Motion in Space

Find the lengths of the curves in Exercises 21 and 22.

**21.** $\mathbf{r}(t) = (2\cos t)\mathbf{i} + (2\sin t)\mathbf{j} + t^2\mathbf{k}, \quad 0 \le t \le \pi/4$

**22.** $\mathbf{r}(t) = (3\cos t)\mathbf{i} + (3\sin t)\mathbf{j} + 2t^{3/2}\mathbf{k}, \quad 0 \le t \le 3$

In Exercises 23–26, find **T**, **N**, **B**, $\kappa$, and $\tau$ at the given value of $t$.

**23.** $\mathbf{r}(t) = \frac{4}{9}(1+t)^{3/2}\mathbf{i} + \frac{4}{9}(1-t)^{3/2}\mathbf{j} + \frac{1}{3}t\mathbf{k}, \quad t = 0$

**24.** $\mathbf{r}(t) = (e^t \sin 2t)\mathbf{i} + (e^t \cos 2t)\mathbf{j} + 2e^t\mathbf{k}, \quad t = 0$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**25.** $\mathbf{r}(t) = t\mathbf{i} + \frac{1}{2}e^{2t}\mathbf{j}, \quad t = \ln 2$

**26.** $\mathbf{r}(t) = (3\cosh 2t)\mathbf{i} + (3\sinh 2t)\mathbf{j} + 6t\mathbf{k}, \quad t = \ln 2$

In Exercises 27 and 28, write $\mathbf{a}$ in the form $\mathbf{a} = a_T\mathbf{T} + a_N\mathbf{N}$ at $t = 0$ without finding $\mathbf{T}$ and $\mathbf{N}$.

**27.** $\mathbf{r}(t) = (2 + 3t + 3t^2)\mathbf{i} + (4t + 4t^2)\mathbf{j} - (6\cos t)\mathbf{k}$

**28.** $\mathbf{r}(t) = (2 + t)\mathbf{i} + (t + 2t^2)\mathbf{j} + (1 + t^2)\mathbf{k}$

**29.** Find $\mathbf{T}$, $\mathbf{N}$, $\mathbf{B}$, $\kappa$, and $\tau$ as functions of $t$ if $\mathbf{r}(t) = (\sin t)\mathbf{i} + \left(\sqrt{2}\cos t\right)\mathbf{j} + (\sin t)\mathbf{k}$.

**30.** At what times in the interval $0 \le t \le \pi$ are the velocity and acceleration vectors of the motion $\mathbf{r}(t) = \mathbf{i} + (5\cos t)\mathbf{j} + (3\sin t)\mathbf{k}$ orthogonal?

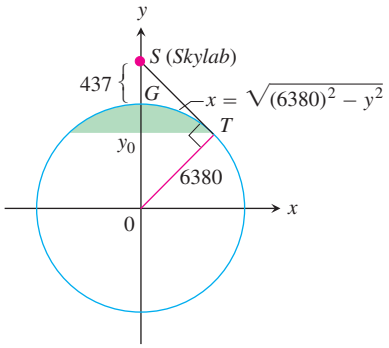
**31.** The position of a particle moving in space at time $t \ge 0$ is

$$\mathbf{r}(t) = 2\mathbf{i} + \left(4\sin\frac{t}{2}\right)\mathbf{j} + \left(3 - \frac{t}{\pi}\right)\mathbf{k}.$$

Find the first time $\mathbf{r}$ is orthogonal to the vector $\mathbf{i} - \mathbf{j}$.

**32.** Find equations for the osculating, normal, and rectifying planes of the curve $\mathbf{r}(t) = t\mathbf{i} + t^2\mathbf{j} + t^3\mathbf{k}$ at the point $(1, 1, 1)$.

**33.** Find parametric equations for the line that is tangent to the curve $\mathbf{r}(t) = e^t\mathbf{i} + (\sin t)\mathbf{j} + \ln(1 - t)\mathbf{k}$ at $t = 0$.



**34.** Find parametric equations for the line tangent to the helix $\mathbf{r}(t) = \left(\sqrt{2}\cos t\right)\mathbf{i} + \left(\sqrt{2}\sin t\right)\mathbf{j} + t\mathbf{k}$ at the point where $t = \pi/4$.

**35. The view from *Skylab 4*** What percentage of Earth's surface area could the astronauts see when *Skylab 4* was at its apogee height, 437 km above the surface? To find out, model the visible surface as the surface generated by revolving the circular arc $GT$, shown here, about the $y$-axis. Then carry out these steps:

1. Use similar triangles in the figure to show that $y_0/6380 = 6380/(6380 + 437)$. Solve for $y_0$.
2. To four significant digits, calculate the visible area as

$$VA = \int_{y_0}^{6380} 2\pi x\sqrt{1 + \left(\frac{dx}{dy}\right)^2}\,dy.$$

3. Express the result as a percentage of Earth's surface area.

# Chapter 13 Questions to Guide Your Review

1. State the rules for differentiating and integrating vector functions. Give examples.
2. How do you define and calculate the velocity, speed, direction of motion, and acceleration of a body moving along a sufficiently differentiable space curve? Give an example.
3. What is special about the derivatives of vector functions of constant length? Give an example.
4. What are the vector and parametric equations for ideal projectile motion? How do you find a projectile's maximum height, flight time, and range? Give examples.
5. How do you define and calculate the length of a segment of a smooth space curve? Give an example. What mathematical assumptions are involved in the definition?
6. How do you measure distance along a smooth curve in space from a preselected base point? Give an example.
7. What is a differentiable curve's unit tangent vector? Give an example.
8. Define curvature, circle of curvature (osculating circle), center of curvature, and radius of curvature for twice-differentiable curves in the plane. Give examples. What curves have zero curvature? Constant curvature?
9. What is a plane curve's principal normal vector? When is it defined? Which way does it point? Give an example.
10. How do you define $\mathbf{N}$ and $\kappa$ for curves in space? How are these quantities related? Give examples.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**11.** What is a curve's binormal vector? Give an example. How is this vector related to the curve's torsion? Give an example.

**12.** What formulas are available for writing a moving body's acceleration as a sum of its tangential and normal components? Give an example. Why might one want to write the acceleration this way? What if the body moves at a constant speed? At a constant speed around a circle?

**13.** State Kepler's laws. To what phenomena do they apply?

Chapter

# 14 PARTIAL DERIVATIVES

History

**OVERVIEW** In studying a real-world phenomenon, a quantity being investigated usually depends on two or more independent variables. So we need to extend the basic ideas of the calculus of functions of a single variable to functions of several variables. Although the calculus rules remain essentially the same, the calculus is even richer. The derivatives of functions of several variables are more varied and more interesting because of the different ways in which the variables can interact. Their integrals lead to a greater variety of applications. The studies of probability, statistics, fluid dynamics, and electricity, to mention only a few, all lead in natural ways to functions of more than one variable.

## 14.1 Functions of Several Variables

Project Project

Many functions depend on more than one independent variable. The function $V = \pi r^2 h$ calculates the volume of a right circular cylinder from its radius and height. The function $f(x, y) = x^2 + y^2$ calculates the height of the paraboloid $z = x^2 + y^2$ above the point $P(x, y)$ from the two coordinates of $P$. The temperature $T$ of a point on Earth's surface depends on its latitude $x$ and longitude $y$, expressed by writing $T = f(x, y)$. In this section, we define functions of more than one independent variable and discuss ways to graph them.

Real-valued functions of several independent real variables are defined much the way you would imagine from the single-variable case. The domains are sets of ordered pairs (triples, quadruples, $n$-tuples) of real numbers, and the ranges are sets of real numbers of the kind we have worked with all along.

**DEFINITIONS** **Function of $n$ Independent Variables**

Suppose $D$ is a set of $n$-tuples of real numbers $(x_1, x_2, \ldots, x_n)$. A **real-valued function** $f$ on $D$ is a rule that assigns a unique (single) real number

$$w = f(x_1, x_2, \ldots, x_n)$$

to each element in $D$. The set $D$ is the function's **domain**. The set of $w$-values taken on by $f$ is the function's **range**. The symbol $w$ is the **dependent variable** of $f$, and $f$ is said to be a function of the $n$ **independent variables** $x_1$ to $x_n$. We also call the $x_j$'s the function's **input variables** and call $w$ the function's **output variable**.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

If $f$ is a function of two independent variables, we usually call the independent variables $x$ and $y$ and picture the domain of $f$ as a region in the $xy$-plane. If $f$ is a function of three independent variables, we call the variables $x$, $y$, and $z$ and picture the domain as a region in space.

In applications, we tend to use letters that remind us of what the variables stand for. To say that the volume of a right circular cylinder is a function of its radius and height, we might write $V = f(r, h)$. To be more specific, we might replace the notation $f(r, h)$ by the formula that calculates the value of $V$ from the values of $r$ and $h$, and write $V = \pi r^2 h$. In either case, $r$ and $h$ would be the independent variables and $V$ the dependent variable of the function.

As usual, we evaluate functions defined by formulas by substituting the values of the independent variables in the formula and calculating the corresponding value of the dependent variable.

**EXAMPLE 1** Evaluating a Function

The value of $f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$ at the point $(3, 0, 4)$ is

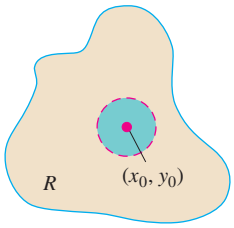
$$f(3, 0, 4) = \sqrt{(3)^2 + (0)^2 + (4)^2} = \sqrt{25} = 5.$$

From Section 12.1, we recognize $f$ as the distance function from the origin to the point $(x, y, z)$ in Cartesian space coordinates. ■

## Domains and Ranges

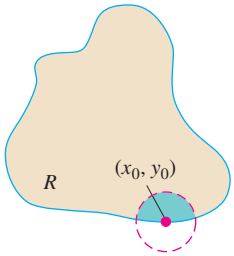
In defining a function of more than one variable, we follow the usual practice of excluding inputs that lead to complex numbers or division by zero. If $f(x, y) = \sqrt{y - x^2}$, $y$ cannot be less than $x^2$. If $f(x, y) = 1/(xy)$, $xy$ cannot be zero. The domain of a function is assumed to be the largest set for which the defining rule generates real numbers, unless the domain is otherwise specified explicitly. The range consists of the set of output values for the dependent variable.

**EXAMPLE 2(a)** Functions of Two Variables



| Function | Domain | Range |
|---|---|---|
| $w = \sqrt{y - x^2}$ | $y \geq x^2$ | $[0, \infty)$ |
| $w = \dfrac{1}{xy}$ | $xy \neq 0$ | $(-\infty, 0) \cup (0, \infty)$ |
| $w = \sin xy$ | Entire plane | $[-1, 1]$ |

**(b)** Functions of Three Variables



| Function | Domain | Range |
|---|---|---|
| $w = \sqrt{x^2 + y^2 + z^2}$ | Entire space | $[0, \infty)$ |
| $w = \dfrac{1}{x^2 + y^2 + z^2}$ | $(x, y, z) \neq (0, 0, 0)$ | $(0, \infty)$ |
| $w = xy \ln z$ | Half-space $z > 0$ | $(-\infty, \infty)$ |

■

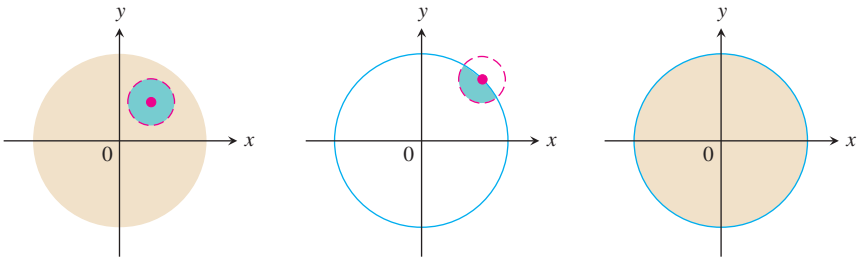
(a) Interior point

(b) Boundary point

**FIGURE 14.1** Interior points and boundary points of a plane region $R$. An interior point is necessarily a point of $R$. A boundary point of $R$ need not belong to $R$.



## Functions of Two Variables

Regions in the plane can have interior points and boundary points just like intervals on the real line. Closed intervals $[a, b]$ include their boundary points, open intervals $(a, b)$ don't include their boundary points, and intervals such as $[a, b)$ are neither open nor closed.

**DEFINITIONS Interior and Boundary Points, Open, Closed**

A point $(x_0, y_0)$ in a region (set) $R$ in the $xy$-plane is an **interior point** of $R$ if it is the center of a disk of positive radius that lies entirely in $R$ (Figure 14.1). A point $(x_0, y_0)$ is a **boundary point** of $R$ if every disk centered at $(x_0, y_0)$ contains points that lie outside of $R$ as well as points that lie in $R$. (The boundary point itself need not belong to $R$.)

The interior points of a region, as a set, make up the **interior** of the region. The region's boundary points make up its **boundary**. A region is **open** if it consists entirely of interior points. A region is **closed** if it contains all its boundary points (Figure 14.2).

$\{(x, y) \mid x^2 + y^2 < 1\}$
Open unit disk.
Every point an interior point.

$\{(x, y) \mid x^2 + y^2 = 1\}$
Boundary of unit disk. (The unit circle.)

$\{(x, y) \mid x^2 + y^2 \le 1\}$
Closed unit disk.
Contains all boundary points.

**FIGURE 14.2** Interior points and boundary points of the unit disk in the plane.

As with intervals of real numbers, some regions in the plane are neither open nor closed. If you start with the open disk in Figure 14.2 and add to it some of but not all its boundary points, the resulting set is neither open nor closed. The boundary points that *are* there keep the set from being open. The absence of the remaining boundary points keeps the set from being closed.

**DEFINITIONS Bounded and Unbounded Regions in the Plane**

A region in the plane is **bounded** if it lies inside a disk of fixed radius. A region is **unbounded** if it is not bounded.

Examples of *bounded* sets in the plane include line segments, triangles, interiors of triangles, rectangles, circles, and disks. Examples of *unbounded* sets in the plane include lines, coordinate axes, the graphs of functions defined on infinite intervals, quadrants, half-planes, and the plane itself.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

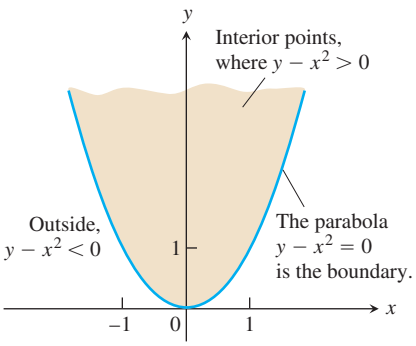


**FIGURE 14.3** The domain of $f(x, y) = \sqrt{y - x^2}$ consists of the shaded region and its bounding parabola $y = x^2$ (Example 3).

### EXAMPLE 3 Describing the Domain of a Function of Two Variables

Describe the domain of the function $f(x, y) = \sqrt{y - x^2}$.

**Solution** Since $f$ is defined only where $y - x^2 \geq 0$, the domain is the closed, unbounded region shown in Figure 14.3. The parabola $y = x^2$ is the boundary of the domain. The points above the parabola make up the domain's interior. ■

## Graphs, Level Curves, and Contours of Functions of Two Variables

There are two standard ways to picture the values of a function $f(x, y)$. One is to draw and label curves in the domain on which $f$ has a constant value. The other is to sketch the surface $z = f(x, y)$ in space.

**DEFINITIONS Level Curve, Graph, Surface**

The set of points in the plane where a function $f(x, y)$ has a constant value $f(x, y) = c$ is called a **level curve** of $f$. The set of all points $(x, y, f(x, y))$ in space, for $(x, y)$ in the domain of $f$, is called the **graph** of $f$. The graph of $f$ is also called the **surface** $\boldsymbol{z = f(x, y)}$.

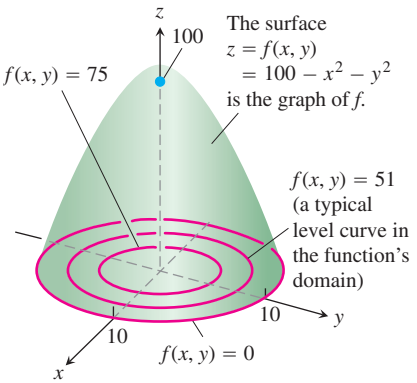

**FIGURE 14.4** The graph and selected level curves of the function $f(x, y) = 100 - x^2 - y^2$ (Example 4).

### EXAMPLE 4 Graphing a Function of Two Variables

Graph $f(x, y) = 100 - x^2 - y^2$ and plot the level curves $f(x, y) = 0$, $f(x, y) = 51$, and $f(x, y) = 75$ in the domain of $f$ in the plane.

**Solution** The domain of $f$ is the entire $xy$-plane, and the range of $f$ is the set of real numbers less than or equal to 100. The graph is the paraboloid $z = 100 - x^2 - y^2$, a portion of which is shown in Figure 14.4.

The level curve $f(x, y) = 0$ is the set of points in the $xy$-plane at which

$$f(x, y) = 100 - x^2 - y^2 = 0, \quad \text{or} \quad x^2 + y^2 = 100,$$

which is the circle of radius 10 centered at the origin. Similarly, the level curves $f(x, y) = 51$ and $f(x, y) = 75$ (Figure 14.4) are the circles

$$f(x, y) = 100 - x^2 - y^2 = 51, \quad \text{or} \quad x^2 + y^2 = 49$$

$$f(x, y) = 100 - x^2 - y^2 = 75, \quad \text{or} \quad x^2 + y^2 = 25.$$

The level curve $f(x, y) = 100$ consists of the origin alone. (It is still a level curve.) ■

The curve in space in which the plane $z = c$ cuts a surface $z = f(x, y)$ is made up of the points that represent the function value $f(x, y) = c$. It is called the **contour curve** $f(x, y) = c$ to distinguish it from the level curve $f(x, y) = c$ in the domain of $f$. Figure 14.5 shows the contour curve $f(x, y) = 75$ on the surface $z = 100 - x^2 - y^2$ defined by the function $f(x, y) = 100 - x^2 - y^2$. The contour curve lies directly above the circle $x^2 + y^2 = 25$, which is the level curve $f(x, y) = 75$ in the function's domain.

Not everyone makes this distinction, however, and you may wish to call both kinds of curves by a single name and rely on context to convey which one you have in mind. On most maps, for example, the curves that represent constant elevation (height above sea level) are called contours, not level curves (Figure 14.6).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

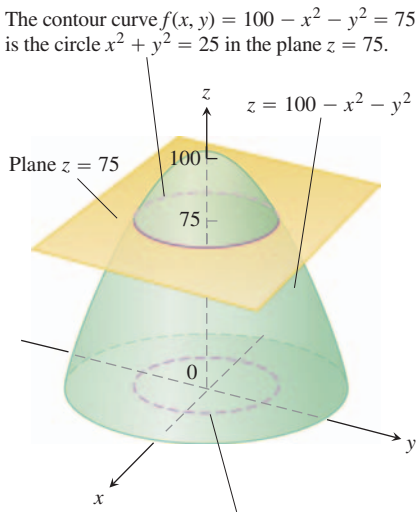

**FIGURE 14.5** A plane $z = c$ parallel to the $xy$-plane intersecting a surface $z = f(x, y)$ produces a contour curve.

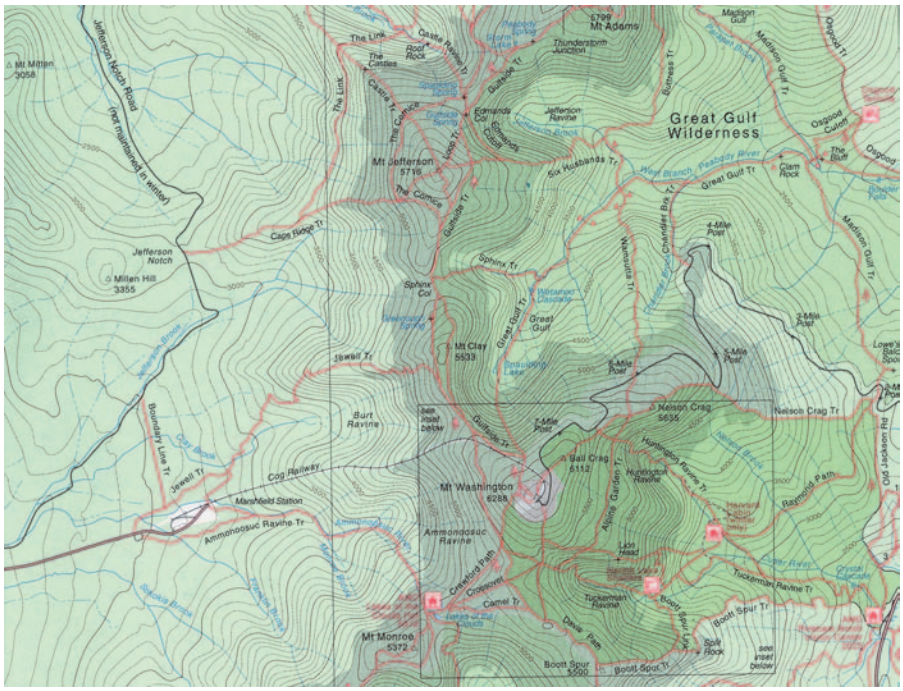

**FIGURE 14.6** Contours on Mt. Washington in New Hampshire. (Reproduced by permission from the Appalachian Mountain Club.)

## Functions of Three Variables

In the plane, the points where a function of two independent variables has a constant value $f(x, y) = c$ make a curve in the function's domain. In space, the points where a function of three independent variables has a constant value $f(x, y, z) = c$ make a surface in the function's domain.

**DEFINITION Level Surface**

The set of points $(x, y, z)$ in space where a function of three independent variables has a constant value $f(x, y, z) = c$ is called a **level surface** of $f$.

Since the graphs of functions of three variables consist of points $(x, y, z, f(x, y, z))$ lying in a four-dimensional space, we cannot sketch them effectively in our three-dimensional frame of reference. We can see how the function behaves, however, by looking at its three-dimensional level surfaces.

**EXAMPLE 5** Describing Level Surfaces of a Function of Three Variables

Describe the level surfaces of the function

$$f(x, y, z) = \sqrt{x^2 + y^2 + z^2}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

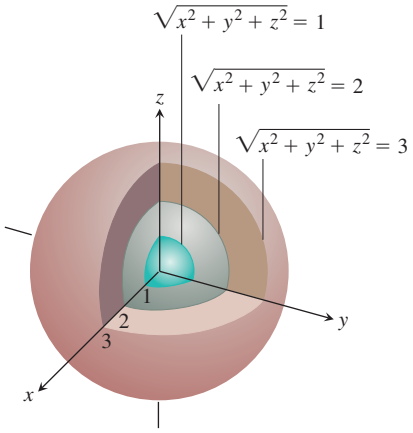

**FIGURE 14.7** The level surfaces of $f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$ are concentric spheres (Example 5).

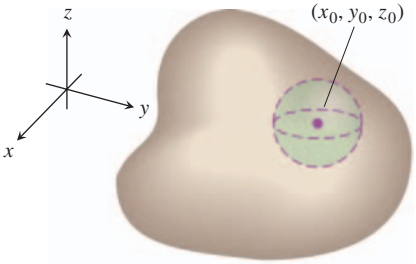
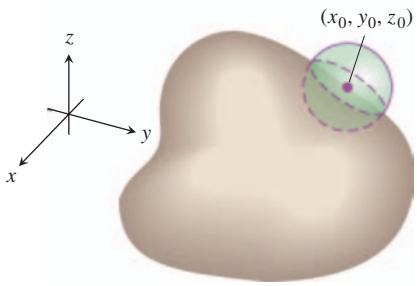
**Solution** The value of $f$ is the distance from the origin to the point $(x, y, z)$. Each level surface $\sqrt{x^2 + y^2 + z^2} = c$, $c > 0$, is a sphere of radius $c$ centered at the origin. Figure 14.7 shows a cutaway view of three of these spheres. The level surface $\sqrt{x^2 + y^2 + z^2} = 0$ consists of the origin alone.



We are not graphing the function here; we are looking at level surfaces in the function's domain. The level surfaces show how the function's values change as we move through its domain. If we remain on a sphere of radius $c$ centered at the origin, the function maintains a constant value, namely $c$. If we move from one sphere to another, the function's value changes. It increases if we move away from the origin and decreases if we move toward the origin. The way the values change depends on the direction we take. The dependence of change on direction is important. We return to it in Section 14.5. ■

The definitions of interior, boundary, open, closed, bounded, and unbounded for regions in space are similar to those for regions in the plane. To accommodate the extra dimension, we use solid balls of positive radius instead of disks.



**DEFINITIONS Interior and Boundary Points for Space Regions**

A point $(x_0, y_0, z_0)$ in a region $R$ in space is an **interior point** of $R$ if it is the center of a solid ball that lies entirely in $R$ (Figure 14.8a). A point $(x_0, y_0, z_0)$ is a **boundary point** of $R$ if every sphere centered at $(x_0, y_0, z_0)$ encloses points that lie outside of $R$ as well as points that lie inside $R$ (Figure 14.8b). The **interior** of $R$ is the set of interior points of $R$. The **boundary** of $R$ is the set of boundary points of $R$.

A region is **open** if it consists entirely of interior points. A region is **closed** if it contains its entire boundary.

(a) Interior point

(b) Boundary point

**FIGURE 14.8** Interior points and boundary points of a region in space.

Examples of *open* sets in space include the interior of a sphere, the open half-space $z > 0$, the first octant (where $x$, $y$, and $z$ are all positive), and space itself.

Examples of *closed* sets in space include lines, planes, the closed half-space $z \geq 0$, the first octant together with its bounding planes, and space itself (since it has no boundary points).

A solid sphere with part of its boundary removed or a solid cube with a missing face, edge, or corner point would be *neither open nor closed*.

Functions of more than three independent variables are also important. For example, the temperature on a surface in space may depend not only on the location of the point $P(x, y, z)$ on the surface, but also on time $t$ when it is visited, so we would write $T = f(x, y, z, t)$.

## Computer Graphing

Three-dimensional graphing programs for computers and calculators make it possible to graph functions of two variables with only a few keystrokes. We can often get information more quickly from a graph than from a formula.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 6** Modeling Temperature Beneath Earth's Surface

The temperature beneath the Earth's surface is a function of the depth $x$ beneath the surface and the time $t$ of the year. If we measure $x$ in feet and $t$ as the number of days elapsed from the expected date of the yearly highest surface temperature, we can model the variation in temperature with the function

$$w = \cos(1.7 \times 10^{-2}t - 0.2x)e^{-0.2x}.$$

(The temperature at 0 ft is scaled to vary from $+1$ to $-1$, so that the variation at $x$ feet can be interpreted as a fraction of the variation at the surface.)

Figure 14.9 shows a computer-generated graph of the function. At a depth of 15 ft, the variation (change in vertical amplitude in the figure) is about 5% of the surface variation. At 30 ft, there is almost no variation during the year.

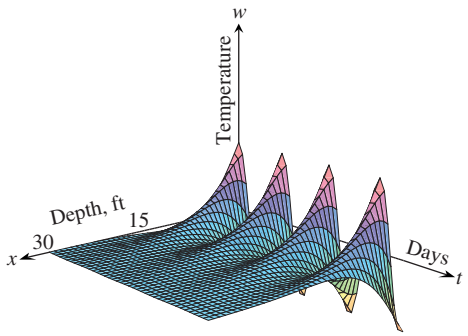


**FIGURE 14.9** This computer-generated graph of

$$w = \cos(1.7 \times 10^{-2}t - 0.2x)e^{-0.2x}$$

shows the seasonal variation of the temperature belowground as a fraction of surface temperature. At $x = 15$ ft, the variation is only 5% of the variation at the surface. At $x = 30$ ft, the variation is less than 0.25% of the surface variation (Example 6). (Adapted from art provided by Norton Starr.)

The graph also shows that the temperature 15 ft below the surface is about half a year out of phase with the surface temperature. When the temperature is lowest on the surface (late January, say), it is at its highest 15 ft below. Fifteen feet below the ground, the seasons are reversed. ■

Figure 14.10 shows computer-generated graphs of a number of functions of two variables together with their level curves.

# EXERCISES 14.1

## Domain, Range, and Level Curves

In Exercises 1–12, **(a)** find the function's domain, **(b)** find the function's range, **(c)** describe the function's level curves, **(d)** find the boundary of the function's domain, **(e)** determine if the domain is an open region, a closed region, or neither, and **(f)** decide if the domain is bounded or unbounded.

**1.** $f(x, y) = y - x$

**2.** $f(x, y) = \sqrt{y - x}$

**3.** $f(x, y) = 4x^2 + 9y^2$

**4.** $f(x, y) = x^2 - y^2$

**5.** $f(x, y) = xy$

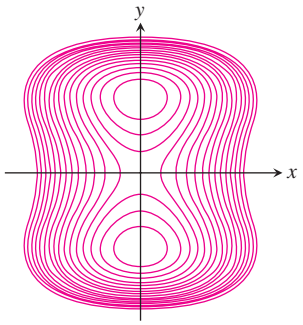
**6.** $f(x, y) = y/x^2$

**7.** $f(x, y) = \dfrac{1}{\sqrt{16 - x^2 - y^2}}$

**8.** $f(x, y) = \sqrt{9 - x^2 - y^2}$

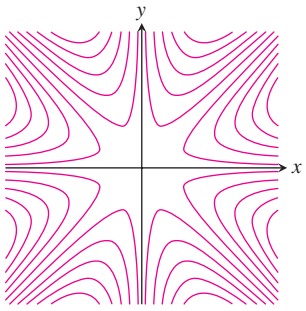
**9.** $f(x, y) = \ln(x^2 + y^2)$

**10.** $f(x, y) = e^{-(x^2+y^2)}$



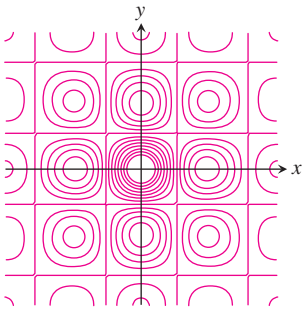
**11.** $f(x, y) = \sin^{-1}(y - x)$

**12.** $f(x, y) = \tan^{-1}\left(\dfrac{y}{x}\right)$

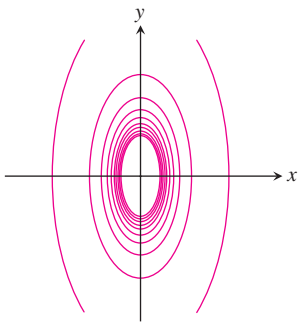


## Identifying Surfaces and Level Curves

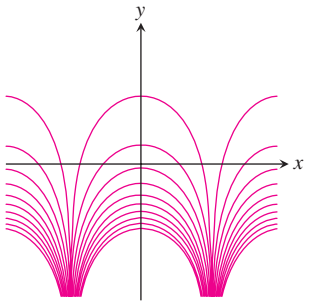
Exercises 13–18 show level curves for the functions graphed in (a)–(f). Match each set of curves with the appropriate function.



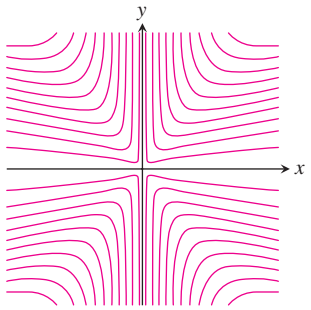
**13.**



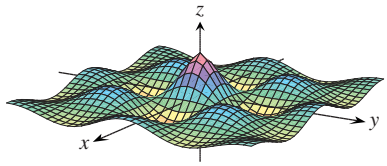
**14.**



**15.**

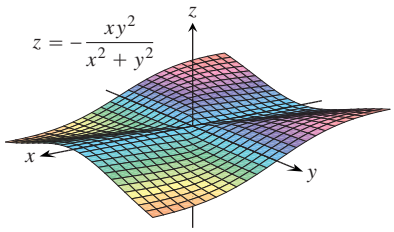


**16.**

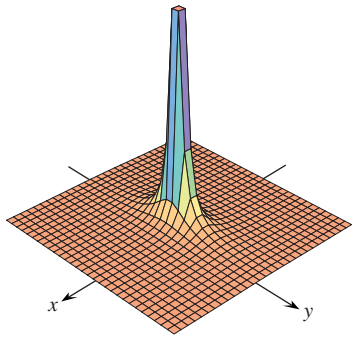


**17.**

**18.**

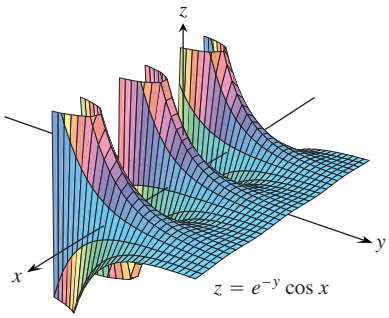


**a.**



$z = (\cos x)(\cos y)\, e^{-\sqrt{x^2+y^2}/4}$

**b.**



**c.**

$z = \dfrac{1}{4x^2 + y^2}$

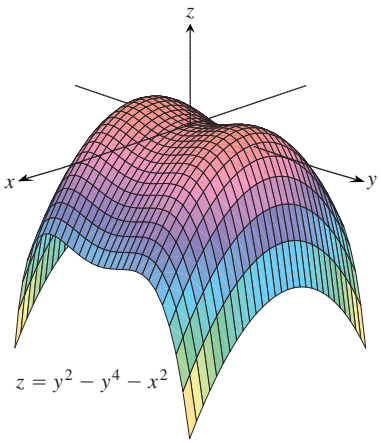
**d.**



$z = e^{-y}\cos x$

**e.**

$z = \dfrac{xy(x^2 - y^2)}{x^2 + y^2}$

**f.**

$z = y^2 - y^4 - x^2$

## Identifying Functions of Two Variables

Display the values of the functions in Exercises 19–28 in two ways: **(a)** by sketching the surface $z = f(x, y)$ and **(b)** by drawing an assortment of level curves in the function's domain. Label each level curve with its function value.

**19.** $f(x, y) = y^2$

**20.** $f(x, y) = 4 - y^2$

**21.** $f(x, y) = x^2 + y^2$

**22.** $f(x, y) = \sqrt{x^2 + y^2}$

**23.** $f(x, y) = -(x^2 + y^2)$

**24.** $f(x, y) = 4 - x^2 - y^2$

**25.** $f(x, y) = 4x^2 + y^2$

**26.** $f(x, y) = 4x^2 + y^2 + 1$

**27.** $f(x, y) = 1 - |y|$

**28.** $f(x, y) = 1 - |x| - |y|$

## Finding a Level Curve

In Exercises 29–32, find an equation for the level curve of the function $f(x, y)$ that passes through the given point.

**29.** $f(x, y) = 16 - x^2 - y^2, \quad (2\sqrt{2}, \sqrt{2})$

**30.** $f(x, y) = \sqrt{x^2 - 1}, \quad (1, 0)$

**31.** $f(x, y) = \displaystyle\int_x^y \frac{dt}{1 + t^2}, \quad (-\sqrt{2}, \sqrt{2})$

**32.** $f(x, y) = \displaystyle\sum_{n=0}^{\infty} \left(\frac{x}{y}\right)^n, \quad (1, 2)$

## Sketching Level Surfaces

In Exercises 33–40, sketch a typical level surface for the function.

**33.** $f(x, y, z) = x^2 + y^2 + z^2$

**34.** $f(x, y, z) = \ln(x^2 + y^2 + z^2)$

**35.** $f(x, y, z) = x + z$

**36.** $f(x, y, z) = z$

**37.** $f(x, y, z) = x^2 + y^2$

**38.** $f(x, y, z) = y^2 + z^2$

**39.** $f(x, y, z) = z - x^2 - y^2$

**40.** $f(x, y, z) = (x^2/25) + (y^2/16) + (z^2/9)$

## Finding a Level Surface

In Exercises 41–44, find an equation for the level surface of the function through the given point.

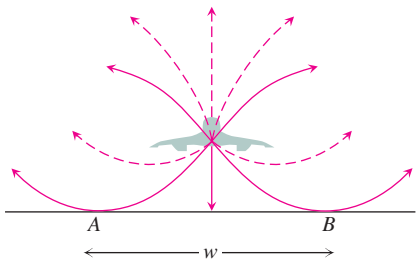
**41.** $f(x, y, z) = \sqrt{x - y} - \ln z, \quad (3, -1, 1)$

**42.** $f(x, y, z) = \ln(x^2 + y + z^2), \quad (-1, 2, 1)$

**43.** $g(x, y, z) = \displaystyle\sum_{n=0}^{\infty} \frac{(x + y)^n}{n! z^n}, \quad (\ln 2, \ln 4, 3)$

**44.** $g(x, y, z) = \displaystyle\int_x^y \frac{d\theta}{\sqrt{1 - \theta^2}} + \int_{\sqrt{2}}^z \frac{dt}{t\sqrt{t^2 - 1}}, \quad (0, 1/2, 2)$

## Theory and Examples



**45. The maximum value of a function on a line in space** Does the function $f(x, y, z) = xyz$ have a maximum value on the line $x = 20 - t, y = t, z = 20$? If so, what is it? Give reasons for your answer. (*Hint:* Along the line, $w = f(x, y, z)$ is a differentiable function of $t$.)

**46. The minimum value of a function on a line in space** Does the function $f(x, y, z) = xy - z$ have a minimum value on the line $x = t - 1, y = t - 2, z = t + 7$? If so, what is it? Give reasons for your answer. (*Hint:* Along the line, $w = f(x, y, z)$ is a differentiable function of $t$.)

**47. The Concorde's sonic booms** Sound waves from the *Concorde* bend as the temperature changes above and below the altitude at which the plane flies. The sonic boom carpet is the region on the

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

ground that receives shock waves directly from the plane, not reflected from the atmosphere or diffracted along the ground. The carpet is determined by the grazing rays striking the ground from the point directly under the plane. (See accompanying figure.)

Sonic boom carpet

The width $w$ of the region in which people on the ground hear the *Concorde*'s sonic boom directly, not reflected from a layer in the atmosphere, is a function of

$T$ = air temperature at ground level (in degrees Kelvin)

$h$ = the *Concorde*'s altitude (in kilometers)

$d$ = the vertical temperature gradient (temperature drop in degrees Kelvin per kilometer).

The formula for $w$ is

$$w = 4\left(\frac{Th}{d}\right)^{1/2}.$$

The Washington-bound *Concorde* approached the United States from Europe on a course that took it south of Nantucket Island at an altitude of 16.8 km. If the surface temperature is 290 K and the vertical temperature gradient is 5 K/km, how many kilometers south of Nantucket did the plane have to be flown to keep its sonic boom carpet away from the island? (From "Concorde Sonic Booms as an Atmospheric Probe" by N. K. Balachandra, W. L. Donn, and D. H. Rind, *Science*, Vol. 197 (July 1, 1977), pp. 47–49.)

**48.** As you know, the graph of a real-valued function of a single real variable is a set in a two-coordinate space. The graph of a real-valued function of two independent real variables is a set in a three-coordinate space. The graph of a real-valued function of three independent real variables is a set in a four-coordinate space. How would you define the graph of a real-valued function $f(x_1, x_2, x_3, x_4)$ of four independent real variables? How would you define the graph of a real-valued function $f(x_1, x_2, x_3, \ldots, x_n)$ of $n$ independent real variables?

## COMPUTER EXPLORATIONS

### Explicit Surfaces

Use a CAS to perform the following steps for each of the functions in Exercises 49–52.

**a.** Plot the surface over the given rectangle.

**b.** Plot several level curves in the rectangle.

**c.** Plot the level curve of $f$ through the given point.

**49.** $f(x, y) = x \sin\dfrac{y}{2} + y \sin 2x, \quad 0 \le x \le 5\pi \quad 0 \le y \le 5\pi,$
$P(3\pi, 3\pi)$

**50.** $f(x, y) = (\sin x)(\cos y)e^{\sqrt{x^2+y^2}/8}, \quad 0 \le x \le 5\pi,$
$0 \le y \le 5\pi, \quad P(4\pi, 4\pi)$

**51.** $f(x, y) = \sin(x + 2\cos y), \quad -2\pi \le x \le 2\pi,$
$-2\pi \le y \le 2\pi, \quad P(\pi, \pi)$

**52.** $f(x, y) = e^{(x^{0.1}-y)} \sin(x^2 + y^2), \quad 0 \le x \le 2\pi,$
$-2\pi \le y \le \pi, \quad P(\pi, -\pi)$

### Implicit Surfaces

Use a CAS to plot the level surfaces in Exercises 53–56.

**53.** $4 \ln(x^2 + y^2 + z^2) = 1$ **54.** $x^2 + z^2 = 1$

**55.** $x + y^2 - 3z^2 = 1$

**56.** $\sin\left(\dfrac{x}{2}\right) - (\cos y)\sqrt{x^2 + z^2} = 2$

### Parametrized Surfaces

Just as you describe curves in the plane parametrically with a pair of equations $x = f(t), y = g(t)$ defined on some parameter interval $I$, you can sometimes describe surfaces in space with a triple of equations $x = f(u, v), y = g(u, v), z = h(u, v)$ defined on some parameter rectangle $a \le u \le b, c \le v \le d$. Many computer algebra systems permit you to plot such surfaces in *parametric mode*. (Parametrized surfaces are discussed in detail in Section 16.6.) Use a CAS to plot the surfaces in Exercises 57–60. Also plot several level curves in the $xy$-plane.

**57.** $x = u\cos v, \quad y = u\sin v, \quad z = u, \quad 0 \le u \le 2,$
$0 \le v \le 2\pi$

**58.** $x = u\cos v, \quad y = u\sin v, \quad z = v, \quad 0 \le u \le 2,$
$0 \le v \le 2\pi$

**59.** $x = (2 + \cos u)\cos v, \quad y = (2 + \cos u)\sin v, \quad z = \sin u,$
$0 \le u \le 2\pi, \quad 0 \le v \le 2\pi$

**60.** $x = 2\cos u\cos v, \quad y = 2\cos u\sin v, \quad z = 2\sin u,$
$0 \le u \le 2\pi, \quad 0 \le v \le \pi$

# 14.2 Limits and Continuity in Higher Dimensions

This section treats limits and continuity for multivariable functions. The definition of the limit of a function of two or three variables is similar to the definition of the limit of a function of a single variable but with a crucial difference, as we now see.

## Limits

If the values of $f(x, y)$ lie arbitrarily close to a fixed real number $L$ for all points $(x, y)$ sufficiently close to a point $(x_0, y_0)$, we say that $f$ approaches the limit $L$ as $(x, y)$ approaches $(x_0, y_0)$. This is similar to the informal definition for the limit of a function of a single variable. Notice, however, that if $(x_0, y_0)$ lies in the interior of $f$'s domain, $(x, y)$ can approach $(x_0, y_0)$ from any direction. The direction of approach can be an issue, as in some of the examples that follow.

**DEFINITION Limit of a Function of Two Variables**

We say that a function $f(x, y)$ approaches the **limit** $L$ as $(x, y)$ approaches $(x_0, y_0)$, and write

$$\lim_{(x,y)\to(x_0,y_0)} f(x, y) = L$$

if, for every number $\epsilon > 0$, there exists a corresponding number $\delta > 0$ such that for all $(x, y)$ in the domain of $f$,

$$|f(x, y) - L| < \epsilon \quad \text{whenever} \quad 0 < \sqrt{(x - x_0)^2 + (y - y_0)^2} < \delta.$$

The definition of limit says that the distance between $f(x, y)$ and $L$ becomes arbitrarily small whenever the distance from $(x, y)$ to $(x_0, y_0)$ is made sufficiently small (but not 0).

The definition of limit applies to boundary points $(x_0, y_0)$ as well as interior points of the domain of $f$. The only requirement is that the point $(x, y)$ remain in the domain at all times. It can be shown, as for functions of a single variable, that

$$\lim_{(x,y)\to(x_0,y_0)} x = x_0$$

$$\lim_{(x,y)\to(x_0,y_0)} y = y_0$$

$$\lim_{(x,y)\to(x_0,y_0)} k = k \quad \text{(any number } k\text{)}.$$

For example, in the first limit statement above, $f(x, y) = x$ and $L = x_0$. Using the definition of limit, suppose that $\epsilon > 0$ is chosen. If we let $\delta$ equal this $\epsilon$, we see that

$$0 < \sqrt{(x - x_0)^2 + (y - y_0)^2} < \delta = \epsilon$$

implies

$$0 < \sqrt{(x - x_0)^2} < \epsilon$$

$$|x - x_0| < \epsilon \qquad \sqrt{a^2} = |a|$$

$$|f(x, y) - x_0| < \epsilon \qquad x = f(x, y)$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

That is,

$$|f(x, y) - x_0| < \epsilon \qquad \text{whenever} \qquad 0 < \sqrt{(x - x_0)^2 + (y - y_0)^2} < \delta.$$

So

$$\lim_{(x, y)\to(x_0, y_0)} f(x, y) = \lim_{(x, y)\to(x_0, y_0)} x = x_0.$$

It can also be shown that the limit of the sum of two functions is the sum of their limits (when they both exist), with similar results for the limits of the differences, products, constant multiples, quotients, and powers.

**THEOREM 1 Properties of Limits of Functions of Two Variables**

The following rules hold if $L$, $M$, and $k$ are real numbers and

$$\lim_{(x, y)\to(x_0, y_0)} f(x, y) = L \qquad \text{and} \qquad \lim_{(x, y)\to(x_0, y_0)} g(x, y) = M.$$

1. *Sum Rule:* $\lim_{(x, y)\to(x_0, y_0)} (f(x, y) + g(x, y)) = L + M$
2. *Difference Rule:* $\lim_{(x, y)\to(x_0, y_0)} (f(x, y) - g(x, y)) = L - M$
3. *Product Rule:* $\lim_{(x, y)\to(x_0, y_0)} (f(x, y) \cdot g(x, y)) = L \cdot M$
4. *Constant Multiple Rule:* $\lim_{(x, y)\to(x_0, y_0)} (kf(x, y)) = kL$ (any number $k$)
5. *Quotient Rule:* $\lim_{(x, y)\to(x_0, y_0)} \dfrac{f(x, y)}{g(x, y)} = \dfrac{L}{M}$ $M \neq 0$
6. *Power Rule:* If $r$ and $s$ are integers with no common factors, and $s \neq 0$, then

$$\lim_{(x, y)\to(x_0, y_0)} (f(x, y))^{r/s} = L^{r/s}$$

provided $L^{r/s}$ is a real number. (If $s$ is even, we assume that $L > 0$.)

While we won't prove Theorem 1 here, we give an informal discussion of why it's true. If $(x, y)$ is sufficiently close to $(x_0, y_0)$, then $f(x, y)$ is close to $L$ and $g(x, y)$ is close to $M$ (from the informal interpretation of limits). It is then reasonable that $f(x, y) + g(x, y)$ is close to $L + M$; $f(x, y) - g(x, y)$ is close to $L - M$; $f(x, y)g(x, y)$ is close to $LM$; $kf(x, y)$ is close to $kL$; and that $f(x, y)/g(x, y)$ is close to $L/M$ if $M \neq 0$.

When we apply Theorem 1 to polynomials and rational functions, we obtain the useful result that the limits of these functions as $(x, y) \to (x_0, y_0)$ can be calculated by evaluating the functions at $(x_0, y_0)$. The only requirement is that the rational functions be defined at $(x_0, y_0)$.

**EXAMPLE 1** Calculating Limits

**(a)** $$\lim_{(x, y)\to(0,1)} \frac{x - xy + 3}{x^2y + 5xy - y^3} = \frac{0 - (0)(1) + 3}{(0)^2(1) + 5(0)(1) - (1)^3} = -3$$

**(b)** $$\lim_{(x, y)\to(3, -4)} \sqrt{x^2 + y^2} = \sqrt{(3)^2 + (-4)^2} = \sqrt{25} = 5$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 2** Calculating Limits

Find

$$\lim_{(x,y)\to(0,0)} \frac{x^2 - xy}{\sqrt{x} - \sqrt{y}}.$$

**Solution** Since the denominator $\sqrt{x} - \sqrt{y}$ approaches 0 as $(x, y) \to (0, 0)$, we cannot use the Quotient Rule from Theorem 1. If we multiply numerator and denominator by $\sqrt{x} + \sqrt{y}$, however, we produce an equivalent fraction whose limit we *can* find:

$$\lim_{(x,y)\to(0,0)} \frac{x^2 - xy}{\sqrt{x} - \sqrt{y}} = \lim_{(x,y)\to(0,0)} \frac{(x^2 - xy)(\sqrt{x} + \sqrt{y})}{(\sqrt{x} - \sqrt{y})(\sqrt{x} + \sqrt{y})}$$

$$= \lim_{(x,y)\to(0,0)} \frac{x(x - y)(\sqrt{x} + \sqrt{y})}{x - y} \qquad \text{Algebra}$$

$$= \lim_{(x,y)\to(0,0)} x(\sqrt{x} + \sqrt{y}) \qquad \text{Cancel the nonzero factor } (x - y).$$

$$= 0(\sqrt{0} + \sqrt{0}) = 0$$

We can cancel the factor $(x - y)$ because the path $y = x$ (along which $x - y = 0$) is *not* in the domain of the function

$$\frac{x^2 - xy}{\sqrt{x} - \sqrt{y}}.$$

■

**EXAMPLE 3** Applying the Limit Definition

Find $\lim_{(x,y)\to(0,0)} \frac{4xy^2}{x^2 + y^2}$ if it exists.

**Solution** We first observe that along the line $x = 0$, the function always has value 0 when $y \neq 0$. Likewise, along the line $y = 0$, the function has value 0 provided $x \neq 0$. So if the limit does exist as $(x, y)$ approaches $(0, 0)$, the value of the limit must be 0. To see if this is true, we apply the definition of limit.

Let $\epsilon > 0$ be given, but arbitrary. We want to find a $\delta > 0$ such that

$$\left| \frac{4xy^2}{x^2 + y^2} - 0 \right| < \epsilon \qquad \text{whenever} \qquad 0 < \sqrt{x^2 + y^2} < \delta$$

or

$$\frac{4|x|y^2}{x^2 + y^2} < \epsilon \qquad \text{whenever} \qquad 0 < \sqrt{x^2 + y^2} < \delta.$$

Since $y^2 \leq x^2 + y^2$ we have that

$$\frac{4|x|y^2}{x^2 + y^2} \leq 4|x| = 4\sqrt{x^2} \leq 4\sqrt{x^2 + y^2}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

So if we choose $\delta = \epsilon/4$ and let $0 < \sqrt{x^2 + y^2} < \delta$, we get

$$\left|\frac{4xy^2}{x^2 + y^2} - 0\right| \le 4\sqrt{x^2 + y^2} < 4\delta = 4\left(\frac{\epsilon}{4}\right) = \epsilon.$$

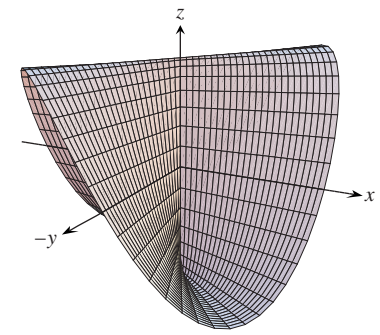
It follows from the definition that

$$\lim_{(x,y)\to(0,0)} \frac{4xy^2}{x^2 + y^2} = 0.$$

## Continuity

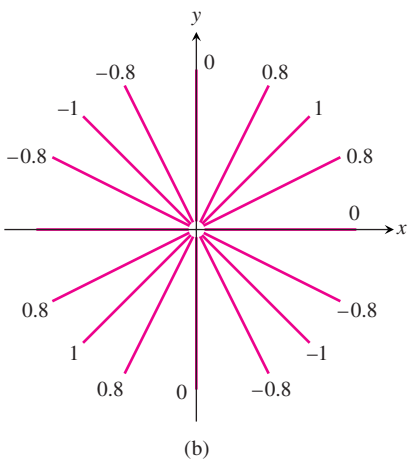
As with functions of a single variable, continuity is defined in terms of limits.

**DEFINITION Continuous Function of Two Variables**



A function $f(x, y)$ is **continuous at the point $(x_0, y_0)$** if

1. $f$ is defined at $(x_0, y_0)$,
2. $\lim_{(x,y)\to(x_0,y_0)} f(x, y)$ exists,
3. $\lim_{(x,y)\to(x_0,y_0)} f(x, y) = f(x_0, y_0)$.



A function is **continuous** if it is continuous at every point of its domain.

As with the definition of limit, the definition of continuity applies at boundary points as well as interior points of the domain of $f$. The only requirement is that the point $(x, y)$ remain in the domain at all times.

As you may have guessed, one of the consequences of Theorem 1 is that algebraic combinations of continuous functions are continuous at every point at which all the functions involved are defined. This means that sums, differences, products, constant multiples, quotients, and powers of continuous functions are continuous where defined. In particular, polynomials and rational functions of two variables are continuous at every point at which they are defined.

(a)

(b)

**FIGURE 14.11** (a) The graph of

$$f(x, y) = \begin{cases} \dfrac{2xy}{x^2 + y^2}, & (x, y) \neq (0, 0) \\ 0, & (x, y) = (0, 0). \end{cases}$$

The function is continuous at every point except the origin. (b) The level curves of $f$ (Example 4).

**EXAMPLE 4** A Function with a Single Point of Discontinuity

Show that

$$f(x, y) = \begin{cases} \dfrac{2xy}{x^2 + y^2}, & (x, y) \neq (0, 0) \\ 0, & (x, y) = (0, 0) \end{cases}$$

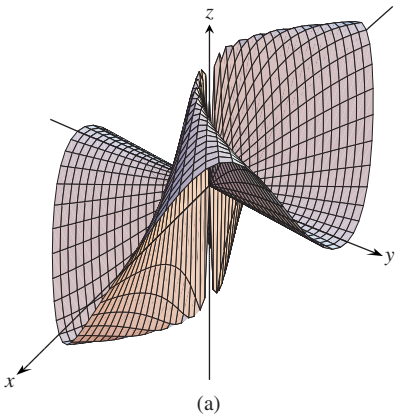
is continuous at every point except the origin (Figure 14.11).

**Solution** The function $f$ is continuous at any point $(x, y) \neq (0, 0)$ because its values are then given by a rational function of $x$ and $y$.

At $(0, 0)$, the value of $f$ is defined, but $f$, we claim, has no limit as $(x, y) \to (0, 0)$. The reason is that different paths of approach to the origin can lead to different results, as we now see.

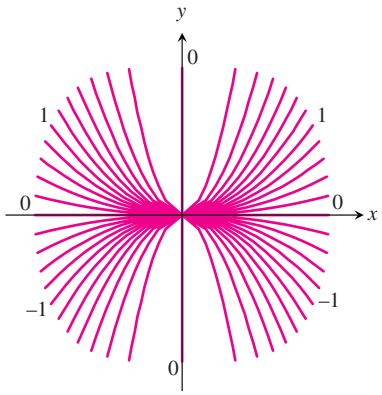
Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

For every value of $m$, the function $f$ has a constant value on the "punctured" line $y = mx$, $x \neq 0$, because



$$f(x, y)\Big|_{y=mx} = \frac{2xy}{x^2 + y^2}\Big|_{y=mx} = \frac{2x(mx)}{x^2 + (mx)^2} = \frac{2mx^2}{x^2 + m^2x^2} = \frac{2m}{1 + m^2}.$$

Therefore, $f$ has this number as its limit as $(x, y)$ approaches $(0, 0)$ along the line:



$$\lim_{\substack{(x,y)\to(0,0)\\ \text{along } y=mx}} f(x, y) = \lim_{(x,y)\to(0,0)} \left[f(x, y)\Big|_{y=mx}\right] = \frac{2m}{1 + m^2}.$$

This limit changes with $m$. There is therefore no single number we may call the limit of $f$ as $(x, y)$ approaches the origin. The limit fails to exist, and the function is not continuous. ■

Example 4 illustrates an important point about limits of functions of two variables (or even more variables, for that matter). For a limit to exist at a point, the limit must be the same along every approach path. This result is analogous to the single-variable case where both the left- and right-sided limits had to have the same value; therefore, for functions of two or more variables, if we ever find paths with different limits, we know the function has no limit at the point they approach.

(a)

(b)

**FIGURE 14.12** (a) The graph of $f(x, y) = 2x^2y/(x^4 + y^2)$. As the graph suggests and the level-curve values in part (b) confirm, $\lim_{(x,y)\to(0,0)} f(x, y)$ does not exist (Example 5).

**Two-Path Test for Nonexistence of a Limit**
If a function $f(x, y)$ has different limits along two different paths as $(x, y)$ approaches $(x_0, y_0)$, then $\lim_{(x,y)\to(x_0,y_0)} f(x, y)$ does not exist.

## EXAMPLE 5 Applying the Two-Path Test

Show that the function

$$f(x, y) = \frac{2x^2y}{x^4 + y^2}$$

(Figure 14.12) has no limit as $(x, y)$ approaches $(0, 0)$.

**Solution** The limit cannot be found by direct substitution, which gives the form $0/0$. We examine the values of $f$ along curves that end at $(0, 0)$. Along the curve $y = kx^2$, $x \neq 0$, the function has the constant value

$$f(x, y)\Big|_{y=kx^2} = \frac{2x^2y}{x^4 + y^2}\Big|_{y=kx^2} = \frac{2x^2(kx^2)}{x^4 + (kx^2)^2} = \frac{2kx^4}{x^4 + k^2x^4} = \frac{2k}{1 + k^2}.$$

Therefore,

$$\lim_{\substack{(x,y)\to(0,0)\\ \text{along } y=kx^2}} f(x, y) = \lim_{(x,y)\to(0,0)} \left[f(x, y)\Big|_{y=kx^2}\right] = \frac{2k}{1 + k^2}.$$

This limit varies with the path of approach. If $(x, y)$ approaches $(0, 0)$ along the parabola $y = x^2$, for instance, $k = 1$ and the limit is 1. If $(x, y)$ approaches $(0, 0)$ along the $x$-axis, $k = 0$ and the limit is 0. By the two-path test, $f$ has no limit as $(x, y)$ approaches $(0, 0)$.

The language here may seem contradictory. You might well ask, "What do you mean $f$ has no limit as $(x, y)$ approaches the origin—it has lots of limits." But that is

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

the point. There is no *single* path-independent limit, and therefore, by the definition, $\lim_{(x,y)\to(0,0)} f(x, y)$ does not exist. ■

Compositions of continuous functions are also continuous. The proof, omitted here, is similar to that for functions of a single variable (Theorem 10 in Section 2.6).

**Continuity of Composites**
If $f$ is continuous at $(x_0, y_0)$ and $g$ is a single-variable function continuous at $f(x_0, y_0)$, then the composite function $h = g \circ f$ defined by $h(x, y) = g(f(x, y))$ is continuous at $(x_0, y_0)$.

For example, the composite functions

$$e^{x-y}, \qquad \cos\frac{xy}{x^2 + 1}, \qquad \ln(1 + x^2y^2)$$

are continuous at every point $(x, y)$.

As with functions of a single variable, the general rule is that composites of continuous functions are continuous. The only requirement is that each function be continuous where it is applied.

## Functions of More Than Two Variables

The definitions of limit and continuity for functions of two variables and the conclusions about limits and continuity for sums, products, quotients, powers, and composites all extend to functions of three or more variables. Functions like

$$\ln(x + y + z) \qquad \text{and} \qquad \frac{y \sin z}{x - 1}$$

are continuous throughout their domains, and limits like

$$\lim_{P\to(1,0,-1)} \frac{e^{x+z}}{z^2 + \cos\sqrt{xy}} = \frac{e^{1-1}}{(-1)^2 + \cos 0} = \frac{1}{2},$$

where $P$ denotes the point $(x, y, z)$, may be found by direct substitution.

## Extreme Values of Continuous Functions on Closed, Bounded Sets

We have seen that a function of a single variable that is continuous throughout a closed, bounded interval $[a, b]$ takes on an absolute maximum value and an absolute minimum value at least once in $[a, b]$. The same is true of a function $z = f(x, y)$ that is continuous on a closed, bounded set $R$ in the plane (like a line segment, a disk, or a filled-in triangle). The function takes on an absolute maximum value at some point in $R$ and an absolute minimum value at some point in $R$.

Theorems similar to these and other theorems of this section hold for functions of three or more variables. A continuous function $w = f(x, y, z)$, for example, must take on absolute maximum and minimum values on any closed, bounded set (solid ball or cube, spherical shell, rectangular solid) on which it is defined.

We learn how to find these extreme values in Section 14.7, but first we need to study derivatives in higher dimensions. That is the topic of the next section.

# EXERCISES 14.2

## Limits with Two Variables

Find the limits in Exercises 1–12.

1. $\lim_{(x,y)\to(0,0)} \dfrac{3x^2 - y^2 + 5}{x^2 + y^2 + 2}$
2. $\lim_{(x,y)\to(0,4)} \dfrac{x}{\sqrt{y}}$
3. $\lim_{(x,y)\to(3,4)} \sqrt{x^2 + y^2 - 1}$
4. $\lim_{(x,y)\to(2,-3)} \left(\dfrac{1}{x} + \dfrac{1}{y}\right)^2$
5. $\lim_{(x,y)\to(0,\pi/4)} \sec x \tan y$
6. $\lim_{(x,y)\to(0,0)} \cos \dfrac{x^2 + y^3}{x + y + 1}$
7. $\lim_{(x,y)\to(0,\ln 2)} e^{x-y}$
8. $\lim_{(x,y)\to(1,1)} \ln |1 + x^2 y^2|$
9. $\lim_{(x,y)\to(0,0)} \dfrac{e^y \sin x}{x}$
10. $\lim_{(x,y)\to(1,1)} \cos \sqrt[3]{|xy| - 1}$
11. $\lim_{(x,y)\to(1,0)} \dfrac{x \sin y}{x^2 + 1}$
12. $\lim_{(x,y)\to(\pi/2,0)} \dfrac{\cos y + 1}{y - \sin x}$

## Limits of Quotients

Find the limits in Exercises 13–20 by rewriting the fractions first.

13. $\lim_{\substack{(x,y)\to(1,1)\\ x\neq y}} \dfrac{x^2 - 2xy + y^2}{x - y}$
14. $\lim_{\substack{(x,y)\to(1,1)\\ x\neq y}} \dfrac{x^2 - y^2}{x - y}$
15. $\lim_{\substack{(x,y)\to(1,1)\\ x\neq 1}} \dfrac{xy - y - 2x + 2}{x - 1}$
16. $\lim_{\substack{(x,y)\to(2,-4)\\ y\neq -4,\, x\neq x^2}} \dfrac{y + 4}{x^2 y - xy + 4x^2 - 4x}$
17. $\lim_{\substack{(x,y)\to(0,0)\\ x\neq y}} \dfrac{x - y + 2\sqrt{x} - 2\sqrt{y}}{\sqrt{x} - \sqrt{y}}$
18. $\lim_{\substack{(x,y)\to(2,2)\\ x+y\neq 4}} \dfrac{x + y - 4}{\sqrt{x + y} - 2}$
19. $\lim_{\substack{(x,y)\to(2,0)\\ 2x-y\neq 4}} \dfrac{\sqrt{2x - y} - 2}{2x - y - 4}$
20. $\lim_{\substack{(x,y)\to(4,3)\\ x\neq y+1}} \dfrac{\sqrt{x} - \sqrt{y + 1}}{x - y - 1}$

## Limits with Three Variables

Find the limits in Exercises 21–26.

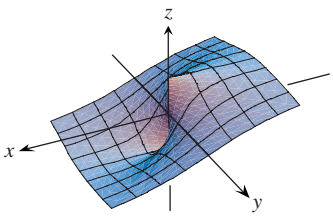
21. $\lim_{P\to(1,3,4)} \left(\dfrac{1}{x} + \dfrac{1}{y} + \dfrac{1}{z}\right)$
22. $\lim_{P\to(1,-1,-1)} \dfrac{2xy + yz}{x^2 + z^2}$
23. $\lim_{P\to(3,3,0)} (\sin^2 x + \cos^2 y + \sec^2 z)$
24. $\lim_{P\to(-1/4,\pi/2,2)} \tan^{-1} xyz$
25. $\lim_{P\to(\pi,0,3)} ze^{-2y} \cos 2x$
26. $\lim_{P\to(0,-2,0)} \ln \sqrt{x^2 + y^2 + z^2}$

## Continuity in the Plane

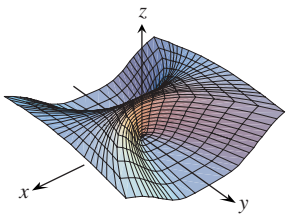
At what points $(x, y)$ in the plane are the functions in Exercises 27–30 continuous?

27. **a.** $f(x, y) = \sin(x + y)$ **b.** $f(x, y) = \ln(x^2 + y^2)$
28. **a.** $f(x, y) = \dfrac{x + y}{x - y}$ **b.** $f(x, y) = \dfrac{y}{x^2 + 1}$
29. **a.** $g(x, y) = \sin \dfrac{1}{xy}$ **b.** $g(x, y) = \dfrac{x + y}{2 + \cos x}$
30. **a.** $g(x, y) = \dfrac{x^2 + y^2}{x^2 - 3x + 2}$ **b.** $g(x, y) = \dfrac{1}{x^2 - y}$

## Continuity in Space



At what points $(x, y, z)$ in space are the functions in Exercises 31–34 continuous?



31. **a.** $f(x, y, z) = x^2 + y^2 - 2z^2$
    **b.** $f(x, y, z) = \sqrt{x^2 + y^2 - 1}$
32. **a.** $f(x, y, z) = \ln xyz$ **b.** $f(x, y, z) = e^{x+y} \cos z$
33. **a.** $h(x, y, z) = xy \sin \dfrac{1}{z}$ **b.** $h(x, y, z) = \dfrac{1}{x^2 + z^2 - 1}$
34. **a.** $h(x, y, z) = \dfrac{1}{|y| + |z|}$ **b.** $h(x, y, z) = \dfrac{1}{|xy| + |z|}$

## No Limit at a Point

By considering different paths of approach, show that the functions in Exercises 35–42 have no limit as $(x, y) \to (0, 0)$.

35. $f(x, y) = -\dfrac{x}{\sqrt{x^2 + y^2}}$
36. $f(x, y) = \dfrac{x^4}{x^4 + y^2}$

37. $f(x, y) = \dfrac{x^4 - y^2}{x^4 + y^2}$
38. $f(x, y) = \dfrac{xy}{|xy|}$
39. $g(x, y) = \dfrac{x - y}{x + y}$
40. $g(x, y) = \dfrac{x + y}{x - y}$
41. $h(x, y) = \dfrac{x^2 + y}{y}$
42. $h(x, y) = \dfrac{x^2}{x^2 - y}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Theory and Examples

**43.** If $\lim_{(x,y)\to(x_0,y_0)} f(x,y) = L$, must $f$ be defined at $(x_0, y_0)$? Give reasons for your answer.

**44.** If $f(x_0, y_0) = 3$, what can you say about

$$\lim_{(x,y)\to(x_0,y_0)} f(x,y)$$

if $f$ is continuous at $(x_0, y_0)$? If $f$ is not continuous at $(x_0, y_0)$? Give reasons for your answer.

**The Sandwich Theorem** for functions of two variables states that if $g(x,y) \le f(x,y) \le h(x,y)$ for all $(x,y) \ne (x_0,y_0)$ in a disk centered at $(x_0, y_0)$ and if $g$ and $h$ have the same finite limit $L$ as $(x,y) \to (x_0,y_0)$, then

$$\lim_{(x,y)\to(x_0,y_0)} f(x,y) = L.$$

Use this result to support your answers to the questions in Exercises 45–48.

**45.** Does knowing that

$$1 - \frac{x^2y^2}{3} < \frac{\tan^{-1} xy}{xy} < 1$$

tell you anything about

$$\lim_{(x,y)\to(0,0)} \frac{\tan^{-1} xy}{xy}?$$

Give reasons for your answer.

**46.** Does knowing that

$$2|xy| - \frac{x^2y^2}{6} < 4 - 4\cos\sqrt{|xy|} < 2|xy|$$

tell you anything about

$$\lim_{(x,y)\to(0,0)} \frac{4 - 4\cos\sqrt{|xy|}}{|xy|}?$$

Give reasons for your answer.

**47.** Does knowing that $|\sin(1/x)| \le 1$ tell you anything about

$$\lim_{(x,y)\to(0,0)} y \sin\frac{1}{x}?$$

Give reasons for your answer.

**48.** Does knowing that $|\cos(1/y)| \le 1$ tell you anything about

$$\lim_{(x,y)\to(0,0)} x \cos\frac{1}{y}?$$

Give reasons for your answer.

**49.** (*Continuation of Example 4.*)

**a.** Reread Example 4. Then substitute $m = \tan\theta$ into the formula

$$f(x,y)\Big|_{y=mx} = \frac{2m}{1+m^2}$$

and simplify the result to show how the value of $f$ varies with the line's angle of inclination.

**b.** Use the formula you obtained in part (a) to show that the limit of $f$ as $(x,y) \to (0,0)$ along the line $y = mx$ varies from $-1$ to 1 depending on the angle of approach.

**50. Continuous extension** Define $f(0,0)$ in a way that extends

$$f(x,y) = xy\frac{x^2 - y^2}{x^2 + y^2}$$

to be continuous at the origin.

## Changing to Polar Coordinates

If you cannot make any headway with $\lim_{(x,y)\to(0,0)} f(x,y)$ in rectangular coordinates, try changing to polar coordinates. Substitute $x = r\cos\theta$, $y = r\sin\theta$, and investigate the limit of the resulting expression as $r \to 0$. In other words, try to decide whether there exists a number $L$ satisfying the following criterion:

Given $\epsilon > 0$, there exists a $\delta > 0$ such that for all $r$ and $\theta$,

$$|r| < \delta \quad \Rightarrow \quad |f(r,\theta) - L| < \epsilon. \tag{1}$$

If such an $L$ exists, then

$$\lim_{(x,y)\to(0,0)} f(x,y) = \lim_{r\to 0} f(r,\theta) = L.$$

For instance,

$$\lim_{(x,y)\to(0,0)} \frac{x^3}{x^2+y^2} = \lim_{r\to 0} \frac{r^3\cos^3\theta}{r^2} = \lim_{r\to 0} r\cos^3\theta = 0.$$

To verify the last of these equalities, we need to show that Equation (1) is satisfied with $f(r,\theta) = r\cos^3\theta$ and $L = 0$. That is, we need to show that given any $\epsilon > 0$ there exists a $\delta > 0$ such that for all $r$ and $\theta$,

$$|r| < \delta \quad \Rightarrow \quad |r\cos^3\theta - 0| < \epsilon.$$

Since

$$|r\cos^3\theta| = |r||\cos^3\theta| \le |r| \cdot 1 = |r|,$$

the implication holds for all $r$ and $\theta$ if we take $\delta = \epsilon$.

In contrast,

$$\frac{x^2}{x^2+y^2} = \frac{r^2\cos^2\theta}{r^2} = \cos^2\theta$$

takes on all values from 0 to 1 regardless of how small $|r|$ is, so that $\lim_{(x,y)\to(0,0)} x^2/(x^2+y^2)$ does not exist.

In each of these instances, the existence or nonexistence of the limit as $r \to 0$ is fairly clear. Shifting to polar coordinates does not always help, however, and may even tempt us to false conclusions. For example, the limit may exist along every straight line (or ray) $\theta =$ constant and yet fail to exist in the broader sense. Example 4 illustrates this point. In polar coordinates, $f(x,y) = (2x^2y)/(x^4+y^2)$ becomes

$$f(r\cos\theta, r\sin\theta) = \frac{r\cos\theta\sin 2\theta}{r^2\cos^4\theta + \sin^2\theta}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

for $r \neq 0$. If we hold $\theta$ constant and let $r \to 0$, the limit is 0. On the path $y = x^2$, however, we have $r \sin\theta = r^2 \cos^2\theta$ and

$$f(r\cos\theta, r\sin\theta) = \frac{r\cos\theta \sin 2\theta}{r^2\cos^4\theta + (r\cos^2\theta)^2}$$

$$= \frac{2r\cos^2\theta\sin\theta}{2r^2\cos^4\theta} = \frac{r\sin\theta}{r^2\cos^2\theta} = 1.$$

In Exercises 51–56, find the limit of $f$ as $(x, y) \to (0, 0)$ or show that the limit does not exist.

**51.** $f(x, y) = \dfrac{x^3 - xy^2}{x^2 + y^2}$

**52.** $f(x, y) = \cos\left(\dfrac{x^3 - y^3}{x^2 + y^2}\right)$

**53.** $f(x, y) = \dfrac{y^2}{x^2 + y^2}$

**54.** $f(x, y) = \dfrac{2x}{x^2 + x + y^2}$

**55.** $f(x, y) = \tan^{-1}\left(\dfrac{|x| + |y|}{x^2 + y^2}\right)$

**56.** $f(x, y) = \dfrac{x^2 - y^2}{x^2 + y^2}$

In Exercises 57 and 58, define $f(0, 0)$ in a way that extends $f$ to be continuous at the origin.

**57.** $f(x, y) = \ln\left(\dfrac{3x^2 - x^2y^2 + 3y^2}{x^2 + y^2}\right)$

**58.** $f(x, y) = \dfrac{3x^2y}{x^2 + y^2}$

## Using the $\delta$-$\epsilon$ Definition

Each of Exercises 59–62 gives a function $f(x, y)$ and a positive number $\epsilon$. In each exercise, show that there exists a $\delta > 0$ such that for all $(x, y)$,

$$\sqrt{x^2 + y^2} < \delta \quad \Rightarrow \quad |f(x, y) - f(0, 0)| < \epsilon.$$

**59.** $f(x, y) = x^2 + y^2, \quad \epsilon = 0.01$

**60.** $f(x, y) = y/(x^2 + 1), \quad \epsilon = 0.05$

**61.** $f(x, y) = (x + y)/(x^2 + 1), \quad \epsilon = 0.01$

**62.** $f(x, y) = (x + y)/(2 + \cos x), \quad \epsilon = 0.02$

Each of Exercises 63–66 gives a function $f(x, y, z)$ and a positive number $\epsilon$. In each exercise, show that there exists a $\delta > 0$ such that for all $(x, y, z)$,

$$\sqrt{x^2 + y^2 + z^2} < \delta \quad \Rightarrow \quad |f(x, y, z) - f(0, 0, 0)| < \epsilon.$$

**63.** $f(x, y, z) = x^2 + y^2 + z^2, \quad \epsilon = 0.015$

**64.** $f(x, y, z) = xyz, \quad \epsilon = 0.008$

**65.** $f(x, y, z) = \dfrac{x + y + z}{x^2 + y^2 + z^2 + 1}, \quad \epsilon = 0.015$

**66.** $f(x, y, z) = \tan^2 x + \tan^2 y + \tan^2 z, \quad \epsilon = 0.03$

**67.** Show that $f(x, y, z) = x + y - z$ is continuous at every point $(x_0, y_0, z_0)$.

**68.** Show that $f(x, y, z) = x^2 + y^2 + z^2$ is continuous at the origin.

# 14.3 Partial Derivatives

The calculus of several variables is basically single-variable calculus applied to several variables one at a time. When we hold all but one of the independent variables of a function constant and differentiate with respect to that one variable, we get a "partial" derivative. This section shows how partial derivatives are defined and interpreted geometrically, and how to calculate them by applying the rules for differentiating functions of a single variable.

## Partial Derivatives of a Function of Two Variables

If $(x_0, y_0)$ is a point in the domain of a function $f(x, y)$, the vertical plane $y = y_0$ will cut the surface $z = f(x, y)$ in the curve $z = f(x, y_0)$ (Figure 14.13). This curve is the graph of the function $z = f(x, y_0)$ in the plane $y = y_0$. The horizontal coordinate in this plane is $x$; the vertical coordinate is $z$. The $y$-value is held constant at $y_0$, so $y$ is not a variable.

We define the partial derivative of $f$ with respect to $x$ at the point $(x_0, y_0)$ as the ordinary derivative of $f(x, y_0)$ with respect to $x$ at the point $x = x_0$. To distinguish partial derivatives from ordinary derivatives we use the symbol $\partial$ rather than the $d$ previously used.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

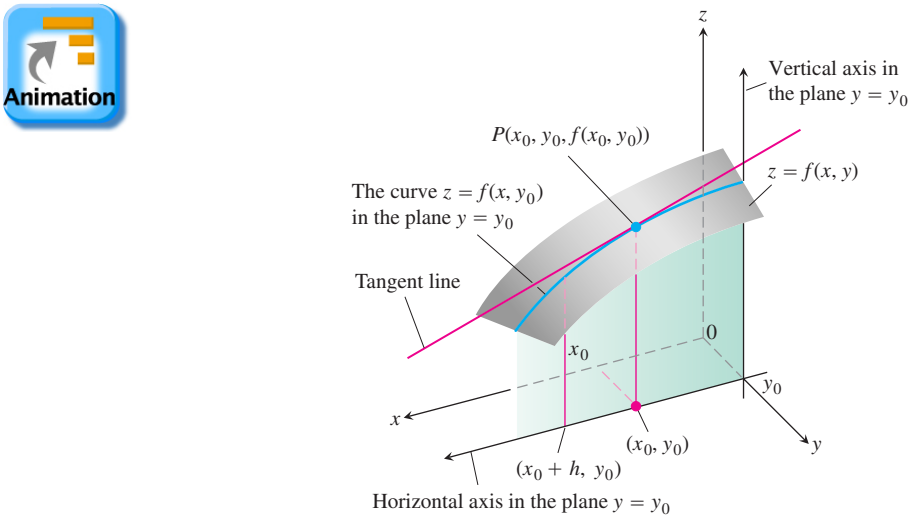

**FIGURE 14.13** The intersection of the plane $y = y_0$ with the surface $z = f(x, y)$, viewed from above the first quadrant of the $xy$-plane.

**DEFINITION Partial Derivative with Respect to $x$**

The **partial derivative of $f(x, y)$ with respect to $x$** at the point $(x_0, y_0)$ is

$$\left.\frac{\partial f}{\partial x}\right|_{(x_0, y_0)} = \lim_{h \to 0} \frac{f(x_0 + h, y_0) - f(x_0, y_0)}{h},$$

provided the limit exists.

An equivalent expression for the partial derivative is

$$\left.\frac{d}{dx} f(x, y_0)\right|_{x = x_0}.$$

The slope of the curve $z = f(x, y_0)$ at the point $P(x_0, y_0, f(x_0, y_0))$ in the plane $y = y_0$ is the value of the partial derivative of $f$ with respect to $x$ at $(x_0, y_0)$. The tangent line to the curve at $P$ is the line in the plane $y = y_0$ that passes through $P$ with this slope. The partial derivative $\partial f/\partial x$ at $(x_0, y_0)$ gives the rate of change of $f$ with respect to $x$ when $y$ is held fixed at the value $y_0$. This is the rate of change of $f$ in the direction of $\mathbf{i}$ at $(x_0, y_0)$.

The notation for a partial derivative depends on what we want to emphasize:

| | |
|---|---|
| $\frac{\partial f}{\partial x}(x_0, y_0)$ or $f_x(x_0, y_0)$ | "Partial derivative of $f$ with respect to $x$ at $(x_0, y_0)$" or "$f$ sub $x$ at $(x_0, y_0)$." Convenient for stressing the point $(x_0, y_0)$. |
| $\left.\frac{\partial z}{\partial x}\right\|_{(x_0, y_0)}$ | "Partial derivative of $z$ with respect to $x$ at $(x_0, y_0)$." Common in science and engineering when you are dealing with variables and do not mention the function explicitly. |
| $f_x$, $\frac{\partial f}{\partial x}$, $z_x$, or $\frac{\partial z}{\partial x}$ | "Partial derivative of $f$ (or $z$) with respect to $x$." Convenient when you regard the partial derivative as a function in its own right. |

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

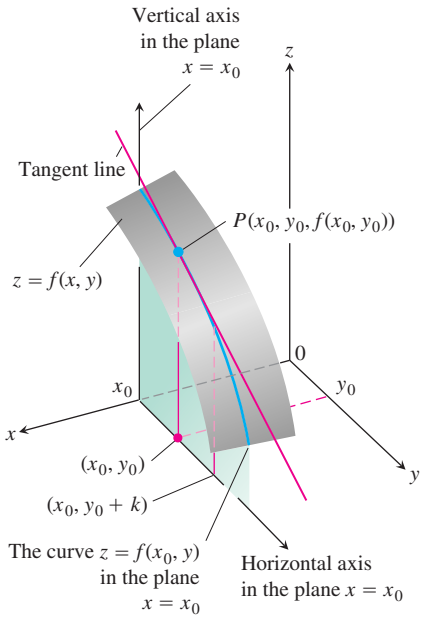

**FIGURE 14.14** The intersection of the plane $x = x_0$ with the surface $z = f(x, y)$, viewed from above the first quadrant of the $xy$-plane.

The definition of the partial derivative of $f(x, y)$ with respect to $y$ at a point $(x_0, y_0)$ is similar to the definition of the partial derivative of $f$ with respect to $x$. We hold $x$ fixed at the value $x_0$ and take the ordinary derivative of $f(x_0, y)$ with respect to $y$ at $y_0$ .

**DEFINITION Partial Derivative with Respect to $y$**

The **partial derivative of $f(x, y)$ with respect to $y$** at the point $(x_0, y_0)$ is

$$\left.\frac{\partial f}{\partial y}\right|_{(x_0, y_0)} = \left.\frac{d}{dy} f(x_0, y)\right|_{y=y_0} = \lim_{h \to 0} \frac{f(x_0, y_0 + h) - f(x_0, y_0)}{h},$$

provided the limit exists.

The slope of the curve $z = f(x_0, y)$ at the point $P(x_0, y_0, f(x_0, y_0))$ in the vertical plane $x = x_0$ (Figure 14.14) is the partial derivative of $f$ with respect to $y$ at $(x_0, y_0)$. The tangent line to the curve at $P$ is the line in the plane $x = x_0$ that passes through $P$ with this slope. The partial derivative gives the rate of change of $f$ with respect to $y$ at $(x_0, y_0)$ when $x$ is held fixed at the value $x_0$. This is the rate of change of $f$ in the direction of $\mathbf{j}$ at $(x_0, y_0)$.

The partial derivative with respect to $y$ is denoted the same way as the partial derivative with respect to $x$:

$$\frac{\partial f}{\partial y}(x_0, y_0), \qquad f_y(x_0, y_0), \qquad \frac{\partial f}{\partial y}, \qquad f_y .$$

Notice that we now have two tangent lines associated with the surface $z = f(x, y)$ at the point $P(x_0, y_0, f(x_0, y_0))$ (Figure 14.15). Is the plane they determine tangent to the surface at $P$? We will see that it is, but we have to learn more about partial derivatives before we can find out why.

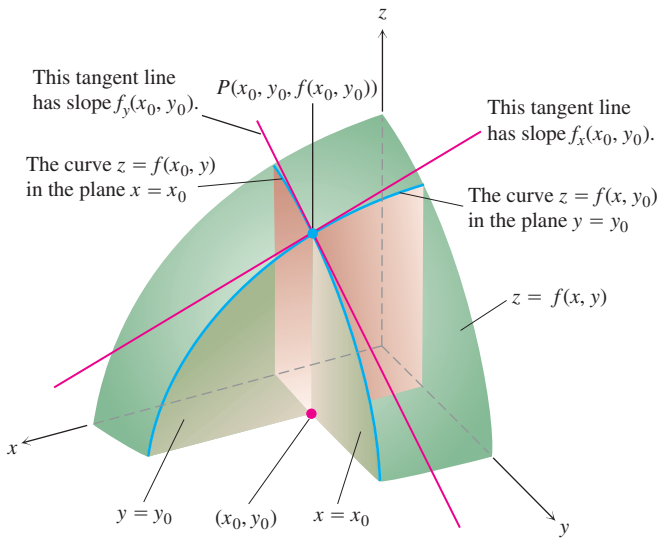

**FIGURE 14.15** Figures 14.13 and 14.14 combined. The tangent lines at the point $(x_0, y_0, f(x_0, y_0))$ determine a plane that, in this picture at least, appears to be tangent to the surface.

## Calculations

The definitions of $\partial f/\partial x$ and $\partial f/\partial y$ give us two different ways of differentiating $f$ at a point: with respect to $x$ in the usual way while treating $y$ as a constant and with respect to $y$ in the usual way while treating $x$ as constant. As the following examples show, the values of these partial derivatives are usually different at a given point $(x_0, y_0)$.

**EXAMPLE 1** Finding Partial Derivatives at a Point

Find the values of $\partial f/\partial x$ and $\partial f/\partial y$ at the point $(4, -5)$ if

$$f(x, y) = x^2 + 3xy + y - 1.$$

**Solution** To find $\partial f/\partial x$, we treat $y$ as a constant and differentiate with respect to $x$:

$$\frac{\partial f}{\partial x} = \frac{\partial}{\partial x}(x^2 + 3xy + y - 1) = 2x + 3 \cdot 1 \cdot y + 0 - 0 = 2x + 3y.$$

The value of $\partial f/\partial x$ at $(4, -5)$ is $2(4) + 3(-5) = -7$.

To find $\partial f/\partial y$, we treat $x$ as a constant and differentiate with respect to $y$:

$$\frac{\partial f}{\partial y} = \frac{\partial}{\partial y}(x^2 + 3xy + y - 1) = 0 + 3 \cdot x \cdot 1 + 1 - 0 = 3x + 1.$$

The value of $\partial f/\partial y$ at $(4, -5)$ is $3(4) + 1 = 13$. ■

**EXAMPLE 2** Finding a Partial Derivative as a Function

Find $\partial f/\partial y$ if $f(x, y) = y \sin xy$.

**Solution** We treat $x$ as a constant and $f$ as a product of $y$ and $\sin xy$:

$$\frac{\partial f}{\partial y} = \frac{\partial}{\partial y}(y \sin xy) = y\frac{\partial}{\partial y}\sin xy + (\sin xy)\frac{\partial}{\partial y}(y)$$

$$= (y \cos xy)\frac{\partial}{\partial y}(xy) + \sin xy = xy \cos xy + \sin xy.$$ ■

### USING TECHNOLOGY Partial Differentiation

A simple grapher can support your calculations even in multiple dimensions. If you specify the values of all but one independent variable, the grapher can calculate partial derivatives and can plot traces with respect to that remaining variable. Typically, a CAS can compute partial derivatives symbolically and numerically as easily as it can compute simple derivatives. Most systems use the same command to differentiate a function, regardless of the number of variables. (Simply specify the variable with which differentiation is to take place).

**EXAMPLE 3** Partial Derivatives May Be Different Functions

Find $f_x$ and $f_y$ if

$$f(x, y) = \frac{2y}{y + \cos x}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** We treat $f$ as a quotient. With $y$ held constant, we get

$$f_x = \frac{\partial}{\partial x}\left(\frac{2y}{y + \cos x}\right) = \frac{(y + \cos x)\frac{\partial}{\partial x}(2y) - 2y\frac{\partial}{\partial x}(y + \cos x)}{(y + \cos x)^2}$$

$$= \frac{(y + \cos x)(0) - 2y(-\sin x)}{(y + \cos x)^2} = \frac{2y \sin x}{(y + \cos x)^2}.$$

With $x$ held constant, we get

$$f_y = \frac{\partial}{\partial y}\left(\frac{2y}{y + \cos x}\right) = \frac{(y + \cos x)\frac{\partial}{\partial y}(2y) - 2y\frac{\partial}{dy}(y + \cos x)}{(y + \cos x)^2}$$

$$= \frac{(y + \cos x)(2) - 2y(1)}{(y + \cos x)^2} = \frac{2 \cos x}{(y + \cos x)^2}.$$

Implicit differentiation works for partial derivatives the way it works for ordinary derivatives, as the next example illustrates.

### EXAMPLE 4 Implicit Partial Differentiation

Find $\partial z/\partial x$ if the equation

$$yz - \ln z = x + y$$

defines $z$ as a function of the two independent variables $x$ and $y$ and the partial derivative exists.

**Solution** We differentiate both sides of the equation with respect to $x$, holding $y$ constant and treating $z$ as a differentiable function of $x$:

$$\frac{\partial}{\partial x}(yz) - \frac{\partial}{\partial x}\ln z = \frac{\partial x}{\partial x} + \frac{\partial y}{\partial x}$$

$$y\frac{\partial z}{\partial x} - \frac{1}{z}\frac{\partial z}{\partial x} = 1 + 0 \qquad \text{With } y \text{ constant, } \frac{\partial}{\partial x}(yz) = y\frac{\partial z}{\partial x}.$$

$$\left(y - \frac{1}{z}\right)\frac{\partial z}{\partial x} = 1$$

$$\frac{\partial z}{\partial x} = \frac{z}{yz - 1}.$$

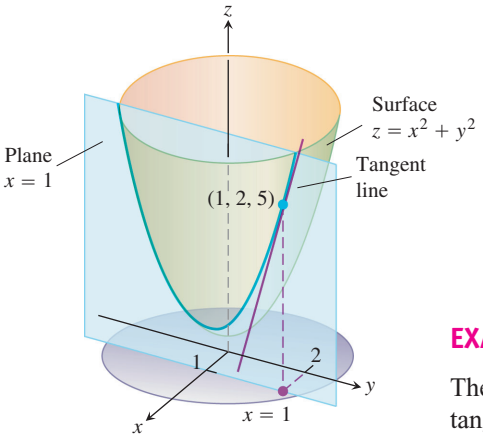

**FIGURE 14.16** The tangent to the curve of intersection of the plane $x = 1$ and surface $z = x^2 + y^2$ at the point (1, 2, 5) (Example 5).

### EXAMPLE 5 Finding the Slope of a Surface in the y-Direction

The plane $x = 1$ intersects the paraboloid $z = x^2 + y^2$ in a parabola. Find the slope of the tangent to the parabola at (1, 2, 5) (Figure 14.16).

**Solution** The slope is the value of the partial derivative $\partial z/\partial y$ at (1, 2):

$$\left.\frac{\partial z}{\partial y}\right|_{(1,2)} = \left.\frac{\partial}{\partial y}(x^2 + y^2)\right|_{(1,2)} = \left.2y\right|_{(1,2)} = 2(2) = 4.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

As a check, we can treat the parabola as the graph of the single-variable function $z = (1)^2 + y^2 = 1 + y^2$ in the plane $x = 1$ and ask for the slope at $y = 2$. The slope, calculated now as an ordinary derivative, is

$$\left.\frac{dz}{dy}\right|_{y=2} = \left.\frac{d}{dy}(1 + y^2)\right|_{y=2} = \left.2y\right|_{y=2} = 4.$$

■

## Functions of More Than Two Variables

The definitions of the partial derivatives of functions of more than two independent variables are like the definitions for functions of two variables. They are ordinary derivatives with respect to one variable, taken while the other independent variables are held constant.

**EXAMPLE 6** A Function of Three Variables

If $x$, $y$, and $z$ are independent variables and

$$f(x, y, z) = x \sin(y + 3z),$$

then

$$\frac{\partial f}{\partial z} = \frac{\partial}{\partial z}[x \sin(y + 3z)] = x\frac{\partial}{\partial z}\sin(y + 3z)$$

$$= x\cos(y + 3z)\frac{\partial}{\partial z}(y + 3z) = 3x\cos(y + 3z).$$

■

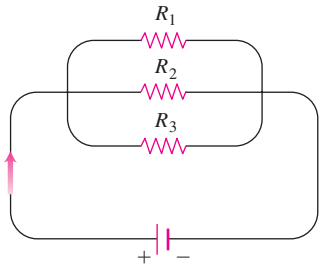

**FIGURE 14.17** Resistors arranged this way are said to be connected in parallel (Example 7). Each resistor lets a portion of the current through. Their equivalent resistance $R$ is calculated with the formula

$$\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}.$$

**EXAMPLE 7** Electrical Resistors in Parallel

If resistors of $R_1$, $R_2$, and $R_3$ ohms are connected in parallel to make an $R$-ohm resistor, the value of $R$ can be found from the equation

$$\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}$$

(Figure 14.17). Find the value of $\partial R/\partial R_2$ when $R_1 = 30$, $R_2 = 45$, and $R_3 = 90$ ohms.

**Solution** To find $\partial R/\partial R_2$, we treat $R_1$ and $R_3$ as constants and, using implicit differentiation, differentiate both sides of the equation with respect to $R_2$:

$$\frac{\partial}{\partial R_2}\left(\frac{1}{R}\right) = \frac{\partial}{\partial R_2}\left(\frac{1}{R_1} + \frac{1}{R_2} + \frac{1}{R_3}\right)$$

$$-\frac{1}{R^2}\frac{\partial R}{\partial R_2} = 0 - \frac{1}{R_2^2} + 0$$

$$\frac{\partial R}{\partial R_2} = \frac{R^2}{R_2^2} = \left(\frac{R}{R_2}\right)^2.$$

When $R_1 = 30$, $R_2 = 45$, and $R_3 = 90$,

$$\frac{1}{R} = \frac{1}{30} + \frac{1}{45} + \frac{1}{90} = \frac{3 + 2 + 1}{90} = \frac{6}{90} = \frac{1}{15},$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

so $R = 15$ and

$$\frac{\partial R}{\partial R_2} = \left(\frac{15}{45}\right)^2 = \left(\frac{1}{3}\right)^2 = \frac{1}{9}.$$

## Partial Derivatives and Continuity

A function $f(x, y)$ can have partial derivatives with respect to both $x$ and $y$ at a point without the function being continuous there. This is different from functions of a single variable, where the existence of a derivative implies continuity. If the partial derivatives of $f(x, y)$ exist and are continuous throughout a disk centered at $(x_0, y_0)$, however, then $f$ *is* continuous at $(x_0, y_0)$, as we see at the end of this section.

### EXAMPLE 8 Partials Exist, But $f$ Discontinuous

Let

$$f(x, y) = \begin{cases} 0, & xy \neq 0 \\ 1, & xy = 0 \end{cases}$$

(Figure 14.18).

**(a)** Find the limit of $f$ as $(x, y)$ approaches $(0, 0)$ along the line $y = x$.

**(b)** Prove that $f$ is not continuous at the origin.

**(c)** Show that both partial derivatives $\partial f/\partial x$ and $\partial f/\partial y$ exist at the origin.

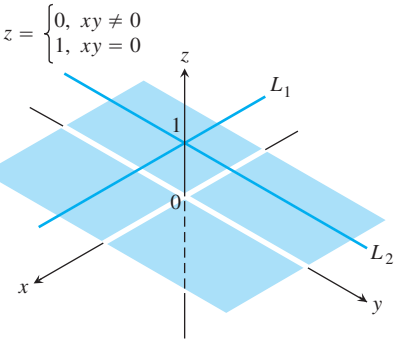

**FIGURE 14.18** The graph of

$$f(x, y) = \begin{cases} 0, & xy \neq 0 \\ 1, & xy = 0 \end{cases}$$

consists of the lines $L_1$ and $L_2$ and the four open quadrants of the $xy$-plane. The function has partial derivatives at the origin but is not continuous there (Example 8).

**Solution**

**(a)** Since $f(x, y)$ is constantly zero along the line $y = x$ (except at the origin), we have

$$\lim_{(x,y)\to(0,0)} f(x, y)\Big|_{y=x} = \lim_{(x,y)\to(0,0)} 0 = 0.$$

**(b)** Since $f(0, 0) = 1$, the limit in part (a) proves that $f$ is not continuous at $(0, 0)$.

**(c)** To find $\partial f/\partial x$ at $(0, 0)$, we hold $y$ fixed at $y = 0$. Then $f(x, y) = 1$ for all $x$, and the graph of $f$ is the line $L_1$ in Figure 14.18. The slope of this line at any $x$ is $\partial f/\partial x = 0$. In particular, $\partial f/\partial x = 0$ at $(0, 0)$. Similarly, $\partial f/\partial y$ is the slope of line $L_2$ at any $y$, so $\partial f/\partial y = 0$ at $(0, 0)$.

Example 8 notwithstanding, it is still true in higher dimensions that *differentiability* at a point implies continuity. What Example 8 suggests is that we need a stronger requirement for differentiability in higher dimensions than the mere existence of the partial derivatives. We define differentiability for functions of two variables at the end of this section and revisit the connection to continuity.

## Second-Order Partial Derivatives

When we differentiate a function $f(x, y)$ twice, we produce its second-order derivatives. These derivatives are usually denoted by

$$\frac{\partial^2 f}{\partial x^2} \quad \text{“}d \text{ squared } f dx \text{ squared”} \quad \text{or} \quad f_{xx} \quad \text{“}f \text{ sub } xx\text{”}$$

$$\frac{\partial^2 f}{\partial y^2} \quad \text{“}d \text{ squared } f dy \text{ squared”} \quad \text{or} \quad f_{yy} \quad \text{“}f \text{ sub } yy\text{”}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$\frac{\partial^2 f}{\partial x \partial y}$ "$d$ squared $f dx\, dy$" or $f_{yx}$ "$f$ sub $yx$"

$\frac{\partial^2 f}{\partial y \partial x}$ "$d$ squared $f dy\, dx$" or $f_{xy}$ "$f$ sub $xy$"

The defining equations are

$$\frac{\partial^2 f}{\partial x^2} = \frac{\partial}{\partial x}\left(\frac{\partial f}{\partial x}\right), \qquad \frac{\partial^2 f}{\partial x \partial y} = \frac{\partial}{\partial x}\left(\frac{\partial f}{\partial y}\right),$$

and so on. Notice the order in which the derivatives are taken:

$\frac{\partial^2 f}{\partial x \partial y}$ Differentiate first with respect to $y$, then with respect to $x$.

$f_{yx} = (f_y)_x$ Means the same thing.

HISTORICAL BIOGRAPHY

Pierre-Simon Laplace (1749–1827)

**EXAMPLE 9** Finding Second-Order Partial Derivatives

If $f(x, y) = x \cos y + ye^x$, find

$$\frac{\partial^2 f}{\partial x^2}, \quad \frac{\partial^2 f}{\partial y \partial x}, \quad \frac{\partial^2 f}{\partial y^2}, \quad \text{and} \quad \frac{\partial^2 f}{\partial x \partial y}.$$

**Solution**

$$\frac{\partial f}{\partial x} = \frac{\partial}{\partial x}(x \cos y + ye^x) \qquad \frac{\partial f}{\partial y} = \frac{\partial}{\partial y}(x \cos y + ye^x)$$

$$= \cos y + ye^x \qquad = -x \sin y + e^x$$

So

$$\frac{\partial^2 f}{\partial y \partial x} = \frac{\partial}{\partial y}\left(\frac{\partial f}{\partial x}\right) = -\sin y + e^x \qquad \frac{\partial^2 f}{\partial x \partial y} = \frac{\partial}{\partial x}\left(\frac{\partial f}{\partial y}\right) = -\sin y + e^x$$

$$\frac{\partial^2 f}{\partial x^2} = \frac{\partial}{\partial x}\left(\frac{\partial f}{\partial x}\right) = ye^x. \qquad \frac{\partial^2 f}{\partial y^2} = \frac{\partial}{\partial y}\left(\frac{\partial f}{\partial y}\right) = -x \cos y.$$

■

## The Mixed Derivative Theorem

You may have noticed that the "mixed" second-order partial derivatives

$$\frac{\partial^2 f}{\partial y \partial x} \quad \text{and} \quad \frac{\partial^2 f}{\partial x \partial y}$$

in Example 9 were equal. This was not a coincidence. They must be equal whenever $f$, $f_x$, $f_y$, $f_{xy}$, and $f_{yx}$ are continuous, as stated in the following theorem.

**THEOREM 2 The Mixed Derivative Theorem**

If $f(x, y)$ and its partial derivatives $f_x$, $f_y$, $f_{xy}$, and $f_{yx}$ are defined throughout an open region containing a point $(a, b)$ and are all continuous at $(a, b)$, then

$$f_{xy}(a, b) = f_{yx}(a, b).$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

HISTORICAL BIOGRAPHY

Alexis Clairaut
(1713–1765)

Theorem 2 is also known as Clairaut's Theorem, named after the French mathematician Alexis Clairaut who discovered it. A proof is given in Appendix 7. Theorem 2 says that to calculate a mixed second-order derivative, we may differentiate in either order, provided the continuity conditions are satisfied. This can work to our advantage.

### EXAMPLE 10 Choosing the Order of Differentiation

Find $\partial^2 w/\partial x \partial y$ if

$$w = xy + \frac{e^y}{y^2 + 1}.$$

**Solution** The symbol $\partial^2 w/\partial x \partial y$ tells us to differentiate first with respect to $y$ and then with respect to $x$. If we postpone the differentiation with respect to $y$ and differentiate first with respect to $x$, however, we get the answer more quickly. In two steps,

$$\frac{\partial w}{\partial x} = y \qquad \text{and} \qquad \frac{\partial^2 w}{\partial y \partial x} = 1.$$

If we differentiate first with respect to $y$, we obtain $\partial^2 w/\partial x \partial y = 1$ as well. ■

## Partial Derivatives of Still Higher Order

Although we will deal mostly with first- and second-order partial derivatives, because these appear the most frequently in applications, there is no theoretical limit to how many times we can differentiate a function as long as the derivatives involved exist. Thus, we get third- and fourth-order derivatives denoted by symbols like

$$\frac{\partial^3 f}{\partial x \partial y^2} = f_{yyx}$$

$$\frac{\partial^4 f}{\partial x^2 \partial y^2} = f_{yyxx},$$

and so on. As with second-order derivatives, the order of differentiation is immaterial as long as all the derivatives through the order in question are continuous.

### EXAMPLE 11 Calculating a Partial Derivative of Fourth-Order

Find $f_{yxyz}$ if $f(x, y, z) = 1 - 2xy^2z + x^2y$.

**Solution** We first differentiate with respect to the variable $y$, then $x$, then $y$ again, and finally with respect to $z$:

$$f_y = -4xyz + x^2$$

$$f_{yx} = -4yz + 2x$$

$$f_{yxy} = -4z$$

$$f_{yxyz} = -4$$ ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Differentiability

The starting point for differentiability is not Fermat's difference quotient but rather the idea of increment. You may recall from our work with functions of a single variable in Section 3.8 that if $y = f(x)$ is differentiable at $x = x_0$, then the change in the value of $f$ that results from changing $x$ from $x_0$ to $x_0 + \Delta x$ is given by an equation of the form

$$\Delta y = f'(x_0)\Delta x + \epsilon \Delta x$$

in which $\epsilon \to 0$ as $\Delta x \to 0$. For functions of two variables, the analogous property becomes the definition of differentiability. The Increment Theorem (from advanced calculus) tells us when to expect the property to hold.

**THEOREM 3 The Increment Theorem for Functions of Two Variables**

Suppose that the first partial derivatives of $f(x, y)$ are defined throughout an open region $R$ containing the point $(x_0, y_0)$ and that $f_x$ and $f_y$ are continuous at $(x_0, y_0)$. Then the change

$$\Delta z = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0)$$

in the value of $f$ that results from moving from $(x_0, y_0)$ to another point $(x_0 + \Delta x, y_0 + \Delta y)$ in $R$ satisfies an equation of the form

$$\Delta z = f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \epsilon_1 \Delta x + \epsilon_2 \Delta y,$$

in which each of $\epsilon_1, \epsilon_2 \to 0$ as both $\Delta x, \Delta y \to 0$.

You can see where the epsilons come from in the proof in Appendix 7. You will also see that similar results hold for functions of more than two independent variables.

**DEFINITION Differentiable Function**

A function $z = f(x, y)$ is **differentiable at** $(x_0, y_0)$ if $f_x(x_0, y_0)$ and $f_y(x_0, y_0)$ exist and $\Delta z$ satisfies an equation of the form

$$\Delta z = f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \epsilon_1 \Delta x + \epsilon_2 \Delta y,$$

in which each of $\epsilon_1, \epsilon_2 \to 0$ as both $\Delta x, \Delta y \to 0$. We call $f$ **differentiable** if it is differentiable at every point in its domain.

In light of this definition, we have the immediate corollary of Theorem 3 that a function is differentiable if its first partial derivatives are *continuous*.

**COROLLARY OF THEOREM 3 Continuity of Partial Derivatives Implies Differentiability**

If the partial derivatives $f_x$ and $f_y$ of a function $f(x, y)$ are continuous throughout an open region $R$, then $f$ is differentiable at every point of $R$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

If $z = f(x, y)$ is differentiable, then the definition of differentiability assures that $\Delta z = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0)$ approaches 0 as $\Delta x$ and $\Delta y$ approach 0. This tells us that a function of two variables is continuous at every point where it is differentiable.

**THEOREM 4 Differentiability Implies Continuity**

If a function $f(x, y)$ is differentiable at $(x_0, y_0)$, then $f$ is continuous at $(x_0, y_0)$.

As we can see from Theorems 3 and 4, a function $f(x, y)$ must be continuous at a point $(x_0, y_0)$ if $f_x$ and $f_y$ are continuous throughout an open region containing $(x_0, y_0)$. Remember, however, that it is still possible for a function of two variables to be discontinuous at a point where its first partial derivatives exist, as we saw in Example 8. Existence alone of the partial derivative at a point is not enough.

# EXERCISES 14.3

## Calculating First-Order Partial Derivatives

In Exercises 1–22, find $\partial f/\partial x$ and $\partial f/\partial y$.

1. $f(x, y) = 2x^2 - 3y - 4$
2. $f(x, y) = x^2 - xy + y^2$
3. $f(x, y) = (x^2 - 1)(y + 2)$
4. $f(x, y) = 5xy - 7x^2 - y^2 + 3x - 6y + 2$
5. $f(x, y) = (xy - 1)^2$
6. $f(x, y) = (2x - 3y)^3$
7. $f(x, y) = \sqrt{x^2 + y^2}$
8. $f(x, y) = (x^3 + (y/2))^{2/3}$
9. $f(x, y) = 1/(x + y)$
10. $f(x, y) = x/(x^2 + y^2)$
11. $f(x, y) = (x + y)/(xy - 1)$
12. $f(x, y) = \tan^{-1}(y/x)$
13. $f(x, y) = e^{(x+y+1)}$
14. $f(x, y) = e^{-x}\sin(x + y)$
15. $f(x, y) = \ln(x + y)$
16. $f(x, y) = e^{xy}\ln y$
17. $f(x, y) = \sin^2(x - 3y)$
18. $f(x, y) = \cos^2(3x - y^2)$
19. $f(x, y) = x^y$
20. $f(x, y) = \log_y x$
21. $f(x, y) = \displaystyle\int_x^y g(t)\,dt$ ($g$ continuous for all $t$)
22. $f(x, y) = \displaystyle\sum_{n=0}^{\infty}(xy)^n$ ($|xy| < 1$)

In Exercises 23–34, find $f_x$, $f_y$, and $f_z$.

23. $f(x, y, z) = 1 + xy^2 - 2z^2$
24. $f(x, y, z) = xy + yz + xz$
25. $f(x, y, z) = x - \sqrt{y^2 + z^2}$
26. $f(x, y, z) = (x^2 + y^2 + z^2)^{-1/2}$
27. $f(x, y, z) = \sin^{-1}(xyz)$
28. $f(x, y, z) = \sec^{-1}(x + yz)$
29. $f(x, y, z) = \ln(x + 2y + 3z)$
30. $f(x, y, z) = yz\ln(xy)$
31. $f(x, y, z) = e^{-(x^2+y^2+z^2)}$
32. $f(x, y, z) = e^{-xyz}$
33. $f(x, y, z) = \tanh(x + 2y + 3z)$
34. $f(x, y, z) = \sinh(xy - z^2)$

In Exercises 35–40, find the partial derivative of the function with respect to each variable.

35. $f(t, \alpha) = \cos(2\pi t - \alpha)$
36. $g(u, v) = v^2 e^{(2u/v)}$
37. $h(\rho, \phi, \theta) = \rho\sin\phi\cos\theta$
38. $g(r, \theta, z) = r(1 - \cos\theta) - z$
39. **Work done by the heart** (Section 3.8, Exercise 51)

$$W(P, V, \delta, v, g) = PV + \frac{V\delta v^2}{2g}$$

40. **Wilson lot size formula** (Section 4.5, Exercise 45)

$$A(c, h, k, m, q) = \frac{km}{q} + cm + \frac{hq}{2}$$

## Calculating Second-Order Partial Derivatives

Find all the second-order partial derivatives of the functions in Exercises 41–46.

41. $f(x, y) = x + y + xy$
42. $f(x, y) = \sin xy$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**43.** $g(x, y) = x^2y + \cos y + y \sin x$

**44.** $h(x, y) = xe^y + y + 1$ **45.** $r(x, y) = \ln(x + y)$

**46.** $s(x, y) = \tan^{-1}(y/x)$

## Mixed Partial Derivatives

In Exercises 47–50, verify that $w_{xy} = w_{yx}$.

**47.** $w = \ln(2x + 3y)$ **48.** $w = e^x + x \ln y + y \ln x$

**49.** $w = xy^2 + x^2y^3 + x^3y^4$ **50.** $w = x \sin y + y \sin x + xy$

**51.** Which order of differentiation will calculate $f_{xy}$ faster: $x$ first or $y$ first? Try to answer without writing anything down.

**a.** $f(x, y) = x \sin y + e^y$

**b.** $f(x, y) = 1/x$

**c.** $f(x, y) = y + (x/y)$

**d.** $f(x, y) = y + x^2y + 4y^3 - \ln(y^2 + 1)$

**e.** $f(x, y) = x^2 + 5xy + \sin x + 7e^x$

**f.** $f(x, y) = x \ln xy$

**52.** The fifth-order partial derivative $\partial^5 f/\partial x^2 \partial y^3$ is zero for each of the following functions. To show this as quickly as possible, which variable would you differentiate with respect to first: $x$ or $y$? Try to answer without writing anything down.

**a.** $f(x, y) = y^2x^4e^x + 2$

**b.** $f(x, y) = y^2 + y(\sin x - x^4)$

**c.** $f(x, y) = x^2 + 5xy + \sin x + 7e^x$

**d.** $f(x, y) = xe^{y^2/2}$

## Using the Partial Derivative Definition

In Exercises 53 and 54, use the limit definition of partial derivative to compute the partial derivatives of the functions at the specified points.

**53.** $f(x, y) = 1 - x + y - 3x^2y$, $\dfrac{\partial f}{\partial x}$ and $\dfrac{\partial f}{\partial y}$ at $(1, 2)$

**54.** $f(x, y) = 4 + 2x - 3y - xy^2$, $\dfrac{\partial f}{\partial x}$ and $\dfrac{\partial f}{\partial y}$ at $(-2, 1)$

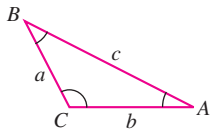
**55. Three variables** Let $w = f(x, y, z)$ be a function of three independent variables and write the formal definition of the partial derivative $\partial f/\partial z$ at $(x_0, y_0, z_0)$. Use this definition to find $\partial f/\partial z$ at $(1, 2, 3)$ for $f(x, y, z) = x^2yz^2$.

**56. Three variables** Let $w = f(x, y, z)$ be a function of three independent variables and write the formal definition of the partial derivative $\partial f/\partial y$ at $(x_0, y_0, z_0)$. Use this definition to find $\partial f/\partial y$ at $(-1, 0, 3)$ for $f(x, y, z) = -2xy^2 + yz^2$.

## Differentiating Implicitly

**57.** Find the value of $\partial z/\partial x$ at the point $(1, 1, 1)$ if the equation

$$xy + z^3x - 2yz = 0$$



defines $z$ as a function of the two independent variables $x$ and $y$ and the partial derivative exists.

**58.** Find the value of $\partial x/\partial z$ at the point $(1, -1, -3)$ if the equation

$$xz + y \ln x - x^2 + 4 = 0$$

defines $x$ as a function of the two independent variables $y$ and $z$ and the partial derivative exists.

Exercises 59 and 60 are about the triangle shown here.

**59.** Express $A$ implicitly as a function of $a$, $b$, and $c$ and calculate $\partial A/\partial a$ and $\partial A/\partial b$.

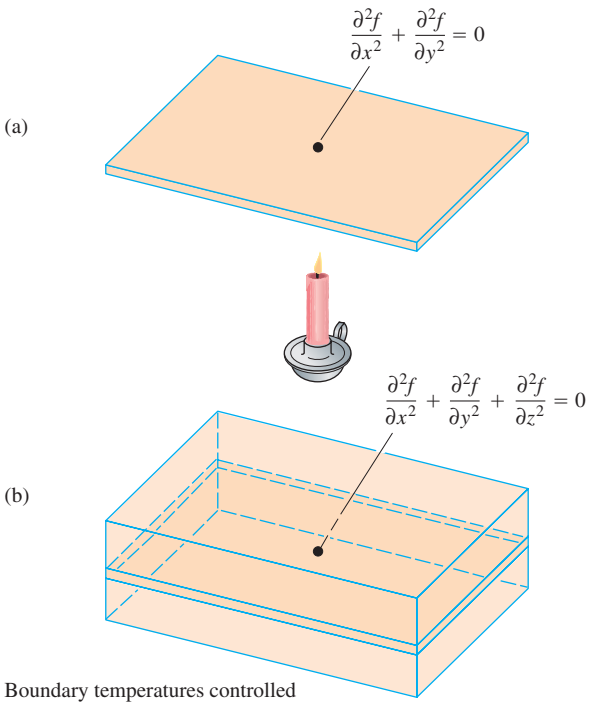
**60.** Express $a$ implicitly as a function of $A$, $b$, and $B$ and calculate $\partial a/\partial A$ and $\partial a/\partial B$.

**61. Two dependent variables** Express $v_x$ in terms of $u$ and $v$ if the equations $x = v \ln u$ and $y = u \ln v$ define $u$ and $v$ as functions of the independent variables $x$ and $y$, and if $v_x$ exists. (*Hint:* Differentiate both equations with respect to $x$ and solve for $v_x$ by eliminating $u_x$.)

**62. Two dependent variables** Find $\partial x/\partial u$ and $\partial y/\partial u$ if the equations $u = x^2 - y^2$ and $v = x^2 - y$ define $x$ and $y$ as functions of the independent variables $u$ and $v$, and the partial derivatives exist. (See the hint in Exercise 61.) Then let $s = x^2 + y^2$ and find $\partial s/\partial u$.

## Laplace Equations

The **three-dimensional Laplace equation**



$$\frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} + \frac{\partial^2 f}{\partial z^2} = 0$$

is satisfied by steady-state temperature distributions $T = f(x, y, z)$ in space, by gravitational potentials, and by electrostatic potentials. The **two-dimensional Laplace equation**

$$\frac{\partial^2 f}{\partial x^2} + \frac{\partial^2 f}{\partial y^2} = 0,$$

obtained by dropping the $\partial^2 f/\partial z^2$ term from the previous equation, describes potentials and steady-state temperature distributions in a plane (see the accompanying figure). The plane (a) may be treated as a thin slice of the solid (b) perpendicular to the $z$-axis.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Show that each function in Exercises 63–68 satisfies a Laplace equation.

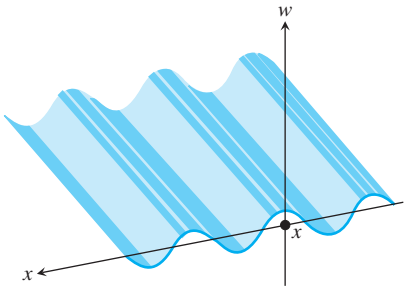
**63.** $f(x, y, z) = x^2 + y^2 - 2z^2$

**64.** $f(x, y, z) = 2z^3 - 3(x^2 + y^2)z$

**65.** $f(x, y) = e^{-2y} \cos 2x$

**66.** $f(x, y) = \ln\sqrt{x^2 + y^2}$

**67.** $f(x, y, z) = (x^2 + y^2 + z^2)^{-1/2}$



**68.** $f(x, y, z) = e^{3x+4y} \cos 5z$

## The Wave Equation

If we stand on an ocean shore and take a snapshot of the waves, the picture shows a regular pattern of peaks and valleys in an instant of time. We see periodic vertical motion in space, with respect to distance. If we stand in the water, we can feel the rise and fall of the water as the waves go by. We see periodic vertical motion in time. In physics, this beautiful symmetry is expressed by the **one-dimensional wave equation**

$$\frac{\partial^2 w}{\partial t^2} = c^2 \frac{\partial^2 w}{\partial x^2},$$

where $w$ is the wave height, $x$ is the distance variable, $t$ is the time variable, and $c$ is the velocity with which the waves are propagated.

In our example, $x$ is the distance across the ocean's surface, but in other applications, $x$ might be the distance along a vibrating string, distance through air (sound waves), or distance through space (light waves). The number $c$ varies with the medium and type of wave.

Show that the functions in Exercises 69–75 are all solutions of the wave equation.

**69.** $w = \sin(x + ct)$ **70.** $w = \cos(2x + 2ct)$

**71.** $w = \sin(x + ct) + \cos(2x + 2ct)$

**72.** $w = \ln(2x + 2ct)$ **73.** $w = \tan(2x - 2ct)$

**74.** $w = 5\cos(3x + 3ct) + e^{x+ct}$

**75.** $w = f(u)$, where $f$ is a differentiable function of $u$, and $u = a(x + ct)$, where $a$ is a constant

## Continuous Partial Derivatives

**76.** Does a function $f(x, y)$ with continuous first partial derivatives throughout an open region $R$ have to be continuous on $R$? Give reasons for your answer.

**77.** If a function $f(x, y)$ has continuous second partial derivatives throughout an open region $R$, must the first-order partial derivatives of $f$ be continuous on $R$? Give reasons for your answer.

# 14.4 The Chain Rule

The Chain Rule for functions of a single variable studied in Section 3.5 said that when $w = f(x)$ was a differentiable function of $x$ and $x = g(t)$ was a differentiable function of $t$, $w$ became a differentiable function of $t$ and $dw/dt$ could be calculated with the formula

$$\frac{dw}{dt} = \frac{dw}{dx}\frac{dx}{dt}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

For functions of two or more variables the Chain Rule has several forms. The form depends on how many variables are involved but works like the Chain Rule in Section 3.5 once we account for the presence of additional variables.

## Functions of Two Variables

The Chain Rule formula for a function $w = f(x, y)$ when $x = x(t)$ and $y = y(t)$ are both differentiable functions of $t$ is given in the following theorem.

**THEOREM 5 Chain Rule for Functions of Two Independent Variables**

If $w = f(x, y)$ has continuous partial derivatives $f_x$ and $f_y$ and if $x = x(t)$, $y = y(t)$ are differentiable functions of $t$, then the composite $w = f(x(t), y(t))$ is a differentiable function of $t$ and

$$\frac{df}{dt} = f_x(x(t), y(t)) \cdot x'(t) + f_y(x(t), y(t)) \cdot y'(t),$$

or

$$\frac{dw}{dt} = \frac{\partial f}{\partial x}\frac{dx}{dt} + \frac{\partial f}{\partial y}\frac{dy}{dt}.$$

**Proof** The proof consists of showing that if $x$ and $y$ are differentiable at $t = t_0$, then $w$ is differentiable at $t_0$ and

$$\left(\frac{dw}{dt}\right)_{t_0} = \left(\frac{\partial w}{\partial x}\right)_{P_0}\left(\frac{dx}{dt}\right)_{t_0} + \left(\frac{\partial w}{\partial y}\right)_{P_0}\left(\frac{dy}{dt}\right)_{t_0},$$

where $P_0 = (x(t_0), y(t_0))$. The subscripts indicate where each of the derivatives are to be evaluated.

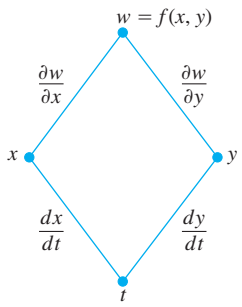
Let $\Delta x$, $\Delta y$, and $\Delta w$ be the increments that result from changing $t$ from $t_0$ to $t_0 + \Delta t$. Since $f$ is differentiable (see the definition in Section 14.3),

$$\Delta w = \left(\frac{\partial w}{\partial x}\right)_{P_0}\Delta x + \left(\frac{\partial w}{\partial y}\right)_{P_0}\Delta y + \epsilon_1\Delta x + \epsilon_2\Delta y,$$

where $\epsilon_1, \epsilon_2 \to 0$ as $\Delta x, \Delta y \to 0$. To find $dw/dt$, we divide this equation through by $\Delta t$ and let $\Delta t$ approach zero. The division gives

$$\frac{\Delta w}{\Delta t} = \left(\frac{\partial w}{\partial x}\right)_{P_0}\frac{\Delta x}{\Delta t} + \left(\frac{\partial w}{\partial y}\right)_{P_0}\frac{\Delta y}{\Delta t} + \epsilon_1\frac{\Delta x}{\Delta t} + \epsilon_2\frac{\Delta y}{\Delta t}.$$

Letting $\Delta t$ approach zero gives



$$\left(\frac{dw}{dt}\right)_{t_0} = \lim_{\Delta t \to 0}\frac{\Delta w}{\Delta t}$$

$$= \left(\frac{\partial w}{\partial x}\right)_{P_0}\left(\frac{dx}{dt}\right)_{t_0} + \left(\frac{\partial w}{\partial y}\right)_{P_0}\left(\frac{dy}{dt}\right)_{t_0} + 0 \cdot \left(\frac{dx}{dt}\right)_{t_0} + 0 \cdot \left(\frac{dy}{dt}\right)_{t_0}. \quad \blacksquare$$

The **tree diagram** in the margin provides a convenient way to remember the Chain Rule. From the diagram, you see that when $t = t_0$, the derivatives $dx/dt$ and $dy/dt$ are

To remember the Chain Rule picture the diagram below. To find $dw/dt$, start at $w$ and read down each route to $t$, multiplying derivatives along the way. Then add the products.

**Chain Rule**

$$\frac{dw}{dt} = \frac{\partial w}{\partial x}\frac{dx}{dt} + \frac{\partial w}{\partial y}\frac{dy}{dt}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

evaluated at $t_0$. The value of $t_0$ then determines the value $x_0$ for the differentiable function $x$ and the value $y_0$ for the differentiable function $y$. The partial derivatives $\partial w/\partial x$ and $\partial w/\partial y$ (which are themselves functions of $x$ and $y$) are evaluated at the point $P_0(x_0, y_0)$ corresponding to $t_0$. The "true" independent variable is $t$, whereas $x$ and $y$ are *intermediate variables* (controlled by $t$) and $w$ is the dependent variable.

A more precise notation for the Chain Rule shows how the various derivatives in Theorem 5 are evaluated:

$$\frac{dw}{dt}(t_0) = \frac{\partial f}{\partial x}(x_0, y_0) \cdot \frac{dx}{dt}(t_0) + \frac{\partial f}{\partial y}(x_0, y_0) \cdot \frac{dy}{dt}(t_0).$$

**EXAMPLE 1** Applying the Chain Rule

Use the Chain Rule to find the derivative of

$$w = xy$$

with respect to $t$ along the path $x = \cos t, y = \sin t$. What is the derivative's value at $t = \pi/2$?

**Solution** We apply the Chain Rule to find $dw/dt$ as follows:

$$\begin{aligned}
\frac{dw}{dt} &= \frac{\partial w}{\partial x}\frac{dx}{dt} + \frac{\partial w}{\partial y}\frac{dy}{dt} \\
&= \frac{\partial (xy)}{\partial x} \cdot \frac{d}{dt}(\cos t) + \frac{\partial (xy)}{\partial y} \cdot \frac{d}{dt}(\sin t) \\
&= (y)(-\sin t) + (x)(\cos t) \\
&= (\sin t)(-\sin t) + (\cos t)(\cos t) \\
&= -\sin^2 t + \cos^2 t \\
&= \cos 2t.
\end{aligned}$$

In this example, we can check the result with a more direct calculation. As a function of $t$,

$$w = xy = \cos t \sin t = \frac{1}{2}\sin 2t,$$

so

$$\frac{dw}{dt} = \frac{d}{dt}\left(\frac{1}{2}\sin 2t\right) = \frac{1}{2} \cdot 2\cos 2t = \cos 2t.$$

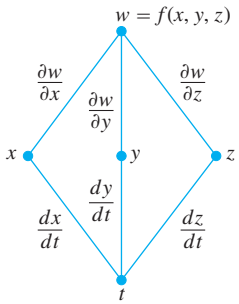
In either case, at the given value of $t$,

$$\left(\frac{dw}{dt}\right)_{t=\pi/2} = \cos\left(2 \cdot \frac{\pi}{2}\right) = \cos \pi = -1. \quad \blacksquare$$

## Functions of Three Variables

You can probably predict the Chain Rule for functions of three variables, as it only involves adding the expected third term to the two-variable formula.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



**THEOREM 6 Chain Rule for Functions of Three Independent Variables**

If $w = f(x, y, z)$ is differentiable and $x$, $y$, and $z$ are differentiable functions of $t$, then $w$ is a differentiable function of $t$ and

$$\frac{dw}{dt} = \frac{\partial f}{\partial x}\frac{dx}{dt} + \frac{\partial f}{\partial y}\frac{dy}{dt} + \frac{\partial f}{\partial z}\frac{dz}{dt}.$$

Here we have three routes from $w$ to $t$ instead of two, but finding $dw/dt$ is still the same. Read down each route, multiplying derivatives along the way; then add.

**Chain Rule**

$$\frac{dw}{dt} = \frac{\partial w}{\partial x}\frac{dx}{dt} + \frac{\partial w}{\partial y}\frac{dy}{dt} + \frac{\partial w}{\partial z}\frac{dz}{dt}$$

The proof is identical with the proof of Theorem 5 except that there are now three intermediate variables instead of two. The diagram we use for remembering the new equation is similar as well, with three routes from $w$ to $t$.

**EXAMPLE 2** Changes in a Function's Values Along a Helix

Find $dw/dt$ if

$$w = xy + z, \qquad x = \cos t, \qquad y = \sin t, \qquad z = t.$$

In this example the values of $w$ are changing along the path of a helix (Section 13.1). What is the derivative's value at $t = 0$?

**Solution**

$$\begin{aligned}\frac{dw}{dt} &= \frac{\partial w}{\partial x}\frac{dx}{dt} + \frac{\partial w}{\partial y}\frac{dy}{dt} + \frac{\partial w}{\partial z}\frac{dz}{dt}\\ &= (y)(-\sin t) + (x)(\cos t) + (1)(1)\\ &= (\sin t)(-\sin t) + (\cos t)(\cos t) + 1 \qquad \text{Substitute for the intermediate variables.}\\ &= -\sin^2 t + \cos^2 t + 1 = 1 + \cos 2t.\end{aligned}$$

$$\left(\frac{dw}{dt}\right)_{t=0} = 1 + \cos(0) = 2.$$

Here is a physical interpretation of change along a curve. If $w = T(x, y, z)$ is the temperature at each point $(x, y, z)$ along a curve $C$ with parametric equations $x = x(t)$, $y = y(t)$, and $z = z(t)$, then the composite function $w = T(x(t), y(t), z(t))$ represents the temperature relative to $t$ along the curve. The derivative $dw/dt$ is then the instantaneous rate of change of temperature along the curve, as calculated in Theorem 6.

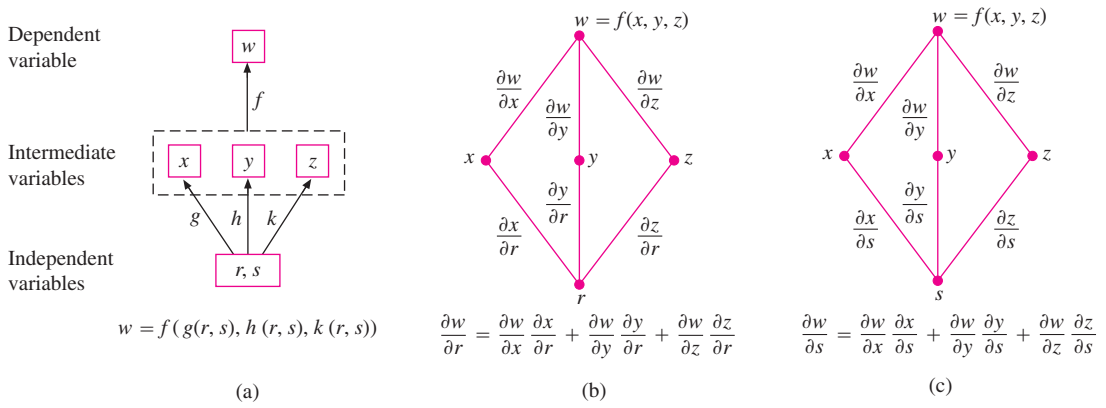
## Functions Defined on Surfaces

If we are interested in the temperature $w = f(x, y, z)$ at points $(x, y, z)$ on a globe in space, we might prefer to think of $x$, $y$, and $z$ as functions of the variables $r$ and $s$ that give the points' longitudes and latitudes. If $x = g(r, s)$, $y = h(r, s)$, and $z = k(r, s)$, we could then express the temperature as a function of $r$ and $s$ with the composite function

$$w = f(g(r, s), h(r, s), k(r, s)).$$

Under the right conditions, $w$ would have partial derivatives with respect to both $r$ and $s$ that could be calculated in the following way.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



**THEOREM 7 Chain Rule for Two Independent Variables and Three Intermediate Variables**

Suppose that $w = f(x, y, z)$, $x = g(r, s)$, $y = h(r, s)$, and $z = k(r, s)$. If all four functions are differentiable, then $w$ has partial derivatives with respect to $r$ and $s$, given by the formulas

$$\frac{\partial w}{\partial r} = \frac{\partial w}{\partial x}\frac{\partial x}{\partial r} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial r} + \frac{\partial w}{\partial z}\frac{\partial z}{\partial r}$$

$$\frac{\partial w}{\partial s} = \frac{\partial w}{\partial x}\frac{\partial x}{\partial s} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial s} + \frac{\partial w}{\partial z}\frac{\partial z}{\partial s}.$$

The first of these equations can be derived from the Chain Rule in Theorem 6 by holding $s$ fixed and treating $r$ as $t$. The second can be derived in the same way, holding $r$ fixed and treating $s$ as $t$. The tree diagrams for both equations are shown in Figure 14.19.

$w = f(g(r, s), h(r, s), k(r, s))$

$\dfrac{\partial w}{\partial r} = \dfrac{\partial w}{\partial x}\dfrac{\partial x}{\partial r} + \dfrac{\partial w}{\partial y}\dfrac{\partial y}{\partial r} + \dfrac{\partial w}{\partial z}\dfrac{\partial z}{\partial r}$

$\dfrac{\partial w}{\partial s} = \dfrac{\partial w}{\partial x}\dfrac{\partial x}{\partial s} + \dfrac{\partial w}{\partial y}\dfrac{\partial y}{\partial s} + \dfrac{\partial w}{\partial z}\dfrac{\partial z}{\partial s}$

(a) (b) (c)

**FIGURE 14.19** Composite function and tree diagrams for Theorem 7.

**EXAMPLE 3** Partial Derivatives Using Theorem 7

Express $\partial w/\partial r$ and $\partial w/\partial s$ in terms of $r$ and $s$ if

$$w = x + 2y + z^2, \qquad x = \frac{r}{s}, \qquad y = r^2 + \ln s, \qquad z = 2r.$$

**Solution**

$$\frac{\partial w}{\partial r} = \frac{\partial w}{\partial x}\frac{\partial x}{\partial r} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial r} + \frac{\partial w}{\partial z}\frac{\partial z}{\partial r}$$

$$= (1)\left(\frac{1}{s}\right) + (2)(2r) + (2z)(2)$$

$$= \frac{1}{s} + 4r + (4r)(2) = \frac{1}{s} + 12r$$

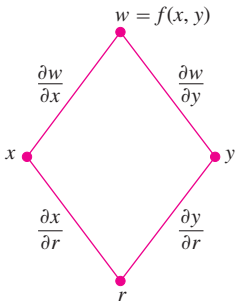
Substitute for intermediate variable $z$.

$$\frac{\partial w}{\partial s} = \frac{\partial w}{\partial x}\frac{\partial x}{\partial s} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial s} + \frac{\partial w}{\partial z}\frac{\partial z}{\partial s}$$

$$= (1)\left(-\frac{r}{s^2}\right) + (2)\left(\frac{1}{s}\right) + (2z)(0) = \frac{2}{s} - \frac{r}{s^2}$$

■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



If $f$ is a function of two variables instead of three, each equation in Theorem 7 becomes correspondingly one term shorter.

**If $w = f(x, y)$, $x = g(r, s)$, and $y = h(r, s)$, then**

$$\frac{\partial w}{\partial r} = \frac{\partial w}{\partial x}\frac{\partial x}{\partial r} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial r} \quad \text{and} \quad \frac{\partial w}{\partial s} = \frac{\partial w}{\partial x}\frac{\partial x}{\partial s} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial s}.$$

Figure 14.20 shows the tree diagram for the first of these equations. The diagram for the second equation is similar; just replace $r$ with $s$.

**Chain Rule**

$$\frac{\partial w}{\partial r} = \frac{\partial w}{\partial x}\frac{\partial x}{\partial r} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial r}$$

**FIGURE 14.20** Tree diagram for the equation

$$\frac{\partial w}{\partial r} = \frac{\partial w}{\partial x}\frac{\partial x}{\partial r} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial r}.$$

## EXAMPLE 4 More Partial Derivatives

Express $\partial w/\partial r$ and $\partial w/\partial s$ in terms of $r$ and $s$ if

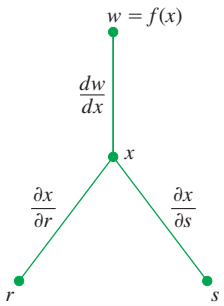
$$w = x^2 + y^2, \qquad x = r - s, \qquad y = r + s.$$

**Solution**

$$\frac{\partial w}{\partial r} = \frac{\partial w}{\partial x}\frac{\partial x}{\partial r} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial r}$$
$$= (2x)(1) + (2y)(1)$$
$$= 2(r - s) + 2(r + s)$$
$$= 4r$$

$$\frac{\partial w}{\partial s} = \frac{\partial w}{\partial x}\frac{\partial x}{\partial s} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial s}$$
$$= (2x)(-1) + (2y)(1)$$
$$= -2(r - s) + 2(r + s)$$
$$= 4s$$

Substitute for the intermediate variables.



If $f$ is a function of $x$ alone, our equations become even simpler.

**If $w = f(x)$ and $x = g(r, s)$, then**

$$\frac{\partial w}{\partial r} = \frac{dw}{dx}\frac{\partial x}{\partial r} \quad \text{and} \quad \frac{\partial w}{\partial s} = \frac{dw}{dx}\frac{\partial x}{\partial s}.$$

In this case, we can use the ordinary (single-variable) derivative, $dw/dx$. The tree diagram is shown in Figure 14.21.

**Chain Rule**

$$\frac{\partial w}{\partial r} = \frac{dw}{dx}\frac{\partial x}{\partial r}$$

$$\frac{\partial w}{\partial s} = \frac{dw}{dx}\frac{\partial x}{\partial s}$$

**FIGURE 14.21** Tree diagram for differentiating $f$ as a composite function of $r$ and $s$ with one intermediate variable.

## Implicit Differentiation Revisited

The two-variable Chain Rule in Theorem 5 leads to a formula that takes most of the work out of implicit differentiation. Suppose that

1. The function $F(x, y)$ is differentiable and
2. The equation $F(x, y) = 0$ defines $y$ implicitly as a differentiable function of $x$, say $y = h(x)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

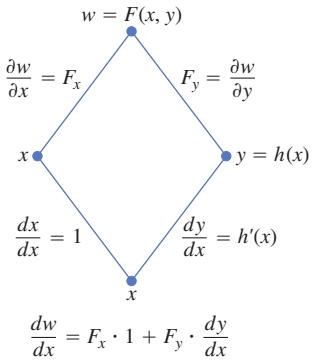


**FIGURE 14.22** Tree diagram for differentiating $w = F(x, y)$ with respect to $x$. Setting $dw/dx = 0$ leads to a simple computational formula for implicit differentiation (Theorem 8).

Since $w = F(x, y) = 0$, the derivative $dw/dx$ must be zero. Computing the derivative from the Chain Rule (tree diagram in Figure 14.22), we find

$$0 = \frac{dw}{dx} = F_x \frac{dx}{dx} + F_y \frac{dy}{dx} \qquad \text{Theorem 5 with } t = x \text{ and } f = F$$

$$= F_x \cdot 1 + F_y \cdot \frac{dy}{dx}.$$

If $F_y = \partial w/\partial y \neq 0$, we can solve this equation for $dy/dx$ to get

$$\frac{dy}{dx} = -\frac{F_x}{F_y}.$$

This relationship gives a surprisingly simple shortcut to finding derivatives of implicitly defined functions, which we state here as a theorem.

**THEOREM 8 A Formula for Implicit Differentiation**

Suppose that $F(x, y)$ is differentiable and that the equation $F(x, y) = 0$ defines $y$ as a differentiable function of $x$. Then at any point where $F_y \neq 0$,

$$\frac{dy}{dx} = -\frac{F_x}{F_y}.$$

**EXAMPLE 5** Implicit Differentiation

Use Theorem 8 to find $dy/dx$ if $y^2 - x^2 - \sin xy = 0$.

**Solution** Take $F(x, y) = y^2 - x^2 - \sin xy$. Then

$$\frac{dy}{dx} = -\frac{F_x}{F_y} = -\frac{-2x - y\cos xy}{2y - x\cos xy}$$

$$= \frac{2x + y\cos xy}{2y - x\cos xy}.$$

This calculation is significantly shorter than the single-variable calculation with which we found $dy/dx$ in Section 3.6, Example 3. ■

## Functions of Many Variables

We have seen several different forms of the Chain Rule in this section, but you do not have to memorize them all if you can see them as special cases of the same general formula. When solving particular problems, it may help to draw the appropriate tree diagram by placing the dependent variable on top, the intermediate variables in the middle, and the selected independent variable at the bottom. To find the derivative of the dependent variable with respect to the selected independent variable, start at the dependent variable and read down each route of the tree to the independent variable, calculating and multiplying the derivatives along each route. Then add the products you found for the different routes.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

In general, suppose that $w = f(x, y, \ldots, v)$ is a differentiable function of the variables $x, y, \ldots, v$ (a finite set) and the $x, y, \ldots, v$ are differentiable functions of $p, q, \ldots, t$ (another finite set). Then $w$ is a differentiable function of the variables $p$ through $t$ and the partial derivatives of $w$ with respect to these variables are given by equations of the form

$$\frac{\partial w}{\partial p} = \frac{\partial w}{\partial x}\frac{\partial x}{\partial p} + \frac{\partial w}{\partial y}\frac{\partial y}{\partial p} + \cdots + \frac{\partial w}{\partial v}\frac{\partial v}{\partial p}.$$

The other equations are obtained by replacing $p$ by $q, \ldots, t$, one at a time.

One way to remember this equation is to think of the right-hand side as the dot product of two vectors with components

$$\underbrace{\left(\frac{\partial w}{\partial x}, \frac{\partial w}{\partial y}, \ldots, \frac{\partial w}{\partial v}\right)}_{\substack{\text{Derivatives of } w \text{ with} \\ \text{respect to the} \\ \text{intermediate variables}}} \quad \text{and} \quad \underbrace{\left(\frac{\partial x}{\partial p}, \frac{\partial y}{\partial p}, \ldots, \frac{\partial v}{\partial p}\right)}_{\substack{\text{Derivatives of the intermediate} \\ \text{variables with respect to the} \\ \text{selected independent variable}}}.$$

# EXERCISES 14.4

## Chain Rule: One Independent Variable

In Exercises 1–6, **(a)** express $dw/dt$ as a function of $t$, both by using the Chain Rule and by expressing $w$ in terms of $t$ and differentiating directly with respect to $t$. Then **(b)** evaluate $dw/dt$ at the given value of $t$.

**1.** $w = x^2 + y^2, \quad x = \cos t, \quad y = \sin t; \quad t = \pi$

**2.** $w = x^2 + y^2, \quad x = \cos t + \sin t, \quad y = \cos t - \sin t; \quad t = 0$

**3.** $w = \dfrac{x}{z} + \dfrac{y}{z}, \quad x = \cos^2 t, \quad y = \sin^2 t, \quad z = 1/t; \quad t = 3$

**4.** $w = \ln(x^2 + y^2 + z^2), \quad x = \cos t, \quad y = \sin t, \quad z = 4\sqrt{t}; \quad t = 3$

**5.** $w = 2ye^x - \ln z, \quad x = \ln(t^2 + 1), \quad y = \tan^{-1} t, \quad z = e^t; \quad t = 1$

**6.** $w = z - \sin xy, \quad x = t, \quad y = \ln t, \quad z = e^{t-1}; \quad t = 1$

## Chain Rule: Two and Three Independent Variables

In Exercises 7 and 8, **(a)** express $\partial z/\partial u$ and $\partial z/\partial v$ as functions of $u$ and $v$ both by using the Chain Rule and by expressing $z$ directly in terms of $u$ and $v$ before differentiating. Then **(b)** evaluate $\partial z/\partial u$ and $\partial z/\partial v$ at the given point $(u, v)$.

**7.** $z = 4e^x \ln y, \quad x = \ln(u \cos v), \quad y = u \sin v; \quad (u, v) = (2, \pi/4)$

**8.** $z = \tan^{-1}(x/y), \quad x = u \cos v, \quad y = u \sin v; \quad (u, v) = (1.3, \pi/6)$

In Exercises 9 and 10, **(a)** express $\partial w/\partial u$ and $\partial w/\partial v$ as functions of $u$ and $v$ both by using the Chain Rule and by expressing $w$ directly in terms of $u$ and $v$ before differentiating. Then **(b)** evaluate $\partial w/\partial u$ and $\partial w/\partial v$ at the given point $(u, v)$.

**9.** $w = xy + yz + xz, \quad x = u + v, \quad y = u - v, \quad z = uv; \quad (u, v) = (1/2, 1)$

**10.** $w = \ln(x^2 + y^2 + z^2), \quad x = ue^v \sin u, \quad y = ue^v \cos u, \quad z = ue^v; \quad (u, v) = (-2, 0)$

In Exercises 11 and 12, **(a)** express $\partial u/\partial x$, $\partial u/\partial y$, and $\partial u/\partial z$ as functions of $x$, $y$, and $z$ both by using the Chain Rule and by expressing $u$ directly in terms of $x$, $y$, and $z$ before differentiating. Then **(b)** evaluate $\partial u/\partial x$, $\partial u/\partial y$, and $\partial u/\partial z$ at the given point $(x, y, z)$.

**11.** $u = \dfrac{p - q}{q - r}, \quad p = x + y + z, \quad q = x - y + z, \quad r = x + y - z; \quad (x, y, z) = \left(\sqrt{3}, 2, 1\right)$

**12.** $u = e^{qr} \sin^{-1} p, \quad p = \sin x, \quad q = z^2 \ln y, \quad r = 1/z; \quad (x, y, z) = (\pi/4, 1/2, -1/2)$

## Using a Tree Diagram

In Exercises 13–24, draw a tree diagram and write a Chain Rule formula for each derivative.

**13.** $\dfrac{dz}{dt}$ for $z = f(x, y), \quad x = g(t), \quad y = h(t)$

**14.** $\dfrac{dz}{dt}$ for $z = f(u, v, w), \quad u = g(t), \quad v = h(t), \quad w = k(t)$

**15.** $\dfrac{\partial w}{\partial u}$ and $\dfrac{\partial w}{\partial v}$ for $w = h(x, y, z), \quad x = f(u, v), \quad y = g(u, v), \quad z = k(u, v)$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**16.** $\frac{\partial w}{\partial x}$ and $\frac{\partial w}{\partial y}$ for $w = f(r, s, t)$, $r = g(x, y)$, $s = h(x, y)$, $t = k(x, y)$

**17.** $\frac{\partial w}{\partial u}$ and $\frac{\partial w}{\partial v}$ for $w = g(x, y)$, $x = h(u, v)$, $y = k(u, v)$

**18.** $\frac{\partial w}{\partial x}$ and $\frac{\partial w}{\partial y}$ for $w = g(u, v)$, $u = h(x, y)$, $v = k(x, y)$

**19.** $\frac{\partial z}{\partial t}$ and $\frac{\partial z}{\partial s}$ for $z = f(x, y)$, $x = g(t, s)$, $y = h(t, s)$

**20.** $\frac{\partial y}{\partial r}$ for $y = f(u)$, $u = g(r, s)$

**21.** $\frac{\partial w}{\partial s}$ and $\frac{\partial w}{\partial t}$ for $w = g(u)$, $u = h(s, t)$

**22.** $\frac{\partial w}{\partial p}$ for $w = f(x, y, z, v)$, $x = g(p, q)$, $y = h(p, q)$, $z = j(p, q)$, $v = k(p, q)$

**23.** $\frac{\partial w}{\partial r}$ and $\frac{\partial w}{\partial s}$ for $w = f(x, y)$, $x = g(r)$, $y = h(s)$

**24.** $\frac{\partial w}{\partial s}$ for $w = g(x, y)$, $x = h(r, s, t)$, $y = k(r, s, t)$

## Implicit Differentiation

Assuming that the equations in Exercises 25–28 define $y$ as a differentiable function of $x$, use Theorem 8 to find the value of $dy/dx$ at the given point.

**25.** $x^3 - 2y^2 + xy = 0$, $(1, 1)$

**26.** $xy + y^2 - 3x - 3 = 0$, $(-1, 1)$

**27.** $x^2 + xy + y^2 - 7 = 0$, $(1, 2)$

**28.** $xe^y + \sin xy + y - \ln 2 = 0$, $(0, \ln 2)$

## Three-Variable Implicit Differentiation

Theorem 8 can be generalized to functions of three variables and even more. The three-variable version goes like this: If the equation $F(x, y, z) = 0$ determines $z$ as a differentiable function of $x$ and $y$, then, at points where $F_z \neq 0$,

$$\frac{\partial z}{\partial x} = -\frac{F_x}{F_z} \quad \text{and} \quad \frac{\partial z}{\partial y} = -\frac{F_y}{F_z}.$$

Use these equations to find the values of $\partial z/\partial x$ and $\partial z/\partial y$ at the points in Exercises 29–32.

**29.** $z^3 - xy + yz + y^3 - 2 = 0$, $(1, 1, 1)$

**30.** $\frac{1}{x} + \frac{1}{y} + \frac{1}{z} - 1 = 0$, $(2, 3, 6)$

**31.** $\sin(x + y) + \sin(y + z) + \sin(x + z) = 0$, $(\pi, \pi, \pi)$

**32.** $xe^y + ye^z + 2 \ln x - 2 - 3 \ln 2 = 0$, $(1, \ln 2, \ln 3)$

## Finding Specified Partial Derivatives

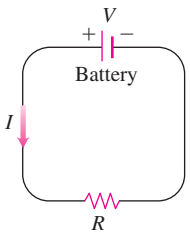
**33.** Find $\partial w/\partial r$ when $r = 1, s = -1$ if $w = (x + y + z)^2$, $x = r - s$, $y = \cos(r + s)$, $z = \sin(r + s)$.

**34.** Find $\partial w/\partial v$ when $u = -1, v = 2$ if $w = xy + \ln z$, $x = v^2/u$, $y = u + v$, $z = \cos u$.

**35.** Find $\partial w/\partial v$ when $u = 0, v = 0$ if $w = x^2 + (y/x)$, $x = u - 2v + 1$, $y = 2u + v - 2$.

**36.** Find $\partial z/\partial u$ when $u = 0, v = 1$ if $z = \sin xy + x \sin y$, $x = u^2 + v^2$, $y = uv$.

**37.** Find $\partial z/\partial u$ and $\partial z/\partial v$ when $u = \ln 2$, $v = 1$ if $z = 5 \tan^{-1} x$ and $x = e^u + \ln v$.



**38.** Find $\partial z/\partial u$ and $\partial z/\partial v$ when $u = 1$ and $v = -2$ if $z = \ln q$ and $q = \sqrt{v + 3} \tan^{-1} u$.

## Theory and Examples

**39. Changing voltage in a circuit** The voltage $V$ in a circuit that satisfies the law $V = IR$ is slowly dropping as the battery wears out. At the same time, the resistance $R$ is increasing as the resistor heats up. Use the equation

$$\frac{dV}{dt} = \frac{\partial V}{\partial I}\frac{dI}{dt} + \frac{\partial V}{\partial R}\frac{dR}{dt}$$

to find how the current is changing at the instant when $R = 600$ ohms, $I = 0.04$ amp, $dR/dt = 0.5$ ohm/sec, and $dV/dt = -0.01$ volt/sec.

**40. Changing dimensions in a box** The lengths $a$, $b$, and $c$ of the edges of a rectangular box are changing with time. At the instant in question, $a = 1$ m, $b = 2$ m, $c = 3$ m, $da/dt = db/dt = 1$ m/sec, and $dc/dt = -3$ m/sec. At what rates are the box's volume $V$ and surface area $S$ changing at that instant? Are the box's interior diagonals increasing in length or decreasing?

**41.** If $f(u, v, w)$ is differentiable and $u = x - y$, $v = y - z$, and $w = z - x$, show that

$$\frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} + \frac{\partial f}{\partial z} = 0.$$

**42. Polar coordinates** Suppose that we substitute polar coordinates $x = r\cos\theta$ and $y = r\sin\theta$ in a differentiable function $w = f(x, y)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**a.** Show that

$$\frac{\partial w}{\partial r} = f_x \cos\theta + f_y \sin\theta$$

and

$$\frac{1}{r}\frac{\partial w}{\partial \theta} = -f_x \sin\theta + f_y \cos\theta\,.$$

**b.** Solve the equations in part (a) to express $f_x$ and $f_y$ in terms of $\partial w/\partial r$ and $\partial w/\partial \theta$.

**c.** Show that

$$(f_x)^2 + (f_y)^2 = \left(\frac{\partial w}{\partial r}\right)^2 + \frac{1}{r^2}\left(\frac{\partial w}{\partial \theta}\right)^2.$$

**43. Laplace equations** Show that if $w = f(u, v)$ satisfies the Laplace equation $f_{uu} + f_{vv} = 0$ and if $u = (x^2 - y^2)/2$ and $v = xy$, then $w$ satisfies the Laplace equation $w_{xx} + w_{yy} = 0$.

**44. Laplace equations** Let $w = f(u) + g(v)$, where $u = x + iy$ and $v = x - iy$ and $i = \sqrt{-1}$. Show that $w$ satisfies the Laplace equation $w_{xx} + w_{yy} = 0$ if all the necessary functions are differentiable.

## Changes in Functions Along Curves

**45. Extreme values on a helix** Suppose that the partial derivatives of a function $f(x, y, z)$ at points on the helix $x = \cos t$, $y = \sin t$, $z = t$ are

$$f_x = \cos t, \qquad f_y = \sin t, \qquad f_z = t^2 + t - 2.$$

At what points on the curve, if any, can $f$ take on extreme values?

**46. A space curve** Let $w = x^2 e^{2y} \cos 3z$. Find the value of $dw/dt$ at the point $(1, \ln 2, 0)$ on the curve $x = \cos t$, $y = \ln(t + 2)$, $z = t$.

**47. Temperature on a circle** Let $T = f(x, y)$ be the temperature at the point $(x, y)$ on the circle $x = \cos t$, $y = \sin t$, $0 \le t \le 2\pi$ and suppose that

$$\frac{\partial T}{\partial x} = 8x - 4y, \qquad \frac{\partial T}{\partial y} = 8y - 4x.$$

**a.** Find where the maximum and minimum temperatures on the circle occur by examining the derivatives $dT/dt$ and $d^2T/dt^2$.

**b.** Suppose that $T = 4x^2 - 4xy + 4y^2$. Find the maximum and minimum values of $T$ on the circle.

**48. Temperature on an ellipse** Let $T = g(x, y)$ be the temperature at the point $(x, y)$ on the ellipse

$$x = 2\sqrt{2}\cos t, \qquad y = \sqrt{2}\sin t, \qquad 0 \le t \le 2\pi,$$

and suppose that

$$\frac{\partial T}{\partial x} = y, \qquad \frac{\partial T}{\partial y} = x.$$

**a.** Locate the maximum and minimum temperatures on the ellipse by examining $dT/dt$ and $d^2T/dt^2$.

**b.** Suppose that $T = xy - 2$. Find the maximum and minimum values of $T$ on the ellipse.

## Differentiating Integrals

Under mild continuity restrictions, it is true that if

$$F(x) = \int_a^b g(t, x)\,dt,$$

then $F'(x) = \displaystyle\int_a^b g_x(t, x)\,dt$. Using this fact and the Chain Rule, we can find the derivative of

$$F(x) = \int_a^{f(x)} g(t, x)\,dt$$

by letting

$$G(u, x) = \int_a^u g(t, x)\,dt,$$

where $u = f(x)$. Find the derivatives of the functions in Exercises 49 and 50.

**49.** $F(x) = \displaystyle\int_0^{x^2} \sqrt{t^4 + x^3}\,dt$

**50.** $F(x) = \displaystyle\int_{x^2}^1 \sqrt{t^3 + x^2}\,dt$

# 14.5 Directional Derivatives and Gradient Vectors

If you look at the map (Figure 14.23) showing contours on the West Point Area along the Hudson River in New York, you will notice that the tributary streams flow perpendicular to the contours. The streams are following paths of steepest descent so the waters reach the Hudson as quickly as possible. Therefore, the instantaneous rate of change in a stream's

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

altitude above sea level has a particular direction. In this section, you see why this direction, called the "downhill" direction, is perpendicular to the contours.

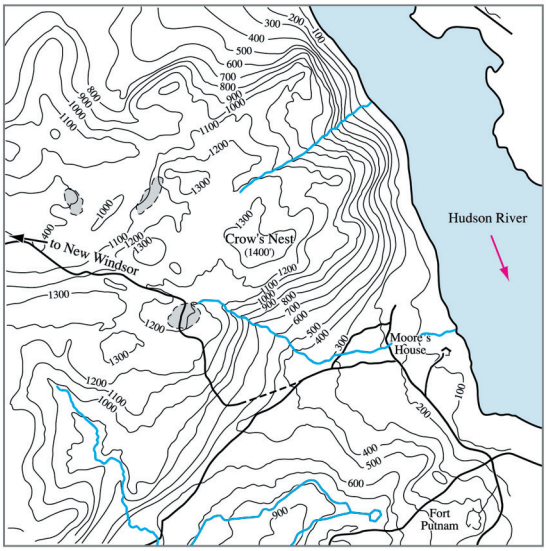

**FIGURE 14.23** Contours of the West Point Area in New York show streams, which follow paths of steepest descent, running perpendicular to the contours.

## Directional Derivatives in the Plane

We know from Section 14.4 that if $f(x, y)$ is differentiable, then the rate at which $f$ changes with respect to $t$ along a differentiable curve $x = g(t), y = h(t)$ is

$$\frac{df}{dt} = \frac{\partial f}{\partial x}\frac{dx}{dt} + \frac{\partial f}{\partial y}\frac{dy}{dt}.$$

At any point $P_0(x_0, y_0) = P_0(g(t_0), h(t_0))$, this equation gives the rate of change of $f$ with respect to increasing $t$ and therefore depends, among other things, on the direction of motion along the curve. If the curve is a straight line and $t$ is the arc length parameter along the line measured from $P_0$ in the direction of a given unit vector $\mathbf{u}$, then $df/dt$ is the rate of change of $f$ with respect to distance in its domain in the direction of $\mathbf{u}$. By varying $\mathbf{u}$, we find the rates at which $f$ changes with respect to distance as we move through $P_0$ in different directions. We now define this idea more precisely.

Suppose that the function $f(x, y)$ is defined throughout a region $R$ in the $xy$-plane, that $P_0(x_0, y_0)$ is a point in $R$, and that $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j}$ is a unit vector. Then the equations

$$x = x_0 + su_1, \qquad y = y_0 + su_2$$

parametrize the line through $P_0$ parallel to $\mathbf{u}$. If the parameter $s$ measures arc length from $P_0$ in the direction of $\mathbf{u}$, we find the rate of change of $f$ at $P_0$ in the direction of $\mathbf{u}$ by calculating $df/ds$ at $P_0$ (Figure 14.24).

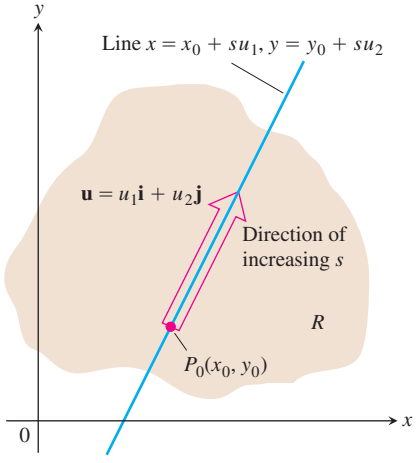

**FIGURE 14.24** The rate of change of $f$ in the direction of $\mathbf{u}$ at a point $P_0$ is the rate at which $f$ changes along this line at $P_0$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**DEFINITION Directional Derivative**

The **derivative of $f$ at $P_0(x_0, y_0)$ in the direction of the unit vector $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j}$** is the number

$$\left(\frac{df}{ds}\right)_{\mathbf{u},P_0} = \lim_{s\to 0} \frac{f(x_0 + su_1, y_0 + su_2) - f(x_0, y_0)}{s}, \tag{1}$$

provided the limit exists.

The directional derivative is also denoted by

$$(D_{\mathbf{u}} f)_{P_0}. \qquad \text{"The derivative of } f \text{ at } P_0 \text{ in the direction of } \mathbf{u}\text{"}$$

**EXAMPLE 1** Finding a Directional Derivative Using the Definition

Find the derivative of

$$f(x, y) = x^2 + xy$$

at $P_0(1, 2)$ in the direction of the unit vector $\mathbf{u} = \left(1/\sqrt{2}\right)\mathbf{i} + \left(1/\sqrt{2}\right)\mathbf{j}$.

**Solution**

$$\left(\frac{df}{ds}\right)_{\mathbf{u},P_0} = \lim_{s\to 0} \frac{f(x_0 + su_1, y_0 + su_2) - f(x_0, y_0)}{s} \qquad \text{Equation (1)}$$

$$= \lim_{s\to 0} \frac{f\left(1 + s\cdot\frac{1}{\sqrt{2}}, 2 + s\cdot\frac{1}{\sqrt{2}}\right) - f(1, 2)}{s}$$

$$= \lim_{s\to 0} \frac{\left(1 + \frac{s}{\sqrt{2}}\right)^2 + \left(1 + \frac{s}{\sqrt{2}}\right)\left(2 + \frac{s}{\sqrt{2}}\right) - (1^2 + 1\cdot 2)}{s}$$

$$= \lim_{s\to 0} \frac{\left(1 + \frac{2s}{\sqrt{2}} + \frac{s^2}{2}\right) + \left(2 + \frac{3s}{\sqrt{2}} + \frac{s^2}{2}\right) - 3}{s}$$

$$= \lim_{s\to 0} \frac{\frac{5s}{\sqrt{2}} + s^2}{s} = \lim_{s\to 0}\left(\frac{5}{\sqrt{2}} + s\right) = \left(\frac{5}{\sqrt{2}} + 0\right) = \frac{5}{\sqrt{2}}.$$

The rate of change of $f(x, y) = x^2 + xy$ at $P_0(1, 2)$ in the direction $\mathbf{u} = \left(1/\sqrt{2}\right)\mathbf{i} + \left(1/\sqrt{2}\right)\mathbf{j}$ is $5/\sqrt{2}$. ■

## Interpretation of the Directional Derivative

The equation $z = f(x, y)$ represents a surface $S$ in space. If $z_0 = f(x_0, y_0)$, then the point $P(x_0, y_0, z_0)$ lies on $S$. The vertical plane that passes through $P$ and $P_0(x_0, y_0)$ parallel to $\mathbf{u}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

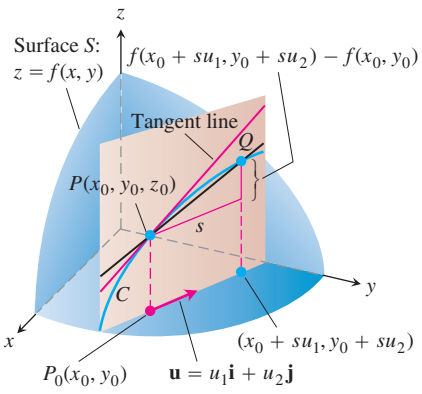

**FIGURE 14.25** The slope of curve $C$ at $P_0$ is $\lim_{Q \to P}$ slope $(PQ)$; this is the directional derivative

$$\left(\frac{df}{ds}\right)_{\mathbf{u},P_0} = (D_{\mathbf{u}}f)_{P_0}.$$

intersects $S$ in a curve $C$ (Figure 14.25). The rate of change of $f$ in the direction of $\mathbf{u}$ is the slope of the tangent to $C$ at $P$.

When $\mathbf{u} = \mathbf{i}$, the directional derivative at $P_0$ is $\partial f/\partial x$ evaluated at $(x_0, y_0)$. When $\mathbf{u} = \mathbf{j}$, the directional derivative at $P_0$ is $\partial f/\partial y$ evaluated at $(x_0, y_0)$. The directional derivative generalizes the two partial derivatives. We can now ask for the rate of change of $f$ in any direction $\mathbf{u}$, not just the directions $\mathbf{i}$ and $\mathbf{j}$.

Here's a physical interpretation of the directional derivative. Suppose that $T = f(x, y)$ is the temperature at each point $(x, y)$ over a region in the plane. Then $f(x_0, y_0)$ is the temperature at the point $P_0(x_0, y_0)$ and $(D_{\mathbf{u}}f)_{P_0}$ is the instantaneous rate of change of the temperature at $P_0$ stepping off in the direction $\mathbf{u}$.

## Calculation and Gradients

We now develop an efficient formula to calculate the directional derivative for a differentiable function $f$. We begin with the line

$$x = x_0 + su_1, \qquad y = y_0 + su_2, \tag{2}$$

through $P_0(x_0, y_0)$, parametrized with the arc length parameter $s$ increasing in the direction of the unit vector $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j}$. Then

$$\left(\frac{df}{ds}\right)_{\mathbf{u},P_0} = \left(\frac{\partial f}{\partial x}\right)_{P_0}\frac{dx}{ds} + \left(\frac{\partial f}{\partial y}\right)_{P_0}\frac{dy}{ds} \qquad \text{Chain Rule for differentiable } f$$

$$= \left(\frac{\partial f}{\partial x}\right)_{P_0} \cdot u_1 + \left(\frac{\partial f}{\partial y}\right)_{P_0} \cdot u_2 \qquad \text{From Equations (2), } dx/ds = u_1 \text{ and } dy/ds = u_2$$

$$= \underbrace{\left[\left(\frac{\partial f}{\partial x}\right)_{P_0}\mathbf{i} + \left(\frac{\partial f}{\partial y}\right)_{P_0}\mathbf{j}\right]}_{\text{Gradient of } f \text{ at } P_0} \cdot \underbrace{\left[u_1\mathbf{i} + u_2\mathbf{j}\right]}_{\text{Direction } \mathbf{u}}. \tag{3}$$

**DEFINITION Gradient Vector**

The **gradient vector (gradient)** of $f(x, y)$ at a point $P_0(x_0, y_0)$ is the vector

$$\nabla f = \frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j}$$

obtained by evaluating the partial derivatives of $f$ at $P_0$.

The notation $\nabla f$ is read "grad $f$" as well as "gradient of $f$" and "del $f$." The symbol $\nabla$ by itself is read "del." Another notation for the gradient is grad $f$, read the way it is written.

Equation (3) says that the derivative of a differentiable function $f$ in the direction of $\mathbf{u}$ at $P_0$ is the dot product of $\mathbf{u}$ with the gradient of $f$ at $P_0$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**THEOREM 9 The Directional Derivative Is a Dot Product**

If $f(x, y)$ is differentiable in an open region containing $P_0(x_0, y_0)$, then

$$\left(\frac{df}{ds}\right)_{\mathbf{u},P_0} = (\nabla f)_{P_0} \cdot \mathbf{u}, \tag{4}$$

the dot product of the gradient $f$ at $P_0$ and $\mathbf{u}$.

**EXAMPLE 2** Finding the Directional Derivative Using the Gradient

Find the derivative of $f(x, y) = xe^y + \cos(xy)$ at the point $(2, 0)$ in the direction of $\mathbf{v} = 3\mathbf{i} - 4\mathbf{j}$.

**Solution** The direction of $\mathbf{v}$ is the unit vector obtained by dividing $\mathbf{v}$ by its length:

$$\mathbf{u} = \frac{\mathbf{v}}{|\mathbf{v}|} = \frac{\mathbf{v}}{5} = \frac{3}{5}\mathbf{i} - \frac{4}{5}\mathbf{j}.$$

The partial derivatives of $f$ are everywhere continuous and at $(2, 0)$ are given by

$$f_x(2, 0) = (e^y - y\sin(xy))_{(2,0)} = e^0 - 0 = 1$$
$$f_y(2, 0) = (xe^y - x\sin(xy))_{(2,0)} = 2e^0 - 2 \cdot 0 = 2.$$

The gradient of $f$ at $(2, 0)$ is

$$\nabla f|_{(2,0)} = f_x(2, 0)\mathbf{i} + f_y(2, 0)\mathbf{j} = \mathbf{i} + 2\mathbf{j}$$

(Figure 14.26). The derivative of $f$ at $(2, 0)$ in the direction of $\mathbf{v}$ is therefore

$$(D_{\mathbf{u}}f)|_{(2,0)} = \nabla f|_{(2,0)} \cdot \mathbf{u} \quad \text{Equation (4)}$$
$$= (\mathbf{i} + 2\mathbf{j}) \cdot \left(\frac{3}{5}\mathbf{i} - \frac{4}{5}\mathbf{j}\right) = \frac{3}{5} - \frac{8}{5} = -1.$$

Evaluating the dot product in the formula

$$D_{\mathbf{u}}f = \nabla f \cdot \mathbf{u} = |\nabla f||\mathbf{u}|\cos\theta = |\nabla f|\cos\theta,$$

where $\theta$ is the angle between the vectors $\mathbf{u}$ and $\nabla f$, reveals the following properties.

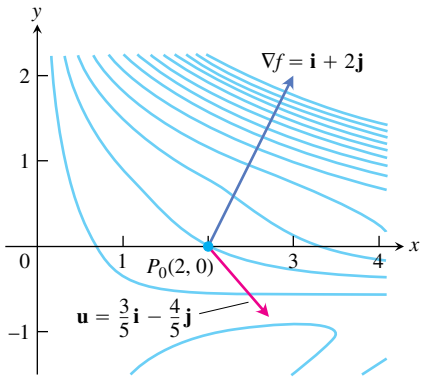

**FIGURE 14.26** Picture $\nabla f$ as a vector in the domain of $f$. In the case of $f(x, y) = xe^y + \cos(xy)$, the domain is the entire plane. The rate at which $f$ changes at $(2, 0)$ in the direction $\mathbf{u} = (3/5)\mathbf{i} - (4/5)\mathbf{j}$ is $\nabla f \cdot \mathbf{u} = -1$ (Example 2).

**Properties of the Directional Derivative $D_{\mathbf{u}}f = \nabla f \cdot \mathbf{u} = |\nabla f|\cos\theta$**

1. The function $f$ increases most rapidly when $\cos\theta = 1$ or when $\mathbf{u}$ is the direction of $\nabla f$. That is, at each point $P$ in its domain, $f$ increases most rapidly in the direction of the gradient vector $\nabla f$ at $P$. The derivative in this direction is
$$D_{\mathbf{u}}f = |\nabla f|\cos(0) = |\nabla f|.$$
2. Similarly, $f$ decreases most rapidly in the direction of $-\nabla f$. The derivative in this direction is $D_{\mathbf{u}}f = |\nabla f|\cos(\pi) = -|\nabla f|$.
3. Any direction $\mathbf{u}$ orthogonal to a gradient $\nabla f \neq 0$ is a direction of zero change in $f$ because $\theta$ then equals $\pi/2$ and
$$D_{\mathbf{u}}f = |\nabla f|\cos(\pi/2) = |\nabla f| \cdot 0 = 0.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

As we discuss later, these properties hold in three dimensions as well as two.

### EXAMPLE 3 Finding Directions of Maximal, Minimal, and Zero Change

Find the directions in which $f(x, y) = (x^2/2) + (y^2/2)$

**(a)** Increases most rapidly at the point (1, 1)

**(b)** Decreases most rapidly at (1, 1).

**(c)** What are the directions of zero change in $f$ at (1, 1)?

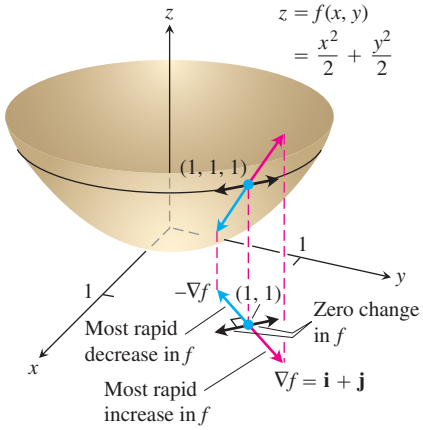

**FIGURE 14.27** The direction in which $f(x, y) = (x^2/2) + (y^2/2)$ increases most rapidly at (1, 1) is the direction of $\nabla f|_{(1,1)} = \mathbf{i} + \mathbf{j}$. It corresponds to the direction of steepest ascent on the surface at (1, 1, 1) (Example 3).

**Solution**

**(a)** The function increases most rapidly in the direction of $\nabla f$ at (1, 1). The gradient there is

$$(\nabla f)_{(1,1)} = (x\mathbf{i} + y\mathbf{j})_{(1,1)} = \mathbf{i} + \mathbf{j}\,.$$

Its direction is

$$\mathbf{u} = \frac{\mathbf{i} + \mathbf{j}}{|\mathbf{i} + \mathbf{j}|} = \frac{\mathbf{i} + \mathbf{j}}{\sqrt{(1)^2 + (1)^2}} = \frac{1}{\sqrt{2}}\mathbf{i} + \frac{1}{\sqrt{2}}\mathbf{j}.$$

**(b)** The function decreases most rapidly in the direction of $-\nabla f$ at (1, 1), which is

$$-\mathbf{u} = -\frac{1}{\sqrt{2}}\mathbf{i} - \frac{1}{\sqrt{2}}\mathbf{j}.$$

**(c)** The directions of zero change at (1, 1) are the directions orthogonal to $\nabla f$:

$$\mathbf{n} = -\frac{1}{\sqrt{2}}\mathbf{i} + \frac{1}{\sqrt{2}}\mathbf{j} \qquad \text{and} \qquad -\mathbf{n} = \frac{1}{\sqrt{2}}\mathbf{i} - \frac{1}{\sqrt{2}}\mathbf{j}.$$

See Figure 14.27. ■

## Gradients and Tangents to Level Curves

If a differentiable function $f(x, y)$ has a constant value $c$ along a smooth curve $\mathbf{r} = g(t)\mathbf{i} + h(t)\mathbf{j}$ (making the curve a level curve of $f$), then $f(g(t), h(t)) = c$. Differentiating both sides of this equation with respect to $t$ leads to the equations

$$\frac{d}{dt} f(g(t), h(t)) = \frac{d}{dt}(c)$$

$$\frac{\partial f}{\partial x}\frac{dg}{dt} + \frac{\partial f}{\partial y}\frac{dh}{dt} = 0 \qquad \text{Chain Rule}$$

$$\underbrace{\left(\frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j}\right)}_{\nabla f} \cdot \underbrace{\left(\frac{dg}{dt}\mathbf{i} + \frac{dh}{dt}\mathbf{j}\right)}_{\frac{d\mathbf{r}}{dt}} = 0. \tag{5}$$

Equation (5) says that $\nabla f$ is normal to the tangent vector $d\mathbf{r}/dt$, so it is normal to the curve.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

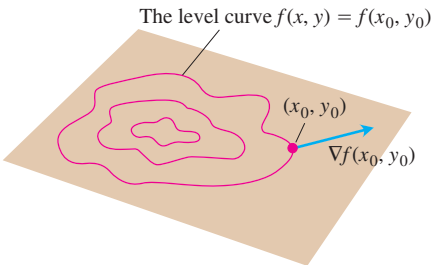

**FIGURE 14.28** The gradient of a differentiable function of two variables at a point is always normal to the function's level curve through that point.

At every point $(x_0, y_0)$ in the domain of a differentiable function $f(x, y)$, the gradient of $f$ is normal to the level curve through $(x_0, y_0)$ (Figure 14.28).

Equation (5) validates our observation that streams flow perpendicular to the contours in topographical maps (see Figure 14.23). Since the downflowing stream will reach its destination in the fastest way, it must flow in the direction of the negative gradient vectors from Property 2 for the directional derivative. Equation (5) tells us these directions are perpendicular to the level curves.

This observation also enables us to find equations for tangent lines to level curves. They are the lines normal to the gradients. The line through a point $P_0(x_0, y_0)$ normal to a vector $\mathbf{N} = A\mathbf{i} + B\mathbf{j}$ has the equation

$$A(x - x_0) + B(y - y_0) = 0$$

(Exercise 35). If $\mathbf{N}$ is the gradient $(\nabla f)_{(x_0, y_0)} = f_x(x_0, y_0)\mathbf{i} + f_y(x_0, y_0)\mathbf{j}$, the equation is the tangent line given by

$$f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0) = 0. \tag{6}$$

## EXAMPLE 4 Finding the Tangent Line to an Ellipse

Find an equation for the tangent to the ellipse

$$\frac{x^2}{4} + y^2 = 2$$

(Figure 14.29) at the point $(-2, 1)$.

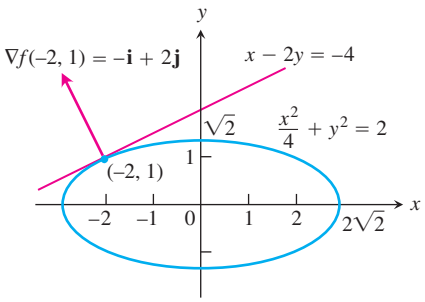

**FIGURE 14.29** We can find the tangent to the ellipse $(x^2/4) + y^2 = 2$ by treating the ellipse as a level curve of the function $f(x, y) = (x^2/4) + y^2$ (Example 4).

**Solution** The ellipse is a level curve of the function

$$f(x, y) = \frac{x^2}{4} + y^2.$$

The gradient of $f$ at $(-2, 1)$ is

$$\nabla f|_{(-2,1)} = \left(\frac{x}{2}\mathbf{i} + 2y\mathbf{j}\right)_{(-2,1)} = -\mathbf{i} + 2\mathbf{j}.$$

The tangent is the line

$$(-1)(x + 2) + (2)(y - 1) = 0 \qquad \text{Equation (6)}$$

$$x - 2y = -4.$$

■

If we know the gradients of two functions $f$ and $g$, we automatically know the gradients of their constant multiples, sum, difference, product, and quotient. You are asked to establish the following rules in Exercise 36. Notice that these rules have the same form as the corresponding rules for derivatives of single-variable functions.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Algebra Rules for Gradients**

1. *Constant Multiple Rule:* $\nabla(kf) = k\nabla f$ (any number $k$)
2. *Sum Rule:* $\nabla(f + g) = \nabla f + \nabla g$
3. *Difference Rule:* $\nabla(f - g) = \nabla f - \nabla g$
4. *Product Rule:* $\nabla(fg) = f\nabla g + g\nabla f$
5. *Quotient Rule:* $\nabla\left(\frac{f}{g}\right) = \frac{g\nabla f - f\nabla g}{g^2}$

**EXAMPLE 5** Illustrating the Gradient Rules

We illustrate the rules with

$$f(x, y) = x - y \qquad g(x, y) = 3y$$
$$\nabla f = \mathbf{i} - \mathbf{j} \qquad \nabla g = 3\mathbf{j}.$$

We have

1. $\nabla(2f) = \nabla(2x - 2y) = 2\mathbf{i} - 2\mathbf{j} = 2\nabla f$
2. $\nabla(f + g) = \nabla(x + 2y) = \mathbf{i} + 2\mathbf{j} = \nabla f + \nabla g$
3. $\nabla(f - g) = \nabla(x - 4y) = \mathbf{i} - 4\mathbf{j} = \nabla f - \nabla g$
4. $$\begin{aligned}\nabla(fg) &= \nabla(3xy - 3y^2) = 3y\mathbf{i} + (3x - 6y)\mathbf{j} \\ &= 3y(\mathbf{i} - \mathbf{j}) + 3y\mathbf{j} + (3x - 6y)\mathbf{j} \\ &= 3y(\mathbf{i} - \mathbf{j}) + (3x - 3y)\mathbf{j} \\ &= 3y(\mathbf{i} - \mathbf{j}) + (x - y)3\mathbf{j} = g\nabla f + f\nabla g\end{aligned}$$
5. $$\begin{aligned}\nabla\left(\frac{f}{g}\right) &= \nabla\left(\frac{x - y}{3y}\right) = \nabla\left(\frac{x}{3y} - \frac{1}{3}\right) \\ &= \frac{1}{3y}\mathbf{i} - \frac{x}{3y^2}\mathbf{j} \\ &= \frac{3y\mathbf{i} - 3x\mathbf{j}}{9y^2} = \frac{3y(\mathbf{i} - \mathbf{j}) - (3x - 3y)\mathbf{j}}{9y^2} \\ &= \frac{3y(\mathbf{i} - \mathbf{j}) - (x - y)3\mathbf{j}}{9y^2} = \frac{g\nabla f - f\nabla g}{g^2}.\end{aligned}$$

## Functions of Three Variables

For a differentiable function $f(x, y, z)$ and a unit vector $\mathbf{u} = u_1\mathbf{i} + u_2\mathbf{j} + u_3\mathbf{k}$ in space, we have

$$\nabla f = \frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j} + \frac{\partial f}{\partial z}\mathbf{k}$$

and

$$D_{\mathbf{u}}f = \nabla f \cdot \mathbf{u} = \frac{\partial f}{\partial x}u_1 + \frac{\partial f}{\partial y}u_2 + \frac{\partial f}{\partial z}u_3.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The directional derivative can once again be written in the form

$$D_{\mathbf{u}}f = \nabla f \cdot \mathbf{u} = |\nabla f||u| \cos\theta = |\nabla f| \cos\theta,$$

so the properties listed earlier for functions of two variables continue to hold. At any given point, $f$ increases most rapidly in the direction of $\nabla f$ and decreases most rapidly in the direction of $-\nabla f$. In any direction orthogonal to $\nabla f$, the derivative is zero.

**EXAMPLE 6** Finding Directions of Maximal, Minimal, and Zero Change

**(a)** Find the derivative of $f(x, y, z) = x^3 - xy^2 - z$ at $P_0(1, 1, 0)$ in the direction of $\mathbf{v} = 2\mathbf{i} - 3\mathbf{j} + 6\mathbf{k}$.

**(b)** In what directions does $f$ change most rapidly at $P_0$, and what are the rates of change in these directions?

**Solution**

**(a)** The direction of $\mathbf{v}$ is obtained by dividing $\mathbf{v}$ by its length:

$$|\mathbf{v}| = \sqrt{(2)^2 + (-3)^2 + (6)^2} = \sqrt{49} = 7$$

$$\mathbf{u} = \frac{\mathbf{v}}{|\mathbf{v}|} = \frac{2}{7}\mathbf{i} - \frac{3}{7}\mathbf{j} + \frac{6}{7}\mathbf{k}.$$

The partial derivatives of $f$ at $P_0$ are

$$f_x = (3x^2 - y^2)_{(1,1,0)} = 2, \qquad f_y = -2xy|_{(1,1,0)} = -2, \qquad f_z = -1|_{(1,1,0)} = -1.$$

The gradient of $f$ at $P_0$ is

$$\nabla f|_{(1,1,0)} = 2\mathbf{i} - 2\mathbf{j} - \mathbf{k}.$$

The derivative of $f$ at $P_0$ in the direction of $\mathbf{v}$ is therefore

$$(D_{\mathbf{u}}f)_{(1,1,0)} = \nabla f|_{(1,1,0)} \cdot \mathbf{u} = (2\mathbf{i} - 2\mathbf{j} - \mathbf{k}) \cdot \left(\frac{2}{7}\mathbf{i} - \frac{3}{7}\mathbf{j} + \frac{6}{7}\mathbf{k}\right)$$

$$= \frac{4}{7} + \frac{6}{7} - \frac{6}{7} = \frac{4}{7}.$$

**(b)** The function increases most rapidly in the direction of $\nabla f = 2\mathbf{i} - 2\mathbf{j} - \mathbf{k}$ and decreases most rapidly in the direction of $-\nabla f$. The rates of change in the directions are, respectively,

$$|\nabla f| = \sqrt{(2)^2 + (-2)^2 + (-1)^2} = \sqrt{9} = 3 \quad \text{and} \quad -|\nabla f| = -3. \qquad \blacksquare$$

# EXERCISES 14.5

## Calculating Gradients at Points

In Exercises 1–4, find the gradient of the function at the given point. Then sketch the gradient together with the level curve that passes through the point.

**1.** $f(x, y) = y - x, \quad (2, 1)$

**2.** $f(x, y) = \ln(x^2 + y^2), \quad (1, 1)$

**3.** $g(x, y) = y - x^2, \quad (-1, 0)$

**4.** $g(x, y) = \dfrac{x^2}{2} - \dfrac{y^2}{2}, \quad \left(\sqrt{2}, 1\right)$

In Exercises 5–8, find $\nabla f$ at the given point.

**5.** $f(x, y, z) = x^2 + y^2 - 2z^2 + z \ln x, \quad (1, 1, 1)$

**6.** $f(x, y, z) = 2z^3 - 3(x^2 + y^2)z + \tan^{-1} xz, \quad (1, 1, 1)$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

7. $f(x, y, z) = (x^2 + y^2 + z^2)^{-1/2} + \ln(xyz), \quad (-1, 2, -2)$
8. $f(x, y, z) = e^{x+y}\cos z + (y + 1)\sin^{-1} x, \quad (0, 0, \pi/6)$

## Finding Directional Derivatives

In Exercises 9–16, find the derivative of the function at $P_0$ in the direction of $\mathbf{A}$.

Exercises

9. $f(x, y) = 2xy - 3y^2, \quad P_0(5, 5), \quad \mathbf{A} = 4\mathbf{i} + 3\mathbf{j}$
10. $f(x, y) = 2x^2 + y^2, \quad P_0(-1, 1), \quad \mathbf{A} = 3\mathbf{i} - 4\mathbf{j}$
11. $g(x, y) = x - (y^2/x) + \sqrt{3}\sec^{-1}(2xy), \quad P_0(1, 1), \quad \mathbf{A} = 12\mathbf{i} + 5\mathbf{j}$
12. $h(x, y) = \tan^{-1}(y/x) + \sqrt{3}\sin^{-1}(xy/2), \quad P_0(1, 1), \quad \mathbf{A} = 3\mathbf{i} - 2\mathbf{j}$
13. $f(x, y, z) = xy + yz + zx, \quad P_0(1, -1, 2), \quad \mathbf{A} = 3\mathbf{i} + 6\mathbf{j} - 2\mathbf{k}$
14. $f(x, y, z) = x^2 + 2y^2 - 3z^2, \quad P_0(1, 1, 1), \quad \mathbf{A} = \mathbf{i} + \mathbf{j} + \mathbf{k}$
15. $g(x, y, z) = 3e^x \cos yz, \quad P_0(0, 0, 0), \quad \mathbf{A} = 2\mathbf{i} + \mathbf{j} - 2\mathbf{k}$
16. $h(x, y, z) = \cos xy + e^{yz} + \ln zx, \quad P_0(1, 0, 1/2), \quad \mathbf{A} = \mathbf{i} + 2\mathbf{j} + 2\mathbf{k}$

## Directions of Most Rapid Increase and Decrease

In Exercises 17–22, find the directions in which the functions increase and decrease most rapidly at $P_0$. Then find the derivatives of the functions in these directions.

Exercises

17. $f(x, y) = x^2 + xy + y^2, \quad P_0(-1, 1)$
18. $f(x, y) = x^2 y + e^{xy}\sin y, \quad P_0(1, 0)$
19. $f(x, y, z) = (x/y) - yz, \quad P_0(4, 1, 1)$
20. $g(x, y, z) = xe^y + z^2, \quad P_0(1, \ln 2, 1/2)$
21. $f(x, y, z) = \ln xy + \ln yz + \ln xz, \quad P_0(1, 1, 1)$
22. $h(x, y, z) = \ln(x^2 + y^2 - 1) + y + 6z, \quad P_0(1, 1, 0)$

## Tangent Lines to Curves

In Exercises 23–26, sketch the curve $f(x, y) = c$ together with $\nabla f$ and the tangent line at the given point. Then write an equation for the tangent line.

Exercises

23. $x^2 + y^2 = 4, \quad (\sqrt{2}, \sqrt{2})$
24. $x^2 - y = 1, \quad (\sqrt{2}, 1)$
25. $xy = -4, \quad (2, -2)$
26. $x^2 - xy + y^2 = 7, \quad (-1, 2)$

## Theory and Examples

27. **Zero directional derivative** In what direction is the derivative of $f(x, y) = xy + y^2$ at $P(3, 2)$ equal to zero?
28. **Zero directional derivative** In what directions is the derivative of $f(x, y) = (x^2 - y^2)/(x^2 + y^2)$ at $P(1, 1)$ equal to zero?
29. Is there a direction $\mathbf{u}$ in which the rate of change of $f(x, y) = x^2 - 3xy + 4y^2$ at $P(1, 2)$ equals 14? Give reasons for your answer.
30. **Changing temperature along a circle** Is there a direction $\mathbf{u}$ in which the rate of change of the temperature function $T(x, y, z) = 2xy - yz$ (temperature in degrees Celsius, distance in feet) at $P(1, -1, 1)$ is $-3°\text{C/ft}$? Give reasons for your answer.
31. The derivative of $f(x, y)$ at $P_0(1, 2)$ in the direction of $\mathbf{i} + \mathbf{j}$ is $2\sqrt{2}$ and in the direction of $-2\mathbf{j}$ is $-3$. What is the derivative of $f$ in the direction of $-\mathbf{i} - 2\mathbf{j}$? Give reasons for your answer.
32. The derivative of $f(x, y, z)$ at a point $P$ is greatest in the direction of $\mathbf{v} = \mathbf{i} + \mathbf{j} - \mathbf{k}$. In this direction, the value of the derivative is $2\sqrt{3}$.
    a. What is $\nabla f$ at $P$? Give reasons for your answer.
    b. What is the derivative of $f$ at $P$ in the direction of $\mathbf{i} + \mathbf{j}$?
33. **Directional derivatives and scalar components** How is the derivative of a differentiable function $f(x, y, z)$ at a point $P_0$ in the direction of a unit vector $\mathbf{u}$ related to the scalar component of $(\nabla f)_{P_0}$ in the direction of $\mathbf{u}$? Give reasons for your answer.
34. **Directional derivatives and partial derivatives** Assuming that the necessary derivatives of $f(x, y, z)$ are defined, how are $D_{\mathbf{i}} f$, $D_{\mathbf{j}} f$, and $D_{\mathbf{k}} f$ related to $f_x$, $f_y$, and $f_z$? Give reasons for your answer.
35. **Lines in the *xy*-plane** Show that $A(x - x_0) + B(y - y_0) = 0$ is an equation for the line in the $xy$-plane through the point $(x_0, y_0)$ normal to the vector $\mathbf{N} = A\mathbf{i} + B\mathbf{j}$.
36. **The algebra rules for gradients** Given a constant $k$ and the gradients

$$\nabla f = \frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j} + \frac{\partial f}{\partial z}\mathbf{k}$$

and

$$\nabla g = \frac{\partial g}{\partial x}\mathbf{i} + \frac{\partial g}{\partial y}\mathbf{j} + \frac{\partial g}{\partial z}\mathbf{k},$$

use the scalar equations

$$\frac{\partial}{\partial x}(kf) = k\frac{\partial f}{\partial x}, \qquad \frac{\partial}{\partial x}(f \pm g) = \frac{\partial f}{\partial x} \pm \frac{\partial g}{\partial x},$$

$$\frac{\partial}{\partial x}(fg) = f\frac{\partial g}{\partial x} + g\frac{\partial f}{\partial x}, \qquad \frac{\partial}{\partial x}\left(\frac{f}{g}\right) = \frac{g\dfrac{\partial f}{\partial x} - f\dfrac{\partial g}{\partial x}}{g^2},$$

and so on, to establish the following rules.

    a. $\nabla(kf) = k\nabla f$
    b. $\nabla(f + g) = \nabla f + \nabla g$
    c. $\nabla(f - g) = \nabla f - \nabla g$
    d. $\nabla(fg) = f\nabla g + g\nabla f$
    e. $\nabla\left(\dfrac{f}{g}\right) = \dfrac{g\nabla f - f\nabla g}{g^2}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# 14.6 Tangent Planes and Differentials

In this section we define the tangent plane at a point on a smooth surface in space. We calculate an equation of the tangent plane from the partial derivatives of the function defining the surface. This idea is similar to the definition of the tangent line at a point on a curve in the coordinate plane for single-variable functions (Section 2.7). We then study the total differential and linearization of functions of several variables.

## Tangent Planes and Normal Lines

If $\mathbf{r} = g(t)\mathbf{i} + h(t)\mathbf{j} + k(t)\mathbf{k}$ is a smooth curve on the level surface $f(x, y, z) = c$ of a differentiable function $f$, then $f(g(t), h(t), k(t)) = c$. Differentiating both sides of this equation with respect to $t$ leads to

$$\frac{d}{dt} f(g(t), h(t), k(t)) = \frac{d}{dt}(c)$$

$$\frac{\partial f}{\partial x}\frac{dg}{dt} + \frac{\partial f}{\partial y}\frac{dh}{dt} + \frac{\partial f}{\partial z}\frac{dk}{dt} = 0 \qquad \text{Chain Rule}$$

$$\underbrace{\left(\frac{\partial f}{\partial x}\mathbf{i} + \frac{\partial f}{\partial y}\mathbf{j} + \frac{\partial f}{\partial z}\mathbf{k}\right)}_{\nabla f} \cdot \underbrace{\left(\frac{dg}{dt}\mathbf{i} + \frac{dh}{dt}\mathbf{j} + \frac{dk}{dt}\mathbf{k}\right)}_{d\mathbf{r}/dt} = 0. \tag{1}$$

At every point along the curve, $\nabla f$ is orthogonal to the curve's velocity vector.

Now let us restrict our attention to the curves that pass through $P_0$ (Figure 14.30). All the velocity vectors at $P_0$ are orthogonal to $\nabla f$ at $P_0$, so the curves' tangent lines all lie in the plane through $P_0$ normal to $\nabla f$. We call this plane the tangent plane of the surface at $P_0$. The line through $P_0$ perpendicular to the plane is the surface's normal line at $P_0$.

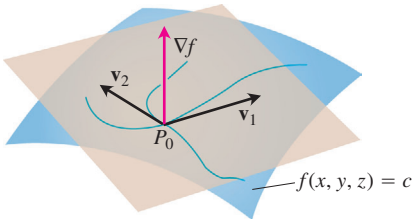

**FIGURE 14.30** The gradient $\nabla f$ is orthogonal to the velocity vector of every smooth curve in the surface through $P_0$. The velocity vectors at $P_0$ therefore lie in a common plane, which we call the tangent plane at $P_0$.

**DEFINITIONS Tangent Plane, Normal Line**

The **tangent plane** at the point $P_0(x_0, y_0, z_0)$ on the level surface $f(x, y, z) = c$ of a differentiable function $f$ is the plane through $P_0$ normal to $\nabla f|_{P_0}$.

The **normal line** of the surface at $P_0$ is the line through $P_0$ parallel to $\nabla f|_{P_0}$.

Thus, from Section 12.5, the tangent plane and normal line have the following equations:

**Tangent Plane to $f(x, y, z) = c$ at $P_0(x_0, y_0, z_0)$**

$$f_x(P_0)(x - x_0) + f_y(P_0)(y - y_0) + f_z(P_0)(z - z_0) = 0 \tag{2}$$

**Normal Line to $f(x, y, z) = c$ at $P_0(x_0, y_0, z_0)$**

$$x = x_0 + f_x(P_0)t, \qquad y = y_0 + f_y(P_0)t, \qquad z = z_0 + f_z(P_0)t \tag{3}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

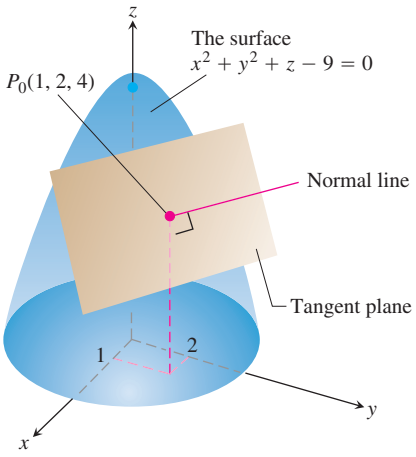

**FIGURE 14.31** The tangent plane and normal line to the surface $x^2 + y^2 + z - 9 = 0$ at $P_0(1, 2, 4)$ (Example 1).

## EXAMPLE 1 Finding the Tangent Plane and Normal Line

Find the tangent plane and normal line of the surface

$$f(x, y, z) = x^2 + y^2 + z - 9 = 0 \qquad \text{A circular paraboloid}$$

at the point $P_0(1, 2, 4)$.

**Solution** The surface is shown in Figure 14.31.

The tangent plane is the plane through $P_0$ perpendicular to the gradient of $f$ at $P_0$. The gradient is

$$\nabla f|_{P_0} = (2x\mathbf{i} + 2y\mathbf{j} + \mathbf{k})_{(1,2,4)} = 2\mathbf{i} + 4\mathbf{j} + \mathbf{k}.$$

The tangent plane is therefore the plane

$$2(x - 1) + 4(y - 2) + (z - 4) = 0, \qquad \text{or} \qquad 2x + 4y + z = 14.$$

The line normal to the surface at $P_0$ is

$$x = 1 + 2t, \qquad y = 2 + 4t, \qquad z = 4 + t. \qquad \blacksquare$$

To find an equation for the plane tangent to a smooth surface $z = f(x, y)$ at a point $P_0(x_0, y_0, z_0)$ where $z_0 = f(x_0, y_0)$, we first observe that the equation $z = f(x, y)$ is equivalent to $f(x, y) - z = 0$. The surface $z = f(x, y)$ is therefore the zero level surface of the function $F(x, y, z) = f(x, y) - z$. The partial derivatives of $F$ are

$$F_x = \frac{\partial}{\partial x}(f(x, y) - z) = f_x - 0 = f_x$$

$$F_y = \frac{\partial}{\partial y}(f(x, y) - z) = f_y - 0 = f_y$$

$$F_z = \frac{\partial}{\partial z}(f(x, y) - z) = 0 - 1 = -1.$$

The formula

$$F_x(P_0)(x - x_0) + F_y(P_0)(y - y_0) + F_z(P_0)(z - z_0) = 0$$

for the plane tangent to the level surface at $P_0$ therefore reduces to

$$f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0) - (z - z_0) = 0.$$

**Plane Tangent to a Surface $z = f(x, y)$ at $(x_0, y_0, f(x_0, y_0))$**

The plane tangent to the surface $z = f(x, y)$ of a differentiable function $f$ at the point $P_0(x_0, y_0, z_0) = (x_0, y_0, f(x_0, y_0))$ is

$$f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0) - (z - z_0) = 0. \qquad (4)$$

## EXAMPLE 2 Finding a Plane Tangent to a Surface $z = f(x, y)$

Find the plane tangent to the surface $z = x \cos y - ye^x$ at (0, 0, 0).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** We calculate the partial derivatives of $f(x, y) = x\cos y - ye^x$ and use Equation (4):

$$f_x(0, 0) = (\cos y - ye^x)_{(0,0)} = 1 - 0 \cdot 1 = 1$$

$$f_y(0, 0) = (-x \sin y - e^x)_{(0,0)} = 0 - 1 = -1.$$

The tangent plane is therefore

$$1 \cdot (x - 0) - 1 \cdot (y - 0) - (z - 0) = 0, \qquad \text{Equation (4)}$$

or

$$x - y - z = 0.$$ ■

**EXAMPLE 3** Tangent Line to the Curve of Intersection of Two Surfaces

The surfaces

$$f(x, y, z) = x^2 + y^2 - 2 = 0 \qquad \text{A cylinder}$$

and

$$g(x, y, z) = x + z - 4 = 0 \qquad \text{A plane}$$

meet in an ellipse $E$ (Figure 14.32). Find parametric equations for the line tangent to $E$ at the point $P_0(1, 1, 3)$.

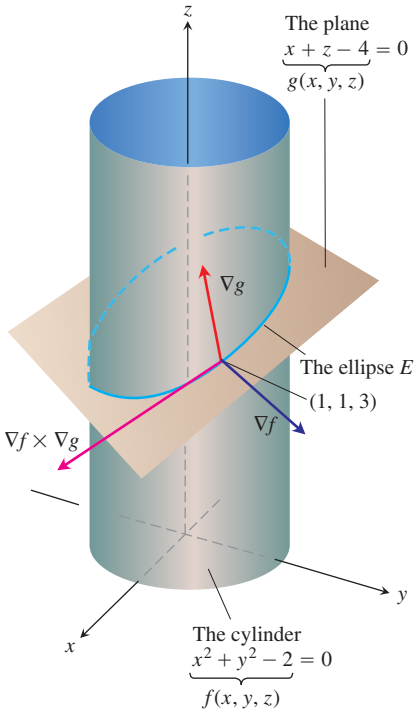

**FIGURE 14.32** The cylinder $f(x, y, z) = x^2 + y^2 - 2 = 0$ and the plane $g(x, y, z) = x + z - 4 = 0$ intersect in an ellipse $E$ (Example 3).

**Solution** The tangent line is orthogonal to both $\nabla f$ and $\nabla g$ at $P_0$, and therefore parallel to $\mathbf{v} = \nabla f \times \nabla g$. The components of $\mathbf{v}$ and the coordinates of $P_0$ give us equations for the line. We have

$$\nabla f|_{(1,1,3)} = (2x\mathbf{i} + 2y\mathbf{j})_{(1,1,3)} = 2\mathbf{i} + 2\mathbf{j}$$

$$\nabla g|_{(1,1,3)} = (\mathbf{i} + \mathbf{k})_{(1,1,3)} = \mathbf{i} + \mathbf{k}$$

$$\mathbf{v} = (2\mathbf{i} + 2\mathbf{j}) \times (\mathbf{i} + \mathbf{k}) = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ 2 & 2 & 0 \\ 1 & 0 & 1 \end{vmatrix} = 2\mathbf{i} - 2\mathbf{j} - 2\mathbf{k}.$$

The tangent line is

$$x = 1 + 2t, \qquad y = 1 - 2t, \qquad z = 3 - 2t.$$ ■

## Estimating Change in a Specific Direction

The directional derivative plays the role of an ordinary derivative when we want to estimate how much the value of a function $f$ changes if we move a small distance $ds$ from a point $P_0$ to another point nearby. If $f$ were a function of a single variable, we would have

$$df = f'(P_0)\, ds. \qquad \text{Ordinary derivative} \times \text{increment}$$

For a function of two or more variables, we use the formula

$$df = (\nabla f|_{P_0} \cdot \mathbf{u})\, ds, \qquad \text{Directional derivative} \times \text{increment}$$

where $\mathbf{u}$ is the direction of the motion away from $P_0$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Estimating the Change in $f$ in a Direction $\mathbf{u}$**

To estimate the change in the value of a differentiable function $f$ when we move a small distance $ds$ from a point $P_0$ in a particular direction $\mathbf{u}$, use the formula

$$df = \underbrace{(\nabla f|_{P_0} \cdot \mathbf{u})}_{\substack{\text{Directional} \\ \text{derivative}}} \cdot \underbrace{ds}_{\substack{\text{Distance} \\ \text{increment}}}$$

**EXAMPLE 4** Estimating Change in the Value of $f(x, y, z)$

Estimate how much the value of

$$f(x, y, z) = y \sin x + 2yz$$

will change if the point $P(x, y, z)$ moves 0.1 unit from $P_0(0, 1, 0)$ straight toward $P_1(2, 2, -2)$.

**Solution** We first find the derivative of $f$ at $P_0$ in the direction of the vector $\overrightarrow{P_0P_1} = 2\mathbf{i} + \mathbf{j} - 2\mathbf{k}$. The direction of this vector is

$$\mathbf{u} = \frac{\overrightarrow{P_0P_1}}{|\overrightarrow{P_0P_1}|} = \frac{\overrightarrow{P_0P_1}}{3} = \frac{2}{3}\mathbf{i} + \frac{1}{3}\mathbf{j} - \frac{2}{3}\mathbf{k}.$$

The gradient of $f$ at $P_0$ is

$$\nabla f|_{(0,1,0)} = ((y \cos x)\mathbf{i} + (\sin x + 2z)\mathbf{j} + 2y\mathbf{k}))_{(0,1,0)} = \mathbf{i} + 2\mathbf{k}.$$

Therefore,

$$\nabla f|_{P_0} \cdot \mathbf{u} = (\mathbf{i} + 2\mathbf{k}) \cdot \left(\frac{2}{3}\mathbf{i} + \frac{1}{3}\mathbf{j} - \frac{2}{3}\mathbf{k}\right) = \frac{2}{3} - \frac{4}{3} = -\frac{2}{3}.$$

The change $df$ in $f$ that results from moving $ds = 0.1$ unit away from $P_0$ in the direction of $\mathbf{u}$ is approximately

$$df = (\nabla f|_{P_0} \cdot \mathbf{u})(ds) = \left(-\frac{2}{3}\right)(0.1) \approx -0.067 \text{ unit.}$$

■

## How to Linearize a Function of Two Variables

Functions of two variables can be complicated, and we sometimes need to replace them with simpler ones that give the accuracy required for specific applications without being so difficult to work with. We do this in a way that is similar to the way we find linear replacements for functions of a single variable (Section 3.8).

Suppose the function we wish to replace is $z = f(x, y)$ and that we want the replacement to be effective near a point $(x_0, y_0)$ at which we know the values of $f$, $f_x$, and $f_y$ and at which $f$ is differentiable. If we move from $(x_0, y_0)$ to any point $(x, y)$ by increments $\Delta x = x - x_0$ and $\Delta y = y - y_0$, then the definition of differentiability from Section 14.3 gives the change

$$f(x, y) - f(x_0, y_0) = f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y + \epsilon_1\Delta x + \epsilon_2\Delta y,$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

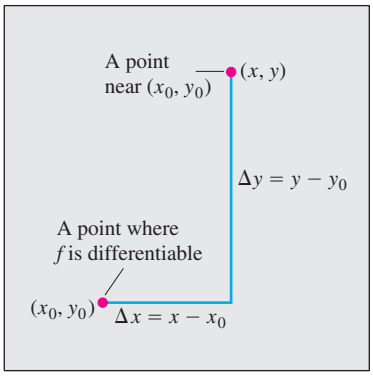

**FIGURE 14.33** If $f$ is differentiable at $(x_0, y_0)$, then the value of $f$ at any point $(x, y)$ nearby is approximately $f(x_0, y_0) + f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y$.

where $\epsilon_1, \epsilon_2 \to 0$ as $\Delta x, \Delta y \to 0$. If the increments $\Delta x$ and $\Delta y$ are small, the products $\epsilon_1 \Delta x$ and $\epsilon_2 \Delta y$ will eventually be smaller still and we will have

$$f(x, y) \approx \underbrace{f(x_0, y_0) + f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0)}_{L(x, y)}.$$

In other words, as long as $\Delta x$ and $\Delta y$ are small, $f$ will have approximately the same value as the linear function $L$. If $f$ is hard to use, and our work can tolerate the error involved, we may approximate $f$ by $L$ (Figure 14.33).

**DEFINITIONS Linearization, Standard Linear Approximation**

The **linearization** of a function $f(x, y)$ at a point $(x_0, y_0)$ where $f$ is differentiable is the function

$$L(x, y) = f(x_0, y_0) + f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0). \quad (5)$$

The approximation

$$f(x, y) \approx L(x, y)$$

is the **standard linear approximation** of $f$ at $(x_0, y_0)$.

From Equation (4), we see that the plane $z = L(x, y)$ is tangent to the surface $z = f(x, y)$ at the point $(x_0, y_0)$. Thus, the linearization of a function of two variables is a tangent-*plane* approximation in the same way that the linearization of a function of a single variable is a tangent-*line* approximation.

**EXAMPLE 5** Finding a Linearization

Find the linearization of

$$f(x, y) = x^2 - xy + \frac{1}{2}y^2 + 3$$

at the point (3, 2).

**Solution** We first evaluate $f$, $f_x$, and $f_y$ at the point $(x_0, y_0) = (3, 2)$:

$$f(3, 2) = \left(x^2 - xy + \frac{1}{2}y^2 + 3\right)_{(3,2)} = 8$$

$$f_x(3, 2) = \frac{\partial}{\partial x}\left(x^2 - xy + \frac{1}{2}y^2 + 3\right)_{(3,2)} = (2x - y)_{(3,2)} = 4$$

$$f_y(3, 2) = \frac{\partial}{\partial y}\left(x^2 - xy + \frac{1}{2}y^2 + 3\right)_{(3,2)} = (-x + y)_{(3,2)} = -1,$$

giving

$$L(x, y) = f(x_0, y_0) + f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0)$$
$$= 8 + (4)(x - 3) + (-1)(y - 2) = 4x - y - 2.$$

The linearization of $f$ at (3, 2) is $L(x, y) = 4x - y - 2$. ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

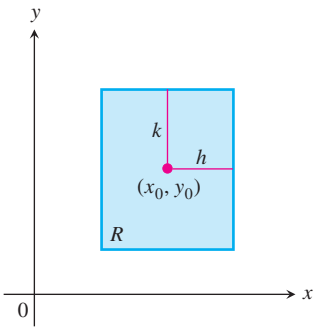

**FIGURE 14.34** The rectangular region $R$: $|x - x_0| \le h, |y - y_0| \le k$ in the $xy$-plane.

When approximating a differentiable function $f(x, y)$ by its linearization $L(x, y)$ at $(x_0, y_0)$, an important question is how accurate the approximation might be.

If we can find a common upper bound $M$ for $|f_{xx}|, |f_{yy}|$, and $|f_{xy}|$ on a rectangle $R$ centered at $(x_0, y_0)$ (Figure 14.34), then we can bound the error $E$ throughout $R$ by using a simple formula (derived in Section 14.10). The **error** is defined by $E(x, y) = f(x, y) - L(x, y)$.

**The Error in the Standard Linear Approximation**

If $f$ has continuous first and second partial derivatives throughout an open set containing a rectangle $R$ centered at $(x_0, y_0)$ and if $M$ is any upper bound for the values of $|f_{xx}|, |f_{yy}|$, and $|f_{xy}|$ on $R$, then the error $E(x, y)$ incurred in replacing $f(x, y)$ on $R$ by its linearization

$$L(x, y) = f(x_0, y_0) + f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0)$$

satisfies the inequality

$$|E(x, y)| \le \frac{1}{2} M(|x - x_0| + |y - y_0|)^2.$$

To make $|E(x, y)|$ small for a given $M$, we just make $|x - x_0|$ and $|y - y_0|$ small.

**EXAMPLE 6** Bounding the Error in Example 5

Find an upper bound for the error in the approximation $f(x, y) \approx L(x, y)$ in Example 5 over the rectangle

$$R: \quad |x - 3| \le 0.1, \qquad |y - 2| \le 0.1\,.$$

Express the upper bound as a percentage of $f(3, 2)$, the value of $f$ at the center of the rectangle.

**Solution** We use the inequality

$$|E(x, y)| \le \frac{1}{2} M(|x - x_0| + |y - y_0|)^2\,.$$

To find a suitable value for $M$, we calculate $f_{xx}, f_{xy}$, and $f_{yy}$, finding, after a routine differentiation, that all three derivatives are constant, with values

$$|f_{xx}| = |2| = 2, \qquad |f_{xy}| = |-1| = 1, \qquad |f_{yy}| = |1| = 1.$$

The largest of these is 2, so we may safely take $M$ to be 2. With $(x_0, y_0) = (3, 2)$, we then know that, throughout $R$,

$$|E(x, y)| \le \frac{1}{2}(2)(|x - 3| + |y - 2|)^2 = (|x - 3| + |y - 2|)^2.$$

Finally, since $|x - 3| \le 0.1$ and $|y - 2| \le 0.1$ on $R$, we have

$$|E(x, y)| \le (0.1 + 0.1)^2 = 0.04.$$

As a percentage of $f(3, 2) = 8$, the error is no greater than

$$\frac{0.04}{8} \times 100 = 0.5\%\,.$$

■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Differentials

Recall from Section 3.8 that for a function of a single variable, $y = f(x)$, we defined the change in $f$ as $x$ changes from $a$ to $a + \Delta x$ by

$$\Delta f = f(a + \Delta x) - f(a)$$

and the differential of $f$ as

$$df = f'(a)\Delta x.$$

We now consider a function of two variables.

Suppose a differentiable function $f(x, y)$ and its partial derivatives exist at a point $(x_0, y_0)$. If we move to a nearby point $(x_0 + \Delta x, y_0 + \Delta y)$, the change in $f$ is

$$\Delta f = f(x_0 + \Delta x, y_0 + \Delta y) - f(x_0, y_0).$$

A straightforward calculation from the definition of $L(x, y)$, using the notation $x - x_0 = \Delta x$ and $y - y_0 = \Delta y$, shows that the corresponding change in $L$ is

$$\begin{aligned}\Delta L &= L(x_0 + \Delta x, y_0 + \Delta y) - L(x_0, y_0) \\ &= f_x(x_0, y_0)\Delta x + f_y(x_0, y_0)\Delta y.\end{aligned}$$

The **differentials** $dx$ and $dy$ are independent variables, so they can be assigned any values. Often we take $dx = \Delta x = x - x_0$, and $dy = \Delta y = y - y_0$. We then have the following definition of the differential or *total* differential of $f$.

**DEFINITION Total Differential**

If we move from $(x_0, y_0)$ to a point $(x_0 + dx, y_0 + dy)$ nearby, the resulting change

$$df = f_x(x_0, y_0)\, dx + f_y(x_0, y_0)\, dy$$

in the linearization of $f$ is called the **total differential of $f$**.

**EXAMPLE 7** Estimating Change in Volume

Suppose that a cylindrical can is designed to have a radius of 1 in. and a height of 5 in., but that the radius and height are off by the amounts $dr = +0.03$ and $dh = -0.1$. Estimate the resulting absolute change in the volume of the can.

**Solution** To estimate the absolute change in $V = \pi r^2 h$, we use

$$\Delta V \approx dV = V_r(r_0, h_0)\, dr + V_h(r_0, h_0)\, dh.$$

With $V_r = 2\pi rh$ and $V_h = \pi r^2$, we get

$$\begin{aligned}dV &= 2\pi r_0 h_0\, dr + \pi r_0^2\, dh = 2\pi(1)(5)(0.03) + \pi(1)^2(-0.1) \\ &= 0.3\pi - 0.1\pi = 0.2\pi \approx 0.63 \text{ in.}^3\end{aligned}$$

■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Instead of absolute change in the value of a function $f(x, y)$, we can estimate *relative change* or *percentage change* by

$$\frac{df}{f(x_0, y_0)} \quad \text{and} \quad \frac{df}{f(x_0, y_0)} \times 100,$$

respectively. In Example 7, the relative change is estimated by

$$\frac{dV}{V(r_0, h_0)} = \frac{0.2\pi}{\pi r_0^2 h_0} = \frac{0.2\pi}{\pi(1)^2(5)} = 0.04,$$

giving 4% as an estimate of the percentage change.

## EXAMPLE 8 Sensitivity to Change

Your company manufactures right circular cylindrical molasses storage tanks that are 25 ft high with a radius of 5 ft. How sensitive are the tanks' volumes to small variations in height and radius?

**Solution** With $V = \pi r^2 h$, we have the approximation for the change in volume as

$$\begin{aligned} dV &= V_r(5, 25)\, dr + V_h(5, 25)\, dh \\ &= (2\pi rh)_{(5,25)}\, dr + (\pi r^2)_{(5,25)}\, dh \\ &= 250\pi\, dr + 25\pi\, dh. \end{aligned}$$

Thus, a 1-unit change in $r$ will change $V$ by about $250\pi$ units. A 1-unit change in $h$ will change $V$ by about $25\pi$ units. The tank's volume is 10 times more sensitive to a small change in $r$ than it is to a small change of equal size in $h$. As a quality control engineer concerned with being sure the tanks have the correct volume, you would want to pay special attention to their radii.

In contrast, if the values of $r$ and $h$ are reversed to make $r = 25$ and $h = 5$, then the total differential in $V$ becomes

$$dV = (2\pi rh)_{(25,5)}\, dr + (\pi r^2)_{(25,5)}\, dh = 250\pi\, dr + 625\pi\, dh.$$

Now the volume is more sensitive to changes in $h$ than to changes in $r$ (Figure 14.35).

The general rule is that functions are most sensitive to small changes in the variables that generate the largest partial derivatives. ■

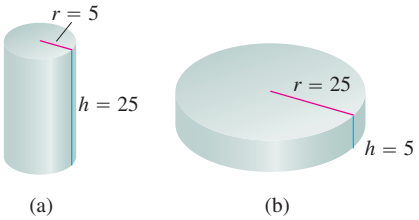

**FIGURE 14.35** The volume of cylinder (a) is more sensitive to a small change in $r$ than it is to an equally small change in $h$. The volume of cylinder (b) is more sensitive to small changes in $h$ than it is to small changes in $r$ (Example 8).

## EXAMPLE 9 Estimating Percentage Error

The volume $V = \pi r^2 h$ of a right circular cylinder is to be calculated from measured values of $r$ and $h$. Suppose that $r$ is measured with an error of no more than 2% and $h$ with an error of no more than 0.5%. Estimate the resulting possible percentage error in the calculation of $V$.

**Solution** We are told that

$$\left|\frac{dr}{r} \times 100\right| \le 2 \quad \text{and} \quad \left|\frac{dh}{h} \times 100\right| \le 0.5.$$

Since

$$\frac{dV}{V} = \frac{2\pi rh\, dr + \pi r^2\, dh}{\pi r^2 h} = \frac{2\, dr}{r} + \frac{dh}{h},$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

we have

$$\left|\frac{dV}{V}\right| = \left|2\frac{dr}{r} + \frac{dh}{h}\right|$$
$$\leq \left|2\frac{dr}{r}\right| + \left|\frac{dh}{h}\right|$$
$$\leq 2(0.02) + 0.005 = 0.045.$$

We estimate the error in the volume calculation to be at most 4.5%. ■

## Functions of More Than Two Variables

Analogous results hold for differentiable functions of more than two variables.

1. The **linearization** of $f(x, y, z)$ at a point $P_0(x_0, y_0, z_0)$ is
$$L(x, y, z) = f(P_0) + f_x(P_0)(x - x_0) + f_y(P_0)(y - y_0) + f_z(P_0)(z - z_0).$$

2. Suppose that $R$ is a closed rectangular solid centered at $P_0$ and lying in an open region on which the second partial derivatives of $f$ are continuous. Suppose also that $|f_{xx}|, |f_{yy}|, |f_{zz}|, |f_{xy}|, |f_{xz}|$, and $|f_{yz}|$ are all less than or equal to $M$ throughout $R$. Then the **error** $E(x, y, z) = f(x, y, z) - L(x, y, z)$ in the approximation of $f$ by $L$ is bounded throughout $R$ by the inequality
$$|E| \leq \frac{1}{2}M(|x - x_0| + |y - y_0| + |z - z_0|)^2.$$

3. If the second partial derivatives of $f$ are continuous and if $x$, $y$, and $z$ change from $x_0, y_0,$ and $z_0$ by small amounts $dx$, $dy$, and $dz$, the **total differential**
$$df = f_x(P_0)\,dx + f_y(P_0)\,dy + f_z(P_0)\,dz$$
gives a good approximation of the resulting change in $f$.

**EXAMPLE 10** Finding a Linear Approximation in 3-Space

Find the linearization $L(x, y, z)$ of
$$f(x, y, z) = x^2 - xy + 3\sin z$$
at the point $(x_0, y_0, z_0) = (2, 1, 0)$. Find an upper bound for the error incurred in replacing $f$ by $L$ on the rectangle
$$R: \quad |x - 2| \leq 0.01, \qquad |y - 1| \leq 0.02, \qquad |z| \leq 0.01.$$

**Solution** A routine evaluation gives
$$f(2, 1, 0) = 2, \qquad f_x(2, 1, 0) = 3, \qquad f_y(2, 1, 0) = -2, \qquad f_z(2, 1, 0) = 3.$$
Thus,
$$L(x, y, z) = 2 + 3(x - 2) + (-2)(y - 1) + 3(z - 0) = 3x - 2y + 3z - 2.$$
Since
$$f_{xx} = 2, \qquad f_{yy} = 0, \qquad f_{zz} = -3\sin z,$$
$$f_{xy} = -1, \qquad f_{xz} = 0, \qquad f_{yz} = 0,$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

we may safely take $M$ to be $\max |-3 \sin z| = 3$. Hence, the error incurred by replacing $f$ by $L$ on $R$ satisfies

$$|E| \leq \frac{1}{2}(3)(0.01 + 0.02 + 0.01)^2 = 0.0024\,.$$

The error will be no greater than 0.0024. ■

# EXERCISES 14.6

## Tangent Planes and Normal Lines to Surfaces

In Exercises 1–8, find equations for the

**(a)** tangent plane and **(b)** normal line at the point $P_0$ on the given surface.

**1.** $x^2 + y^2 + z^2 = 3, \quad P_0(1, 1, 1)$

**2.** $x^2 + y^2 - z^2 = 18, \quad P_0(3, 5, -4)$

**3.** $2z - x^2 = 0, \quad P_0(2, 0, 2)$

**4.** $x^2 + 2xy - y^2 + z^2 = 7, \quad P_0(1, -1, 3)$

**5.** $\cos \pi x - x^2y + e^{xz} + yz = 4, \quad P_0(0, 1, 2)$

**6.** $x^2 - xy - y^2 - z = 0, \quad P_0(1, 1, -1)$

**7.** $x + y + z = 1, \quad P_0(0, 1, 0)$

**8.** $x^2 + y^2 - 2xy - x + 3y - z = -4, \quad P_0(2, -3, 18)$

In Exercises 9–12, find an equation for the plane that is tangent to the given surface at the given point.

**9.** $z = \ln(x^2 + y^2), \quad (1, 0, 0)$ **10.** $z = e^{-(x^2+y^2)}, \quad (0, 0, 1)$

**11.** $z = \sqrt{y - x}, \quad (1, 2, 1)$ **12.** $z = 4x^2 + y^2, \quad (1, 1, 5)$

## Tangent Lines to Curves

In Exercises 13–18, find parametric equations for the line tangent to the curve of intersection of the surfaces at the given point.

**13.** Surfaces: $x + y^2 + 2z = 4, \quad x = 1$
Point: $(1, 1, 1)$

**14.** Surfaces: $xyz = 1, \quad x^2 + 2y^2 + 3z^2 = 6$
Point: $(1, 1, 1)$

**15.** Surfaces: $x^2 + 2y + 2z = 4, \quad y = 1$
Point: $(1, 1, 1/2)$

**16.** Surfaces: $x + y^2 + z = 2, \quad y = 1$
Point: $(1/2, 1, 1/2)$

**17.** Surfaces: $x^3 + 3x^2y^2 + y^3 + 4xy - z^2 = 0, \quad x^2 + y^2 + z^2 = 11$
Point: $(1, 1, 3)$

**18.** Surfaces: $x^2 + y^2 = 4, \quad x^2 + y^2 - z = 0$
Point: $\left(\sqrt{2}, \sqrt{2}, 4\right)$

## Estimating Change

**19.** By about how much will

$$f(x, y, z) = \ln\sqrt{x^2 + y^2 + z^2}$$

change if the point $P(x, y, z)$ moves from $P_0(3, 4, 12)$ a distance of $ds = 0.1$ unit in the direction of $3\mathbf{i} + 6\mathbf{j} - 2\mathbf{k}$?

**20.** By about how much will

$$f(x, y, z) = e^x \cos yz$$

change as the point $P(x, y, z)$ moves from the origin a distance of $ds = 0.1$ unit in the direction of $2\mathbf{i} + 2\mathbf{j} - 2\mathbf{k}$?

**21.** By about how much will

$$g(x, y, z) = x + x \cos z - y \sin z + y$$

change if the point $P(x, y, z)$ moves from $P_0(2, -1, 0)$ a distance of $ds = 0.2$ unit toward the point $P_1(0, 1, 2)$?

**22.** By about how much will

$$h(x, y, z) = \cos(\pi xy) + xz^2$$

change if the point $P(x, y, z)$ moves from $P_0(-1, -1, -1)$ a distance of $ds = 0.1$ unit toward the origin?

**23. Temperature change along a circle** Suppose that the Celsius temperature at the point $(x, y)$ in the $xy$-plane is $T(x, y) = x \sin 2y$ and that distance in the $xy$-plane is measured in meters. A particle is moving *clockwise* around the circle of radius 1 m centered at the origin at the constant rate of 2 m/sec.

**a.** How fast is the temperature experienced by the particle changing in degrees Celsius per meter at the point $P\left(1/2, \sqrt{3}/2\right)$?

**b.** How fast is the temperature experienced by the particle changing in degrees Celsius per second at $P$?

**24. Changing temperature along a space curve** The Celsius temperature in a region in space is given by $T(x, y, z) = 2x^2 - xyz$. A particle is moving in this region and its position at time $t$ is given by $x = 2t^2, y = 3t, z = -t^2$, where time is measured in seconds and distance in meters.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**a.** How fast is the temperature experienced by the particle changing in degrees Celsius per meter when the particle is at the point $P(8, 6, -4)$?

**b.** How fast is the temperature experienced by the particle changing in degrees Celsius per second at $P$?

## Finding Linearizations

In Exercises 25–30, find the linearization $L(x, y)$ of the function at each point.

**25.** $f(x, y) = x^2 + y^2 + 1$ at **a.** $(0, 0)$, **b.** $(1, 1)$

**26.** $f(x, y) = (x + y + 2)^2$ at **a.** $(0, 0)$, **b.** $(1, 2)$

**27.** $f(x, y) = 3x - 4y + 5$ at **a.** $(0, 0)$, **b.** $(1, 1)$

**28.** $f(x, y) = x^3y^4$ at **a.** $(1, 1)$, **b.** $(0, 0)$

**29.** $f(x, y) = e^x \cos y$ at **a.** $(0, 0)$, **b.** $(0, \pi/2)$

**30.** $f(x, y) = e^{2y-x}$ at **a.** $(0, 0)$, **b.** $(1, 2)$

## Upper Bounds for Errors in Linear Approximations

In Exercises 31–36, find the linearization $L(x, y)$ of the function $f(x, y)$ at $P_0$. Then find an upper bound for the magnitude $|E|$ of the error in the approximation $f(x, y) \approx L(x, y)$ over the rectangle $R$.

**31.** $f(x, y) = x^2 - 3xy + 5$ at $P_0(2, 1)$,
$R$: $|x - 2| \le 0.1$, $|y - 1| \le 0.1$

**32.** $f(x, y) = (1/2)x^2 + xy + (1/4)y^2 + 3x - 3y + 4$ at $P_0(2, 2)$,
$R$: $|x - 2| \le 0.1$, $|y - 2| \le 0.1$

**33.** $f(x, y) = 1 + y + x \cos y$ at $P_0(0, 0)$,
$R$: $|x| \le 0.2$, $|y| \le 0.2$
(Use $|\cos y| \le 1$ and $|\sin y| \le 1$ in estimating $E$.)

**34.** $f(x, y) = xy^2 + y \cos(x - 1)$ at $P_0(1, 2)$,
$R$: $|x - 1| \le 0.1$, $|y - 2| \le 0.1$

**35.** $f(x, y) = e^x \cos y$ at $P_0(0, 0)$,
$R$: $|x| \le 0.1$, $|y| \le 0.1$
(Use $e^x \le 1.11$ and $|\cos y| \le 1$ in estimating $E$.)

**36.** $f(x, y) = \ln x + \ln y$ at $P_0(1, 1)$,
$R$: $|x - 1| \le 0.2$, $|y - 1| \le 0.2$

## Functions of Three Variables

Find the linearizations $L(x, y, z)$ of the functions in Exercises 37–42 at the given points.

**37.** $f(x, y, z) = xy + yz + xz$ at
**a.** $(1, 1, 1)$ **b.** $(1, 0, 0)$ **c.** $(0, 0, 0)$

**38.** $f(x, y, z) = x^2 + y^2 + z^2$ at
**a.** $(1, 1, 1)$ **b.** $(0, 1, 0)$ **c.** $(1, 0, 0)$

**39.** $f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$ at
**a.** $(1, 0, 0)$ **b.** $(1, 1, 0)$ **c.** $(1, 2, 2)$

**40.** $f(x, y, z) = (\sin xy)/z$ at
**a.** $(\pi/2, 1, 1)$ **b.** $(2, 0, 1)$

**41.** $f(x, y, z) = e^x + \cos(y + z)$ at
**a.** $(0, 0, 0)$ **b.** $\left(0, \frac{\pi}{2}, 0\right)$ **c.** $\left(0, \frac{\pi}{4}, \frac{\pi}{4}\right)$

**42.** $f(x, y, z) = \tan^{-1}(xyz)$ at
**a.** $(1, 0, 0)$ **b.** $(1, 1, 0)$ **c.** $(1, 1, 1)$

In Exercises 43–46, find the linearization $L(x, y, z)$ of the function $f(x, y, z)$ at $P_0$. Then find an upper bound for the magnitude of the error $E$ in the approximation $f(x, y, z) \approx L(x, y, z)$ over the region $R$.

**43.** $f(x, y, z) = xz - 3yz + 2$ at $P_0(1, 1, 2)$
$R$: $|x - 1| \le 0.01$, $|y - 1| \le 0.01$, $|z - 2| \le 0.02$

**44.** $f(x, y, z) = x^2 + xy + yz + (1/4)z^2$ at $P_0(1, 1, 2)$
$R$: $|x - 1| \le 0.01$, $|y - 1| \le 0.01$, $|z - 2| \le 0.08$

**45.** $f(x, y, z) = xy + 2yz - 3xz$ at $P_0(1, 1, 0)$
$R$: $|x - 1| \le 0.01$, $|y - 1| \le 0.01$, $|z| \le 0.01$

**46.** $f(x, y, z) = \sqrt{2} \cos x \sin(y + z)$ at $P_0(0, 0, \pi/4)$
$R$: $|x| \le 0.01$, $|y| \le 0.01$, $|z - \pi/4| \le 0.01$

## Estimating Error; Sensitivity to Change

**47. Estimating maximum error** Suppose that $T$ is to be found from the formula $T = x(e^y + e^{-y})$, where $x$ and $y$ are found to be 2 and ln 2 with maximum possible errors of $|dx| = 0.1$ and $|dy| = 0.02$. Estimate the maximum possible error in the computed value of $T$.

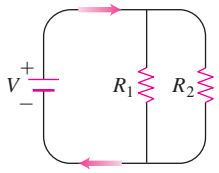
**48. Estimating volume of a cylinder** About how accurately may $V = \pi r^2 h$ be calculated from measurements of $r$ and $h$ that are in error by 1%?

**49. Maximum percentage error** If $r = 5.0$ cm and $h = 12.0$ cm to the nearest millimeter, what should we expect the maximum percentage error in calculating $V = \pi r^2 h$ to be?

**50. Variation in electrical resistance** The resistance $R$ produced by wiring resistors of $R_1$ and $R_2$ ohms in parallel (see accompanying figure) can be calculated from the formula

$$\frac{1}{R} = \frac{1}{R_1} + \frac{1}{R_2}.$$

**a.** Show that



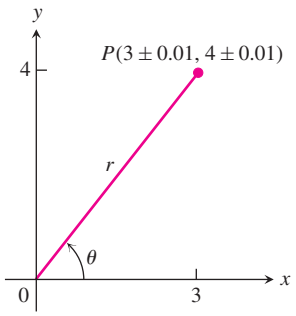
$$dR = \left(\frac{R}{R_1}\right)^2 dR_1 + \left(\frac{R}{R_2}\right)^2 dR_2.$$

**b.** You have designed a two-resistor circuit like the one shown on the next page to have resistances of $R_1 = 100$ ohms and $R_2 = 400$ ohms, but there is always some variation in manufacturing and the resistors received by your firm will probably not have these exact values. Will the value of $R$ be

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

more sensitive to variation in $R_1$ or to variation in $R_2$? Give reasons for your answer.



**c.** In another circuit like the one shown you plan to change $R_1$ from 20 to 20.1 ohms and $R_2$ from 25 to 24.9 ohms. By about what percentage will this change $R$?

**51.** You plan to calculate the area of a long, thin rectangle from measurements of its length and width. Which dimension should you measure more carefully? Give reasons for your answer.

**52. a.** Around the point $(1, 0)$, is $f(x, y) = x^2(y + 1)$ more sensitive to changes in $x$ or to changes in $y$? Give reasons for your answer.

**b.** What ratio of $dx$ to $dy$ will make $df$ equal zero at $(1, 0)$?

**53. Error carryover in coordinate changes**

**a.** If $x = 3 \pm 0.01$ and $y = 4 \pm 0.01$, as shown here, with approximately what accuracy can you calculate the polar coordinates $r$ and $\theta$ of the point $P(x, y)$ from the formulas $r^2 = x^2 + y^2$ and $\theta = \tan^{-1}(y/x)$? Express your estimates as percentage changes of the values that $r$ and $\theta$ have at the point $(x_0, y_0) = (3, 4)$.

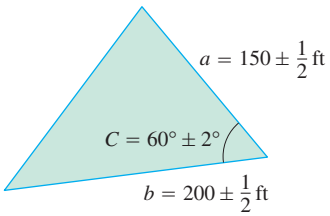
**b.** At the point $(x_0, y_0) = (3, 4)$, are the values of $r$ and $\theta$ more sensitive to changes in $x$ or to changes in $y$? Give reasons for your answer.

**54. Designing a soda can** A standard 12-fl oz can of soda is essentially a cylinder of radius $r = 1$ in. and height $h = 5$ in.

**a.** At these dimensions, how sensitive is the can's volume to a small change in radius versus a small change in height?

**b.** Could you design a soda can that *appears* to hold more soda but in fact holds the same 12-fl oz? What might its dimensions be? (There is more than one correct answer.)

**55. Value of a 2 × 2 determinant** If $|a|$ is much greater than $|b|$, $|c|$, and $|d|$, to which of $a$, $b$, $c$, and $d$ is the value of the determinant



$$f(a, b, c, d) = \begin{vmatrix} a & b \\ c & d \end{vmatrix}$$

most sensitive? Give reasons for your answer.

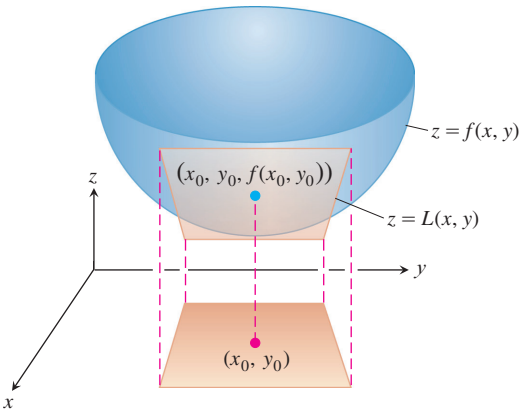
**56. Estimating maximum error** Suppose that $u = xe^y + y \sin z$ and that $x$, $y$, and $z$ can be measured with maximum possible errors of $\pm 0.2$, $\pm 0.6$, and $\pm \pi/180$, respectively. Estimate the maximum possible error in calculating $u$ from the measured values $x = 2$, $y = \ln 3$, $z = \pi/2$.

**57. The Wilson lot size formula** The Wilson lot size formula in economics says that the most economical quantity $Q$ of goods (radios, shoes, brooms, whatever) for a store to order is given by the formula $Q = \sqrt{2KM/h}$, where $K$ is the cost of placing the order, $M$ is the number of items sold per week, and $h$ is the weekly holding cost for each item (cost of space, utilities, security, and so on). To which of the variables $K$, $M$, and $h$ is $Q$ most sensitive near the point $(K_0, M_0, h_0) = (2, 20, 0.05)$? Give reasons for your answer.

**58. Surveying a triangular field** The area of a triangle is $(1/2)ab \sin C$, where $a$ and $b$ are the lengths of two sides of the triangle and $C$ is the measure of the included angle. In surveying a triangular plot, you have measured $a$, $b$, and $C$ to be 150 ft, 200 ft, and 60°, respectively. By about how much could your area calculation be in error if your values of $a$ and $b$ are off by half a foot each and your measurement of $C$ is off by 2°? See the accompanying figure. Remember to use radians.

## Theory and Examples

**59. The linearization of $f(x, y)$ is a tangent-plane approximation** Show that the tangent plane at the point $P_0(x_0, y_0, f(x_0, y_0))$ on the surface $z = f(x, y)$ defined by a differentiable function $f$ is the plane



$$f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0) - (z - f(x_0, y_0)) = 0$$

or

$$z = f(x_0, y_0) + f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0).$$

Thus, the tangent plane at $P_0$ is the graph of the linearization of $f$ at $P_0$ (see accompanying figure).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**60. Change along the involute of a circle** Find the derivative of $f(x, y) = x^2 + y^2$ in the direction of the unit tangent vector of the curve

$$\mathbf{r}(t) = (\cos t + t \sin t)\mathbf{i} + (\sin t - t \cos t)\mathbf{j}, \qquad t > 0.$$

**61. Change along a helix** Find the derivative of $f(x, y, z) = x^2 + y^2 + z^2$ in the direction of the unit tangent vector of the helix

$$\mathbf{r}(t) = (\cos t)\mathbf{i} + (\sin t)\mathbf{j} + t\mathbf{k}$$

at the points where $t = -\pi/4$, 0, and $\pi/4$. The function $f$ gives the square of the distance from a point $P(x, y, z)$ on the helix to the origin. The derivatives calculated here give the rates at which the square of the distance is changing with respect to $t$ as $P$ moves through the points where $t = -\pi/4$, 0, and $\pi/4$.

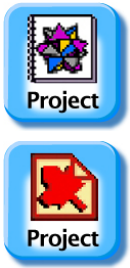
**62. Normal curves** A smooth curve is *normal* to a surface $f(x, y, z) = c$ at a point of intersection if the curve's velocity vector is a nonzero scalar multiple of $\nabla f$ at the point.

Show that the curve

$$\mathbf{r}(t) = \sqrt{t}\mathbf{i} + \sqrt{t}\mathbf{j} - \frac{1}{4}(t + 3)\mathbf{k}$$

is normal to the surface $x^2 + y^2 - z = 3$ when $t = 1$.

**63. Tangent curves** A smooth curve is *tangent* to the surface at a point of intersection if its velocity vector is orthogonal to $\nabla f$ there.



Show that the curve

$$\mathbf{r}(t) = \sqrt{t}\mathbf{i} + \sqrt{t}\mathbf{j} + (2t - 1)\mathbf{k}$$

is tangent to the surface $x^2 + y^2 - z = 1$ when $t = 1$.

# 14.7 Extreme Values and Saddle Points

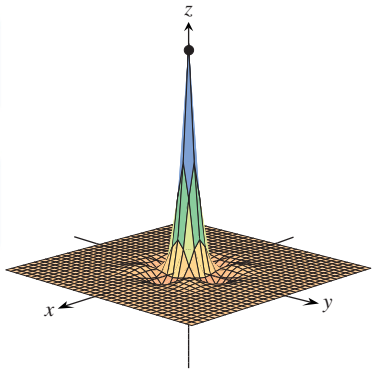

**FIGURE 14.36** The function

$$z = (\cos x)(\cos y)e^{-\sqrt{x^2+y^2}}$$

has a maximum value of 1 and a minimum value of about $-0.067$ on the square region $|x| \le 3\pi/2, |y| \le 3\pi/2$.

Continuous functions of two variables assume extreme values on closed, bounded domains (see Figures 14.36 and 14.37). We see in this section that we can narrow the search for these extreme values by examining the functions' first partial derivatives. A function of two variables can assume extreme values only at domain boundary points or at interior domain points where both first partial derivatives are zero or where one or both of the first partial derivatives fails to exist. However, the vanishing of derivatives at an interior point $(a, b)$ does not always signal the presence of an extreme value. The surface that is the graph of the function might be shaped like a saddle right above $(a, b)$ and cross its tangent plane there.

## Derivative Tests for Local Extreme Values

To find the local extreme values of a function of a single variable, we look for points where the graph has a horizontal tangent line. At such points, we then look for local maxima, local minima, and points of inflection. For a function $f(x, y)$ of two variables, we look for points where the surface $z = f(x, y)$ has a horizontal tangent *plane*. At such points, we then look for local maxima, local minima, and saddle points (more about saddle points in a moment).

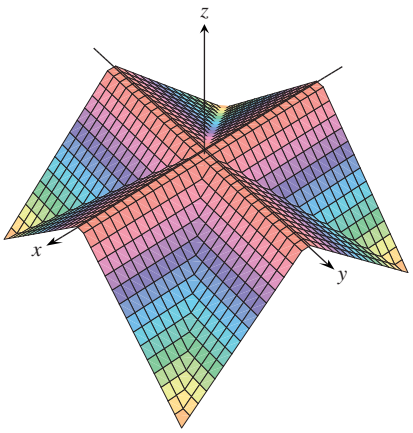

**FIGURE 14.37** The "roof surface"

$$z = \frac{1}{2}\left(\left|\,|x| - |y|\,\right| - |x| - |y|\right)$$

viewed from the point (10, 15, 20). The defining function has a maximum value of 0 and a minimum value of $-a$ on the square region $|x| \le a, |y| \le a$.

HISTORICAL BIOGRAPHY

Siméon-Denis Poisson
(1781–1840)

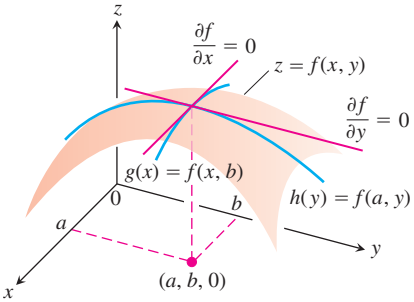

**FIGURE 14.39** If a local maximum of $f$ occurs at $x = a, y = b$, then the first partial derivatives $f_x(a, b)$ and $f_y(a, b)$ are both zero.

**DEFINITIONS Local Maximum, Local Minimum**

Let $f(x, y)$ be defined on a region $R$ containing the point $(a, b)$. Then

1. $f(a, b)$ is a **local maximum** value of $f$ if $f(a, b) \ge f(x, y)$ for all domain points $(x, y)$ in an open disk centered at $(a, b)$.
2. $f(a, b)$ is a **local minimum** value of $f$ if $f(a, b) \le f(x, y)$ for all domain points $(x, y)$ in an open disk centered at $(a, b)$.

Local maxima correspond to mountain peaks on the surface $z = f(x, y)$ and local minima correspond to valley bottoms (Figure 14.38). At such points the tangent planes, when they exist, are horizontal. Local extrema are also called **relative extrema**.

As with functions of a single variable, the key to identifying the local extrema is a first derivative test.

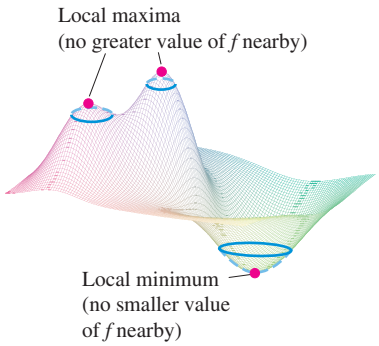

**FIGURE 14.38** A local maximum is a mountain peak and a local minimum is a valley low.

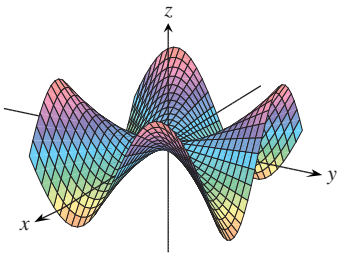
**THEOREM 10 First Derivative Test for Local Extreme Values**

If $f(x, y)$ has a local maximum or minimum value at an interior point $(a, b)$ of its domain and if the first partial derivatives exist there, then $f_x(a, b) = 0$ and $f_y(a, b) = 0$.

**Proof** If $f$ has a local extremum at $(a, b)$, then the function $g(x) = f(x, b)$ has a local extremum at $x = a$ (Figure 14.39). Therefore, $g'(a) = 0$ (Chapter 4, Theorem 2). Now $g'(a) = f_x(a, b)$, so $f_x(a, b) = 0$. A similar argument with the function $h(y) = f(a, y)$ shows that $f_y(a, b) = 0$. ■

If we substitute the values $f_x(a, b) = 0$ and $f_y(a, b) = 0$ into the equation

$$f_x(a, b)(x - a) + f_y(a, b)(y - b) - (z - f(a, b)) = 0$$



for the tangent plane to the surface $z = f(x, y)$ at $(a, b)$, the equation reduces to

$$0 \cdot (x - a) + 0 \cdot (y - b) - z + f(a, b) = 0$$

or

$$z = f(a, b).$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$$z = \frac{xy(x^2 - y^2)}{x^2 + y^2}$$

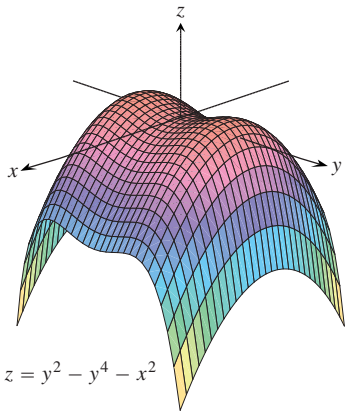


**FIGURE 14.40** Saddle points at the origin.

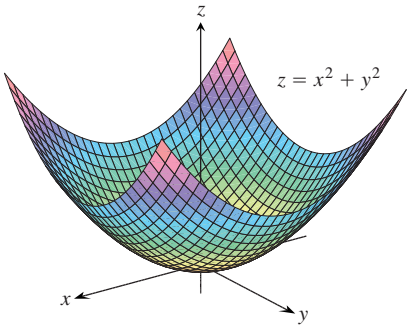

**FIGURE 14.41** The graph of the function $f(x, y) = x^2 + y^2$ is the paraboloid $z = x^2 + y^2$. The function has a local minimum value of 0 at the origin (Example 1).

Thus, Theorem 10 says that the surface does indeed have a horizontal tangent plane at a local extremum, provided there is a tangent plane there.

**DEFINITION Critical Point**

An interior point of the domain of a function $f(x, y)$ where both $f_x$ and $f_y$ are zero or where one or both of $f_x$ and $f_y$ do not exist is a **critical point** of $f$.

Theorem 10 says that the only points where a function $f(x, y)$ can assume extreme values are critical points and boundary points. As with differentiable functions of a single variable, not every critical point gives rise to a local extremum. A differentiable function of a single variable might have a point of inflection. A differentiable function of two variables might have a *saddle point*.

**DEFINITION Saddle Point**

A differentiable function $f(x, y)$ has a **saddle point** at a critical point $(a, b)$ if in every open disk centered at $(a, b)$ there are domain points $(x, y)$ where $f(x, y) > f(a, b)$ and domain points $(x, y)$ where $f(x, y) < f(a, b)$. The corresponding point $(a, b, f(a, b))$ on the surface $z = f(x, y)$ is called a saddle point of the surface (Figure 14.40).

**EXAMPLE 1** Finding Local Extreme Values

Find the local extreme values of $f(x, y) = x^2 + y^2$.

**Solution** The domain of $f$ is the entire plane (so there are no boundary points) and the partial derivatives $f_x = 2x$ and $f_y = 2y$ exist everywhere. Therefore, local extreme values can occur only where

$$f_x = 2x = 0 \qquad \text{and} \qquad f_y = 2y = 0.$$

The only possibility is the origin, where the value of $f$ is zero. Since $f$ is never negative, we see that the origin gives a local minimum (Figure 14.41). ■

**EXAMPLE 2** Identifying a Saddle Point

Find the local extreme values (if any) of $f(x, y) = y^2 - x^2$.

**Solution** The domain of $f$ is the entire plane (so there are no boundary points) and the partial derivatives $f_x = -2x$ and $f_y = 2y$ exist everywhere. Therefore, local extrema can occur only at the origin (0, 0). Along the positive $x$-axis, however, $f$ has the value $f(x, 0) = -x^2 < 0$; along the positive $y$-axis, $f$ has the value $f(0, y) = y^2 > 0$. Therefore, every open disk in the $xy$-plane centered at (0, 0) contains points where the function is positive and points where it is negative. The function has a saddle point at the origin (Figure 14.42) instead of a local extreme value. We conclude that the function has no local extreme values. ■

That $f_x = f_y = 0$ at an interior point $(a, b)$ of $R$ does not guarantee $f$ has a local extreme value there. If $f$ and its first and second partial derivatives are continuous on $R$, however, we may be able to learn more from the following theorem, proved in Section 14.10.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

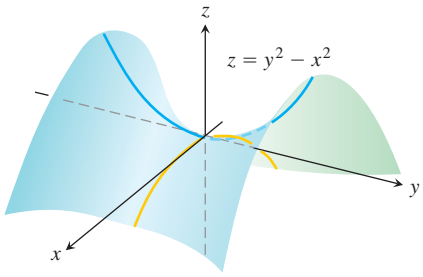

**FIGURE 14.42** The origin is a saddle point of the function $f(x, y) = y^2 - x^2$. There are no local extreme values (Example 2).

**THEOREM 11 Second Derivative Test for Local Extreme Values**

Suppose that $f(x, y)$ and its first and second partial derivatives are continuous throughout a disk centered at $(a, b)$ and that $f_x(a, b) = f_y(a, b) = 0$. Then

i. $f$ has a **local maximum** at $(a, b)$ if $f_{xx} < 0$ and $f_{xx}f_{yy} - f_{xy}^2 > 0$ at $(a, b)$.

ii. $f$ has a **local minimum** at $(a, b)$ if $f_{xx} > 0$ and $f_{xx}f_{yy} - f_{xy}^2 > 0$ at $(a, b)$.

iii. $f$ has a **saddle point** at $(a, b)$ if $f_{xx}f_{yy} - f_{xy}^2 < 0$ at $(a, b)$.

iv. **The test is inconclusive** at $(a, b)$ if $f_{xx}f_{yy} - f_{xy}^2 = 0$ at $(a, b)$. In this case, we must find some other way to determine the behavior of $f$ at $(a, b)$.

The expression $f_{xx}f_{yy} - f_{xy}^2$ is called the **discriminant** or **Hessian** of $f$. It is sometimes easier to remember it in determinant form,

$$f_{xx}f_{yy} - f_{xy}^2 = \begin{vmatrix} f_{xx} & f_{xy} \\ f_{xy} & f_{yy} \end{vmatrix}.$$

Theorem 11 says that if the discriminant is positive at the point $(a, b)$, then the surface curves the same way in all directions: downward if $f_{xx} < 0$, giving rise to a local maximum, and upward if $f_{xx} > 0$, giving a local minimum. On the other hand, if the discriminant is negative at $(a, b)$, then the surface curves up in some directions and down in others, so we have a saddle point.

**EXAMPLE 3** Finding Local Extreme Values

Find the local extreme values of the function

$$f(x, y) = xy - x^2 - y^2 - 2x - 2y + 4.$$

**Solution** The function is defined and differentiable for all $x$ and $y$ and its domain has no boundary points. The function therefore has extreme values only at the points where $f_x$ and $f_y$ are simultaneously zero. This leads to

$$f_x = y - 2x - 2 = 0, \qquad f_y = x - 2y - 2 = 0,$$

or

$$x = y = -2.$$

Therefore, the point $(-2, -2)$ is the only point where $f$ may take on an extreme value. To see if it does so, we calculate

$$f_{xx} = -2, \qquad f_{yy} = -2, \qquad f_{xy} = 1.$$

The discriminant of $f$ at $(a, b) = (-2, -2)$ is

$$f_{xx}f_{yy} - f_{xy}^2 = (-2)(-2) - (1)^2 = 4 - 1 = 3.$$

The combination

$$f_{xx} < 0 \qquad \text{and} \qquad f_{xx}f_{yy} - f_{xy}^2 > 0$$

tells us that $f$ has a local maximum at $(-2, -2)$. The value of $f$ at this point is $f(-2, -2) = 8$. ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

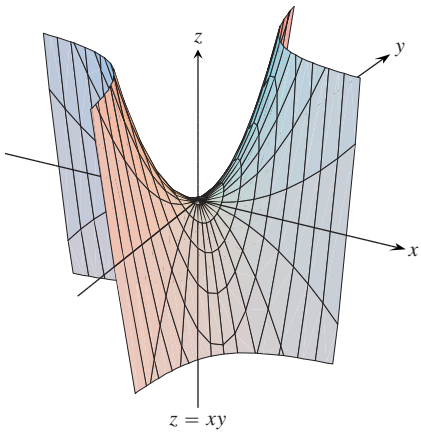

**FIGURE 14.43** The surface $z = xy$ has a saddle point at the origin (Example 4).

**EXAMPLE 4** Searching for Local Extreme Values

Find the local extreme values of $f(x, y) = xy$.

**Solution** Since $f$ is differentiable everywhere (Figure 14.43), it can assume extreme values only where

$$f_x = y = 0 \qquad \text{and} \qquad f_y = x = 0.$$

Thus, the origin is the only point where $f$ might have an extreme value. To see what happens there, we calculate

$$f_{xx} = 0, \qquad f_{yy} = 0, \qquad f_{xy} = 1.$$

The discriminant,

$$f_{xx}f_{yy} - f_{xy}^2 = -1,$$

is negative. Therefore, the function has a saddle point at (0, 0). We conclude that $f(x, y) = xy$ has no local extreme values. ■

## Absolute Maxima and Minima on Closed Bounded Regions

We organize the search for the absolute extrema of a continuous function $f(x, y)$ on a closed and bounded region $R$ into three steps.

1. *List the interior points of R* where $f$ may have local maxima and minima and evaluate $f$ at these points. These are the critical points of $f$.
2. *List the boundary points of R* where $f$ has local maxima and minima and evaluate $f$ at these points. We show how to do this shortly.
3. *Look through the lists* for the maximum and minimum values of $f$. These will be the absolute maximum and minimum values of $f$ on $R$. Since absolute maxima and minima are also local maxima and minima, the absolute maximum and minimum values of $f$ appear somewhere in the lists made in Steps 1 and 2.

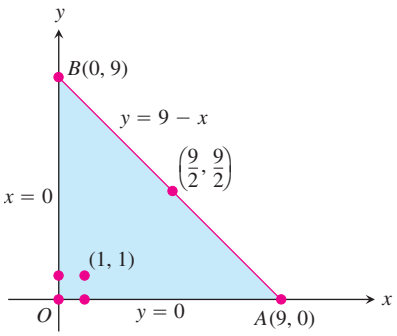

**FIGURE 14.44** This triangular region is the domain of the function in Example 5.

**EXAMPLE 5** Finding Absolute Extrema

Find the absolute maximum and minimum values of

$$f(x, y) = 2 + 2x + 2y - x^2 - y^2$$

on the triangular region in the first quadrant bounded by the lines $x = 0, y = 0, y = 9 - x$.

**Solution** Since $f$ is differentiable, the only places where $f$ can assume these values are points inside the triangle (Figure 14.44) where $f_x = f_y = 0$ and points on the boundary.

**(a) Interior points**. For these we have

$$f_x = 2 - 2x = 0, \qquad f_y = 2 - 2y = 0,$$

yielding the single point $(x, y) = (1, 1)$. The value of $f$ there is

$$f(1, 1) = 4.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**(b) Boundary points**. We take the triangle one side at a time:

**(i)** On the segment $OA$, $y = 0$. The function

$$f(x, y) = f(x, 0) = 2 + 2x - x^2$$

may now be regarded as a function of $x$ defined on the closed interval $0 \le x \le 9$. Its extreme values (we know from Chapter 4) may occur at the endpoints

$$x = 0 \quad \text{where} \quad f(0, 0) = 2$$

$$x = 9 \quad \text{where} \quad f(9, 0) = 2 + 18 - 81 = -61$$

and at the interior points where $f'(x, 0) = 2 - 2x = 0$. The only interior point where $f'(x, 0) = 0$ is $x = 1$, where

$$f(x, 0) = f(1, 0) = 3.$$

**(ii)** On the segment $OB$, $x = 0$ and

$$f(x, y) = f(0, y) = 2 + 2y - y^2.$$

We know from the symmetry of $f$ in $x$ and $y$ and from the analysis we just carried out that the candidates on this segment are

$$f(0, 0) = 2, \qquad f(0, 9) = -61, \qquad f(0, 1) = 3.$$

**(iii)** We have already accounted for the values of $f$ at the endpoints of $AB$, so we need only look at the interior points of $AB$. With $y = 9 - x$, we have

$$f(x, y) = 2 + 2x + 2(9 - x) - x^2 - (9 - x)^2 = -61 + 18x - 2x^2.$$

Setting $f'(x, 9 - x) = 18 - 4x = 0$ gives

$$x = \frac{18}{4} = \frac{9}{2}.$$

At this value of $x$,

$$y = 9 - \frac{9}{2} = \frac{9}{2} \qquad \text{and} \qquad f(x, y) = f\left(\frac{9}{2}, \frac{9}{2}\right) = -\frac{41}{2}.$$

**Summary** We list all the candidates: $4, 2, -61, 3, -(41/2)$. The maximum is 4, which $f$ assumes at $(1, 1)$. The minimum is $-61$, which $f$ assumes at $(0, 9)$ and $(9, 0)$. ■

Solving extreme value problems with algebraic constraints on the variables usually requires the method of Lagrange multipliers in the next section. But sometimes we can solve such problems directly, as in the next example.

## EXAMPLE 6 Solving a Volume Problem with a Constraint

A delivery company accepts only rectangular boxes the sum of whose length and girth (perimeter of a cross-section) does not exceed 108 in. Find the dimensions of an acceptable box of largest volume.

**Solution** Let $x$, $y$, and $z$ represent the length, width, and height of the rectangular box, respectively. Then the girth is $2y + 2z$. We want to maximize the volume $V = xyz$ of the

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

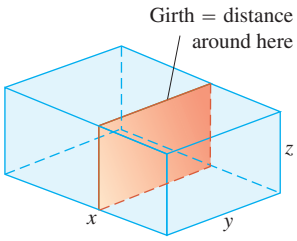

**FIGURE 14.45** The box in Example 6.

box (Figure 14.45) satisfying $x + 2y + 2z = 108$ (the largest box accepted by the delivery company). Thus, we can write the volume of the box as a function of two variables.

$V = xyz$ and $x = 108 - 2y - 2z$

$$V(y, z) = (108 - 2y - 2z)yz$$
$$= 108yz - 2y^2z - 2yz^2$$

Setting the first partial derivatives equal to zero,

$$V_y(y, z) = 108z - 4yz - 2z^2 = (108 - 4y - 2z)z = 0$$
$$V_z(y, z) = 108y - 2y^2 - 4yz = (108 - 2y - 4z)y = 0,$$

gives the critical points (0, 0), (0, 54), (54, 0), and (18, 18). The volume is zero at (0, 0), (0, 54), (54, 0), which are not maximum values. At the point (18, 18), we apply the Second Derivative Test (Theorem 11):

$$V_{yy} = -4z, \qquad V_{zz} = -4y, \qquad V_{yz} = 108 - 4y - 4z.$$

Then

$$V_{yy}V_{zz} - V_{yz}^2 = 16yz - 16(27 - y - z)^2.$$

Thus,

$$V_{yy}(18, 18) = -4(18) < 0$$

and

$$\left[V_{yy}V_{zz} - V_{yz}^2\right]_{(18,18)} = 16(18)(18) - 16(-9)^2 > 0$$

imply that (18, 18) gives a maximum volume. The dimensions of the package are $x = 108 - 2(18) - 2(18) = 36$ in., $y = 18$ in., and $z = 18$ in. The maximum volume is $V = (36)(18)(18) = 11{,}664$ in.$^3$, or 6.75 ft$^3$. ■

Despite the power of Theorem 10, we urge you to remember its limitations. It does not apply to boundary points of a function's domain, where it is possible for a function to have extreme values along with nonzero derivatives. Also, it does not apply to points where either $f_x$ or $f_y$ fails to exist.

### Summary of Max-Min Tests

The extreme values of $f(x, y)$ can occur only at

i. **boundary points** of the domain of $f$
ii. **critical points** (interior points where $f_x = f_y = 0$ or points where $f_x$ or $f_y$ fail to exist).

If the first- and second-order partial derivatives of $f$ are continuous throughout a disk centered at a point $(a, b)$ and $f_x(a, b) = f_y(a, b) = 0$, the nature of $f(a, b)$ can be tested with the **Second Derivative Test**:

i. $f_{xx} < 0$ and $f_{xx}f_{yy} - f_{xy}^2 > 0$ at $(a, b)$ $\Rightarrow$ **local maximum**
ii. $f_{xx} > 0$ and $f_{xx}f_{yy} - f_{xy}^2 > 0$ at $(a, b)$ $\Rightarrow$ **local minimum**
iii. $f_{xx}f_{yy} - f_{xy}^2 < 0$ at $(a, b)$ $\Rightarrow$ **saddle point**
iv. $f_{xx}f_{yy} - f_{xy}^2 = 0$ at $(a, b)$ $\Rightarrow$ **test is inconclusive**.

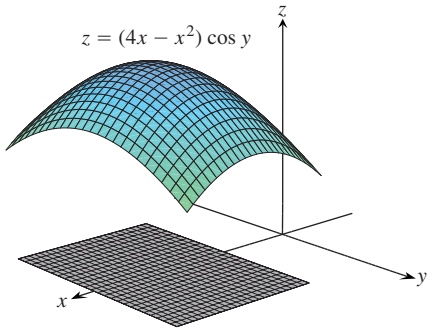
# EXERCISES 14.7

## Finding Local Extrema



Find all the local maxima, local minima, and saddle points of the functions in Exercises 1–30.

1. $f(x, y) = x^2 + xy + y^2 + 3x - 3y + 4$
2. $f(x, y) = x^2 + 3xy + 3y^2 - 6x + 3y - 6$
3. $f(x, y) = 2xy - 5x^2 - 2y^2 + 4x + 4y - 4$
4. $f(x, y) = 2xy - 5x^2 - 2y^2 + 4x - 4$
5. $f(x, y) = x^2 + xy + 3x + 2y + 5$
6. $f(x, y) = y^2 + xy - 2x - 2y + 2$
7. $f(x, y) = 5xy - 7x^2 + 3x - 6y + 2$
8. $f(x, y) = 2xy - x^2 - 2y^2 + 3x + 4$
9. $f(x, y) = x^2 - 4xy + y^2 + 6y + 2$
10. $f(x, y) = 3x^2 + 6xy + 7y^2 - 2x + 4y$
11. $f(x, y) = 2x^2 + 3xy + 4y^2 - 5x + 2y$
12. $f(x, y) = 4x^2 - 6xy + 5y^2 - 20x + 26y$
13. $f(x, y) = x^2 - y^2 - 2x + 4y + 6$
14. $f(x, y) = x^2 - 2xy + 2y^2 - 2x + 2y + 1$
15. $f(x, y) = x^2 + 2xy$
16. $f(x, y) = 3 + 2x + 2y - 2x^2 - 2xy - y^2$
17. $f(x, y) = x^3 - y^3 - 2xy + 6$
18. $f(x, y) = x^3 + 3xy + y^3$
19. $f(x, y) = 6x^2 - 2x^3 + 3y^2 + 6xy$
20. $f(x, y) = 3y^2 - 2y^3 - 3x^2 + 6xy$
21. $f(x, y) = 9x^3 + y^3/3 - 4xy$
22. $f(x, y) = 8x^3 + y^3 + 6xy$
23. $f(x, y) = x^3 + y^3 + 3x^2 - 3y^2 - 8$
24. $f(x, y) = 2x^3 + 2y^3 - 9x^2 + 3y^2 - 12y$
25. $f(x, y) = 4xy - x^4 - y^4$
26. $f(x, y) = x^4 + y^4 + 4xy$
27. $f(x, y) = \dfrac{1}{x^2 + y^2 - 1}$
28. $f(x, y) = \dfrac{1}{x} + xy + \dfrac{1}{y}$
29. $f(x, y) = y \sin x$
30. $f(x, y) = e^{2x} \cos y$

## Finding Absolute Extrema

In Exercises 31–38, find the absolute maxima and minima of the functions on the given domains.

31. $f(x, y) = 2x^2 - 4x + y^2 - 4y + 1$ on the closed triangular plate bounded by the lines $x = 0, y = 2, y = 2x$ in the first quadrant
32. $D(x, y) = x^2 - xy + y^2 + 1$ on the closed triangular plate in the first quadrant bounded by the lines $x = 0, y = 4, y = x$
33. $f(x, y) = x^2 + y^2$ on the closed triangular plate bounded by the lines $x = 0, y = 0, y + 2x = 2$ in the first quadrant
34. $T(x, y) = x^2 + xy + y^2 - 6x$ on the rectangular plate $0 \le x \le 5, -3 \le y \le 3$
35. $T(x, y) = x^2 + xy + y^2 - 6x + 2$ on the rectangular plate $0 \le x \le 5, -3 \le y \le 0$
36. $f(x, y) = 48xy - 32x^3 - 24y^2$ on the rectangular plate $0 \le x \le 1, 0 \le y \le 1$
37. $f(x, y) = (4x - x^2) \cos y$ on the rectangular plate $1 \le x \le 3$, $-\pi/4 \le y \le \pi/4$ (see accompanying figure).

38. $f(x, y) = 4x - 8xy + 2y + 1$ on the triangular plate bounded by the lines $x = 0, y = 0, x + y = 1$ in the first quadrant
39. Find two numbers $a$ and $b$ with $a \le b$ such that

$$\int_a^b (6 - x - x^2)\, dx$$

has its largest value.

40. Find two numbers $a$ and $b$ with $a \le b$ such that

$$\int_a^b (24 - 2x - x^2)^{1/3}\, dx$$

has its largest value.

41. **Temperatures** The flat circular plate in Figure 14.46 has the shape of the region $x^2 + y^2 \le 1$. The plate, including the boundary where $x^2 + y^2 = 1$, is heated so that the temperature at the point $(x, y)$ is

$$T(x, y) = x^2 + 2y^2 - x.$$

Find the temperatures at the hottest and coldest points on the plate.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

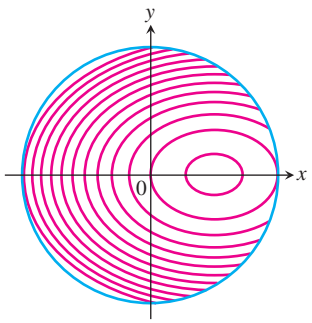


**FIGURE 14.46** Curves of constant temperature are called isotherms. The figure shows isotherms of the temperature function $T(x, y) = x^2 + 2y^2 - x$ on the disk $x^2 + y^2 \le 1$ in the $xy$-plane. Exercise 41 asks you to locate the extreme temperatures.

**42.** Find the critical point of

$$f(x, y) = xy + 2x - \ln x^2y$$

in the open first quadrant $(x > 0, y > 0)$ and show that $f$ takes on a minimum there (Figure 14.47).

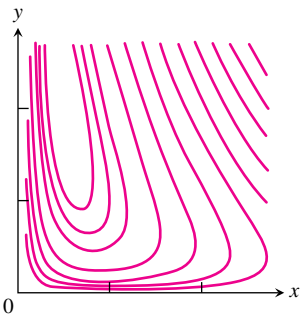

**FIGURE 14.47** The function $f(x, y) = xy + 2x - \ln x^2y$ (selected level curves shown here) takes on a minimum value somewhere in the open first quadrant $x > 0, y > 0$ (Exercise 42).

## Theory and Examples

**43.** Find the maxima, minima, and saddle points of $f(x, y)$, if any, given that

**a.** $f_x = 2x - 4y$ and $f_y = 2y - 4x$

**b.** $f_x = 2x - 2$ and $f_y = 2y - 4$

**c.** $f_x = 9x^2 - 9$ and $f_y = 2y + 4$

Describe your reasoning in each case.

**44.** The discriminant $f_{xx}f_{yy} - f_{xy}{}^2$ is zero at the origin for each of the following functions, so the Second Derivative Test fails there. Determine whether the function has a maximum, a minimum, or neither at the origin by imagining what the surface $z = f(x, y)$ looks like. Describe your reasoning in each case.

**a.** $f(x, y) = x^2y^2$ **b.** $f(x, y) = 1 - x^2y^2$

**c.** $f(x, y) = xy^2$ **d.** $f(x, y) = x^3y^2$

**e.** $f(x, y) = x^3y^3$ **f.** $f(x, y) = x^4y^4$

**45.** Show that $(0, 0)$ is a critical point of $f(x, y) = x^2 + kxy + y^2$ no matter what value the constant $k$ has. (*Hint:* Consider two cases: $k = 0$ and $k \ne 0$.)

**46.** For what values of the constant $k$ does the Second Derivative Test guarantee that $f(x, y) = x^2 + kxy + y^2$ will have a saddle point at $(0, 0)$? A local minimum at $(0, 0)$? For what values of $k$ is the Second Derivative Test inconclusive? Give reasons for your answers.

**47.** If $f_x(a, b) = f_y(a, b) = 0$, must $f$ have a local maximum or minimum value at $(a, b)$? Give reasons for your answer.

**48.** Can you conclude anything about $f(a, b)$ if $f$ and its first and second partial derivatives are continuous throughout a disk centered at $(a, b)$ and $f_{xx}(a, b)$ and $f_{yy}(a, b)$ differ in sign? Give reasons for your answer.

**49.** Among all the points on the graph of $z = 10 - x^2 - y^2$ that lie above the plane $x + 2y + 3z = 0$, find the point farthest from the plane.

**50.** Find the point on the graph of $z = x^2 + y^2 + 10$ nearest the plane $x + 2y - z = 0$.

**51.** The function $f(x, y) = x + y$ fails to have an absolute maximum value in the closed first quadrant $x \ge 0$ and $y \ge 0$. Does this contradict the discussion on finding absolute extrema given in the text? Give reasons for your answer.

**52.** Consider the function $f(x, y) = x^2 + y^2 + 2xy - x - y + 1$ over the square $0 \le x \le 1$ and $0 \le y \le 1$.

**a.** Show that $f$ has an absolute minimum along the line segment $2x + 2y = 1$ in this square. What *is* the absolute minimum value?

**b.** Find the absolute maximum value of $f$ over the square.

## Extreme Values on Parametrized Curves

To find the extreme values of a function $f(x, y)$ on a curve $x = x(t), y = y(t)$, we treat $f$ as a function of the single variable $t$ and

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

use the Chain Rule to find where $df/dt$ is zero. As in any other single-variable case, the extreme values of $f$ are then found among the values at the

**a.** critical points (points where $df/dt$ is zero or fails to exist), and

**b.** endpoints of the parameter domain.

Find the absolute maximum and minimum values of the following functions on the given curves.

**53.** Functions:

**a.** $f(x, y) = x + y$ **b.** $g(x, y) = xy$

**c.** $h(x, y) = 2x^2 + y^2$

Curves:

**i.** The semicircle $x^2 + y^2 = 4, \quad y \geq 0$

**ii.** The quarter circle $x^2 + y^2 = 4, \quad x \geq 0, \quad y \geq 0$

Use the parametric equations $x = 2\cos t, y = 2\sin t$.

**54.** Functions:

**a.** $f(x, y) = 2x + 3y$ **b.** $g(x, y) = xy$

**c.** $h(x, y) = x^2 + 3y^2$

Curves:

**i.** The semi-ellipse $(x^2/9) + (y^2/4) = 1, \quad y \geq 0$

**ii.** The quarter ellipse $(x^2/9) + (y^2/4) = 1, \quad x \geq 0, \quad y \geq 0$

Use the parametric equations $x = 3\cos t, y = 2\sin t$.

**55.** Function: $f(x, y) = xy$

Curves:

**i.** The line $x = 2t, \quad y = t + 1$

**ii.** The line segment $x = 2t, \quad y = t + 1, \quad -1 \leq t \leq 0$

**iii.** The line segment $x = 2t, \quad y = t + 1, \quad 0 \leq t \leq 1$

**56.** Functions:

**a.** $f(x, y) = x^2 + y^2$ **b.** $g(x, y) = 1/(x^2 + y^2)$

Curves:

**i.** The line $x = t, \quad y = 2 - 2t$

**ii.** The line segment $x = t, \quad y = 2 - 2t, \quad 0 \leq t \leq 1$

## Least Squares and Regression Lines

When we try to fit a line $y = mx + b$ to a set of numerical data points $(x_1, y_1), (x_2, y_2), \ldots, (x_n, y_n)$ (Figure 14.48), we usually choose the line that minimizes the sum of the squares of the vertical distances from the points to the line. In theory, this means finding the values of $m$ and $b$ that minimize the value of the function

$$w = (mx_1 + b - y_1)^2 + \cdots + (mx_n + b - y_n)^2. \qquad (1)$$

The values of $m$ and $b$ that do this are found with the First and Second Derivative Tests to be

$$m = \frac{\left(\sum x_k\right)\left(\sum y_k\right) - n\sum x_k y_k}{\left(\sum x_k\right)^2 - n\sum x_k^2}, \qquad (2)$$

$$b = \frac{1}{n}\left(\sum y_k - m\sum x_k\right), \qquad (3)$$

with all sums running from $k = 1$ to $k = n$. Many scientific calculators have these formulas built in, enabling you to find $m$ and $b$ with only a few key strokes after you have entered the data.

The line $y = mx + b$ determined by these values of $m$ and $b$ is called the **least squares line, regression line,** or **trend line** for the data under study. Finding a least squares line lets you

1. summarize data with a simple expression,
2. predict values of $y$ for other, experimentally untried values of $x$,
3. handle data analytically.

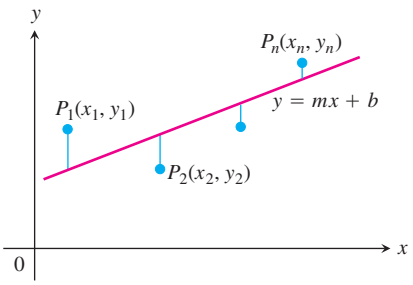

**FIGURE 14.48** To fit a line to noncollinear points, we choose the line that minimizes the sum of the squares of the deviations.

**EXAMPLE** Find the least squares line for the points (0, 1), (1, 3), (2, 2), (3, 4), (4, 5).

**Solution** We organize the calculations in a table:

| $k$ | $x_k$ | $y_k$ | $x_k^2$ | $x_k y_k$ |
|---|---|---|---|---|
| 1 | 0 | 1 | 0 | 0 |
| 2 | 1 | 3 | 1 | 3 |
| 3 | 2 | 2 | 4 | 4 |
| 4 | 3 | 4 | 9 | 12 |
| 5 | 4 | 5 | 16 | 20 |
| $\Sigma$ | 10 | 15 | 30 | 39 |

Then we find

$$m = \frac{(10)(15) - 5(39)}{(10)^2 - 5(30)} = 0.9$$

Equation (2) with $n = 5$ and data from the table

and use the value of $m$ to find

$$b = \frac{1}{5}\left(15 - \left(0.9\right)\left(10\right)\right) = 1.2.$$

Equation (3) with $n = 5, m = 0.9$

The least squares line is $y = 0.9x + 1.2$ (Figure 14.49). ■

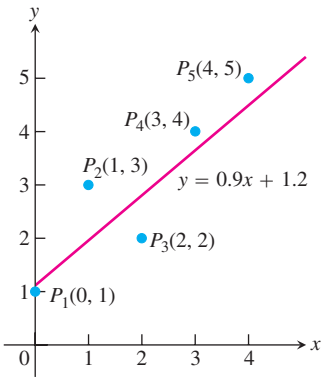

**FIGURE 14.49** The least squares line for the data in the example.

In Exercises 57–60, use Equations (2) and (3) to find the least squares line for each set of data points. Then use the linear equation you obtain to predict the value of $y$ that would correspond to $x = 4$.

**57.** $(-1, 2)$, $(0, 1)$, $(3, -4)$ **58.** $(-2, 0)$, $(0, 2)$, $(2, 3)$

**59.** $(0, 0)$, $(1, 2)$, $(2, 3)$ **60.** $(0, 1)$, $(2, 2)$, $(3, 2)$

T **61.** Write a linear equation for the effect of irrigation on the yield of alfalfa by fitting a least squares line to the data in Table 14.1 (from the University of California Experimental Station, *Bulletin* No. 450, p. 8). Plot the data and draw the line.

**TABLE 14.1** Growth of alfalfa

| $x$ (total seasonal depth of water applied, in.) | $y$ (average alfalfa yield, tons/acre) |
|---|---|
| 12 | 5.27 |
| 18 | 5.68 |
| 24 | 6.25 |
| 30 | 7.21 |
| 36 | 8.20 |
| 42 | 8.71 |

T **62. Craters of Mars** One theory of crater formation suggests that the frequency of large craters should fall off as the square of the diameter (Marcus, *Science*, June 21, 1968, p. 1334). Pictures from *Mariner IV* show the frequencies listed in Table 14.2. Fit a line of the form $F = m(1/D^2) + b$ to the data. Plot the data and draw the line.

**TABLE 14.2** Crater sizes on Mars

| Diameter in km, $D$ | $1/D^2$ (for left value of class interval) | Frequency, $F$ |
|---|---|---|
| 32–45 | 0.001 | 51 |
| 45–64 | 0.0005 | 22 |
| 64–90 | 0.00024 | 14 |
| 90–128 | 0.000123 | 4 |

T **63. Köchel numbers** In 1862, the German musicologist Ludwig von Köchel made a chronological list of the musical works of Wolfgang Amadeus Mozart. This list is the source of the Köchel numbers, or "K numbers," that now accompany the titles of Mozart's pieces (Sinfonia Concertante in E-flat major, K.364, for example). Table 14.3 gives the Köchel numbers and composition dates ($y$) of ten of Mozart's works.

**a.** Plot $y$ vs. K to show that $y$ is close to being a linear function of K.

**b.** Find a least squares line $y = m\text{K} + b$ for the data and add the line to your plot in part (a).

**c.** K.364 was composed in 1779. What date is predicted by the least squares line?

**TABLE 14.3** Compositions by Mozart

| Köchel number, K | Year composed, $y$ |
|---|---|

COMPUTER EXPLORATIONS

## Exploring Local Extrema at Critical Points

In Exercises 65–70, you will explore functions to identify their local extrema. Use a CAS to perform the following steps:

**a.** Plot the function over the given rectangle.

**b.** Plot some level curves in the rectangle.

**c.** Calculate the function's first partial derivatives and use the CAS equation solver to find the critical points. How do the critical points relate to the level curves plotted in part (b)? Which critical points, if any, appear to give a saddle point? Give reasons for your answer.

**d.** Calculate the function's second partial derivatives and find the discriminant $f_{xx}f_{yy} - f_{xy}^2$.

**e.** Using the max-min tests, classify the critical points found in part (c). Are your findings consistent with your discussion in part (c)?

**65.** $f(x, y) = x^2 + y^3 - 3xy, \quad -5 \le x \le 5, \quad -5 \le y \le 5$

**66.** $f(x, y) = x^3 - 3xy^2 + y^2, \quad -2 \le x \le 2, \quad -2 \le y \le 2$

**67.** $f(x, y) = x^4 + y^2 - 8x^2 - 6y + 16, \quad -3 \le x \le 3, \quad -6 \le y \le 6$

**68.** $f(x, y) = 2x^4 + y^4 - 2x^2 - 2y^2 + 3, \quad -3/2 \le x \le 3/2, \quad -3/2 \le y \le 3/2$

**69.** $f(x, y) = 5x^6 + 18x^5 - 30x^4 + 30xy^2 - 120x^3, \quad -4 \le x \le 3, \quad -2 \le y \le 2$

**70.** $f(x, y) = \begin{cases} x^5 \ln (x^2 + y^2), & (x, y) \ne (0, 0) \\ 0, & (x, y) = (0, 0) \end{cases}, \quad -2 \le x \le 2, \quad -2 \le y \le 2$

# 14.8 Lagrange Multipliers

HISTORICAL BIOGRAPHY

Joseph Louis Lagrange
(1736–1813)

Sometimes we need to find the extreme values of a function whose domain is constrained to lie within some particular subset of the plane—a disk, for example, a closed triangular region, or along a curve. In this section, we explore a powerful method for finding extreme values of constrained functions: the method of *Lagrange multipliers*.

## Constrained Maxima and Minima

**EXAMPLE 1** Finding a Minimum with Constraint

Find the point $P(x, y, z)$ closest to the origin on the plane $2x + y - z - 5 = 0$.

**Solution** The problem asks us to find the minimum value of the function

$$|\overrightarrow{OP}| = \sqrt{(x-0)^2 + (y-0)^2 + (z-0)^2}$$
$$= \sqrt{x^2 + y^2 + z^2}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

subject to the constraint that

$$2x + y - z - 5 = 0.$$

Since $|\overrightarrow{OP}|$ has a minimum value wherever the function

$$f(x, y, z) = x^2 + y^2 + z^2$$

has a minimum value, we may solve the problem by finding the minimum value of $f(x, y, z)$ subject to the constraint $2x + y - z - 5 = 0$ (thus avoiding square roots). If we regard $x$ and $y$ as the independent variables in this equation and write $z$ as

$$z = 2x + y - 5,$$

our problem reduces to one of finding the points $(x, y)$ at which the function

$$h(x, y) = f(x, y, 2x + y - 5) = x^2 + y^2 + (2x + y - 5)^2$$

has its minimum value or values. Since the domain of $h$ is the entire $xy$-plane, the First Derivative Test of Section 14.7 tells us that any minima that $h$ might have must occur at points where

$$h_x = 2x + 2(2x + y - 5)(2) = 0, \qquad h_y = 2y + 2(2x + y - 5) = 0.$$

This leads to

$$10x + 4y = 20, \qquad 4x + 4y = 10,$$

and the solution

$$x = \frac{5}{3}, \qquad y = \frac{5}{6}.$$

We may apply a geometric argument together with the Second Derivative Test to show that these values minimize $h$. The $z$-coordinate of the corresponding point on the plane $z = 2x + y - 5$ is

$$z = 2\left(\frac{5}{3}\right) + \frac{5}{6} - 5 = -\frac{5}{6}.$$

Therefore, the point we seek is

$$\text{Closest point:} \qquad P\left(\frac{5}{3}, \frac{5}{6}, -\frac{5}{6}\right).$$

The distance from $P$ to the origin is $5/\sqrt{6} \approx 2.04$. ■

Attempts to solve a constrained maximum or minimum problem by substitution, as we might call the method of Example 1, do not always go smoothly. This is one of the reasons for learning the new method of this section.

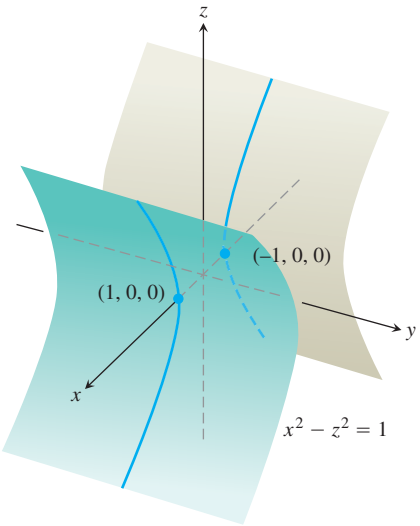

**FIGURE 14.50** The hyperbolic cylinder $x^2 - z^2 - 1 = 0$ in Example 2.

## EXAMPLE 2 Finding a Minimum with Constraint

Find the points closest to the origin on the hyperbolic cylinder $x^2 - z^2 - 1 = 0$.

**Solution 1** The cylinder is shown in Figure 14.50. We seek the points on the cylinder closest to the origin. These are the points whose coordinates minimize the value of the function

$$f(x, y, z) = x^2 + y^2 + z^2$$ Square of the distance

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

subject to the constraint that $x^2 - z^2 - 1 = 0$. If we regard $x$ and $y$ as independent variables in the constraint equation, then

$$z^2 = x^2 - 1$$

and the values of $f(x, y, z) = x^2 + y^2 + z^2$ on the cylinder are given by the function

$$h(x, y) = x^2 + y^2 + (x^2 - 1) = 2x^2 + y^2 - 1.$$

To find the points on the cylinder whose coordinates minimize $f$, we look for the points in the $xy$-plane whose coordinates minimize $h$. The only extreme value of $h$ occurs where

$$h_x = 4x = 0 \qquad \text{and} \qquad h_y = 2y = 0,$$

that is, at the point $(0, 0)$. But there are no points on the cylinder where both $x$ and $y$ are zero. What went wrong?

What happened was that the First Derivative Test found (as it should have) the point *in the domain of h* where $h$ has a minimum value. We, on the other hand, want the points *on the cylinder* where $h$ has a minimum value. Although the domain of $h$ is the entire $xy$-plane, the domain from which we can select the first two coordinates of the points $(x, y, z)$ on the cylinder is restricted to the "shadow" of the cylinder on the $xy$-plane; it does not include the band between the lines $x = -1$ and $x = 1$ (Figure 14.51).

We can avoid this problem if we treat $y$ and $z$ as independent variables (instead of $x$ and $y$) and express $x$ in terms of $y$ and $z$ as

$$x^2 = z^2 + 1.$$

With this substitution, $f(x, y, z) = x^2 + y^2 + z^2$ becomes

$$k(y, z) = (z^2 + 1) + y^2 + z^2 = 1 + y^2 + 2z^2$$

and we look for the points where $k$ takes on its smallest value. The domain of $k$ in the $yz$-plane now matches the domain from which we select the $y$- and $z$-coordinates of the points $(x, y, z)$ on the cylinder. Hence, the points that minimize $k$ in the plane will have corresponding points on the cylinder. The smallest values of $k$ occur where

$$k_y = 2y = 0 \qquad \text{and} \qquad k_z = 4z = 0,$$

or where $y = z = 0$. This leads to

$$x^2 = z^2 + 1 = 1, \qquad x = \pm 1.$$

The corresponding points on the cylinder are $(\pm 1, 0, 0)$. We can see from the inequality

$$k(y, z) = 1 + y^2 + 2z^2 \geq 1$$

that the points $(\pm 1, 0, 0)$ give a minimum value for $k$. We can also see that the minimum distance from the origin to a point on the cylinder is 1 unit.

**The hyperbolic cylinder $x^2 - z^2 = 1$**

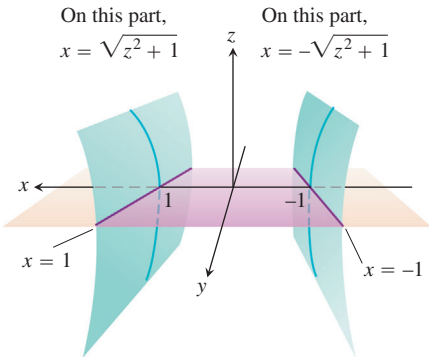

**FIGURE 14.51** The region in the $xy$-plane from which the first two coordinates of the points $(x, y, z)$ on the hyperbolic cylinder $x^2 - z^2 = 1$ are selected excludes the band $-1 < x < 1$ in the $xy$-plane (Example 2).

**Solution 2** Another way to find the points on the cylinder closest to the origin is to imagine a small sphere centered at the origin expanding like a soap bubble until it just touches the cylinder (Figure 14.52). At each point of contact, the cylinder and sphere have the same tangent plane and normal line. Therefore, if the sphere and cylinder are represented as the level surfaces obtained by setting

$$f(x, y, z) = x^2 + y^2 + z^2 - a^2 \qquad \text{and} \qquad g(x, y, z) = x^2 - z^2 - 1$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

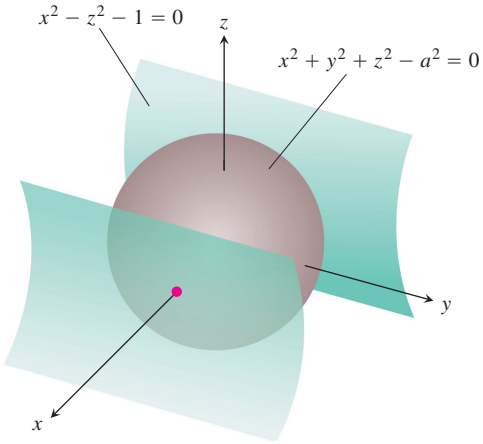

**FIGURE 14.52** A sphere expanding like a soap bubble centered at the origin until it just touches the hyperbolic cylinder $x^2 - z^2 - 1 = 0$ (Example 2).

equal to 0, then the gradients $\nabla f$ and $\nabla g$ will be parallel where the surfaces touch. At any point of contact, we should therefore be able to find a scalar $\lambda$ ("lambda") such that

$$\nabla f = \lambda \nabla g,$$

or

$$2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k} = \lambda(2x\mathbf{i} - 2z\mathbf{k}).$$

Thus, the coordinates $x$, $y$, and $z$ of any point of tangency will have to satisfy the three scalar equations

$$2x = 2\lambda x, \qquad 2y = 0, \qquad 2z = -2\lambda z.$$

For what values of $\lambda$ will a point $(x, y, z)$ whose coordinates satisfy these scalar equations also lie on the surface $x^2 - z^2 - 1 = 0$? To answer this question, we use our knowledge that no point on the surface has a zero $x$-coordinate to conclude that $x \neq 0$. Hence, $2x = 2\lambda x$ only if

$$2 = 2\lambda, \qquad \text{or} \qquad \lambda = 1.$$

For $\lambda = 1$, the equation $2z = -2\lambda z$ becomes $2z = -2z$. If this equation is to be satisfied as well, $z$ must be zero. Since $y = 0$ also (from the equation $2y = 0$), we conclude that the points we seek all have coordinates of the form

$$(x, 0, 0).$$

What points on the surface $x^2 - z^2 = 1$ have coordinates of this form? The answer is the points $(x, 0, 0)$ for which

$$x^2 - (0)^2 = 1, \qquad x^2 = 1, \qquad \text{or} \qquad x = \pm 1.$$

The points on the cylinder closest to the origin are the points $(\pm 1, 0, 0)$. ■

## The Method of Lagrange Multipliers

In Solution 2 of Example 2, we used the **method of Lagrange multipliers**. The method says that the extreme values of a function $f(x, y, z)$ whose variables are subject to a constraint $g(x, y, z) = 0$ are to be found on the surface $g = 0$ at the points where

$$\nabla f = \lambda \nabla g$$

for some scalar $\lambda$ (called a **Lagrange multiplier**).

To explore the method further and see why it works, we first make the following observation, which we state as a theorem.

### THEOREM 12 The Orthogonal Gradient Theorem

Suppose that $f(x, y, z)$ is differentiable in a region whose interior contains a smooth curve

$$C: \quad \mathbf{r}(t) = g(t)\mathbf{i} + h(t)\mathbf{j} + k(t)\mathbf{k}.$$

If $P_0$ is a point on $C$ where $f$ has a local maximum or minimum relative to its values on $C$, then $\nabla f$ is orthogonal to $C$ at $P_0$.

**Proof** We show that $\nabla f$ is orthogonal to the curve's velocity vector at $P_0$. The values of $f$ on $C$ are given by the composite $f(g(t), h(t), k(t))$, whose derivative with respect to $t$ is

$$\frac{df}{dt} = \frac{\partial f}{\partial x}\frac{dg}{dt} + \frac{\partial f}{\partial y}\frac{dh}{dt} + \frac{\partial f}{\partial z}\frac{dk}{dt} = \nabla f \cdot \mathbf{v}.$$

At any point $P_0$ where $f$ has a local maximum or minimum relative to its values on the curve, $df/dt = 0$, so

$$\nabla f \cdot \mathbf{v} = 0.$$ ■

By dropping the $z$-terms in Theorem 12, we obtain a similar result for functions of two variables.

### COROLLARY OF THEOREM 12

At the points on a smooth curve $\mathbf{r}(t) = g(t)\mathbf{i} + h(t)\mathbf{j}$ where a differentiable function $f(x, y)$ takes on its local maxima and minima relative to its values on the curve, $\nabla f \cdot \mathbf{v} = 0$, where $\mathbf{v} = d\mathbf{r}/dt$.

Theorem 12 is the key to the method of Lagrange multipliers. Suppose that $f(x, y, z)$ and $g(x, y, z)$ are differentiable and that $P_0$ is a point on the surface $g(x, y, z) = 0$ where $f$ has a local maximum or minimum value relative to its other values on the surface. Then $f$ takes on a local maximum or minimum at $P_0$ relative to its values on every differentiable curve through $P_0$ on the surface $g(x, y, z) = 0$. Therefore, $\nabla f$ is orthogonal to the velocity vector of every such differentiable curve through $P_0$. So is $\nabla g$, moreover (because $\nabla g$ is orthogonal to the level surface $g = 0$, as we saw in Section 14.5). Therefore, at $P_0$, $\nabla f$ is some scalar multiple $\lambda$ of $\nabla g$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**The Method of Lagrange Multipliers**

Suppose that $f(x, y, z)$ and $g(x, y, z)$ are differentiable. To find the local maximum and minimum values of $f$ subject to the constraint $g(x, y, z) = 0$, find the values of $x$, $y$, $z$, and $\lambda$ that simultaneously satisfy the equations

$$\nabla f = \lambda \nabla g \qquad \text{and} \qquad g(x, y, z) = 0. \tag{1}$$

For functions of two independent variables, the condition is similar, but without the variable $z$.

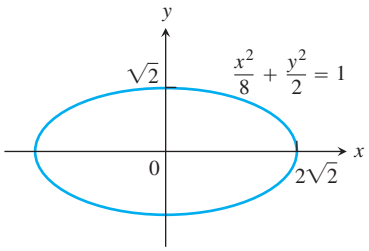

**FIGURE 14.53** Example 3 shows how to find the largest and smallest values of the product $xy$ on this ellipse.

**EXAMPLE 3** Using the Method of Lagrange Multipliers

Find the greatest and smallest values that the function

$$f(x, y) = xy$$

takes on the ellipse (Figure 14.53)

$$\frac{x^2}{8} + \frac{y^2}{2} = 1.$$

**Solution** We want the extreme values of $f(x, y) = xy$ subject to the constraint

$$g(x, y) = \frac{x^2}{8} + \frac{y^2}{2} - 1 = 0.$$

To do so, we first find the values of $x$, $y$, and $\lambda$ for which

$$\nabla f = \lambda \nabla g \qquad \text{and} \qquad g(x, y) = 0.$$

The gradient equation in Equations (1) gives

$$y\mathbf{i} + x\mathbf{j} = \frac{\lambda}{4}x\mathbf{i} + \lambda y\mathbf{j},$$

from which we find

$$y = \frac{\lambda}{4}x, \qquad x = \lambda y, \qquad \text{and} \qquad y = \frac{\lambda}{4}(\lambda y) = \frac{\lambda^2}{4}y,$$

so that $y = 0$ or $\lambda = \pm 2$. We now consider these two cases.

**Case 1:** If $y = 0$, then $x = y = 0$. But $(0, 0)$ is not on the ellipse. Hence, $y \neq 0$.
**Case 2:** If $y \neq 0$, then $\lambda = \pm 2$ and $x = \pm 2y$. Substituting this in the equation $g(x, y) = 0$ gives

$$\frac{(\pm 2y)^2}{8} + \frac{y^2}{2} = 1, \qquad 4y^2 + 4y^2 = 8 \qquad \text{and} \qquad y = \pm 1.$$

The function $f(x, y) = xy$ therefore takes on its extreme values on the ellipse at the four points $(\pm 2, 1)$, $(\pm 2, -1)$. The extreme values are $xy = 2$ and $xy = -2$.

**The Geometry of the Solution**

The level curves of the function $f(x, y) = xy$ are the hyperbolas $xy = c$ (Figure 14.54). The farther the hyperbolas lie from the origin, the larger the absolute value of $f$. We want

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

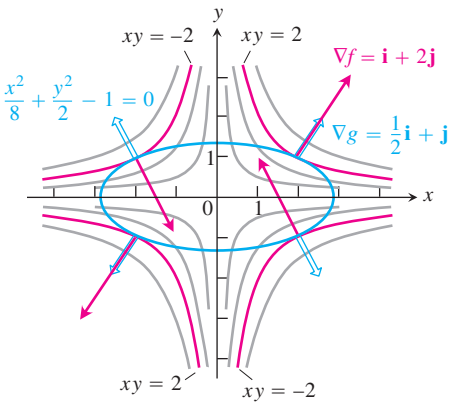

**FIGURE 14.54** When subjected to the constraint $g(x, y) = x^2/8 + y^2/2 - 1 = 0$, the function $f(x, y) = xy$ takes on extreme values at the four points $(\pm 2, \pm 1)$. These are the points on the ellipse when $\nabla f$ (red) is a scalar multiple of $\nabla g$ (blue) (Example 3).

to find the extreme values of $f(x, y)$, given that the point $(x, y)$ also lies on the ellipse $x^2 + 4y^2 = 8$. Which hyperbolas intersecting the ellipse lie farthest from the origin? The hyperbolas that just graze the ellipse, the ones that are tangent to it, are farthest. At these points, any vector normal to the hyperbola is normal to the ellipse, so $\nabla f = y\mathbf{i} + x\mathbf{j}$ is a multiple ($\lambda = \pm 2$) of $\nabla g = (x/4)\mathbf{i} + y\mathbf{j}$. At the point $(2, 1)$, for example,

$$\nabla f = \mathbf{i} + 2\mathbf{j}, \qquad \nabla g = \frac{1}{2}\mathbf{i} + \mathbf{j}, \qquad \text{and} \qquad \nabla f = 2\nabla g.$$

At the point $(-2, 1)$,

$$\nabla f = \mathbf{i} - 2\mathbf{j}, \qquad \nabla g = -\frac{1}{2}\mathbf{i} + \mathbf{j}, \qquad \text{and} \qquad \nabla f = -2\nabla g. \quad \blacksquare$$

**EXAMPLE 4** Finding Extreme Function Values on a Circle

Find the maximum and minimum values of the function $f(x, y) = 3x + 4y$ on the circle $x^2 + y^2 = 1$.

**Solution** We model this as a Lagrange multiplier problem with

$$f(x, y) = 3x + 4y, \qquad g(x, y) = x^2 + y^2 - 1$$

and look for the values of $x$, $y$, and $\lambda$ that satisfy the equations

$$\nabla f = \lambda \nabla g: \quad 3\mathbf{i} + 4\mathbf{j} = 2x\lambda\mathbf{i} + 2y\lambda\mathbf{j}$$
$$g(x, y) = 0: \quad x^2 + y^2 - 1 = 0.$$

The gradient equation in Equations (1) implies that $\lambda \neq 0$ and gives

$$x = \frac{3}{2\lambda}, \qquad y = \frac{2}{\lambda}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

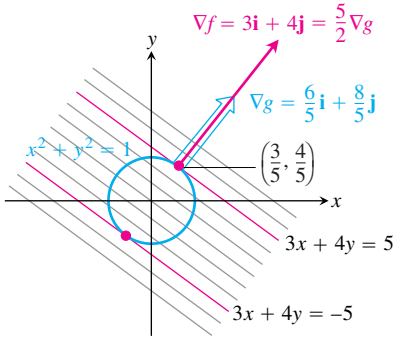

**FIGURE 14.55** The function $f(x, y) = 3x + 4y$ takes on its largest value on the unit circle $g(x, y) = x^2 + y^2 - 1 = 0$ at the point $(3/5, 4/5)$ and its smallest value at the point $(-3/5, -4/5)$ (Example 4). At each of these points, $\nabla f$ is a scalar multiple of $\nabla g$. The figure shows the gradients at the first point but not the second.

These equations tell us, among other things, that $x$ and $y$ have the same sign. With these values for $x$ and $y$, the equation $g(x, y) = 0$ gives

$$\left(\frac{3}{2\lambda}\right)^2 + \left(\frac{2}{\lambda}\right)^2 - 1 = 0,$$

so

$$\frac{9}{4\lambda^2} + \frac{4}{\lambda^2} = 1, \qquad 9 + 16 = 4\lambda^2, \qquad 4\lambda^2 = 25, \qquad \text{and} \qquad \lambda = \pm\frac{5}{2}.$$

Thus,

$$x = \frac{3}{2\lambda} = \pm\frac{3}{5}, \qquad y = \frac{2}{\lambda} = \pm\frac{4}{5},$$

and $f(x, y) = 3x + 4y$ has extreme values at $(x, y) = \pm(3/5, 4/5)$.

By calculating the value of $3x + 4y$ at the points $\pm(3/5, 4/5)$, we see that its maximum and minimum values on the circle $x^2 + y^2 = 1$ are

$$3\left(\frac{3}{5}\right) + 4\left(\frac{4}{5}\right) = \frac{25}{5} = 5 \qquad \text{and} \qquad 3\left(-\frac{3}{5}\right) + 4\left(-\frac{4}{5}\right) = -\frac{25}{5} = -5.$$

### The Geometry of the Solution

The level curves of $f(x, y) = 3x + 4y$ are the lines $3x + 4y = c$ (Figure 14.55). The farther the lines lie from the origin, the larger the absolute value of $f$. We want to find the extreme values of $f(x, y)$ given that the point $(x, y)$ also lies on the circle $x^2 + y^2 = 1$. Which lines intersecting the circle lie farthest from the origin? The lines tangent to the circle are farthest. At the points of tangency, any vector normal to the line is normal to the circle, so the gradient $\nabla f = 3\mathbf{i} + 4\mathbf{j}$ is a multiple ($\lambda = \pm 5/2$) of the gradient $\nabla g = 2x\mathbf{i} + 2y\mathbf{j}$. At the point $(3/5, 4/5)$, for example,

$$\nabla f = 3\mathbf{i} + 4\mathbf{j}, \qquad \nabla g = \frac{6}{5}\mathbf{i} + \frac{8}{5}\mathbf{j}, \qquad \text{and} \qquad \nabla f = \frac{5}{2}\nabla g. \quad \blacksquare$$

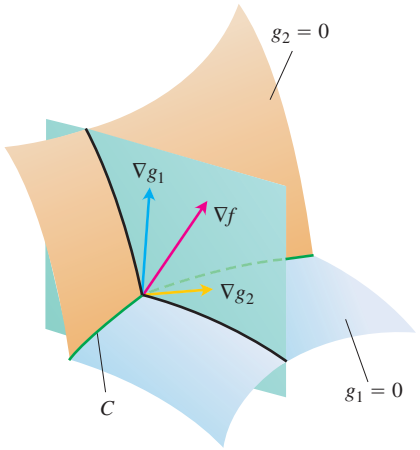

**FIGURE 14.56** The vectors $\nabla g_1$ and $\nabla g_2$ lie in a plane perpendicular to the curve $C$ because $\nabla g_1$ is normal to the surface $g_1 = 0$ and $\nabla g_2$ is normal to the surface $g_2 = 0$.

## Lagrange Multipliers with Two Constraints

Many problems require us to find the extreme values of a differentiable function $f(x, y, z)$ whose variables are subject to two constraints. If the constraints are

$$g_1(x, y, z) = 0 \qquad \text{and} \qquad g_2(x, y, z) = 0$$

and $g_1$ and $g_2$ are differentiable, with $\nabla g_1$ not parallel to $\nabla g_2$, we find the constrained local maxima and minima of $f$ by introducing two Lagrange multipliers $\lambda$ and $\mu$ (mu, pronounced "mew"). That is, we locate the points $P(x, y, z)$ where $f$ takes on its constrained extreme values by finding the values of $x, y, z, \lambda,$ and $\mu$ that simultaneously satisfy the equations

$$\nabla f = \lambda\nabla g_1 + \mu\nabla g_2, \qquad g_1(x, y, z) = 0, \qquad g_2(x, y, z) = 0 \qquad (2)$$

Equations (2) have a nice geometric interpretation. The surfaces $g_1 = 0$ and $g_2 = 0$ (usually) intersect in a smooth curve, say $C$ (Figure 14.56). Along this curve we seek the points where $f$ has local maximum and minimum values relative to its other values on the curve.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

These are the points where $\nabla f$ is normal to $C$, as we saw in Theorem 12. But $\nabla g_1$ and $\nabla g_2$ are also normal to $C$ at these points because $C$ lies in the surfaces $g_1 = 0$ and $g_2 = 0$. Therefore, $\nabla f$ lies in the plane determined by $\nabla g_1$ and $\nabla g_2$, which means that $\nabla f = \lambda \nabla g_1 + \mu \nabla g_2$ for some $\lambda$ and $\mu$. Since the points we seek also lie in both surfaces, their coordinates must satisfy the equations $g_1(x, y, z) = 0$ and $g_2(x, y, z) = 0$, which are the remaining requirements in Equations (2).

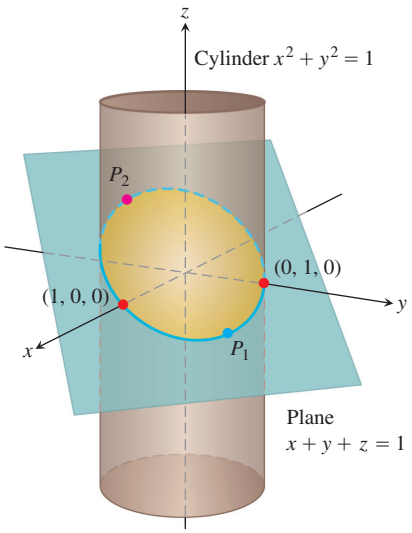

**FIGURE 14.57** On the ellipse where the plane and cylinder meet, what are the points closest to and farthest from the origin? (Example 5)

## EXAMPLE 5 Finding Extremes of Distance on an Ellipse

The plane $x + y + z = 1$ cuts the cylinder $x^2 + y^2 = 1$ in an ellipse (Figure 14.57). Find the points on the ellipse that lie closest to and farthest from the origin.

**Solution** We find the extreme values of

$$f(x, y, z) = x^2 + y^2 + z^2$$

(the square of the distance from $(x, y, z)$ to the origin) subject to the constraints

$$g_1(x, y, z) = x^2 + y^2 - 1 = 0 \tag{3}$$

$$g_2(x, y, z) = x + y + z - 1 = 0. \tag{4}$$

The gradient equation in Equations (2) then gives

$$\nabla f = \lambda \nabla g_1 + \mu \nabla g_2$$

$$2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k} = \lambda(2x\mathbf{i} + 2y\mathbf{j}) + \mu(\mathbf{i} + \mathbf{j} + \mathbf{k})$$

$$2x\mathbf{i} + 2y\mathbf{j} + 2z\mathbf{k} = (2\lambda x + \mu)\mathbf{i} + (2\lambda y + \mu)\mathbf{j} + \mu\mathbf{k}$$

or

$$2x = 2\lambda x + \mu, \qquad 2y = 2\lambda y + \mu, \qquad 2z = \mu. \tag{5}$$

The scalar equations in Equations (5) yield

$$\begin{aligned} 2x = 2\lambda x + 2z &\Rightarrow (1 - \lambda)x = z, \\ 2y = 2\lambda y + 2z &\Rightarrow (1 - \lambda)y = z. \end{aligned} \tag{6}$$

Equations (6) are satisfied simultaneously if either $\lambda = 1$ and $z = 0$ or $\lambda \neq 1$ and $x = y = z/(1 - \lambda)$.

If $z = 0$, then solving Equations (3) and (4) simultaneously to find the corresponding points on the ellipse gives the two points (1, 0, 0) and (0, 1, 0). This makes sense when you look at Figure 14.57.

If $x = y$, then Equations (3) and (4) give

$$\begin{aligned} x^2 + x^2 - 1 = 0 \qquad & \qquad x + x + z - 1 = 0 \\ 2x^2 = 1 \qquad & \qquad z = 1 - 2x \\ x = \pm\frac{\sqrt{2}}{2} \qquad & \qquad z = 1 \mp \sqrt{2}. \end{aligned}$$

The corresponding points on the ellipse are

$$P_1 = \left(\frac{\sqrt{2}}{2}, \frac{\sqrt{2}}{2}, 1 - \sqrt{2}\right) \quad \text{and} \quad P_2 = \left(-\frac{\sqrt{2}}{2}, -\frac{\sqrt{2}}{2}, 1 + \sqrt{2}\right).$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Here we need to be careful, however. Although $P_1$ and $P_2$ both give local maxima of $f$ on the ellipse, $P_2$ is farther from the origin than $P_1$.

The points on the ellipse closest to the origin are (1, 0, 0) and (0, 1, 0). The point on the ellipse farthest from the origin is $P_2$. ■

# EXERCISES 14.8

## Two Independent Variables with One Constraint

1. **Extrema on an ellipse** Find the points on the ellipse $x^2 + 2y^2 = 1$ where $f(x, y) = xy$ as its extreme values.
2. **Extrema on a circle** Find the extreme values of $f(x, y) = xy$ subject to the constraint $g(x, y) = x^2 + y^2 - 10 = 0$.
3. **Maximum on a line** Find the maximum value of $f(x, y) = 49 - x^2 - y^2$ on the line $x + 3y = 10$.
4. **Extrema on a line** Find the local extreme values of $f(x, y) = x^2y$ on the line $x + y = 3$.
5. **Constrained minimum** Find the points on the curve $xy^2 = 54$ nearest the origin.
6. **Constrained minimum** Find the points on the curve $x^2y = 2$ nearest the origin.
7. Use the method of Lagrange multipliers to find
   a. **Minimum on a hyperbola** The minimum value of $x + y$, subject to the constraints $xy = 16, x > 0, y > 0$
   b. **Maximum on a line** The maximum value of $xy$, subject to the constraint $x + y = 16$.

   Comment on the geometry of each solution.
8. **Extrema on a curve** Find the points on the curve $x^2 + xy + y^2 = 1$ in the $xy$-plane that are nearest to and farthest from the origin.
9. **Minimum surface area with fixed volume** Find the dimensions of the closed right circular cylindrical can of smallest surface area whose volume is $16\pi$ cm$^3$.
10. **Cylinder in a sphere** Find the radius and height of the open right circular cylinder of largest surface area that can be inscribed in a sphere of radius $a$. What *is* the largest surface area?
11. **Rectangle of greatest area in an ellipse** Use the method of Lagrange multipliers to find the dimensions of the rectangle of greatest area that can be inscribed in the ellipse $x^2/16 + y^2/9 = 1$ with sides parallel to the coordinate axes.
12. **Rectangle of longest perimeter in an ellipse** Find the dimensions of the rectangle of largest perimeter that can be inscribed in the ellipse $x^2/a^2 + y^2/b^2 = 1$ with sides parallel to the coordinate axes. What *is* the largest perimeter?
13. **Extrema on a circle** Find the maximum and minimum values of $x^2 + y^2$ subject to the constraint $x^2 - 2x + y^2 - 4y = 0$.
14. **Extrema on a circle** Find the maximum and minimum values of $3x - y + 6$ subject to the constraint $x^2 + y^2 = 4$.
15. **Ant on a metal plate** The temperature at a point $(x, y)$ on a metal plate is $T(x, y) = 4x^2 - 4xy + y^2$. An ant on the plate walks around the circle of radius 5 centered at the origin. What are the highest and lowest temperatures encountered by the ant?
16. **Cheapest storage tank** Your firm has been asked to design a storage tank for liquid petroleum gas. The customer's specifications call for a cylindrical tank with hemispherical ends, and the tank is to hold 8000 m$^3$ of gas. The customer also wants to use the smallest amount of material possible in building the tank. What radius and height do you recommend for the cylindrical portion of the tank?

## Three Independent Variables with One Constraint

17. **Minimum distance to a point** Find the point on the plane $x + 2y + 3z = 13$ closest to the point $(1, 1, 1)$.
18. **Maximum distance to a point** Find the point on the sphere $x^2 + y^2 + z^2 = 4$ farthest from the point $(1, -1, 1)$.
19. **Minimum distance to the origin** Find the minimum distance from the surface $x^2 + y^2 - z^2 = 1$ to the origin.
20. **Minimum distance to the origin** Find the point on the surface $z = xy + 1$ nearest the origin.
21. **Minimum distance to the origin** Find the points on the surface $z^2 = xy + 4$ closest to the origin.
22. **Minimum distance to the origin** Find the point(s) on the surface $xyz = 1$ closest to the origin.
23. **Extrema on a sphere** Find the maximum and minimum values of

$$f(x, y, z) = x - 2y + 5z$$

on the sphere $x^2 + y^2 + z^2 = 30$.

24. **Extrema on a sphere** Find the points on the sphere $x^2 + y^2 + z^2 = 25$ where $f(x, y, z) = x + 2y + 3z$ has its maximum and minimum values.
25. **Minimizing a sum of squares** Find three real numbers whose sum is 9 and the sum of whose squares is as small as possible.
26. **Maximizing a product** Find the largest product the positive numbers $x$, $y$, and $z$ can have if $x + y + z^2 = 16$.
27. **Rectangular box of longest volume in a sphere** Find the dimensions of the closed rectangular box with maximum volume that can be inscribed in the unit sphere.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**28. Box with vertex on a plane** Find the volume of the largest closed rectangular box in the first octant having three faces in the coordinate planes and a vertex on the plane $x/a + y/b + z/c = 1$, where $a > 0$, $b > 0$, and $c > 0$.

**29. Hottest point on a space probe** A space probe in the shape of the ellipsoid

$$4x^2 + y^2 + 4z^2 = 16$$

enters Earth's atmosphere and its surface begins to heat. After 1 hour, the temperature at the point $(x, y, z)$ on the probe's surface is

$$T(x, y, z) = 8x^2 + 4yz - 16z + 600\,.$$

Find the hottest point on the probe's surface.

**30. Extreme temperatures on a sphere** Suppose that the Celsius temperature at the point $(x, y, z)$ on the sphere $x^2 + y^2 + z^2 = 1$ is $T = 400xyz^2$. Locate the highest and lowest temperatures on the sphere.

**31. Maximizing a utility function: an example from economics** In economics, the usefulness or *utility* of amounts $x$ and $y$ of two capital goods $G_1$ and $G_2$ is sometimes measured by a function $U(x, y)$. For example, $G_1$ and $G_2$ might be two chemicals a pharmaceutical company needs to have on hand and $U(x, y)$ the gain from manufacturing a product whose synthesis requires different amounts of the chemicals depending on the process used. If $G_1$ costs $a$ dollars per kilogram, $G_2$ costs $b$ dollars per kilogram, and the total amount allocated for the purchase of $G_1$ and $G_2$ together is $c$ dollars, then the company's managers want to maximize $U(x, y)$ given that $ax + by = c$. Thus, they need to solve a typical Lagrange multiplier problem.

Suppose that

$$U(x, y) = xy + 2x$$

and that the equation $ax + by = c$ simplifies to

$$2x + y = 30.$$

Find the maximum value of $U$ and the corresponding values of $x$ and $y$ subject to this latter constraint.

**32. Locating a radio telescope** You are in charge of erecting a radio telescope on a newly discovered planet. To minimize interference, you want to place it where the magnetic field of the planet is weakest. The planet is spherical, with a radius of 6 units. Based on a coordinate system whose origin is at the center of the planet, the strength of the magnetic field is given by $M(x, y, z) = 6x - y^2 + xz + 60$. Where should you locate the radio telescope?

## Extreme Values Subject to Two Constraints

**33.** Maximize the function $f(x, y, z) = x^2 + 2y - z^2$ subject to the constraints $2x - y = 0$ and $y + z = 0$.

**34.** Minimize the function $f(x, y, z) = x^2 + y^2 + z^2$ subject to the constraints $x + 2y + 3z = 6$ and $x + 3y + 9z = 9$.

**35. Minimum distance to the origin** Find the point closest to the origin on the line of intersection of the planes $y + 2z = 12$ and $x + y = 6$.

**36. Maximum value on line of intersection** Find the maximum value that $f(x, y, z) = x^2 + 2y - z^2$ can have on the line of intersection of the planes $2x - y = 0$ and $y + z = 0$.

**37. Extrema on a curve of intersection** Find the extreme values of $f(x, y, z) = x^2yz + 1$ on the intersection of the plane $z = 1$ with the sphere $x^2 + y^2 + z^2 = 10$.

**38. a. Maximum on line of intersection** Find the maximum value of $w = xyz$ on the line of intersection of the two planes $x + y + z = 40$ and $x + y - z = 0$.

**b.** Give a geometric argument to support your claim that you have found a maximum, and not a minimum, value of $w$.

**39. Extrema on a circle of intersection** Find the extreme values of the function $f(x, y, z) = xy + z^2$ on the circle in which the plane $y - x = 0$ intersects the sphere $x^2 + y^2 + z^2 = 4$.

**40. Minimum distance to the origin** Find the point closest to the origin on the curve of intersection of the plane $2y + 4z = 5$ and the cone $z^2 = 4x^2 + 4y^2$.

## Theory and Examples

**41. The condition $\nabla f = \lambda \nabla g$ is not sufficient** Although $\nabla f = \lambda \nabla g$ is a necessary condition for the occurrence of an extreme value of $f(x, y)$ subject to the condition $g(x, y) = 0$, it does not in itself guarantee that one exists. As a case in point, try using the method of Lagrange multipliers to find a maximum value of $f(x, y) = x + y$ subject to the constraint that $xy = 16$. The method will identify the two points $(4, 4)$ and $(-4, -4)$ as candidates for the location of extreme values. Yet the sum $(x + y)$ has no maximum value on the hyperbola $xy = 16$. The farther you go from the origin on this hyperbola in the first quadrant, the larger the sum $f(x, y) = x + y$ becomes.

**42. A least squares plane** The plane $z = Ax + By + C$ is to be "fitted" to the following points $(x_k, y_k, z_k)$:

$$(0, 0, 0), \quad (0, 1, 1), \quad (1, 1, 1), \quad (1, 0, -1).$$

Find the values of $A$, $B$, and $C$ that minimize

$$\sum_{k=1}^{4} (Ax_k + By_k + C - z_k)^2,$$

the sum of the squares of the deviations.

**43. a. Maximum on a sphere** Show that the maximum value of $a^2b^2c^2$ on a sphere of radius $r$ centered at the origin of a Cartesian $abc$-coordinate system is $(r^2/3)^3$.

**b. Geometric and arithmetic means** Using part (a), show that for nonnegative numbers $a$, $b$, and $c$,

$$(abc)^{1/3} \le \frac{a + b + c}{3};$$

that is, the *geometric mean* of three nonnegative numbers is less than or equal to their *arithmetic mean*.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**44. Sum of products** Let $a_1, a_2, \ldots, a_n$ be $n$ positive numbers. Find the maximum of $\Sigma_{i=1}^{n} a_i x_i$ subject to the constraint $\Sigma_{i=1}^{n} x_i^2 = 1$.

COMPUTER EXPLORATIONS

## Implementing the Method of Lagrange Multipliers

In Exercises 45–50, use a CAS to perform the following steps implementing the method of Lagrange multipliers for finding constrained extrema:

**a.** Form the function $h = f - \lambda_1 g_1 - \lambda_2 g_2$, where $f$ is the function to optimize subject to the constraints $g_1 = 0$ and $g_2 = 0$.

**b.** Determine all the first partial derivatives of $h$, including the partials with respect to $\lambda_1$ and $\lambda_2$, and set them equal to 0.

**c.** Solve the system of equations found in part (b) for all the unknowns, including $\lambda_1$ and $\lambda_2$.

**d.** Evaluate $f$ at each of the solution points found in part (c) and select the extreme value subject to the constraints asked for in the exercise.

**45.** Minimize $f(x, y, z) = xy + yz$ subject to the constraints $x^2 + y^2 - 2 = 0$ and $x^2 + z^2 - 2 = 0$.

**46.** Minimize $f(x, y, z) = xyz$ subject to the constraints $x^2 + y^2 - 1 = 0$ and $x - z = 0$.

**47.** Maximize $f(x, y, z) = x^2 + y^2 + z^2$ subject to the constraints $2y + 4z - 5 = 0$ and $4x^2 + 4y^2 - z^2 = 0$.

**48.** Minimize $f(x, y, z) = x^2 + y^2 + z^2$ subject to the constraints $x^2 - xy + y^2 - z^2 - 1 = 0$ and $x^2 + y^2 - 1 = 0$.

**49.** Minimize $f(x, y, z, w) = x^2 + y^2 + z^2 + w^2$ subject to the constraints $2x - y + z - w - 1 = 0$ and $x + y - z + w - 1 = 0$.

**50.** Determine the distance from the line $y = x + 1$ to the parabola $y^2 = x$. (*Hint:* Let $(x, y)$ be a point on the line and $(w, z)$ a point on the parabola. You want to minimize $(x - w)^2 + (y - z)^2$.)

# 14.9 Partial Derivatives with Constrained Variables

In finding partial derivatives of functions like $w = f(x, y)$, we have assumed $x$ and $y$ to be independent. In many applications, however, this is not the case. For example, the internal energy $U$ of a gas may be expressed as a function $U = f(P, V, T)$ of pressure $P$, volume $V$, and temperature $T$. If the individual molecules of the gas do not interact, however, $P$, $V$, and $T$ obey (and are constrained by) the ideal gas law

$$PV = nRT \qquad (n \text{ and } R \text{ constant}),$$

and fail to be independent. In this section we learn how to find partial derivatives in situations like this, which you may encounter in studying economics, engineering, or physics.†

## Decide Which Variables Are Dependent and Which Are Independent

If the variables in a function $w = f(x, y, z)$ are constrained by a relation like the one imposed on $x$, $y$, and $z$ by the equation $z = x^2 + y^2$, the geometric meanings and the numerical values of the partial derivatives of $f$ will depend on which variables are chosen to be dependent and which are chosen to be independent. To see how this choice can affect the outcome, we consider the calculation of $\partial w/\partial x$ when $w = x^2 + y^2 + z^2$ and $z = x^2 + y^2$.

**EXAMPLE 1** Finding a Partial Derivative with Constrained Independent Variables

Find $\partial w/\partial x$ if $w = x^2 + y^2 + z^2$ and $z = x^2 + y^2$.

†This section is based on notes written for MIT by Arthur P. Mattuck.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Solution** We are given two equations in the four unknowns $x$, $y$, $z$, and $w$. Like many such systems, this one can be solved for two of the unknowns (the dependent variables) in terms of the others (the independent variables). In being asked for $\partial w/\partial x$, we are told that $w$ is to be a dependent variable and $x$ an independent variable. The possible choices for the other variables come down to

| *Dependent* | *Independent* |
|---|---|
| $w, z$ | $x, y$ |
| $w, y$ | $x, z$ |

In either case, we can express $w$ explicitly in terms of the selected independent variables. We do this by using the second equation $z = x^2 + y^2$ to eliminate the remaining dependent variable in the first equation.

In the first case, the remaining dependent variable is $z$. We eliminate it from the first equation by replacing it by $x^2 + y^2$. The resulting expression for $w$ is

$$w = x^2 + y^2 + z^2 = x^2 + y^2 + (x^2 + y^2)^2$$
$$= x^2 + y^2 + x^4 + 2x^2y^2 + y^4$$

and

$$\frac{\partial w}{\partial x} = 2x + 4x^3 + 4xy^2. \tag{1}$$

This is the formula for $\partial w/\partial x$ when $x$ and $y$ are the independent variables.

In the second case, where the independent variables are $x$ and $z$ and the remaining dependent variable is $y$, we eliminate the dependent variable $y$ in the expression for $w$ by replacing $y^2$ in the second equation by $z - x^2$. This gives

$$w = x^2 + y^2 + z^2 = x^2 + (z - x^2) + z^2 = z + z^2$$

and

$$\frac{\partial w}{\partial x} = 0. \tag{2}$$

This is the formula for $\partial w/\partial x$ when $x$ and $z$ are the independent variables.

The formulas for $\partial w/\partial x$ in Equations (1) and (2) are genuinely different. We cannot change either formula into the other by using the relation $z = x^2 + y^2$. There is not just one $\partial w/\partial x$, there are two, and we see that the original instruction to find $\partial w/\partial x$ was incomplete. *Which* $\partial w/\partial x$? we ask.

The geometric interpretations of Equations (1) and (2) help to explain why the equations differ. The function $w = x^2 + y^2 + z^2$ measures the square of the distance from the point $(x, y, z)$ to the origin. The condition $z = x^2 + y^2$ says that the point $(x, y, z)$ lies on the paraboloid of revolution shown in Figure 14.58. What does it mean to calculate $\partial w/\partial x$ at a point $P(x, y, z)$ that can move only on this surface? What is the value of $\partial w/\partial x$ when the coordinates of $P$ are, say, $(1, 0, 1)$?

If we take $x$ and $y$ to be independent, then we find $\partial w/\partial x$ by holding $y$ fixed (at $y = 0$ in this case) and letting $x$ vary. Hence, $P$ moves along the parabola $z = x^2$ in the $xz$-plane. As $P$ moves on this parabola, $w$, which is the square of the distance from $P$ to the origin, changes. We calculate $\partial w/\partial x$ in this case (our first solution above) to be

$$\frac{\partial w}{\partial x} = 2x + 4x^3 + 4xy^2.$$

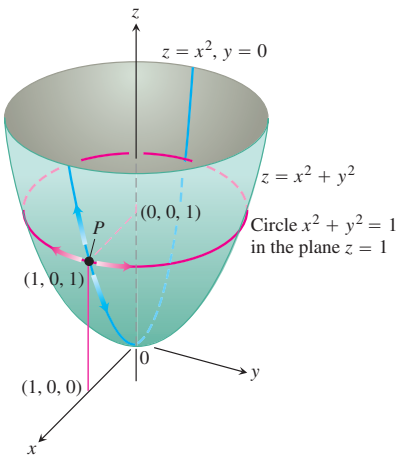

**FIGURE 14.58** If $P$ is constrained to lie on the paraboloid $z = x^2 + y^2$, the value of the partial derivative of $w = x^2 + y^2 + z^2$ with respect to $x$ at $P$ depends on the direction of motion (Example 1). (1) As $x$ changes, with $y = 0$, $P$ moves up or down the surface on the parabola $z = x^2$ in the $xz$-plane with $\partial w/\partial x = 2x + 4x^3$. (2) As $x$ changes, with $z = 1$, $P$ moves on the circle $x^2 + y^2 = 1$, $z = 1$, and $\partial w/\partial x = 0$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

At the point $P(1, 0, 1)$, the value of this derivative is

$$\frac{\partial w}{\partial x} = 2 + 4 + 0 = 6.$$

If we take $x$ and $z$ to be independent, then we find $\partial w/\partial x$ by holding $z$ fixed while $x$ varies. Since the $z$-coordinate of $P$ is 1, varying $x$ moves $P$ along a circle in the plane $z = 1$. As $P$ moves along this circle, its distance from the origin remains constant, and $w$, being the square of this distance, does not change. That is,

$$\frac{\partial w}{\partial x} = 0,$$

as we found in our second solution. ■

### How to Find $\partial w/\partial x$ When the Variables in $w = f(x, y, z)$ Are Constrained by Another Equation

As we saw in Example 1, a typical routine for finding $\partial w/\partial x$ when the variables in the function $w = f(x, y, z)$ are related by another equation has three steps. These steps apply to finding $\partial w/\partial y$ and $\partial w/\partial z$ as well.

1. *Decide* which variables are to be dependent and which are to be independent. (In practice, the decision is based on the physical or theoretical context of our work. In the exercises at the end of this section, we say which variables are which.)
2. *Eliminate* the other dependent variable(s) in the expression for $w$.
3. *Differentiate* as usual.

If we cannot carry out Step 2 after deciding which variables are dependent, we differentiate the equations as they are and try to solve for $\partial w/\partial x$ afterward. The next example shows how this is done.

**EXAMPLE 2** Finding a Partial Derivative with Identified Constrained Independent Variables

Find $\partial w/\partial x$ at the point $(x, y, z) = (2, -1, 1)$ if

$$w = x^2 + y^2 + z^2, \qquad z^3 - xy + yz + y^3 = 1,$$

and $x$ and $y$ are the independent variables.

**Solution** It is not convenient to eliminate $z$ in the expression for $w$. We therefore differentiate both equations implicitly with respect to $x$, treating $x$ and $y$ as independent variables and $w$ and $z$ as dependent variables. This gives

$$\frac{\partial w}{\partial x} = 2x + 2z\frac{\partial z}{\partial x} \tag{3}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

and

$$3z^2\frac{\partial z}{\partial x} - y + y\frac{\partial z}{\partial x} + 0 = 0. \tag{4}$$

These equations may now be combined to express $\partial w/\partial x$ in terms of $x$, $y$, and $z$. We solve Equation (4) for $\partial z/\partial x$ to get

$$\frac{\partial z}{\partial x} = \frac{y}{y + 3z^2}$$

and substitute into Equation (3) to get

$$\frac{\partial w}{\partial x} = 2x + \frac{2yz}{y + 3z^2}.$$

The value of this derivative at $(x, y, z) = (2, -1, 1)$ is

$$\left(\frac{\partial w}{\partial x}\right)_{(2,-1,1)} = 2(2) + \frac{2(-1)(1)}{-1 + 3(1)^2} = 4 + \frac{-2}{2} = 3. \quad \blacksquare$$

HISTORICAL BIOGRAPHY

Sonya Kovalevsky

## Notation

To show what variables are assumed to be independent in calculating a derivative, we can use the following notation:

$\left(\frac{\partial w}{\partial x}\right)_y$ $\partial w/\partial x$ with $x$ and $y$ independent

$\left(\frac{\partial f}{\partial y}\right)_{x,t}$ $\partial f/\partial y$ with $y$, $x$ and $t$ independent

**EXAMPLE 3** Finding a Partial Derivative with Constrained Variables Notationally Identified

Find $(\partial w/\partial x)_{y,z}$ if $w = x^2 + y - z + \sin t$ and $x + y = t$.

**Solution** With $x$, $y$, $z$ independent, we have

$$t = x + y, \qquad w = x^2 + y - z + \sin(x + y)$$

$$\left(\frac{\partial w}{\partial x}\right)_{y,z} = 2x + 0 - 0 + \cos(x + y)\frac{\partial}{\partial x}(x + y)$$

$$= 2x + \cos(x + y). \quad \blacksquare$$

## Arrow Diagrams

In solving problems like the one in Example 3, it often helps to start with an arrow diagram that shows how the variables and functions are related. If

$$w = x^2 + y - z + \sin t \qquad \text{and} \qquad x + y = t$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

and we are asked to find $\partial w/\partial x$ when $x$, $y$, and $z$ are independent, the appropriate diagram is one like this:

$$\begin{pmatrix} x \\ y \\ z \end{pmatrix} \rightarrow \begin{pmatrix} x \\ y \\ z \\ t \end{pmatrix} \rightarrow w \tag{5}$$

Independent variables | Intermediate variables | Dependent variable

To avoid confusion between the independent and intermediate variables with the same symbolic names in the diagram, it is helpful to rename the intermediate variables (so they are seen as *functions* of the independent variables). Thus, let $u = x$, $v = y$, and $s = z$ denote the renamed intermediate variables. With this notation, the arrow diagram becomes

$$\begin{pmatrix} x \\ y \\ z \end{pmatrix} \rightarrow \begin{pmatrix} u \\ v \\ s \\ t \end{pmatrix} \rightarrow w \tag{6}$$

Independent variables | Intermediate variables and relations $u = x$, $v = y$, $s = z$, $t = x + y$ | Dependent variable

The diagram shows the independent variables on the left, the intermediate variables and their relation to the independent variables in the middle, and the dependent variable on the right. The function $w$ now becomes

$$w = u^2 + v - s + \sin t,$$

where

$$u = x, \qquad v = y, \qquad s = z, \qquad \text{and} \qquad t = x + y.$$

To find $\partial w/\partial x$, we apply the four-variable form of the Chain Rule to $w$, guided by the arrow diagram in Equation (6):

$$\begin{aligned} \frac{\partial w}{\partial x} &= \frac{\partial w}{\partial u}\frac{\partial u}{\partial x} + \frac{\partial w}{\partial v}\frac{\partial v}{\partial x} + \frac{\partial w}{\partial s}\frac{\partial s}{\partial x} + \frac{\partial w}{\partial t}\frac{\partial t}{\partial x} \\ &= (2u)(1) + (1)(0) + (-1)(0) + (\cos t)(1) \\ &= 2u + \cos t \\ &= 2x + \cos(x + y). \end{aligned}$$

Substituting the original independent variables $u = x$ and $t = x + y$.

# EXERCISES 14.9

## Finding Partial Derivatives with Constrained Variables

In Exercises 1–3, begin by drawing a diagram that shows the relations among the variables.

**1.** If $w = x^2 + y^2 + z^2$ and $z = x^2 + y^2$, find

**a.** $\left(\dfrac{\partial w}{\partial y}\right)_z$ **b.** $\left(\dfrac{\partial w}{\partial z}\right)_x$ **c.** $\left(\dfrac{\partial w}{\partial z}\right)_y$.

**2.** If $w = x^2 + y - z + \sin t$ and $x + y = t$, find

**a.** $\left(\dfrac{\partial w}{\partial y}\right)_{x,z}$ **b.** $\left(\dfrac{\partial w}{\partial y}\right)_{z,t}$ **c.** $\left(\dfrac{\partial w}{\partial z}\right)_{x,y}$

**d.** $\left(\dfrac{\partial w}{\partial z}\right)_{y,t}$ **e.** $\left(\dfrac{\partial w}{\partial t}\right)_{x,z}$ **f.** $\left(\dfrac{\partial w}{\partial t}\right)_{y,z}$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

**3.** Let $U = f(P, V, T)$ be the internal energy of a gas that obeys the ideal gas law $PV = nRT$ ($n$ and $R$ constant). Find

**a.** $\left(\dfrac{\partial U}{\partial P}\right)_V$ **b.** $\left(\dfrac{\partial U}{\partial T}\right)_V$.

**4.** Find

**a.** $\left(\dfrac{\partial w}{\partial x}\right)_y$ **b.** $\left(\dfrac{\partial w}{\partial z}\right)_y$

at the point $(x, y, z) = (0, 1, \pi)$ if

$w = x^2 + y^2 + z^2$ and $y \sin z + z \sin x = 0$.

Exercises

**5.** Find

**a.** $\left(\dfrac{\partial w}{\partial y}\right)_x$ **b.** $\left(\dfrac{\partial w}{\partial y}\right)_z$

at the point $(w, x, y, z) = (4, 2, 1, -1)$ if

$w = x^2y^2 + yz - z^3$ and $x^2 + y^2 + z^2 = 6$.

**6.** Find $(\partial u/\partial y)_x$ at the point $(u, v) = \left(\sqrt{2}, 1\right)$, if $x = u^2 + v^2$ and $y = uv$.

**7.** Suppose that $x^2 + y^2 = r^2$ and $x = r\cos\theta$, as in polar coordinates. Find

$$\left(\frac{\partial x}{\partial r}\right)_\theta \quad \text{and} \quad \left(\frac{\partial r}{\partial x}\right)_y.$$

**8.** Suppose that

$$w = x^2 - y^2 + 4z + t \quad \text{and} \quad x + 2z + t = 25.$$

Show that the equations

$$\frac{\partial w}{\partial x} = 2x - 1 \quad \text{and} \quad \frac{\partial w}{\partial x} = 2x - 2$$

each give $\partial w/\partial x$, depending on which variables are chosen to be dependent and which variables are chosen to be independent. Identify the independent variables in each case.

## Partial Derivatives Without Specific Formulas

**9.** Establish the fact, widely used in hydrodynamics, that if $f(x, y, z) = 0$, then

$$\left(\frac{\partial x}{\partial y}\right)_z \left(\frac{\partial y}{\partial z}\right)_x \left(\frac{\partial z}{\partial x}\right)_y = -1.$$

(*Hint:* Express all the derivatives in terms of the formal partial derivatives $\partial f/\partial x$, $\partial f/\partial y$, and $\partial f/\partial z$. )

**10.** If $z = x + f(u)$, where $u = xy$, show that

$$x\frac{\partial z}{\partial x} - y\frac{\partial z}{\partial y} = x.$$

**11.** Suppose that the equation $g(x, y, z) = 0$ determines $z$ as a differentiable function of the independent variables $x$ and $y$ and that $g_z \neq 0$. Show that

$$\left(\frac{\partial z}{\partial y}\right)_x = -\frac{\partial g/\partial y}{\partial g/\partial z}.$$

**12.** Suppose that $f(x, y, z, w) = 0$ and $g(x, y, z, w) = 0$ determine $z$ and $w$ as differentiable functions of the independent variables $x$ and $y$, and suppose that

$$\frac{\partial f}{\partial z}\frac{\partial g}{\partial w} - \frac{\partial f}{\partial w}\frac{\partial g}{\partial z} \neq 0.$$

Show that

$$\left(\frac{\partial z}{\partial x}\right)_y = -\frac{\dfrac{\partial f}{\partial x}\dfrac{\partial g}{\partial w} - \dfrac{\partial f}{\partial w}\dfrac{\partial g}{\partial x}}{\dfrac{\partial f}{\partial z}\dfrac{\partial g}{\partial w} - \dfrac{\partial f}{\partial w}\dfrac{\partial g}{\partial z}}$$

and

$$\left(\frac{\partial w}{\partial y}\right)_x = -\frac{\dfrac{\partial f}{\partial z}\dfrac{\partial g}{\partial y} - \dfrac{\partial f}{\partial y}\dfrac{\partial g}{\partial z}}{\dfrac{\partial f}{\partial z}\dfrac{\partial g}{\partial w} - \dfrac{\partial f}{\partial w}\dfrac{\partial g}{\partial z}}.$$

# 14.10 Taylor's Formula for Two Variables

This section uses Taylor's formula to derive the Second Derivative Test for local extreme values (Section 14.7) and the error formula for linearizations of functions of two independent variables (Section 14.6). The use of Taylor's formula in these derivations leads to an extension of the formula that provides polynomial approximations of all orders for functions of two independent variables.

## Derivation of the Second Derivative Test

Let $f(x, y)$ have continuous partial derivatives in an open region $R$ containing a point $P(a, b)$ where $f_x = f_y = 0$ (Figure 14.59). Let $h$ and $k$ be increments small enough to put the

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

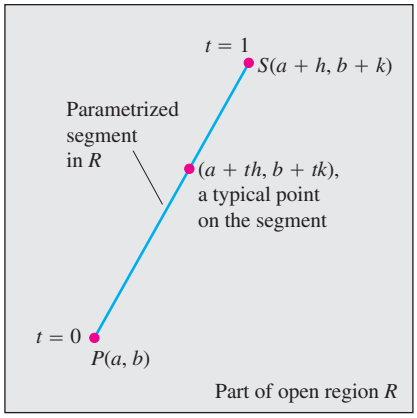

**FIGURE 14.59** We begin the derivation of the second derivative test at $P(a, b)$ by parametrizing a typical line segment from $P$ to a point $S$ nearby.

point $S(a + h, b + k)$ and the line segment joining it to $P$ inside $R$. We parametrize the segment $PS$ as

$$x = a + th, \qquad y = b + tk, \qquad 0 \le t \le 1 .$$

If $F(t) = f(a + th, b + tk)$, the Chain Rule gives

$$F'(t) = f_x \frac{dx}{dt} + f_y \frac{dy}{dt} = hf_x + kf_y .$$

Since $f_x$ and $f_y$ are differentiable (they have continuous partial derivatives), $F'$ is a differentiable function of $t$ and

$$F'' = \frac{\partial F'}{\partial x}\frac{dx}{dt} + \frac{\partial F'}{\partial y}\frac{dy}{dt} = \frac{\partial}{\partial x}(hf_x + kf_y)\cdot h + \frac{\partial}{\partial y}(hf_x + kf_y)\cdot k$$

$$= h^2 f_{xx} + 2hkf_{xy} + k^2 f_{yy} . \qquad f_{xy} = f_{yx}$$

Since $F$ and $F'$ are continuous on $[0, 1]$ and $F'$ is differentiable on $(0, 1)$, we can apply Taylor's formula with $n = 2$ and $a = 0$ to obtain

$$F(1) = F(0) + F'(0)(1 - 0) + F''(c)\frac{(1 - 0)^2}{2}$$
$$F(1) = F(0) + F'(0) + \frac{1}{2}F''(c) \tag{1}$$

for some $c$ between 0 and 1. Writing Equation (1) in terms of $f$ gives

$$f(a + h, b + k) = f(a, b) + hf_x(a, b) + kf_y(a, b) + \frac{1}{2}\left(h^2 f_{xx} + 2hkf_{xy} + k^2 f_{yy}\right)\Big|_{(a+ch,\, b+ck)} . \tag{2}$$

Since $f_x(a, b) = f_y(a, b) = 0$, this reduces to

$$f(a + h, b + k) - f(a, b) = \frac{1}{2}\left(h^2 f_{xx} + 2hkf_{xy} + k^2 f_{yy}\right)\Big|_{(a+ch,\, b+ck)} . \tag{3}$$

The presence of an extremum of $f$ at $(a, b)$ is determined by the sign of $f(a + h, b + k) - f(a, b)$. By Equation (3), this is the same as the sign of

$$Q(c) = (h^2 f_{xx} + 2hkf_{xy} + k^2 f_{yy})|_{(a+ch, b+ck)} .$$

Now, if $Q(0) \neq 0$, the sign of $Q(c)$ will be the same as the sign of $Q(0)$ for sufficiently small values of $h$ and $k$. We can predict the sign of

$$Q(0) = h^2 f_{xx}(a, b) + 2hkf_{xy}(a, b) + k^2 f_{yy}(a, b) \tag{4}$$

from the signs of $f_{xx}$ and $f_{xx}f_{yy} - f_{xy}^2$ at $(a, b)$. Multiply both sides of Equation (4) by $f_{xx}$ and rearrange the right-hand side to get

$$f_{xx}Q(0) = (hf_{xx} + kf_{xy})^2 + (f_{xx}f_{yy} - f_{xy}^2)k^2 . \tag{5}$$

From Equation (5) we see that

1. If $f_{xx} < 0$ and $f_{xx}f_{yy} - f_{xy}^2 > 0$ at $(a, b)$, then $Q(0) < 0$ for all sufficiently small nonzero values of $h$ and $k$, and $f$ has a *local maximum* value at $(a, b)$.
2. If $f_{xx} > 0$ and $f_{xx}f_{yy} - f_{xy}^2 > 0$ at $(a, b)$, then $Q(0) > 0$ for all sufficiently small nonzero values of $h$ and $k$ and $f$ has a *local minimum* value at $(a, b)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

3. If $f_{xx}f_{yy} - f_{xy}^2 < 0$ at $(a, b)$, there are combinations of arbitrarily small nonzero values of $h$ and $k$ for which $Q(0) > 0$, and other values for which $Q(0) < 0$. Arbitrarily close to the point $P_0(a, b, f(a, b))$ on the surface $z = f(x, y)$ there are points above $P_0$ and points below $P_0$, so $f$ has a *saddle point* at $(a, b)$.
4. If $f_{xx}f_{yy} - f_{xy}^2 = 0$, another test is needed. The possibility that $Q(0)$ equals zero prevents us from drawing conclusions about the sign of $Q(c)$.

## The Error Formula for Linear Approximations

We want to show that the difference $E(x, y)$, between the values of a function $f(x, y)$, and its linearization $L(x, y)$ at $(x_0, y_0)$ satisfies the inequality

$$|E(x, y)| \le \frac{1}{2} M(|x - x_0| + |y - y_0|)^2.$$

The function $f$ is assumed to have continuous second partial derivatives throughout an open set containing a closed rectangular region $R$ centered at $(x_0, y_0)$. The number $M$ is an upper bound for $|f_{xx}|, |f_{yy}|$, and $|f_{xy}|$ on $R$.

The inequality we want comes from Equation (2). We substitute $x_0$ and $y_0$ for $a$ and $b$, and $x - x_0$ and $y - y_0$ for $h$ and $k$, respectively, and rearrange the result as

$$f(x, y) = \underbrace{f(x_0, y_0) + f_x(x_0, y_0)(x - x_0) + f_y(x_0, y_0)(y - y_0)}_{\text{linearization } L(x, y)}$$

$$+ \underbrace{\frac{1}{2}\left((x - x_0)^2 f_{xx} + 2(x - x_0)(y - y_0)f_{xy} + (y - y_0)^2 f_{yy}\right)\Big|_{(x_0 + c(x - x_0),\, y_0 + c(y - y_0))}}_{\text{error } E(x, y)}.$$

This equation reveals that

$$|E| \le \frac{1}{2}\left(|x - x_0|^2 |f_{xx}| + 2|x - x_0||y - y_0||f_{xy}| + |y - y_0|^2 |f_{yy}|\right).$$

Hence, if $M$ is an upper bound for the values of $|f_{xx}|, |f_{xy}|$, and $|f_{yy}|$ on $R$,

$$|E| \le \frac{1}{2}\left(|x - x_0|^2 M + 2|x - x_0||y - y_0|M + |y - y_0|^2 M\right)$$

$$= \frac{1}{2} M(|x - x_0| + |y - y_0|)^2.$$

## Taylor's Formula for Functions of Two Variables

The formulas derived earlier for $F'$ and $F''$ can be obtained by applying to $f(x, y)$ the operators

$$\left(h\frac{\partial}{\partial x} + k\frac{\partial}{\partial y}\right) \qquad \text{and} \qquad \left(h\frac{\partial}{\partial x} + k\frac{\partial}{\partial y}\right)^2 = h^2\frac{\partial^2}{\partial x^2} + 2hk\frac{\partial^2}{\partial x\,\partial y} + k^2\frac{\partial^2}{\partial y^2}.$$

These are the first two instances of a more general formula,

$$F^{(n)}(t) = \frac{d^n}{dt^n}F(t) = \left(h\frac{\partial}{\partial x} + k\frac{\partial}{\partial y}\right)^n f(x, y), \tag{6}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

which says that applying $d^n/dt^n$ to $F(t)$ gives the same result as applying the operator

$$\left(h\frac{\partial}{\partial x} + k\frac{\partial}{\partial y}\right)^n$$

to $f(x, y)$ after expanding it by the Binomial Theorem.

If partial derivatives of $f$ through order $n + 1$ are continuous throughout a rectangular region centered at $(a, b)$, we may extend the Taylor formula for $F(t)$ to

$$F(t) = F(0) + F'(0)t + \frac{F''(0)}{2!}t^2 + \cdots + \frac{F^{(n)}(0)}{n!}t^{(n)} + \text{ remainder},$$

and take $t = 1$ to obtain

$$F(1) = F(0) + F'(0) + \frac{F''(0)}{2!} + \cdots + \frac{F^{(n)}(0)}{n!} + \text{ remainder}.$$

When we replace the first $n$ derivatives on the right of this last series by their equivalent expressions from Equation (6) evaluated at $t = 0$ and add the appropriate remainder term, we arrive at the following formula.

**Taylor's Formula for $f(x, y)$ at the Point $(a, b)$**

Suppose $f(x, y)$ and its partial derivatives through order $n + 1$ are continuous throughout an open rectangular region $R$ centered at a point $(a, b)$. Then, throughout $R$,

$$\begin{aligned} f(a + h, b + k) = {} & f(a, b) + (hf_x + kf_y)|_{(a,b)} + \frac{1}{2!}(h^2f_{xx} + 2hkf_{xy} + k^2f_{yy})|_{(a,b)} \\ & + \frac{1}{3!}(h^3f_{xxx} + 3h^2kf_{xxy} + 3hk^2f_{xyy} + k^3f_{yyy})|_{(a,b)} + \cdots + \frac{1}{n!}\left(h\frac{\partial}{\partial x} + k\frac{\partial}{\partial y}\right)^n f\Big|_{(a,b)} \\ & + \frac{1}{(n+1)!}\left(h\frac{\partial}{\partial x} + k\frac{\partial}{\partial y}\right)^{n+1} f\Big|_{(a+ch,b+ck)}. \end{aligned} \tag{7}$$

The first $n$ derivative terms are evaluated at $(a, b)$. The last term is evaluated at some point $(a + ch, b + ck)$ on the line segment joining $(a, b)$ and $(a + h, b + k)$.

If $(a, b) = (0, 0)$ and we treat $h$ and $k$ as independent variables (denoting them now by $x$ and $y$), then Equation (7) assumes the following simpler form.

**Taylor's Formula for $f(x, y)$ at the Origin**

$$\begin{aligned} f(x, y) = {} & f(0, 0) + xf_x + yf_y + \frac{1}{2!}(x^2f_{xx} + 2xyf_{xy} + y^2f_{yy}) \\ & + \frac{1}{3!}(x^3f_{xxx} + 3x^2yf_{xxy} + 3xy^2f_{xyy} + y^3f_{yyy}) + \cdots + \frac{1}{n!}\left(x\frac{\partial}{\partial x} + y\frac{\partial}{\partial y}\right)^n f \\ & + \frac{1}{(n+1)!}\left(x\frac{\partial}{\partial x} + y\frac{\partial}{\partial y}\right)^{n+1} f\Big|_{(cx,cy)} \end{aligned} \tag{8}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The first $n$ derivative terms are evaluated at (0, 0). The last term is evaluated at a point on the line segment joining the origin and $(x, y)$.

Taylor's formula provides polynomial approximations of two-variable functions. The first $n$ derivative terms give the polynomial; the last term gives the approximation error. The first three terms of Taylor's formula give the function's linearization. To improve on the linearization, we add higher power terms.

**EXAMPLE 1** Finding a Quadratic Approximation

Find a quadratic approximation to $f(x, y) = \sin x \sin y$ near the origin. How accurate is the approximation if $|x| \le 0.1$ and $|y| \le 0.1$?

**Solution** We take $n = 2$ in Equation (8):

$$f(x, y) = f(0, 0) + (xf_x + yf_y) + \frac{1}{2}(x^2 f_{xx} + 2xyf_{xy} + y^2 f_{yy})$$

$$+ \frac{1}{6}(x^3 f_{xxx} + 3x^2 y f_{xxy} + 3xy^2 f_{xyy} + y^3 f_{yyy})_{(cx,cy)}$$

with

$$f(0, 0) = \sin x \sin y|_{(0,0)} = 0, \qquad f_{xx}(0, 0) = -\sin x \sin y|_{(0,0)} = 0,$$

$$f_x(0, 0) = \cos x \sin y|_{(0,0)} = 0, \qquad f_{xy}(0, 0) = \cos x \cos y|_{(0,0)} = 1,$$

$$f_y(0, 0) = \sin x \cos y|_{(0,0)} = 0, \qquad f_{yy}(0, 0) = -\sin x \sin y|_{(0,0)} = 0,$$

we have

$$\sin x \sin y \approx 0 + 0 + 0 + \frac{1}{2}(x^2(0) + 2xy(1) + y^2(0)),$$

$$\sin x \sin y \approx xy.$$

The error in the approximation is

$$E(x, y) = \frac{1}{6}(x^3 f_{xxx} + 3x^2 y f_{xxy} + 3xy^2 f_{xyy} + y^3 f_{yyy})|_{(cx,cy)}.$$

The third derivatives never exceed 1 in absolute value because they are products of sines and cosines. Also, $|x| \le 0.1$ and $|y| \le 0.1$. Hence

$$|E(x, y)| \le \frac{1}{6}((0.1)^3 + 3(0.1)^3 + 3(0.1)^3 + (0.1)^3) = \frac{8}{6}(0.1)^3 \le 0.00134$$

(rounded up). The error will not exceed 0.00134 if $|x| \le 0.1$ and $|y| \le 0.1$. ■

# EXERCISES 14.10

## Finding Quadratic and Cubic Approximations

In Exercises 1–10, use Taylor's formula for $f(x, y)$ at the origin to find quadratic and cubic approximations of $f$ near the origin.

**1.** $f(x, y) = xe^y$

**2.** $f(x, y) = e^x \cos y$

**3.** $f(x, y) = y \sin x$

**4.** $f(x, y) = \sin x \cos y$

**5.** $f(x, y) = e^x \ln(1 + y)$

**6.** $f(x, y) = \ln(2x + y + 1)$

**7.** $f(x, y) = \sin(x^2 + y^2)$

**8.** $f(x, y) = \cos(x^2 + y^2)$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**9.** $f(x, y) = \dfrac{1}{1 - x - y}$ **10.** $f(x, y) = \dfrac{1}{1 - x - y + xy}$

**11.** Use Taylor's formula to find a quadratic approximation of $f(x, y) = \cos x \cos y$ at the origin. Estimate the error in the approximation if $|x| \le 0.1$ and $|y| \le 0.1$.

**12.** Use Taylor's formula to find a quadratic approximation of $e^x \sin y$ at the origin. Estimate the error in the approximation if $|x| \le 0.1$ and $|y| \le 0.1$.

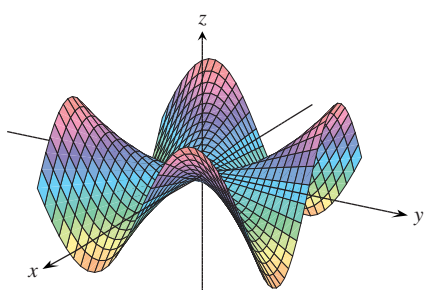
# Chapter 14 Additional and Advanced Exercises



## Partial Derivatives

**1. Function with saddle at the origin** If you did Exercise 50 in Section 14.2, you know that the function

$$f(x, y) = \begin{cases} xy\dfrac{x^2 - y^2}{x^2 + y^2}, & (x, y) \neq (0, 0) \\ 0, & (x, y) = (0, 0) \end{cases}$$

(see the accompanying figure) is continuous at (0, 0). Find $f_{xy}(0, 0)$ and $f_{yx}(0, 0)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

2. **Finding a function from second partials** Find a function $w = f(x, y)$ whose first partial derivatives are $\partial w/\partial x = 1 + e^x \cos y$ and $\partial w/\partial y = 2y - e^x \sin y$ and whose value at the point $(\ln 2, 0)$ is $\ln 2$.

3. **A proof of Leibniz's Rule** Leibniz's Rule says that if $f$ is continuous on $[a, b]$ and if $u(x)$ and $v(x)$ are differentiable functions of $x$ whose values lie in $[a, b]$, then

$$\frac{d}{dx}\int_{u(x)}^{v(x)} f(t)\,dt = f(v(x))\frac{dv}{dx} - f(u(x))\frac{du}{dx}.$$

Prove the rule by setting

$$g(u, v) = \int_u^v f(t)\,dt, \qquad u = u(x), \qquad v = v(x)$$

and calculating $dg/dx$ with the Chain Rule.

4. **Finding a function with constrained second partials** Suppose that $f$ is a twice-differentiable function of $r$, that $r = \sqrt{x^2 + y^2 + z^2}$, and that

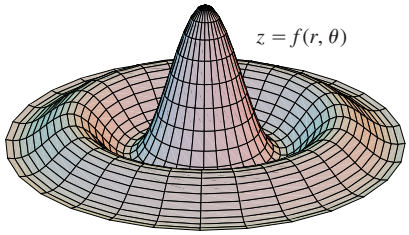
$$f_{xx} + f_{yy} + f_{zz} = 0.$$

Show that for some constants $a$ and $b$,

$$f(r) = \frac{a}{r} + b.$$

5. **Homogeneous functions** A function $f(x, y)$ is *homogeneous of degree n* ($n$ a nonnegative integer) if $f(tx, ty) = t^n f(x, y)$ for all $t$, $x$, and $y$. For such a function (sufficiently differentiable), prove that

**a.** $x\dfrac{\partial f}{\partial x} + y\dfrac{\partial f}{\partial y} = nf(x, y)$



**b.** $x^2\left(\dfrac{\partial^2 f}{\partial x^2}\right) + 2xy\left(\dfrac{\partial^2 f}{\partial x \partial y}\right) + y^2\left(\dfrac{\partial^2 f}{\partial y^2}\right) = n(n-1)f.$

6. **Surface in polar coordinates** Let

$$f(r, \theta) = \begin{cases} \dfrac{\sin 6r}{6r}, & r \neq 0 \\ 1, & r = 0, \end{cases}$$

where $r$ and $\theta$ are polar coordinates. Find

**a.** $\lim_{r \to 0} f(r, \theta)$ **b.** $f_r(0, 0)$ **c.** $f_\theta(r, \theta)$, $r \neq 0$.

## Gradients and Tangents

7. **Properties of position vectors** Let $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$ and let $r = |\mathbf{r}|$.

**a.** Show that $\nabla r = \mathbf{r}/r$.

**b.** Show that $\nabla(r^n) = nr^{n-2}\mathbf{r}$.

**c.** Find a function whose gradient equals $\mathbf{r}$.

**d.** Show that $\mathbf{r} \cdot d\mathbf{r} = r\,dr$.

**e.** Show that $\nabla(\mathbf{A} \cdot \mathbf{r}) = \mathbf{A}$ for any constant vector $\mathbf{A}$.

8. **Gradient orthogonal to tangent** Suppose that a differentiable function $f(x, y)$ has the constant value $c$ along the differentiable curve $x = g(t), y = h(t)$; that is

$$f(g(t), h(t)) = c$$

for all values of $t$. Differentiate both sides of this equation with respect to $t$ to show that $\nabla f$ is orthogonal to the curve's tangent vector at every point on the curve.

9. **Curve tangent to a surface** Show that the curve

$$\mathbf{r}(t) = (\ln t)\mathbf{i} + (t \ln t)\mathbf{j} + t\mathbf{k}$$

is tangent to the surface

$$xz^2 - yz + \cos xy = 1$$

at $(0, 0, 1)$.

10. **Curve tangent to a surface** Show that the curve

$$\mathbf{r}(t) = \left(\frac{t^3}{4} - 2\right)\mathbf{i} + \left(\frac{4}{t} - 3\right)\mathbf{j} + \cos(t - 2)\mathbf{k}$$

is tangent to the surface

$$x^3 + y^3 + z^3 - xyz = 0$$

at $(0, -1, 1)$.

## Extreme Values

11. **Extrema on a surface** Show that the only possible maxima and minima of $z$ on the surface $z = x^3 + y^3 - 9xy + 27$ occur at $(0, 0)$ and $(3, 3)$. Show that neither a maximum nor a minimum occurs at $(0, 0)$. Determine whether $z$ has a maximum or a minimum at $(3, 3)$.

12. **Maximum in closed first quadrant** Find the maximum value of $f(x, y) = 6xye^{-(2x+3y)}$ in the closed first quadrant (includes the nonnegative axes).

13. **Minimum volume cut from first octant** Find the minimum volume for a region bounded by the planes $x = 0, y = 0, z = 0$ and a plane tangent to the ellipsoid

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$$

at a point in the first octant.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**14. Minimum distance from line to parabola in *xy*-plane** By minimizing the function $f(x, y, u, v) = (x - u)^2 + (y - v)^2$ subject to the constraints $y = x + 1$ and $u = v^2$, find the minimum distance in the $xy$-plane from the line $y = x + 1$ to the parabola $y^2 = x$.

## Theory and Examples

**15. Boundedness of first partials implies continuity** Prove the following theorem: If $f(x, y)$ is defined in an open region $R$ of the $xy$-plane and if $f_x$ and $f_y$ are bounded on $R$, then $f(x, y)$ is continuous on $R$. (The assumption of boundedness is essential.)

**16.** Suppose that $\mathbf{r}(t) = g(t)\mathbf{i} + h(t)\mathbf{j} + k(t)\mathbf{k}$ is a smooth curve in the domain of a differentiable function $f(x, y, z)$. Describe the relation between $df/dt$, $\nabla f$, and $\mathbf{v} = d\mathbf{r}/dt$. What can be said about $\nabla f$ and $\mathbf{v}$ at interior points of the curve where $f$ has extreme values relative to its other values on the curve? Give reasons for your answer.

**17. Finding functions from partial derivatives** Suppose that $f$ and $g$ are functions of $x$ and $y$ such that

$$\frac{\partial f}{\partial y} = \frac{\partial g}{\partial x} \quad \text{and} \quad \frac{\partial f}{\partial x} = \frac{\partial g}{\partial y},$$

and suppose that

$$\frac{\partial f}{\partial x} = 0, \qquad f(1, 2) = g(1, 2) = 5 \qquad \text{and} \qquad f(0, 0) = 4.$$

Find $f(x, y)$ and $g(x, y)$.

**18. Rate of change of the rate of change** We know that if $f(x, y)$ is a function of two variables and if $\mathbf{u} = a\mathbf{i} + b\mathbf{j}$ is a unit vector, then $D_{\mathbf{u}} f(x, y) = f_x(x, y)a + f_y(x, y)b$ is the rate of change of $f(x, y)$ at $(x, y)$ in the direction of $\mathbf{u}$. Give a similar formula for the rate of change *of the rate of change of* $f(x, y)$ at $(x, y)$ in the direction $\mathbf{u}$.

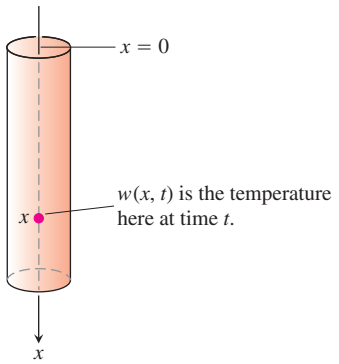
**19. Path of a heat-seeking particle** A heat-seeking particle has the property that at any point $(x, y)$ in the plane it moves in the direction of maximum temperature increase. If the temperature at $(x, y)$ is $T(x, y) = -e^{-2y} \cos x$, find an equation $y = f(x)$ for the path of a heat-seeking particle at the point $(\pi/4, 0)$.

**20. Velocity after a ricochet** A particle traveling in a straight line with constant velocity $\mathbf{i} + \mathbf{j} - 5\mathbf{k}$ passes through the point $(0, 0, 30)$ and hits the surface $z = 2x^2 + 3y^2$. The particle ricochets off the surface, the angle of reflection being equal to the angle of incidence. Assuming no loss of speed, what is the velocity of the particle after the ricochet? Simplify your answer.

**21. Directional derivatives tangent to a surface** Let $S$ be the surface that is the graph of $f(x, y) = 10 - x^2 - y^2$. Suppose that the temperature in space at each point $(x, y, z)$ is $T(x, y, z) = x^2y + y^2z + 4x + 14y + z$.

**a.** Among all the possible directions tangential to the surface $S$ at the point $(0, 0, 10)$, which direction will make the rate of change of temperature at $(0, 0, 10)$ a maximum?

**b.** Which direction tangential to $S$ at the point $(1, 1, 8)$ will make the rate of change of temperature a maximum?



**22. Drilling another borehole** On a flat surface of land, geologists drilled a borehole straight down and hit a mineral deposit at 1000 ft. They drilled a second borehole 100 ft to the north of the first and hit the mineral deposit at 950 ft. A third borehole 100 ft east of the first borehole struck the mineral deposit at 1025 ft. The geologists have reasons to believe that the mineral deposit is in the shape of a dome, and for the sake of economy, they would like to find where the deposit is closest to the surface. Assuming the surface to be the $xy$-plane, in what direction from the first borehole would you suggest the geologists drill their fourth borehole?

## The One-Dimensional Heat Equation

If $w(x, t)$ represents the temperature at position $x$ at time $t$ in a uniform conducting rod with perfectly insulated sides (see the accompanying figure), then the partial derivatives $w_{xx}$ and $w_t$ satisfy a differential equation of the form

$$w_{xx} = \frac{1}{c^2} w_t.$$

This equation is called the **one-dimensional heat equation**. The value of the positive constant $c^2$ is determined by the material from which the rod is made. It has been determined experimentally for a broad range of materials. For a given application, one finds the appropriate value in a table. For dry soil, for example, $c^2 = 0.19$ ft$^2$/day.

In chemistry and biochemistry, the heat equation is known as the **diffusion equation**. In this context, $w(x, t)$ represents the concentration of a dissolved substance, a salt for instance, diffusing along a tube filled with liquid. The value of $w(x, t)$ is the concentration at point $x$ at time $t$. In other applications, $w(x, t)$ represents the diffusion of a gas down a long, thin pipe.

In electrical engineering, the heat equation appears in the forms

$$v_{xx} = RCv_t$$

and

$$i_{xx} = RCi_t.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

These equations describe the voltage $v$ and the flow of current $i$ in a coaxial cable or in any other cable in which leakage and inductance are negligible. The functions and constants in these equations are

$v(x, t)$ = voltage at point $x$ at time $t$

$R$ = resistance per unit length

$C$ = capacitance to ground per unit of cable length

$i(x, t)$ = current at point $x$ at time $t$.

**23.** Find all solutions of the one-dimensional heat equation of the form $w = e^{rt} \sin \pi x$, where $r$ is a constant.

**24.** Find all solutions of the one-dimensional heat equation that have the form $w = e^{rt} \sin kx$ and satisfy the conditions that $w(0, t) = 0$ and $w(L, t) = 0$. What happens to these solutions as $t \to \infty$?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# Chapter 14 Practice Exercises

## Domain, Range, and Level Curves

In Exercises 1–4, find the domain and range of the given function and identify its level curves. Sketch a typical level curve.

**1.** $f(x, y) = 9x^2 + y^2$ **2.** $f(x, y) = e^{x+y}$

**3.** $g(x, y) = 1/xy$ **4.** $g(x, y) = \sqrt{x^2 - y}$

In Exercises 5–8, find the domain and range of the given function and identify its level surfaces. Sketch a typical level surface.

**5.** $f(x, y, z) = x^2 + y^2 - z$ **6.** $g(x, y, z) = x^2 + 4y^2 + 9z^2$

**7.** $h(x, y, z) = \dfrac{1}{x^2 + y^2 + z^2}$

**8.** $k(x, y, z) = \dfrac{1}{x^2 + y^2 + z^2 + 1}$

## Evaluating Limits

Find the limits in Exercises 9–14.

**9.** $\lim_{(x,y)\to(\pi,\,\ln 2)} e^y \cos x$ **10.** $\lim_{(x,y)\to(0,0)} \dfrac{2 + y}{x + \cos y}$

**11.** $\lim_{(x,y)\to(1,1)} \dfrac{x - y}{x^2 - y^2}$ **12.** $\lim_{(x,y)\to(1,1)} \dfrac{x^3y^3 - 1}{xy - 1}$

**13.** $\lim_{P\to(1,\,-1,\,e)} \ln|x + y + z|$ **14.** $\lim_{P\to(1,-1,-1)} \tan^{-1}(x + y + z)$

By considering different paths of approach, show that the limits in Exercises 15 and 16 do not exist.

**15.** $\lim_{\substack{(x,y)\to(0,0)\\ y\neq x^2}} \dfrac{y}{x^2 - y}$ **16.** $\lim_{\substack{(x,y)\to(0,0)\\ xy\neq 0}} \dfrac{x^2 + y^2}{xy}$

**17. Continuous extension** Let $f(x, y) = (x^2 - y^2)/(x^2 + y^2)$ for $(x, y) \neq (0, 0)$. Is it possible to define $f(0, 0)$ in a way that makes $f$ continuous at the origin? Why?

**18. Continuous extension** Let

$$f(x, y) = \begin{cases} \dfrac{\sin(x - y)}{|x| + |y|}, & |x| + |y| \neq 0 \\ 0, & (x, y) = (0, 0). \end{cases}$$

Is $f$ continuous at the origin? Why?

## Partial Derivatives

In Exercises 19–24, find the partial derivative of the function with respect to each variable.

**19.** $g(r, \theta) = r\cos\theta + r\sin\theta$

**20.** $f(x, y) = \dfrac{1}{2}\ln(x^2 + y^2) + \tan^{-1}\dfrac{y}{x}$

**21.** $f(R_1, R_2, R_3) = \dfrac{1}{R_1} + \dfrac{1}{R_2} + \dfrac{1}{R_3}$

**22.** $h(x, y, z) = \sin(2\pi x + y - 3z)$

**23.** $P(n, R, T, V) = \dfrac{nRT}{V}$ (the ideal gas law)

**24.** $f(r, l, T, w) = \dfrac{1}{2rl}\sqrt{\dfrac{T}{\pi w}}$

## Second-Order Partials

Find the second-order partial derivatives of the functions in Exercises 25–28.

**25.** $g(x, y) = y + \dfrac{x}{y}$ **26.** $g(x, y) = e^x + y\sin x$

**27.** $f(x, y) = x + xy - 5x^3 + \ln(x^2 + 1)$

**28.** $f(x, y) = y^2 - 3xy + \cos y + 7e^y$

## Chain Rule Calculations

**29.** Find $dw/dt$ at $t = 0$ if $w = \sin(xy + \pi), x = e^t$, and $y = \ln(t + 1)$.

**30.** Find $dw/dt$ at $t = 1$ if $w = xe^y + y\sin z - \cos z, x = 2\sqrt{t}$, $y = t - 1 + \ln t$, and $z = \pi t$.

**31.** Find $\partial w/\partial r$ and $\partial w/\partial s$ when $r = \pi$ and $s = 0$ if $w = \sin(2x - y)$, $x = r + \sin s, y = rs$.

**32.** Find $\partial w/\partial u$ and $\partial w/\partial v$ when $u = v = 0$ if $w = \ln\sqrt{1 + x^2} - \tan^{-1}x$ and $x = 2e^u\cos v$.

**33.** Find the value of the derivative of $f(x, y, z) = xy + yz + xz$ with respect to $t$ on the curve $x = \cos t, y = \sin t, z = \cos 2t$ at $t = 1$.

**34.** Show that if $w = f(s)$ is any differentiable function of $s$ and if $s = y + 5x$, then

$$\frac{\partial w}{\partial x} - 5\frac{\partial w}{\partial y} = 0.$$

## Implicit Differentiation

Assuming that the equations in Exercises 35 and 36 define $y$ as a differentiable function of $x$, find the value of $dy/dx$ at point $P$.

**35.** $1 - x - y^2 - \sin xy = 0, \quad P(0, 1)$

**36.** $2xy + e^{x+y} - 2 = 0, \quad P(0, \ln 2)$

## Directional Derivatives

In Exercises 37–40, find the directions in which $f$ increases and decreases most rapidly at $P_0$ and find the derivative of $f$ in each direction. Also, find the derivative of $f$ at $P_0$ in the direction of the vector $\mathbf{v}$.

**37.** $f(x, y) = \cos x\cos y, \quad P_0(\pi/4, \pi/4), \quad \mathbf{v} = 3\mathbf{i} + 4\mathbf{j}$

**38.** $f(x, y) = x^2e^{-2y}, \quad P_0(1, 0), \quad \mathbf{v} = \mathbf{i} + \mathbf{j}$

**39.** $f(x, y, z) = \ln(2x + 3y + 6z), \quad P_0(-1, -1, 1), \quad \mathbf{v} = 2\mathbf{i} + 3\mathbf{j} + 6\mathbf{k}$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**40.** $f(x, y, z) = x^2 + 3xy - z^2 + 2y + z + 4, \quad P_0(0, 0, 0),$ $\mathbf{v} = \mathbf{i} + \mathbf{j} + \mathbf{k}$

**41. Derivative in velocity direction** Find the derivative of $f(x, y, z) = xyz$ in the direction of the velocity vector of the helix

$$\mathbf{r}(t) = (\cos 3t)\mathbf{i} + (\sin 3t)\mathbf{j} + 3t\mathbf{k}$$

at $t = \pi/3$.

**42. Maximum directional derivative** What is the largest value that the directional derivative of $f(x, y, z) = xyz$ can have at the point $(1, 1, 1)$?

**43. Directional derivatives with given values** At the point $(1, 2)$, the function $f(x, y)$ has a derivative of 2 in the direction toward $(2, 2)$ and a derivative of $-2$ in the direction toward $(1, 1)$.

**a.** Find $f_x(1, 2)$ and $f_y(1, 2)$.

**b.** Find the derivative of $f$ at $(1, 2)$ in the direction toward the point $(4, 6)$.

**44.** Which of the following statements are true if $f(x, y)$ is differentiable at $(x_0, y_0)$? Give reasons for your answers.

**a.** If $\mathbf{u}$ is a unit vector, the derivative of $f$ at $(x_0, y_0)$ in the direction of $\mathbf{u}$ is $(f_x(x_0, y_0)\mathbf{i} + f_y(x_0, y_0)\mathbf{j}) \cdot \mathbf{u}$.

**b.** The derivative of $f$ at $(x_0, y_0)$ in the direction of $\mathbf{u}$ is a vector.

**c.** The directional derivative of $f$ at $(x_0, y_0)$ has its greatest value in the direction of $\nabla f$.

**d.** At $(x_0, y_0)$, vector $\nabla f$ is normal to the curve $f(x, y) = f(x_0, y_0)$.

## Gradients, Tangent Planes, and Normal Lines

In Exercises 45 and 46, sketch the surface $f(x, y, z) = c$ together with $\nabla f$ at the given points.

**45.** $x^2 + y + z^2 = 0; \quad (0, -1, \pm 1), \quad (0, 0, 0)$

**46.** $y^2 + z^2 = 4; \quad (2, \pm 2, 0), \quad (2, 0, \pm 2)$

In Exercises 47 and 48, find an equation for the plane tangent to the level surface $f(x, y, z) = c$ at the point $P_0$. Also, find parametric equations for the line that is normal to the surface at $P_0$.

**47.** $x^2 - y - 5z = 0, \quad P_0(2, -1, 1)$

**48.** $x^2 + y^2 + z = 4, \quad P_0(1, 1, 2)$

In Exercises 49 and 50, find an equation for the plane tangent to the surface $z = f(x, y)$ at the given point.

**49.** $z = \ln(x^2 + y^2), \quad (0, 1, 0)$

**50.** $z = 1/(x^2 + y^2), \quad (1, 1, 1/2)$

In Exercises 51 and 52, find equations for the lines that are tangent and normal to the level curve $f(x, y) = c$ at the point $P_0$. Then sketch the lines and level curve together with $\nabla f$ at $P_0$.

**51.** $y - \sin x = 1, \quad P_0(\pi, 1)$ **52.** $\dfrac{y^2}{2} - \dfrac{x^2}{2} = \dfrac{3}{2}, \quad P_0(1, 2)$

## Tangent Lines to Curves

In Exercises 53 and 54, find parametric equations for the line that is tangent to the curve of intersection of the surfaces at the given point.

**53.** Surfaces: $x^2 + 2y + 2z = 4, \quad y = 1$

Point: $(1, 1, 1/2)$

**54.** Surfaces: $x + y^2 + z = 2, \quad y = 1$

Point: $(1/2, 1, 1/2)$

## Linearizations

In Exercises 55 and 56, find the linearization $L(x, y)$ of the function $f(x, y)$ at the point $P_0$. Then find an upper bound for the magnitude of the error $E$ in the approximation $f(x, y) \approx L(x, y)$ over the rectangle $R$.

**55.** $f(x, y) = \sin x \cos y, \quad P_0(\pi/4, \pi/4)$

$R: \quad \left|x - \dfrac{\pi}{4}\right| \le 0.1, \quad \left|y - \dfrac{\pi}{4}\right| \le 0.1$

**56.** $f(x, y) = xy - 3y^2 + 2, \quad P_0(1, 1)$

$R: \quad |x - 1| \le 0.1, \quad |y - 1| \le 0.2$

Find the linearizations of the functions in Exercises 57 and 58 at the given points.

**57.** $f(x, y, z) = xy + 2yz - 3xz$ at $(1, 0, 0)$ and $(1, 1, 0)$

**58.** $f(x, y, z) = \sqrt{2} \cos x \sin(y + z)$ at $(0, 0, \pi/4)$ and $(\pi/4, \pi/4, 0)$

## Estimates and Sensitivity to Change

**59. Measuring the volume of a pipeline** You plan to calculate the volume inside a stretch of pipeline that is about 36 in. in diameter and 1 mile long. With which measurement should you be more careful, the length or the diameter? Why?

**60. Sensitivity to change** Near the point $(1, 2)$, is $f(x, y) = x^2 - xy + y^2 - 3$ more sensitive to changes in $x$ or to changes in $y$? How do you know?

**61. Change in an electrical circuit** Suppose that the current $I$ (amperes) in an electrical circuit is related to the voltage $V$ (volts) and the resistance $R$ (ohms) by the equation $I = V/R$. If the voltage drops from 24 to 23 volts and the resistance drops from 100 to 80 ohms, will $I$ increase or decrease? By about how much? Is the change in $I$ more sensitive to change in the voltage or to change in the resistance? How do you know?

**62. Maximum error in estimating the area of an ellipse** If $a = 10$ cm and $b = 16$ cm to the nearest millimeter, what should you expect the maximum percentage error to be in the calculated area $A = \pi ab$ of the ellipse $x^2/a^2 + y^2/b^2 = 1$?

**63. Error in estimating a product** Let $y = uv$ and $z = u + v$, where $u$ and $v$ are positive independent variables.

**a.** If $u$ is measured with an error of 2% and $v$ with an error of 3%, about what is the percentage error in the calculated value of $y$?

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**b.** Show that the percentage error in the calculated value of $z$ is less than the percentage error in the value of $y$.

**64. Cardiac index** To make different people comparable in studies of cardiac output (Section 3.7, Exercise 25), researchers divide the measured cardiac output by the body surface area to find the *cardiac index* $C$:

$$C = \frac{\text{cardiac output}}{\text{body surface area}}.$$

The body surface area $B$ of a person with weight $w$ and height $h$ is approximated by the formula

$$B = 71.84w^{0.425}h^{0.725},$$

which gives $B$ in square centimeters when $w$ is measured in kilograms and $h$ in centimeters. You are about to calculate the cardiac index of a person with the following measurements:

| | |
|---|---|
| Cardiac output: | 7 L/min |
| Weight: | 70 kg |
| Height: | 180 cm |

Which will have a greater effect on the calculation, a 1-kg error in measuring the weight or a 1-cm error in measuring the height?

## Local Extrema

Test the functions in Exercises 65–70 for local maxima and minima and saddle points. Find each function's value at these points.

**65.** $f(x, y) = x^2 - xy + y^2 + 2x + 2y - 4$

**66.** $f(x, y) = 5x^2 + 4xy - 2y^2 + 4x - 4y$

**67.** $f(x, y) = 2x^3 + 3xy + 2y^3$

**68.** $f(x, y) = x^3 + y^3 - 3xy + 15$

**69.** $f(x, y) = x^3 + y^3 + 3x^2 - 3y^2$

**70.** $f(x, y) = x^4 - 8x^2 + 3y^2 - 6y$

## Absolute Extrema

In Exercises 71–78, find the absolute maximum and minimum values of $f$ on the region $R$.

**71.** $f(x, y) = x^2 + xy + y^2 - 3x + 3y$

$R$: The triangular region cut from the first quadrant by the line $x + y = 4$

**72.** $f(x, y) = x^2 - y^2 - 2x + 4y + 1$

$R$: The rectangular region in the first quadrant bounded by the coordinate axes and the lines $x = 4$ and $y = 2$

**73.** $f(x, y) = y^2 - xy - 3y + 2x$

$R$: The square region enclosed by the lines $x = \pm 2$ and $y = \pm 2$

**74.** $f(x, y) = 2x + 2y - x^2 - y^2$

$R$: The square region bounded by the coordinate axes and the lines $x = 2, y = 2$ in the first quadrant

**75.** $f(x, y) = x^2 - y^2 - 2x + 4y$

$R$: The triangular region bounded below by the $x$-axis, above by the line $y = x + 2$, and on the right by the line $x = 2$

**76.** $f(x, y) = 4xy - x^4 - y^4 + 16$

$R$: The triangular region bounded below by the line $y = -2$, above by the line $y = x$, and on the right by the line $x = 2$

**77.** $f(x, y) = x^3 + y^3 + 3x^2 - 3y^2$

$R$: The square region enclosed by the lines $x = \pm 1$ and $y = \pm 1$

**78.** $f(x, y) = x^3 + 3xy + y^3 + 1$

$R$: The square region enclosed by the lines $x = \pm 1$ and $y = \pm 1$

## Lagrange Multipliers

**79. Extrema on a circle** Find the extreme values of $f(x, y) = x^3 + y^2$ on the circle $x^2 + y^2 = 1$.

**80. Extrema on a circle** Find the extreme values of $f(x, y) = xy$ on the circle $x^2 + y^2 = 1$.

**81. Extrema in a disk** Find the extreme values of $f(x, y) = x^2 + 3y^2 + 2y$ on the unit disk $x^2 + y^2 \le 1$.

**82. Extrema in a disk** Find the extreme values of $f(x, y) = x^2 + y^2 - 3x - xy$ on the disk $x^2 + y^2 \le 9$.

**83. Extrema on a sphere** Find the extreme values of $f(x, y, z) = x - y + z$ on the unit sphere $x^2 + y^2 + z^2 = 1$.

**84. Minimum distance to origin** Find the points on the surface $z^2 - xy = 4$ closest to the origin.

**85. Minimizing cost of a box** A closed rectangular box is to have volume $V$ cm$^3$. The cost of the material used in the box is $a$ cents/cm$^2$ for top and bottom, $b$ cents/cm$^2$ for front and back, and $c$ cents/cm$^2$ for the remaining sides. What dimensions minimize the total cost of materials?

**86. Least volume** Find the plane $x/a + y/b + z/c = 1$ that passes through the point (2, 1, 2) and cuts off the least volume from the first octant.

**87. Extrema on curve of intersecting surfaces** Find the extreme values of $f(x, y, z) = x(y + z)$ on the curve of intersection of the right circular cylinder $x^2 + y^2 = 1$ and the hyperbolic cylinder $xz = 1$.

**88. Minimum distance to origin on curve of intersecting plane and cone** Find the point closest to the origin on the curve of intersection of the plane $x + y + z = 1$ and the cone $z^2 = 2x^2 + 2y^2$.

## Partial Derivatives with Constrained Variables

In Exercises 89 and 90, begin by drawing a diagram that shows the relations among the variables.

**89.** If $w = x^2e^{yz}$ and $z = x^2 - y^2$ find

**a.** $\left(\dfrac{\partial w}{\partial y}\right)_z$ **b.** $\left(\dfrac{\partial w}{\partial z}\right)_x$ **c.** $\left(\dfrac{\partial w}{\partial z}\right)_y$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**90.** Let $U = f(P, V, T)$ be the internal energy of a gas that obeys the ideal gas law $PV = nRT$ ($n$ and $R$ constant). Find

**a.** $\left(\dfrac{\partial U}{\partial T}\right)_P$ **b.** $\left(\dfrac{\partial U}{\partial V}\right)_T$.

## Theory and Examples

**91.** Let $w = f(r, \theta), r = \sqrt{x^2 + y^2}$, and $\theta = \tan^{-1}(y/x)$. Find $\partial w/\partial x$ and $\partial w/\partial y$ and express your answers in terms of $r$ and $\theta$.

**92.** Let $z = f(u, v), u = ax + by$, and $v = ax - by$. Express $z_x$ and $z_y$ in terms of $f_u, f_v$, and the constants $a$ and $b$.

**93.** If $a$ and $b$ are constants, $w = u^3 + \tanh u + \cos u$, and $u = ax + by$, show that

$$a\frac{\partial w}{\partial y} = b\frac{\partial w}{\partial x}.$$

**94. Using the Chain Rule** If $w = \ln(x^2 + y^2 + 2z)$, $x = r + s$, $y = r - s$, and $z = 2rs$, find $w_r$ and $w_s$ by the Chain Rule. Then check your answer another way.

**95. Angle between vectors** The equations $e^u \cos v - x = 0$ and $e^u \sin v - y = 0$ define $u$ and $v$ as differentiable functions of $x$ and $y$. Show that the angle between the vectors

$$\frac{\partial u}{\partial x}\mathbf{i} + \frac{\partial u}{\partial y}\mathbf{j} \quad \text{and} \quad \frac{\partial v}{\partial x}\mathbf{i} + \frac{\partial v}{\partial y}\mathbf{j}$$

is constant.

**96. Polar coordinates and second derivatives** Introducing polar coordinates $x = r\cos\theta$ and $y = r\sin\theta$ changes $f(x, y)$ to $g(r, \theta)$. Find the value of $\partial^2 g/\partial\theta^2$ at the point $(r, \theta) = (2, \pi/2)$, given that

$$\frac{\partial f}{\partial x} = \frac{\partial f}{\partial y} = \frac{\partial^2 f}{\partial x^2} = \frac{\partial^2 f}{\partial y^2} = 1$$

at that point.

**97. Normal line parallel to a plane** Find the points on the surface

$$(y + z)^2 + (z - x)^2 = 16$$

where the normal line is parallel to the $yz$-plane.

**98. Tangent plane parallel to $xy$-plane** Find the points on the surface

$$xy + yz + zx - x - z^2 = 0$$

where the tangent plane is parallel to the $xy$-plane.

**99. When gradient is parallel to position vector** Suppose that $\nabla f(x, y, z)$ is always parallel to the position vector $x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$. Show that $f(0, 0, a) = f(0, 0, -a)$ for any $a$.

**100. Directional derivative in all directions, but no gradient** Show that the directional derivative of

$$f(x, y, z) = \sqrt{x^2 + y^2 + z^2}$$

at the origin equals 1 in any direction but that $f$ has no gradient vector at the origin.

**101. Normal line through origin** Show that the line normal to the surface $xy + z = 2$ at the point $(1, 1, 1)$ passes through the origin.

**102. Tangent plane and normal line**

**a.** Sketch the surface $x^2 - y^2 + z^2 = 4$.

**b.** Find a vector normal to the surface at $(2, -3, 3)$. Add the vector to your sketch.

**c.** Find equations for the tangent plane and normal line at $(2, -3, 3)$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

# Chapter 14 Questions to Guide Your Review

1. What is a real-valued function of two independent variables? Three independent variables? Give examples.
2. What does it mean for sets in the plane or in space to be open? Closed? Give examples. Give examples of sets that are neither open nor closed.
3. How can you display the values of a function $f(x, y)$ of two independent variables graphically? How do you do the same for a function $f(x, y, z)$ of three independent variables?
4. What does it mean for a function $f(x, y)$ to have limit $L$ as $(x, y) \to (x_0, y_0)$ ? What are the basic properties of limits of functions of two independent variables?
5. When is a function of two (three) independent variables continuous at a point in its domain? Give examples of functions that are continuous at some points but not others.
6. What can be said about algebraic combinations and composites of continuous functions?
7. Explain the two-path test for nonexistence of limits.
8. How are the partial derivatives $\partial f/\partial x$ and $\partial f/\partial y$ of a function $f(x, y)$ defined? How are they interpreted and calculated?
9. How does the relation between first partial derivatives and continuity of functions of two independent variables differ from the relation between first derivatives and continuity for real-valued functions of a single independent variable? Give an example.
10. What is the Mixed Derivative Theorem for mixed second-order partial derivatives? How can it help in calculating partial derivatives of second and higher orders? Give examples.
11. What does it mean for a function $f(x, y)$ to be differentiable? What does the Increment Theorem say about differentiability?
12. How can you sometimes decide from examining $f_x$ and $f_y$ that a function $f(x, y)$ is differentiable? What is the relation between the differentiability of $f$ and the continuity of $f$ at a point?
13. What is the Chain Rule? What form does it take for functions of two independent variables? Three independent variables? Functions defined on surfaces? How do you diagram these different forms? Give examples. What pattern enables one to remember all the different forms?
14. What is the derivative of a function $f(x, y)$ at a point $P_0$ in the direction of a unit vector $\mathbf{u}$? What rate does it describe? What geometric interpretation does it have? Give examples.
15. What is the gradient vector of a differentiable function $f(x, y)$? How is it related to the function's directional derivatives? State the analogous results for functions of three independent variables.
16. How do you find the tangent line at a point on a level curve of a differentiable function $f(x, y)$? How do you find the tangent plane and normal line at a point on a level surface of a differentiable function $f(x, y, z)$? Give examples.
17. How can you use directional derivatives to estimate change?
18. How do you linearize a function $f(x, y)$ of two independent variables at a point $(x_0, y_0)$ ? Why might you want to do this? How do you linearize a function of three independent variables?
19. What can you say about the accuracy of linear approximations of functions of two (three) independent variables?
20. If $(x, y)$ moves from $(x_0, y_0)$ to a point $(x_0 + dx, y_0 + dy)$ nearby, how can you estimate the resulting change in the value of a differentiable function $f(x, y)$? Give an example.
21. How do you define local maxima, local minima, and saddle points for a differentiable function $f(x, y)$? Give examples.
22. What derivative tests are available for determining the local extreme values of a function $f(x, y)$? How do they enable you to narrow your search for these values? Give examples.
23. How do you find the extrema of a continuous function $f(x, y)$ on a closed bounded region of the $xy$-plane? Give an example.
24. Describe the method of Lagrange multipliers and give examples.
25. If $w = f(x, y, z)$ , where the variables $x$, $y$, and $z$ are constrained by an equation $g(x, y, z) = 0$ , what is the meaning of the notation $(\partial w/\partial x)_y$ ? How can an arrow diagram help you calculate this partial derivative with constrained variables? Give examples.
26. How does Taylor's formula for a function $f(x, y)$ generate polynomial approximations and error estimates?

Chapter

# 15 MULTIPLE INTEGRALS

**OVERVIEW** In this chapter we consider the integral of a function of two variables $f(x, y)$ over a region in the plane and the integral of a function of three variables $f(x, y, z)$ over a region in space. These integrals are called *multiple integrals* and are defined as the limit of approximating Riemann sums, much like the single-variable integrals presented in Chapter 5. We can use multiple integrals to calculate quantities that vary over two or three dimensions, such as the total mass or the angular momentum of an object of varying density and the volumes of solids with general curved boundaries.

## 15.1 Double Integrals

In Chapter 5 we defined the definite integral of a continuous function $f(x)$ over an interval $[a, b]$ as a limit of Riemann sums. In this section we extend this idea to define the integral of a continuous function of two variables $f(x, y)$ over a bounded region $R$ in the plane. In both cases the integrals are limits of approximating Riemann sums. The Riemann sums for the integral of a single-variable function $f(x)$ are obtained by partitioning a finite interval into thin subintervals, multiplying the width of each subinterval by the value of $f$ at a point $c_k$ inside that subinterval, and then adding together all the products. A similar method of partitioning, multiplying, and summing is used to construct double integrals. However, this time we pack a planar region $R$ with small rectangles, rather than small subintervals. We then take the product of each small rectangle's area with the value of $f$ at a point inside that rectangle, and finally sum together all these products. When $f$ is continuous, these sums converge to a single number as each of the small rectangles shrinks in both width and height. The limit is the *double integral* of $f$ over $R$. As with single integrals, we can evaluate multiple integrals via antiderivatives, which frees us from the formidable task of calculating a double integral directly from its definition as a limit of Riemann sums. The major practical problem that arises in evaluating multiple integrals lies in determining the limits of integration. While the integrals of Chapter 5 were evaluated over an interval, which is determined by its two endpoints, multiple integrals are evaluated over a region in the plane or in space. This gives rise to limits of integration which often involve variables, not just constants. Describing the regions of integration is the main new issue that arises in the calculation of multiple integrals.

### Double Integrals over Rectangles

We begin our investigation of double integrals by considering the simplest type of planar region, a rectangle. We consider a function $f(x, y)$ defined on a rectangular region $R$,

$$R: \quad a \le x \le b, \quad c \le y \le d.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

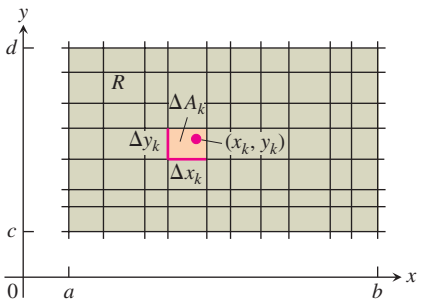

**FIGURE 15.1** Rectangular grid partitioning the region $R$ into small rectangles of area $\Delta A_k = \Delta x_k\, \Delta y_k$.

We subdivide $R$ into small rectangles using a network of lines parallel to the $x$- and $y$-axes (Figure 15.1). The lines divide $R$ into $n$ rectangular pieces, where the number of such pieces $n$ gets large as the width and height of each piece gets small. These rectangles form a **partition** of $R$. A small rectangular piece of width $\Delta x$ and height $\Delta y$ has area $\Delta A = \Delta x \Delta y$. If we number the small pieces partitioning $R$ in some order, then their areas are given by numbers $\Delta A_1, \Delta A_2, \ldots, \Delta A_n$, where $\Delta A_k$ is the area of the $k$th small rectangle.

To form a Riemann sum over $R$, we choose a point $(x_k, y_k)$ in the $k$th small rectangle, multiply the value of $f$ at that point by the area $\Delta A_k$, and add together the products:

$$S_n = \sum_{k=1}^{n} f(x_k, y_k)\, \Delta A_k.$$

Depending on how we pick $(x_k, y_k)$ in the $k$th small rectangle, we may get different values for $S_n$.

We are interested in what happens to these Riemann sums as the widths and heights of all the small rectangles in the partition of $R$ approach zero. The **norm** of a partition $P$, written $\|P\|$, is the largest width or height of any rectangle in the partition. If $\|P\| = 0.1$ then all the rectangles in the partition of $R$ have width at most 0.1 and height at most 0.1. Sometimes the Riemann sums converge as the norm of $P$ goes to zero, written $\|P\| \to 0$. The resulting limit is then written as

$$\lim_{\|P\|\to 0} \sum_{k=1}^{n} f(x_k, y_k)\, \Delta A_k.$$

As $\|P\| \to 0$ and the rectangles get narrow and short, their number $n$ increases, so we can also write this limit as

$$\lim_{n\to\infty} \sum_{k=1}^{n} f(x_k, y_k)\, \Delta A_k.$$

with the understanding that $\Delta A_k \to 0$ as $n \to \infty$ and $\|P\| \to 0$.

There are many choices involved in a limit of this kind. The collection of small rectangles is determined by the grid of vertical and horizontal lines that determine a rectangular partition of $R$. In each of the resulting small rectangles there is a choice of an arbitrary point $(x_k, y_k)$ at which $f$ is evaluated. These choices together determine a single Riemann sum. To form a limit, we repeat the whole process again and again, choosing partitions whose rectangle widths and heights both go to zero and whose number goes to infinity.

When a limit of the sums $S_n$ exists, giving the same limiting value no matter what choices are made, then the function $f$ is said to be **integrable** and the limit is called the **double integral** of $f$ over $R$, written as

$$\iint_R f(x, y)\, dA \qquad \text{or} \qquad \iint_R f(x, y)\, dx\, dy.$$

It can be shown that if $f(x, y)$ is a continuous function throughout $R$, then $f$ is integrable, as in the single-variable case discussed in Chapter 5. Many discontinuous functions are also integrable, including functions which are discontinuous only on a finite number of points or smooth curves. We leave the proof of these facts to a more advanced text.

## Double Integrals as Volumes

When $f(x, y)$ is a positive function over a rectangular region $R$ in the $xy$-plane, we may interpret the double integral of $f$ over $R$ as the volume of the 3-dimensional solid region over the $xy$-plane bounded below by $R$ and above by the surface $z = f(x, y)$ (Figure 15.2). Each term $f(x_k, y_k)\Delta A_k$ in the sum $S_n = \sum f(x_k, y_k)\Delta A_k$ is the volume of a vertical

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

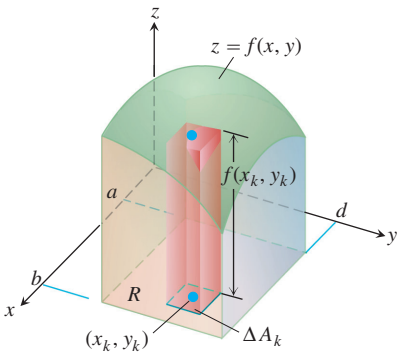

**FIGURE 15.2** Approximating solids with rectangular boxes leads us to define the volumes of more general solids as double integrals. The volume of the solid shown here is the double integral of $f(x, y)$ over the base region $R$.

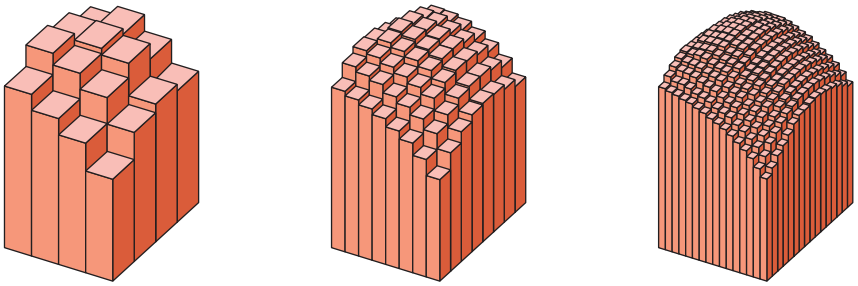

rectangular box that approximates the volume of the portion of the solid that stands directly above the base $\Delta A_k$. The sum $S_n$ thus approximates what we want to call the total volume of the solid. We *define* this volume to be

$$\text{Volume} = \lim_{n\to\infty} S_n = \iint_R f(x, y)\, dA,$$

where $\Delta A_k \to 0$ as $n \to \infty$.

As you might expect, this more general method of calculating volume agrees with the methods in Chapter 6, but we do not prove this here. Figure 15.3 shows Riemann sum approximations to the volume becoming more accurate as the number $n$ of boxes increases.

(a) $n = 16$ (b) $n = 64$ (c) $n = 256$

**FIGURE 15.3** As $n$ increases, the Riemann sum approximations approach the total volume of the solid shown in Figure 15.2.

## Fubini's Theorem for Calculating Double Integrals

Suppose that we wish to calculate the volume under the plane $z = 4 - x - y$ over the rectangular region $R$: $0 \le x \le 2$, $0 \le y \le 1$ in the $xy$-plane. If we apply the method of slicing from Section 6.1, with slices perpendicular to the $x$-axis (Figure 15.4), then the volume is

$$\int_{x=0}^{x=2} A(x)\, dx, \tag{1}$$

where $A(x)$ is the cross-sectional area at $x$. For each value of $x$, we may calculate $A(x)$ as the integral

$$A(x) = \int_{y=0}^{y=1} (4 - x - y)\, dy, \tag{2}$$

which is the area under the curve $z = 4 - x - y$ in the plane of the cross-section at $x$. In calculating $A(x)$, $x$ is held fixed and the integration takes place with respect to $y$. Combining Equations (1) and (2), we see that the volume of the entire solid is

$$\text{Volume} = \int_{x=0}^{x=2} A(x)\, dx = \int_{x=0}^{x=2} \left( \int_{y=0}^{y=1} (4 - x - y)\, dy \right) dx$$

$$= \int_{x=0}^{x=2} \left[ 4y - xy - \frac{y^2}{2} \right]_{y=0}^{y=1} dx = \int_{x=0}^{x=2} \left( \frac{7}{2} - x \right) dx$$

$$= \left[ \frac{7}{2}x - \frac{x^2}{2} \right]_0^2 = 5. \tag{3}$$

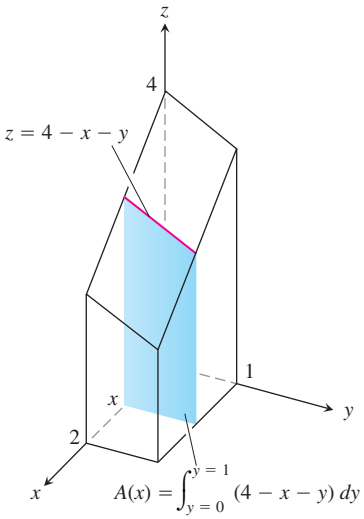

**FIGURE 15.4** To obtain the cross-sectional area $A(x)$, we hold $x$ fixed and integrate with respect to $y$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

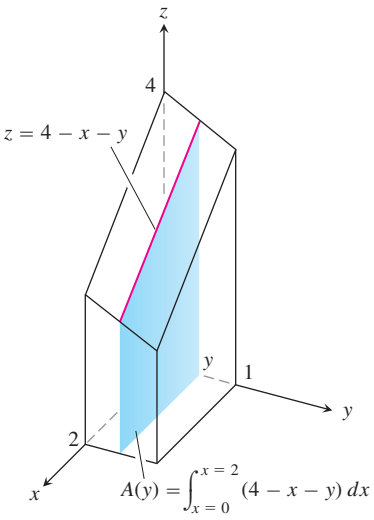

**FIGURE 15.5** To obtain the cross-sectional area $A(y)$, we hold $y$ fixed and integrate with respect to $x$.

If we just wanted to write a formula for the volume, without carrying out any of the integrations, we could write

$$\text{Volume} = \int_0^2 \int_0^1 (4 - x - y)\, dy\, dx.$$

The expression on the right, called an **iterated** or **repeated integral**, says that the volume is obtained by integrating $4 - x - y$ with respect to $y$ from $y = 0$ to $y = 1$, holding $x$ fixed, and then integrating the resulting expression in $x$ with respect to $x$ from $x = 0$ to $x = 2$. The limits of integration 0 and 1 are associated with $y$, so they are placed on the integral closest to $dy$. The other limits of integration, 0 and 2, are associated with the variable $x$, so they are placed on the outside integral symbol that is paired with $dx$.

What would have happened if we had calculated the volume by slicing with planes perpendicular to the $y$-axis (Figure 15.5)? As a function of $y$, the typical cross-sectional area is

$$A(y) = \int_{x=0}^{x=2} (4 - x - y)\, dx = \left[4x - \frac{x^2}{2} - xy\right]_{x=0}^{x=2} = 6 - 2y. \tag{4}$$

The volume of the entire solid is therefore

$$\text{Volume} = \int_{y=0}^{y=1} A(y)\, dy = \int_{y=0}^{y=1} (6 - 2y)\, dy = \left[6y - y^2\right]_0^1 = 5,$$

in agreement with our earlier calculation.

Again, we may give a formula for the volume as an iterated integral by writing

$$\text{Volume} = \int_0^1 \int_0^2 (4 - x - y)\, dx\, dy.$$

The expression on the right says we can find the volume by integrating $4 - x - y$ with respect to $x$ from $x = 0$ to $x = 2$ as in Equation (4) and integrating the result with respect to $y$ from $y = 0$ to $y = 1$. In this iterated integral, the order of integration is first $x$ and then $y$, the reverse of the order in Equation (3).

What do these two volume calculations with iterated integrals have to do with the double integral

$$\iint_R (4 - x - y)\, dA$$

over the rectangle $R$: $0 \le x \le 2, 0 \le y \le 1$? The answer is that both iterated integrals give the value of the double integral. This is what we would reasonably expect, since the double integral measures the volume of the same region as the two iterated integrals. A theorem published in 1907 by Guido Fubini says that the double integral of any continuous function over a rectangle can be calculated as an iterated integral in either order of integration. (Fubini proved his theorem in greater generality, but this is what it says in our setting.)

HISTORICAL BIOGRAPHY

Guido Fubini
(1879–1943)

**THEOREM 1 Fubini's Theorem (First Form)**

If $f(x, y)$ is continuous throughout the rectangular region $R$: $a \le x \le b$, $c \le y \le d$, then

$$\iint_R f(x, y)\, dA = \int_c^d \int_a^b f(x, y)\, dx\, dy = \int_a^b \int_c^d f(x, y)\, dy\, dx.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Fubini's Theorem says that double integrals over rectangles can be calculated as iterated integrals. Thus, we can evaluate a double integral by integrating with respect to one variable at a time.

Fubini's Theorem also says that we may calculate the double integral by integrating in *either* order, a genuine convenience, as we see in Example 3. When we calculate a volume by slicing, we may use either planes perpendicular to the $x$-axis or planes perpendicular to the $y$-axis.

**EXAMPLE 1** Evaluating a Double Integral

Calculate $\iint_R f(x, y)\, dA$ for

$$f(x, y) = 1 - 6x^2y \qquad \text{and} \qquad R: \quad 0 \le x \le 2, \quad -1 \le y \le 1.$$

**Solution** By Fubini's Theorem,

$$\iint_R f(x, y)\, dA = \int_{-1}^{1}\int_{0}^{2} (1 - 6x^2y)\, dx\, dy = \int_{-1}^{1} \Big[x - 2x^3y\Big]_{x=0}^{x=2} dy$$

$$= \int_{-1}^{1} (2 - 16y)\, dy = \Big[2y - 8y^2\Big]_{-1}^{1} = 4.$$

Reversing the order of integration gives the same answer:

$$\int_{0}^{2}\int_{-1}^{1} (1 - 6x^2y)\, dy\, dx = \int_{0}^{2} \Big[y - 3x^2y^2\Big]_{y=-1}^{y=1} dx$$

$$= \int_{0}^{2} [(1 - 3x^2) - (-1 - 3x^2)]\, dx$$

$$= \int_{0}^{2} 2\, dx = 4.$$

■

## USING TECHNOLOGY Multiple Integration

Most CAS can calculate both multiple and iterated integrals. The typical procedure is to apply the CAS integrate command in nested iterations according to the order of integration you specify.

| Integral | Typical CAS Formulation |
|---|---|
| $\iint x^2y\, dx\, dy$ | int (int ($x \wedge 2 * y, x$), $y$) ; |
| $\int_{-\pi/3}^{\pi/4}\int_{0}^{1} x \cos y\, dx\, dy$ | int (int ($x * \cos(y), x = 0 \,..\, 1), y = -\text{Pi}/3 \,..\, \text{Pi}/4$); |

If a CAS cannot produce an exact value for a definite integral, it can usually find an approximate value numerically. Setting up a multiple integral for a CAS to solve can be a highly nontrivial task, and requires an understanding of how to describe the boundaries of the region and set up an appropriate integral.

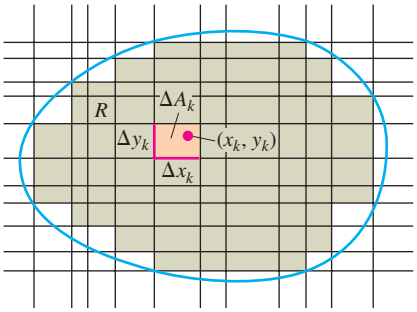

**FIGURE 15.6** A rectangular grid partitioning a bounded nonrectangular region into rectangular cells.

## Double Integrals over Bounded Nonrectangular Regions

To define the double integral of a function $f(x, y)$ over a bounded, nonrectangular region $R$, such as the one in Figure 15.6, we again begin by covering $R$ with a grid of small rectangular cells whose union contains all points of $R$. This time, however, we cannot exactly fill $R$ with a finite number of rectangles lying inside $R$, since its boundary is curved, and some of the small rectangles in the grid lie partly outside $R$. A partition of $R$ is formed by taking the rectangles that lie completely inside it, not using any that are either partly or completely outside. For commonly arising regions, more and more of $R$ is included as the norm of a partition (the largest width or height of any rectangle used) approaches zero.

Once we have a partition of $R$, we number the rectangles in some order from 1 to $n$ and let $\Delta A_k$ be the area of the $k$th rectangle. We then choose a point $(x_k, y_k)$ in the $k$th rectangle and form the Riemann sum

$$S_n = \sum_{k=1}^{n} f(x_k, y_k)\, \Delta A_k.$$

As the norm of the partition forming $S_n$ goes to zero, $\|P\| \to 0$, the width and height of each enclosed rectangle goes to zero and their number goes to infinity. If $f(x, y)$ is a continuous function, then these Riemann sums converge to a limiting value, not dependent on any of the choices we made. This limit is called the **double integral** of $f(x, y)$ over $R$:

$$\lim_{\|P\|\to 0} \sum_{k=1}^{n} f(x_k, y_k)\, \Delta A_k = \iint_R f(x, y)\, dA.$$

The nature of the boundary of $R$ introduces issues not found in integrals over an interval. When $R$ has a curved boundary, the $n$ rectangles of a partition lie inside $R$ but do not cover all of $R$. In order for a partition to approximate $R$ well, the parts of $R$ covered by small rectangles lying partly outside $R$ must become negligible as the norm of the partition approaches zero. This property of being nearly filled in by a partition of small norm is satisfied by all the regions that we will encounter. There is no problem with boundaries made from polygons, circles, ellipses, and from continuous graphs over an interval, joined end to end. A curve with a "fractal" type of shape would be problematic, but such curves are not relevant for most applications. A careful discussion of which type of regions $R$ can be used for computing double integrals is left to a more advanced text.

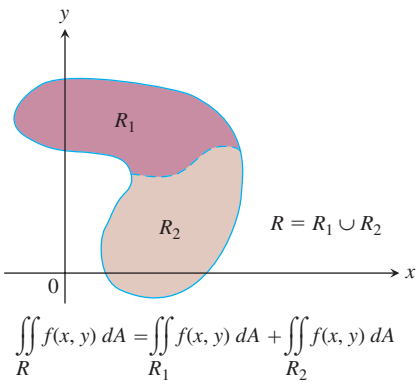
Double integrals of continuous functions over nonrectangular regions have the same algebraic properties (summarized further on) as integrals over rectangular regions. The domain Additivity Property says that if $R$ is decomposed into nonoverlapping regions $R_1$ and $R_2$ with boundaries that are again made of a finite number of line segments or smooth curves (see Figure 15.7 for an example), then

$$\iint_R f(x, y)\, dA = \iint_{R_1} f(x, y)\, dA + \iint_{R_2} f(x, y)\, dA.$$

If $f(x, y)$ is positive and continuous over $R$ we define the volume of the solid region between $R$ and the surface $z = f(x, y)$ to be $\iint_R f(x, y)\, dA$, as before (Figure 15.8).

If $R$ is a region like the one shown in the $xy$-plane in Figure 15.9, bounded "above" and "below" by the curves $y = g_2(x)$ and $y = g_1(x)$ and on the sides by the lines $x = a, x = b$, we may again calculate the volume by the method of slicing. We first calculate the cross-sectional area

$$A(x) = \int_{y=g_1(x)}^{y=g_2(x)} f(x, y)\, dy$$



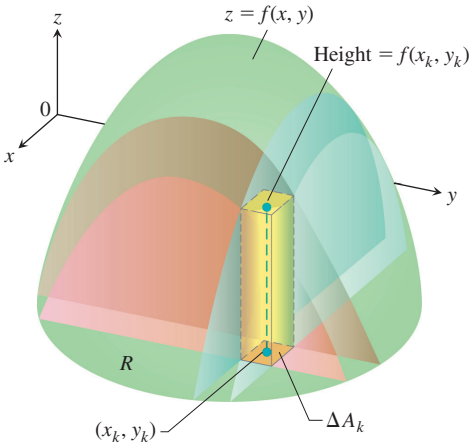


**FIGURE 15.7** The Additivity Property for rectangular regions holds for regions bounded by continuous curves.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$$\text{Volume} = \lim \sum f(x_k, y_k)\,\Delta A_k = \iint_R f(x, y)\,dA$$

**FIGURE 15.8** We define the volumes of solids with curved bases the same way we define the volumes of solids with rectangular bases.

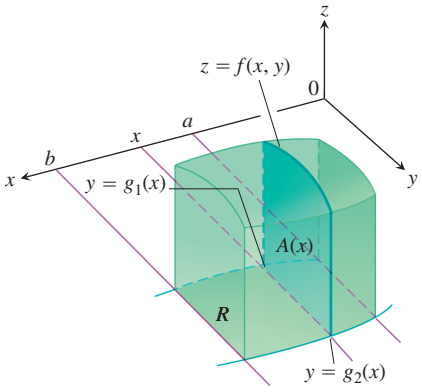

**FIGURE 15.9** The area of the vertical slice shown here is

$$A(x) = \int_{g_1(x)}^{g_2(x)} f(x, y)\,dy.$$

To calculate the volume of the solid, we integrate this area from $x = a$ to $x = b$.

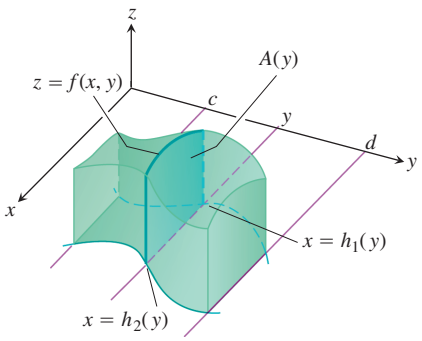

**FIGURE 15.10** The volume of the solid shown here is

$$\int_c^d A(y)\,dy = \int_c^d \int_{h_1(y)}^{h_2(y)} f(x, y)\,dx\,dy.$$

and then integrate $A(x)$ from $x = a$ to $x = b$ to get the volume as an iterated integral:

$$V = \int_a^b A(x)\,dx = \int_a^b \int_{g_1(x)}^{g_2(x)} f(x, y)\,dy\,dx. \tag{5}$$

Similarly, if $R$ is a region like the one shown in Figure 15.10, bounded by the curves $x = h_2(y)$ and $x = h_1(y)$ and the lines $y = c$ and $y = d$, then the volume calculated by slicing is given by the iterated integral

$$\text{Volume} = \int_c^d \int_{h_1(y)}^{h_2(y)} f(x, y)\,dx\,dy. \tag{6}$$

That the iterated integrals in Equations (5) and (6) both give the volume that we defined to be the double integral of $f$ over $R$ is a consequence of the following stronger form of Fubini's Theorem.

**THEOREM 2 Fubini's Theorem (Stronger Form)**

Let $f(x, y)$ be continuous on a region $R$.

1. If $R$ is defined by $a \le x \le b$, $g_1(x) \le y \le g_2(x)$, with $g_1$ and $g_2$ continuous on $[a, b]$, then

$$\iint_R f(x, y)\,dA = \int_a^b \int_{g_1(x)}^{g_2(x)} f(x, y)\,dy\,dx.$$

2. If $R$ is defined by $c \le y \le d$, $h_1(y) \le x \le h_2(y)$, with $h_1$ and $h_2$ continuous on $[c, d]$, then

$$\iint_R f(x, y)\,dA = \int_c^d \int_{h_1(y)}^{h_2(y)} f(x, y)\,dx\,dy.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**EXAMPLE 2** Finding Volume

Find the volume of the prism whose base is the triangle in the $xy$-plane bounded by the $x$-axis and the lines $y = x$ and $x = 1$ and whose top lies in the plane

$$z = f(x, y) = 3 - x - y.$$

**Solution** See Figure 15.11 on page 1075. For any $x$ between 0 and 1, $y$ may vary from $y = 0$ to $y = x$ (Figure 15.11b). Hence,

$$V = \int_0^1 \int_0^x (3 - x - y)\, dy\, dx = \int_0^1 \left[3y - xy - \frac{y^2}{2}\right]_{y=0}^{y=x} dx$$

$$= \int_0^1 \left(3x - \frac{3x^2}{2}\right) dx = \left[\frac{3x^2}{2} - \frac{x^3}{2}\right]_{x=0}^{x=1} = 1.$$

When the order of integration is reversed (Figure 15.11c), the integral for the volume is

$$V = \int_0^1 \int_y^1 (3 - x - y)\, dx\, dy = \int_0^1 \left[3x - \frac{x^2}{2} - xy\right]_{x=y}^{x=1} dy$$

$$= \int_0^1 \left(3 - \frac{1}{2} - y - 3y + \frac{y^2}{2} + y^2\right) dy$$

$$= \int_0^1 \left(\frac{5}{2} - 4y + \frac{3}{2}y^2\right) dy = \left[\frac{5}{2}y - 2y^2 + \frac{y^3}{2}\right]_{y=0}^{y=1} = 1.$$

The two integrals are equal, as they should be. ■

Although Fubini's Theorem assures us that a double integral may be calculated as an iterated integral in either order of integration, the value of one integral may be easier to find than the value of the other. The next example shows how this can happen.

**EXAMPLE 3** Evaluating a Double Integral

Calculate

$$\iint_R \frac{\sin x}{x}\, dA,$$

where $R$ is the triangle in the $xy$-plane bounded by the $x$-axis, the line $y = x$, and the line $x = 1$.

**Solution** The region of integration is shown in Figure 15.12. If we integrate first with respect to $y$ and then with respect to $x$, we find

$$\int_0^1 \left(\int_0^x \frac{\sin x}{x}\, dy\right) dx = \int_0^1 \left(y\,\frac{\sin x}{x}\right]_{y=0}^{y=x} dx = \int_0^1 \sin x\, dx$$

$$= -\cos(1) + 1 \approx 0.46.$$

If we reverse the order of integration and attempt to calculate

$$\int_0^1 \int_y^1 \frac{\sin x}{x}\, dx\, dy,$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

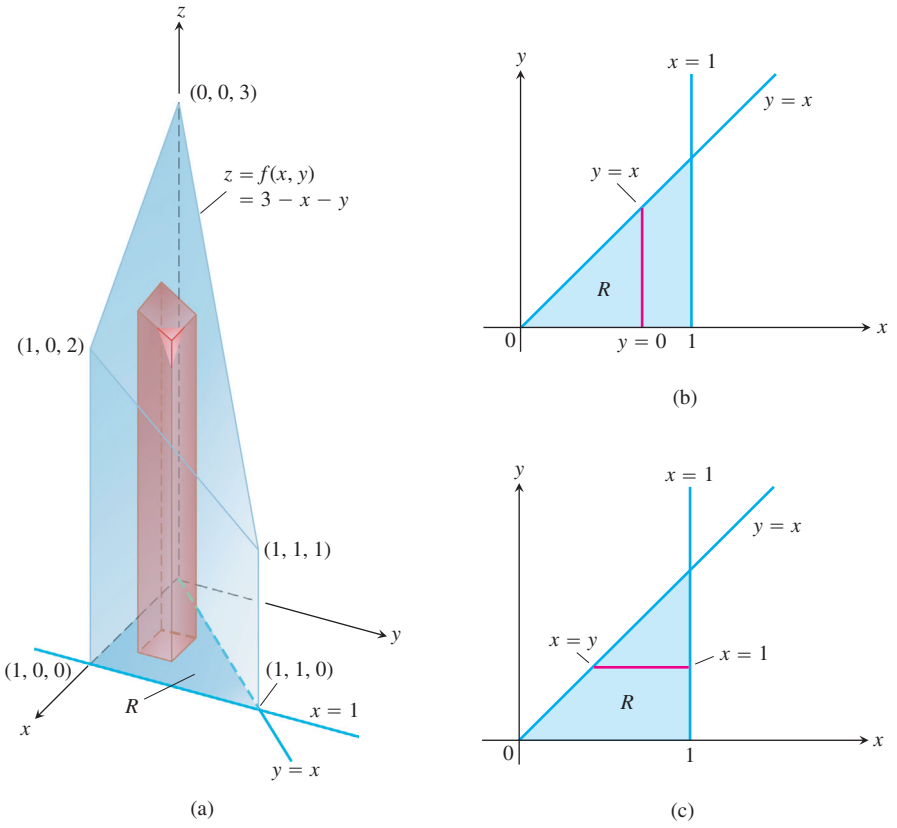

**FIGURE 15.11** (a) Prism with a triangular base in the $xy$-plane. The volume of this prism is defined as a double integral over $R$. To evaluate it as an iterated integral, we may integrate first with respect to $y$ and then with respect to $x$, or the other way around (Example 2).
(b) Integration limits of

$$\int_{x=0}^{x=1} \int_{y=0}^{y=x} f(x, y)\, dy\, dx.$$

If we integrate first with respect to $y$, we integrate along a vertical line through $R$ and then integrate from left to right to include all the vertical lines in $R$.
(c) Integration limits of

$$\int_{y=0}^{y=1} \int_{x=y}^{x=1} f(x, y)\, dx\, dy.$$

If we integrate first with respect to $x$, we integrate along a horizontal line through $R$ and then integrate from bottom to top to include all the horizontal lines in $R$.

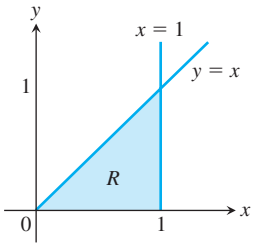

**FIGURE 15.12** The region of integration in Example 3.

we run into a problem, because $\int ((\sin x)/x)\, dx$ cannot be expressed in terms of elementary functions (there is no simple antiderivative).

There is no general rule for predicting which order of integration will be the good one in circumstances like these. If the order you first choose doesn't work, try the other. Sometimes neither order will work, and then we need to use numerical approximations. ■

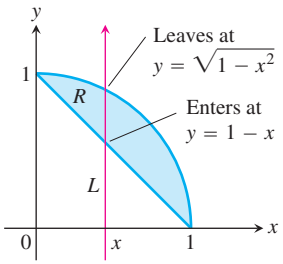
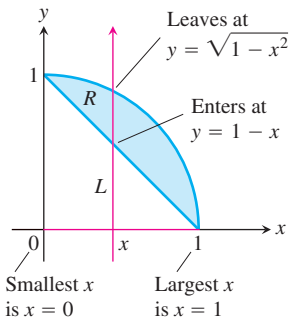
## Finding Limits of Integration



We now give a procedure for finding limits of integration that applies for many regions in the plane. Regions that are more complicated, and for which this procedure fails, can often be split up into pieces on which the procedure works.

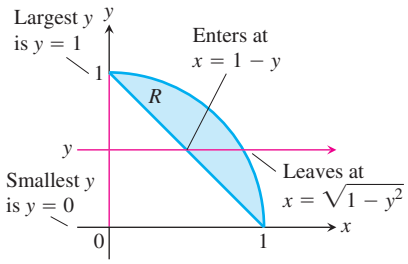
When faced with evaluating $\iint_R f(x, y)\,dA$, integrating first with respect to $y$ and then with respect to $x$, do the following:

**1.** *Sketch*. Sketch the region of integration and label the bounding curves.



**2.** *Find the y-limits of integration*. Imagine a vertical line $L$ cutting through $R$ in the direction of increasing $y$. Mark the $y$-values where $L$ enters and leaves. These are the $y$-limits of integration and are usually functions of $x$ (instead of constants).

**3.** *Find the x-limits of integration*. Choose $x$-limits that include all the vertical lines through $R$. The integral shown here is



$$\iint_R f(x, y)\,dA = \int_{x=0}^{x=1} \int_{y=1-x}^{y=\sqrt{1-x^2}} f(x, y)\,dy\,dx.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

To evaluate the same double integral as an iterated integral with the order of integration reversed, use horizontal lines instead of vertical lines in Steps 2 and 3. The integral is

$$\iint_R f(x, y)\, dA = \int_0^1 \int_{1-y}^{\sqrt{1-y^2}} f(x, y)\, dx\, dy.$$

**EXAMPLE 4** Reversing the Order of Integration

Sketch the region of integration for the integral

$$\int_0^2 \int_{x^2}^{2x} (4x + 2)\, dy\, dx$$

and write an equivalent integral with the order of integration reversed.

**Solution** The region of integration is given by the inequalities $x^2 \le y \le 2x$ and $0 \le x \le 2$. It is therefore the region bounded by the curves $y = x^2$ and $y = 2x$ between $x = 0$ and $x = 2$ (Figure 15.13a).

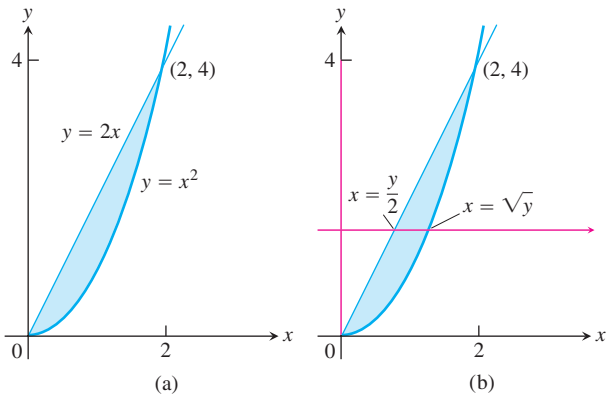


**FIGURE 15.13** Region of integration for Example 4.

To find limits for integrating in the reverse order, we imagine a horizontal line passing from left to right through the region. It enters at $x = y/2$ and leaves at $x = \sqrt{y}$. To include all such lines, we let $y$ run from $y = 0$ to $y = 4$ (Figure 15.13b). The integral is

$$\int_0^4 \int_{y/2}^{\sqrt{y}} (4x + 2)\, dx\, dy.$$

The common value of these integrals is 8. ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Properties of Double Integrals

Like single integrals, double integrals of continuous functions have algebraic properties that are useful in computations and applications.

### Properties of Double Integrals

If $f(x, y)$ and $g(x, y)$ are continuous, then

**1.** *Constant Multiple:* $\iint_R cf(x, y)\, dA = c \iint_R f(x, y)\, dA$ (any number $c$)

**2.** *Sum and Difference:*

$$\iint_R (f(x, y) \pm g(x, y))\, dA = \iint_R f(x, y)\, dA \pm \iint_R g(x, y)\, dA$$

**3.** *Domination:*

**(a)** $\iint_R f(x, y)\, dA \geq 0$ if $f(x, y) \geq 0$ on $R$

**(b)** $\iint_R f(x, y)\, dA \geq \iint_R g(x, y)\, dA$ if $f(x, y) \geq g(x, y)$ on $R$

**4.** *Additivity:* $\iint_R f(x, y)\, dA = \iint_{R_1} f(x, y)\, dA + \iint_{R_2} f(x, y)\, dA$

if $R$ is the union of two nonoverlapping regions $R_1$ and $R_2$ (Figure 15.7).

The idea behind these properties is that integrals behave like sums. If the function $f(x, y)$ is replaced by its constant multiple $cf(x, y)$, then a Riemann sum for $f$

$$S_n = \sum_{k=1}^{n} f(x_k, y_k)\, \Delta A_k$$

is replaced by a Riemann sum for $cf$

$$\sum_{k=1}^{n} cf(x_k, y_k)\, \Delta A_k = c \sum_{k=1}^{n} f(x_k, y_k)\, \Delta A_k = cS_n.$$

Taking limits as $n \to \infty$ shows that $c \lim_{n\to\infty} S_n = c \iint_R f\, dA$ and $\lim_{n\to\infty} cS_n = \iint_R cf\, dA$ are equal. It follows that the constant multiple property carries over from sums to double integrals.

The other properties are also easy to verify for Riemann sums, and carry over to double integrals for the same reason. While this discussion gives the idea, an actual proof that these properties hold requires a more careful analysis of how Riemann sums converge.

# EXERCISES 15.1

## Finding Regions of Integration and Double Integrals

In Exercises 1–10, sketch the region of integration and evaluate the integral.

1. $\int_0^3 \int_0^2 (4 - y^2)\, dy\, dx$
2. $\int_0^3 \int_{-2}^0 (x^2y - 2xy)\, dy\, dx$
3. $\int_{-1}^0 \int_{-1}^1 (x + y + 1)\, dx\, dy$
4. $\int_\pi^{2\pi} \int_0^\pi (\sin x + \cos y)\, dx\, dy$
5. $\int_0^\pi \int_0^x x \sin y\, dy\, dx$
6. $\int_0^\pi \int_0^{\sin x} y\, dy\, dx$
7. $\int_1^{\ln 8} \int_0^{\ln y} e^{x+y}\, dx\, dy$
8. $\int_1^2 \int_y^{y^2} dx\, dy$
9. $\int_0^1 \int_0^{y^2} 3y^3 e^{xy}\, dx\, dy$
10. $\int_1^4 \int_0^{\sqrt{x}} \frac{3}{2} e^{y/\sqrt{x}}\, dy\, dx$

In Exercises 11–16, integrate $f$ over the given region.

11. **Quadrilateral** $f(x, y) = x/y$ over the region in the first quadrant bounded by the lines $y = x, y = 2x, x = 1, x = 2$
12. **Square** $f(x, y) = 1/(xy)$ over the square $1 \le x \le 2$, $1 \le y \le 2$
13. **Triangle** $f(x, y) = x^2 + y^2$ over the triangular region with vertices (0, 0), (1, 0), and (0, 1)
14. **Rectangle** $f(x, y) = y \cos xy$ over the rectangle $0 \le x \le \pi$, $0 \le y \le 1$
15. **Triangle** $f(u, v) = v - \sqrt{u}$ over the triangular region cut from the first quadrant of the $uv$-plane by the line $u + v = 1$
16. **Curved region** $f(s, t) = e^s \ln t$ over the region in the first quadrant of the $st$-plane that lies above the curve $s = \ln t$ from $t = 1$ to $t = 2$

Each of Exercises 17–20 gives an integral over a region in a Cartesian coordinate plane. Sketch the region and evaluate the integral.

17. $\int_{-2}^0 \int_v^{-v} 2\, dp\, dv$ (the $pv$-plane)
18. $\int_0^1 \int_0^{\sqrt{1-s^2}} 8t\, dt\, ds$ (the $st$-plane)
19. $\int_{-\pi/3}^{\pi/3} \int_0^{\sec t} 3 \cos t\, du\, dt$ (the $tu$-plane)
20. $\int_0^3 \int_1^{4-2u} \frac{4 - 2u}{v^2}\, dv\, du$ (the $uv$-plane)

## Reversing the Order of Integration

In Exercises 21–30, sketch the region of integration and write an equivalent double integral with the order of integration reversed.

21. $\int_0^1 \int_2^{4-2x} dy\, dx$
22. $\int_0^2 \int_{y-2}^0 dx\, dy$
23. $\int_0^1 \int_y^{\sqrt{y}} dx\, dy$
24. $\int_0^1 \int_{1-x}^{1-x^2} dy\, dx$
25. $\int_0^1 \int_1^{e^x} dy\, dx$
26. $\int_0^{\ln 2} \int_{e^x}^2 dx\, dy$
27. $\int_0^{3/2} \int_0^{9-4x^2} 16x\, dy\, dx$
28. $\int_0^2 \int_0^{4-y^2} y\, dx\, dy$
29. $\int_0^1 \int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} 3y\, dx\, dy$
30. $\int_0^2 \int_{-\sqrt{4-x^2}}^{\sqrt{4-x^2}} 6x\, dy\, dx$

## Evaluating Double Integrals

In Exercises 31–40, sketch the region of integration, reverse the order of integration, and evaluate the integral.

31. $\int_0^\pi \int_x^\pi \frac{\sin y}{y}\, dy\, dx$
32. $\int_0^2 \int_x^2 2y^2 \sin xy\, dy\, dx$
33. $\int_0^1 \int_y^1 x^2 e^{xy}\, dx\, dy$
34. $\int_0^2 \int_0^{4-x^2} \frac{xe^{2y}}{4 - y}\, dy\, dx$
35. $\int_0^{2\sqrt{\ln 3}} \int_{y/2}^{\sqrt{\ln 3}} e^{x^2}\, dx\, dy$
36. $\int_0^3 \int_{\sqrt{x/3}}^1 e^{y^3}\, dy\, dx$
37. $\int_0^{1/16} \int_{y^{1/4}}^{1/2} \cos(16\pi x^5)\, dx\, dy$
38. $\int_0^8 \int_{\sqrt[3]{x}}^2 \frac{dy\, dx}{y^4 + 1}$
39. **Square region** $\iint_R (y - 2x^2)\, dA$ where $R$ is the region bounded by the square $|x| + |y| = 1$
40. **Triangular region** $\iint_R xy\, dA$ where $R$ is the region bounded by the lines $y = x, y = 2x$, and $x + y = 2$

## Volume Beneath a Surface $z = f(x, y)$

41. Find the volume of the region bounded by the paraboloid $z = x^2 + y^2$ and below by the triangle enclosed by the lines $y = x, x = 0$, and $x + y = 2$ in the $xy$-plane.
42. Find the volume of the solid that is bounded above by the cylinder $z = x^2$ and below by the region enclosed by the parabola $y = 2 - x^2$ and the line $y = x$ in the $xy$-plane.
43. Find the volume of the solid whose base is the region in the $xy$-plane that is bounded by the parabola $y = 4 - x^2$ and the line $y = 3x$, while the top of the solid is bounded by the plane $z = x + 4$.
44. Find the volume of the solid in the first octant bounded by the coordinate planes, the cylinder $x^2 + y^2 = 4$, and the plane $z + y = 3$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Exercises

**45.** Find the volume of the solid in the first octant bounded by the coordinate planes, the plane $x = 3$, and the parabolic cylinder $z = 4 - y^2$.

**46.** Find the volume of the solid cut from the first octant by the surface $z = 4 - x^2 - y$.

**47.** Find the volume of the wedge cut from the first octant by the cylinder $z = 12 - 3y^2$ and the plane $x + y = 2$.

**48.** Find the volume of the solid cut from the square column $|x| + |y| \le 1$ by the planes $z = 0$ and $3x + z = 3$.

**49.** Find the volume of the solid that is bounded on the front and back by the planes $x = 2$ and $x = 1$, on the sides by the cylinders $y = \pm 1/x$, and above and below by the planes $z = x + 1$ and $z = 0$.

**50.** Find the volume of the solid bounded on the front and back by the planes $x = \pm\pi/3$, on the sides by the cylinders $y = \pm\sec x$, above by the cylinder $z = 1 + y^2$, and below by the $xy$-plane.

## Integrals over Unbounded Regions

Improper double integrals can often be computed similarly to improper integrals of one variable. The first iteration of the following improper integrals is conducted just as if they were proper integrals. One then evaluates an improper integral of a single variable by taking appropriate limits, as in Section 8.8. Evaluate the improper integrals in Exercises 51–54 as iterated integrals.

Exercises

**51.** $\displaystyle\int_1^\infty \int_{e^{-x}}^1 \frac{1}{x^3 y}\, dy\, dx$

**52.** $\displaystyle\int_{-1}^1 \int_{-1/\sqrt{1-x^2}}^{1/\sqrt{1-x^2}} (2y + 1)\, dy\, dx$

**53.** $\displaystyle\int_{-\infty}^\infty \int_{-\infty}^\infty \frac{1}{(x^2 + 1)(y^2 + 1)}\, dx\, dy$

**54.** $\displaystyle\int_0^\infty \int_0^\infty xe^{-(x+2y)}\, dx\, dy$

## Approximating Double Integrals

In Exercises 55 and 56, approximate the double integral of $f(x, y)$ over the region $R$ partitioned by the given vertical lines $x = a$ and horizontal lines $y = c$. In each subrectangle, use $(x_k, y_k)$ as indicated for your approximation.

$$\iint_R f(x, y)\, dA \approx \sum_{k=1}^n f(x_k, y_k)\, \Delta A_k$$

Exercises

**55.** $f(x, y) = x + y$ over the region $R$ bounded above by the semicircle $y = \sqrt{1 - x^2}$ and below by the $x$-axis, using the partition $x = -1, -1/2, 0, 1/4, 1/2, 1$ and $y = 0, 1/2, 1$ with $(x_k, y_k)$ the lower left corner in the $k$th subrectangle (provided the subrectangle lies within $R$)

**56.** $f(x, y) = x + 2y$ over the region $R$ inside the circle $(x - 2)^2 + (y - 3)^2 = 1$ using the partition $x = 1, 3/2, 2, 5/2, 3$ and $y = 2, 5/2, 3, 7/2, 4$ with $(x_k, y_k)$ the center (centroid) in the $k$th subrectangle (provided the subrectangle lies within $R$)

## Theory and Examples

**57. Circular sector** Integrate $f(x, y) = \sqrt{4 - x^2}$ over the smaller sector cut from the disk $x^2 + y^2 \le 4$ by the rays $\theta = \pi/6$ and $\theta = \pi/2$.

**58. Unbounded region** Integrate $f(x, y) = 1/[(x^2 - x)(y - 1)^{2/3}]$ over the infinite rectangle $2 \le x < \infty$, $0 \le y \le 2$.

**59. Noncircular cylinder** A solid right (noncircular) cylinder has its base $R$ in the $xy$-plane and is bounded above by the paraboloid $z = x^2 + y^2$. The cylinder's volume is

$$V = \int_0^1 \int_0^y (x^2 + y^2)\, dx\, dy + \int_1^2 \int_0^{2-y} (x^2 + y^2)\, dx\, dy.$$

Sketch the base region $R$ and express the cylinder's volume as a single iterated integral with the order of integration reversed. Then evaluate the integral to find the volume.

**60. Converting to a double integral** Evaluate the integral

$$\int_0^2 (\tan^{-1}\pi x - \tan^{-1} x)\, dx.$$

(*Hint:* Write the integrand as an integral.)

**61. Maximizing a double integral** What region $R$ in the $xy$-plane maximizes the value of

$$\iint_R (4 - x^2 - 2y^2)\, dA?$$

Give reasons for your answer.

**62. Minimizing a double integral** What region $R$ in the $xy$-plane minimizes the value of

$$\iint_R (x^2 + y^2 - 9)\, dA?$$

Give reasons for your answer.

**63.** Is it possible to evaluate the integral of a continuous function $f(x, y)$ over a rectangular region in the $xy$-plane and get different answers depending on the order of integration? Give reasons for your answer.

**64.** How would you evaluate the double integral of a continuous function $f(x, y)$ over the region $R$ in the $xy$-plane enclosed by the triangle with vertices (0, 1), (2, 0), and (1, 2)? Give reasons for your answer.

**65. Unbounded region** Prove that

$$\int_{-\infty}^\infty \int_{-\infty}^\infty e^{-x^2-y^2}\, dx\, dy = \lim_{b\to\infty} \int_{-b}^b \int_{-b}^b e^{-x^2-y^2}\, dx\, dy$$
$$= 4\left(\int_0^\infty e^{-x^2}\, dx\right)^2.$$

**66. Improper double integral** Evaluate the improper integral

$$\int_0^1 \int_0^3 \frac{x^2}{(y - 1)^{2/3}}\, dy\, dx.$$

**COMPUTER EXPLORATIONS**

## Evaluating Double Integrals Numerically

Use a CAS double-integral evaluator to estimate the values of the integrals in Exercises 67–70.

**67.** $\int_1^3 \int_1^x \frac{1}{xy}\, dy\, dx$

**68.** $\int_0^1 \int_0^1 e^{-(x^2+y^2)}\, dy\, dx$

**69.** $\int_0^1 \int_0^1 \tan^{-1} xy\, dy\, dx$

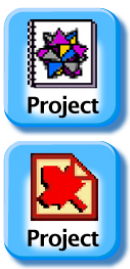
**70.** $\int_{-1}^1 \int_0^{\sqrt{1-x^2}} 3\sqrt{1 - x^2 - y^2}\, dy\, dx$

Use a CAS double-integral evaluator to find the integrals in Exercises 71–76. Then reverse the order of integration and evaluate, again with a CAS.

**71.** $\int_0^1 \int_{2y}^4 e^{x^2}\, dx\, dy$

**72.** $\int_0^3 \int_{x^2}^9 x \cos(y^2)\, dy\, dx$

**73.** $\int_0^2 \int_{y^3}^{4\sqrt{2y}} (x^2y - xy^2)\, dx\, dy$



**74.** $\int_0^2 \int_0^{4-y^2} e^{xy}\, dx\, dy$

**75.** $\int_1^2 \int_0^{x^2} \frac{1}{x + y}\, dy\, dx$

**76.** $\int_1^2 \int_{y^3}^8 \frac{1}{\sqrt{x^2 + y^2}}\, dx\, dy$

# 15.2 Area, Moments, and Centers of Mass

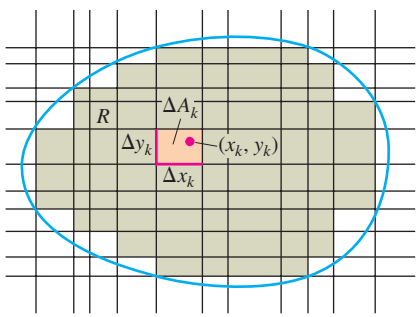

**FIGURE 15.14** As the norm of a partition of the region $R$ approaches zero, the sum of the areas $\Delta A_k$ gives the area of $R$ defined by the double integral $\iint_R dA$.

In this section, we show how to use double integrals to calculate the areas of bounded regions in the plane and to find the average value of a function of two variables. Then we study the physical problem of finding the center of mass of a thin plate covering a region in the plane.

## Areas of Bounded Regions in the Plane

If we take $f(x, y) = 1$ in the definition of the double integral over a region $R$ in the preceding section, the Riemann sums reduce to

$$S_n = \sum_{k=1}^{n} f(x_k, y_k)\,\Delta A_k = \sum_{k=1}^{n} \Delta A_k. \tag{1}$$

This is simply the sum of the areas of the small rectangles in the partition of $R$, and approximates what we would like to call the area of $R$. As the norm of a partition of $R$ approaches zero, the height and width of all rectangles in the partition approach zero, and the coverage of $R$ becomes increasingly complete (Figure 15.14). We define the area of $R$ to be the limit

$$Area = \lim_{\|P\|\to 0} \sum_{k=1}^{n} \Delta A_k = \iint_R dA \tag{2}$$

**DEFINITION Area**

The **area** of a closed, bounded plane region $R$ is

$$A = \iint_R dA.$$

As with the other definitions in this chapter, the definition here applies to a greater variety of regions than does the earlier single-variable definition of area, but it agrees with the earlier definition on regions to which they both apply. To evaluate the integral in the definition of area, we integrate the constant function $f(x, y) = 1$ over $R$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

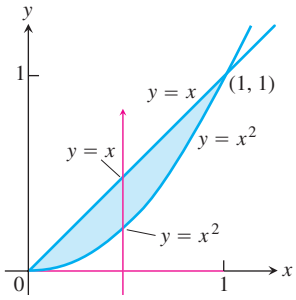

FIGURE 15.15 The region in Example 1.

**EXAMPLE 1** Finding Area

Find the area of the region $R$ bounded by $y = x$ and $y = x^2$ in the first quadrant.

**Solution** We sketch the region (Figure 15.15), noting where the two curves intersect, and calculate the area as

$$A = \int_0^1 \int_{x^2}^{x} dy\, dx = \int_0^1 \Big[ y \Big]_{x^2}^{x} dx$$

$$= \int_0^1 (x - x^2)\, dx = \left[ \frac{x^2}{2} - \frac{x^3}{3} \right]_0^1 = \frac{1}{6}.$$

Notice that the single integral $\int_0^1 (x - x^2)\, dx$, obtained from evaluating the inside iterated integral, is the integral for the area between these two curves using the method of Section 5.5. ■

**EXAMPLE 2** Finding Area

Find the area of the region $R$ enclosed by the parabola $y = x^2$ and the line $y = x + 2$.

**Solution** If we divide $R$ into the regions $R_1$ and $R_2$ shown in Figure 15.16a, we may calculate the area as

$$A = \iint_{R_1} dA + \iint_{R_2} dA = \int_0^1 \int_{-\sqrt{y}}^{\sqrt{y}} dx\, dy + \int_1^4 \int_{y-2}^{\sqrt{y}} dx\, dy.$$

On the other hand, reversing the order of integration (Figure 15.16b) gives

$$A = \int_{-1}^{2} \int_{x^2}^{x+2} dy\, dx.$$

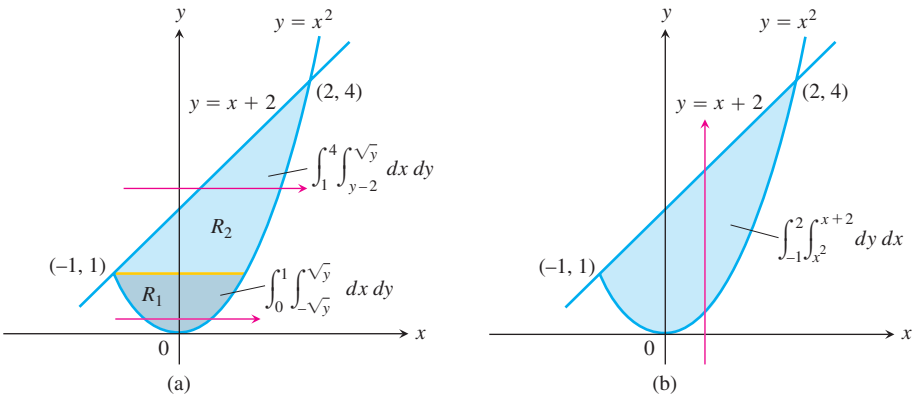

FIGURE 15.16 Calculating this area takes (a) two double integrals if the first integration is with respect to $x$, but (b) only one if the first integration is with respect to $y$ (Example 2).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

This second result, which requires only one integral, is simpler and is the only one we would bother to write down in practice. The area is

$$A = \int_{-1}^{2} \left[ y \right]_{x^2}^{x+2} dx = \int_{-1}^{2} (x + 2 - x^2)\, dx = \left[ \frac{x^2}{2} + 2x - \frac{x^3}{3} \right]_{-1}^{2} = \frac{9}{2}.$$

■

## Average Value

The average value of an integrable function of one variable on a closed interval is the integral of the function over the interval divided by the length of the interval. For an integrable function of two variables defined on a bounded region in the plane, the average value is the integral over the region divided by the area of the region. This can be visualized by thinking of the function as giving the height at one instant of some water sloshing around in a tank whose vertical walls lie over the boundary of the region. The average height of the water in the tank can be found by letting the water settle down to a constant height. The height is then equal to the volume of water in the tank divided by the area of $R$. We are led to define the average value of an integrable function $f$ over a region $R$ to be

$$\textbf{Average value of } f \text{ over } R = \frac{1}{\text{area of } R} \iint_R f\, dA. \tag{3}$$

If $f$ is the temperature of a thin plate covering $R$, then the double integral of $f$ over $R$ divided by the area of $R$ is the plate's average temperature. If $f(x, y)$ is the distance from the point $(x, y)$ to a fixed point $P$, then the average value of $f$ over $R$ is the average distance of points in $R$ from $P$.

**EXAMPLE 3** Finding Average Value

Find the average value of $f(x, y) = x \cos xy$ over the rectangle $R$: $0 \le x \le \pi$, $0 \le y \le 1$.

**Solution** The value of the integral of $f$ over $R$ is

$$\int_0^{\pi} \int_0^{1} x \cos xy\, dy\, dx = \int_0^{\pi} \left[ \sin xy \right]_{y=0}^{y=1} dx \qquad \int x \cos xy\, dy = \sin xy + C$$

$$= \int_0^{\pi} (\sin x - 0)\, dx = -\cos x \Big]_0^{\pi} = 1 + 1 = 2.$$

The area of $R$ is $\pi$. The average value of $f$ over $R$ is $2/\pi$. ■

## Moments and Centers of Mass for Thin Flat Plates

In Section 6.4 we introduced the concepts of moments and centers of mass, and we saw how to compute these quantities for thin rods or strips and for plates of constant density. Using multiple integrals we can extend these calculations to a great variety of shapes with varying density. We first consider the problem of finding the center of mass of a thin flat plate: a disk of aluminum, say, or a triangular sheet of metal. We assume the distribution of

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

mass in such a plate to be continuous. A material's *density* function, denoted by $\delta(x, y)$, is the mass per unit area. The *mass* of a plate is obtained by integrating the density function over the region $R$ forming the plate. The first moment about an axis is calculated by integrating over $R$ the distance from the axis times the density. The center of mass is found from the first moments. Table 15.1 gives the double integral formulas for mass, first moments, and center of mass.

**TABLE 15.1** Mass and first moment formulas for thin plates covering a region $R$ in the $xy$-plane

**Mass:** $M = \iint_R \delta(x, y)\, dA$ $\delta(x, y)$ is the density at $(x, y)$

**First moments:** $M_x = \iint_R y\delta(x, y)\, dA, \quad M_y = \iint_R x\delta(x, y)\, dA$

**Center of mass:** $\bar{x} = \dfrac{M_y}{M}, \quad \bar{y} = \dfrac{M_x}{M}$

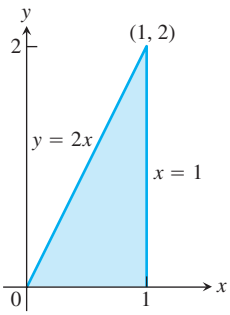

**FIGURE 15.17** The triangular region covered by the plate in Example 4.

**EXAMPLE 4** Finding the Center of Mass of a Thin Plate of Variable Density

A thin plate covers the triangular region bounded by the $x$-axis and the lines $x = 1$ and $y = 2x$ in the first quadrant. The plate's density at the point $(x, y)$ is $\delta(x, y) = 6x + 6y + 6$. Find the plate's mass, first moments, and center of mass about the coordinate axes.

**Solution** We sketch the plate and put in enough detail to determine the limits of integration for the integrals we have to evaluate (Figure 15.17).

The plate's mass is

$$M = \int_0^1 \int_0^{2x} \delta(x, y)\, dy\, dx = \int_0^1 \int_0^{2x} (6x + 6y + 6)\, dy\, dx$$

$$= \int_0^1 \Big[6xy + 3y^2 + 6y\Big]_{y=0}^{y=2x} dx$$

$$= \int_0^1 (24x^2 + 12x)\, dx = \Big[8x^3 + 6x^2\Big]_0^1 = 14.$$

The first moment about the $x$-axis is

$$M_x = \int_0^1 \int_0^{2x} y\delta(x, y)\, dy\, dx = \int_0^1 \int_0^{2x} (6xy + 6y^2 + 6y)\, dy\, dx$$

$$= \int_0^1 \Big[3xy^2 + 2y^3 + 3y^2\Big]_{y=0}^{y=2x} dx = \int_0^1 (28x^3 + 12x^2)\, dx$$

$$= \Big[7x^4 + 4x^3\Big]_0^1 = 11.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

A similar calculation gives the moment about the $y$-axis:

$$M_y = \int_0^1 \int_0^{2x} x\delta(x, y)\, dy\, dx = 10.$$

The coordinates of the center of mass are therefore

$$\bar{x} = \frac{M_y}{M} = \frac{10}{14} = \frac{5}{7}, \qquad \bar{y} = \frac{M_x}{M} = \frac{11}{14}.$$

## Moments of Inertia

A body's first moments (Table 15.1) tell us about balance and about the torque the body exerts about different axes in a gravitational field. If the body is a rotating shaft, however, we are more likely to be interested in how much energy is stored in the shaft or about how much energy it will take to accelerate the shaft to a particular angular velocity. This is where the second moment or moment of inertia comes in.

Think of partitioning the shaft into small blocks of mass $\Delta m_k$ and let $r_k$ denote the distance from the $k$th block's center of mass to the axis of rotation (Figure 15.18). If the shaft rotates at an angular velocity of $\omega = d\theta/dt$ radians per second, the block's center of mass will trace its orbit at a linear speed of

$$v_k = \frac{d}{dt}(r_k\theta) = r_k \frac{d\theta}{dt} = r_k\omega.$$

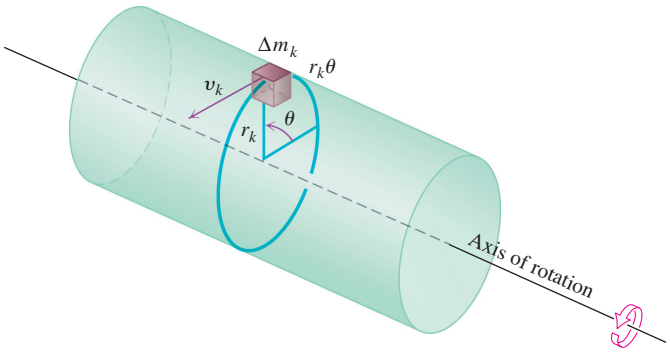

**FIGURE 15.18** To find an integral for the amount of energy stored in a rotating shaft, we first imagine the shaft to be partitioned into small blocks. Each block has its own kinetic energy. We add the contributions of the individual blocks to find the kinetic energy of the shaft.

The block's kinetic energy will be approximately

$$\frac{1}{2}\Delta m_k v_k^2 = \frac{1}{2}\Delta m_k(r_k\omega)^2 = \frac{1}{2}\omega^2 r_k^2\, \Delta m_k.$$

The kinetic energy of the shaft will be approximately

$$\sum \frac{1}{2}\omega^2 r_k^2\, \Delta m_k.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

The integral approached by these sums as the shaft is partitioned into smaller and smaller blocks gives the shaft's kinetic energy:

$$\text{KE}_{\text{shaft}} = \int \frac{1}{2}\omega^2 r^2\, dm = \frac{1}{2}\omega^2 \int r^2\, dm. \tag{4}$$

The factor

$$I = \int r^2\, dm$$

is the *moment of inertia* of the shaft about its axis of rotation, and we see from Equation (4) that the shaft's kinetic energy is

$$\text{KE}_{\text{shaft}} = \frac{1}{2} I\omega^2.$$

The moment of inertia of a shaft resembles in some ways the inertia of a locomotive. To start a locomotive with mass $m$ moving at a linear velocity $v$, we need to provide a kinetic energy of $\text{KE} = (1/2)mv^2$. To stop the locomotive we have to remove this amount of energy. To start a shaft with moment of inertia $I$ rotating at an angular velocity $\omega$, we need to provide a kinetic energy of $\text{KE} = (1/2)I\omega^2$. To stop the shaft we have to take this amount of energy back out. The shaft's moment of inertia is analogous to the locomotive's mass. What makes the locomotive hard to start or stop is its mass. What makes the shaft hard to start or stop is its moment of inertia. The moment of inertia depends not only on the mass of the shaft, but also its distribution.

The moment of inertia also plays a role in determining how much a horizontal metal beam will bend under a load. The stiffness of the beam is a constant times $I$, the moment of inertia of a typical cross-section of the beam about the beam's longitudinal axis. The greater the value of $I$, the stiffer the beam and the less it will bend under a given load. That is why we use I-beams instead of beams whose cross-sections are square. The flanges at the top and bottom of the beam hold most of the beam's mass away from the longitudinal axis to maximize the value of $I$ (Figure 15.19).

To see the moment of inertia at work, try the following experiment. Tape two coins to the ends of a pencil and twiddle the pencil about the center of mass. The moment of inertia accounts for the resistance you feel each time you change the direction of motion. Now move the coins an equal distance toward the center of mass and twiddle the pencil again. The system has the same mass and the same center of mass but now offers less resistance to the changes in motion. The moment of inertia has been reduced. The moment of inertia is what gives a baseball bat, golf club, or tennis racket its "feel." Tennis rackets that weigh the same, look the same, and have identical centers of mass will feel different and behave differently if their masses are not distributed the same way.

Computations of moments of inertia for thin plates in the plane lead to double integral formulas, which are summarized in Table 15.2. A small thin piece of mass $\Delta m$ is equal to its small area $\Delta A$ multiplied by the density of a point in the piece. Computations of moments of inertia for objects occupying a region in space are discussed in Section 15.5.

The mathematical difference between the **first moments** $M_x$ and $M_y$ and the **moments of inertia**, or **second moments**, $I_x$ and $I_y$ is that the second moments use the *squares* of the "lever-arm" distances $x$ and $y$.

The moment $I_0$ is also called the **polar moment** of inertia about the origin. It is calculated by integrating the density $\delta(x, y)$ (mass per unit area) times $r^2 = x^2 + y^2$, the square of the distance from a representative point $(x, y)$ to the origin. Notice that $I_0 = I_x + I_y$; once we find two, we get the third automatically. (The moment $I_0$ is sometimes called $I_z$, for

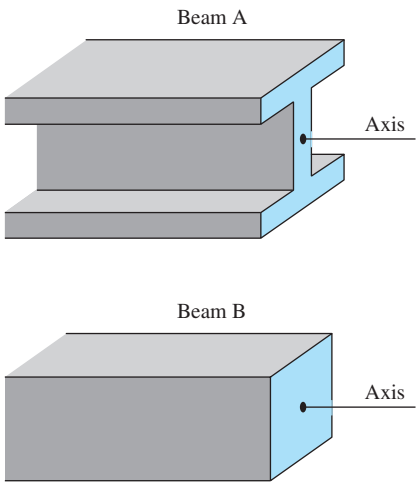

**FIGURE 15.19** The greater the polar moment of inertia of the cross-section of a beam about the beam's longitudinal axis, the stiffer the beam. Beams A and B have the same cross-sectional area, but A is stiffer.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

moment of inertia about the $z$-axis. The identity $I_z = I_x + I_y$ is then called the **Perpendicular Axis Theorem**.)

The **radius of gyration** $R_x$ is defined by the equation

$$I_x = MR_x^2.$$

It tells how far from the $x$-axis the entire mass of the plate might be concentrated to give the same $I_x$. The radius of gyration gives a convenient way to express the moment of inertia in terms of a mass and a length. The radii $R_y$ and $R_0$ are defined in a similar way, with

$$I_y = MR_y^2 \quad \text{and} \quad I_0 = MR_0^2.$$

We take square roots to get the formulas in Table 15.2, which gives the formulas for moments of inertia (second moments) as well as for radii of gyration.

**TABLE 15.2** Second moment formulas for thin plates in the $xy$-plane

**Moments of inertia (second moments):**

About the $x$-axis: $I_x = \iint y^2\delta(x, y)\, dA$

About the $y$-axis: $I_y = \iint x^2\delta(x, y)\, dA$

About a line $L$: $I_L = \iint r^2(x, y)\delta(x, y)\, dA$,
where $r(x, y) =$ distance from $(x, y)$ to $L$

About the origin (polar moment): $I_0 = \iint (x^2 + y^2)\delta(x, y)\, dA = I_x + I_y$

**Radii of gyration:**

About the $x$-axis: $R_x = \sqrt{I_x/M}$

About the $y$-axis: $R_y = \sqrt{I_y/M}$

About the origin: $R_0 = \sqrt{I_0/M}$

**EXAMPLE 5** Finding Moments of Inertia and Radii of Gyration

For the thin plate in Example 4 (Figure 15.17), find the moments of inertia and radii of gyration about the coordinate axes and the origin.

**Solution** Using the density function $\delta(x, y) = 6x + 6y + 6$ given in Example 4, the moment of inertia about the $x$-axis is

$$I_x = \int_0^1 \int_0^{2x} y^2\delta(x, y)\, dy\, dx = \int_0^1 \int_0^{2x} (6xy^2 + 6y^3 + 6y^2)\, dy\, dx$$

$$= \int_0^1 \left[2xy^3 + \frac{3}{2}y^4 + 2y^3\right]_{y=0}^{y=2x} dx = \int_0^1 (40x^4 + 16x^3)\, dx$$

$$= \left[8x^5 + 4x^4\right]_0^1 = 12.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Similarly, the moment of inertia about the $y$-axis is

$$I_y = \int_0^1 \int_0^{2x} x^2 \delta(x, y)\, dy\, dx = \frac{39}{5}.$$

Notice that we integrate $y^2$ times density in calculating $I_x$ and $x^2$ times density to find $I_y$.

Since we know $I_x$ and $I_y$, we do not need to evaluate an integral to find $I_0$; we can use the equation $I_0 = I_x + I_y$ instead:

$$I_0 = 12 + \frac{39}{5} = \frac{60 + 39}{5} = \frac{99}{5}.$$

The three radii of gyration are

$$R_x = \sqrt{I_x/M} = \sqrt{12/14} = \sqrt{6/7} \approx 0.93$$

$$R_y = \sqrt{I_y/M} = \sqrt{\left(\frac{39}{5}\right)/14} = \sqrt{39/70} \approx 0.75$$

$$R_0 = \sqrt{I_0/M} = \sqrt{\left(\frac{99}{5}\right)/14} = \sqrt{99/70} \approx 1.19. \quad \blacksquare$$

Moments are also of importance in statistics. The first moment is used in computing the mean $\mu$ of a set of data, and the second moment is used in computing the variance $\left(\Sigma^2\right)$ and the standard deviation $\left(\Sigma\right)$. Third and fourth moments are used for computing statistical quantities known as skewness and kurtosis.

## Centroids of Geometric Figures

When the density of an object is constant, it cancels out of the numerator and denominator of the formulas for $\bar{x}$ and $\bar{y}$ in Table 15.1. As far as $\bar{x}$ and $\bar{y}$ are concerned, $\delta$ might as well be 1. Thus, when $\delta$ is constant, the location of the center of mass becomes a feature of the object's shape and not of the material of which it is made. In such cases, engineers may call the center of mass the **centroid** of the shape. To find a centroid, we set $\delta$ equal to 1 and proceed to find $\bar{x}$ and $\bar{y}$ as before, by dividing first moments by masses.

### EXAMPLE 6 Finding the Centroid of a Region

Find the centroid of the region in the first quadrant that is bounded above by the line $y = x$ and below by the parabola $y = x^2$.

**Solution** We sketch the region and include enough detail to determine the limits of integration (Figure 15.20). We then set $\delta$ equal to 1 and evaluate the appropriate formulas from Table 15.1:

$$M = \int_0^1 \int_{x^2}^{x} 1\, dy\, dx = \int_0^1 \Big[y\Big]_{y=x^2}^{y=x} dx = \int_0^1 (x - x^2)\, dx = \left[\frac{x^2}{2} - \frac{x^3}{3}\right]_0^1 = \frac{1}{6}$$

$$M_x = \int_0^1 \int_{x^2}^{x} y\, dy\, dx = \int_0^1 \left[\frac{y^2}{2}\right]_{y=x^2}^{y=x} dx$$

$$= \int_0^1 \left(\frac{x^2}{2} - \frac{x^4}{2}\right) dx = \left[\frac{x^3}{6} - \frac{x^5}{10}\right]_0^1 = \frac{1}{15}$$

$$M_y = \int_0^1 \int_{x^2}^{x} x\, dy\, dx = \int_0^1 \Big[xy\Big]_{y=x^2}^{y=x} dx = \int_0^1 (x^2 - x^3)\, dx = \left[\frac{x^3}{3} - \frac{x^4}{4}\right]_0^1 = \frac{1}{12}.$$

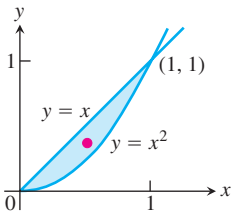

**FIGURE 15.20** The centroid of this region is found in Example 6.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

From these values of $M$, $M_x$, and $M_y$, we find

$$\bar{x} = \frac{M_y}{M} = \frac{1/12}{1/6} = \frac{1}{2} \qquad \text{and} \qquad \bar{y} = \frac{M_x}{M} = \frac{1/15}{1/6} = \frac{2}{5}.$$

The centroid is the point $(1/2, 2/5)$.

# EXERCISES 15.2

## Area by Double Integration

In Exercises 1–8, sketch the region bounded by the given lines and curves. Then express the region's area as an iterated double integral and evaluate the integral.

1. The coordinate axes and the line $x + y = 2$
2. The lines $x = 0, y = 2x$, and $y = 4$
3. The parabola $x = -y^2$ and the line $y = x + 2$
4. The parabola $x = y - y^2$ and the line $y = -x$
5. The curve $y = e^x$ and the lines $y = 0, x = 0$, and $x = \ln 2$
6. The curves $y = \ln x$ and $y = 2 \ln x$ and the line $x = e$, in the first quadrant
7. The parabolas $x = y^2$ and $x = 2y - y^2$
8. The parabolas $x = y^2 - 1$ and $x = 2y^2 - 2$

## Identifying the Region of Integration

The integrals and sums of integrals in Exercises 9–14 give the areas of regions in the $xy$-plane. Sketch each region, label each bounding curve with its equation, and give the coordinates of the points where the curves intersect. Then find the area of the region.

9. $\displaystyle\int_0^6 \int_{y^2/3}^{2y} dx\, dy$

10. $\displaystyle\int_0^3 \int_{-x}^{x(2-x)} dy\, dx$

11. $\displaystyle\int_0^{\pi/4} \int_{\sin x}^{\cos x} dy\, dx$

12. $\displaystyle\int_{-1}^{2} \int_{y^2}^{y+2} dx\, dy$

13. $\displaystyle\int_{-1}^{0} \int_{-2x}^{1-x} dy\, dx + \int_0^2 \int_{-x/2}^{1-x} dy\, dx$

14. $\displaystyle\int_0^2 \int_{x^2-4}^{0} dy\, dx + \int_0^4 \int_0^{\sqrt{x}} dy\, dx$

## Average Values

15. Find the average value of $f(x, y) = \sin(x + y)$ over
    a. the rectangle $0 \le x \le \pi, \quad 0 \le y \le \pi$
    b. the rectangle $0 \le x \le \pi, \quad 0 \le y \le \pi/2$
16. Which do you think will be larger, the average value of $f(x, y) = xy$ over the square $0 \le x \le 1, 0 \le y \le 1$, or the average value of $f$ over the quarter circle $x^2 + y^2 \le 1$ in the first quadrant? Calculate them to find out.
17. Find the average height of the paraboloid $z = x^2 + y^2$ over the square $0 \le x \le 2, 0 \le y \le 2$.
18. Find the average value of $f(x, y) = 1/(xy)$ over the square $\ln 2 \le x \le 2 \ln 2, \ln 2 \le y \le 2 \ln 2$.

## Constant Density

19. **Finding center of mass** Find a center of mass of a thin plate of density $\delta = 3$ bounded by the lines $x = 0, y = x$, and the parabola $y = 2 - x^2$ in the first quadrant.
20. **Finding moments of inertia and radii of gyration** Find the moments of inertia and radii of gyration about the coordinate axes of a thin rectangular plate of constant density $\delta$ bounded by the lines $x = 3$ and $y = 3$ in the first quadrant.
21. **Finding a centroid** Find the centroid of the region in the first quadrant bounded by the $x$-axis, the parabola $y^2 = 2x$, and the line $x + y = 4$.
22. **Finding a centroid** Find the centroid of the triangular region cut from the first quadrant by the line $x + y = 3$.
23. **Finding a centroid** Find the centroid of the semicircular region bounded by the $x$-axis and the curve $y = \sqrt{1 - x^2}$.
24. **Finding a centroid** The area of the region in the first quadrant bounded by the parabola $y = 6x - x^2$ and the line $y = x$ is $125/6$ square units. Find the centroid.
25. **Finding a centroid** Find the centroid of the region cut from the first quadrant by the circle $x^2 + y^2 = a^2$.
26. **Finding a centroid** Find the centroid of the region between the $x$-axis and the arch $y = \sin x, 0 \le x \le \pi$.
27. **Finding moments of inertia** Find the moment of inertia about the $x$-axis of a thin plate of density $\delta = 1$ bounded by the circle $x^2 + y^2 = 4$. Then use your result to find $I_y$ and $I_0$ for the plate.
28. **Finding a moment of inertia** Find the moment of inertia with respect to the $y$-axis of a thin sheet of constant density $\delta = 1$ bounded by the curve $y = (\sin^2 x)/x^2$ and the interval $\pi \le x \le 2\pi$ of the $x$-axis.
29. **The centroid of an infinite region** Find the centroid of the infinite region in the second quadrant enclosed by the coordinate axes and the curve $y = e^x$. (Use improper integrals in the mass-moment formulas.)

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**30. The first moment of an infinite plate** Find the first moment about the $y$-axis of a thin plate of density $\delta(x, y) = 1$ covering the infinite region under the curve $y = e^{-x^2/2}$ in the first quadrant.

## Variable Density

**31. Finding a moment of inertia and radius of gyration** Find the moment of inertia and radius of gyration about the $x$-axis of a thin plate bounded by the parabola $x = y - y^2$ and the line $x + y = 0$ if $\delta(x, y) = x + y$.

**32. Finding mass** Find the mass of a thin plate occupying the smaller region cut from the ellipse $x^2 + 4y^2 = 12$ by the parabola $x = 4y^2$ if $\delta(x, y) = 5x$.

**33. Finding a center of mass** Find the center of mass of a thin triangular plate bounded by the $y$-axis and the lines $y = x$ and $y = 2 - x$ if $\delta(x, y) = 6x + 3y + 3$.

**34. Finding a center of mass and moment of inertia** Find the center of mass and moment of inertia about the $x$-axis of a thin plate bounded by the curves $x = y^2$ and $x = 2y - y^2$ if the density at the point $(x, y)$ is $\delta(x, y) = y + 1$.

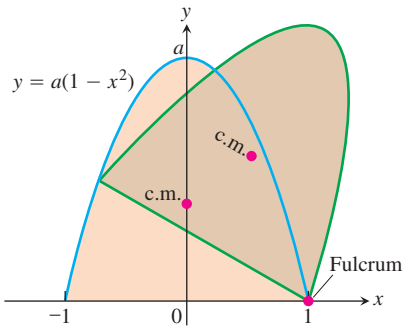
**35. Center of mass, moment of inertia, and radius of gyration** Find the center of mass and the moment of inertia and radius of gyration about the $y$-axis of a thin rectangular plate cut from the first quadrant by the lines $x = 6$ and $y = 1$ if $\delta(x, y) = x + y + 1$.

**36. Center of mass, moment of inertia, and radius of gyration** Find the center of mass and the moment of inertia and radius of gyration about the $y$-axis of a thin plate bounded by the line $y = 1$ and the parabola $y = x^2$ if the density is $\delta(x, y) = y + 1$.

**37. Center of mass, moment of inertia, and radius of gyration** Find the center of mass and the moment of inertia and radius of gyration about the $y$-axis of a thin plate bounded by the $x$-axis, the lines $x = \pm 1$, and the parabola $y = x^2$ if $\delta(x, y) = 7y + 1$.

**38. Center of mass, moment of inertia, and radius of gyration** Find the center of mass and the moment of inertia and radius of gyration about the $x$-axis of a thin rectangular plate bounded by the lines $x = 0, x = 20, y = -1$, and $y = 1$ if $\delta(x, y) = 1 + (x/20)$.

**39. Center of mass, moments of inertia, and radii of gyration** Find the center of mass, the moment of inertia and radii of gyration about the coordinate axes, and the polar moment of inertia and radius of gyration of a thin triangular plate bounded by the lines $y = x, y = -x$, and $y = 1$ if $\delta(x, y) = y + 1$.



**40. Center of mass, moments of inertia, and radii of gyration** Repeat Exercise 39 for $\delta(x, y) = 3x^2 + 1$.

## Theory and Examples

**41. Bacterium population** If $f(x, y) = (10{,}000e^y)/(1 + |x|/2)$ represents the "population density" of a certain bacterium on the $xy$-plane, where $x$ and $y$ are measured in centimeters, find the total population of bacteria within the rectangle $-5 \le x \le 5$ and $-2 \le y \le 0$.

**42. Regional population** If $f(x, y) = 100\,(y + 1)$ represents the population density of a planar region on Earth, where $x$ and $y$ are measured in miles, find the number of people in the region bounded by the curves $x = y^2$ and $x = 2y - y^2$.

**43. Appliance design** When we design an appliance, one of the concerns is how hard the appliance will be to tip over. When tipped, it will right itself as long as its center of mass lies on the correct side of the *fulcrum*, the point on which the appliance is riding as it tips. Suppose that the profile of an appliance of approximately constant density is parabolic, like an old-fashioned radio. It fills the region $0 \le y \le a(1 - x^2)$, $-1 \le x \le 1$, in the $xy$-plane (see accompanying figure). What values of $a$ will guarantee that the appliance will have to be tipped more than $45^\circ$ to fall over?

**44. Minimizing a moment of inertia** A rectangular plate of constant density $\delta(x, y) = 1$ occupies the region bounded by the lines $x = 4$ and $y = 2$ in the first quadrant. The moment of inertia $I_a$ of the rectangle about the line $y = a$ is given by the integral

$$I_a = \int_0^4 \int_0^2 (y - a)^2 \, dy \, dx.$$

Find the value of $a$ that minimizes $I_a$.

**45. Centroid of unbounded region** Find the centroid of the infinite region in the $xy$-plane bounded by the curves $y = 1/\sqrt{1 - x^2}$, $y = -1/\sqrt{1 - x^2}$, and the lines $x = 0, x = 1$.

**46. Radius of gyration of slender rod** Find the radius of gyration of a slender rod of constant linear density $\delta$ gm/cm and length $L$ cm with respect to an axis

**a.** through the rod's center of mass perpendicular to the rod's axis.

**b.** perpendicular to the rod's axis at one end of the rod.

**47.** (*Continuation of Exercise 34.*) A thin plate of now constant density $\delta$ occupies the region $R$ in the $xy$-plane bounded by the curves $x = y^2$ and $x = 2y - y^2$.

**a. Constant density** Find $\delta$ such that the plate has the same mass as the plate in Exercise 34.

**b. Average value** Compare the value of $\delta$ found in part (a) with the average value of $\delta(x, y) = y + 1$ over $R$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**48. Average temperature in Texas** According to the *Texas Almanac*, Texas has 254 counties and a National Weather Service station in each county. Assume that at time $t_0$, each of the 254 weather stations recorded the local temperature. Find a formula that would give a reasonable approximation to the average temperature in Texas at time $t_0$. Your answer should involve information that you would expect to be readily available in the *Texas Almanac*.

## The Parallel Axis Theorem

Let $L_{\text{c.m.}}$ be a line in the $xy$-plane that runs through the center of mass of a thin plate of mass $m$ covering a region in the plane. Let $L$ be a line in the plane parallel to and $h$ units away from $L_{\text{c.m.}}$. The **Parallel Axis Theorem** says that under these conditions the moments of inertia $I_L$ and $I_{\text{c.m.}}$ of the plate about $L$ and $L_{\text{c.m.}}$ satisfy the equation

$$I_L = I_{\text{c.m.}} + mh^2.$$

This equation gives a quick way to calculate one moment when the other moment and the mass are known.

**49. Proof of the Parallel Axis Theorem**

**a.** Show that the first moment of a thin flat plate about any line in the plane of the plate through the plate's center of mass is zero. (*Hint:* Place the center of mass at the origin with the line along the $y$-axis. What does the formula $\bar{x} = M_y/M$ then tell you?)

**b.** Use the result in part (a) to derive the Parallel Axis Theorem. Assume that the plane is coordinatized in a way that makes $L_{\text{c.m.}}$ the $y$-axis and $L$ the line $x = h$. Then expand the integrand of the integral for $I_L$ to rewrite the integral as the sum of integrals whose values you recognize.

**50. Finding moments of inertia**

**a.** Use the Parallel Axis Theorem and the results of Example 4 to find the moments of inertia of the plate in Example 4 about the vertical and horizontal lines through the plate's center of mass.

**b.** Use the results in part (a) to find the plate's moments of inertia about the lines $x = 1$ and $y = 2$.

## Pappus's Formula

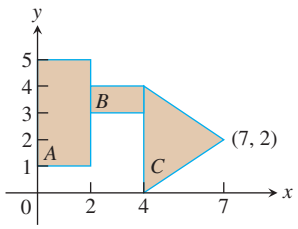
Pappus knew that the centroid of the union of two nonoverlapping plane regions lies on the line segment joining their individual centroids. More specifically, suppose that $m_1$ and $m_2$ are the masses of thin plates $P_1$ and $P_2$ that cover nonoverlapping regions in the $xy$-plane. Let $\mathbf{c}_1$ and $\mathbf{c}_2$ be the vectors from the origin to the respective centers of mass of $P_1$ and $P_2$. Then the center of mass of the union $P_1 \cup P_2$ of the two plates is determined by the vector

$$\mathbf{c} = \frac{m_1\mathbf{c}_1 + m_2\mathbf{c}_2}{m_1 + m_2}. \tag{5}$$

Equation (5) is known as **Pappus's formula**. For more than two nonoverlapping plates, as long as their number is finite, the formula generalizes to

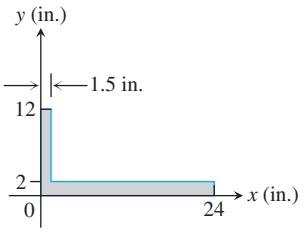
$$\mathbf{c} = \frac{m_1\mathbf{c}_1 + m_2\mathbf{c}_2 + \cdots + m_n\mathbf{c}_n}{m_1 + m_2 + \cdots + m_n}. \tag{6}$$

This formula is especially useful for finding the centroid of a plate of irregular shape that is made up of pieces of constant density whose centroids we know from geometry. We find the centroid of each piece and apply Equation (6) to find the centroid of the plate.



**51.** Derive Pappus's formula (Equation (5)). (*Hint:* Sketch the plates as regions in the first quadrant and label their centers of mass as $(\bar{x}_1, \bar{y}_1)$ and $(\bar{x}_2, \bar{y}_2)$. What are the moments of $P_1 \cup P_2$ about the coordinate axes?)

**52.** Use Equation (5) and mathematical induction to show that Equation (6) holds for any positive integer $n > 2$.



**53.** Let $A$, $B$, and $C$ be the shapes indicated in the accompanying figure. Use Pappus's formula to find the centroid of

**a.** $A \cup B$ **b.** $A \cup C$

**c.** $B \cup C$ **d.** $A \cup B \cup C$.

**54. Locating center of mass** Locate the center of mass of the carpenter's square, shown here.

**55.** An isosceles triangle $T$ has base $2a$ and altitude $h$. The base lies along the diameter of a semicircular disk $D$ of radius $a$ so that the two together make a shape resembling an ice cream cone. What relation must hold between $a$ and $h$ to place the centroid of $T \cup D$ on the common boundary of $T$ and $D$? Inside $T$?

**56.** An isosceles triangle $T$ of altitude $h$ has as its base one side of a square $Q$ whose edges have length $s$. (The square and triangle do not overlap.) What relation must hold between $h$ and $s$ to place the centroid of $T \cup Q$ on the base of the triangle? Compare your answer with the answer to Exercise 55.

# 15.3 Double Integrals in Polar Form

Integrals are sometimes easier to evaluate if we change to polar coordinates. This section shows how to accomplish the change and how to evaluate integrals over regions whose boundaries are given by polar equations.

## Integrals in Polar Coordinates

When we defined the double integral of a function over a region $R$ in the $xy$-plane, we began by cutting $R$ into rectangles whose sides were parallel to the coordinate axes. These were the natural shapes to use because their sides have either constant $x$-values or constant $y$-values. In polar coordinates, the natural shape is a "polar rectangle" whose sides have constant $r$- and $\theta$-values.

Suppose that a function $f(r, \theta)$ is defined over a region $R$ that is bounded by the rays $\theta = \alpha$ and $\theta = \beta$ and by the continuous curves $r = g_1(\theta)$ and $r = g_2(\theta)$. Suppose also that $0 \le g_1(\theta) \le g_2(\theta) \le a$ for every value of $\theta$ between $\alpha$ and $\beta$. Then $R$ lies in a fan-shaped region $Q$ defined by the inequalities $0 \le r \le a$ and $\alpha \le \theta \le \beta$. See Figure 15.21.

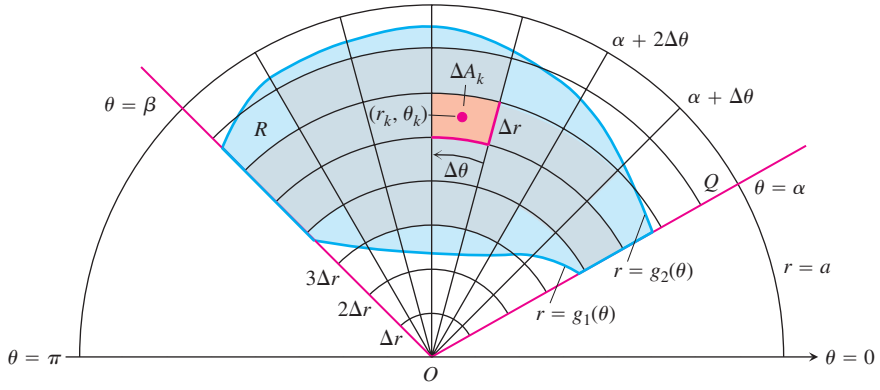

**FIGURE 15.21** The region $R$: $g_1(\theta) \le r \le g_2(\theta)$, $\alpha \le \theta \le \beta$, is contained in the fan-shaped region $Q$: $0 \le r \le a$, $\alpha \le \theta \le \beta$. The partition of $Q$ by circular arcs and rays induces a partition of $R$.

We cover $Q$ by a grid of circular arcs and rays. The arcs are cut from circles centered at the origin, with radii $\Delta r, 2\Delta r, \ldots, m\Delta r$, where $\Delta r = a/m$. The rays are given by

$$\theta = \alpha, \quad \theta = \alpha + \Delta\theta, \quad \theta = \alpha + 2\Delta\theta, \quad \ldots, \quad \theta = \alpha + m'\Delta\theta = \beta,$$

where $\Delta\theta = (\beta - \alpha)/m'$. The arcs and rays partition $Q$ into small patches called "polar rectangles."

We number the polar rectangles that lie inside $R$ (the order does not matter), calling their areas $\Delta A_1, \Delta A_2, \ldots, \Delta A_n$. We let $(r_k, \theta_k)$ be any point in the polar rectangle whose area is $\Delta A_k$. We then form the sum

$$S_n = \sum_{k=1}^{n} f(r_k, \theta_k)\, \Delta A_k.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

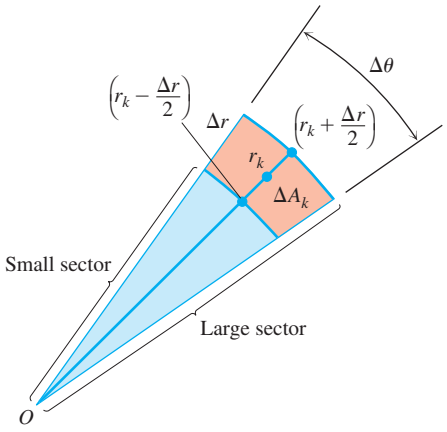

**FIGURE 15.22** The observation that

$$\Delta A_k = \begin{pmatrix}\text{area of}\\ \text{large sector}\end{pmatrix} - \begin{pmatrix}\text{area of}\\ \text{small sector}\end{pmatrix}$$

leads to the formula $\Delta A_k = r_k\,\Delta r\,\Delta\theta$.

If $f$ is continuous throughout $R$, this sum will approach a limit as we refine the grid to make $\Delta r$ and $\Delta\theta$ go to zero. The limit is called the double integral of $f$ over $R$. In symbols,

$$\lim_{n\to\infty} S_n = \iint_R f(r,\theta)\,dA.$$

To evaluate this limit, we first have to write the sum $S_n$ in a way that expresses $\Delta A_k$ in terms of $\Delta r$ and $\Delta\theta$. For convenience we choose $r_k$ to be the average of the radii of the inner and outer arcs bounding the $k$th polar rectangle $\Delta A_k$. The radius of the inner arc bounding $\Delta A_k$ is then $r_k - (\Delta r/2)$ (Figure 15.22). The radius of the outer arc is $r_k + (\Delta r/2)$.

The area of a wedge-shaped sector of a circle having radius $r$ and angle $\theta$ is

$$A = \frac{1}{2}\theta \cdot r^2,$$

as can be seen by multiplying $\pi r^2$, the area of the circle, by $\theta/2\pi$, the fraction of the circle's area contained in the wedge. So the areas of the circular sectors subtended by these arcs at the origin are

$$\text{Inner radius:}\quad \frac{1}{2}\left(r_k - \frac{\Delta r}{2}\right)^2\Delta\theta$$

$$\text{Outer radius:}\quad \frac{1}{2}\left(r_k + \frac{\Delta r}{2}\right)^2\Delta\theta.$$

Therefore,

$$\Delta A_k = \text{area of large sector} - \text{area of small sector}$$

$$= \frac{\Delta\theta}{2}\left[\left(r_k + \frac{\Delta r}{2}\right)^2 - \left(r_k - \frac{\Delta r}{2}\right)^2\right] = \frac{\Delta\theta}{2}(2r_k\,\Delta r) = r_k\,\Delta r\,\Delta\theta.$$

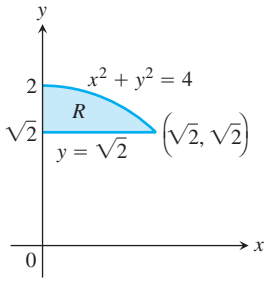
Combining this result with the sum defining $S_n$ gives

$$S_n = \sum_{k=1}^{n} f(r_k,\theta_k) r_k\,\Delta r\,\Delta\theta.$$

As $n \to \infty$ and the values of $\Delta r$ and $\Delta\theta$ approach zero, these sums converge to the double integral

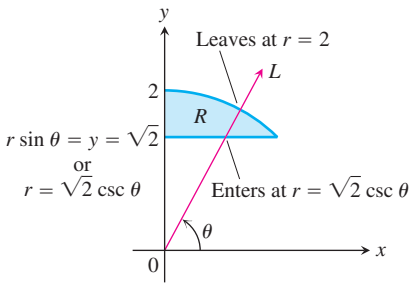
$$\lim_{n\to\infty} S_n = \iint_R f(r,\theta)\,r\,dr\,d\theta.$$

A version of Fubini's Theorem says that the limit approached by these sums can be evaluated by repeated single integrations with respect to $r$ and $\theta$ as



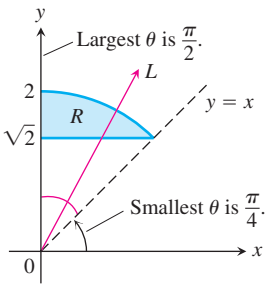
$$\iint_R f(r,\theta)\,dA = \int_{\theta=\alpha}^{\theta=\beta}\int_{r=g_1(\theta)}^{r=g_2(\theta)} f(r,\theta)\,r\,dr\,d\theta.$$

## Finding Limits of Integration



The procedure for finding limits of integration in rectangular coordinates also works for polar coordinates. To evaluate $\iint_R f(r,\theta)\,dA$ over a region $R$ in polar coordinates, integrating first with respect to $r$ and then with respect to $\theta$, take the following steps.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



1. *Sketch*: Sketch the region and label the bounding curves.

2. *Find the r-limits of integration*: Imagine a ray $L$ from the origin cutting through $R$ in the direction of increasing $r$. Mark the $r$-values where $L$ enters and leaves $R$. These are the $r$-limits of integration. They usually depend on the angle $\theta$ that $L$ makes with the positive $x$-axis.

3. *Find the θ-limits of integration*: Find the smallest and largest $\theta$-values that bound $R$. These are the $\theta$-limits of integration.

The integral is

$$\iint_R f(r, \theta)\, dA = \int_{\theta=\pi/4}^{\theta=\pi/2} \int_{r=\sqrt{2}\csc\theta}^{r=2} f(r, \theta)\, r\, dr\, d\theta.$$

## EXAMPLE 1 Finding Limits of Integration

Find the limits of integration for integrating $f(r, \theta)$ over the region $R$ that lies inside the cardioid $r = 1 + \cos\theta$ and outside the circle $r = 1$.

### Solution

1. We first sketch the region and label the bounding curves (Figure 15.23).
2. Next we find the *r-limits of integration*. A typical ray from the origin enters $R$ where $r = 1$ and leaves where $r = 1 + \cos\theta$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

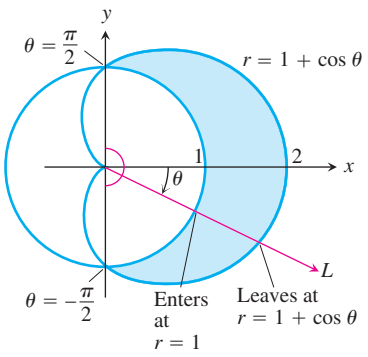


**FIGURE 15.23** Finding the limits of integration in polar coordinates for the region in Example 1.

**3.** Finally we find the *θ-limits of integration*. The rays from the origin that intersect $R$ run from $\theta = -\pi/2$ to $\theta = \pi/2$. The integral is

$$\int_{-\pi/2}^{\pi/2} \int_{1}^{1+\cos\theta} f(r, \theta)\, r\, dr\, d\theta.$$

If $f(r, \theta)$ is the constant function whose value is 1, then the integral of $f$ over $R$ is the area of $R$.

**Area in Polar Coordinates**

The area of a closed and bounded region $R$ in the polar coordinate plane is

$$A = \iint_R r\, dr\, d\theta.$$

This formula for area is consistent with all earlier formulas, although we do not prove this fact.

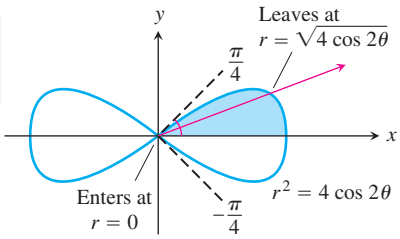

**FIGURE 15.24** To integrate over the shaded region, we run $r$ from 0 to $\sqrt{4\cos 2\theta}$ and $\theta$ from 0 to $\pi/4$ (Example 2).

## EXAMPLE 2 Finding Area in Polar Coordinates

Find the area enclosed by the lemniscate $r^2 = 4\cos 2\theta$.

**Solution** We graph the lemniscate to determine the limits of integration (Figure 15.24) and see from the symmetry of the region that the total area is 4 times the first-quadrant portion.

$$A = 4\int_0^{\pi/4} \int_0^{\sqrt{4\cos 2\theta}} r\, dr\, d\theta = 4\int_0^{\pi/4} \left[\frac{r^2}{2}\right]_{r=0}^{r=\sqrt{4\cos 2\theta}} d\theta$$

$$= 4\int_0^{\pi/4} 2\cos 2\theta\, d\theta = 4\sin 2\theta \Big]_0^{\pi/4} = 4.$$

## Changing Cartesian Integrals into Polar Integrals

The procedure for changing a Cartesian integral $\iint_R f(x, y)\, dx\, dy$ into a polar integral has two steps. First substitute $x = r\cos\theta$ and $y = r\sin\theta$, and replace $dx\, dy$ by $r\, dr\, d\theta$ in the Cartesian integral. Then supply polar limits of integration for the boundary of $R$.

The Cartesian integral then becomes

$$\iint_R f(x, y)\, dx\, dy = \iint_G f(r\cos\theta, r\sin\theta)\, r\, dr\, d\theta,$$

where $G$ denotes the region of integration in polar coordinates. This is like the substitution method in Chapter 5 except that there are now two variables to substitute for instead of one. Notice that $dx\, dy$ is not replaced by $dr\, d\theta$ but by $r\, dr\, d\theta$. A more general discussion of changes of variables (substitutions) in multiple integrals is given in Section 15.7.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

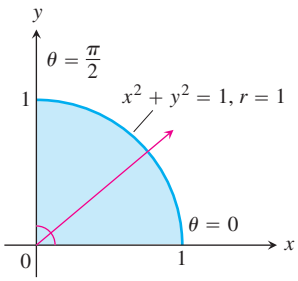

**FIGURE 15.25** In polar coordinates, this region is described by simple inequalities:

$$0 \le r \le 1 \quad \text{and} \quad 0 \le \theta \le \pi/2$$

(Example 3).

## EXAMPLE 3 Changing Cartesian Integrals to Polar Integrals

Find the polar moment of inertia about the origin of a thin plate of density $\delta(x, y) = 1$ bounded by the quarter circle $x^2 + y^2 = 1$ in the first quadrant.

**Solution** We sketch the plate to determine the limits of integration (Figure 15.25). In Cartesian coordinates, the polar moment is the value of the integral

$$\int_0^1 \int_0^{\sqrt{1-x^2}} (x^2 + y^2)\, dy\, dx.$$

Integration with respect to $y$ gives

$$\int_0^1 \left( x^2\sqrt{1 - x^2} + \frac{(1 - x^2)^{3/2}}{3} \right) dx,$$

an integral difficult to evaluate without tables.

Things go better if we change the original integral to polar coordinates. Substituting $x = r\cos\theta, y = r\sin\theta$ and replacing $dx\, dy$ by $r\, dr\, d\theta$, we get

$$\int_0^1 \int_0^{\sqrt{1-x^2}} (x^2 + y^2)\, dy\, dx = \int_0^{\pi/2} \int_0^1 (r^2)\, r\, dr\, d\theta$$

$$= \int_0^{\pi/2} \left[ \frac{r^4}{4} \right]_{r=0}^{r=1} d\theta = \int_0^{\pi/2} \frac{1}{4}\, d\theta = \frac{\pi}{8}.$$

Why is the polar coordinate transformation so effective here? One reason is that $x^2 + y^2$ simplifies to $r^2$. Another is that the limits of integration become constants. ■

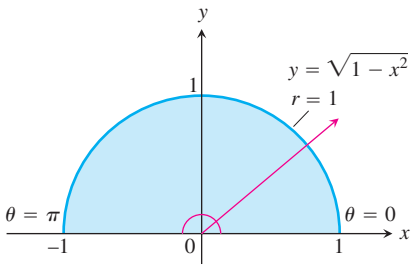

**FIGURE 15.26** The semicircular region in Example 4 is the region

$$0 \le r \le 1, \qquad 0 \le \theta \le \pi.$$

## EXAMPLE 4 Evaluating Integrals Using Polar Coordinates

Evaluate

$$\iint_R e^{x^2+y^2}\, dy\, dx,$$

where $R$ is the semicircular region bounded by the $x$-axis and the curve $y = \sqrt{1 - x^2}$ (Figure 15.26).

**Solution** In Cartesian coordinates, the integral in question is a nonelementary integral and there is no direct way to integrate $e^{x^2+y^2}$ with respect to either $x$ or $y$. Yet this integral and others like it are important in mathematics—in statistics, for example—and we need to find a way to evaluate it. Polar coordinates save the day. Substituting $x = r\cos\theta, y = r\sin\theta$ and replacing $dy\, dx$ by $r\, dr\, d\theta$ enables us to evaluate the integral as

$$\iint_R e^{x^2+y^2}\, dy\, dx = \int_0^{\pi} \int_0^1 e^{r^2}\, r\, dr\, d\theta = \int_0^{\pi} \left[ \frac{1}{2} e^{r^2} \right]_0^1 d\theta$$

$$= \int_0^{\pi} \frac{1}{2}(e - 1)\, d\theta = \frac{\pi}{2}(e - 1).$$

The $r$ in the $r\, dr\, d\theta$ was just what we needed to integrate $e^{r^2}$. Without it, we would have been unable to proceed. ■

# EXERCISES 15.3

## Evaluating Polar Integrals

In Exercises 1–16, change the Cartesian integral into an equivalent polar integral. Then evaluate the polar integral.

1. $\int_{-1}^{1}\int_{0}^{\sqrt{1-x^2}} dy\,dx$
2. $\int_{-1}^{1}\int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} dy\,dx$
3. $\int_{0}^{1}\int_{0}^{\sqrt{1-y^2}} (x^2+y^2)\,dx\,dy$
4. $\int_{-1}^{1}\int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} (x^2+y^2)\,dy\,dx$
5. $\int_{-a}^{a}\int_{-\sqrt{a^2-x^2}}^{\sqrt{a^2-x^2}} dy\,dx$
6. $\int_{0}^{2}\int_{0}^{\sqrt{4-y^2}} (x^2+y^2)\,dx\,dy$
7. $\int_{0}^{6}\int_{0}^{y} x\,dx\,dy$
8. $\int_{0}^{2}\int_{0}^{x} y\,dy\,dx$
9. $\int_{-1}^{0}\int_{-\sqrt{1-x^2}}^{0} \frac{2}{1+\sqrt{x^2+y^2}}\,dy\,dx$
10. $\int_{-1}^{1}\int_{-\sqrt{1-y^2}}^{0} \frac{4\sqrt{x^2+y^2}}{1+x^2+y^2}\,dx\,dy$
11. $\int_{0}^{\ln 2}\int_{0}^{\sqrt{(\ln 2)^2-y^2}} e^{\sqrt{x^2+y^2}}\,dx\,dy$
12. $\int_{0}^{1}\int_{0}^{\sqrt{1-x^2}} e^{-(x^2+y^2)}\,dy\,dx$
13. $\int_{0}^{2}\int_{0}^{\sqrt{1-(x-1)^2}} \frac{x+y}{x^2+y^2}\,dy\,dx$
14. $\int_{0}^{2}\int_{-\sqrt{1-(y-1)^2}}^{0} xy^2\,dx\,dy$
15. $\int_{-1}^{1}\int_{-\sqrt{1-y^2}}^{\sqrt{1-y^2}} \ln(x^2+y^2+1)\,dx\,dy$
16. $\int_{-1}^{1}\int_{-\sqrt{1-x^2}}^{\sqrt{1-x^2}} \frac{2}{(1+x^2+y^2)^2}\,dy\,dx$

## Finding Area in Polar Coordinates

17. Find the area of the region cut from the first quadrant by the curve $r = 2(2 - \sin 2\theta)^{1/2}$.
18. **Cardioid overlapping a circle** Find the area of the region that lies inside the cardioid $r = 1 + \cos\theta$ and outside the circle $r = 1$.
19. **One leaf of a rose** Find the area enclosed by one leaf of the rose $r = 12\cos 3\theta$.
20. **Snail shell** Find the area of the region enclosed by the positive $x$-axis and spiral $r = 4\theta/3$, $0 \le \theta \le 2\pi$. The region looks like a snail shell.
21. **Cardioid in the first quadrant** Find the area of the region cut from the first quadrant by the cardioid $r = 1 + \sin\theta$.
22. **Overlapping cardioids** Find the area of the region common to the interiors of the cardioids $r = 1 + \cos\theta$ and $r = 1 - \cos\theta$.

## Masses and Moments

23. **First moment of a plate** Find the first moment about the $x$-axis of a thin plate of constant density $\delta(x, y) = 3$, bounded below by the $x$-axis and above by the cardioid $r = 1 - \cos\theta$.
24. **Inertial and polar moments of a disk** Find the moment of inertia about the $x$-axis and the polar moment of inertia about the origin of a thin disk bounded by the circle $x^2 + y^2 = a^2$ if the disk's density at the point $(x, y)$ is $\delta(x, y) = k(x^2 + y^2)$, $k$ a constant.
25. **Mass of a plate** Find the mass of a thin plate covering the region outside the circle $r = 3$ and inside the circle $r = 6\sin\theta$ if the plate's density function is $\delta(x, y) = 1/r$.
26. **Polar moment of a cardioid overlapping circle** Find the polar moment of inertia about the origin of a thin plate covering the region that lies inside the cardioid $r = 1 - \cos\theta$ and outside the circle $r = 1$ if the plate's density function is $\delta(x, y) = 1/r^2$.
27. **Centroid of a cardioid region** Find the centroid of the region enclosed by the cardioid $r = 1 + \cos\theta$.
28. **Polar moment of a cardioid region** Find the polar moment of inertia about the origin of a thin plate enclosed by the cardioid $r = 1 + \cos\theta$ if the plate's density function is $\delta(x, y) = 1$.

## Average Values

29. **Average height of a hemisphere** Find the average height of the hemisphere $z = \sqrt{a^2 - x^2 - y^2}$ above the disk $x^2 + y^2 \le a^2$ in the $xy$-plane.
30. **Average height of a cone** Find the average height of the (single) cone $z = \sqrt{x^2 + y^2}$ above the disk $x^2 + y^2 \le a^2$ in the $xy$-plane.
31. **Average distance from interior of disk to center** Find the average distance from a point $P(x, y)$ in the disk $x^2 + y^2 \le a^2$ to the origin.
32. **Average distance squared from a point in a disk to a point in its boundary** Find the average value of the *square* of the distance from the point $P(x, y)$ in the disk $x^2 + y^2 \le 1$ to the boundary point $A(1, 0)$.

## Theory and Examples

33. **Converting to a polar integral** Integrate $f(x, y) = [\ln(x^2 + y^2)]/\sqrt{x^2 + y^2}$ over the region $1 \le x^2 + y^2 \le e$.
34. **Converting to a polar integral** Integrate $f(x, y) = [\ln(x^2 + y^2)]/(x^2 + y^2)$ over the region $1 \le x^2 + y^2 \le e^2$.
35. **Volume of noncircular right cylinder** The region that lies inside the cardioid $r = 1 + \cos\theta$ and outside the circle $r = 1$ is the base of a solid right cylinder. The top of the cylinder lies in the plane $z = x$. Find the cylinder's volume.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**36. Volume of noncircular right cylinder** The region enclosed by the lemniscate $r^2 = 2\cos 2\theta$ is the base of a solid right cylinder whose top is bounded by the sphere $z = \sqrt{2 - r^2}$. Find the cylinder's volume.

**37. Converting to polar integrals**

**a.** The usual way to evaluate the improper integral $I = \int_0^\infty e^{-x^2}\,dx$ is first to calculate its square:

$$I^2 = \left(\int_0^\infty e^{-x^2}\,dx\right)\left(\int_0^\infty e^{-y^2}\,dy\right) = \int_0^\infty\int_0^\infty e^{-(x^2+y^2)}\,dx\,dy.$$

Evaluate the last integral using polar coordinates and solve the resulting equation for $I$.

**b.** Evaluate

$$\lim_{x\to\infty} \operatorname{erf}(x) = \lim_{x\to\infty}\int_0^x \frac{2e^{-t^2}}{\sqrt{\pi}}\,dt.$$

**38. Converting to a polar integral** Evaluate the integral

$$\int_0^\infty\int_0^\infty \frac{1}{(1 + x^2 + y^2)^2}\,dx\,dy.$$

**39. Existence** Integrate the function $f(x, y) = 1/(1 - x^2 - y^2)$ over the disk $x^2 + y^2 \le 3/4$. Does the integral of $f(x, y)$ over the disk $x^2 + y^2 \le 1$ exist? Give reasons for your answer.

**40. Area formula in polar coordinates** Use the double integral in polar coordinates to derive the formula

$$A = \int_\alpha^\beta \frac{1}{2}r^2\,d\theta$$

for the area of the fan-shaped region between the origin and polar curve $r = f(\theta)$, $\alpha \le \theta \le \beta$.

**41. Average distance to a given point inside a disk** Let $P_0$ be a point inside a circle of radius $a$ and let $h$ denote the distance from $P_0$ to the center of the circle. Let $d$ denote the distance from an arbitrary point $P$ to $P_0$. Find the average value of $d^2$ over the region enclosed by the circle. (*Hint:* Simplify your work by placing the center of the circle at the origin and $P_0$ on the $x$-axis.)

**42. Area** Suppose that the area of a region in the polar coordinate plane is

$$A = \int_{\pi/4}^{3\pi/4}\int_{\csc\theta}^{2\sin\theta} r\,dr\,d\theta.$$

Sketch the region and find its area.

COMPUTER EXPLORATIONS

## Coordinate Conversions

In Exercises 43–46, use a CAS to change the Cartesian integrals into an equivalent polar integral and evaluate the polar integral. Perform the following steps in each exercise.

**a.** Plot the Cartesian region of integration in the $xy$-plane.

**b.** Change each boundary curve of the Cartesian region in part (a) to its polar representation by solving its Cartesian equation for $r$ and $\theta$.

**c.** Using the results in part (b), plot the polar region of integration in the $r\theta$-plane.

**d.** Change the integrand from Cartesian to polar coordinates. Determine the limits of integration from your plot in part (c) and evaluate the polar integral using the CAS integration utility.

**43.** $\displaystyle\int_0^1\int_x^1 \frac{y}{x^2 + y^2}\,dy\,dx$

**44.** $\displaystyle\int_0^1\int_0^{x/2} \frac{x}{x^2 + y^2}\,dy\,dx$

**45.** $\displaystyle\int_0^1\int_{-y/3}^{y/3} \frac{y}{\sqrt{x^2 + y^2}}\,dx\,dy$

**46.** $\displaystyle\int_0^1\int_y^{2-y} \sqrt{x + y}\,dx\,dy$

# 15.4 Triple Integrals in Rectangular Coordinates

Just as double integrals allow us to deal with more general situations than could be handled by single integrals, triple integrals enable us to solve still more general problems. We use triple integrals to calculate the volumes of three-dimensional shapes, the masses and moments of solids of varying density, and the average value of a function over a three-dimensional region. Triple integrals also arise in the study of vector fields and fluid flow in three dimensions, as we will see in Chapter 16.

## Triple Integrals

If $F(x, y, z)$ is a function defined on a closed bounded region $D$ in space, such as the region occupied by a solid ball or a lump of clay, then the integral of $F$ over $D$ may be defined in

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

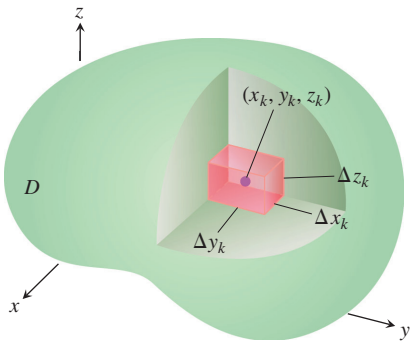

**FIGURE 15.27** Partitioning a solid with rectangular cells of volume $\Delta V_k$.

the following way. We partition a rectangular boxlike region containing $D$ into rectangular cells by planes parallel to the coordinate axis (Figure 15.27). We number the cells that lie inside $D$ from 1 to $n$ in some order, the $k$th cell having dimensions $\Delta x_k$ by $\Delta y_k$ by $\Delta z_k$ and volume $\Delta V_k = \Delta x_k \Delta y_k \Delta z_k$. We choose a point $(x_k, y_k, z_k)$ in each cell and form the sum

$$S_n = \sum_{k=1}^{n} F(x_k, y_k, z_k)\, \Delta V_k. \tag{1}$$

We are interested in what happens as $D$ is partitioned by smaller and smaller cells, so that $\Delta x_k$, $\Delta y_k$, $\Delta z_k$ and the norm of the partition $\|P\|$, the largest value among $\Delta x_k$, $\Delta y_k$, $\Delta z_k$, all approach zero. When a single limiting value is attained, no matter how the partitions and points $(x_k, y_k, z_k)$ are chosen, we say that $F$ is **integrable** over $D$. As before, it can be shown that when $F$ is continuous and the bounding surface of $D$ is formed from finitely many smooth surfaces joined together along finitely many smooth curves, then $F$ is integrable. As $\|P\| \to 0$ and the number of cells $n$ goes to $\infty$, the sums $S_n$ approach a limit. We call this limit the **triple integral of $F$ over $D$** and write

$$\lim_{n\to\infty} S_n = \iiint_D F(x, y, z)\, dV \qquad \text{or} \qquad \lim_{\|P\|\to 0} S_n = \iiint_D F(x, y, z)\, dx\, dy\, dz.$$

The regions $D$ over which continuous functions are integrable are those that can be closely approximated by small rectangular cells. Such regions include those encountered in applications.

## Volume of a Region in Space

If $F$ is the constant function whose value is 1, then the sums in Equation (1) reduce to

$$S_n = \sum F(x_k, y_k, z_k)\, \Delta V_k = \sum 1 \cdot \Delta V_k = \sum \Delta V_k.$$

As $\Delta x_k$, $\Delta y_k$, and $\Delta z_k$ approach zero, the cells $\Delta V_k$ become smaller and more numerous and fill up more and more of $D$. We therefore define the volume of $D$ to be the triple integral

$$\lim_{n\to\infty} \sum_{k=1}^{n} \Delta V_k = \iiint_D dV.$$

**DEFINITION Volume**

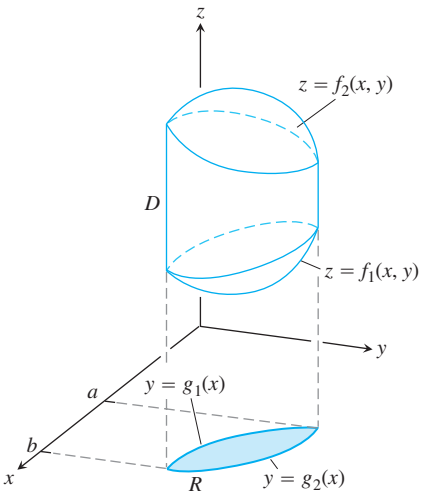
The **volume** of a closed, bounded region $D$ in space is

$$V = \iiint_D dV.$$

This definition is in agreement with our previous definitions of volume, though we omit the verification of this fact. As we see in a moment, this integral enables us to calculate the volumes of solids enclosed by curved surfaces.

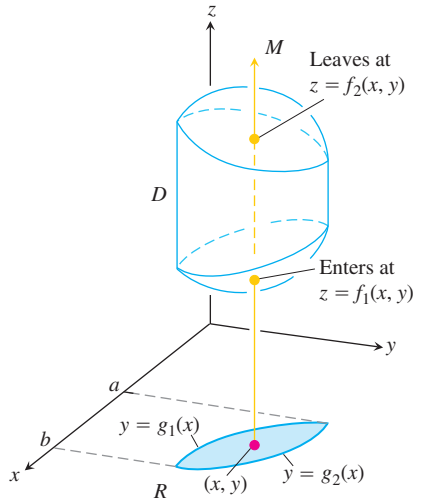
Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Finding Limits of Integration



We evaluate a triple integral by applying a three-dimensional version of Fubini's Theorem (Section 15.1) to evaluate it by three repeated single integrations. As with double integrals, there is a geometric procedure for finding the limits of integration for these single integrals.

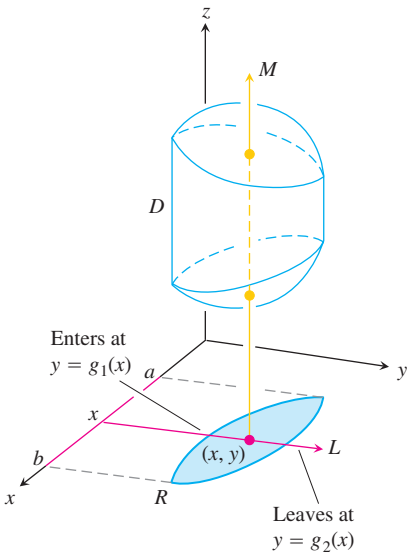
To evaluate



$$\iiint_D F(x, y, z)\, dV$$

over a region $D$, integrate first with respect to $z$, then with respect to $y$, finally with $x$.

1. *Sketch:* Sketch the region $D$ along with its "shadow" $R$ (vertical projection) in the $xy$-plane. Label the upper and lower bounding surfaces of $D$ and the upper and lower bounding curves of $R$.



2. *Find the z-limits of integration:* Draw a line $M$ passing through a typical point $(x, y)$ in $R$ parallel to the $z$-axis. As $z$ increases, $M$ enters $D$ at $z = f_1(x, y)$ and leaves at $z = f_2(x, y)$. These are the $z$-limits of integration.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**3.** *Find the y-limits of integration:* Draw a line $L$ through $(x, y)$ parallel to the $y$-axis. As $y$ increases, $L$ enters $R$ at $y = g_1(x)$ and leaves at $y = g_2(x)$. These are the $y$-limits of integration.

**4.** *Find the x-limits of integration:* Choose $x$-limits that include all lines through $R$ parallel to the $y$-axis ($x = a$ and $x = b$ in the preceding figure). These are the $x$-limits of integration. The integral is

$$\int_{x=a}^{x=b} \int_{y=g_1(x)}^{y=g_2(x)} \int_{z=f_1(x,y)}^{z=f_2(x,y)} F(x, y, z)\, dz\, dy\, dx.$$

Follow similar procedures if you change the order of integration. The "shadow" of region $D$ lies in the plane of the last two variables with respect to which the iterated integration takes place.

The above procedure applies whenever a solid region $D$ is bounded above and below by a surface, and when the "shadow" region $R$ is bounded by a lower and upper curve. It does not apply to regions with complicated holes through them, although sometimes such regions can be subdivided into simpler regions for which the procedure does apply.

**EXAMPLE 1** Finding a Volume

Find the volume of the region $D$ enclosed by the surfaces $z = x^2 + 3y^2$ and $z = 8 - x^2 - y^2$.

**Solution** The volume is

$$V = \iiint_D dz\, dy\, dx,$$

the integral of $F(x, y, z) = 1$ over $D$. To find the limits of integration for evaluating the integral, we first sketch the region. The surfaces (Figure 15.28) intersect on the elliptical cylinder $x^2 + 3y^2 = 8 - x^2 - y^2$ or $x^2 + 2y^2 = 4$, $z > 0$. The boundary of the region $R$, the projection of $D$ onto the $xy$-plane, is an ellipse with the same equation: $x^2 + 2y^2 = 4$. The "upper" boundary of $R$ is the curve $y = \sqrt{(4 - x^2)/2}$. The lower boundary is the curve $y = -\sqrt{(4 - x^2)/2}$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

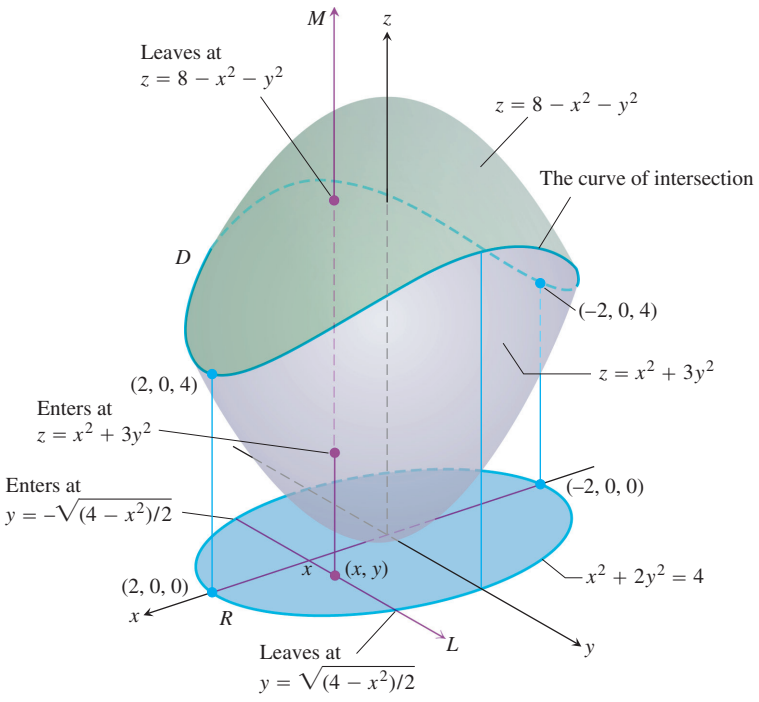


**FIGURE 15.28** The volume of the region enclosed by two paraboloids, calculated in Example 1.

Now we find the $z$-limits of integration. The line $M$ passing through a typical point $(x, y)$ in $R$ parallel to the $z$-axis enters $D$ at $z = x^2 + 3y^2$ and leaves at $z = 8 - x^2 - y^2$.

Next we find the $y$-limits of integration. The line $L$ through $(x, y)$ parallel to the $y$-axis enters $R$ at $y = -\sqrt{(4 - x^2)/2}$ and leaves at $y = \sqrt{(4 - x^2)/2}$.

Finally we find the $x$-limits of integration. As $L$ sweeps across $R$, the value of $x$ varies from $x = -2$ at $(-2, 0, 0)$ to $x = 2$ at $(2, 0, 0)$. The volume of $D$ is

$$V = \iiint_D dz\, dy\, dx$$

$$= \int_{-2}^{2} \int_{-\sqrt{(4-x^2)/2}}^{\sqrt{(4-x^2)/2}} \int_{x^2+3y^2}^{8-x^2-y^2} dz\, dy\, dx$$

$$= \int_{-2}^{2} \int_{-\sqrt{(4-x^2)/2}}^{\sqrt{(4-x^2)/2}} (8 - 2x^2 - 4y^2)\, dy\, dx$$

$$= \int_{-2}^{2} \left[ (8 - 2x^2)y - \frac{4}{3}y^3 \right]_{y=-\sqrt{(4-x^2)/2}}^{y=\sqrt{(4-x^2)/2}} dx$$

$$= \int_{-2}^{2} \left( 2(8 - 2x^2)\sqrt{\frac{4 - x^2}{2}} - \frac{8}{3}\left(\frac{4 - x^2}{2}\right)^{3/2} \right) dx$$

$$= \int_{-2}^{2} \left[ 8\left(\frac{4 - x^2}{2}\right)^{3/2} - \frac{8}{3}\left(\frac{4 - x^2}{2}\right)^{3/2} \right] dx = \frac{4\sqrt{2}}{3} \int_{-2}^{2} (4 - x^2)^{3/2}\, dx$$

$$= 8\pi\sqrt{2}.$$

After integration with the substitution $x = 2 \sin u$. ■

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

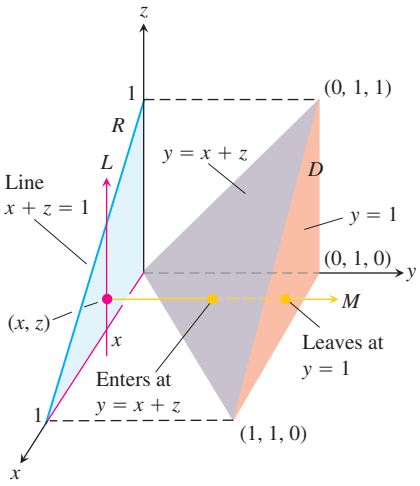

**FIGURE 15.29** Finding the limits of integration for evaluating the triple integral of a function defined over the tetrahedron $D$ (Example 2).

In the next example, we project $D$ onto the $xz$-plane instead of the $xy$-plane, to show how to use a different order of integration.

### EXAMPLE 2 Finding the Limits of Integration in the Order $dy\,dz\,dx$

Set up the limits of integration for evaluating the triple integral of a function $F(x, y, z)$ over the tetrahedron $D$ with vertices $(0, 0, 0)$, $(1, 1, 0)$, $(0, 1, 0)$, and $(0, 1, 1)$.

**Solution** We sketch $D$ along with its "shadow" $R$ in the $xz$-plane (Figure 15.29). The upper (right-hand) bounding surface of $D$ lies in the plane $y = 1$. The lower (left-hand) bounding surface lies in the plane $y = x + z$. The upper boundary of $R$ is the line $z = 1 - x$. The lower boundary is the line $z = 0$.

First we find the $y$-limits of integration. The line through a typical point $(x, z)$ in $R$ parallel to the $y$-axis enters $D$ at $y = x + z$ and leaves at $y = 1$.

Next we find the $z$-limits of integration. The line $L$ through $(x, z)$ parallel to the $z$-axis enters $R$ at $z = 0$ and leaves at $z = 1 - x$.

Finally we find the $x$-limits of integration. As $L$ sweeps across $R$, the value of $x$ varies from $x = 0$ to $x = 1$. The integral is

$$\int_0^1 \int_0^{1-x} \int_{x+z}^{1} F(x, y, z)\, dy\, dz\, dx.$$

■

### EXAMPLE 3 Revisiting Example 2 Using the Order $dz\,dy\,dx$

To integrate $F(x, y, z)$ over the tetrahedron $D$ in the order $dz\,dy\,dx$, we perform the steps in the following way.

First we find the $z$-limits of integration. A line parallel to the $z$-axis through a typical point $(x, y)$ in the $xy$-plane "shadow" enters the tetrahedron at $z = 0$ and exits through the upper plane where $z = y - x$ (Figure 15.29).

Next we find the $y$-limits of integration. On the $xy$-plane, where $z = 0$, the sloped side of the tetrahedron crosses the plane along the line $y = x$. A line through $(x, y)$ parallel to the $y$-axis enters the shadow in the $xy$-plane at $y = x$ and exits at $y = 1$.

Finally we find the $x$-limits of integration. As the line parallel to the $y$-axis in the previous step sweeps out the shadow, the value of $x$ varies from $x = 0$ to $x = 1$ at the point $(1, 1, 0)$. The integral is

$$\int_0^1 \int_x^1 \int_0^{y-x} F(x, y, z)\, dz\, dy\, dx.$$

For example, if $F(x, y, z) = 1$, we would find the volume of the tetrahedron to be

$$\begin{aligned} V &= \int_0^1 \int_x^1 \int_0^{y-x} dz\, dy\, dx \\ &= \int_0^1 \int_x^1 (y - x)\, dy\, dx \\ &= \int_0^1 \left[\frac{1}{2}y^2 - xy\right]_{y=x}^{y=1} dx \\ &= \int_0^1 \left(\frac{1}{2} - x + \frac{1}{2}x^2\right) dx \\ &= \left[\frac{1}{2}x - \frac{1}{2}x^2 + \frac{1}{6}x^3\right]_0^1 \\ &= \frac{1}{6}. \end{aligned}$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

We get the same result by integrating with the order $dy\,dz\,dx$,

$$V = \int_0^1 \int_0^{1-x} \int_{x+z}^1 dy\,dz\,dx = \frac{1}{6}.$$

As we have seen, there are sometimes (but not always) two different orders in which the iterated single integrations for evaluating a double integral may be worked. For triple integrals, there can be as many as six, since there are six ways of ordering $dx$, $dy$, and $dz$. Each ordering leads to a different description of the region of integration in space, and to different limits of integration.

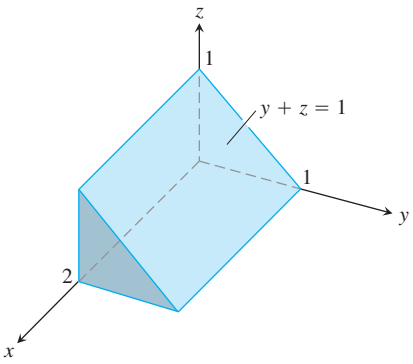

**FIGURE 15.30** Example 4 gives six different iterated triple integrals for the volume of this prism.

## EXAMPLE 4 Using Different Orders of Integration

Each of the following integrals gives the volume of the solid shown in Figure 15.30.

**(a)** $\displaystyle\int_0^1 \int_0^{1-z} \int_0^2 dx\,dy\,dz$

**(b)** $\displaystyle\int_0^1 \int_0^{1-y} \int_0^2 dx\,dz\,dy$

**(c)** $\displaystyle\int_0^1 \int_0^2 \int_0^{1-z} dy\,dx\,dz$

**(d)** $\displaystyle\int_0^2 \int_0^1 \int_0^{1-z} dy\,dz\,dx$

**(e)** $\displaystyle\int_0^1 \int_0^2 \int_0^{1-y} dz\,dx\,dy$

**(f)** $\displaystyle\int_0^2 \int_0^1 \int_0^{1-y} dz\,dy\,dx$

We work out the integrals in parts (b) and (c):

$$V = \int_0^1 \int_0^{1-y} \int_0^2 dx\,dz\,dy \qquad \text{Integral in part (b)}$$

$$= \int_0^1 \int_0^{1-y} 2\,dz\,dy$$

$$= \int_0^1 \Big[2z\Big]_{z=0}^{z=1-y} dy$$

$$= \int_0^1 2(1-y)\,dy$$

$$= 1.$$

Also,

$$V = \int_0^1 \int_0^2 \int_0^{1-z} dy\,dx\,dz \qquad \text{Integral in part (c)}$$

$$= \int_0^1 \int_0^2 (1-z)\,dx\,dz$$

$$= \int_0^1 \Big[x - zx\Big]_{x=0}^{x=2} dz$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

$$= \int_0^1 (2 - 2z)\, dz$$

$$= 1.$$

The integrals in parts (a), (d), (e), and (f) also give $V = 1$. ■

## Average Value of a Function in Space

The average value of a function $F$ over a region $D$ in space is defined by the formula

$$\textbf{Average value} \text{ of } F \text{ over } D = \frac{1}{\text{volume of } D} \iiint_D F\, dV. \tag{2}$$

For example, if $F(x, y, z) = \sqrt{x^2 + y^2 + z^2}$, then the average value of $F$ over $D$ is the average distance of points in $D$ from the origin. If $F(x, y, z)$ is the temperature at $(x, y, z)$ on a solid that occupies a region $D$ in space, then the average value of $F$ over $D$ is the average temperature of the solid.

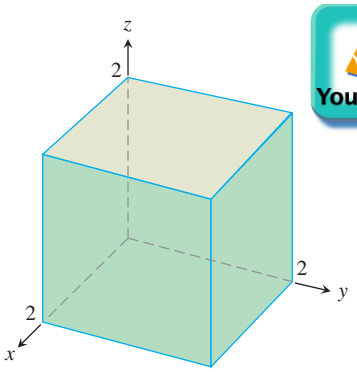

**FIGURE 15.31** The region of integration in Example 5.

**EXAMPLE 5** Finding an Average Value

Find the average value of $F(x, y, z) = xyz$ over the cube bounded by the coordinate planes and the planes $x = 2$, $y = 2$, and $z = 2$ in the first octant.

**Solution** We sketch the cube with enough detail to show the limits of integration (Figure 15.31). We then use Equation (2) to calculate the average value of $F$ over the cube.

The volume of the cube is $(2)(2)(2) = 8$. The value of the integral of $F$ over the cube is

$$\int_0^2 \int_0^2 \int_0^2 xyz\, dx\, dy\, dz = \int_0^2 \int_0^2 \left[\frac{x^2}{2} yz\right]_{x=0}^{x=2} dy\, dz = \int_0^2 \int_0^2 2yz\, dy\, dz$$

$$= \int_0^2 \left[y^2 z\right]_{y=0}^{y=2} dz = \int_0^2 4z\, dz = \left[2z^2\right]_0^2 = 8.$$

With these values, Equation (2) gives

$$\text{Average value of } xyz \text{ over the cube} = \frac{1}{\text{volume}} \iiint_{\text{cube}} xyz\, dV = \left(\frac{1}{8}\right)(8) = 1.$$

In evaluating the integral, we chose the order $dx\, dy\, dz$, but any of the other five possible orders would have done as well. ■

## Properties of Triple Integrals

Triple integrals have the same algebraic properties as double and single integrals.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**Properties of Triple Integrals**

If $F = F(x, y, z)$ and $G = G(x, y, z)$ are continuous, then

1. *Constant Multiple:* $\iiint_D kF\,dV = k\iiint_D F\,dV$ (any number $k$)
2. *Sum and Difference:* $\iiint_D (F \pm G)\,dV = \iiint_D F\,dV \pm \iiint_D G\,dV$
3. *Domination:*
   (a) $\iiint_D F\,dV \geq 0$ if $F \geq 0$ on $D$
   (b) $\iiint_D F\,dV \geq \iiint_D G\,dV$ if $F \geq G$ on $D$
4. *Additivity:* $\iiint_D F\,dV = \iiint_{D_1} E\,dV + \iiint_{D_2} F\,dV$
   if $D$ is the union of two nonoverlapping regions $D_1$ and $D_2$.

# EXERCISES 15.4

## Evaluating Triple Integrals in Different Iterations

1. Evaluate the integral in Example 2 taking $F(x, y, z) = 1$ to find the volume of the tetrahedron.
2. **Volume of rectangular solid** Write six different iterated triple integrals for the volume of the rectangular solid in the first octant bounded by the coordinate planes and the planes $x = 1, y = 2$, and $z = 3$. Evaluate one of the integrals.
3. **Volume of tetrahedron** Write six different iterated triple integrals for the volume of the tetrahedron cut from the first octant by the plane $6x + 3y + 2z = 6$. Evaluate one of the integrals.
4. **Volume of solid** Write six different iterated triple integrals for the volume of the region in the first octant enclosed by the cylinder $x^2 + z^2 = 4$ and the plane $y = 3$. Evaluate one of the integrals.
5. **Volume enclosed by paraboloids** Let $D$ be the region bounded by the paraboloids $z = 8 - x^2 - y^2$ and $z = x^2 + y^2$. Write six different triple iterated integrals for the volume of $D$. Evaluate one of the integrals.
6. **Volume inside paraboloid beneath a plane** Let $D$ be the region bounded by the paraboloid $z = x^2 + y^2$ and the plane $z = 2y$. Write triple iterated integrals in the order $dz\,dx\,dy$ and $dz\,dy\,dx$ that give the volume of $D$. Do not evaluate either integral.

## Evaluating Triple Iterated Integrals

Evaluate the integrals in Exercises 7–20.

7. $\displaystyle\int_0^1\int_0^1\int_0^1 (x^2 + y^2 + z^2)\,dz\,dy\,dx$

8. $\displaystyle\int_0^{\sqrt{2}}\int_0^{3y}\int_{x^2+3y^2}^{8-x^2-y^2} dz\,dx\,dy$

9. $\displaystyle\int_1^e\int_1^e\int_1^e \frac{1}{xyz}\,dx\,dy\,dz$

10. $\displaystyle\int_0^1\int_0^{3-3x}\int_0^{3-3x-y} dz\,dy\,dx$

11. $\displaystyle\int_0^1\int_0^{\pi}\int_0^{\pi} y\sin z\,dx\,dy\,dz$

12. $\displaystyle\int_{-1}^1\int_{-1}^1\int_{-1}^1 (x + y + z)\,dy\,dx\,dz$

13. $\displaystyle\int_0^3\int_0^{\sqrt{9-x^2}}\int_0^{\sqrt{9-x^2}} dz\,dy\,dx$

14. $\displaystyle\int_0^2\int_{-\sqrt{4-y^2}}^{\sqrt{4-y^2}}\int_0^{2x+y} dz\,dx\,dy$

15. $\displaystyle\int_0^1\int_0^{2-x}\int_0^{2-x-y} dz\,dy\,dx$

16. $\displaystyle\int_0^1\int_0^{1-x^2}\int_3^{4-x^2-y} x\,dz\,dy\,dx$

17. $\displaystyle\int_0^{\pi}\int_0^{\pi}\int_0^{\pi} \cos(u + v + w)\,du\,dv\,dw$ ($uvw$-space)

18. $\displaystyle\int_1^e\int_1^e\int_1^e \ln r\ln s\ln t\,dt\,dr\,ds$ ($rst$-space)

19. $\displaystyle\int_0^{\pi/4}\int_0^{\ln\sec v}\int_{-\infty}^{2t} e^x\,dx\,dt\,dv$ ($tvx$-space)

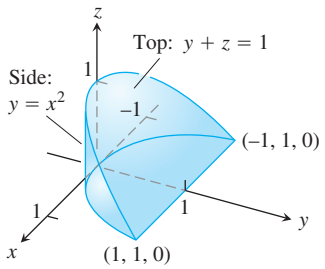
Exercises



**20.** $\displaystyle\int_0^7 \int_0^2 \int_0^{\sqrt{4-q^2}} \frac{q}{r+1}\, dp\, dq\, dr$ ($pqr$-space)

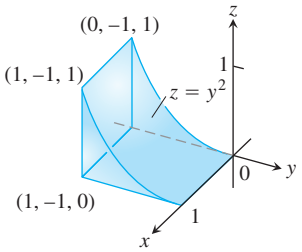
## Volumes Using Triple Integrals

Exercises

**21.** Here is the region of integration of the integral

$$\int_{-1}^{1} \int_{x^2}^{1} \int_{0}^{1-y} dz\, dy\, dx\,.$$

Rewrite the integral as an equivalent iterated integral in the order



**a.** $dy\, dz\, dx$ **b.** $dy\, dx\, dz$

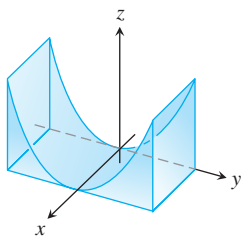
**c.** $dx\, dy\, dz$ **d.** $dx\, dz\, dy$

**e.** $dz\, dx\, dy$.

**22.** Here is the region of integration of the integral

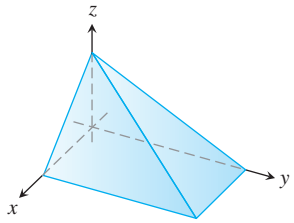
$$\int_0^1 \int_{-1}^0 \int_0^{y^2} dz\, dy\, dx.$$

Rewrite the integral as an equivalent iterated integral in the order



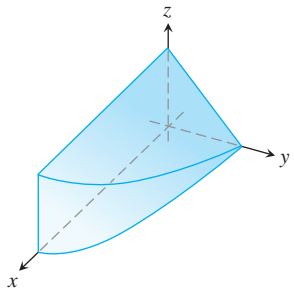
**a.** $dy\, dz\, dx$ **b.** $dy\, dx\, dz$

**c.** $dx\, dy\, dz$ **d.** $dx\, dz\, dy$

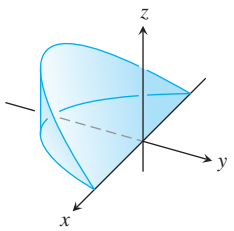


**e.** $dz\, dx\, dy$.

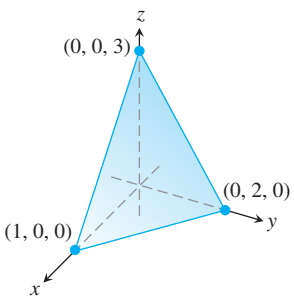
Find the volumes of the regions in Exercises 23–36.



**23.** The region between the cylinder $z = y^2$ and the $xy$-plane that is bounded by the planes $x = 0, x = 1, y = -1, y = 1$

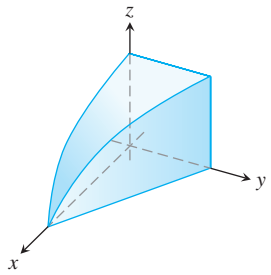


**24.** The region in the first octant bounded by the coordinate planes and the planes $x + z = 1, y + 2z = 2$

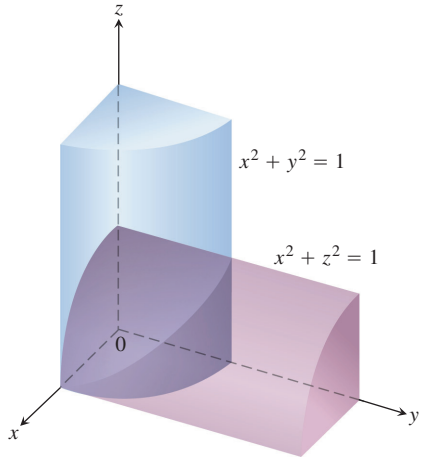


**25.** The region in the first octant bounded by the coordinate planes, the plane $y + z = 2$, and the cylinder $x = 4 - y^2$

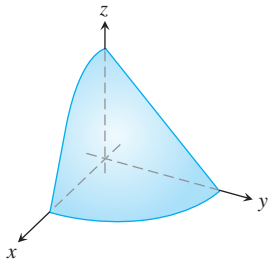
**26.** The wedge cut from the cylinder $x^2 + y^2 = 1$ by the planes $z = -y$ and $z = 0$



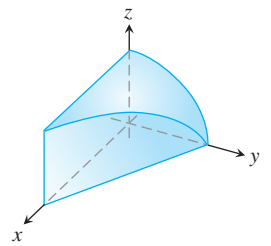
**27.** The tetrahedron in the first octant bounded by the coordinate planes and the plane passing through (1, 0, 0), (0, 2, 0), and (0, 0, 3).



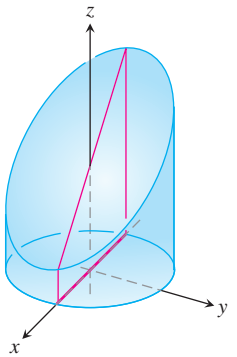
Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley



**28.** The region in the first octant bounded by the coordinate planes, the plane $y = 1 - x$, and the surface $z = \cos(\pi x/2)$, $0 \le x \le 1$



**29.** The region common to the interiors of the cylinders $x^2 + y^2 = 1$ and $x^2 + z^2 = 1$, one-eighth of which is shown in the accompanying figure.



**30.** The region in the first octant bounded by the coordinate planes and the surface $z = 4 - x^2 - y$

**31.** The region in the first octant bounded by the coordinate planes, the plane $x + y = 4$, and the cylinder $y^2 + 4z^2 = 16$

**32.** The region cut from the cylinder $x^2 + y^2 = 4$ by the plane $z = 0$ and the plane $x + z = 3$

**33.** The region between the planes $x + y + 2z = 2$ and $2x + 2y + z = 4$ in the first octant

**34.** The finite region bounded by the planes $z = x$, $x + z = 8$, $z = y$, $y = 8$, and $z = 0$.

**35.** The region cut from the solid elliptical cylinder $x^2 + 4y^2 \le 4$ by the $xy$-plane and the plane $z = x + 2$

**36.** The region bounded in back by the plane $x = 0$, on the front and sides by the parabolic cylinder $x = 1 - y^2$, on the top by the paraboloid $z = x^2 + y^2$, and on the bottom by the $xy$-plane

## Average Values

In Exercises 37–40, find the average value of $F(x, y, z)$ over the given region.

**37.** $F(x, y, z) = x^2 + 9$ over the cube in the first octant bounded by the coordinate planes and the planes $x = 2$, $y = 2$, and $z = 2$

**38.** $F(x, y, z) = x + y - z$ over the rectangular solid in the first octant bounded by the coordinate planes and the planes $x = 1$, $y = 1$, and $z = 2$

**39.** $F(x, y, z) = x^2 + y^2 + z^2$ over the cube in the first octant bounded by the coordinate planes and the planes $x = 1$, $y = 1$, and $z = 1$

**40.** $F(x, y, z) = xyz$ over the cube in the first octant bounded by the coordinate planes and the planes $x = 2$, $y = 2$, and $z = 2$

## Changing the Order of Integration

Evaluate the integrals in Exercises 41–44 by changing the order of integration in an appropriate way.

**41.** $\displaystyle\int_0^4 \int_0^1 \int_{2y}^2 \frac{4\cos(x^2)}{2\sqrt{z}}\, dx\, dy\, dz$

**42.** $\displaystyle\int_0^1 \int_0^1 \int_{x^2}^1 12xze^{zy^2}\, dy\, dx\, dz$

**43.** $\displaystyle\int_0^1 \int_{\sqrt[3]{z}}^1 \int_0^{\ln 3} \frac{\pi e^{2x} \sin \pi y^2}{y^2}\, dx\, dy\, dz$

**44.** $\displaystyle\int_0^2 \int_0^{4-x^2} \int_0^x \frac{\sin 2z}{4 - z}\, dy\, dz\, dx$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

## Theory and Examples

**45. Finding upper limit of iterated integral** Solve for $a$:

$$\int_0^1 \int_0^{4-a-x^2} \int_a^{4-x^2-y} dz\, dy\, dx = \frac{4}{15}.$$

**46. Ellipsoid** For what value of $c$ is the volume of the ellipsoid $x^2 + (y/2)^2 + (z/c)^2 = 1$ equal to $8\pi$?

**47. Minimizing a triple integral** What domain $D$ in space minimizes the value of the integral

$$\iiint_D (4x^2 + 4y^2 + z^2 - 4)\, dV\,?$$

Give reasons for your answer.

**48. Maximizing a triple integral** What domain $D$ in space maximizes the value of the integral

$$\iiint_D (1 - x^2 - y^2 - z^2)\, dV\,?$$

Give reasons for your answer.

COMPUTER EXPLORATIONS

## Numerical Evaluations

In Exercises 49–52, use a CAS integration utility to evaluate the triple integral of the given function over the specified solid region.

**49.** $F(x, y, z) = x^2y^2z$ over the solid cylinder bounded by $x^2 + y^2 = 1$ and the planes $z = 0$ and $z = 1$

**50.** $F(x, y, z) = |xyz|$ over the solid bounded below by the paraboloid $z = x^2 + y^2$ and above by the plane $z = 1$

**51.** $F(x, y, z) = \dfrac{z}{(x^2 + y^2 + z^2)^{3/2}}$ over the solid bounded below by the cone $z = \sqrt{x^2 + y^2}$ and above by the plane $z = 1$

**52.** $F(x, y, z) = x^4 + y^2 + z^2$ over the solid sphere $x^2 + y^2 + z^2 \le 1$

# 15.5 Masses and Moments in Three Dimensions

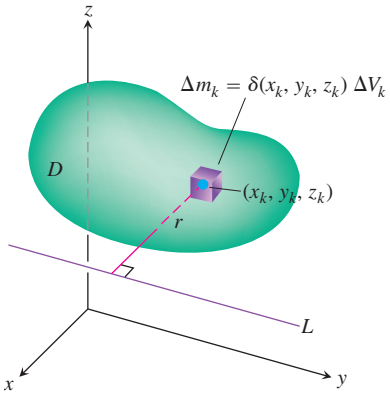

**FIGURE 15.32** To define an object's mass and moment of inertia about a line, we first imagine it to be partitioned into a finite number of mass elements $\Delta m_k$.

This section shows how to calculate the masses and moments of three-dimensional objects in Cartesian coordinates. The formulas are similar to those for two-dimensional objects. For calculations in spherical and cylindrical coordinates, see Section 15.6.

## Masses and Moments

If $\delta(x, y, z)$ is the density of an object occupying a region $D$ in space (mass per unit volume), the integral of $\delta$ over $D$ gives the **mass** of the object. To see why, imagine partitioning the object into $n$ mass elements like the one in Figure 15.32. The object's mass is the limit

$$M = \lim_{n\to\infty} \sum_{k=1}^{n} \Delta m_k = \lim_{n\to\infty} \sum_{k=1}^{n} \delta(x_k, y_k, z_k)\,\Delta V_k = \iiint_D \delta(x, y, z)\,dV.$$

We now derive a formula for the moment of inertia. If $r(x, y, z)$ is the distance from the point $(x, y, z)$ in $D$ to a line $L$, then the moment of inertia of the mass $\Delta m_k = \delta(x_k, y_k, z_k)\Delta V_k$ about the line $L$ (shown in Figure 15.32) is approximately $\Delta I_k = r^2(x_k, y_k, z_k)\Delta m_k$. **The moment of inertia about $L$** of the entire object is

$$I_L = \lim_{n\to\infty} \sum_{k=1}^{n} \Delta I_k = \lim_{n\to\infty} \sum_{k=1}^{n} r^2(x_k, y_k, z_k)\,\delta(x_k, y_k, z_k)\,\Delta V_k = \iiint_D r^2\delta\,dV.$$

If $L$ is the $x$-axis, then $r^2 = y^2 + z^2$ (Figure 15.33) and

$$I_x = \iiint_D (y^2 + z^2)\,\delta\,dV.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

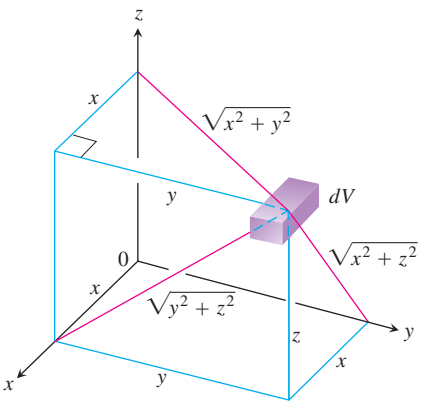

**FIGURE 15.33** Distances from $dV$ to the coordinate planes and axes.

Similarly, if $L$ is the $y$-axis or $z$-axis we have

$$I_y = \iiint_D (x^2 + z^2)\,\delta\,dV \qquad \text{and} \qquad I_z = \iiint_D (x^2 + y^2)\,\delta\,dV.$$

Likewise, we can obtain the **first moments about the coordinate planes**. For example,

$$M_{yz} = \iiint_D x\delta(x, y, z)\,dV$$

gives the first moment about the $yz$-plane.

The mass and moment formulas in space analogous to those discussed for planar regions in Section 15.2 are summarized in Table 15.3.

**TABLE 15.3** Mass and moment formulas for solid objects in space

**Mass:** $M = \iiint_D \delta\,dV \qquad (\delta = \delta(x, y, z) = \text{density})$

**First moments about the coordinate planes:**

$$M_{yz} = \iiint_D x\,\delta\,dV, \qquad M_{xz} = \iiint_D y\,\delta\,dV, \qquad M_{xy} = \iiint_D z\,\delta\,dV$$

**Center of mass:**

$$\bar{x} = \frac{M_{yz}}{M}, \qquad \bar{y} = \frac{M_{xz}}{M}, \qquad \bar{z} = \frac{M_{xy}}{M}$$

**Moments of inertia (second moments) about the coordinate axes:**

$$I_x = \iiint (y^2 + z^2)\,\delta\,dV$$

$$I_y = \iiint (x^2 + z^2)\,\delta\,dV$$

$$I_z = \iiint (x^2 + y^2)\,\delta\,dV$$

**Moments of inertia about a line *L*:**

$$I_L = \iiint r^2\,\delta\,dV \qquad (r(x, y, z) = \text{distance from the point } (x, y, z) \text{ to line } L)$$

**Radius of gyration about a line *L*:**

$$R_L = \sqrt{I_L/M}$$

**EXAMPLE 1** Finding the Center of Mass of a Solid in Space

Find the center of mass of a solid of constant density $\delta$ bounded below by the disk $R$: $x^2 + y^2 \le 4$ in the plane $z = 0$ and above by the paraboloid $z = 4 - x^2 - y^2$ (Figure 15.34).

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

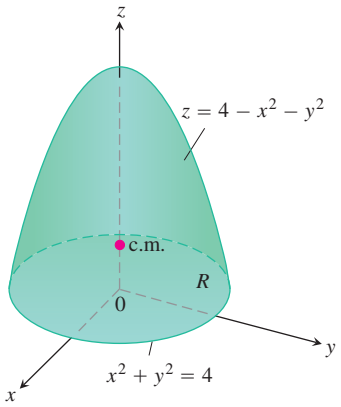

**FIGURE 15.34** Finding the center of mass of a solid (Example 1).

**Solution** By symmetry $\bar{x} = \bar{y} = 0$. To find $\bar{z}$, we first calculate

$$M_{xy} = \iiint_R \int_{z=0}^{z=4-x^2-y^2} z\,\delta\,dz\,dy\,dx = \iint_R \left[\frac{z^2}{2}\right]_{z=0}^{z=4-x^2-y^2} \delta\,dy\,dx$$

$$= \frac{\delta}{2}\iint_R (4 - x^2 - y^2)^2\,dy\,dx$$

$$= \frac{\delta}{2}\int_0^{2\pi}\int_0^2 (4 - r^2)^2\,r\,dr\,d\theta \quad \text{Polar coordinates}$$

$$= \frac{\delta}{2}\int_0^{2\pi}\left[-\frac{1}{6}(4 - r^2)^3\right]_{r=0}^{r=2} d\theta = \frac{16\delta}{3}\int_0^{2\pi} d\theta = \frac{32\pi\delta}{3}.$$

A similar calculation gives

$$M = \iiint_R \int_0^{4-x^2-y^2} \delta\,dz\,dy\,dx = 8\pi\delta.$$

Therefore $\bar{z} = (M_{xy}/M) = 4/3$ and the center of mass is $(\bar{x}, \bar{y}, \bar{z}) = (0, 0, 4/3)$. ■

When the density of a solid object is constant (as in Example 1), the center of mass is called the **centroid** of the object (as was the case for two-dimensional shapes in Section 15.2).

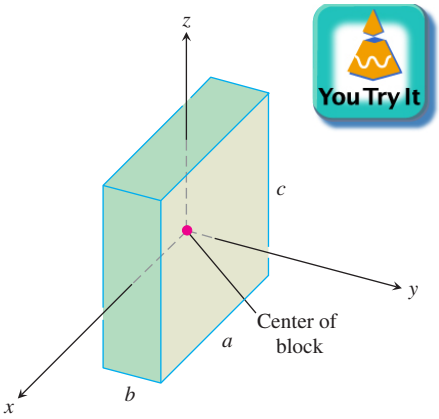

**FIGURE 15.35** Finding $I_x$, $I_y$, and $I_z$ for the block shown here. The origin lies at the center of the block (Example 2).

## EXAMPLE 2 Finding the Moments of Inertia About the Coordinate Axes

Find $I_x$, $I_y$, $I_z$ for the rectangular solid of constant density $\delta$ shown in Figure 15.35.

**Solution** The formula for $I_x$ gives

$$I_x = \int_{-c/2}^{c/2}\int_{-b/2}^{b/2}\int_{-a/2}^{a/2} (y^2 + z^2)\,\delta\,dx\,dy\,dz.$$

We can avoid some of the work of integration by observing that $(y^2 + z^2)\delta$ is an even function of $x$, $y$, and $z$. The rectangular solid consists of eight symmetric pieces, one in each octant. We can evaluate the integral on one of these pieces and then multiply by 8 to get the total value.

$$I_x = 8\int_0^{c/2}\int_0^{b/2}\int_0^{a/2} (y^2 + z^2)\,\delta\,dx\,dy\,dz = 4a\delta\int_0^{c/2}\int_0^{b/2} (y^2 + z^2)\,dy\,dz$$

$$= 4a\delta\int_0^{c/2}\left[\frac{y^3}{3} + z^2 y\right]_{y=0}^{y=b/2} dz$$

$$= 4a\delta\int_0^{c/2}\left(\frac{b^3}{24} + \frac{z^2 b}{2}\right) dz$$

$$= 4a\delta\left(\frac{b^3 c}{48} + \frac{c^3 b}{48}\right) = \frac{abc\delta}{12}(b^2 + c^2) = \frac{M}{12}(b^2 + c^2).$$

Similarly,

$$I_y = \frac{M}{12}(a^2 + c^2) \quad \text{and} \quad I_z = \frac{M}{12}(a^2 + b^2).$$ ■

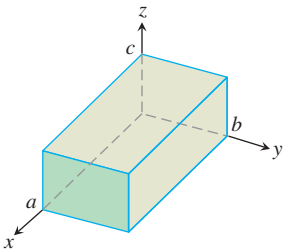
# EXERCISES 15.5

## Constant Density



The solids in Exercises 1–12 all have constant density $\delta = 1$.

**1.** (*Example 1 Revisited.*) Evaluate the integral for $I_x$ in Table 15.3 directly to show that the shortcut in Example 2 gives the same answer. Use the results in Example 2 to find the radius of gyration of the rectangular solid about each coordinate axis.

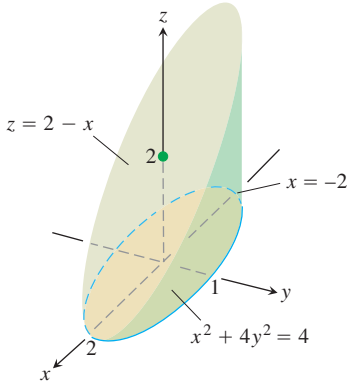
**2. Moments of inertia** The coordinate axes in the figure run through the centroid of a solid wedge parallel to the labeled edges. Find $I_x$, $I_y$, and $I_z$ if $a = b = 6$ and $c = 4$.

**3. Moments of inertia** Find the moments of inertia of the rectangular solid shown here with respect to its edges by calculating $I_x$, $I_y$, and $I_z$.

**4. a. Centroid and moments of inertia** Find the centroid and the moments of inertia $I_x$, $I_y$, and $I_z$ of the tetrahedron whose vertices are the points (0, 0, 0), (1, 0, 0), (0, 1, 0), and (0, 0, 1).

**b. Radius of gyration** Find the radius of gyration of the tetrahedron about the $x$-axis. Compare it with the distance from the centroid to the $x$-axis.

**5. Center of mass and moments of inertia** A solid "trough" of constant density is bounded below by the surface $z = 4y^2$, above by the plane $z = 4$, and on the ends by the planes $x = 1$ and $x = -1$. Find the center of mass and the moments of inertia with respect to the three axes.



**6. Center of mass** A solid of constant density is bounded below by the plane $z = 0$, on the sides by the elliptical cylinder $x^2 + 4y^2 = 4$, and above by the plane $z = 2 - x$ (see the accompanying figure).

**a.** Find $\bar{x}$ and $\bar{y}$.

**b.** Evaluate the integral

$$M_{xy} = \int_{-2}^{2} \int_{-(1/2)\sqrt{4-x^2}}^{(1/2)\sqrt{4-x^2}} \int_{0}^{2-x} z \, dz \, dy \, dx$$

using integral tables to carry out the final integration with respect to $x$. Then divide $M_{xy}$ by $M$ to verify that $\bar{z} = 5/4$.

**7. a. Center of mass** Find the center of mass of a solid of constant density bounded below by the paraboloid $z = x^2 + y^2$ and above by the plane $z = 4$.

**b.** Find the plane $z = c$ that divides the solid into two parts of equal volume. This plane does not pass through the center of mass.

**8. Moments and radii of gyration** A solid cube, 2 units on a side, is bounded by the planes $x = \pm 1, z = \pm 1, y = 3$, and $y = 5$. Find the center of mass and the moments of inertia and radii of gyration about the coordinate axes.

**9. Moment of inertia and radius of gyration about a line** A wedge like the one in Exercise 2 has $a = 4$, $b = 6$, and $c = 3$. Make a quick sketch to check for yourself that the square of the distance from a typical point $(x, y, z)$ of the wedge to the line $L: z = 0, y = 6$ is $r^2 = (y - 6)^2 + z^2$. Then calculate the moment of inertia and radius of gyration of the wedge about $L$.

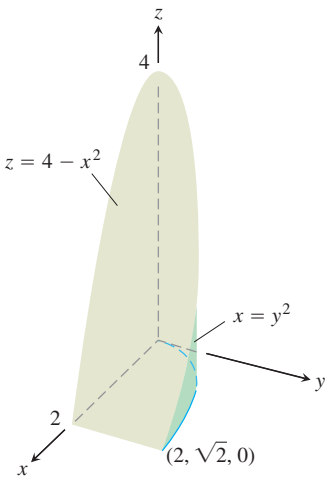
**10. Moment of inertia and radius of gyration about a line** A wedge like the one in Exercise 2 has $a = 4$, $b = 6$, and $c = 3$. Make a quick sketch to check for yourself that the square of the distance from a typical point $(x, y, z)$ of the wedge to the line $L: x = 4, y = 0$ is $r^2 = (x - 4)^2 + y^2$. Then calculate the moment of inertia and radius of gyration of the wedge about $L$.

**11. Moment of inertia and radius of gyration about a line** A solid like the one in Exercise 3 has $a = 4$, $b = 2$, and $c = 1$. Make a quick sketch to check for yourself that the square of the distance between a typical point $(x, y, z)$ of the solid and the line $L: y = 2, z = 0$ is $r^2 = (y - 2)^2 + z^2$. Then find the moment of inertia and radius of gyration of the solid about $L$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**12. Moment of inertia and radius of gyration about a line** A solid like the one in Exercise 3 has $a = 4, b = 2$, and $c = 1$. Make a quick sketch to check for yourself that the square of the distance between a typical point $(x, y, z)$ of the solid and the line $L: x = 4, y = 0$ is $r^2 = (x - 4)^2 + y^2$. Then find the moment of inertia and radius of gyration of the solid about $L$.

## Variable Density



In Exercises 13 and 14, find

**a.** the mass of the solid.

**b.** the center of mass.

**13.** A solid region in the first octant is bounded by the coordinate planes and the plane $x + y + z = 2$. The density of the solid is $\delta(x, y, z) = 2x$.

**14.** A solid in the first octant is bounded by the planes $y = 0$ and $z = 0$ and by the surfaces $z = 4 - x^2$ and $x = y^2$ (see the accompanying figure). Its density function is $\delta(x, y, z) = kxy$, $k$ a constant.

In Exercises 15 and 16, find

**a.** the mass of the solid.

**b.** the center of mass.

**c.** the moments of inertia about the coordinate axes.

**d.** the radii of gyration about the coordinate axes.

**15.** A solid cube in the first octant is bounded by the coordinate planes and by the planes $x = 1, y = 1$, and $z = 1$. The density of the cube is $\delta(x, y, z) = x + y + z + 1$.

**16.** A wedge like the one in Exercise 2 has dimensions $a = 2, b = 6$, and $c = 3$. The density is $\delta(x, y, z) = x + 1$. Notice that if the density is constant, the center of mass will be $(0, 0, 0)$.

**17. Mass** Find the mass of the solid bounded by the planes $x + z = 1, x - z = -1, y = 0$ and the surface $y = \sqrt{z}$. The density of the solid is $\delta(x, y, z) = 2y + 5$.

**18. Mass** Find the mass of the solid region bounded by the parabolic surfaces $z = 16 - 2x^2 - 2y^2$ and $z = 2x^2 + 2y^2$ if the density of the solid is $\delta(x, y, z) = \sqrt{x^2 + y^2}$.

## Work

In Exercises 19 and 20, calculate the following.

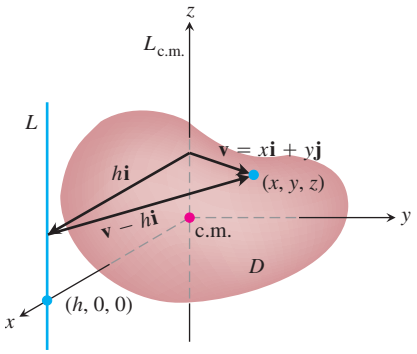
**a.** The amount of work done by (constant) gravity $g$ in moving the liquid filling in the container to the $xy$-plane. (*Hint:* Partition the liquid into small volume elements $\Delta V_i$ and find the work done (approximately) by gravity on each element. Summation and passage to the limit gives a triple integral to evaluate.)

**b.** The work done by gravity in moving the center of mass down to the $xy$-plane.

**19.** The container is a cubical box in the first octant bounded by the coordinate planes and the planes $x = 1, y = 1$, and $z = 1$. The density of the liquid filling the box is $\delta(x, y, z) = x + y + z + 1$ (see Exercise 15).

**20.** The container is in the shape of the region bounded by $y = 0, z = 0, z = 4 - x^2$, and $x = y^2$. The density of the liquid filling the region is $\delta(x, y, z) = kxy$, $k$ a constant (see Exercise 14).

## The Parallel Axis Theorem



The Parallel Axis Theorem (Exercises 15.2) holds in three dimensions as well as in two. Let $L_{\text{c.m.}}$ be a line through the center of mass of a body of mass $m$ and let $L$ be a parallel line $h$ units away from $L_{\text{c.m.}}$. The **Parallel Axis Theorem** says that the moments of inertia $I_{\text{c.m.}}$ and $I_L$ of the body about $L_{\text{c.m.}}$ and $L$ satisfy the equation

$$I_L = I_{\text{c.m.}} + mh^2. \tag{1}$$

As in the two-dimensional case, the theorem gives a quick way to calculate one moment when the other moment and the mass are known.

**21. Proof of the Parallel Axis Theorem**

**a.** Show that the first moment of a body in space about any plane through the body's center of mass is zero. (*Hint:* Place the body's center of mass at the origin and let the plane be the $yz$-plane. What does the formula $\bar{x} = M_{yz}/M$ then tell you?)

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

**b.** To prove the Parallel Axis Theorem, place the body with its center of mass at the origin, with the line $L_{\text{c.m.}}$ along the $z$-axis and the line $L$ perpendicular to the $xy$-plane at the point $(h, 0, 0)$. Let $D$ be the region of space occupied by the body. Then, in the notation of the figure,

$$I_L = \iiint_D |\mathbf{v} - h\mathbf{i}|^2 \, dm.$$

Expand the integrand in this integral and complete the proof.

**22.** The moment of inertia about a diameter of a solid sphere of constant density and radius $a$ is $(2/5)ma^2$, where $m$ is the mass of the sphere. Find the moment of inertia about a line tangent to the sphere.

**23.** The moment of inertia of the solid in Exercise 3 about the $z$-axis is $I_z = abc(a^2 + b^2)/3$.

**a.** Use Equation (1) to find the moment of inertia and radius of gyration of the solid about the line parallel to the $z$-axis through the solid's center of mass.

**b.** Use Equation (1) and the result in part (a) to find the moment of inertia and radius of gyration of the solid about the line $x = 0, y = 2b$.

**24.** If $a = b = 6$ and $c = 4$, the moment of inertia of the solid wedge in Exercise 2 about the $x$-axis is $I_x = 208$. Find the moment of inertia of the wedge about the line $y = 4, z = -4/3$ (the edge of the wedge's narrow end).

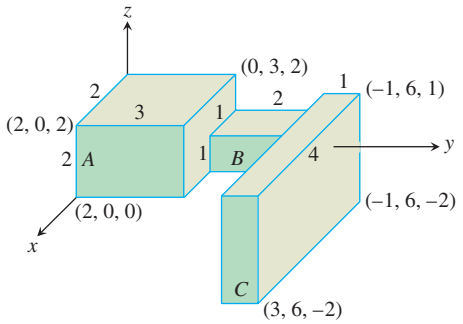
## Pappus's Formula

Pappus's formula (Exercises 15.2) holds in three dimensions as well as in two. Suppose that bodies $B_1$ and $B_2$ of mass $m_1$ and $m_2$, respectively, occupy nonoverlapping regions in space and that $\mathbf{c}_1$ and $\mathbf{c}_2$ are the vectors from the origin to the bodies' respective centers of mass. Then the center of mass of the union $B_1 \cup B_2$ of the two bodies is determined by the vector

$$\mathbf{c} = \frac{m_1\mathbf{c}_1 + m_2\mathbf{c}_2}{m_1 + m_2}.$$

As before, this formula is called **Pappus's formula**. As in the two-dimensional case, the formula generalizes to

$$\mathbf{c} = \frac{m_1\mathbf{c}_1 + m_2\mathbf{c}_2 + \cdots + m_n\mathbf{c}_n}{m_1 + m_2 + \cdots + m_n}$$



for $n$ bodies.

**25.** Derive Pappus's formula. (*Hint:* Sketch $B_1$ and $B_2$ as nonoverlapping regions in the first octant and label their centers of mass $(\bar{x}_1, \bar{y}_1, \bar{z}_1)$ and $(\bar{x}_2, \bar{y}_2, \bar{z}_2)$. Express the moments of $B_1 \cup B_2$ about the coordinate planes in terms of the masses $m_1$ and $m_2$ and the coordinates of these centers.)

**26.** The accompanying figure shows a solid made from three rectangular solids of constant density $\delta = 1$. Use Pappus's formula to find the center of mass of

**a.** $A \cup B$ **b.** $A \cup C$

**c.** $B \cup C$ **d.** $A \cup B \cup C$.

**27.** **a.** Suppose that a solid right circular cone $C$ of base radius $a$ and altitude $h$ is constructed on the circular base of a solid hemisphere $S$ of radius $a$ so that the union of the two solids resembles an ice cream cone. The centroid of a solid cone lies one-fourth of the way from the base toward the vertex. The centroid of a solid hemisphere lies three-eighths of the way from the base to the top. What relation must hold between $h$ and $a$ to place the centroid of $C \cup S$ in the common base of the two solids?

**b.** If you have not already done so, answer the analogous question about a triangle and a semicircle (Section 15.2, Exercise 55). The answers are not the same.

**28.** A solid pyramid $P$ with height $h$ and four congruent sides is built with its base as one face of a solid cube $C$ whose edges have length $s$. The centroid of a solid pyramid lies one-fourth of the way from the base toward the vertex. What relation must hold between $h$ and $s$ to place the centroid of $P \cup C$ in the base of the pyramid? Compare your answer with the answer to Exercise 27. Also compare it with the answer to Exercise 56 in Section 15.2.

# 15.6 Triple Integrals in Cylindrical and Spherical Coordinates

When a calculation in physics, engineering, or geometry involves a cylinder, cone, or sphere, we can often simplify our work by using cylindrical or spherical coordinates, which are introduced in this section. The procedure for transforming to these coordinates and evaluating the resulting triple integrals is similar to the transformation to polar coordinates in the plane studied in Section 15.3.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

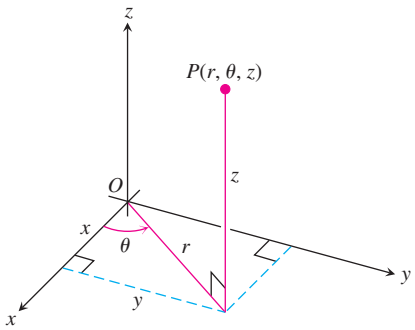

**FIGURE 15.36** The cylindrical coordinates of a point in space are $r$, $\theta$, and $z$.

## Integration in Cylindrical Coordinates

We obtain cylindrical coordinates for space by combining polar coordinates in the $xy$-plane with the usual $z$-axis. This assigns to every point in space one or more coordinate triples of the form $(r, \theta, z)$, as shown in Figure 15.36.

**DEFINITION Cylindrical Coordinates**

**Cylindrical coordinates** represent a point $P$ in space by ordered triples $(r, \theta, z)$ in which

1. $r$ and $\theta$ are polar coordinates for the vertical projection of $P$ on the $xy$-plane
2. $z$ is the rectangular vertical coordinate.

The values of $x$, $y$, $r$, and $\theta$ in rectangular and cylindrical coordinates are related by the usual equations.

**Equations Relating Rectangular $(x, y, z)$ and Cylindrical $(r, \theta, z)$ Coordinates**

$$x = r\cos\theta, \qquad y = r\sin\theta, \qquad z = z,$$
$$r^2 = x^2 + y^2, \qquad \tan\theta = y/x$$

In cylindrical coordinates, the equation $r = a$ describes not just a circle in the $xy$-plane but an entire cylinder about the $z$-axis (Figure 15.37). The $z$-axis is given by $r = 0$. The equation $\theta = \theta_0$ describes the plane that contains the $z$-axis and makes an angle $\theta_0$ with the positive $x$-axis. And, just as in rectangular coordinates, the equation $z = z_0$ describes a plane perpendicular to the $z$-axis.

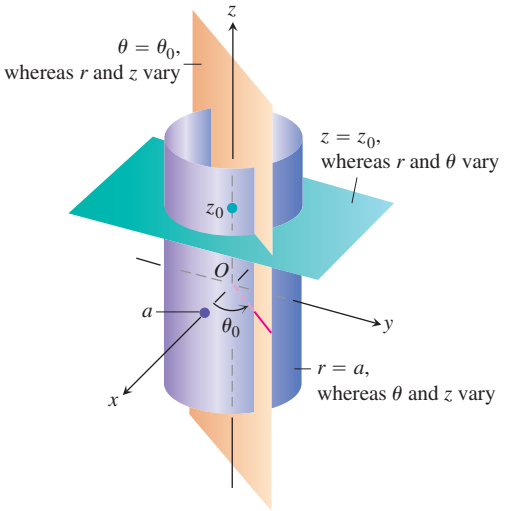

**FIGURE 15.37** Constant-coordinate equations in cylindrical coordinates yield cylinders and planes.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

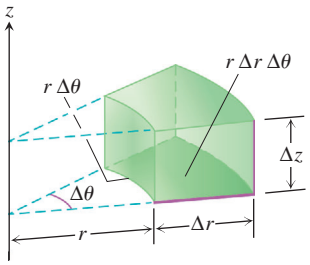

**FIGURE 15.38** In cylindrical coordinates the volume of the wedge is approximated by the product $\Delta V = \Delta z\, r\, \Delta r\, \Delta\theta$.

Cylindrical coordinates are good for describing cylinders whose axes run along the $z$-axis and planes that either contain the $z$-axis or lie perpendicular to the $z$-axis. Surfaces like these have equations of constant coordinate value:

$r = 4.$ Cylinder, radius 4, axis the $z$-axis

$\theta = \dfrac{\pi}{3}.$ Plane containing the $z$-axis

$z = 2.$ Plane perpendicular to the $z$-axis

When computing triple integrals over a region $D$ in cylindrical coordinates, we partition the region into $n$ small cylindrical wedges, rather than into rectangular boxes. In the $k$th cylindrical wedge, $r$, $\theta$ and $z$ change by $\Delta r_k$, $\Delta\theta_k$, and $\Delta z_k$, and the largest of these numbers among all the cylindrical wedges is called the **norm** of the partition. We define the triple integral as a limit of Riemann sums using these wedges. The volume of such a cylindrical wedge $\Delta V_k$ is obtained by taking the area $\Delta A_k$ of its base in the $r\theta$-plane and multiplying by the height $\Delta z$ (Figure 15.38).

For a point $(r_k, \theta_k, z_k)$ in the center of the $k$th wedge, we calculated in polar coordinates that $\Delta A_k = r_k\, \Delta r_k\, \Delta\theta_k$. So $\Delta V_k = \Delta z_k\, r_k\, \Delta r_k\, \Delta\theta_k$ and a Riemann sum for $f$ over $D$ has the form

$$S_n = \sum_{k=1}^{n} f(r_k, \theta_k, z_k)\, \Delta z_k\, r_k\, \Delta r_k\, \Delta\theta_k.$$

The triple integral of a function $f$ over $D$ is obtained by taking a limit of such Riemann sums with partitions whose norms approach zero

$$\lim_{n\to\infty} S_n = \iiint_D f\, dV = \iiint_D f\, dz\, r\, dr\, d\theta.$$

Triple integrals in cylindrical coordinates are then evaluated as iterated integrals, as in the following example.

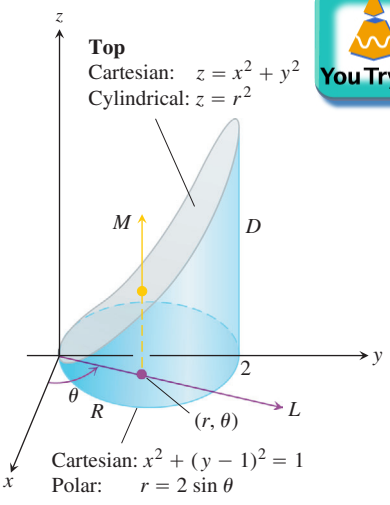

**FIGURE 15.39** Finding the limits of integration for evaluating an integral in cylindrical coordinates (Example 1).

## EXAMPLE 1 Finding Limits of Integration in Cylindrical Coordinates

Find the limits of integration in cylindrical coordinates for integrating a function $f(r, \theta, z)$ over the region $D$ bounded below by the plane $z = 0$, laterally by the circular cylinder $x^2 + (y - 1)^2 = 1$, and above by the paraboloid $z = x^2 + y^2$.

**Solution** The base of $D$ is also the region's projection $R$ on the $xy$-plane. The boundary of $R$ is the circle $x^2 + (y - 1)^2 = 1$. Its polar coordinate equation is

$$x^2 + (y - 1)^2 = 1$$
$$x^2 + y^2 - 2y + 1 = 1$$
$$r^2 - 2r \sin\theta = 0$$
$$r = 2 \sin\theta.$$

The region is sketched in Figure 15.39.

We find the limits of integration, starting with the $z$-limits. A line $M$ through a typical point $(r, \theta)$ in $R$ parallel to the $z$-axis enters $D$ at $z = 0$ and leaves at $z = x^2 + y^2 = r^2$.

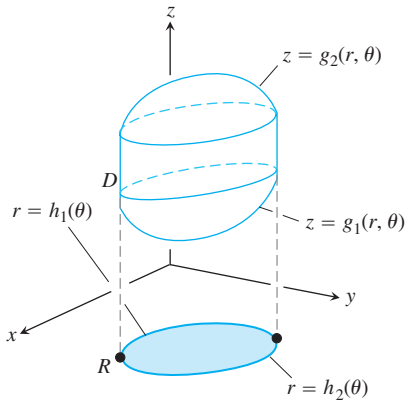
Next we find the $r$-limits of integration. A ray $L$ through $(r, \theta)$ from the origin enters $R$ at $r = 0$ and leaves at $r = 2 \sin\theta$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

Finally we find the $\theta$-limits of integration. As $L$ sweeps across $R$, the angle $\theta$ it makes with the positive $x$-axis runs from $\theta = 0$ to $\theta = \pi$. The integral is

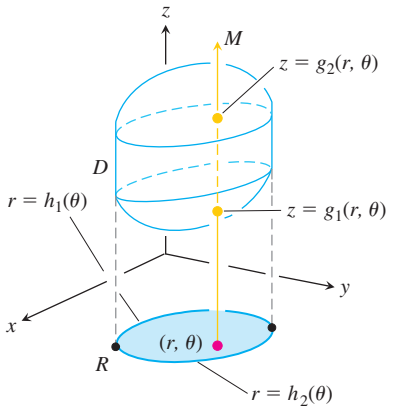
$$\iiint_D f(r, \theta, z)\, dV = \int_0^{\pi} \int_0^{2 \sin \theta} \int_0^{r^2} f(r, \theta, z)\, dz\, r\, dr\, d\theta.$$

Example 1 illustrates a good procedure for finding limits of integration in cylindrical coordinates. The procedure is summarized as follows.



## How to Integrate in Cylindrical Coordinates

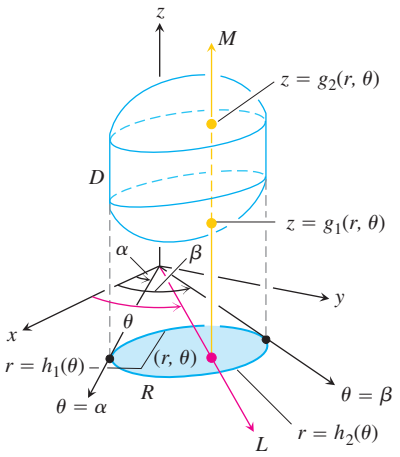
To evaluate



$$\iiint_D f(r, \theta, z)\, dV$$

over a region $D$ in space in cylindrical coordinates, integrating first with respect to $z$, then with respect to $r$, and finally with respect to $\theta$, take the following steps.

**1.** *Sketch*. Sketch the region $D$ along with its projection $R$ on the $xy$-plane. Label the surfaces and curves that bound $D$ and $R$.



**2.** *Find the $z$-limits of integration*. Draw a line $M$ through a typical point $(r, \theta)$ of $R$ parallel to the $z$-axis. As $z$ increases, $M$ enters $D$ at $z = g_1(r, \theta)$ and leaves at $z = g_2(r, \theta)$. These are the $z$-limits of integration.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

3. *Find the r-limits of integration.* Draw a ray $L$ through $(r, \theta)$ from the origin. The ray enters $R$ at $r = h_1(\theta)$ and leaves at $r = h_2(\theta)$. These are the $r$-limits of integration.

4. *Find the θ-limits of integration.* As $L$ sweeps across $R$, the angle $\theta$ it makes with the positive $x$-axis runs from $\theta = \alpha$ to $\theta = \beta$. These are the $\theta$-limits of integration. The integral is

$$\iiint_D f(r, \theta, z)\, dV = \int_{\theta=\alpha}^{\theta=\beta} \int_{r=h_1(\theta)}^{r=h_2(\theta)} \int_{z=g_1(r,\theta)}^{z=g_2(r,\theta)} f(r, \theta, z)\, dz\, r\, dr\, d\theta.$$

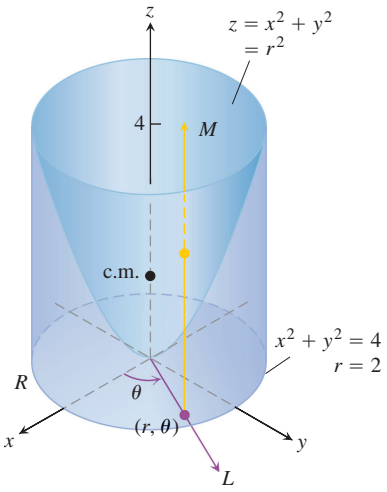


**FIGURE 15.40** Example 2 shows how to find the centroid of this solid.

## EXAMPLE 2 Finding a Centroid

Find the centroid ($\delta = 1$) of the solid enclosed by the cylinder $x^2 + y^2 = 4$, bounded above by the paraboloid $z = x^2 + y^2$, and bounded below by the $xy$-plane.

**Solution** We sketch the solid, bounded above by the paraboloid $z = r^2$ and below by the plane $z = 0$ (Figure 15.40). Its base $R$ is the disk $0 \le r \le 2$ in the $xy$-plane.

The solid's centroid $(\bar{x}, \bar{y}, \bar{z})$ lies on its axis of symmetry, here the $z$-axis. This makes $\bar{x} = \bar{y} = 0$. To find $\bar{z}$, we divide the first moment $M_{xy}$ by the mass $M$.

To find the limits of integration for the mass and moment integrals, we continue with the four basic steps. We completed our initial sketch. The remaining steps give the limits of integration.

*The z-limits.* A line $M$ through a typical point $(r, \theta)$ in the base parallel to the $z$-axis enters the solid at $z = 0$ and leaves at $z = r^2$.

*The r-limits.* A ray $L$ through $(r, \theta)$ from the origin enters $R$ at $r = 0$ and leaves at $r = 2$.

*The θ-limits.* As $L$ sweeps over the base like a clock hand, the angle $\theta$ it makes with the positive $x$-axis runs from $\theta = 0$ to $\theta = 2\pi$. The value of $M_{xy}$ is

$$M_{xy} = \int_0^{2\pi} \int_0^2 \int_0^{r^2} z\, dz\, r\, dr\, d\theta = \int_0^{2\pi} \int_0^2 \left[\frac{z^2}{2}\right]_0^{r^2} r\, dr\, d\theta$$

$$= \int_0^{2\pi} \int_0^2 \frac{r^5}{2}\, dr\, d\theta = \int_0^{2\pi} \left[\frac{r^6}{12}\right]_0^2 d\theta = \int_0^{2\pi} \frac{16}{3}\, d\theta = \frac{32\pi}{3}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

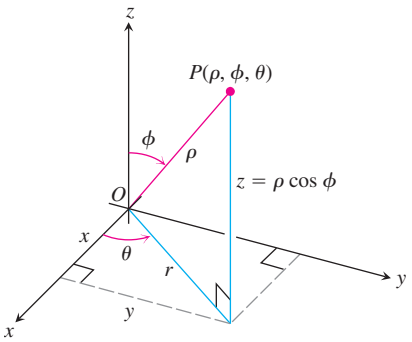

**FIGURE 15.41** The spherical coordinates $\rho$, $\phi$, and $\theta$ and their relation to $x$, $y$, $z$, and $r$.

The value of $M$ is

$$M = \int_0^{2\pi}\int_0^{2}\int_0^{r^2} dz\, r\, dr\, d\theta = \int_0^{2\pi}\int_0^{2}\left[z\right]_0^{r^2} r\, dr\, d\theta$$

$$= \int_0^{2\pi}\int_0^{2} r^3\, dr\, d\theta = \int_0^{2\pi}\left[\frac{r^4}{4}\right]_0^{2} d\theta = \int_0^{2\pi} 4\, d\theta = 8\pi.$$

Therefore,

$$\bar{z} = \frac{M_{xy}}{M} = \frac{32\pi}{3}\,\frac{1}{8\pi} = \frac{4}{3},$$

and the centroid is $(0, 0, 4/3)$. Notice that the centroid lies outside the solid. ■

## Spherical Coordinates and Integration

Spherical coordinates locate points in space with two angles and one distance, as shown in Figure 15.41. The first coordinate, $\rho = |\overrightarrow{OP}|$, is the point's distance from the origin. Unlike $r$, *the variable $\rho$ is never negative*. The second coordinate, $\phi$, is the angle $\overrightarrow{OP}$ makes with the positive $z$-axis. It is required to lie in the interval $[0, \pi]$. The third coordinate is the angle $\theta$ as measured in cylindrical coordinates.

**DEFINITION Spherical Coordinates**

**Spherical coordinates** represent a point $P$ in space by ordered triples $(\rho, \phi, \theta)$ in which

1. $\rho$ is the distance from $P$ to the origin.
2. $\phi$ is the angle $\overrightarrow{OP}$ makes with the positive $z$-axis $(0 \le \phi \le \pi)$.
3. $\theta$ is the angle from cylindrical coordinates.

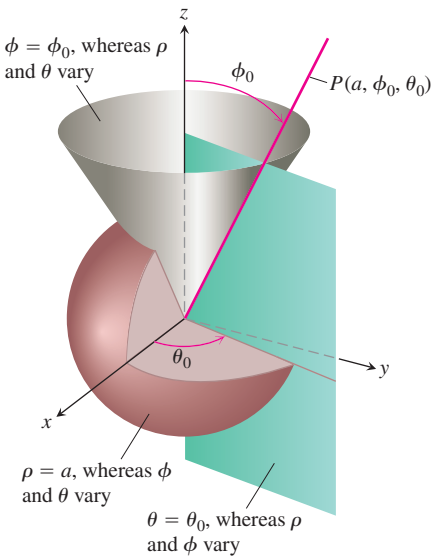

**FIGURE 15.42** Constant-coordinate equations in spherical coordinates yield spheres, single cones, and half-planes.

On maps of the Earth, $\theta$ is related to the meridian of a point on the Earth and $\phi$ to its latitude, while $\rho$ is related to elevation above the Earth's surface.

The equation $\rho = a$ describes the sphere of radius $a$ centered at the origin (Figure 15.42). The equation $\phi = \phi_0$ describes a single cone whose vertex lies at the origin and whose axis lies along the $z$-axis. (We broaden our interpretation to include the $xy$-plane as the cone $\phi = \pi/2$.) If $\phi_0$ is greater than $\pi/2$, the cone $\phi = \phi_0$ opens downward. The equation $\theta = \theta_0$ describes the half-plane that contains the $z$-axis and makes an angle $\theta_0$ with the positive $x$-axis.

**Equations Relating Spherical Coordinates to Cartesian and Cylindrical Coordinates**

$$r = \rho\sin\phi, \qquad x = r\cos\theta = \rho\sin\phi\cos\theta,$$
$$z = \rho\cos\phi, \qquad y = r\sin\theta = \rho\sin\phi\sin\theta, \tag{1}$$
$$\rho = \sqrt{x^2 + y^2 + z^2} = \sqrt{r^2 + z^2}.$$

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

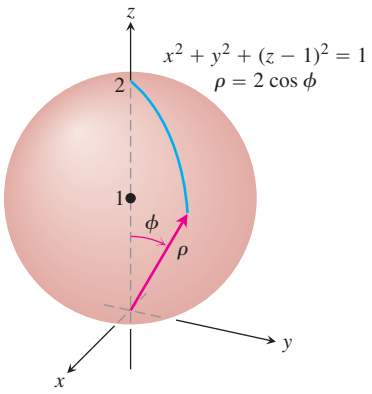

**FIGURE 15.43** The sphere in Example 3.

**EXAMPLE 3** Converting Cartesian to Spherical

Find a spherical coordinate equation for the sphere $x^2 + y^2 + (z - 1)^2 = 1$.

**Solution** We use Equations (1) to substitute for $x$, $y$, and $z$:

$$x^2 + y^2 + (z - 1)^2 = 1$$

$$\rho^2 \sin^2 \phi \cos^2 \theta + \rho^2 \sin^2 \phi \sin^2 \theta + (\rho \cos \phi - 1)^2 = 1 \qquad \text{Equations (1)}$$

$$\rho^2 \sin^2 \phi \underbrace{(\cos^2 \theta + \sin^2 \theta)}_{1} + \rho^2 \cos^2 \phi - 2\rho \cos \phi + 1 = 1$$

$$\rho^2 \underbrace{(\sin^2 \phi + \cos^2 \phi)}_{1} = 2\rho \cos \phi$$

$$\rho^2 = 2\rho \cos \phi$$

$$\rho = 2 \cos \phi \,.$$

See Figure 15.43. ■

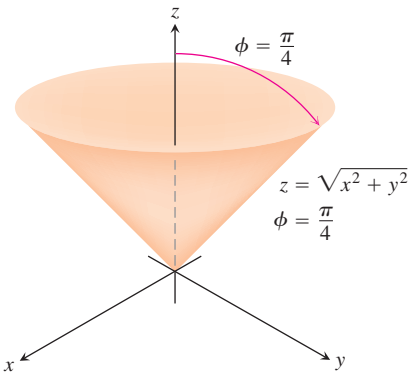

**FIGURE 15.44** The cone in Example 4.

**EXAMPLE 4** Converting Cartesian to Spherical

Find a spherical coordinate equation for the cone $z = \sqrt{x^2 + y^2}$ (Figure 15.44).

**Solution 1** *Use geometry*. The cone is symmetric with respect to the $z$-axis and cuts the first quadrant of the $yz$-plane along the line $z = y$. The angle between the cone and the positive $z$-axis is therefore $\pi/4$ radians. The cone consists of the points whose spherical coordinates have $\phi$ equal to $\pi/4$, so its equation is $\phi = \pi/4$.

**Solution 2** *Use algebra*. If we use Equations (1) to substitute for $x$, $y$, and $z$ we obtain the same result:

$$z = \sqrt{x^2 + y^2}$$

$$\rho \cos \phi = \sqrt{\rho^2 \sin^2 \phi} \qquad \text{Example 3}$$

$$\rho \cos \phi = \rho \sin \phi \qquad \rho \geq 0, \sin \phi \geq 0$$

$$\cos \phi = \sin \phi$$

$$\phi = \frac{\pi}{4} \,. \qquad 0 \leq \phi \leq \pi$$

■

Spherical coordinates are good for describing spheres centered at the origin, half-planes hinged along the $z$-axis, and cones whose vertices lie at the origin and whose axes lie along the $z$-axis. Surfaces like these have equations of constant coordinate value:

$\rho = 4$ Sphere, radius 4, center at origin

$\phi = \frac{\pi}{3}$ Cone opening up from the origin, making an angle of $\pi/3$ radians with the positive $z$-axis

$\theta = \frac{\pi}{3} \,.$ Half-plane, hinged along the $z$-axis, making an angle of $\pi/3$ radians with the positive $x$-axis

When computing triple integrals over a region $D$ in spherical coordinates, we partition the region into $n$ spherical wedges. The size of the $k$th spherical wedge, which contains a point $(\rho_k, \phi_k, \theta_k)$, is given by changes by $\Delta\rho_k$, $\Delta\theta_k$, and $\Delta\phi_k$ in $\rho$, $\theta$, and $\phi$. Such a spherical wedge has one edge a circular arc of length $\rho_k \, \Delta\phi_k$, another edge a circular arc of

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

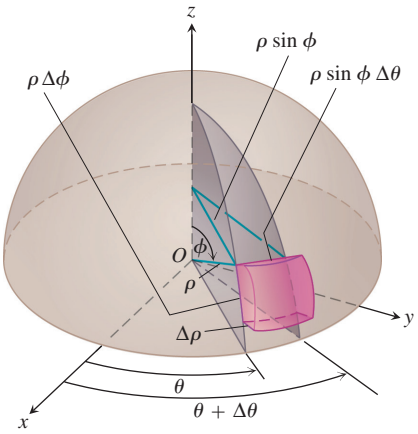

**FIGURE 15.45** In spherical coordinates

$$dV = d\rho \cdot \rho\, d\phi \cdot \rho \sin\phi\, d\theta$$
$$= \rho^2 \sin\phi\, d\rho\, d\phi\, d\theta.$$

length $\rho_k \sin\phi_k\, \Delta\theta_k$, and thickness $\Delta\rho_k$. The spherical wedge closely approximates a cube of these dimensions when $\Delta\rho_k$, $\Delta\theta_k$, and $\Delta\phi_k$ are all small (Figure 15.45). It can be shown that the volume of this spherical wedge $\Delta V_k$ is $\Delta V_k = \rho_k^2 \sin\phi_k\, \Delta\rho_k\, \Delta\phi_k\, \Delta\theta_k$ for $(\rho_k, \phi_k, \theta_k)$ a point chosen inside the wedge.

The corresponding Riemann sum for a function $F(\rho, \phi, \theta)$ is

$$S_n = \sum_{k=1}^{n} F(\rho_k, \phi_k, \theta_k)\, \rho_k^2 \sin\phi_k\, \Delta\rho_k\, \Delta\phi_k\, \Delta\theta_k.$$

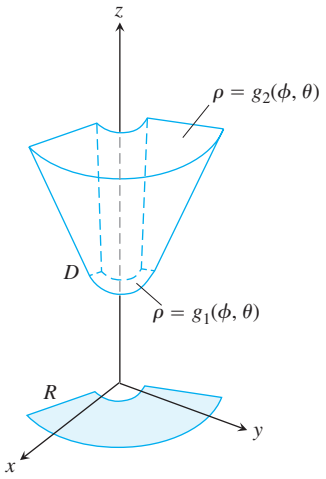
As the norm of a partition approaches zero, and the spherical wedges get smaller, the Riemann sums have a limit when $F$ is continuous:

$$\lim_{n\to\infty} S_n = \iiint_D F(\rho, \phi, \theta)\, dV = \iiint_D F(\rho, \phi, \theta)\, \rho^2 \sin\phi\, d\rho\, d\phi\, d\theta.$$

In spherical coordinates, we have

$$dV = \rho^2 \sin\phi\, d\rho\, d\phi\, d\theta.$$

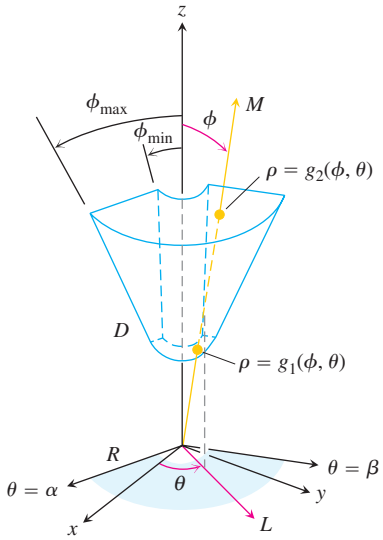
To evaluate integrals in spherical coordinates, we usually integrate first with respect to $\rho$. The procedure for finding the limits of integration is shown below. We restrict our attention to integrating over domains that are solids of revolution about the $z$-axis (or portions thereof) and for which the limits for $\theta$ and $\phi$ are constant.



## How to Integrate in Spherical Coordinates

To evaluate

$$\iiint_D f(\rho, \phi, \theta)\, dV$$



over a region $D$ in space in spherical coordinates, integrating first with respect to $\rho$, then with respect to $\phi$, and finally with respect to $\theta$, take the following steps.

**1.** *Sketch*. Sketch the region $D$ along with its projection $R$ on the $xy$-plane. Label the surfaces that bound $D$.

Copyright © 2005 Pearson Education, Inc., publishing as Pearson Addison-Wesley

2. *Find the $\rho$-limits of integration.* Draw a ray $M$ from the origin through $D$ making an angle $\phi$ with the positive $z$-axis. Also draw the projection of $M$ on the $xy$-plane (call the projection $L$). The ray $L$ makes an angle $\theta$ with the positive $x$-axis. As $\rho$ increases, $M$ enters $D$ at $\rho = g_1(\phi, \theta)$ and leaves at $\rho = g_2(\phi, \theta)$. These are the $\rho$-limits of integration.

3. *Find the $\phi$-limits of integration.* For any given $\theta$, the angle $\phi$ that $M$ makes with the $z$-axis runs from $\phi = \phi_{min}$ to $\phi = \phi_{max}$. These are the $\phi$ -limits of integration.

4. *Find the $\theta$-limits of integration.* The ray $L$ sweeps over $R$ as $\theta$ runs from $\alpha$ to $\beta$. These are the $\theta$-limits of integration. The integral is

$$\iiint_D f(\rho, \phi, \theta)\, dV = \int_{\theta=\alpha}^{\theta=\beta} \int_{\phi=\phi_{min}}^{\phi=\phi_{max}} \int_{\rho=g_1(\phi,\theta)}^{\rho=g_2(\phi,\theta)} f(\rho, \phi, \theta)\, \rho^2 \sin\phi\, d\rho\, d\phi\, d\theta.$$

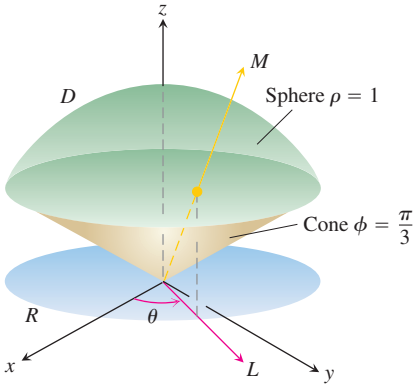


**FIGURE 15.46** The ice cream cone in Example 5.

## EXAMPLE 5 Finding a Volume in Spherical Coordinates

Find the volume of the "ice cream cone" $D$ cut from the solid sphere $\rho \le 1$ by the cone $\phi = \pi/3$.

**Solution** The volume is $V = \iiint_D \rho^2 \sin\phi\, d\rho\, d\phi\, d\theta$, the integral of $f(\rho, \phi, \theta) = 1$ over $D$.
